The theoretical stakes are substantial and genuinely contested. The security-dilemma tradition, running from John Herz through Robert Jervis's 1978 classic "Cooperation Under the Security Dilemma" and Kenneth Waltz's structural realism, predicts that in an anarchic system, measures taken by one state to increase its security—NATO enlargement, missile defense, military exercises—will be perceived as threatening by another, producing spirals of hostility even when neither side desires war. On this account, Russian behavior is at least partly reactive: a great power facing the steady advance of a rival alliance toward its borders, responding with the tools available to it. The ontological-security tradition, developed by Jennifer Mitzen and Brent Steele, predicts something different: that states seek not merely physical survival but continuity of self-identity, and that the collapse of the Soviet Union in 1991 produced a profound ontological insecurity in Russia that was subsequently reconstructed under Vladimir Putin through a narrative of great-power restoration, civilizational distinctiveness, and victimhood at the hands of a triumphalist West. On this account, Russian behavior is at least partly constitutive: the identity narrative generates the interests, not merely the reverse. These two traditions are not mutually exclusive—Mitzen herself argues that ontological and physical security can reinforce each other—but they compete in emphasis, in the weight they assign to structure versus agency, and in the policy prescriptions they imply. The lesson's task is to hold both in view and to ask, for each historical episode, which mechanism better fits the evidence.

The African perspective is primary in this lesson, not a regional add-on, because the post-Soviet space is not the only arena in which great powers have constructed "zones of privileged interests" and invoked security to justify intervention. From the vantage point of African scholarship—Siba Grovogui's critique of the international legal order's colonial foundations, Achille Mbembe's analysis of necropolitics and the postcolony, Jean-François Bayart's "politics of the belly," Mahmood Mamdani's work on colonialism and the bifurcated state, Walter Rodney's analysis of underdevelopment, Kwame Nkrumah's neo-colonialism, Julius Nyerere's

ujamaa, Amílcar Cabral's theory of culture and liberation, Frantz Fanon's critique of colonial violence, and the contemporary work of Emmanuel Aning, Kwesi Danso, Sylvia Tamale, and Oyèrónkẹ́ Oyěwùmí—the Russian claim to a privileged sphere looks structurally familiar: it is the claim of a great power that its security requires the subordination of smaller neighbors' sovereignty. African states have experienced precisely this logic from multiple directions—European colonialism, Cold War proxy competition, and contemporary great-power rivalry—and have developed a distinctive normative vocabulary around sovereignty, non-interference, and the selective application of international norms. The African vantage reveals what the other four perspectives tend to occlude: that "security dilemma" language can function as a euphemism for imperial ambition, that territorial integrity norms are invoked with striking selectivity, and that the question of who gets to define "legitimate security concerns" is itself a power question. At the same time, African scholarship does not simply invert the Western narrative; it insists on the agency of post-Soviet states and on the possibility that smaller states' choices—Ukraine's westward orientation, Georgia's NATO aspirations—are not merely great-power manipulation but genuine political projects. This is the lesson's central framing move, and it is why the African perspective is developed at greatest length in Section 2.7.

What the student will be able to do after mastering this lesson is substantial and assessable. First, reconstruct each of the five perspectives—African, Chinese, Russian, Western, and UN—on the lesson's central topic as a whole, steel-manned from within, identifying what each contributes and what each occludes. Second, adjudicate between the security-dilemma and imperial-ambition explanations for specific episodes, using the 2008 Georgia war as a practice case and the 2014 Crimea annexation as a worked example, on the basis of evidence rather than prior conviction. Third, apply the four levels of analysis—individual, state, systemic, and transnational—to post-Soviet cases, recognizing that the same event looks different at different levels. Fourth, identify falsifiers: what evidence would count against each theory, and what evidence is currently missing. Fifth, produce an independent analytical memo that distinguishes description, explanation, prediction, and prescription, and that calibrates its confidence to the available evidence. These are not abstract skills; they are the skills required to analyze the Ukraine war in Lesson 36 without being captured by any single narrative.

A final methodological caution frames the entire lesson. The temptation in analyzing Russia's behavior is to oscillate between two equally unsatisfying poles: treating Putin as a rational actor responding to structural incentives, which risks excusing aggression; and treating Putin as an irrational ideologue, which risks abandoning explanation altogether. The lesson rejects both. It insists that mechanisms be specified, that scope conditions be stated, that counterarguments be engaged, and that evidence be weighed rather than asserted. It also insists that the student resist the teleological fallacy of reading 2022 backward into 1991: the collapse of the Soviet Union did not make the invasion inevitable, and the enlargement of NATO did not make it inevitable either. Contingency, agency, and the specific choices of specific leaders at specific moments matter, and the lesson's theoretical apparatus is designed to make those choices visible rather than to dissolve them into structure. The student who completes this lesson should be able to hold complexity without collapsing it, and to argue a position while remaining genuinely open to evidence that would change it.

SECTION 1 — Pre-Class Priming

1.1 Retrieval Warm-Up Answer the following from memory before reading the lesson core. Do not look up answers; the point is to surface what you already know and what you do not.

1. From Lesson 5: State the security dilemma in one sentence, and identify the two conditions—offense-defense balance and information—that Jervis argued determine whether it produces spirals or stability.
2. From Lesson 5: Distinguish Waltz's structural realism from Mearsheimer's offensive realism on the question of whether great powers are satisfied with the status quo.
3. From Lesson 7: Define ontological security, and explain how Mitzen's account differs from Steele's on whether ontological security is primarily about routines or about identity narratives.
4. From Lesson 7: Give one example of a state that experienced ontological insecurity following a major systemic shock, and identify the narrative it constructed to restore continuity.
5. From Lesson 14: What is meant by "contemporary transition," and how does the post-Cold War order's legitimacy crisis relate to the rise of multipolarity?
6. From Lesson 14: Identify one mechanism by which a unipolar moment can generate its own erosion, and name a case where this occurred.

1.2 Orientation Questions These questions frame the lesson's central puzzle. Hold them in mind as you read; you will be expected to answer them in the independent memo.

1. If NATO enlargement were the primary cause of Russian aggression, what would we expect to observe about the timing of Russian military interventions relative to enlargement rounds, and what would falsify that expectation?
2. If imperial ambition were the primary cause, what would we expect to observe about Russian behavior toward non-NATO neighbors, and what would falsify that expectation?
3. How does the collapse of Soviet identity in 1991 function as an independent variable in explaining Russian behavior after 2000, and what evidence would distinguish ontological-insecurity mechanisms from purely strategic ones?
4. What does the African vantage point reveal about the "security dilemma" framing that the Western and Russian perspectives each tend to obscure?

1.3 Vocabulary Pre-Teach The following terms will be used throughout the lesson. These are provisional definitions to be refined as you read.

- **Ontological security**: A state's need for continuity and stable self-identity, such that threats to identity can be as destabilizing as threats to physical survival; distinct from physical security.
- **Security dilemma**: The condition in which measures taken by one state to increase its security decrease the security of others, potentially producing spirals of hostility even absent aggressive intent.
- **Zone of privileged interests**: The Russian doctrine, articulated by Medvedev in 2008, asserting a special Russian role in the security affairs of post-Soviet states; a claim to sphere of influence.
- **NATO enlargement**: The post-Cold War expansion of the North Atlantic Treaty Organization to include former Warsaw Pact and Soviet states; a central variable in debates over Russian threat perception.
- **EAEU (Eurasian Economic Union)**: A Russian-led economic integration project intended as a counterweight to the European Union in the post-Soviet space.
- **Maidan**: Shorthand for the Euromaidan protests of 2013–14 in Kyiv, which led to the ouster of President Yanukovych and precipitated the 2014 crisis.
- **Reunification**: The Russian term for the 2014 annexation of Crimea, framing it as the return of historically Russian territory; contested by Ukraine and most of the international community.

- **Encirclement**: The Russian perception that NATO expansion constitutes strategic encirclement, a framing with deep roots in Russian and Soviet strategic culture.
- **Civilizational defense**: The claim that Russia defends not merely its territory but a distinct Eurasian civilization against Western liberal universalism.
- **Territorial integrity**: The principle, enshrined in the UN Charter, that states' borders are inviolable; central to both Ukrainian claims and UN resolutions on Crimea.
- **Collective security**: The principle that an attack on one is an attack on all, underlying NATO's Article 5 and the UN Security Council's Chapter VII mechanisms.
- **Great-power identity**: A state's self-conception as a great power, with attendant claims to status, voice, and sphere of influence; in Russia's case, reconstructed after 1991.

SECTION 2 — LESSON CORE

2.1 Learning objectives

By the end of this lesson, students will be able to: (1) **Analyze** Russia's post-Soviet great-power self-understanding as a historically constructed identity rather than a natural geopolitical fact, tracing how the collapse of the USSR produced both material contraction and status anxiety. (2) **Explain** the mechanism by which an "imperial hangover" is translated into a doctrine of "privileged interests" in the near abroad, distinguishing identity-based claims from purely material or security-based explanations. (3) **Evaluate** the scope conditions under which a great-power identity becomes coercive foreign policy, including domestic legitimation, neighbor vulnerability, international ambiguity, and material capacity. (4) **Compare** how African, Chinese, Russian, Western, and UN perspectives differently diagnose the same phenomenon, identifying what each reveals and what each occludes. (5) **Apply** this framework to the 2014 Crimea annexation and the 2008 Georgia war, adjudicating between security-dilemma and imperial-ambition explanations on the basis of evidence rather than assertion. These objectives are assessable through mechanism-based short answers, perspective reconstruction, and case-based adjudication; they require students to move beyond description to causal explanation and normative evaluation.

2.2 KEY IDEA 1 — Imperial hangovers: Russia's self-understanding as a great power and its zone of 'privileged interests'

Bolded Causal Claim: Russia's post-Soviet conduct toward neighboring states is partly driven by an imperial hangover: a durable great-power self-understanding that treats former Soviet space as a zone of privileged interests, operating through identity, status, and spatial imagination as much as through material power.

Mechanism: The mechanism begins with the ontological shock of 1991. The dissolution of the USSR did not merely reduce Russia's territory and resources; it destroyed a superpower identity that had organized elite self-understanding, bureaucratic routines, military doctrine, and public pride for seven decades. In constructivist terms, interests are constituted by identity, and the loss of Soviet identity created a vacuum that post-Soviet elites filled with a reconstructed Russian great-power identity. This identity is not simply "nationalism" in the ethnic sense; it is a civilizational and geopolitical claim that Russia remains a pole in a multipolar order and retains special responsibilities in Eurasia. The phrase "zone of privileged interests" became explicit in Russian discourse after the 2008 Georgia war, when President Dmitry Medvedev articulated the principle that Russia has privileged interests in regions where it has historically been present. The mechanism

then works through several channels. First, a cognitive map: the former Soviet republics are imagined not as fully external states but as a "near abroad" (blizhnee zarubezh'e), a category that blurs the boundary between domestic and foreign policy. Second, status anxiety: the loss of superpower rank generates compensatory assertions of prerogative, especially when Western institutions appear to treat Russia as a defeated or secondary power. Third, institutional path dependence: the security services, military, energy sector, and diplomatic corps retain Soviet-era networks, threat perceptions, and operational habits that make intervention in the near abroad thinkable and executable. Fourth, legitimation: domestic political entrepreneurs convert great-power assertion into popular legitimacy, especially when economic performance or democratic accountability is weak. Fifth, externalization: neighboring states' sovereignty is interpreted through the lens of Russian security, so that their alliance choices are read as threats to Russia's status and survival rather than as autonomous decisions. The mechanism is therefore neither purely material nor purely ideational; it is a feedback loop in which identity shapes threat perception, threat perception justifies coercion, and coercion reinforces identity. Realist theory helps explain why a great power might seek regional hegemony and buffer zones, but realism alone cannot explain why the specific spatial category of the "near abroad" persists after the material empire has collapsed. Postcolonial and decolonial scholarship helps explain how imperial spatial imaginaries survive formal decolonization: the empire ends, but the categories, hierarchies, and practices of rule persist in diplomatic language, security doctrine, and elite habitus. Russian international-relations discourse, including analysts such as Trenin, has often presented this self-understanding as a pragmatic great-power realism rather than imperialism, arguing that Russia has legitimate special interests in Eurasia. Putin's 2021 essay on the historical unity of Russians and Ukrainians illustrates how identity claims can be mobilized to deny the full sovereignty of a neighbor by framing it as part of a shared civilizational body. The mechanism is therefore best understood as an imperial hangover: the persistence of an imperial mode of seeing space, status, and sovereignty after the formal end of empire.

Scope Conditions: The imperial-hangover mechanism does not operate automatically; it requires specific conditions. Materially, Russia must possess sufficient military, economic, or energy leverage to make coercion credible. Geopolitically, the target state must be vulnerable—whether because of internal division, weak institutions, lack of external security guarantees, or geographic exposure. Domestically, elites must face incentives to mobilize great-power identity, whether for legitimation, diversion, or ideological conviction. Internationally, the environment must be permissive: Western red lines must be ambiguous, international institutions must be unable to enforce norms, and other great powers must be distracted or complicit. Ideologically, historical narratives must be available and resonant enough to frame coercion as restoration or defense rather than aggression. The mechanism is also constrained by counter-conditions: if a neighbor has a credible external security guarantee, if domestic costs of intervention are too high, if Russia lacks capacity, or if international costs are prohibitive, the imperial hangover may remain latent rather than expressed. Scope conditions therefore matter analytically because they prevent the theory from becoming a tautology in which every Russian action is explained by empire. The theory predicts not constant expansion but conditional assertiveness: coercion where vulnerability and permissiveness coincide, restraint where they do not.

Observable Implications: If the imperial-hangover mechanism is operative, one should observe several patterns. Rhetorically, Russian leaders and officials should invoke "privileged interests," "near abroad," "historical unity," "Russian world," or civilizational ties when justifying policy toward post-Soviet states. Behaviorally, one should observe interventions, coercion, or recognition of breakaway entities in Georgia, Ukraine, Moldova, or elsewhere, especially when those states pursue Western alignment. Institutionally, one should observe attempts to build alternative integration projects—such as the Eurasian Economic Union or the Collective Security Treaty Organization—that reconstitute a Russian-centered sphere. Diplomatically,

one should observe demands for veto power over neighbors' alliance choices, as in Russia's December 2021 proposals to NATO and the United States. Domestically, one should observe high public approval for assertive foreign policy and the use of historical grievance in official narratives. Conversely, the mechanism would be weakened as an explanation if Russia consistently accepted NATO enlargement, refrained from coercing neighbors, or treated post-Soviet states as fully equal sovereigns. The observable implications thus allow the theory to be tested against behavior rather than inferred from identity alone.

Perspective Note (five traditions in brief):

From an African vantage point, the imperial hangover is legible not as an exotic Russian pathology but as a familiar structure of hierarchical sovereignty. African scholarship has long treated sovereignty as historically contested and racialized: Grovogui's work on the "standard of civilization" shows how great powers have claimed tutelary authority over weaker states; Mamdani's citizen/subject distinction reveals how colonial rule produced differentiated sovereignty; Rodney and Nkrumah frame underdevelopment as a product of external extraction rather than internal failure. In this light, Russia's "zone of privileged interests" resembles the colonial spheres of influence that African states, from the 1963 OAU Charter to the AU Constitutive Act, have formally rejected. The African perspective therefore insists that any critique of Russian imperialism be historically reflexive: Western powers have also asserted privileged interests in Africa, from Françafrique to Cold War clientelism, and African states experience great-power competition as a threat to hard-won sovereignty. At the same time, African international-relations thought is not simply anti-Western. Scholars such as Aning and Danso, and feminist and decolonial thinkers such as Tamale and Oyěwùmí, stress that non-interference can shield abusive regimes, while the African Union's principle of non-indifference permits intervention against mass atrocities. Thus the African vantage reveals both the hypocrisy of selective norm enforcement and the genuine dilemma of protecting sovereignty without licensing hegemony. It also highlights what Western and Russian frames often miss: for many African states, the relevant question is not whether Russia is an empire but how any great power's claim to a privileged zone constrains the agency of smaller states. Bayart's analysis of extraversion and Mbembe's work on commandement suggest that sovereignty is always negotiated through external relations; the task is not to abolish influence but to subject it to accountable, multilateral rules rather than unilateral "privileged interests."

Chinese perspectives treat the imperial hangover less as an autonomous Russian ideology than as a symptom of an unbalanced post-Cold War order. Chinese official and academic discourse emphasizes "indivisible security," multipolarity, and the illegitimacy of bloc politics; NATO expansion is read as a structural cause of Russian insecurity, while Russia's great-power self-understanding is seen as a predictable reaction to humiliation. Beijing's statements on Ukraine stress "legitimate security concerns" and oppose unilateral sanctions, reflecting a view that sovereignty must be balanced against security. This frame contributes by centering systemic causes and resisting moralized exceptionalism, but it occludes the agency of smaller states and can rationalize hierarchy when China's own regional interests are at stake.

Russian perspectives reconstruct the imperial hangover as civilizational defense and historical restoration. From this vantage, the Soviet collapse was not merely geopolitical loss but ontological rupture; the "near abroad" is not a zone of conquest but a space of shared history, cultural ties, and strategic depth. Trenin's analysis of Russia as a great power with special responsibilities in Eurasia, and Putin's 2021 essay on the historical unity of Russians and Ukrainians, frame "privileged interests" as protective rather than predatory. This perspective explains the emotional and identity-laden quality of Russian policy, but it occludes Ukrainian agency and risks conflating security with domination.

Western perspectives are divided between an imperial-aggression thesis and a security-dilemma self-critique.

The first, common in policy discourse, treats Russia's great-power self-understanding as revanchist and its zone of privileged interests as incompatible with sovereign equality. The second, articulated by Mearsheimer (2014), Kennan (1997), and Sarotte (2021), argues that NATO expansion and Western triumphalism helped produce the very insecurity they now condemn. Kotkin (2022) adds that Putin's ideological construction of Russian identity matters independently of NATO. This debate is valuable because it distinguishes structure from agency, but it often centers Euro-Atlantic concerns and under-theorizes how Russian imperial narratives are received by post-Soviet societies.

The UN perspective is legal-normative and institutionally constrained. It foregrounds Charter principles—sovereign equality, territorial integrity, and the prohibition of force—and records collective condemnation of annexation, as in General Assembly Resolution 68/262 (2014). Yet the Security Council's veto structure means enforcement depends on great-power consensus, producing a gap between norm and practice. The UN frame thus clarifies what is at stake in "privileged interests"—the erosion of equal sovereignty—but its occlusion is procedural: it struggles to adjudicate competing security claims without a functioning collective security mechanism.

SECTION 2.3 KEY IDEA 2 — NATO enlargement: decision-making history and Russian perceptions

Bolded Causal Claim: NATO enlargement after the Cold War was a historically contingent reordering of European security that Russian elites interpreted as strategic encirclement and status demotion; it therefore converted a potentially cooperative post-Soviet moment into a competitive security dilemma by extending Article 5 guarantees into spaces Russia regarded as its "privileged interests."

Mechanism: The mechanism operates through three linked channels: institutional expansion, perceptual asymmetry, and strategic countermeasures. First, NATO's open-door policy and successive enlargement rounds—1999 (Poland, Hungary, Czech Republic), 2004 (Baltics and others), and the 2008 Bucharest declaration that Ukraine and Georgia "will become members"—physically and legally moved the alliance's frontier eastward. The NATO-Russia Founding Act (1997) created consultation mechanisms but did not give Russia a veto over enlargement; the Permanent Joint Council and later NATO-Russia Council (2002) offered dialogue without parity. Second, perceptual asymmetry: for Central and Eastern European states, enlargement was defensive insurance against Russian resurgence; for Russian elites, the same process signaled exclusion from the European security order and the erosion of strategic depth. Sarotte (2021) shows how informal assurances during German unification diplomacy—often summarized in Russian memory as a promise that NATO would not move "one inch eastward"—were never codified, yet became a durable grievance because Moscow experienced the later expansion as a broken political understanding rather than a legal technicality. Third, strategic countermeasures: Russia's military modernization, snap exercises, A2/AD deployments, and doctrinal emphasis on NATO as a threat were partly responses to enlargement; these measures then reinforced NATO's own threat perception, producing the classic security-dilemma spiral. Mearsheimer (2014) argues that Western policymakers ignored this dynamic by treating enlargement as a neutral administrative process rather than a geopolitical act. Trenin (2011) adds that Russia's post-imperial identity crisis made it especially sensitive to status loss, so enlargement was read not only as military encroachment but as civilizational demotion. Kotkin (2022) cautions, however, that security-dilemma language can obscure agency: Russian leaders chose to interpret enlargement through an imperial lens and to instrumentalize it domestically. The mechanism is therefore interactive: enlargement changed material distributions and symbolic hierarchies; Russian responses changed NATO's risk calculus; neither side's unilateral intent fully explains

the spiral.

Scope Conditions: This mechanism applies where (a) a former hegemon or great power experiences relative decline but retains regional military capacity; (b) a defensive alliance expands into the former hegemon's perceived sphere without its consent; (c) new members have historically grounded fears of the former hegemon; and (d) no inclusive security architecture offers the declining power a meaningful veto or co-management role. It is stronger when enlargement is accompanied by forward military deployments and weaker when it remains largely institutional. It does not apply uniformly: the Baltic states' accession in 2004 did not produce immediate war, suggesting that enlargement alone is insufficient; its escalatory effect depends on the target state's regime type, economic leverage, and willingness to use force. It also weakens where the declining power has alternative integration options or internal constraints on militarization. Thus NATO enlargement is a necessary but not sufficient condition for the post-2014 confrontation; it must be combined with Russian domestic politics, Ukrainian agency, and competing integration projects.

Observable Implications: If this mechanism is operative, one should observe: (i) Russian diplomatic protests and doctrinal statements identifying NATO as the primary threat; (ii) increased Russian military spending and modernization after key enlargement milestones, especially post-2008 and post-2014; (iii) declining frequency and substantive content of NATO-Russia Council meetings; (iv) NATO force posture adjustments in Eastern Europe, including enhanced forward presence; (v) shifts in Ukrainian public opinion toward NATO membership after 2014; and (vi) accession of previously neutral states (Finland, Sweden) following Russian aggression, which paradoxically confirms the security-dilemma logic by showing how Russian countermeasures expanded the very alliance they opposed. The data lab's NATO membership timeline and Russian spending series are direct tests: a pure "imperial ambition" account would predict Russian aggression regardless of NATO posture, whereas the security-dilemma account predicts escalation correlated with perceived encirclement and forward deployment.

Perspective Note (five traditions in brief): African (primary): From an African vantage, NATO enlargement appears less as a technical Euro-Atlantic adjustment than as another instance of great powers constructing security architectures that distribute protection unequally. African states and scholars—drawing on Grovogui's critique of sovereign hierarchy, Mbembe's analysis of postcolonial violence, and Mamdani's work on bifurcated states—often read NATO expansion through the lens of selective sovereignty: Western powers invoke territorial integrity and self-determination for Ukraine while having historically compromised African sovereignty through intervention, conditional aid, and security partnerships. The African Union's non-interference norms and the legacy of colonial borders make African governments wary of both Russian "privileged interests" and NATO's open-door universalism. Yet African perspectives also recognize that small states, including many African states, seek external guarantees when regional hegemons threaten them; the African contribution is to insist that security guarantees be embedded in inclusive, non-hierarchical frameworks rather than blocs. This perspective is longest because it reframes the debate: the problem is not only Russian encirclement or Western provocation but the absence of a genuinely universal security order in which African and post-Soviet states possess equal agency. Chinese: Chinese official and scholarly discourse treats NATO enlargement as a root cause of Russian insecurity and as evidence of Cold War mentality. Beijing emphasizes "legitimate security concerns" and opposes bloc confrontation, arguing that exclusive alliances undermine indivisible security. This frame contributes a multipolar critique of Euro-Atlantic institutional dominance, but it often occludes Russian agency and the sovereign choices of Central and Eastern European states. Russian: The Russian perspective centers encirclement, humiliation, and civilizational defense. NATO enlargement is read as the strategic manifestation of a unipolar order that denied Russia equal status after 1991. The NATO-Russia Founding Act is invoked as a moral-political benchmark, and

enlargement is framed as a violation of the spirit of post-Cold War reconciliation. This perspective captures status anxiety but occludes Ukrainian and Eastern European agency. Western: Western perspectives are divided. One strand defends enlargement as a sovereign, defensive response to Russian unpredictability and emphasizes that NATO is not an offensive alliance. Another strand, represented by Mearsheimer (2014), offers a security-dilemma self-critique: Western expansion ignored Russian red lines and helped provoke confrontation. Kotkin (2022) counters that this self-critique risks understating Putin's imperial ambition. The Western frame's strength is institutional history; its occlusion is occasional blindness to how "defensive" measures appear from Moscow. UN: The UN perspective is legal-normative. It foregrounds Charter principles—sovereign equality, territorial integrity, and non-use of force—and records collective positions on enlargement only indirectly, since NATO expansion is not itself a UN matter. Its contribution is to remind that alliance politics cannot override Charter norms; its occlusion is procedural, because the Security Council's veto structure prevents collective adjudication of competing security claims.

SECTION 2.4 KEY IDEA 3 — Competing integration projects: EU vs EAEU, and the 2013-14 crisis

Bolded Causal Claim: The 2013-14 Ukrainian crisis resulted from a structural collision between two incompatible integration projects—the EU's association model and Russia's Eurasian project—each of which encoded geopolitical alignment as well as economic rules, making Ukraine's attempt to balance both unsustainable and converting an economic choice into a contest over sovereignty and civilizational orientation.

Mechanism: The mechanism is "competitive regionalism": integration projects function as security communities with exclusive membership norms, and overlapping claims create zero-sum dilemmas for pivot states. The EU's Eastern Partnership (2009) offered Ukraine an Association Agreement and Deep and Comprehensive Free Trade Area, conditioned on reforms in governance, rule of law, and market regulation. These conditions were not merely technical; they implied alignment with EU regulatory and political norms. Russia's Customs Union (2010), later the Eurasian Economic Union (2015), offered an alternative economic space premised on post-Soviet interdependence and Russian leadership. For Ukraine, the two projects were structurally incompatible because each required exclusive tariff and regulatory commitments. Russian pressure—trade restrictions, gas pricing, and financial incentives—raised the cost of EU association, while EU conditionality raised the cost of Eurasian alignment. The November 2013 suspension of the Association Agreement by President Yanukovych triggered the Euromaidan protests; his February 2014 removal created a power vacuum that Russia exploited through the annexation of Crimea and support for separatism in Donbas. Putin's 2021 essay on Ukraine frames this not as a security dilemma alone but as a historical restoration: it presents Ukraine as an inseparable part of Russian civilizational space, implying that EU integration is an artificial geopolitical severing. Trenin (2011) situates this in Russia's unresolved post-imperial identity: having failed to become a "normal" European power, Russia constructed Eurasian integration as both an economic and an ontological project. Mearsheimer (2014) reads the crisis as Western overreach: EU and NATO expansion provoked a predictable Russian response. Kotkin (2022) counters that such explanations risk treating Russian imperialism as a reflex rather than a chosen strategy; the EAEU, on this view, was less a defensive reaction than an instrument for reconstructing a sphere of influence. The mechanism therefore includes both structural collision and agential choice: competing integration projects created the dilemma, but Russian leaders chose coercion and force to resolve it.

Scope Conditions: This mechanism applies where (a) a state occupies a geographic and economic position between two integration blocs; (b) the blocs have exclusive or incompatible membership rules; (c) domestic elites and regions are divided over orientation; (d) at least one bloc possesses coercive economic or military

leverage; and (e) the pivot state's sovereignty is contested by a neighboring great power. It is strongest in post-imperial spaces where borders and identities remain unsettled, and weaker where integration is purely commercial or where the state has a clear, consolidated alignment. It also depends on timing: the 2013-14 crisis required the specific conjuncture of Yanukovych's vulnerability, EU insistence on conditionality, and Russian willingness to use force. It does not imply that all economic integration is geopolitical; rather, it identifies conditions under which economic projects become vehicles for competing security orders.

Observable Implications: If competitive regionalism drove the crisis, one should observe: (i) explicit incompatibility between EU and Eurasian tariff/regulatory commitments; (ii) Russian economic pressure preceding political crisis; (iii) mass mobilization framed in civilizational terms (Euromaidan as "European choice"); (iv) Russian annexation and proxy war following the collapse of a pro-Russian government; (v) subsequent reorientation of Ukrainian trade and institutional ties toward the EU; and (vi) EAEU consolidation among other post-Soviet states under Russian pressure. The data lab's public-opinion series on NATO in Ukraine is relevant because the crisis transformed not only economic alignment but security preferences: support for NATO membership rose sharply after 2014, indicating that competing integration projects spilled over into security alignment. A purely domestic-politics account would predict crisis without external structural collision; a purely Russian-imperial account would predict coercion regardless of EU policy. The competitive-regionalism account predicts that the crisis's timing and form were shaped by the incompatibility of the two projects.

Perspective Note (five traditions in brief): African (primary): African scholarship and diplomacy read competing integration projects through the history of external powers shaping African economies. Rodney (1972) and Nkrumah (1965) frame economic integration imposed from outside as a continuation of unequal exchange; Bayart's work on extraversion and Mamdani's analysis of state bifurcation suggest that postcolonial states often face "choices" structured by external actors. From this vantage, the EU-EAEU collision resembles a scramble in which Ukraine's agency is constrained by great-power conditionality and coercion. African states, many of which participate in overlapping regional economic communities, recognize the dilemma of exclusive blocs: the African Union's principle of variable geometry and the reality of multiple memberships reflect an attempt to avoid zero-sum alignment. The African perspective's distinctive contribution is to foreground economic sovereignty and the right of states to pursue non-exclusive, multi-vector integration; its occlusion, shared with other non-great-power perspectives, is limited leverage over the terms of great-power competition. Chinese: China views competing integration projects through the lens of multipolarity and connectivity. Beijing generally opposes exclusive blocs and sanctions, presenting the Belt and Road Initiative and Eurasian connectivity as alternatives to zero-sum regionalism. In the 2013-14 crisis, Chinese discourse emphasized non-interference and a political settlement, while treating NATO/EU expansion as part of a broader Western encroachment. This perspective contributes a critique of bloc politics but often occludes the coercive dimensions of Russian integration and the democratic aspirations expressed during Euromaidan. Russian: The Russian perspective frames the EAEU as legitimate post-Soviet economic integration and the EU's Eastern Partnership as geopolitical encroachment. Putin's 2021 essay supplies the civilizational narrative: Ukraine's westward turn is portrayed as an artificial rupture of a shared historical space. This frame treats Russian pressure as defensive protection of legitimate interests, occluding Ukrainian sovereignty and the coercive nature of trade and energy leverage. Western: Western perspectives generally frame the EU as a voluntary, rules-based project and the EAEU as a geopolitical instrument. Euromaidan is read as a democratic aspiration for European norms; Russian coercion is seen as the cause of crisis. Mearsheimer (2014) offers a self-critical variant, arguing that Western expansion ignored Russian red lines. Kotkin (2022) counters that this understates Putin's imperial agency. The Western frame's

strength is its attention to institutional conditionality and popular mobilization; its occlusion is occasional underestimation of how EU norms function as geopolitical alignment. UN: The UN perspective centers economic sovereignty, self-determination, and the prohibition of coercion. It records the General Assembly's condemnation of the use of force and annexation, while struggling to address economic pressure short of force. Its contribution is to affirm that integration choices must be free; its occlusion is procedural, because the UN lacks mechanisms to regulate competing regional projects or to protect pivot states from coercive leverage.

2.5 KEY IDEA 4 — Security dilemma vs imperial ambition: competing explanations for Russian behavior

Bolded Causal Claim: Russian coercive behavior toward its near abroad since 1991 is overdetermined by two mechanisms that are analytically distinct but empirically entangled: a security-dilemma spiral in which NATO enlargement and Western institutional expansion are perceived in Moscow as existential encirclement, and an imperial-ambition dynamic in which Russian elites, and Putin in particular, have pursued the restoration of great-power status and a zone of privileged influence through deliberate agency; the scholarly task is not to choose one but to specify the conditions under which each mechanism dominates and the evidence that would discriminate between them.

Mechanism: The security-dilemma mechanism, classically formulated by Jervis (1978) and embedded in Waltzian structural realism, operates through the offense-defense balance and the spiral model. When a state takes measures to increase its own security—here, NATO's eastward enlargement and the EU's association agreements—those measures are read by the other side as reducing its security, prompting countermeasures that in turn confirm the first side's fears. The mechanism runs on imperfect information, on the difficulty of distinguishing defensive from offensive capabilities, and on the absence of a central authority to certify intentions. In the post-Soviet case, the mechanism is fed by three structural features: the geographic openness of the East European plain, which makes Russia's western frontier historically vulnerable; the institutional asymmetry between a consolidated NATO and a disintegrating Russian sphere; and the absence of a post-Cold War settlement that both sides accepted as legitimate. The imperial-ambition mechanism, by contrast, is agential and ideational. It runs through elite belief systems that define Russia as a great power entitled to a sphere of influence, through domestic political incentives to mobilize nationalist sentiment, and through the instrumental use of force to prevent the consolidation of independent, Western-aligned states on Russia's borders. Kotkin (2022) emphasizes this agential dimension, arguing that Putin's choices are not mechanically determined by NATO expansion but reflect a deliberate project of imperial restoration. Mearsheimer (2014) offers the most prominent structuralist counter, arguing that Western policymakers ignored Russian red lines and that the crisis was predictable from the logic of great-power politics. The two mechanisms interact: a genuine security dilemma can be exploited by imperial ambition, and imperial ambition can be legitimated by invoking security fears.

Scope Conditions: The security-dilemma explanation has greatest purchase when three conditions hold: the initiating state's actions are plausibly defensive in intent; the responding state's threat perception is sincere rather than instrumental; and de-escalation is possible if the initiating state modifies its behavior. It struggles to explain annexation of territory, the installation of puppet regimes, or the denial of a neighbor's right to exist as a sovereign state, all of which suggest offensive rather than defensive aims. The imperial-ambition explanation has greatest purchase when leadership rhetoric and documents explicitly claim a sphere of influence,

when force is used to alter borders rather than merely to deter, and when behavior persists or escalates regardless of Western restraint. It struggles to explain why Russian threat perception is so widely shared across the Russian elite, including among figures not aligned with Putin, and why specific Western actions—such as the 2008 Bucharest summit promise of eventual NATO membership for Ukraine and Georgia—precede escalations. The two explanations are best treated as competing hypotheses with overlapping predictions, requiring case-level adjudication rather than a priori commitment.

Observable Implications: If the security-dilemma mechanism dominates, Russian behavior should be sensitive to Western restraint: pauses in NATO enlargement, neutrality guarantees, or arms-control agreements should produce de-escalation, and Russian rhetoric should emphasize defensive vulnerability. If the imperial-ambition mechanism dominates, behavior should be insensitive to such concessions, rhetoric should emphasize historical entitlement and civilizational mission, and force should be used to expand or consolidate control regardless of Western posture. The 2008 Georgia war and the 2014 Crimea annexation provide test cases: in both, Western actions (the Bucharest promise; the EU association agreement with Ukraine) preceded Russian force, consistent with the security dilemma, but the scale and character of Russian response—recognition of Abkhazia and South Ossetia, annexation of Crimea—exceeded what pure defense would require, consistent with imperial ambition. The 2022 full-scale invasion, occurring after years of no NATO enlargement to Ukraine, weighs heavily toward the imperial-ambition reading, though security-dilemma theorists argue that the cumulative effect of Western policy created the conditions.

Perspective Note (five traditions in brief): African: African scholars and diplomats tend to read the debate through the lens of sovereignty and non-interference, noting that both superpowers have historically invoked security to justify intervention in weaker states' affairs; the African vantage point stresses that the security dilemma and imperial ambition are not mutually exclusive and that weaker states pay the price of great-power competition, a pattern visible in Cold War proxy conflicts on the continent. Chinese: Chinese analysts, drawing on a civilizational-state framework, tend to emphasize NATO expansion as the root cause and treat Russian security concerns as legitimate, while also noting that great-power competition is structurally inevitable; the Chinese reading leans toward the security-dilemma explanation but does not absolve Russia of agency. Russian: Russian official and scholarly discourse overwhelmingly favors the security-dilemma and encirclement narrative, framing NATO expansion as an existential threat and Russian actions as defensive; imperial ambition is acknowledged by some Russian liberals but rejected by the state as Western propaganda. Western: Western scholarship is divided between realist critics (Mearsheimer) who emphasize the security dilemma and liberal-internationalist and constructivist scholars who emphasize imperial ambition, domestic authoritarianism, and identity; the Western frame's self-critique acknowledges that NATO enlargement may have contributed to Russian insecurity without excusing aggression. UN: The UN perspective avoids adjudicating between the two explanations, instead recording violations of the Charter's prohibition on the use of force and affirming territorial integrity; its contribution is to insist that neither security fears nor historical claims justify annexation, while its occlusion is the inability to address the structural grievances that fuel both mechanisms.

2.6 KEY IDEA 5 — Ontological insecurity after 1991: the collapse of Soviet identity and the reconstruction of Russian identity under Putin

Bolded Causal Claim: The dissolution of the Soviet Union in 1991 produced not merely a geopolitical contraction but an ontological rupture: the collapse of a biographical narrative that had organized Russian and Soviet identity for seven decades, and the subsequent reconstruction of Russian identity under Putin has

been driven by the need to restore ontological security—continuity, self-esteem, and a coherent narrative of the self—through great-power assertion, civilizational distinctiveness, and opposition to the West, with foreign policy serving as identity performance rather than purely instrumental calculation.

Mechanism: Ontological security, as developed by Mitzen (2006) and Steele (2008) in International Relations, refers to the need of states and their publics for a stable sense of self, maintained through routines, biographical narratives, and recognition by others. When a state's identity is disrupted—through defeat, collapse, or territorial loss—the resulting anxiety can drive foreign policy that appears irrational from a purely materialist standpoint but is intelligible as identity repair. The Soviet collapse was precisely such a rupture: it dissolved the ideological, institutional, and territorial framework within which Russian elites and publics had understood themselves, producing what some scholars describe as a period of anomie in the 1990s. The mechanism of reconstruction under Putin has operated through several channels. First, narrative: the construction of a story in which Russia is a great civilization with a special mission, victimized by Western betrayal after 1991, and now recovering its rightful place. Putin's 2021 essay on Ukraine exemplifies this, framing Ukraine as an artificial construct and Russia as the legitimate heir of a shared civilizational space. Second, routine and ritual: the reassertion of state control over media, education, and commemoration, producing a stabilized public narrative. Third, recognition-seeking: demands that the West acknowledge Russia's great-power status, with slights and humiliations—real or perceived—treated as ontological wounds. Fourth, opposition: the construction of the West as the constitutive Other against which Russian identity is defined, making conflict with the West not merely strategic but identity-constituting. The mechanism implies that concessions on material interests may not resolve conflict if they are read as further humiliation, and that identity repair may require not just security but recognition.

Scope Conditions: The ontological-security explanation applies most strongly to states that have experienced sudden identity rupture—imperial collapse, defeat, or regime change—and that possess the resources to pursue identity reconstruction through foreign policy. It is less applicable to states with stable identity narratives or to conflicts driven by straightforward resource competition. It also has limits: it risks overpsychologizing state behavior, treating elite narratives as mass beliefs, and underestimating material interests. Ontological security is not a substitute for structural analysis but a complement that explains why states sometimes pursue costly policies that materialist logic would predict against. The scope condition of recognition is important: the mechanism predicts that states seeking ontological security will be sensitive to symbolic gestures of respect or disrespect, not merely to material distributions.

Observable Implications: If ontological insecurity drives Russian behavior, we should observe: intensified identity rhetoric during periods of perceived humiliation or loss; foreign policy actions that serve symbolic rather than material goals, such as the annexation of Crimea, which carried economic costs but enormous symbolic weight; domestic legitimation of the regime through foreign-policy success; and resistance to settlements that are materially favorable but symbolically humiliating. We should also observe a generational and elite divide, with those socialized in the Soviet period more attached to the imperial narrative. The 2014 Crimea annexation, framed as "reunification" and accompanied by a surge in Putin's approval ratings, is a strong case. The mechanism also predicts that Western offers of integration without recognition of great-power status would be rejected, as in the 2000s, when Putin's early overtures to the West were rebuffed or treated as supplication.

Perspective Note (five traditions in brief): African: African scholarship, from Fanon's analysis of colonial identity to Mbembe's work on necropolitics and Bayart's "politics of the belly," provides a rich vocabulary for understanding identity rupture and reconstruction; African perspectives emphasize that ontological inse-

curity is not unique to Russia but is a feature of post-colonial and post-imperial states generally, and that the search for recognition can drive both emancipatory and destructive politics. The African vantage point also cautions against treating Russian identity claims as sui generis, noting parallels with post-colonial identity projects across the Global South. Chinese: Chinese analysts, drawing on a civilizational-state framework that emphasizes historical continuity and cultural distinctiveness, tend to be sympathetic to Russian identity claims while also noting that China's own identity reconstruction after the "century of humiliation" offers a parallel; the Chinese reading treats ontological security as a legitimate concern but warns against its instrumentalization to justify aggression. Russian: Russian discourse, both official and scholarly, treats identity reconstruction as a natural and necessary response to the trauma of 1991; the state narrative frames Putin's project as restoring dignity and historical truth, while critics within Russia warn of the costs of identity-driven foreign policy. Western: Western scholarship on ontological security has been applied to Russia by constructivist and critical scholars who emphasize the role of narrative, recognition, and humiliation; the Western frame's contribution is analytical precision, while its occlusion is a tendency to pathologize Russian identity claims without examining Western identity projects. UN: The UN perspective is largely silent on ontological security as such, but its emphasis on human dignity, self-determination, and the prohibition of discrimination provides a normative framework within which identity claims can be evaluated; its contribution is to insist that identity reconstruction cannot justify violations of others' rights, while its occlusion is the lack of institutional mechanisms to address identity-based grievances.

SECTION 2.7 — FIVE PERSPECTIVES IN DEPTH

2.7.1 African Perspective (PRIMARY)

The African vantage point on the post-Soviet security dilemma and the reconstruction of Russian identity after 1991 begins from a position that is neither neutral nor disinterested: it is the vantage point of states and peoples who have themselves experienced the collapse of imperial orders, the arbitrary re-drawing of borders, the weaponization of identity, and the selective application of international norms by great powers. To understand what this perspective contributes, one must first grasp that African international-relations scholarship does not treat the post-Soviet crisis as a distant European problem. It treats it as a variation on a pattern that African states have lived through repeatedly: the disintegration of a multi-ethnic imperial state, the scramble by external powers to shape the successor order, the instrumentalization of ethnicity and religion by both local and foreign actors, and the subordination of African (or, in this case, post-Soviet) agency to great-power competition. The African perspective is therefore not a "regional add-on" to Western or Russian analyses; it is a theoretically generative standpoint that reveals dimensions of the post-Soviet crisis that the other four perspectives systematically obscure.

The foundational theoretical resource is the African critique of sovereignty itself. Siba N'Zatioula Grovogui's *Sovereigns, Quasi Sovereigns, and Africans* (1996) demonstrates that the international system's treatment of sovereignty has never been universal. Grovogui argues that the Westphalian model of equal, territorial sovereignty was always a fiction applied selectively: European states were recognized as fully sovereign, while African and other non-European entities were granted "quasi-sovereign" status, subject to intervention, tutelage, and conditional recognition. This framework is directly applicable to the post-Soviet space. When NATO expanded eastward, it did so on the premise that the sovereignty of new member states was inviolable and that their security choices were their own. Yet the same powers that championed this principle in Eastern Europe had, in Africa, repeatedly overridden sovereignty through military intervention, structural adjustment,

and the selective application of the responsibility to protect. The African perspective thus sees in the post-Soviet crisis a confirmation of Grovogui's thesis: sovereignty is not a neutral legal principle but a political resource distributed according to power. The question is not whether Russia's "privileged interests" are legitimate, but whether any great power's claim to a sphere of influence is compatible with the sovereign equality that the UN Charter proclaims. From the African standpoint, the answer is that neither Russia's zone of privileged interests nor NATO's eastward expansion is fully compatible with genuine sovereign equality; both represent the assertion of hierarchical power over nominally equal states.

Mahmood Mamdani's *Citizen and Subject* (1996) and his later work on the politics of naming and belonging provide a second theoretical lens. Mamdani's analysis of how colonial powers constructed "native" and "settler" identities, and how these constructions outlived formal decolonization, illuminates the post-Soviet identity crisis. The Soviet Union, like the colonial empires Mamdani studies, was a multi-ethnic state in which identity was politically constructed and hierarchically ordered. The collapse of the USSR in 1991 did not simply create fifteen new states; it created a crisis of categorization in which millions of people found themselves on the "wrong" side of new borders, their identities suddenly reclassified. The Russian-speaking populations of Ukraine, the Baltic states, and Central Asia experienced a version of what Mamdani calls "the bifurcated state": a condition in which formal citizenship and substantive belonging are misaligned. The African perspective, drawing on Mamdani, insists that this misalignment is not a natural fact but a political construction, and that its resolution requires not great-power management but democratic processes of inclusion and recognition. The Western tendency to treat Russian-speaking minorities as a "problem" to be managed by NATO expansion, and the Russian tendency to treat them as a justification for intervention, are both, from the African standpoint, instances of external powers instrumentalizing identities that should be resolved by the peoples concerned.

Achille Mbembe's work, particularly *On the Postcolony* (2001) and *Necropolitics* (2019), adds a dimension that the other perspectives largely miss: the analysis of how power operates through the control of life and death, and how post-colonial (and post-imperial) states are characterized by a "commandement" that is simultaneously arbitrary and theatrical. Mbembe's concept of the "postcolony" as a space in which sovereignty is performed rather than exercised, and in which the state's claim to authority is constantly undermined by its own violence, resonates with the Russian state's behavior in the post-Soviet period. The Putin regime's reconstruction of Russian identity has involved what Mbembe would recognize as a "politics of the spectacle": the theatrical assertion of great-power status through military intervention, the cultivation of a siege mentality, and the conflation of the leader's body with the nation's body. Mbembe's framework also illuminates the way in which the post-Soviet space has been subjected to what he calls "necropolitics": the subordination of populations to conditions of death and precarity through proxy wars, frozen conflicts, and the militarization of borders. The African perspective, drawing on Mbembe, sees in the Donbas, in Crimea, and in the frozen conflicts of Georgia and Moldova not merely security dilemmas but instances of a broader pattern in which great powers and their proxies exercise power over life and death in spaces they do not fully control.

Jean-François Bayart's *The State in Africa* (1993) and his concept of "extraversion" provide another critical tool. Bayart argues that African states have historically been shaped by their external relations—that is, by the ways in which African elites have leveraged external resources (colonial, Cold War, post-Cold War) to maintain domestic power. The concept of extraversion is directly applicable to the post-Soviet space. Russian elites, like African elites in Bayart's framework, have used external confrontation (with the West, with NATO, with the "near abroad") to consolidate domestic power. The security dilemma, from this perspective, is not merely an objective structural condition but a political resource: it provides the justification for authoritarian consolidation, military spending, and the suppression of dissent. Bayart's framework also illuminates the

role of Western actors: just as Cold War powers instrumentalized African states, NATO and the EU have instrumentalized post-Soviet states in their competition with Russia. The African perspective thus sees in the post-Soviet crisis a triangular dynamic of extraversion in which all three parties—Russia, the West, and the post-Soviet states themselves—use external confrontation to manage internal politics.

Walter Rodney's *How Europe Underdeveloped Africa* (1972) and Kwame Nkrumah's *Neo-Colonialism: The Last Stage of Imperialism* (1965) provide the historical-materialist dimension. Rodney's analysis of how European capitalism systematically underdeveloped Africa—extracting resources, destroying indigenous industries, and creating dependent economies—has a direct analogue in the post-Soviet experience. The "shock therapy" of the 1990s, the privatization of state assets, and the integration of post-Soviet economies into global capitalism on unfavorable terms created the conditions for oligarchic capitalism and political instability. Nkrumah's concept of neo-colonialism—the continuation of imperial control through economic and political means rather than formal colonialism—is applicable to both Russian and Western behavior in the post-Soviet space. Russia's use of energy exports as a political tool, and the West's use of financial institutions and conditionality, are both, from this perspective, forms of neo-colonialism. The African perspective thus insists that the post-Soviet crisis cannot be understood purely in security terms; it must be understood as a crisis of political economy in which great powers compete for resources and markets while local populations bear the costs.

Amílcar Cabral's *Return to the Source* (1973) and Frantz Fanon's *The Wretched of the Earth* (1961) provide the dimension of liberation and recognition. Cabral's insistence that liberation must be rooted in the cultural and historical specificity of the people, and Fanon's analysis of how colonialism dehumanizes both colonizer and colonized, are directly relevant to the ontological dimension of the post-Soviet crisis. Fanon's observation that the colonized subject's identity is defined by the colonizer's gaze—that the colonized internalizes the colonizer's contempt—has a parallel in the Russian experience of the 1990s. The collapse of the Soviet Union was accompanied by a narrative of Western triumphalism that humiliated Russia and treated its collapse as a vindication of Western superiority. From the African perspective, this humiliation is not merely a psychological fact but a political one: it shapes the identity reconstruction that Putin has undertaken, and it explains, in part, the appeal of a narrative that restores Russian dignity through defiance of the West. Cabral's insistence on "return to the source"—on grounding identity in authentic historical and cultural roots rather than in imposed categories—also resonates with Putin's 2021 essay on Ukraine, which appeals to a shared historical and cultural heritage. The African perspective does not endorse Putin's claims, but it recognizes the political logic of identity reconstruction after humiliation, because it has seen this logic operate in post-colonial Africa.

Julius Nyerere's philosophy of ujamaa and his insistence on African unity provide a further dimension. Nyerere argued that African states could not achieve genuine sovereignty in isolation; they needed to cooperate regionally to resist external domination. This insight is applicable to the post-Soviet space: the failure of post-Soviet states to develop effective regional security institutions—beyond the weak Collective Security Treaty Organization and the competing integration projects of the EU and the Eurasian Economic Union—has left them vulnerable to great-power manipulation. The African perspective thus sees in the post-Soviet crisis a failure of regionalism: the inability of post-Soviet states to construct a security architecture that would reduce their dependence on either Russia or the West.

Oyèrónkẹ́ Oyěwùmí's *The Invention of Women* (1997) and Sylvia Tamale's work on gender and African feminisms add a dimension that is almost entirely absent from the other four perspectives. Oyěwùmí's analysis of how Western categories of gender were imposed on African societies, and Tamale's insistence

on the intersection of gender, sexuality, and power in African politics, reveal that the post-Soviet security dilemma is not gender-neutral. The militarization of the post-Soviet space, the use of sexual violence in conflict, and the gendered dimensions of identity reconstruction (the cult of masculine strength in Putin's Russia, the gendered narratives of victimhood and protection) are all amenable to analysis through African feminist frameworks. The African perspective thus contributes a gendered analysis that the Western, Russian, Chinese, and UN perspectives largely lack.

Kwesi Aning and Kwaku Danso's work on African security governance provides a final dimension. Aning and Danso have analyzed how African states navigate between competing external powers, and how the African Union's peace and security architecture attempts to manage conflicts that are often proxy wars. Their analysis of "African solutions to African problems" is applicable to the post-Soviet space: the insistence that external powers should not dictate the terms of regional security, and that local actors must have agency in shaping their own futures. The African perspective thus contributes a norm of local ownership that challenges both Russian and Western claims to manage the post-Soviet space.

What does the African perspective occlude? It risks understating the specificities of the European security architecture and the genuine security concerns that drove NATO enlargement. It may overemphasize the parallels between colonialism and post-Soviet politics, thereby flattening important differences in historical context, institutional development, and agency. It may also understate the role of domestic political dynamics within Russia itself—the way in which Putin's identity reconstruction was driven not only by external humiliation but by internal political calculations. And it may, by focusing on great-power hypocrisy, understate the genuine normative commitments of some Western actors to democratic values and human rights. The African perspective is strongest when it is used not as a replacement for other analyses but as a corrective: a reminder that the international system's treatment of sovereignty, identity, and security is always shaped by power, and that the claims of all great powers—including those that present themselves as defenders of the rules-based order—must be subjected to critical scrutiny.

The African perspective's deepest contribution is to reframe the central question. The other four perspectives ask, in various ways, whether Russia's behavior is driven by security concerns or imperial ambition. The African perspective asks a prior question: who gets to define what counts as a security concern, what counts as imperial ambition, and what counts as legitimate sovereignty? It reveals that these definitions are not neutral but are shaped by the power of those who make them. In this sense, the African perspective does not resolve the debate between the security dilemma and imperial ambition; it exposes the terms of the debate as themselves products of power. This is the contribution that only the African vantage point, with its long experience of living under definitions imposed by others, can make.

2.7.2 Chinese Perspective

The Chinese perspective on the post-Soviet security dilemma is shaped by a distinctive combination of historical experience, strategic interest, and normative commitment. China's position is not merely a reflexive alignment with Russia; it is rooted in a specific reading of international history that emphasizes the dangers of unilateral expansion by great powers and the importance of respecting "legitimate security concerns." The Chinese perspective contributes a structural analysis of NATO expansion as a root cause of the post-Soviet crisis, while its occlusion is a tendency to understate Russian agency and to treat the post-Soviet states as objects of great-power competition rather than as actors with their own interests.

The core of the Chinese position is articulated in the concept of "legitimate security concerns." This concept, which appears repeatedly in Chinese diplomatic statements and in the joint declarations of China and

Russia, holds that every state has the right to security, and that the security of one state cannot be achieved at the expense of another's. The Chinese perspective thus frames NATO expansion not merely as a policy choice but as a violation of this principle: by expanding toward Russia's borders, NATO has created a security environment in which Russia's legitimate concerns are ignored. This framing draws on China's own experience of what it perceives as encirclement—by US alliances in the Asia-Pacific, by the "Quad," and by the AUKUS pact. The Chinese perspective thus sees in the post-Soviet crisis a mirror of its own strategic situation, and it interprets Russian behavior through the lens of defensive realism: Russia is reacting to a threatening security environment, not pursuing imperial ambitions.

The Chinese perspective also draws on a specific reading of the end of the Cold War. Chinese scholars and officials have emphasized that the West made implicit promises to Russia about NATO expansion—promises that were subsequently broken. This reading aligns with Sarotte's (2021) documentation of the "not one inch" discussions, though the Chinese interpretation tends to treat these discussions as firmer commitments than the documentary record supports. The Chinese perspective thus contributes a historical narrative that emphasizes Western betrayal and Russian victimization, while its occlusion is a tendency to treat diplomatic ambiguity as deliberate deception and to understate the agency of the post-Soviet states that sought NATO membership.

China's own strategic interests shape its perspective in ways that are not always acknowledged. China benefits from a Russia that is distracted by confrontation with the West, as this reduces pressure on China in the Asia-Pacific. China also benefits from the weakening of the US-led alliance system, which NATO expansion represents. The Chinese perspective thus has a strategic interest in framing NATO expansion as the root cause of the crisis, and this interest should be recognized as shaping its analysis. At the same time, China's position is not merely cynical: it reflects a genuine normative commitment to sovereignty and non-interference, principles that China has consistently invoked in international forums. The Chinese perspective thus contributes a principled defense of state sovereignty that is, in some respects, more consistent than the Western position, which has itself violated sovereignty in numerous cases.

The Chinese perspective's contribution to the debate between security dilemma and imperial ambition is to emphasize the security dilemma dimension. By framing NATO expansion as the root cause, the Chinese perspective provides a structural explanation for Russian behavior that does not require attributing imperial ambitions to Moscow. This is a valuable corrective to Western analyses that may overemphasize Russian agency and underemphasize structural factors. However, the Chinese perspective's occlusion is significant: it tends to understate the role of Russian domestic politics, the specificities of Putin's identity reconstruction, and the agency of post-Soviet states that chose to align with the West. It also tends to treat "legitimate security concerns" as a self-evident category rather than a contested one, and it does not adequately address the question of how to reconcile competing security concerns when they conflict.

The Chinese perspective also contributes an important insight about the relationship between economic integration and security. China's own experience of economic development through integration into the global economy, combined with its insistence on strategic autonomy, provides a model that it implicitly offers to the post-Soviet space: economic cooperation without military alignment. The Chinese perspective thus sees the competition between the EU and the EAEU not merely as a geopolitical contest but as a choice between different models of development, and it tends to favor the EAEU model as more respectful of state sovereignty. This is a contribution that the Western perspective, with its emphasis on democratic conditionality, tends to occlude.

2.7.3 Russian Perspective

The Russian perspective on the post-Soviet security dilemma is the most directly invested in the outcome, and it is shaped by a combination of historical memory, geopolitical anxiety, and identity reconstruction. It is not a single perspective but a contested field in which official narratives, scholarly analyses, and popular sentiments interact. The Russian perspective's contribution is to articulate the lived experience of post-Soviet decline and the genuine security concerns that NATO expansion generates; its occlusion is a tendency to externalize responsibility for Russia's problems and to conflate legitimate security concerns with imperial ambitions.

The core of the Russian perspective is the concept of encirclement. Russian officials and scholars have consistently argued that NATO expansion represents a strategic threat to Russia, not merely because of the military capabilities it brings to Russia's borders, but because of the political and psychological message it sends: that Russia is being excluded from the European security order and treated as a potential adversary. This framing draws on a deep historical memory of invasion—from the Mongols to Napoleon to Hitler—and on the specific experience of the 1990s, when Russia was weak and the West was strong. The Russian perspective thus sees in NATO expansion not merely a policy choice but a continuation of a historical pattern in which Russia is surrounded and contained by hostile powers.

The concept of humiliation is central to the Russian perspective. The collapse of the Soviet Union was experienced not merely as a geopolitical defeat but as an ontological rupture: the loss of a superpower identity, the disintegration of a multi-ethnic state, and the subordination of Russia to Western norms and institutions. Putin's 2021 essay on Ukraine explicitly invokes this experience, arguing that the West has consistently humiliated Russia and that the post-Soviet states have been used as instruments of Western containment. The Russian perspective thus contributes an analysis of the emotional and identity dimensions of the security dilemma that the Western perspective, with its emphasis on material interests and institutional design, tends to understate.

The Russian perspective also draws on the concept of civilizational defense. Trenin (2011), in *Post-Imperium*, argues that Russia is not merely a state but a civilization, and that its security cannot be reduced to territorial defense. The Russian perspective thus frames the post-Soviet crisis as a civilizational conflict: the defense of Russian (or Eurasian) civilization against Western (Atlanticist) civilization. This framing is not merely rhetorical; it shapes Russian policy by justifying the creation of alternative institutions (the EAEU, the CSTO, the Shanghai Cooperation Organization) and by legitimizing intervention in the "near abroad" as a defense of civilizational space. The Russian perspective's contribution is to insist that security is not merely military but cultural and civilizational; its occlusion is a tendency to treat civilizational claims as natural and self-evident, rather than as politically constructed and contested.

The Russian perspective on the 2013-14 crisis and the annexation of Crimea is particularly revealing. Official Russian narratives frame the annexation as a "reunification" driven by the will of the Crimean people, and they emphasize the threat posed by the Maidan revolution to Russian-speaking populations. This framing draws on the concept of "privileged interests": Russia claims a special responsibility for the security and well-being of Russian-speaking populations in the post-Soviet space, and it treats their protection as a legitimate security concern. The Russian perspective thus contributes an analysis of how identity and diaspora politics shape security behavior; its occlusion is a tendency to treat Russian-speaking populations as objects of Russian policy rather than as agents with their own interests, and to understate the coercive dimensions of Russian intervention.

The Russian perspective also contributes to the debate between security dilemma and imperial ambition by insisting that the two are not mutually exclusive. Russian scholars and officials have argued that Russia's behavior can be simultaneously defensive (responding to NATO expansion) and assertive (reclaiming great-power status). This is a more sophisticated position than either pure security-dilemma or pure imperial-ambition explanations, and it reflects the complexity of Russian motivations. The Russian perspective's occlusion, however, is a tendency to emphasize the defensive dimension and to understate the imperial one, and to treat Russian great-power ambitions as natural and legitimate while treating Western great-power ambitions as aggressive and illegitimate.

The Russian perspective's deepest contribution is to articulate the experience of ontological insecurity: the loss of identity, status, and recognition that followed the collapse of the Soviet Union. This experience is not merely a psychological fact but a political one: it shapes Russian foreign policy, domestic politics, and the relationship between the state and society. The Russian perspective insists that any analysis of the post-Soviet crisis that ignores this dimension is incomplete. Its occlusion is a tendency to treat ontological insecurity as a justification for behavior that violates the sovereignty of others, and to understate the ways in which Russian identity reconstruction has been used to legitimize authoritarianism and aggression.

2.7.4 Western Perspective

The Western perspective on the post-Soviet security dilemma is the most institutionally powerful and the most theoretically developed, but it is also the most contested from within. It is not a monolith: it encompasses realist, liberal, and constructivist strands, and it has been subject to significant self-critique. The Western perspective's contribution is analytical precision and institutional innovation; its occlusion is a tendency to universalize Western experience and to understate the ways in which Western actions have contributed to the crisis.

The realist strand of the Western perspective is most clearly articulated by Mearsheimer (2014), who argues that the West is primarily responsible for the Ukraine crisis. Mearsheimer's argument is that NATO expansion and EU expansion into Ukraine provoked Russia, and that the West ignored Russia's legitimate security concerns. This is a significant self-critique within the Western perspective: it acknowledges that Western actions contributed to the crisis and that the security dilemma is not merely a Russian problem. Mearsheimer's analysis draws on classical realist theory, which emphasizes the anarchic structure of the international system and the security dilemma that it generates. The realist strand's contribution is to provide a structural explanation for Russian behavior that does not require attributing irrationality or evil to Moscow; its occlusion is a tendency to treat great powers as the only relevant actors and to understate the agency of smaller states.

The liberal strand of the Western perspective emphasizes the role of institutions, democracy, and human rights. It argues that NATO and EU expansion were not aggressive acts but responses to the demands of post-Soviet states for security and prosperity. The liberal strand sees the post-Soviet crisis as a conflict between a rules-based international order and a revisionist power that seeks to overturn it. It emphasizes the agency of post-Soviet states, which chose to align with the West, and it treats Russian opposition as an illegitimate attempt to deny these states their sovereign choices. The liberal strand's contribution is to center the agency of smaller states and to provide a normative framework for evaluating Russian behavior; its occlusion is a tendency to treat Western institutions as neutral and benevolent, and to understate the ways in which they serve Western interests.

The constructivist strand of the Western perspective focuses on identity, norms, and discourse. It has been applied to Russia by scholars who emphasize the role of narrative, recognition, and humiliation in shap-

ing Russian behavior. The constructivist strand contributes an analysis of how Russian identity has been reconstructed under Putin and how this reconstruction has shaped foreign policy. It also provides a framework for understanding the competition between Russian and Western narratives about the post-Soviet space. The constructivist strand's occlusion is a tendency to pathologize Russian identity claims—to treat them as irrational or pathological—without examining Western identity projects with the same critical lens.

Sarotte (2021), in *Not One Inch*, provides a detailed historical account of the NATO expansion debate that is essential to the Western perspective. Sarotte documents the discussions about NATO expansion in the 1990s, including the "not one inch" conversations between Western and Russian officials. Her work shows that the expansion was not a simple act of aggression but a complex process involving multiple actors, competing interests, and genuine uncertainty. The Western perspective's contribution, through Sarotte, is to provide an empirically grounded history of the decision-making process; its occlusion is a tendency to focus on Western decision-making and to understate the role of Russian and post-Soviet actors.

Kotkin (2022) provides a different Western perspective, one that emphasizes Russian domestic politics and the agency of the Russian state. Kotkin argues that the post-Soviet crisis is driven not by NATO expansion or by the security dilemma but by the internal dynamics of the Russian state: the need to maintain power, the use of external confrontation to consolidate domestic support, and the ideological project of restoring Russian greatness. Kotkin's analysis draws on a long tradition of Western scholarship that emphasizes the authoritarian and imperial dimensions of Russian politics. The Western perspective's contribution, through Kotkin, is to center domestic politics and to provide a counterweight to structural explanations; its occlusion is a tendency to treat Russian politics as uniquely pathological and to understate the role of Western actions in shaping the context.

The Western perspective also includes a significant self-critical strand that has emerged in response to the Ukraine war. Scholars and policymakers have acknowledged that the West's approach to Russia in the 1990s and 2000s was flawed: that it failed to take Russian security concerns seriously, that it treated Russia as a defeated power rather than a partner, and that it pursued NATO expansion without adequate consideration of its consequences. This self-critique is a genuine contribution: it demonstrates the capacity of the Western perspective to reflect on its own limitations. Its occlusion, however, is a tendency to treat self-critique as sufficient, without fundamentally rethinking the assumptions that shaped Western policy.

The Western perspective's deepest contribution is to provide a normative framework for evaluating the post-Soviet crisis. By insisting on the principles of sovereignty, territorial integrity, and self-determination, the Western perspective provides standards against which Russian behavior can be judged. Its occlusion is a tendency to apply these standards selectively, to treat Western violations of sovereignty as exceptions and Russian violations as the rule, and to understate the ways in which Western power shapes the international order that it claims to defend.

2.7.5 UN Perspective

The UN perspective on the post-Soviet security dilemma is shaped by the tension between the organization's foundational principles and its institutional limitations. The UN is not a single actor but a forum in which competing perspectives interact, and its perspective on the post-Soviet crisis reflects this multiplicity. The UN perspective's contribution is to provide a normative framework based on the Charter; its occlusion is the lack of institutional mechanisms to enforce that framework.

The foundational principle of the UN perspective is territorial integrity. Article 2(4) of the UN Charter

prohibits the threat or use of force against the territorial integrity or political independence of any state. This principle is directly applicable to the post-Soviet crisis: the annexation of Crimea, the intervention in Georgia, and the support for separatist movements in the Donbas are all violations of this principle. The UN perspective thus provides a clear normative standard against which Russian behavior can be judged, and it has been invoked by the General Assembly in resolutions condemning the annexation of Crimea and the invasion of Ukraine.

The principle of self-determination is the other foundational principle of the UN perspective, and it creates a tension with territorial integrity. The UN Charter recognizes the right of peoples to self-determination, and this right has been invoked by both sides in the post-Soviet crisis: by Russia, to justify the annexation of Crimea and the support for separatist movements; and by Ukraine and Georgia, to assert their right to choose their own security alignments. The UN perspective's contribution is to insist that these principles must be balanced, and that neither can be invoked to override the other. Its occlusion is the lack of clear criteria for determining when self-determination overrides territorial integrity, and the tendency of UN bodies to apply these principles selectively.

The UN perspective also emphasizes the prohibition of the use of force and the principle of non-intervention. These principles are directly relevant to the post-Soviet crisis: Russia's interventions in Georgia, Ukraine, and Moldova are violations of these principles, and NATO's expansion, while not a use of force, can be seen as a form of intervention in the security affairs of the post-Soviet space. The UN perspective's contribution is to provide a framework in which all uses of force and intervention can be evaluated; its occlusion is the tendency of UN bodies to focus on Russian violations while understating Western ones.

The UN perspective on collective security is particularly relevant. The UN Security Council is the primary institution for maintaining international peace and security, and its failure to address the post-Soviet crisis is a significant institutional failure. The Russian veto has prevented the Security Council from taking action on Ukraine, Georgia, and other post-Soviet conflicts, and this has undermined the UN's credibility. The UN perspective's contribution is to highlight this institutional failure and to call for reform; its occlusion is the lack of consensus on what reform should look like, and the tendency of member states to prioritize their own interests over the collective good.

The UN perspective also emphasizes the role of international law and human rights. The UN human rights system provides a framework for evaluating the treatment of minorities, the conduct of military operations, and the protection of civilians in conflict. This framework is directly applicable to the post-Soviet crisis: the treatment of Russian-speaking minorities in Ukraine, the conduct of military operations in the Donbas, and the displacement of populations are all amenable to analysis through the UN human rights framework. The UN perspective's contribution is to insist that human rights are universal and that they apply to all parties in the conflict; its occlusion is the lack of enforcement mechanisms and the tendency of UN bodies to be influenced by great-power politics.

The UN perspective's deepest contribution is to provide a universal normative framework that transcends the particular interests of any single state or group of states. By insisting on the principles of the Charter, the UN perspective provides standards against which all behavior can be judged, including the behavior of great powers. Its occlusion is the gap between these standards and the reality of great-power politics: the UN can proclaim principles, but it cannot enforce them against the will of the Security Council's permanent members. This gap is not a failure of the UN alone; it is a failure of the international system that the UN represents. The UN perspective thus contributes both a normative framework and a critique of that framework's limitations, and it insists that the post-Soviet crisis cannot be resolved without addressing the underlying problem of

great-power dominance in the international system.

The UN perspective also contributes an important insight about the relationship between security and development. The UN's sustainable development agenda emphasizes that security cannot be achieved without development, and that the root causes of conflict include poverty, inequality, and lack of opportunity. This insight is applicable to the post-Soviet space: the economic dislocation of the 1990s, the rise of oligarchic capitalism, and the failure to build inclusive political institutions have all contributed to the instability that has fueled the security dilemma. The UN perspective thus contributes a broader understanding of security that goes beyond military considerations; its occlusion is the tendency to treat development as a technical problem rather than a political one, and to understate the role of power in shaping development outcomes.

2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African	Reveals the selective application of sovereignty norms; shows that great powers invoke territorial integrity or self-determination opportunistically	Understates Russian agency and the specific threat perceptions of post-Soviet states	Sovereignty and non-interference as universal principles, equally applied	NATO's Kosovo intervention without UN mandate; Western support for regime change in Ukraine	Russian: African view ignores Russian security fears and civilizational claims; treats all great-power action as equivalent
Chinese	Identifies NATO expansion as structural cause; articulates "legitimate security concerns" framework	Treats Russian actions as reactive rather than imperial; obscures China's own territorial claims	Sovereignty and non-interference, but with great-power security prerogatives	NATO eastward expansion timeline; US withdrawal from ABM Treaty; Maidan as Western-backed	Western: China's framing serves its own hegemonic ambitions and ignores Ukrainian agency

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Russian	Captures encirclement anxiety, ontological insecurity, and civilizational identity claims	Conflates defensive anxiety with imperial ambition; erases Ukrainian sovereignty	Great-power status, sphere of influence, civilizational distinctiveness	NATO expansion to borders; 2008 Bucharest summit promise; Putin's 2021 essay	Western: security dilemma framing cannot explain annexation of Crimea or full-scale invasion
Western	Documents imperial aggression and Russian military buildup; self-critiques security dilemma	Overemphasizes Russian agency; underweights NATO's role in provoking insecurity	Liberal international order, territorial integrity, self-determination	Putin's 2021 essay; military buildup; Crimea annexation; Bucha atrocities	Russian: Western framing ignores legitimate security concerns and historical humiliation
UN	Centers Charter principles of territorial integrity and collective security; highlights development-security nexus	Treats conflict as techni-cal/developmental; underweights power politics	International law, Charter, multilateralism	UNGA Resolution 68/262 on Crimea; ICJ provisional measures	African: UN norms applied selectively, great powers exempt from enforcement

2.8 WORKED EXAMPLE (I do)

Case: The 2014 Crimea Annexation — From the Maidan to "Reunification" and Its Justification Narratives

Levels of Analysis

Individual. At the individual level, the annexation was shaped by Vladimir Putin's personal worldview and decision-making calculus. Putin's March 18, 2014 address to the Federal Assembly framing Crimea as "historically Russian" land revealed a leader who understood the crisis not merely in strategic terms but as an opportunity to repair a perceived historical injustice. The flight of Ukrainian President Viktor Yanukovych

on February 22, 2014, created a window that Putin exploited with speed and secrecy; the decision to deploy "little green men"—unmarked Russian special forces—reflected a personal risk tolerance and a willingness to operate in the gray zone between war and peace. Local Crimean leaders such as Sergey Aksyonov, who had been a marginal figure before the crisis, were elevated by Russian backing, illustrating how individual agency at the periphery can be activated by great-power sponsorship. The individual level also captures the role of Ukrainian actors: the Maidan protesters whose actions toppled Yanukovych, and the interim government in Kyiv whose perceived illegitimacy—amplified by Russian media—provided the pretext for intervention.

State. At the state level, the annexation served identifiable Russian state interests, most prominently the preservation of the Black Sea Fleet's naval base at Sevastopol, which had been leased from Ukraine under agreements that Russia feared might be terminated by a pro-Western government in Kyiv. The Russian state apparatus—military, intelligence, and political—coordinated the seizure of key installations, the installation of a pro-Russian Crimean government, and the organization of a referendum within three weeks of Yanukovych's flight. On the Ukrainian side, state weakness was decisive: the interim government lacked control over its own security forces in Crimea, and the Ukrainian military's reluctance to engage Russian forces reflected both institutional decay and the absence of a clear chain of command. The state level also encompasses the legal and institutional machinery of annexation: the Crimean parliament's vote to join Russia, the March 16 referendum, and the March 18 treaty of accession signed in Moscow. These formal steps were designed to create a veneer of legality, even as they violated Ukraine's constitution and international law.

Systemic. At the systemic level, the annexation occurred within the broader contest over the European security order that had intensified since NATO's 1999 enlargement and the 2008 Bucharest summit promise of eventual membership for Ukraine and Georgia. The Maidan crisis itself was triggered by Yanukovych's decision to suspend the EU association agreement in November 2013 under Russian pressure, placing Ukraine at the center of a competition between EU and Russian integration projects. The systemic context also includes the precedent of the 2008 Georgia war, which demonstrated that Russia was willing to use force to prevent NATO expansion into its near abroad, and the failure of the NATO-Russia Council and the OSCE to build a cooperative security architecture. The unipolar moment of the 1990s had given way to a more contested order by 2014, and the annexation can be read as a Russian assertion that the post-Cold War settlement was not immutable. The systemic level also captures the international response: Western sanctions, diplomatic isolation, and NATO's reinforcement of its eastern flank, which in turn deepened the security dilemma.

Transnational. At the transnational level, the annexation drew on and mobilized Russian diaspora networks, transnational media narratives, and the circulation of identity claims across borders. The Russian-speaking population of Crimea—approximately 60% of the peninsula's population—provided both a demographic pretext and a constituency for the "reunification" narrative. Russian state media, broadcasting into Ukraine and across the post-Soviet space, constructed a narrative of Ukrainian "fascism" and Russian victimhood that resonated with transnational Russian nationalist sentiment. The transnational dimension also includes the international legal and normative contest: the UN General Assembly's Resolution 68/262, the OSCE's condemnation, and the sanctions regime all represented transnational efforts to delegitimize the annexation. Conversely, Russia's invocation of the Kosovo precedent—arguing that if the West could recognize Kosovo's independence, Russia could annex Crimea—was a transnational rhetorical move that sought to expose the hypocrisy of Western normative claims. The transnational level thus reveals how the annexation was simultaneously a local seizure, a national project, and a global normative contest.

Mechanism

The mechanism of the 2014 Crimea annexation combined opportunistic seizure with narrative legitimation. The causal chain ran as follows: the Maidan protests destabilized the Ukrainian state; Yanukovych's flight created a power vacuum; Russian military and intelligence assets exploited this vacuum to seize key installations; a hastily organized referendum provided a veneer of democratic legitimacy; and the "reunification" narrative supplied domestic and international justification. The mechanism was not a single decision but a sequence of escalating commitments, each of which narrowed the range of alternatives and made reversal more costly.

Two motives drove the mechanism. The strategic motive was the preservation of Sevastopol and the prevention of a NATO-aligned Ukraine on Russia's southwestern flank; this was a classic security-dilemma logic in which defensive measures (securing the naval base) appeared threatening to others. The ontological motive was the repair of Russian collective identity: the Soviet collapse had left Crimea—transferred from Russia to Ukraine in 1954 by Khrushchev—outside the Russian state, and its "return" was framed as correcting a historical injustice and restoring national dignity. These motives were not mutually exclusive; rather, they reinforced each other, with the strategic interest providing the occasion and the ontological narrative providing the legitimation.

The mechanism also depended on a specific condition: Ukrainian state weakness. Without the Maidan crisis and Yanukovych's flight, the window for annexation would not have existed. This conditionality is important because it distinguishes the 2014 annexation from a premeditated, long-planned conquest; the evidence suggests that Russia improvised in response to events, though it had contingency plans and the capacity to act quickly. The mechanism thus combined structural opportunity (Ukrainian weakness), strategic interest (Sevastopol), and ontological framing (reunification), producing an outcome that was overdetermined by multiple causal pathways.

Perspective Reconstruction

African perspective (primary). From the African vantage point, the Crimea annexation exemplifies the selective application of sovereignty norms that post-colonial states have long contested and suffered under. The African perspective, drawing on Grovogui's analysis of the "civilizing mission" and Mamdani's work on the colonial state, notes that Western powers invoked self-determination to justify Kosovo's independence in 2008 but invoked territorial integrity to condemn Russia's annexation of Crimea in 2014, revealing that sovereignty is not a universal principle but a tool of great-power politics. African states, many of which inherited arbitrary borders from colonialism and have a particular stake in the principle of territorial integrity, recognized in Crimea a test of whether the post-colonial norm has any binding force when a nuclear power chooses to violate it. The African Union's response was muted and divided, reflecting both the principle of non-interference and the reality that African states depend on great-power patrons and cannot afford to alienate Russia or the West. What the African perspective reveals that the other four miss is the hypocrisy at the heart of the international order: the same powers that violated sovereignty in Iraq, Libya, and Kosovo now invoke sovereignty to condemn Russia, and this hypocrisy undermines the legitimacy of the very norms they claim to defend. The African vantage point thus frames Crimea not as an isolated European crisis but as another instance of a global pattern in which great powers instrumentalize legal principles while exempting themselves from their constraints.

Chinese perspective. China's perspective treats the Crimea annexation as a consequence of NATO expansion and Western interference in Ukraine's internal affairs, while carefully avoiding direct condemnation of

Russia. Beijing's official position emphasizes respect for Ukraine's sovereignty and territorial integrity while simultaneously acknowledging Russia's "legitimate security concerns," a formulation that reflects China's own interest in preserving its strategic partnership with Moscow. Chinese scholars and officials have pointed to the Maidan as a Western-backed regime change that destabilized Ukraine and created the conditions for Russian intervention, framing the crisis as a great-power contest rather than a violation of a smaller state's sovereignty. China's abstention in the UN General Assembly vote on Resolution 68/262 reflected this balancing act, prioritizing its relationship with Russia over full endorsement of Ukrainian territorial integrity. The Chinese perspective occludes the question of Ukrainian agency and the coercive nature of the referendum, and it serves China's own interest in establishing a precedent that great powers have legitimate security prerogatives in their near abroad.

Russian perspective. The Russian perspective frames the annexation as the "reunification" of Crimea with its historical homeland, correcting the "historical injustice" of Khrushchev's 1954 transfer of Crimea to Ukraine. Putin's March 18, 2014 address to the Federal Assembly invoked the "spiritual source" of Russian civilization in Crimea and the protection of Russian speakers from the "nationalist" post-Maidan government in Kyiv. Russian officials and media emphasized the referendum result—over 95% in favor—as an expression of popular will, while dismissing international criticism as Western hypocrisy given the recognition of Kosovo's independence. The Russian perspective treats the annexation as defensive and restorative rather than expansionist, though this framing requires erasing the coercive context of the referendum, the presence of Russian military forces, and the absence of genuine democratic process. The ontological dimension is central: Crimea's return repaired a wound in Russian collective identity opened by the Soviet collapse, and the "reunification" narrative provided domestic legitimation that transcended strategic calculation.

Western perspective. The Western perspective treats the annexation as a violation of international law and the post-Cold War European security order, emphasizing Russia's breach of the Budapest Memorandum and the UN Charter. Western analysts have documented the role of Russian special forces in seizing key installations and the absence of genuine democratic process in the referendum. At the same time, Western self-critique—exemplified by Mearsheimer's argument that NATO enlargement provoked Russian insecurity—has debated whether Western policy contributed to the crisis. The Western perspective's strength is its documentation of Russian military and political actions; its occlusion is the tendency to treat Russian behavior as purely aggressive while underweighting the security dilemma dynamics that NATO expansion may have triggered. The Western response—sanctions, diplomatic isolation, and NATO reinforcement—reflected a commitment to territorial integrity but also a reluctance to risk direct military confrontation with a nuclear power.

UN perspective. The UN perspective centers on the Charter principles of territorial integrity and the prohibition on the use of force, as articulated in General Assembly Resolution 68/262, which affirmed Ukraine's territorial integrity and declared the Crimea referendum invalid. The UN framework treats the annexation as a clear violation of international law, regardless of historical claims or security concerns. However, the UN's collective security mechanisms failed to prevent or reverse the annexation, as Russia's veto in the Security Council blocked any binding action. The UN perspective also highlights the humanitarian and human rights dimensions, including the situation of Crimean Tatars and the militarization of the peninsula. The limitation of the UN approach is its dependence on great-power consensus, which the Crimea crisis exposed as a structural weakness in the collective security system, and its tendency to treat the conflict as a legal violation rather than a political problem rooted in competing security claims.

Explicit Adjudication

The Russian perspective best explains the domestic legitimation and ontological repair function of the annexation: the "reunification" narrative resonated with Russian public opinion and repaired a collective identity wound opened by the Soviet collapse, and no other perspective adequately captures this dimension. The Western perspective best explains the international legal violation and the strategic calculation: the documentation of Russian military action, the breach of the Budapest Memorandum, and the coercive nature of the referendum are well-established. The African perspective reveals the normative hypocrisy that undermines the Western claim to universal principles, showing that the same powers that violated sovereignty in Iraq and Libya now invoke it to condemn Russia. The Chinese perspective correctly identifies the structural context of NATO expansion but wrongly treats Russian action as purely reactive, obscuring the imperial and ontological dimensions. The UN perspective establishes the legal baseline but cannot explain why the violation occurred or why enforcement failed.

The most complete explanation combines the ontological (Russian identity reconstruction), the strategic (naval base, Black Sea control), and the systemic (NATO-Russia contest) levels, while recognizing that no single perspective captures the full causal picture. The security dilemma framing partially explains Russian insecurity but cannot account for the annexation's irreversibility and the "reunification" narrative's domestic political function; the imperial ambition framing captures the expansionist logic but risks treating all Russian security concerns as pretextual. The adjudication thus favors a synthetic explanation that weights the ontological and strategic motives most heavily, while acknowledging that the systemic context of NATO expansion created the conditions for the crisis and that the normative hypocrisy identified by the African perspective weakens the legitimacy of the international response.

SECTION 2.9 PROBLEM PAIR (We do)

1. **Identify the trigger and the structural condition.** Separate the immediate military sequence in South Ossetia in August 2008 from the longer-term NATO enlargement and Russian sphere-of-influence dynamics that made escalation plausible.

2. **Apply the security-dilemma mechanism.** Explain how Georgian NATO aspirations, Russian peacekeeping presence, and mutual worst-case assessments could have produced a spiral even without a master plan for conquest.

3. **Apply the imperial-ambition mechanism.** Explain how Russia's doctrine of "privileged interests," its recognition of Abkhazia and South Ossetia, and its use of force to block NATO expansion fit a sphere-maintenance logic.

4. **Reconstruct all five perspectives.** State, in 2–3 sentences each, how African, Chinese, Russian, Western, and UN vantage points interpret the war.

5. **Adjudicate with evidence.** Use the Tagliavini fact-finding report, the Bucharest summit outcome, Russian military readiness, and the postwar recognition decisions to weigh which mechanism better explains which phase of the crisis.

6. **Specify falsifiers.** State what evidence would have strengthened the pure security-dilemma account

and what evidence would have strengthened the pure imperial-ambition account.

MODEL ANSWER (continuous prose): The 2008 Georgia war is best understood as a two-stage crisis in which a security-dilemma spiral supplied the trigger and an imperial-consolidation logic shaped the aftermath. The structural condition was the unresolved post-Soviet territorial settlement: Georgia sought NATO membership and the restoration of territorial integrity, while Russia retained peacekeeping and political leverage in Abkhazia and South Ossetia and treated the South Caucasus as part of its zone of privileged interests. At the April 2008 Bucharest summit, NATO promised Georgia and Ukraine eventual membership but denied them Membership Action Plans, a compromise that satisfied neither side and likely intensified Georgian urgency and Russian alarm. In August, Georgian forces attacked Tskhinvali after shelling and skirmishes; Russia responded with a large, rapid, and evidently pre-prepared military operation that extended beyond South Ossetia into Georgia proper. The Tagliavini report concluded that Georgia started the large-scale hostilities but that Russia's response was disproportionate and partly pre-planned, which is the central evidentiary hinge for adjudication. The security-dilemma account explains why both sides misread intentions: Georgia feared permanent partition and Russian veto power over its Western alignment, while Russia feared NATO infrastructure on its southern flank and the loss of a buffer. Yet the pure security-dilemma account struggles with the speed of Russian mobilization, the breadth of the military advance, and especially the subsequent recognition of Abkhazia and South Ossetia as independent states, which converted a ceasefire into a durable territorial revision. The imperial-ambition account explains those outcomes as sphere maintenance: Russia used force to demonstrate that NATO expansion into the former Soviet space would carry costs and to lock in client territories. But the pure imperial-ambition account risks overstating intentionality before August and understates the role of Georgian escalation, which gave Moscow both a legal-moral pretext and a military opportunity. From the African perspective, the war raises the problem of selective sovereignty: Georgia's territorial integrity was defended rhetorically while Kosovo's secession had been accepted, and Russia's recognition of breakaway regions looked like great-power prerogative rather than universal principle. From the Chinese perspective, NATO expansion is the root cause and Russia's security concerns are legitimate, though Beijing's own emphasis on territorial integrity makes full endorsement of recognition awkward. From the Russian perspective, the war was defensive civilizational boundary-setting against encirclement and Western double standards. From the Western perspective, it was imperial aggression enabled by post-Cold War overreach, with some self-critique about the Bucharest promise and the absence of a credible deterrent. From the UN perspective, the war exposed the failure of collective security: the Charter's territorial-integrity norm was violated, but enforcement depended on great-power politics rather than institutional authority. The best adjudication is therefore conditional: the security dilemma explains the escalation spiral and mutual misperception, while imperial ambition explains the recognition decisions and the strategic message; neither mechanism alone captures both the trigger and the settlement.

SECTION 2.10 INDEPENDENT MEMO (You do)

(a) Case description (150–200 words): In December 2021, Russia published draft treaties demanding NATO halt enlargement, withdraw forces from post-1997 members, and guarantee no Ukrainian membership. NATO and the United States rejected the core demands while offering arms-control and transparency talks. In February 2022, Russia recognized the Donetsk and Luhansk "people's republics" and launched a full-scale invasion of Ukraine, framing it as demilitarization, denazification, and defense against NATO expansion. The case asks whether the invasion is better explained by a security dilemma intensified by NATO enlargement and Ukrainian alignment, or by imperial ambition to reconstitute a Russian sphere of influence. Relevant evidence includes the 2008 Bucharest promise, the 2014 annexation of Crimea, the Minsk process,

NATO force posture, Russian military buildup, and Ukrainian public opinion on NATO before and after 2014.

(b) Required memo headings as prompts:
- **Mechanism:** Identify the causal mechanism (security dilemma, imperial ambition, ontological insecurity, or a combination), specify its scope conditions, and state what would falsify it.
- **Perspective reconstruction:** Reconstruct the African, Chinese, Russian, Western, and UN perspectives in 3–5 sentences each, steel-manning each from within.
- **Historical analogue:** Compare the case to one earlier episode (for example, 2008 Georgia or 2014 Crimea) and state what is similar, what differs, and what the analogy cannot explain.
- **Falsifiers:** List evidence that would weaken your preferred mechanism and evidence that would strengthen the rival mechanism.

(c) Self-check line: Before finalizing, verify that you have clearly distinguished description (what happened), explanation (why it happened), prediction (what follows if your mechanism holds), and prescription (what policy should follow), and that no single sentence conflates two of these categories.

SECTION 2.11 HINGE QUESTION

Question: Which adjudication best fits the evidence from the 2008 Georgia war?
A. The war was a pure security dilemma: Georgian NATO aspirations and Russian fear alone caused it, with no imperial intent.
B. The war was pure imperial ambition: Russia planned conquest regardless of Georgian actions.
C. The war combined a security-dilemma trigger with imperial consolidation: Georgian escalation provided the occasion, while Russian recognition and occupation reflected sphere-maintenance logic.
D. The war demonstrated successful UN collective security, because Charter mechanisms prevented wider escalation.

Correct answer: C.

Distractor diagnosis:
- **A** is wrong because it cannot explain Russian military readiness, the breadth of the advance, or the recognition of Abkhazia and South Ossetia; it treats a spiral as if it had no strategic settlement phase.
- **B** is wrong because it ignores the Tagliavini finding that Georgia started large-scale hostilities and overstates evidence of a pre-planned conquest of all Georgia; it also cannot explain why the trigger mattered.
- **D** is wrong because the UN did not prevent escalation or reverse territorial change; the case illustrates the dependence of collective security on great-power politics, not its success.

SECTION 2A — DATA LAB

Table 1. NATO enlargement waves, 1999–2024 (indicative, membership counts cumulative)

Wave (year)	New members	Cumulative NATO size	Commonly cited Russian response
1999	Czechia, Hungary, Poland	19	Objection; Kosovo war context

Wave (year)	New members	Cumulative NATO size	Commonly cited Russian response
2004	Bulgaria, Estonia, Latvia, Lithuania, Romania, Slovakia, Slovenia	26	Stronger objection; Baltic accession seen as direct border contact
2009	Albania, Croatia	28	Limited new strategic alarm
2017	Montenegro	29	Sanctions-era tension
2020	North Macedonia	30	Low immediate salience
2023	Finland	31	Major border change; Russian warnings
2024	Sweden	32	Nordic strategic environment altered

Table 2. Russian military spending and NATO–Russia institutional status (indicative)

Period	Russian military spending (% of GDP, approximate)	NATO–Russia institutional status	Defining shock
1997–2001	~3.5–4.0	Founding Act; limited cooperation	Post-Soviet collapse; NATO's first post-Cold War enlargement
2002–2007	~3.5–4.5	NATO–Russia Council established; cooperation	Putin's 2007 Munich speech; Kosovo independence dispute
2008–2013	~3.8–4.5	Suspended after Georgia; partial thaw	2008 Georgia war
2014–2021	~4.0–5.5	Practical cooperation suspended; NRC survives as forum	Crimea annexation; Donbas war
2022–2024	~4.0–6.0+	NRC frozen; war footing	Full-scale invasion of Ukraine

Table 3. Ukrainian public opinion on NATO membership (indicative)

Period	Support for NATO membership (approx.)	Context
2002–2012	15–30%	Regional divide; Yanukovych-era non-bloc posture
2014 (post-Crimea)	40–50%	Annexation; Donbas escalation
2019	50–60%	Constitutional NATO aspiration; Poroshenko/Zelensky periods
2022–2024	75–85%	Full-scale invasion; wartime rally and security demand

Five numbered analysis questions

1. **Trend.** Across the three series, what pattern is most visible? NATO membership moves steadily eastward and northward; Russian military spending remains high by European standards and spikes around crises; Ukrainian support for NATO rises sharply after 2014 and again after 2022. What does this pattern suggest about the relationship between external threat perception, alliance demand, and military burden? State at least one reason why the trend alone cannot establish causation.

2. **Level of analysis.** Which level of analysis best explains the post-2014 deterioration: individual (Putin's beliefs, Ukrainian leaders, public opinion), state (Russian great-power identity, Ukrainian sovereignty, NATO institutional interests), systemic (unipolarity, bipolarity's return, balance of power), or transnational (energy, diaspora, EU regulatory power)? Defend one primary level and one secondary level, and identify what each level misses.

3. **Perspective reconstruction (all five).** Reconstruct how each perspective reads the same data.

    - **African (primary):** The African vantage point begins with sovereignty as a hard-won, post-colonial achievement and treats both NATO expansion and Russian "privileged interests" as possible infringements on smaller states' agency. From this angle, the data are not merely about European security; they are about who gets to define legitimate order. African scholarship on extraversion, conditional sovereignty, and the selective application of norms (Grovogui, Mamdani, Bayart) suggests that Ukrainian sovereignty is real, but so is the suspicion that great powers invoke rules instrumentally. The rise in Ukrainian NATO support after 2014 and 2022 can be read as a genuine security demand by a sovereign state, not as Western manipulation; yet the same data can also be read as evidence that small states are forced into alliance blocs when great-power guarantees fail. Russian spending data do not by themselves prove imperial ambition, but the "privileged interests" doctrine looks, from an African perspective, like a familiar claim to a sphere of influence that post-colonial states have historically resisted. The UN Charter's territorial-integrity norm is therefore not abstract: it is the legal vocabulary through which African states protect themselves against both Western interventionism and Russian sphere-of-influence politics. The African perspective's distinctive contribution is to show that the debate is not only "NATO vs. Russia" but also "whose sovereignty counts, and when?"

- **Chinese:** NATO expansion is treated as a root cause or at least a major enabling condition of Russian insecurity. The waves table supports the claim that the alliance moved toward Russia's borders; the spending table supports the claim that Russia responded to perceived encirclement; the opinion table is read cautiously, because wartime polling may reflect elite and media mobilization. The Chinese perspective emphasizes "legitimate security concerns" and multipolarity, and it occludes the possibility that Russian threat inflation served domestic legitimation.

- **Russian:** The data are read as confirmation of encirclement and humiliation. NATO waves show a shrinking strategic buffer; NRC breakdown shows institutional disregard; Ukrainian opinion is interpreted partly as the result of Western political engineering and partly as a tragic but understandable reaction to war. This perspective's strength is its attention to status and recognition; its weakness is its tendency to treat Russian security claims as automatically overriding Ukrainian sovereignty.

- **Western:** NATO enlargement is read as a response to Central and Eastern European demand, not as unprovoked expansion. The spending data support the claim that Russia remained heavily militarized even during cooperative periods; the opinion data support the claim that Ukrainian NATO aspiration became genuinely popular after Russian coercion. The Western perspective's self-critique, associated with Mearsheimer and others, asks whether alliance expansion ignored Russian red lines and thereby worsened the security dilemma.

- **UN:** The data are filtered through Charter norms: membership choices are sovereign, but force and annexation are prohibited. The NRC table shows institutional failure; the spending table shows militarization; the opinion table shows popular demand. The UN perspective contributes legal clarity but occludes enforcement capacity, since collective security depends on great-power consensus.

4. **Interpretation.** Which causal claims are supported by the data, and which are overreaches? For example, does the correlation between NATO waves and Russian hostility support Mearsheimer's security-dilemma argument, Trenin's post-imperium argument, Kotkin's imperial-ambition argument, or Sarotte's diplomatic-history argument? What would be needed to move from correlation to causation?

5. **Limitation.** Identify at least four limitations: wartime polling; classified or politicized military budgets; endogeneity between NATO expansion and Russian behavior; aggregation that hides regional variation within Ukraine and Russia; absence of a credible counterfactual; and the fact that institutional status (NRC meetings) measures diplomatic formality rather than substantive security.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1: "Ontological Security Spiral" (hand-drawn, A4 landscape)

- **What to draw:** Three concentric circles. Outer circle: "Soviet identity, 1945–1991," drawn with a cracked border. Middle circle: "Post-Soviet disorder, 1991–2000," with jagged edges. Inner circle: "Putin-era reconstruction, 2000–," with a solid border and three icons: an Orthodox cross, a double-headed eagle, and a

map outline of "Eurasia." Draw arrows from the outer circle inward labeled "collapse," "humiliation," and "loss of status." Draw arrows from NATO wave labels (1999, 2004, 2009, 2017, 2020, 2023, 2024) pointing toward the cracks in the outer circle.
- **Labels to place:** "Soviet ontological collapse," "NATO enlargement," "'privileged interests,'" "Crimea as 'reunification,'" "status anxiety," "civilizational defense."
- **Perspective overlay:** Annotate the margin with five color-coded notes: African (sovereignty and selective norms), Chinese (legitimate security concerns), Russian (encirclement and civilizational defense), Western (imperial ambition plus self-critique), UN (Charter and territorial integrity).

Visual 2: "Security Dilemma vs. Imperial Ambition Decision Tree" (hand-drawn, A4 portrait)
- **What to draw:** A root node labeled "NATO/EU expansion + Ukrainian association." Two branches: Branch A "Security dilemma" with nodes "perceived encirclement → defensive mobilization → arms racing → preventive/defensive war"; Branch B "Imperial ambition" with nodes "great-power identity → opportunity → annexation → justification narrative." Add evidence boxes along each branch: "NATO waves," "Russian spending," "NRC breakdown," "Ukrainian opinion." End both branches in a shared node: "2008 Georgia / 2014 Crimea / 2022 Ukraine."
- **Labels to place:** "Mearsheimer," "Trenin," "Kotkin," "Sarotte," "Putin 2021 essay," "adjudication requires process tracing."
- **Perspective overlay:** Color Branch A in blue for Western self-critique and Russian security claims; color Branch B in red for Western/Kotkin imperial-ambition claims; annotate African and UN notes at the shared outcome node: "sovereignty violated either way; Charter test."

Visual 3: "Data Timeline Map" (hand-drawn, A4 landscape)
- **What to draw:** A horizontal timeline from 1997 to 2024. Four stacked bands: (1) NATO waves as vertical bars; (2) Russian military spending as a line; (3) NATO–Russia institutional status as shaded zones (cooperative, crisis, suspended, frozen); (4) Ukrainian NATO support as a line. Mark shocks at 2008, 2014, and 2022 with vertical dashed lines. Add small boxes at each shock: "Georgia," "Crimea," "full-scale invasion."
- **Labels to place:** "Founding Act 1997," "NRC 2002," "Georgia 2008," "Crimea 2014," "invasion 2022," "Finland 2023," "Sweden 2024."
- **Perspective overlay:** At the bottom, place five small perspective tags: African (sovereignty/non-interference), Chinese (root cause/legitimate concerns), Russian (encirclement/humiliation), Western (imperial aggression/self-critique), UN (territorial integrity/Charter failure). Annotate that the same timeline is read as threat, response, demand, or institutional failure depending on perspective.

SECTION 4 — CORNELL NOTES

Cue (prompt)	Notes (with source log)
What is ontological security in the post-Soviet case?	Identity, status, and continuity after 1991; Soviet collapse created a narrative vacuum; Putin-era reconstruction uses history, Orthodoxy, and great-power status. Source log: L7 ontological security; Kotkin 2022; Trenin 2011.

Cue (prompt)	Notes (with source log)
What does "privileged interests" mean?	Russian claim to special influence in former Soviet space; not formal empire but sphere-of-influence logic. Source log: Putin speeches; Trenin 2011.
What are the NATO enlargement waves?	1999, 2004, 2009, 2017, 2020, 2023, 2024; cumulative growth from 16 to 32 members. Source log: NATO records; Sarotte 2021.
What is the NATO–Russia Founding Act (1997)?	Framework for cooperation and security; later strained by enlargement and wars. Source log: NATO–Russia Founding Act 1997.
What is Mearsheimer's (2014) argument?	Western policy, especially NATO/EU expansion, provoked Russian reaction; security-dilemma logic. Source log: Mearsheimer 2014.
What is Sarotte's (2021) argument?	Diplomatic history of "not one inch"; NATO expansion decisions and Russian perceptions; nuance over inevitability. Source log: Sarotte 2021.
What is Kotkin's (2022) argument?	Imperial ambition and ideology, not only security fear; Putin's historical narrative. Source log: Kotkin 2022.
What is Trenin's (2011) argument?	Post-imperium Russia; integration vs. sphere; strategic culture. Source log: Trenin 2011.
What does Putin's 2021 essay claim?	Historical unity of Russians and Ukrainians; denial of Ukrainian separateness; justification narrative. Source log: Putin 2021 essay.
Security dilemma vs. imperial ambition?	Security dilemma: defensive actions read as threats; imperial ambition: expansion for status/identity. Adjudication needs process tracing. Source log: L5 realism; Mearsheimer 2014; Kotkin 2022.
What were 2014 Crimea justification narratives?	"Reunification," protection of Russian speakers, historical rights, response to Maidan. Source log: Putin 2021 essay; Kotkin 2022.
How does the African perspective reframe the debate?	Sovereignty, non-interference, selective norms; both Western and Russian claims can threaten small-state agency. Source log: Grovogui; Mamdani; Bayart.

Summary (3–5 sentences): Post-Soviet ontological insecurity created a vacuum that Putin-era narratives filled with great-power status, civilizational identity, and "privileged interests." NATO enlargement, EU association, and Ukrainian sovereignty demands interacted with these narratives to produce competing security-dilemma and imperial-ambition explanations. The 2014 Crimea annexation shows how identity, status, and justification narratives can convert crisis into territorial change. Data on NATO waves, Russian spending, NRC breakdown, and Ukrainian opinion clarify trends but cannot alone settle causation. An African-centered reading insists that sovereignty and non-interference are not Western or Russian privileges but universal tests of international order.

SECTION 5 — FEYNMAN COMPRESSION

1. **Explain without jargon.** After the Soviet Union collapsed, Russia lost not only territory and power but also a story about who it was. NATO grew eastward, Ukraine moved toward Europe, and Russian leaders said they were being surrounded. Some scholars say Russia acted mainly because it felt threatened; others say it acted because it wanted empire back. The 2014 takeover of Crimea was justified as "reunification," but it violated Ukraine's borders. Data show NATO grew, Russia spent heavily on the military, cooperation with NATO broke down, and Ukrainians increasingly wanted NATO after attacks. The same facts look different depending on whether you prioritize security, empire, sovereignty, or international law.

2. **Mark gaps.** I am not yet sure how much weight to give Putin's personal beliefs versus Russian state interests; whether NATO expansion was a necessary cause or only a background condition; whether Ukrainian opinion data are distorted by war; and whether "ontological insecurity" can be measured rather than narrated.

3. **Reread verification.** Recheck Mearsheimer 2014 for the security-dilemma mechanism; Sarotte 2021 for diplomatic sequencing; Kotkin 2022 for imperial-ambition claims; Trenin 2011 for post-imperium status; the 1997 Founding Act for institutional promises; and Putin's 2021 essay for identity-based justification. Verify that NATO wave dates, cumulative membership counts, and NRC status labels match the data table.

4. **Analogy with explicit limits.** A useful analogy is a neighborhood where one house installs a high fence and cameras after a burglary, while a neighbor reads the fence as preparation for taking over the street. The analogy captures mutual suspicion and status anxiety, but it fails because states are not neighbors with equal rights: Ukraine is a sovereign state, NATO is an alliance, Russia is a nuclear power, and the "fence" here includes annexation and war.

5. **Rewrite.** Post-Soviet Russia's identity crisis, NATO's eastward expansion, and Ukraine's European turn created a contested security environment in which the same data support both security-dilemma and imperial-ambition readings. The 2014 Crimea annexation is the key case: it can be explained as status-driven "reunification," as strategic opportunism, or as a violation of sovereignty. Adjudication requires process tracing across levels of analysis and perspectives, not trend data alone.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L35	Definition	What is ontological security in IR?	A state's need for a stable, continuous sense of self-identity, not merely physical survival; when identity narratives are threatened, states may take actions that risk physical security to restore narrative coherence (Mitzen 2006; Steele 2008).	African scholars read ontological insecurity through the lens of colonial rupture and post-colonial state formation, where identity reconstruction is never fully complete.
L35	Mechanism	How does the security dilemma operate in the post-Soviet space?	Defensive measures by one actor (NATO enlargement, missile defense) are interpreted as threats by another (Russia), prompting countermeasures that confirm the original fear and produce a spiral of mutual insecurity under anarchy (Jervis 1978).	The dilemma is asymmetrically experienced: NATO reads expansion as defensive, Russia reads it as encirclement.
L35	Application	What is Russia's "zone of privileged interests"?	Medvedev's 2008 articulation that Russia claims special influence in the former Soviet space; not formal empire but an asserted sphere of influence (Trenin 2011).	African perspectives are wary of any great-power "privileged interests" claim because it echoes colonial spheres.

Tag	Card Type	Front	Back	Perspective Note
L35	Comparison	Security dilemma vs. imperial ambition as explanations for Russian behavior?	Security dilemma stresses reactive, defensive fear of NATO; imperial ambition stresses expansionist identity and great-power restoration; adjudication turns on proportionality and stated aims (Mearsheimer 2014 vs. Kotkin 2022).	African analysts often find both explanations partial, insisting on local agency and historical contingency.
L35	Source	What does Mearsheimer (2014) argue about Ukraine?	Western, especially US, policy of NATO/EU expansion provoked Russian reaction; Ukraine should be a neutral buffer; realism predicts great-power sphere politics.	Western self-critique strand; African readers note its neglect of Ukrainian agency.
L35	Debate	What is the "encirclement" narrative?	Russian claim that NATO expansion surrounds Russia and threatens its security; used to justify interventions; contested by NATO's defensive, open-door framing.	Chinese diplomacy echoes "legitimate security concerns" language, partially validating the narrative.

Tag	Card Type	Front	Back	Perspective Note
L35	Reconstruction	How does the African perspective view post-Soviet conflicts?	Through sovereignty, non-interference, and suspicion of great-power spheres; support for territorial integrity combined with critique of Western double standards and selective norm application.	Primary vantage point of this lesson; reveals what Western and Russian frames occlude about normative inconsistency.
L35	Occlusion	What does the Chinese perspective tend to occlude?	China's own sphere claims and the inconsistency of its non-interference rhetoric; it downplays Russian violations while emphasizing NATO expansion as root cause.	Highlights the gap between principled sovereignty language and great-power practice.
L35	Adjudication	How to adjudicate security dilemma vs. imperial ambition in Georgia 2008?	Examine timing, proportionality, and stated aims; Russia's recognition of Abkhazia and South Ossetia suggests imperial ambition, while NATO's Bucharest promise suggests a security-dilemma trigger.	African states largely condemned recognition, aligning with territorial integrity norms.

Tag	Card Type	Front	Back	Perspective Note
L35	Visual	What does the NATO expansion timeline (1999–2024) show?	Waves of enlargement moving eastward; Russia's perception of shrinking strategic depth; correlation with spikes in Russian military spending and threat rhetoric.	Visual evidence is read differently across perspectives: defensive consolidation vs. encirclement.
L35	Mechanism	How did the 2013–14 crisis escalate?	Yanukovych's rejection of the EU Association Agreement for a Russian bailout; Maidan protests; Russian annexation of Crimea; separatist war in Donbas.	African observers stress the role of external great-power competition in destabilizing a sovereign state.
L35	Source	What does Putin's 2021 essay on Ukraine argue?	It denies Ukrainian nationhood as separate from Russia, frames Ukraine as historical Russian land, and justifies intervention as reunification.	Russian civilizational-defense narrative; Western and African critics read it as imperial ideology.
L35	Comparison	Western vs. Russian framing of NATO enlargement?	Western: voluntary, defensive, open-door; Russian: encirclement, broken promises, existential threat.	UN framing attempts neutrality but defaults to Charter principles of territorial integrity.

Tag	Card Type	Front	Back	Perspective Note
L35	Reconstruction	UN perspective on Crimea 2014?	General Assembly Resolution 68/262 affirmed Ukraine's territorial integrity; non-recognition of annexation; collective security failure.	African voting patterns at the UN showed diversity, not uniform alignment.
L35	Debate	What is the strongest counterargument to Mearsheimer's thesis?	That Russian aggression preceded and exceeded NATO triggers; that Ukrainian agency and democratic choice matter; that imperial ambition, not just security fear, drives policy (Kotkin 2022).	African scholars add that great-power bargaining over small states' fates reproduces colonial logics.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence Audit (score 0–100)

Concept	Confidence (0–100)	Evidence of Mastery
Ontological security definition and scope		Can define and distinguish from physical security
Security dilemma mechanism (Jervis)		Can trace spiral steps in a case
NATO enlargement history 1999–2024		Can list waves and Russian reactions
EAEU vs. EU integration competition		Can explain 2013–14 trigger
Imperial ambition thesis (Kotkin)		Can state strongest version
African perspective reconstruction		Can steel-man from within
Chinese perspective reconstruction		Can steel-man from within
Russian perspective reconstruction		Can steel-man from within
Western perspective reconstruction		Can steel-man from within

Concept	Confidence (0–100)	Evidence of Mastery
UN perspective reconstruction		Can steel-man from within
Crimea 2014 adjudication		Can distinguish description/explanation/prediction/prescription
Georgia 2008 adjudication		Can apply both competing explanations

7.2 Three-Question Debrief

1. Which of the five perspectives did you find hardest to steel-man from within, and what specific assumption made it difficult?
2. Where did your initial intuition about Russian motives conflict with the evidence you encountered, and what would it take to revise your view?
3. If you had to adjudicate between the security-dilemma and imperial-ambition explanations for a new case, which three pieces of evidence would you demand first?

7.3 Error-Log

Common Misconception	Correction	Evidence
"NATO promised never to expand eastward"	No formal treaty promise existed; Baker-Genscher discussions were ambiguous and contested (Sarotte 2021).	Sarotte 2021; NATO-Russia Founding Act 1997
"Russia invaded solely because of NATO"	Imperial ambition and identity reconstruction are independent drivers; NATO is at most a trigger (Kotkin 2022).	Kotkin 2022; Putin 2021 essay
"Crimea annexation was purely defensive"	It involved irredentist reunification rhetoric and military fait accompli, not just security buffering.	Putin 2021 essay; UN GA Res. 68/262
"Ontological security is only psychology"	It concerns state identity narratives and institutional continuity, not individual psychology.	Mitzen 2006; Steele 2008
"The security dilemma is symmetric"	Threat perception and capability are asymmetric; one side's defense reads as offense to the other.	Jervis 1978; Trenin 2011
"African states uniformly support Russia"	Voting and diplomacy varied; many abstained or supported territorial integrity at the UN.	UN GA voting records 2014, 2022

Common Misconception	Correction	Evidence
"NATO expansion was purely aggressive"	It was also driven by Central and Eastern European demand for security guarantees.	Sarotte 2021; NATO enlargement history

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Ontological security; security dilemma; sphere of influence; territorial integrity	Spiral of mutual threat perception; identity narrative re-construction; integration competition	Mitzen 2006; Steele 2008; Jervis 1978; Mearsheimer 2014; Kotkin 2022; Trenin 2011	Crimea 2014; Georgia 2008; NATO enlargement 1999–2024; Maidan 2013–14	Security dilemma vs. imperial ambition; defensive vs. offensive NATO	If Russia accepted neutral buffers without expansionist claims, security-dilemma thesis strengthened	L5 realism; L7 ontological security; L14 transition; L36 Ukraine war
Privileged interests; en-circlement; reunification	Great-power bargaining over small states; normative inconsis-tency	Sarotte 2021; Putin 2021 essay; NATO-Russia Founding Act 1997	Russian military spending spikes; NATO-Russia Council meetings	Western self-critique vs. Russian civiliza-tional defense	If NATO had stopped at 1997 borders and Russia still intervened, imperial-ambition thesis strengthened	L39 European security; L40 wider Eastern Europe
Sovereignty; non-interference; selective norms	African normative critique; UN Charter principles	Grovogui; Mbembe; Mamdani; Aning	UN GA Res. 68/262; African voting patterns	African vs. Western normative frames	If African states uniformly backed one side, non-interference claim weakened	L1 global order; L3 UN system

SECTION 9 — REVIEW SCHEDULE

- **R1 (Day 1, 20 min):** Re-read Section 2.2–2.6 key ideas; recite the five perspectives in order; check flashcards 1–5.

- **R2 (Day 3, 30 min):** Redo the Problem Pair (Georgia 2008) without notes; compare to model answer; log errors in Section 7.3.
- **R3 (Day 7, 45 min):** Reconstruct the Crimea worked example at all four levels of analysis; test with flashcards 6–10.
- **R4 (Day 14, 60 min):** Write a one-page adjudication memo on a new case (e.g., 2022 full-scale invasion) using the four memo headings; self-check description/explanation/prediction/prescription.
- **R5 (Day 30, 90 min):** Full review of Sections 2.7–2.11; teach the lesson's central puzzle aloud in 5 minutes (Feynman); update confidence audit scores.

SECTION 10 — COMPLETION CHECKLIST

☐ I can define ontological security and distinguish it from physical security.
☐ I can trace the security-dilemma spiral in the post-Soviet space.
☐ I can list NATO enlargement waves 1999–2024 and Russian reactions.
☐ I can explain the EAEU vs. EU competition and the 2013–14 trigger.
☐ I can state Mearsheimer's (2014) argument and its strongest counterargument.
☐ I can state Kotkin's (2022) imperial-ambition thesis.
☐ I can reconstruct the African perspective from within, not as a case study.
☐ I can reconstruct the Chinese perspective and identify its occlusions.
☐ I can reconstruct the Russian perspective and identify its occlusions.
☐ I can reconstruct the Western perspective and its self-critique.
☐ I can reconstruct the UN perspective and its limitations.
☐ I can adjudicate Crimea 2014 across all four levels of analysis.
☐ I can adjudicate Georgia 2008 under both competing explanations.
☐ I can distinguish description, explanation, prediction, and prescription.
☐ I have completed the confidence audit and error log.
☐ I have scheduled R1–R5 reviews.
☐ I can teach the central puzzle in 5 minutes without notes.

37. The Ukraine War: Dynamics and Implications

LESSON METADATA

Field	Value
Lesson number and title	36 — The Ukraine War: Dynamics and Implications
Module	Module 6: Eastern Europe and the Ukraine War
Prerequisites	L22 (conventional warfare); L24 (cyber); L35 (post-Soviet ontology)
Interleaved links	Forward to L37 (lawfare), L38 (energy coercion), L39 (European security), L55 (quantum/NC3)
Reading load	7-9 hours
Content channels	Text, data tables, worked example, problem pair, flashcards, visual anchors
Bloom ceiling	Evaluate (Bloom Level 5)
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

The Russian Federation's full-scale invasion of Ukraine on 24 February 2022 was, in many pre-war assessments, expected to produce rapid strategic decision: a short, high-intensity conventional campaign in which superior mass, airpower, and armored maneuver would compel Kyiv's capitulation or negotiated subordination. Instead, by the end of 2022 the war had passed through a failed blitz, two major Ukrainian counteroffensives, and the beginning of a grinding attritional phase that continued into 2023-2024. The central puzzle of this lesson is therefore not simply why Russia's initial plan failed, but how a war can move through qualitatively different operational regimes—maneuver, counter-maneuver, and attrition—while simultaneously being fought in cyber, information, energy, and industrial domains. The lesson asks students to explain phase transitions, identify the mechanisms that make one template succeed in Kharkiv and fail in Zaporizhzhia, and connect battlefield dynamics to the reordering of European security. It treats the war as a test case for theories of conventional warfare, hybrid conflict, military innovation, industrial mobilization, and alliance politics, while insisting that no single theory is sufficient.

This lesson sits in Module 6 and depends on three earlier conceptual foundations. L22 supplies the vocabulary of conventional warfare: maneuver, attrition, combined arms, logistics, and the offense-defense balance. L24 supplies the cyber and information dimension, including the possibility that digital disruption can substitute for or complement kinetic force. L35 supplies the post-Soviet ontological frame: the contested status of Ukraine, the imperial residue in Russian strategic culture, and the legal-political construction of sovereignty after 1991. The lesson then projects forward to L37 on lawfare, L38 on energy coercion, L39 on European security architecture, and L55 on quantum technologies and nuclear command, control, and communications. In other words, it is a hinge lesson: it converts operational history into structural questions about deterrence, alliance cohesion, and the future of arms control. Students who master it should be able to move from a map

of territorial control to an argument about why a particular force package succeeded or failed, and from there to a judgment about whether NATO's rearmament is a stabilizing or destabilizing response.

By the end of the lesson, a student should be able to reconstruct the war's phases with attention to timing, geography, and force ratios; explain the mechanisms behind the Kharkiv counteroffensive and the 2023 Zaporizhzhia stalemate; analyze hybrid warfare as a blurring of military and civilian domains rather than as a synonym for "everything"; evaluate the drone and electronic-warfare revolution without technological determinism; assess the industrial-base problem through ammunition production, artillery consumption, and Western capacity; and adjudicate competing claims about NATO expansion, rearmament, and arms-control collapse. The student should also be able to write a short analytical memo that separates description, explanation, prediction, and prescription, and that tests its own conclusions against explicit falsifiers. The worked example and problem pair are designed to make these skills procedural rather than merely declarative.

The lesson's theoretical spine is deliberately plural. Offense-defense theory helps explain why Russia's initial blitz failed when Ukrainian resistance, terrain, and logistics denied rapid decision, but it struggles to explain why the same Ukrainian forces could not convert Kharkiv-style success into a breakthrough in Zaporizhzhia. Maneuver-warfare theory explains the former through surprise, tempo, and exploitation of weakly held sectors; attrition theory explains the latter through minefields, prepared defenses, and firepower density. Hybrid-warfare theory, as developed in debates over Russian "new generation warfare," warns against conflating information operations with conventional invasion; the Ukrainian case shows that cyber and information effects can be significant yet subordinate to artillery and infantry. The drone revolution can be read either as a tactical adaptation within existing combined-arms doctrine or as a deeper transformation of the offense-defense balance; the evidence is mixed and phase-dependent. Industrial-base theory reminds students that wars are not won by platforms alone but by sustained production of shells, missiles, and spare parts. Finally, alliance theory explains NATO's cohesion and expansion but must be weighed against the possibility that enlargement contributed to Russian threat perception—a claim that is analytically separable from the normative question of whether enlargement was justified.

The evidentiary base for this lesson is unusually contested because the war is ongoing and information is weaponized. The canonical sources—Freedman (2023) on strategy, Watling (2022) on land warfare, RUSI's Ukraine reports, ISW assessments, and UN OCHA humanitarian reporting—provide a strong but not uncontested record. ISW's daily assessments are invaluable for territorial and operational detail but are open-source and may reflect Ukrainian and Western sourcing biases. RUSI reports offer technical depth on tactics and logistics but are often written for professional military audiences and may understate political constraints. Freedman provides strategic framing but cannot resolve empirical disputes about casualty figures or shell production. UN OCHA documents humanitarian consequences with methodological care but does not adjudicate operational claims. Students should therefore treat all figures—territorial control, drone sortie rates, artillery consumption, production targets—as provisional and should ask which source produced them, for what audience, and with what incentive. The lesson's data lab is designed to make this skepticism habitual rather than rhetorical.

Although the war is geographically European, its consequences are global, and the African perspective is not a peripheral commentary on a European event. From an African vantage point, the war's most immediate significance lies in sovereignty, food security, fuel prices, fertilizer supply, and the politics of a multipolar order in which African states are pressured to align. African governments and scholars have often framed the conflict through the lens of territorial integrity and non-intervention—principles with deep roots in postcolonial statehood—while also noting that Western attention and resources devoted to Ukraine can divert

focus from crises elsewhere. This perspective reveals what the other four often miss: the war's distributional consequences across the Global South, the legitimacy costs of selective humanitarianism, and the possibility that a "European security architecture" is being rebuilt in ways that do not automatically include African security concerns. The lesson therefore places the African perspective first and longest in Section 2.7, not as a regional illustration but as a primary interpretive frame. It also prepares students for the forward link to L38 on energy coercion, where African and European vulnerabilities intersect.

SECTION 1 — Pre-Class Priming

1.1 Retrieval warm-up

1. From L22: What is the difference between maneuver warfare and attritional warfare, and why does logistics often decide which mode is actually available to a force?
2. From L22: How does the offense-defense balance shape incentives for preemptive, preventive, or attritional strategies?
3. From L24: What are the principal limits of cyber operations as substitutes for kinetic military force?
4. From L24: How can information operations affect civilian morale and international legitimacy without necessarily changing battlefield outcomes?
5. From L35: Why is Ukrainian sovereignty contested in Russian strategic discourse, and what does that contestation imply for deterrence and escalation?
6. From L35: How did the post-1991 settlement create both NATO enlargement and Russian grievance, and why should these be treated as related but not identical causal stories?

1.2 Orientation questions

1. Why did Russia's 2022 blitz fail despite apparent advantages in mass, armor, and airpower?
2. What mechanisms explain Ukrainian success in the Kharkiv counteroffensive but stalemate in the 2023 Zaporizhzhia offensive?
3. How did drones and electronic warfare alter the offense-defense balance, and what are their operational and industrial limits?
4. What are the strongest arguments for and against the claim that NATO expansion caused or significantly contributed to the war?

1.3 Vocabulary pre-teach

1. **Attritional stalemate**: A phase of war in which neither side can achieve rapid decision, and outcomes depend on sustained firepower, manpower, logistics, and industrial replacement rates.
2. **Hybrid warfare**: The deliberate blurring of military and civilian domains, including cyber, information, energy, economic, and kinetic instruments, without assuming that all domains are equally decisive.
3. **Electromagnetic spectrum (EMS) contestation**: The struggle to detect, communicate, jam, deceive, and survive across radio, radar, and other electromagnetic frequencies, especially in drone warfare.
4. **First-person-view (FPV) drone**: A small, relatively inexpensive unmanned aerial system guided by a pilot using a live video feed, often used for reconnaissance or one-way attack.
5. **Lancet loitering munition**: A Russian precision-guided unmanned system designed to search for and strike targets, illustrating the shift toward cheaper, more numerous precision effects.

6. **Combined-arms maneuver**: The coordinated use of infantry, armor, artillery, air defense, engineers, and other capabilities to create and exploit breakthroughs.
7. **Maskirovka/deception**: The use of concealment, feints, disinformation, and operational surprise to mislead an adversary about intentions, timing, or force location.
8. **Industrial base**: The national and allied capacity to produce, repair, and sustain weapons, ammunition, platforms, and components over time.
9. **Artillery shell consumption**: The rate at which artillery ammunition is expended, often a binding constraint in high-intensity land warfare.
10. **NATO expansion**: The enlargement of the North Atlantic Treaty Organization to include new member states, with contested implications for deterrence and Russian threat perception.
11. **Arms-control collapse**: The erosion or termination of treaties and verification regimes that previously limited nuclear and conventional forces, especially in Europe.
12. **Humanitarian spillover**: The cross-border effects of war on food, fuel, fertilizer, refugees, and civilian protection, particularly consequential for the Global South.

SECTION 2 — LESSON CORE

2.1 Learning objectives By the end of this lesson the student will be able to:

1. **Analyze** the three-phase structure of the Russia-Ukraine war—failed blitz (February–March 2022), Ukrainian counteroffensives (September–November 2022), and attritional stalemate (2023–2024)—as a sequence of operational-logic failures and adaptations rather than as a chronology of battles, specifying for each phase the decisive variable (political cohesion, mobilization depth, industrial capacity) and the mechanism by which it operated.

2. **Explain** how hybrid warfare in this conflict blurs the military-civilian boundary through the simultaneous use of cyber operations, energy coercion, information warfare, and conventional force, and evaluate which of these instruments produced durable strategic effects versus transient tactical disruption.

3. **Evaluate** the drone and electronic-warfare revolution—FPV drones, Lancet loitering munitions, and the contested electromagnetic spectrum—by identifying the feedback loop between sensor density, strike precision, and force dispersion, and by specifying the scope conditions under which drone saturation degrades rather than enhances combined-arms maneuver.

4. **Assess** the industrial-base problem by comparing Ukrainian and Russian artillery-shell consumption rates with Western production capacity, and by determining whether the binding constraint on Ukrainian offensive operations in 2023 was ammunition scarcity, force-generation shortfalls, or the geometry of Russian defensive belts.

5. **Synthesize** the implications of the war for European security architecture—NATO expansion, rearmament, and the collapse of arms control—into a conditional forecast that distinguishes structural shifts (permanent rearmament, Nordic accession) from contingent ones (U.S. commitment levels, Ukrainian territorial outcomes), and that identifies the falsifiers that would invalidate each claim.

2.2 KEY IDEA 1 — The war's phases: the failed blitz (2022), the Kharkiv/Kherson counteroffensives (2022), the attritional stalemate (2023-2024) Bolded Causal Claim: The Russian invasion of Ukraine in February 2022 failed as a blitzkrieg because its operational design assumed a decapitation strike against a state whose political cohesion and territorial defense had been systematically underestimated; the subsequent phases—Ukrainian counteroffensives in Kharkiv and Kherson in autumn 2022, then attritional stalemate across 2023–2024—were determined by the interaction of mobilization depth, industrial capacity, and the geographic constraints of the theater, not by the quality of individual tactical engagements.

Mechanism: The causal chain runs through three linked mechanisms. First, the blitz failed because Russian planners conflated regime fragility with state fragility: the assumption that the Zelensky government would collapse within seventy-two hours (a premise embedded in the multi-axis thrust toward Kyiv, Kharkiv, and Odesa) ignored the institutional resilience of Ukrainian territorial defense, the decentralized command structure that survived the initial strikes, and the political cohesion produced by the 2014–2022 period of partial mobilization and national consolidation. When the decapitation did not occur, Russian forces were committed to a multi-axis advance without the logistics tail or the force ratios required for sustained maneuver, and the 40-kilometer column north of Kyiv became a symbol of operational overreach rather than a temporary pause. Second, the autumn 2022 counteroffensives succeeded not because Ukraine possessed superior aggregate force but because it exploited a specific asymmetry: Russian forces had overextended along a 1,000-kilometer front after the failed blitz, and the Kharkiv offensive (September 2022) used deception, operational security, and the concentration of Western-supplied artillery and HIMARS to rupture a thinly held sector before Russian command could reallocate reserves. The Kherson offensive (October–November 2022) combined similar fires with the geographic constraint of the Dnipro River, which turned Russian withdrawal into a logistical crisis. Third, the transition to attritional stalemate in 2023–2024 occurred because both sides exhausted their initial mobilization surges and entered a phase in which the binding constraint shifted from tactical skill to industrial throughput: Russia's ability to generate mass through partial mobilization (September 2022) and its defense-industrial ramp-up met Ukraine's dependence on Western ammunition flows, and the result was a positional war in which advances were measured in hundreds of meters and paid for in tens of thousands of casualties. The mechanism here is not "trench warfare returns" but rather the exhaustion of maneuver space under conditions of high sensor density and precision fires, which rewards the defender and punishes the attacker unless the attacker possesses overwhelming fires and air superiority—neither of which either side held.

Scope Conditions: The three-phase model holds under specific conditions that must be stated explicitly. It applies to a theater in which (a) the defender possesses sufficient strategic depth and population to absorb an initial shock and regenerate forces; (b) the attacker's political timeline is shorter than the military timeline required for conquest; (c) external suppliers can sustain the defender's fires and logistics; and (d) the theater's geography permits the defender to trade space for time without losing the political center. Where these conditions fail—for instance, in a state with shallow strategic depth or no external supply line—the blitz may succeed and no counteroffensive phase follows. The model also assumes that the attacker does not escalate to nuclear use, which would terminate the conventional phase structure entirely; this is a scope condition, not a prediction. Additionally, the attritional-stalemate phase is contingent on the defender's ability to maintain mobilization and on the supplier's willingness to sustain ammunition flows; if either falters, the stalemate resolves in favor of the side with greater endurance, which in this case has been Russia's larger population and industrial base, though not without severe economic and demographic costs.

Observable Implications: If the three-phase model is correct, several observable patterns should hold. In the blitz phase, one should observe a mismatch between stated political objectives and force allocation:

Russia's initial force of roughly 190,000 troops across multiple axes was insufficient for the stated goal of regime change in a country of 40 million, and the logistics failures (fuel shortages, maintenance breakdowns) should appear early and persist. In the counteroffensive phase, one should observe that Ukrainian gains correlate with the arrival of Western long-range fires (HIMARS in June 2022, Storm Shadow/SCALP in 2023) and with Russian force dispersal, not with Ukrainian numerical superiority. In the attritional phase, one should observe that territorial changes slow to a crawl even as casualty rates remain high, and that the ratio of artillery shells fired to territory gained deteriorates sharply. One should also observe that the phase transitions are not clean: the blitz bled into positional fighting around Kyiv by late March 2022, and the counteroffensives overlapped with the beginning of Russian mobilization. The model predicts phase overlap, not discrete boundaries. Finally, the model implies that any future phase shift—whether toward renewed maneuver or toward negotiated settlement—will be signaled by changes in industrial throughput or mobilization policy rather than by battlefield events alone.

Perspective Note (five traditions in brief):

African (primary): From the African vantage point, the war's phases are read not as a European security drama but as a global shock whose most consequential effects were felt in food, fuel, and fertilizer markets far from the front. African scholars and policymakers have emphasized that the failed blitz and subsequent stalemate produced a commodity-price spike that hit import-dependent African economies hardest: wheat prices rose sharply in 2022, and the Black Sea Grain Initiative (July 2022) was experienced in Africa as a matter of survival rather than diplomacy. The African perspective foregrounds sovereignty as a non-negotiable norm—Russia's violation of Ukrainian territorial integrity is condemned on the same grounds that African states condemn external interference in their own affairs—while simultaneously insisting that the war's global spillovers demand a voice for the Global South in any settlement. African states' voting patterns at the UN (abstentions and non-alignment rather than automatic alignment with either bloc) reflect a reading of the phases as evidence that great-power war is a luxury the global economy cannot afford, and that the attritional stalemate is not merely a European tragedy but a sustained drag on African development. What this perspective reveals that others miss is the distributional asymmetry of the war: the phases are experienced in Europe as security, in Africa as prices.

Chinese: The Chinese reading of the phases centers on NATO responsibility and the argument that the failed blitz was a predictable consequence of NATO expansion and of the West's refusal to address Russian security concerns, while the attritional stalemate demonstrates the futility of military solutions and the necessity of political settlement. The twelve-point peace plan (February 2023) frames the phases as evidence that escalation must be reversed and that a ceasefire should precede negotiations. Chinese analysts have treated the Kharkiv counteroffensive as a tactical success that does not alter the strategic reality of Russian endurance, and the stalemate as confirmation that neither side can achieve its maximalist aims. This perspective contributes the insight that phase analysis must include the diplomatic track, but it occludes the agency of Ukrainian actors and the question of accountability for the initial invasion.

Russian: The Russian framing rejects the "failed blitz" characterization entirely, describing the February 2022 operation as a "special military operation" whose objectives—denazification, demilitarization, and the protection of Russian-speaking populations—were always limited and whose phases represent deliberate adaptation rather than failure. The Kharkiv and Kherson withdrawals are framed as tactical repositioning to more defensible lines, and the attritional phase is presented as a war of attrition that Russia is structurally better positioned to win given its larger population and industrial base. This perspective contributes the claim that Western assessments of Russian failure rest on maximalist objectives that Moscow never formally

adopted, but it occludes the evident gap between the initial multi-axis thrust and the limited objectives later articulated, as well as the costs of the war to Russian society.

Western: The Western perspective reads the phases as a story of Ukrainian resilience and Western support: the failed blitz as proof that deterrence by denial can work, the counteroffensives as validation of combined-arms assistance, and the stalemate as a call for sustained aid and industrial mobilization. NATO unity and the expansion of the alliance (Finland, Sweden) are treated as strategic gains that outweigh the costs of the war. This perspective contributes the emphasis on agency and on the material basis of military power, but it risks occluding the global spillovers and the possibility that the attritional phase may not resolve in Ukraine's favor without a level of Western commitment that has not yet been demonstrated.

UN: The UN perspective frames the phases through the lens of Charter violation and humanitarian consequence: the failed blitz produced immediate civilian displacement and infrastructure damage; the counteroffensives shifted front lines but not the humanitarian crisis; the stalemate entrenched a protracted conflict with no clear end. General Assembly resolutions (March 2022, and subsequent) condemned the invasion and demanded withdrawal, while humanitarian agencies (OCHA) documented the cumulative toll. This perspective contributes the normative anchor and the humanitarian data, but it has limited leverage over the military dynamics and depends on member-state consensus that has been partial.

SECTION 2.3 — KEY IDEA 2: Hybrid Warfare: Cyber, Energy, Information, and the Blurring of Military/Civilian Domains

Bolded Causal Claim: In the Ukraine war, hybrid warfare did not remain a preparatory or peripheral layer; it became a co-constitutive battlespace in which cyber intrusions, energy coercion, information operations, and strikes on civilian infrastructure jointly eroded the distinction between military and civilian targets, turning societal resilience itself into the contested objective.

Mechanism: The mechanism is cumulative cross-domain attrition. Cyber operations target command, control, communications, intelligence, and logistics networks, not necessarily to produce immediate battlefield effects but to impose friction, delay, and uncertainty. Energy coercion operates through supply interruption, price spikes, and infrastructure vulnerability, converting economic interdependence into leverage. Information operations shape domestic mobilization, elite cohesion, and alliance solidarity by contesting narratives of legitimacy, atrocity, and war aims. Kinetic strikes on power grids, transport nodes, ports, and industrial facilities extend military pressure into civilian life, forcing governments to allocate scarce resources to repair, protection, and social stabilization. Each domain reinforces the others: cyber reconnaissance enables physical targeting; energy shortages amplify information grievances; civilian harm becomes both a military effect and a political message. The result is not a single decisive blow but a sustained compression of the adversary's political, economic, and social capacity, with the boundary between combatant and non-combatant progressively dissolved by functional necessity rather than declared doctrine. Freedman (2023) and RUSI Ukraine reports emphasize that modern campaigns are judged by their capacity to integrate these domains; ISW assessments track how Russian strikes on infrastructure were timed to exploit seasonal demand and repair cycles. UN OCHA reports document the humanitarian translation of this mechanism into displacement, service disruption, and civilian risk.

Scope Conditions: Hybrid warfare of this kind is most effective where the target is deeply embedded in transnational networks—energy pipelines, digital platforms, financial systems, and global media

ecosystems—and where thresholds for retaliation remain ambiguous. It thrives in the gray zone below formal war, where attribution is contested and responses are calibrated to avoid escalation. It is less effective where infrastructure is hardened, diversified, or rapidly repairable; where societies possess high trust and adaptive institutions; where alliances coordinate sanctions, air defense, and cyber defense; and where the attacker's own dependencies create reciprocal vulnerability. The mechanism also weakens when information operations confront credible, locally trusted counter-narratives or when civilian harm generates international mobilization rather than demoralization. In Ukraine, the scope conditions shifted over time: early Russian cyber and information efforts achieved partial disruption but failed to produce strategic paralysis, while later energy and infrastructure strikes imposed real costs without breaking Ukrainian state capacity or Western support.

Observable Implications: The observable implications include large-scale cyber incidents against government and critical infrastructure; repeated strikes on electricity generation, transmission, and heating systems; attacks on ports, railways, and industrial facilities; refugee and displacement flows; spikes in energy prices and rationing; and sustained information campaigns across social media and state media. One should also observe institutional adaptation: Ukraine's repair brigades, distributed energy solutions, cyber defense cooperation, and civil-defense messaging; Western sanctions and export controls; and NATO's increased attention to critical infrastructure protection. If the hybrid mechanism is operating, civilian infrastructure becomes a leading indicator of military pressure rather than a collateral category, and alliance politics becomes an explicit battlespace. Data Lab indicators such as territorial control alone would understate this dimension; they must be read alongside grid damage, cyber incident reporting, energy price movements, and humanitarian access metrics.

Perspective Note (five traditions in brief):

African (primary): From an African vantage point, hybrid warfare in Ukraine is not an exotic Northern phenomenon but a familiar pattern in which external powers weaponize interdependence—energy, food, finance, and information—to discipline weaker states and populations. African scholarship on extraversion, dependency, and the politics of survival (Bayart, Rodney, Mamdani) illuminates how infrastructure and commodity networks become instruments of coercion. The African perspective foregrounds the global spillovers: grain and fertilizer disruptions, fuel price shocks, and debt stress that transferred the war's costs to import-dependent economies. It reveals what Western strategic narratives often occlude: that hybrid warfare's civilian harm is not confined to the theater but is distributed through global markets, and that sovereignty for many states is exercised under conditions of structural vulnerability rather than formal independence. This perspective also cautions against treating African states' non-alignment or hedging as moral failure; such positions often reflect rational assessment of asymmetric exposure to great-power coercion.

Chinese: The Chinese perspective treats hybrid warfare as evidence of a Western-led security architecture that expands into non-military domains—information, finance, technology, and norms—while attributing escalation primarily to NATO's post-Cold War enlargement and to the militarization of economic interdependence. It emphasizes sovereignty, non-interference, and the dangers of bloc confrontation, and it frames cyber and information competition as arenas where unilateral sanctions and narrative dominance are themselves coercive. China's twelve-point peace plan reflects a preference for ceasefire, dialogue, and addressing "legitimate security concerns," implicitly treating hybrid escalation as a symptom of unresolved political order rather than as a discrete Russian strategy. This perspective contributes a critique of Western securitization but occludes the agency of Russian hybrid operations and the coercive use of energy and information by Moscow.

Russian: The Russian perspective frames hybrid warfare as defensive civilizational resistance against a Western hybrid campaign that allegedly preceded the 2022 invasion: NATO expansion, sanctions, information warfare, and the political transformation of Ukraine. In official discourse, the "special military operation" is justified by denazification, demilitarization, and protection of Russian speakers, while Western support for Ukraine is portrayed as evidence of a proxy war. This narrative treats Russian strikes on infrastructure as responses to Western escalation and as efforts to degrade military-industrial capacity, not as attacks on civilians. The perspective contributes an account of how Moscow legitimizes escalation and mobilizes domestic support, but it occludes the initiation of armed force, the documented civilian harm, and the coercive character of energy and information operations directed at Ukraine and Europe.

Western: The Western perspective frames hybrid warfare as a Russian strategy of coercion below the threshold of conventional war, combining cyber attacks, energy leverage, disinformation, and infrastructure strikes to fracture Ukrainian and European resilience. It emphasizes NATO unity, sanctions, cyber defense, and the protection of critical infrastructure as counters. This view contributes a robust account of cross-domain aggression and the need for societal resilience, but it can occlude the ways Western economic and information power also operates coercively, and it sometimes overstates the novelty of hybrid tactics by treating them as uniquely Russian rather than as features of contemporary great-power competition.

UN: The UN perspective frames hybrid warfare through Charter principles and humanitarian consequences: attacks on civilian infrastructure raise questions of distinction and proportionality; energy and food disruptions affect civilian populations far beyond the theater; and information warfare complicates protection and accountability. UN OCHA reports document service disruption, displacement, and access constraints, while General Assembly resolutions condemn aggression and demand withdrawal. This perspective contributes a normative and humanitarian anchor, but it has limited enforcement capacity and depends on member-state consensus that has been partial.

SECTION 2.4 — KEY IDEA 3: Drone and Electronic Warfare Revolution: FPV Drones, Lancet Munitions, and the Contested EMS

Bolded Causal Claim: The Ukraine war has accelerated a tactical revolution in which cheap FPV drones, loitering munitions such as the Lancet, and contested electromagnetic spectrum have made the battlefield radically transparent, shifting advantage from armored mass and maneuver to concealment, electronic warfare, and rapid tactical adaptation.

Mechanism: The mechanism is a sensor-strike loop compressed to minutes and meters. FPV drones provide first-person, low-cost reconnaissance and precision attack, allowing small units to locate, track, and strike vehicles, trenches, and logistics nodes without waiting for higher-echelon fires. Loitering munitions such as the Lancet extend this logic by combining search, identification, and terminal attack in a single expendable platform, particularly against artillery and air-defense systems. Electronic warfare contests the links that make these systems effective: jamming, spoofing, and direction-finding disrupt drone control, GPS navigation, and communications, while counter-EW seeks to restore or bypass them. The result is an environment in which movement is detected quickly, concealment is difficult, and survival depends on dispersion, camouflage, electronic silence, and rapid relocation. Freedman (2023) and Watling (2022) highlight how technological diffusion changes tactical possibilities faster than doctrine; RUSI Ukraine reports document the adaptation cycles between drone innovation and countermeasures. ISW assessments track how drone density affects local offensive potential, while UN OCHA data remind that the same transparency increases risk to civilians and infrastructure near front lines.

Scope Conditions: The drone-EW revolution is most transformative where industrial capacity can sustain high sortie rates, where operators are trained and replaced, where terrain permits concealment and short-range flights, and where adversary air defense and EW are imperfect. It is less decisive where one side achieves electromagnetic dominance, where weather or terrain degrades sensors, where supply chains for drones and components are disrupted, or where forces can harden positions and logistics against persistent observation. The mechanism also depends on the cost-exchange ratio: cheap drones can impose disproportionate costs on expensive platforms, but only if they survive EW and if their production outpaces attrition. In Ukraine, both sides have adapted, producing an evolutionary arms race rather than a one-sided revolution; the advantage shifts locally and temporally rather than settling permanently.

Observable Implications: Observable implications include high drone sortie rates; widespread use of FPV drones for both reconnaissance and attack; Lancet strikes against artillery, radar, and air-defense assets; extensive trench networks and dispersion; rapid relocation of artillery after firing; jamming and spoofing incidents; and high rates of vehicle and equipment loss to small, cheap systems. One should also observe adaptation: drone modifications, frequency hopping, fiber-optic or autonomous guidance experiments, EW upgrades, and changes in tactics such as night movement or camouflage. Data Lab indicators—drone sortie rates, artillery shell consumption, and territorial changes—should be read together: high drone density with low territorial movement suggests a transparent, attritional battlespace rather than maneuver warfare. Civilian harm and infrastructure risk near front lines are also observable consequences.

Perspective Note (five traditions in brief):

African (primary): The African perspective reads the drone-EW revolution less as a purely military-technical breakthrough than as another instance of asymmetric, externally supplied warfare whose costs are borne by societies with limited industrial depth. African scholarship on technology, dependency, and the political economy of violence (Rodney, Bayart, Mamdani) suggests that the diffusion of cheap lethal systems can empower non-state and state actors alike while deepening reliance on external supply chains. For African security, the lesson is double-edged: drones may offer affordable surveillance and border control, but they also lower the threshold for violence, complicate accountability, and risk importing great-power tactical templates into contexts with weak oversight. The perspective foregrounds the global political economy of components, semiconductors, and EW systems, and it asks who controls the data, spectrum, and repair ecosystems on which these technologies depend. It also insists that technological fascination not obscure the human and infrastructural costs visible in UN OCHA reporting.

Chinese: The Chinese perspective emphasizes the democratization of precision strike and the vulnerability of high-value platforms to massed, low-cost systems, reinforcing arguments for integrated air defense, electronic warfare, and industrial mobilization. It treats the contested EMS as a strategic domain in which information and spectrum control are prerequisites for sovereignty. China's own military modernization and its interest in drone swarms, counter-drone systems, and EW are informed by these observations. The perspective contributes a focus on systems integration and industrial scale, but it may occlude the political and legal questions raised by autonomous and semi-autonomous lethal systems, and it often frames technological competition in terms of great-power rivalry rather than civilian protection.

Russian: The Russian perspective presents drone and EW adaptation as evidence of resilience and innovation under sanctions, emphasizing Lancet strikes, FPV drone units, and electronic warfare as tools to offset Western-supplied precision weapons and to impose attrition on Ukrainian forces. Official narratives highlight tactical ingenuity and the "demilitarization" of Ukraine through the destruction of Western equipment. This perspective contributes an account of how Russia has adapted to technological asymmetry, but it oc-

cludes the dependence on imported components, the high attrition of drone operators, and the civilian risks created by pervasive battlefield transparency. It also tends to treat technological adaptation as vindication of the war's aims rather than as a response to strategic failure.

Western: The Western perspective frames the drone-EW revolution as both a warning and an opportunity: cheap systems can offset Russian mass, but they also expose NATO's own vulnerabilities in air defense, logistics, and electromagnetic resilience. It emphasizes rapid procurement, innovation cycles, and the need to integrate drones and EW into combined-arms doctrine. This view contributes a strong focus on adaptation and industrial learning, but it can overstate the transferability of Ukrainian adaptations to NATO contexts and may understate the legal, ethical, and escalation implications of normalizing pervasive drone surveillance and strike.

UN: The UN perspective frames drone and EW proliferation through civilian protection and accountability. Pervasive battlefield transparency does not automatically reduce civilian harm; it can increase targeting of infrastructure and complicate distinction, while EW disruption can affect humanitarian communications and navigation. UN OCHA reports document civilian casualties and access constraints in areas of intense drone and artillery activity. This perspective contributes a humanitarian and legal anchor, but it has limited capacity to regulate rapidly diffusing technologies and depends on state compliance with international humanitarian law.

SECTION 2.5 KEY IDEA 4 — The industrial base problem: ammunition production, artillery shells, and Western capacity

Bolded Causal Claim: In a protracted, artillery-intensive conventional war, the binding constraint on military effectiveness is industrial throughput—especially 155mm-class shell production and the energetics, machine tools, and labor behind it—so that operational tempo becomes a function of factory output rather than tactical superiority.

Mechanism: Modern high-intensity land warfare consumes indirect-fire ammunition at rates that deplete Cold War stockpiles; artillery remains the dominant casualty-producing and suppressive tool, so when shell supply tightens, fire plans shrink, maneuver windows close, and casualty-avoidance tactics become more costly. Western defense industries were optimized for low-volume, high-precision, expeditionary warfare and just-in-time procurement, not mass production of basic munitions; scaling requires not only contracts but energetics, forging capacity, skilled labor, quality assurance, and multi-tier suppliers. Ukraine's own production was limited and vulnerable, while Russia could draw on Soviet-era stockpiles and a more thoroughly mobilized defense-industrial base, creating an asymmetry in sustained fire. Precision munitions such as HIMARS rockets and cruise missiles impose a parallel industrial problem: they are scarce, expensive, and dependent on specialized components, so they complement rather than replace massed artillery. The mechanism is therefore a supply-chain bottleneck translated into battlefield constraint: fewer shells mean less suppression, less suppression means slower maneuver, and slower maneuver means higher attrition for the side seeking breakthrough.

Scope Conditions: This claim holds where war is prolonged, attritional, and dominated by artillery and positional fighting; it is weaker in short campaigns, air-dominant conflicts, or theaters where precision strike and logistics interdiction can substitute for massed fires. It also depends on the adversary's industrial depth: Russia's ability to mobilize legacy stockpiles and sanctioned supply chains partially offset Western aid. The

claim does not imply that industrial capacity alone determines outcomes; command quality, intelligence, morale, and alliance cohesion matter, and industrial adaptation can narrow gaps over time. A strong counterargument is that Western precision and drone innovation can reduce shell dependence, while Russia's apparent stockpile advantages may be finite and its production vulnerable to sanctions and labor constraints.

Observable Implications: Observable signs include rationing of artillery fire, shifts toward cheaper drones and loitering munitions, public production targets and delivery shortfalls, stockpile drawdowns in donor states, and industrial investment in energetics and forging. On the Russian side, sustained high-volume fire despite sanctions suggests either deeper stockpiles or successful industrial mobilization; on the Ukrainian side, intermittent fire superiority correlates with Western delivery cycles. The data-lab focus on shell consumption versus production should show a persistent gap between battlefield demand and Western supply, with partial closure only after multi-year industrial expansion.

Perspective Note (five traditions in brief):

African (primary): From an African vantage, the industrial-base problem is not merely a European logistics issue but a revelation of global productive asymmetry and dependency. African scholarship on uneven development and the political economy of extraction highlights how war-driven demand for minerals, energy, and industrial inputs can reproduce extractive relationships, while African states experience the consequences through food, fuel, and fertilizer price shocks. The African perspective asks who bears the costs of Western rearmament and whether global industrial capacity is being redirected away from development priorities; it also stresses sovereignty, since many African states lack the industrial depth to insulate themselves from externally generated supply shocks. This perspective contributes a structural critique of global production and a reminder that military capacity is embedded in broader political economies, but it may understate the immediate agency of Ukrainian and Russian actors in shaping the war's trajectory.

Chinese: The Chinese perspective emphasizes state capacity and manufacturing depth, treating industrial mobilization as a measure of comprehensive national power. It tends to view Western production constraints as evidence of deindustrialization and over-financialization, while seeing China's own manufacturing base as a strategic asset. In the Ukraine context, Beijing's twelve-point peace plan stresses dialogue and opposes escalation, so Chinese commentary often frames arms production races as prolonging conflict rather than resolving it. This perspective contributes an industrial-capacity lens and a critique of Western supply-chain fragility, but it may occlude the coercive dimensions of Russian aggression and the security dilemmas driving European rearmament.

Russian: The Russian perspective treats the industrial base as proof that a war of attrition favors a state willing to mobilize its economy and society. It emphasizes Soviet-era industrial inheritance, the ability to redirect civilian production, and the claim that Western sanctions have failed to cripple Russian output. Russian discourse frames Western shell shortages as evidence of NATO's lack of strategic stamina, while presenting Russia's own production as defensive necessity. This perspective contributes an understanding of mobilized war economies, but it often overstates Russian resilience and understates the costs of sanctions, labor shortages, and technological dependence.

Western: The Western perspective frames industrial shortfalls as a strategic wake-up call requiring rearmament, alliance burden-sharing, and defense-industrial reform. It emphasizes support for Ukraine, NATO unity, and the need to rebuild capacity after decades of underinvestment. Western analysis often treats shell production as a measurable indicator of commitment and deterrence credibility. This perspective contributes policy urgency and institutional learning, but it may normalize an arms-production race and understate the

global spillovers that African and UN perspectives highlight.

UN: The UN perspective connects industrial capacity to civilian protection and humanitarian access. Higher artillery output and sustained bombardment increase civilian harm, infrastructure destruction, and displacement, while arms transfers raise questions of accountability and end-use monitoring. UN OCHA reports document the humanitarian consequences of intense fighting, including access constraints in areas affected by artillery and drone activity. This perspective contributes a legal and humanitarian anchor, but it has limited leverage over state production decisions and depends on compliance with international humanitarian law.

SECTION 2.6 KEY IDEA 5 — Implications for European security architecture — NATO expansion, rearmament, and the collapse of arms control

Bolded Causal Claim: The Ukraine war has replaced the post-Cold War European security order—built on cooperative security, arms control, and economic interdependence—with a deterrence-centered order in which NATO enlargement, rearmament, and conventional force posture have become the primary mechanisms of stability.

Mechanism: Russia's full-scale invasion destroyed the assumption that economic integration and institutional dialogue could manage European security; the resulting threat perception drove Finland and Sweden into NATO, increased forward deployments in Eastern Europe, and pushed defense spending upward across the alliance. Arms control eroded because treaties require verification, reciprocity, and political trust, all of which collapse during active war; the suspension or expiry of key agreements removed constraints on intermediate-range and strategic systems, while nuclear rhetoric raised escalation risks. The mechanism is a security dilemma feedback loop: Russian aggression prompts NATO consolidation, NATO consolidation is interpreted in Moscow as encirclement and threat, and both sides invest in capabilities that make future restraint harder. European rearmament is further shaped by industrial constraints, so the new order may be rhetorically ambitious but materially uneven. Ukraine's own security status—whether through NATO membership, bilateral guarantees, or a frozen conflict—becomes the hinge on which the architecture turns.

Scope Conditions: This claim applies most directly to the Euro-Atlantic theater and the Russia-NATO relationship; it is less predictive for global security orders or for regions where US commitment is thinner. It is contingent on the war's duration, the durability of US support, European political cohesion, and Russia's capacity to sustain military pressure. If a stable ceasefire emerges, some arms-control and confidence-building measures could revive, though trust deficits would persist. The strongest counterargument is that NATO expansion and rearmament are responses to Russian aggression rather than independent causes of disorder; another is that European defense spending may plateau once the immediate shock fades, leaving the architecture rhetorically militarized but materially constrained.

Observable Implications: Observable indicators include NATO membership changes, defense-budget increases, forward troop deployments, munitions and air-defense procurement, treaty suspensions or withdrawals, nuclear signaling, and European defense-industrial initiatives. A durable shift would be visible in multi-year procurement contracts and infrastructure for rapid reinforcement; a temporary shift would appear as emergency aid without sustained force-structure change. The collapse of arms control is visible in the absence of active verification regimes and in the prominence of nuclear deterrence in public strategy.

Perspective Note (five traditions in brief):

African (primary): From an African perspective, the restructuring of European security is part of a broader

global power realignment with direct consequences for African states. African scholarship on sovereignty, nonalignment, and multipolarity highlights how a re-militarized Europe may redirect diplomatic attention, development finance, and arms flows, while food, fuel, and fertilizer shocks from the war have already strained African economies. African governments have often resisted binary alignment, insisting that security architectures should respect territorial integrity without reproducing bloc politics. This perspective contributes a global-South insistence on the costs of great-power confrontation and a critique of Eurocentric security ordering, but it may understate the immediate security imperatives driving European states.

Chinese: The Chinese perspective frames NATO expansion as a Cold War legacy and a source of instability, while presenting China's twelve-point peace plan as an alternative to military escalation. Beijing emphasizes multipolarity, opposes bloc confrontation, and treats arms-control collapse as a failure of US-Russia relations that should be repaired through dialogue. Chinese commentary often links European rearmament to US hegemony and warns against extending NATO-like structures to Asia. This perspective contributes a critique of alliance-centric security and a diplomatic vocabulary for de-escalation, but it may occlude Russia's responsibility for the invasion and the agency of European states seeking protection.

Russian: The Russian perspective presents the war as a defensive response to NATO expansion, Ukrainian "denazification," and the collapse of post-Soviet security arrangements. It frames rearmament and NATO enlargement as confirmation of a long-standing threat, while treating arms-control breakdown as Western refusal to accommodate Russian security interests. Russian discourse emphasizes civilizational defense and a multipolar order. This perspective contributes an account of how Moscow perceives encirclement, but it relies on contested premises about NATO intentions and often obscures the coercive nature of the invasion.

Western: The Western perspective treats the war as an assault on the rules-based order and frames NATO expansion, rearmament, and support for Ukraine as necessary defensive responses. It emphasizes alliance unity, deterrence, and the global stakes of resisting aggression, while acknowledging spillovers such as food and energy insecurity. Western analysis often presents arms-control collapse as a consequence of Russian noncompliance and aggression. This perspective contributes institutional cohesion and a normative defense of sovereignty, but it may understate the risks of prolonged militarization and the concerns of states that prefer nonalignment.

UN: The UN perspective centers on the Charter principles of territorial integrity and peaceful dispute settlement, while documenting humanitarian consequences and Security Council paralysis. It treats arms control and disarmament norms as essential to international stability, even as great-power rivalry weakens enforcement. UN OCHA reports highlight civilian suffering and access constraints, providing an evidence base for humanitarian action. This perspective contributes legal legitimacy and a humanitarian floor, but it depends on member-state compliance and has limited capacity to compel de-escalation or rebuild arms-control regimes.

2.7 FIVE PERSPECTIVES IN DEPTH

2.7.1 African Perspective (PRIMARY)

The African vantage point on the Ukraine war begins from a position that the other four perspectives systematically underweight: the war is not primarily a European security crisis that happens to have global side effects, but a global event whose most severe and immediate human costs fall on populations that had no agency in its causation. This is not a rhetorical move. It is a structural claim about the location of vulnerabil-

ity in the contemporary international system, and it draws on a theoretical tradition that treats sovereignty, development, and racialized hierarchy as inseparable problems.

The foundational premise is that African states enter the Ukraine crisis already positioned as price-takers in global commodity markets, dependent on imported wheat, fertilizer, and fuel, and lacking the fiscal space to absorb price shocks. Egypt imports roughly sixty percent of its wheat, much of it from Russia and Ukraine; Nigeria, Ethiopia, Kenya, and Sudan are similarly exposed. When Black Sea grain exports were disrupted in 2022, the immediate effect was not a diplomatic abstraction but a food-security emergency across the Horn of Africa and the Sahel, compounding drought and conflict. The African perspective therefore treats the war's "spillovers" not as externalities of a European conflict but as constitutive features of a global order in which African populations bear the costs of great-power decisions made elsewhere. This is the insight that Grovogui (1996) develops in *Sovereigns, Quasi Sovereigns, and Africans*: the international system has historically allocated sovereignty unevenly, and the formal equality of states masks a substantive inequality in whose suffering counts as a security problem and whose counts as a humanitarian footnote.

The second premise concerns sovereignty itself. African states are, in the main, strong defenders of territorial integrity as a norm, because the alternative—redrawing borders by force—threatens a continent whose boundaries were imposed by colonial powers and whose stability depends on the inviolability of those boundaries. The African Union's Constitutive Act (2000) and the OAU's 1964 Cairo Resolution on Border Disputes both enshrine this principle. This is why a majority of African states voted in favor of UN General Assembly Resolution ES-11/1 (March 2022) condemning Russia's aggression, even as many abstained on subsequent resolutions and several—South Africa, Senegal, Mali, Eritrea—either abstained or voted against. The vote pattern is not incoherence; it reflects a genuine tension between two commitments: the defense of sovereignty as a universal norm (which condemns Russia's invasion) and the defense of nonalignment and multipolarity (which resists being conscripted into a Western-led coalition). Nkrumah's (1965) *Neo-Colonialism: The Last Stage of Imperialism* remains the theoretical touchstone here: the fear is not only Russian aggression but the reconstitution of a unipolar order in which African states are expected to align without consultation, their interests treated as derivative.

Mbembe's (2001) *On the Postcolony* and his later work on necropolitics provide a further analytical layer. Mbembe argues that the postcolonial state operates through a logic of "commandement"—a mode of power that combines sovereignty and governmentality in ways that make certain populations expendable. Applied to the Ukraine war, this framework suggests that the differential global response to Ukrainian suffering versus, say, Yemeni or Congolese suffering is not accidental but structural: some lives are rendered grievable and others are not, and this rendering is tied to racialized hierarchies of humanity that the international system reproduces. The African perspective thus asks not only "who violated sovereignty?" but "whose sovereignty violation triggers global mobilization and whose does not?" This is a question the Western perspective, with its focus on the rules-based order, tends to deflect, and the UN perspective, with its universalist legalism, tends to flatten.

The economic mechanism is equally important. Rodney's (1972) *How Europe Underdeveloped Africa* provides the historical frame: Africa's integration into the global economy as a supplier of raw materials and a consumer of manufactured goods means that commodity price shocks transmit asymmetrically. When wheat prices spike, African consumers pay more; when fertilizer prices spike, African farmers plant less; when fuel prices spike, African transport and electricity costs rise. The Black Sea Grain Initiative (July 2022–July 2023), brokered by Turkey and the UN, partially restored grain flows, but its collapse in 2023 renewed pressure. Russia's subsequent offers of free grain to select African states (notably at the July 2023

Russia-Africa Summit in St. Petersburg) were interpreted by many African analysts as a diplomatic instrument designed to cultivate influence, not merely humanitarian relief. The African perspective thus treats food and fertilizer not as humanitarian side issues but as strategic domains in which great-power competition is waged on African terrain.

Bayart's (1993) *The State in Africa* adds a crucial nuance: African states are not passive victims but strategic actors navigating a multipolar environment. South Africa's "non-aligned" positioning, Senegal's AU chairmanship diplomacy (Macky Sall's June 2022 visit to Moscow), and the broader BRICS alignment of several African states reflect deliberate calculations about diversifying partnerships and resisting Western conditionality. The African perspective therefore includes a realist strand: states that depend on Russian arms (Algeria, Egypt, Ethiopia), Russian nuclear technology (Egypt's El Dabaa), or Russian diplomatic support in multilateral forums have material reasons to avoid full alignment with the Western coalition. This is not moral failure; it is the rational behavior of states operating in an anarchic system with limited options.

Fanon's (1961) *The Wretched of the Earth* and Cabral's (1973) *Return to the Source* contribute a liberation-theoretic dimension. For Fanon, colonialism is not merely political domination but a totalizing system that dehumanizes the colonized; for Cabral, the struggle for liberation requires both political and cultural emancipation. Applied to Ukraine, this tradition is ambivalent: on one hand, it recognizes Ukrainian resistance to Russian invasion as a legitimate anti-imperial struggle; on the other, it warns against the instrumentalization of that struggle by Western powers whose own imperial histories are unexamined. The African perspective thus refuses the binary of "defender of freedom" versus "aggressor" when both parties have complex histories, and it insists that solidarity with Ukraine not be purchased at the price of silence about Palestine, Western Sahara, or the Democratic Republic of Congo.

Oyěwùmí's (1997) *The Invention of Women* and Tamale's (2020) *Decolonization and Afro-Feminism* introduce a gendered dimension that the other perspectives largely miss. Oyěwùmí's argument that gender as a category was imposed on African societies through colonial epistemology suggests that the "women and children" framing of humanitarian crises is itself a colonial inheritance. Tamale extends this to argue that African feminist perspectives must center the material conditions of women's lives—access to food, land, and water—rather than abstract rights discourses. In the Ukraine context, this means that the gendered impacts of the war (displacement, food insecurity, energy poverty) are felt most acutely by women in the Global South, and that an African feminist lens would prioritize these material impacts over the geopolitical framing that dominates Western and UN discourse.

Aning and Danso (2019) and related African security scholarship emphasize that the continent's security architecture—the African Union, regional economic communities, and the African Standby Force—has been systematically underfunded and marginalized in global security governance. The Ukraine war has accelerated this marginalization by diverting Western attention and resources from African conflicts (Sahel, Horn of Africa, Great Lakes). The African perspective thus includes a claim about opportunity costs: every dollar spent on Ukraine is a dollar not spent on African security, and the "global" security agenda is in practice a European security agenda with African consequences.

What the African perspective contributes that the others cannot: (1) a structural analysis of how global commodity markets transmit war costs to the most vulnerable; (2) a historical memory of Western double standards that explains nonalignment without reducing it to cynicism or Russian influence; (3) a critique of the racialized hierarchy of grievability that shapes global responses; (4) a feminist-materialist lens on the gendered impacts of the war; and (5) a realist account of African state agency in a multipolar system. What it occludes: it may understate the agency of Ukrainians in their own defense, treating the war primarily as

a great-power event; it may overstate the coherence of "African" positions when the continent's fifty-four states hold diverse views; and it may insufficiently engage with the specific military-technical dynamics of the war (drone warfare, electronic warfare, industrial base) that determine outcomes on the ground. The African perspective is strongest on the political economy and normative dimensions of the war and weakest on its operational military dimensions.

2.7.2 Chinese Perspective

The Chinese perspective on the Ukraine war is structured by a foundational tension: China's formal commitment to sovereignty and territorial integrity (a principle it invokes regarding Taiwan) sits uneasily with its strategic partnership with Russia and its interest in a multipolar order that weakens Western hegemony. This tension is not resolved in Chinese discourse; it is managed through a set of rhetorical and diplomatic moves that shift emphasis depending on audience.

The core Chinese claim, articulated in the February 2022 joint statement between Xi Jinping and Vladimir Putin and reiterated in subsequent official communications, is that NATO expansion is the "root cause" of the Ukraine crisis. The argument runs: NATO's eastward enlargement after the Cold War violated implicit understandings (the "not one inch" debate), encircled Russia, and created a security dilemma that made conflict inevitable. This is a structural-realist argument dressed in historical grievance, and it draws on a Chinese strategic tradition that treats great-power spheres of influence as legitimate and views Western universalism as a mask for hegemony. The twelve-point peace plan released by China's Foreign Ministry in February 2023 reflects this framing: it calls for respecting sovereignty and territorial integrity (a nod to Ukraine's position) but also for abandoning "Cold War mentality" and addressing "legitimate security concerns of all countries" (a nod to Russia's position). The plan notably does not call for Russian withdrawal or condemn the invasion, and it was widely criticized in the West as vague and as serving Russian interests.

China's position on the war's spillovers is more complex. Beijing has expressed concern about food and energy security, and it has positioned itself as a mediator (the Xi-Zelensky phone call of April 2023, the appointment of a special envoy). But China has also benefited economically from the war: discounted Russian oil and gas, expanded trade with Russia (reaching record levels in 2023), and a strengthened position in the Global South as a champion of multipolarity. The Chinese perspective thus treats the war as an opportunity to advance a "community of shared future for mankind" narrative that contrasts Chinese "win-win" cooperation with Western "zero-sum" confrontation.

What the Chinese perspective contributes: a reminder that the post-Cold War European security order was not universally accepted; a diplomatic channel to Moscow that Western states lack; and a framework (the twelve-point plan) that, however imperfect, keeps negotiation on the agenda. What it occludes: it systematically understates Russian agency and the reality of Ukrainian sovereignty; it treats NATO expansion as a sufficient cause of war, ignoring the role of Russian imperial ideology and domestic politics; and it avoids any acknowledgment of war crimes or civilian suffering that would implicate its strategic partner. The Chinese perspective is strongest on the structural critique of unipolarity and weakest on the normative defense of Ukrainian self-determination.

2.7.3 Russian Perspective

The Russian perspective on the Ukraine war is anchored in a narrative that frames the conflict not as an invasion but as a "special military operation" (специальная военная операция) launched on February 24,

2022, in response to an existential threat. This narrative has several interlocking components, each with distinct theoretical and historical roots.

The first component is the claim of denazification. Russian official discourse, from Putin's February 21, 2022 address through subsequent statements, asserts that Ukraine is governed by a "neo-Nazi" regime that threatens Russian-speaking populations in Donbas and that the operation aims to "demilitarize and denazify" Ukraine. This claim draws on the genuine historical trauma of the Great Patriotic War (1941–1945) and on the presence of far-right elements in Ukrainian politics (notably the Azov regiment, which has documented neo-Nazi affiliations among some members). However, the claim is widely rejected by scholars of Ukrainian politics and by the Ukrainian government, which is led by a Jewish president (Volodymyr Zelensky) and which has no Nazi ideology in its state doctrine. The Russian perspective here functions as an ideological justification that mobilizes historical memory to legitimize military action.

The second component is the civilizational defense argument. Putin's July 2021 essay "On the Historical Unity of Russians and Ukrainians" asserts that Russians and Ukrainians are "one people" and that Ukraine's independent statehood is an artificial construct of Soviet and post-Soviet politics. This is a primordialist theory of nationhood that treats ethnic and linguistic ties as determinative of political boundaries, and it is directly contradicted by the Ukrainian national movement's long history and by the principle of self-determination enshrined in the UN Charter. The civilizational framing also positions Russia as the defender of "traditional values" against Western liberalism, a narrative that has gained traction in parts of the Global South and the Western far right.

The third component is the NATO encirclement thesis. Russian discourse treats NATO expansion as a broken promise and a strategic threat, and it frames the 2014 Maidan revolution as a Western-backed coup that installed an anti-Russian government. The Minsk agreements (2014–2015) are cited as evidence that Russia sought a diplomatic solution and that Ukraine and the West failed to implement them. This narrative has some factual basis—NATO did expand eastward, and the Minsk process did stall—but it systematically omits Russian violations of Ukrainian sovereignty (the 2014 annexation of Crimea, the arming of separatists in Donbas) and treats Ukrainian agency as derivative of Western manipulation.

What the Russian perspective contributes: it forces attention to the legitimate security concerns that NATO expansion raised for Russia; it highlights the failure of the Minsk process and the West's role in that failure; and it surfaces the real presence of far-right elements in Ukrainian politics that Western discourse tends to minimize. What it occludes: it denies Ukrainian sovereignty and agency; it obscures the reality of Russian war crimes and civilian targeting; it treats the invasion as defensive when it was an offensive operation of choice; and it relies on a primordialist nationalism that is incompatible with the modern international order. The Russian perspective is strongest as a critique of post-Cold War European security architecture and weakest as a justification for the use of force.

2.7.4 Western Perspective

The Western perspective on the Ukraine war is organized around three commitments: the defense of Ukrainian sovereignty, the preservation of NATO unity, and the maintenance of a "rules-based international order." These commitments are not identical, and their tensions become visible when the war's global spillovers are examined.

The first commitment—defense of Ukraine—rests on the principle that territorial integrity is non-negotiable and that aggression must not be rewarded. This is the position articulated in the Biden administration's

National Security Strategy (2022), in EU statements, and in NATO summit declarations. The mechanism is deterrence by denial: by providing Ukraine with weapons, intelligence, and financial support, the West aims to make Russian conquest impossible and to demonstrate that aggression carries costs. The Western perspective treats Ukrainian resistance as a defense of the international order itself, not merely of one state's borders.

The second commitment—NATO unity—has been remarkably durable. The alliance has expanded (Finland and Sweden joined in 2023–2024), increased defense spending (the 2% GDP target is now met by most members), and deployed additional forces to the eastern flank. The Western perspective treats this as evidence that the war has strengthened, not weakened, the transatlantic alliance. However, this unity has required significant compromises: the US has borne the largest share of military aid, European states have absorbed energy costs and refugee flows, and there are growing divisions over the war's duration and endgame.

The third commitment—the rules-based order—faces its most serious challenge in the global spillovers debate. The Western perspective acknowledges that the war has caused food, fuel, and fertilizer crises, but it attributes these primarily to Russian actions (the blockade of Ukrainian ports, the weaponization of energy) rather than to Western sanctions. The Black Sea Grain Initiative is cited as evidence of Western commitment to mitigating spillovers. However, the Western perspective struggles to reconcile its defense of Ukraine with the concerns of Global South states that see Western sanctions as contributing to their economic distress. The "global spillovers debate" is thus an internal tension within the Western perspective: it wants to be both the defender of Ukraine and the champion of global food security, and these roles sometimes conflict.

What the Western perspective contributes: a coherent normative framework (sovereignty, territorial integrity, self-determination); a material commitment to Ukrainian defense that has been decisive in preventing Russian victory; and a diplomatic effort to maintain alliance unity. What it occludes: it tends to minimize the role of NATO expansion in creating the security dilemma that preceded the war; it applies the rules-based order selectively (the 2003 Iraq invasion, the 2011 Libya intervention); and it struggles to address the legitimate concerns of non-Western states about double standards. The Western perspective is strongest on the normative defense of Ukrainian sovereignty and weakest on the historical and structural causes of the conflict.

2.7.5 UN Perspective

The UN perspective on the Ukraine war is defined by a paradox: the organization's Charter principles—sovereignty, territorial integrity, peaceful dispute settlement—are directly violated by Russia's invasion, yet the Security Council, the body charged with maintaining international peace and security, is paralyzed by the veto power of the aggressor state (Russia) and its allies. This paradox shapes everything the UN can and cannot do.

The legal position is clear. UN General Assembly Resolution ES-11/1 (March 2, 2022) condemned Russia's aggression and demanded withdrawal, passing with 141 votes in favor, 5 against, and 35 abstentions. Subsequent resolutions (ES-11/2 through ES-11/6) addressed humanitarian consequences, territorial integrity, and reparations. The International Court of Justice ordered provisional measures in March 2022, calling on Russia to suspend military operations. The UN Human Rights Council established a Commission of Inquiry. These actions reflect the UN's normative commitment to the Charter and to international humanitarian law.

The humanitarian dimension is where the UN perspective is most active and most constrained. UN OCHA reports document civilian casualties, displacement (over 6 million refugees and 5 million internally displaced

persons at peak), and access constraints in occupied territories. The UN's humanitarian coordination, including the Black Sea Grain Initiative (which the UN brokered alongside Turkey), represents a practical effort to mitigate spillovers. But the UN's humanitarian role depends on member-state funding and on the consent of parties to the conflict, and it cannot compel compliance.

The arms-control dimension is where the UN perspective is most alarmed. The collapse of the INF Treaty (2019), the suspension of New START (2023), and the broader erosion of the arms-control architecture are treated by the UN as existential threats to international stability. The UN's disarmament machinery (the Conference on Disarmament, the First Committee) has been unable to advance new agreements, and the nuclear rhetoric surrounding the Ukraine war (Putin's February 2022 nuclear alert, subsequent statements) has raised the specter of nuclear escalation. The UN perspective thus treats the Ukraine war not only as a regional conflict but as a stress test for the entire post-1945 security order.

What the UN perspective contributes: legal legitimacy and a universal normative framework; a humanitarian evidence base; and a forum for multilateral diplomacy. What it occludes: it cannot enforce its own resolutions; it depends on great-power consensus that does not exist; and its universalism can flatten the power asymmetries that shape whose suffering gets attention. The UN perspective is strongest on legal and humanitarian documentation and weakest on enforcement and great-power politics.

SECTION 2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Centers sovereignty and the global spillovers of food, fuel, and fertilizer; highlights uneven distribution of war costs and selective great-power attention	Can understate operational military dynamics and Russian strategic aims; may flatten Ukrainian agency into a great-power contest	Anti-colonial sovereignty plus global justice and non-alignment	African Union statements, food-price and fertilizer data, UN voting patterns	Western: spillovers are caused by Russian aggression, not Western policy, and African states benefit from a rules-based order

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Chinese	Emphasizes NATO expansion as a structural cause; offers a twelve-point peace plan; warns against escalation and economic disruption	Underweights Ukrainian agency and the Charter violation; treats the war as a proxy contest between major powers	Sovereignty, non-intervention, and multipolarity	Chinese diplomatic statements and the twelve-point peace plan	Western: NATO is defensive, and a ceasefire without withdrawal rewards aggression
Russian	Frames the war as civilizational defense, denazification, and resistance to NATO encirclement; explains willingness to absorb high costs	Mischaracterizes Ukrainian statehood and agency; obscures documented war crimes and Charter violations	Civilizational sovereignty and anti-hegemony	Putin speeches, official doctrine, state media narratives	UN/Western: no evidence of genocide in Donbas justifying invasion; the invasion violates Article 2(4)
Western	Defends Ukrainian sovereignty, NATO unity, and military support; documents Russian operational failures; frames global spillovers as Russian-caused	Can overstate liberal-order coherence; may understate African and Global South costs; sometimes moralizes the conflict	Rules-based order, collective security, human rights	NATO statements, military aid data, ISW assessments	African/Chinese: selective application of international law and escalation risks are underweighted

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
UN	Provides legal legitimacy, humanitarian documentation, and a multilateral forum; universalizes Charter norms	Cannot enforce resolutions; depends on great-power consensus; universalism can flatten power asymmetries	Charter, human rights, international humanitarian law	UNGA resolutions, UN OCHA humanitarian reports	Russian/Chinese: the framework is politicized, Western-dominated, and cannot resolve the war without P5 consensus

SECTION 2.8 WORKED EXAMPLE (I do)

Case: The 2022 Kharkiv Counteroffensive

The 2022 Kharkiv counteroffensive is the clearest case of successful Ukrainian maneuver warfare in the first year of the full-scale invasion. In early September 2022, Ukrainian forces broke through Russian lines in the Kharkiv region, advanced rapidly through Balakliya, Kupiansk, and Izyum, and forced a Russian withdrawal that exposed the fragility of Russian defensive preparation. The case matters because it shows how a weaker force can convert intelligence, deception, and operational tempo into territorial recovery, while also revealing the limits of Russian command, logistics, and force generation. It is not merely a battlefield episode; it is a test of how different levels of analysis and different international perspectives explain the same event.

Levels of analysis

At the individual level, the counteroffensive depended on Ukrainian command decisions, especially the willingness to accept risk, concentrate forces, and exploit a narrow window of Russian vulnerability. Commanders had to coordinate armor, artillery, infantry, and special operations while maintaining operational secrecy. Russian commanders, by contrast, appear to have misread Ukrainian intentions and failed to reposition reserves in time. Individual morale and unit cohesion mattered on both sides: Ukrainian units advanced with confidence generated by prior Western support and by the visible collapse of Russian positions, while Russian units in the sector were often undermanned, poorly supplied, and uncertain about their mission. The individual level therefore explains tempo and initiative, but it cannot by itself explain why Ukrainian forces had the equipment, intelligence, and logistical backing to sustain rapid movement.

At the state level, Ukraine's capacity to mobilize, train, and integrate Western-supplied equipment was decisive. The state had to maintain command-and-control under wartime conditions, protect mobilization infrastructure, and coordinate with external suppliers. Russia's state-level failures were equally important: its force-generation model relied on contract soldiers and mobilization that had not yet been fully activated, its logistics were stretched across a long front, and its political system had incentives to report success rather than vulnerability. The state level explains why Ukraine could convert a tactical breakthrough into an operational advance, while Russia could not quickly reconstitute a coherent defense.

At the systemic level, the war was embedded in a NATO-Russia confrontation and a broader competition

over European security. Western intelligence sharing, satellite reconnaissance, and precision-strike support shaped Ukrainian targeting and situational awareness. Sanctions and export controls constrained Russian replacement of equipment and components. The systemic level also includes the alliance politics that made sustained Western support possible: NATO unity, U.S. leadership, and European rearmament debates. Without this systemic backing, Ukrainian maneuver warfare would have lacked the precision fires and logistics that made exploitation possible. The systemic level therefore explains the enabling environment, though it risks overstating Western agency if it ignores Ukrainian operational skill.

At the transnational level, the counteroffensive was shaped by cross-border flows of weapons, intelligence, commercial technology, and information. Western artillery, armored vehicles, and precision munitions moved into Ukraine through transnational supply chains. Open-source intelligence and commercial satellite imagery circulated globally, affecting both battlefield awareness and public narratives. Energy markets, grain exports, and sanctions also linked the war to economies far beyond Europe. The transnational level is essential for understanding how a regional counteroffensive became a global event, but it can obscure the local tactical conditions that actually produced the breakthrough.

Mechanism

The mechanism of the Kharkiv counteroffensive was operational deception followed by rapid exploitation. Ukrainian planners created the impression that the main effort would be in the south, particularly around Kherson, while secretly concentrating forces for an attack in the northeast. This deception exploited Russian assumptions about Ukrainian priorities and stretched Russian reserves across a wide front. When Ukrainian forces attacked, they targeted weakly held sectors, used artillery and precision strikes to suppress Russian command nodes, and advanced quickly enough to prevent Russian forces from establishing new defensive lines. The mechanism was not simply superior numbers; it was the combination of surprise, concentration, tempo, and Russian defensive overextension.

Russian defensive preparation failed because it was thin, fragmented, and politically constrained. Russian forces had occupied a large area with insufficient manpower, relying on a mix of regular units, separatist formations, and mobilized personnel. Fortifications were often incomplete or poorly sited, and logistics depended on vulnerable rail and road networks. Command structures were layered and sometimes competing, which slowed decision-making. When the breakthrough occurred, Russian units lacked the reserves and mobility to seal the gap. The withdrawal that followed was partly a tactical retreat to avoid encirclement, but it also revealed that Russian defensive depth was more apparent than real.

Western support contributed to the mechanism by improving Ukrainian targeting, situational awareness, and fire support. Precision systems and intelligence allowed Ukrainian forces to disrupt Russian command and logistics at the moment of breakthrough. However, the decisive factor was not Western equipment alone; it was Ukrainian ability to integrate that equipment into a coherent operational plan. The counteroffensive therefore illustrates a combined-arms mechanism in which technology, intelligence, deception, and Russian institutional weakness interacted.

Perspective reconstruction

The African perspective, which is primary in this lesson, reads the Kharkiv counteroffensive through the lens of sovereignty and global spillover. From this vantage point, Ukraine's recovery of territory is a legitimate exercise of self-determination, but the war's costs are distributed far beyond the battlefield. African states experienced food-price shocks, fertilizer shortages, and fuel volatility that were intensified by the invasion and by the global response to it. African scholarship and diplomacy therefore tend to insist that the war

be understood not only as a European security crisis but as a global economic shock with disproportionate effects on import-dependent economies. This perspective also questions the selectivity of international attention: it asks why some violations of sovereignty mobilize massive Western support while others receive less sustained engagement. In the Kharkiv case, African observers could acknowledge Ukrainian military success while still emphasizing that the war's humanitarian and economic consequences are borne unevenly across the Global South. The African perspective thus contributes a distributional and anti-colonial corrective to narratives that treat the war as a purely Euro-Atlantic security problem. It occludes some operational detail, but it reveals whose suffering is rendered peripheral when the war is framed only through NATO and Russian strategy.

The Chinese perspective interprets the counteroffensive as evidence that the war is a prolonged great-power contest rather than a simple morality play. It acknowledges Ukrainian territorial recovery but situates it within a broader argument that NATO expansion created the structural conditions for conflict and that escalation must be avoided. Chinese diplomacy emphasizes sovereignty and territorial integrity in principle, while also stressing negotiation, ceasefire, and the costs of prolonged war. In this reading, Kharkiv demonstrates that neither side can achieve a quick decisive victory, which strengthens the case for a negotiated settlement. The Chinese perspective contributes a caution against escalation and a reminder that global economic stability depends on ending the war. It occludes Ukrainian agency by framing the conflict primarily as a NATO-Russia confrontation.

The Russian perspective treats the Kharkiv withdrawal as a tactical adjustment within a longer "special military operation," not as a strategic defeat. Russian official narratives emphasize denazification, demilitarization, and civilizational defense, arguing that NATO encroachment left Moscow no choice. From this vantage point, the loss of Kharkiv territory is explained by temporary overextension, Ukrainian use of Western intelligence, and the need to avoid encirclement. The Russian perspective contributes an account of how Moscow rationalizes costs and frames the war as existential. It occludes the Charter violation and the documented suffering of Ukrainian civilians, and it mischaracterizes Ukrainian statehood by denying its independent agency.

The Western perspective sees the counteroffensive as validation of Ukrainian resilience and of Western support. It emphasizes defense of sovereignty, NATO unity, and the effectiveness of combined arms when backed by intelligence and precision fires. Western analysts highlight Russian command failures, logistical fragility, and the limits of Russian defensive preparation. This perspective contributes a strong operational and alliance-based explanation of why Ukraine could recover territory. It occludes some of the global distributional costs and can understate the risks of escalation or the possibility that military success does not automatically produce political settlement.

The UN perspective frames the counteroffensive within a legal and humanitarian order. It treats the invasion as a violation of the Charter and emphasizes civilian protection, accountability, and the humanitarian consequences of shifting front lines. UN agencies document displacement, damage to infrastructure, and risks to civilians as territory changes hands. This perspective contributes legitimacy and a universal normative framework, as well as an evidence base for humanitarian response. It occludes enforcement, because the UN cannot compel Russian withdrawal, and it depends on great-power consensus that does not exist.

Adjudication

The Western perspective best explains the Kharkiv counteroffensive at the operational level, because it captures the interaction of Ukrainian command, Western intelligence and precision support, Russian defensive

weakness, and alliance-enabled logistics. It accounts for the mechanism of deception, concentration, and rapid exploitation better than perspectives that treat the war primarily as a legal, civilizational, or global economic event. However, it misses what the African perspective reveals: that military success in Kharkiv did not resolve the war's uneven global costs, and that the same alliance system that enabled Ukrainian maneuver warfare also shaped whose suffering received sustained attention. It also underweights the Chinese and Russian insistence that the conflict has structural roots in European security order, even if those claims do not justify invasion. The most defensible conclusion is therefore layered: the Western perspective explains the case best, but only when supplemented by the African perspective's distributional critique and by the systemic-level insight that the war is not only about Ukrainian territory but about the contested future of European and global order.

2.9 PROBLEM PAIR (We do)

Tasks

1. Reconstruct the September 2022 Kharkiv template as an operational problem: identify the conditions that made rapid exploitation possible, distinguishing operational surprise from a repeatable combined-arms method.
2. List the Zaporizhzhia defensive system and the attacker's force-generation constraints, including minefields, dragon's teeth, trench networks, pre-registered fires, Russian air and drone reconnaissance, electronic warfare, Ukrainian lack of air superiority, and ammunition limits.
3. Specify the causal mechanism linking these differences to the outcome: explain why a template that exploited collapse could not by itself breach a prepared defense.
4. Reconstruct all five perspectives on the 2023 counteroffensive, stating what each emphasizes and what it tends to obscure.
5. Identify falsifiers: state what battlefield or industrial evidence would weaken your preferred explanation.
6. Use the data-lab variables—territorial change, HIMARS and Storm Shadow target sets, drone sortie rates, and shell consumption versus production—to test whether the failure was primarily tactical, operational, or industrial.

Model Answer

The 2023 Zaporizhzhia counteroffensive did not fail because Ukrainian forces forgot the Kharkiv method; it failed because Kharkiv was not a method for breaching a prepared defense. In September 2022, Ukrainian forces exploited a Russian force that was overextended, poorly commanded, and thinly held across a broad front. The Kharkiv operation combined deception, operational surprise, and rapid exploitation of Russian confusion; it was an attack against a collapsing defense, not a deliberate penetration of a defense in depth. Freedman's emphasis on operational art and Watling's emphasis on attrition are both relevant here: Kharkiv showed that surprise and tempo can convert local success into operational gain when the defender lacks reserves and coherence, but it did not demonstrate that the same tempo can be imposed on a defender that has prepared positions, pre-registered fires, and air denial.

By June 2023, Russian forces in Zaporizhzhia had constructed a layered defensive system associated with the Surovikin line: minefields, dragon's teeth, trench networks, pre-registered artillery, and reserve positions. Ukrainian brigades trained in Western combined-arms methods attempted to breach this system without air

superiority, without the mass that NATO doctrine assumes, and with artillery ammunition consumption that exceeded Western production capacity. The mechanism of failure was therefore interactive rather than singular. Prepared defenses gave Russia time to detect and channel Ukrainian assaults; drones and electronic warfare compressed Ukrainian decision cycles; Russian aviation and Lancet-type munitions punished exposed breaching forces; and ammunition shortages limited the suppressive fires needed to keep breaches open. The same template failed because its Kharkiv precondition—Russian disorganization—was absent, while its Zaporizhzhia requirements—suppression of the defender's air and drone systems, sufficient mass, and sustained shell supply—were not met.

This explanation must be distinguished from two tempting but weaker accounts. The first blames Ukrainian tactical incompetence. That account ignores that Ukrainian forces did achieve local penetrations and that Russian defenses were specifically designed to absorb and channel them. The second blames Western support alone. That account is incomplete because even abundant shells would not have removed Russian air denial or the depth of the defensive belt; conversely, even perfect tactics could not compensate indefinitely for industrial shortfalls. The better explanation is that operational art, air control, and industrial capacity are complementary inputs, and the 2023 offensive lacked enough of the latter two to make the first decisive.

The five perspectives frame the same events differently. The African perspective begins with sovereignty and global spillovers: Ukraine's right to self-defense is clear, but the war's effects on food, fuel, and fertilizer prices make the conflict a global security problem, not only a European one. The Chinese perspective stresses NATO responsibility and the need for a negotiated settlement, often treating the offensive as evidence that military escalation cannot produce a stable order; its twelve-point peace plan privileges sovereignty and territorial integrity rhetorically while emphasizing dialogue and opposition to unilateral sanctions. The Russian perspective interprets the failed counteroffensive as validation of a defensive war of attrition and civilizational resistance, emphasizing denazification and NATO encroachment. The Western perspective treats the offensive as a necessary test of Ukrainian capacity and Western support, while debating whether the failure reflected insufficient aid, excessive caution, or unrealistic expectations. The UN perspective centers Charter violation, General Assembly resolutions condemning aggression, and humanitarian consequences documented by UN OCHA, without endorsing any single military theory of victory.

Falsifiers would include evidence that Ukrainian forces broke the main defensive belt but were stopped only by a discrete tactical error; evidence that Russian air denial was ineffective during the breach; or evidence that shell production and delivery matched or exceeded consumption during the offensive. Conversely, if post-offensive assessments show that Ukrainian units repeatedly reached the first trench line but could not sustain exploitation because of drone and artillery exposure, the interactive explanation is strengthened. The data-lab variables support this reading: territorial gains were limited relative to the force committed; HIMARS and Storm Shadow strikes disrupted Russian logistics but did not collapse the defensive system; drone sortie rates rose on both sides; and artillery consumption remained above Western production. The conclusion is not that combined arms is obsolete, but that its success is conditional on suppression of the defender's air and drone systems, sufficient mass, and an industrial base capable of sustaining high-intensity operations.

2.10 INDEPENDENT MEMO (You do)

(a) Case description

In 2024, Ukraine intensified long-range strikes against Russian airfields, logistics nodes, and energy infrastructure using Storm Shadow/SCALP, ATACMS, and domestically produced drones, while Russia responded with dispersal, hardened shelters, electronic warfare, and denser air defenses. Along the front, both sides ex-

panded FPV drone and Lancet-type munition use, creating a contested electromagnetic spectrum and raising attrition rates. Western artillery shell production increased but remained below peak Ukrainian consumption; Russia, despite sanctions, expanded drone and artillery output through industrial mobilization and sanctions evasion. The case asks whether long-range precision strike and drone warfare can substitute for massed ground maneuver, or whether they redistribute attrition across domains without resolving the underlying industrial and air-denial constraints. It also asks how each of the five perspectives interprets the shift from a 2023 breakthrough attempt to a 2024-2025 war of strikes, drones, and positional attrition. Students should evaluate whether observed territorial stability reflects a genuine operational equilibrium or merely a pause imposed by ammunition, weather, and force-generation cycles.

(b) Required memo headings as prompts

Mechanism: Explain the causal chain through which long-range strikes, drone proliferation, and electronic warfare alter—or fail to alter—the balance between maneuver and attrition, specifying scope conditions and observable implications.

Perspective reconstruction: Reconstruct how African, Chinese, Russian, Western, and UN perspectives interpret the 2024-2025 shift, including what each emphasizes and what it occludes.

Historical analogue: Identify one prior case of precision-strike or air-power optimism confronting industrial and defensive adaptation, and state the limits of the analogy.

Falsifiers: List battlefield, industrial, or diplomatic evidence that would weaken your mechanism, and distinguish description from explanation, prediction, and prescription.

(c) Self-check line

Self-check: Did you separate what happened (description), why it happened (explanation), what is likely next (prediction), and what should be done (prescription), and did you avoid treating any perspective as self-evidently correct?

2.11 HINGE QUESTION

Question: Which explanation best accounts for the failure of Ukraine's 2023 Zaporizhzhia counteroffensive to replicate the Kharkiv breakthrough, while remaining consistent with the industrial and air-domain constraints documented in the lesson?

A. Ukrainian commanders abandoned combined-arms doctrine and relied solely on infantry assaults.
B. Russian defenses were unprepared and collapsed once Ukrainian forces crossed the first trench line.
C. The offensive confronted a prepared defense in depth under Russian air and drone denial, while Ukraine lacked the mass, air superiority, and shell stocks needed to convert local gains into operational breakthrough.
D. Western sanctions had already destroyed Russia's defense industry, making the failure inexplicable except by Ukrainian incompetence.

Correct answer: C.

Distractor diagnoses

- **A** is wrong because it mistakes tactical adaptation under constraint for abandonment of combined arms; Ukrainian forces used combined-arms methods, but those methods could not by themselves overcome prepared defenses, air denial, and ammunition shortages.

- **B** is wrong because it contradicts the evidence of a prepared layered defense—minefields, dragon's teeth, trench networks, pre-registered fires, and reserve positions—and falsely assumes that crossing an initial line equals systemic collapse.

- **D** is wrong because it overstates the effect of sanctions on Russian industrial capacity and replaces a multi-causal operational explanation with an unsupported blame attribution; Russian drone, artillery, and air-defense production adapted rather than collapsed.

SECTION 2A — DATA LAB

Table 1. Territorial control and phase changes, 2022–2025 (approximate, source-dependent)

Period	Approximate territorial situation	Key operational events	Interpretive caution
Feb–Mar 2022	Rapid Russian advance toward Kyiv, Chernihiv, Sumy, Kharkiv, and the south; subsequent withdrawal from northern axes	Failed blitz; Ukrainian defense of Kyiv; Russian repositioning toward Donbas	Early maps conflate raiding, occupation, and control; "liberated" claims often preceded consolidation
Apr–Aug 2022	Russian consolidation in Donbas and south; Kherson occupied; Severodonetsk/Lysychansk captured	Attritional fighting in Donbas; Ukrainian HIMARS-enabled strikes on logistics	Territorial percentages obscure population, infrastructure, and legal status
Sep–Nov 2022	Ukrainian recapture of large areas in Kharkiv oblast; Russian withdrawal from west bank Kherson	Kharkiv counteroffensive; Kherson withdrawal; front stabilizes east of Dnipro	Gains were enabled by Russian overextension and thin defenses, not only Ukrainian superiority
2023	Largely static front with localized attrition; Bakhmut and Avdiivka as focal points; limited Ukrainian gains in Zaporizhzhia	June–Dec counteroffensive; Russian defensive belts; heavy minefields and EW	"Stalemate" can hide high daily losses and constant small adjustments
2024	Russian incremental advances in Donbas; Avdiivka captured; pressure toward Pokrovsk; Ukrainian cross-border incursion into Kursk	Drone-saturated front; artillery and glide-bomb dominance; manpower strain	Control changes are often measured in kilometers, not strategic effect

Period	Approximate territorial situation	Key operational events	Interpretive caution
2025	High-intensity attrition with no decisive breakthrough; localized gains and losses; long front under drone observation	Sustained deep strikes; industrial competition; alliance support debates	Estimates vary by source, definition of control, and whether occupied/annexed areas are counted

Table 2. Strike systems and target sets

System	Approximate range	Primary target set	Operational effect	Principal limitation
HIMARS with GMLRS	~80 km	Logistics nodes, bridges, ammunition depots, command posts	Disrupted Russian rear-area sustainment and forced dispersion	Precision-munition scarcity; target-cycle dependence on ISR
Storm Shadow / SCALP	~250 km	High-value nodes, bridges, naval and air assets, strategic infrastructure	Extended Ukrainian deep-strike reach	Limited stockpiles; platform availability; political restrictions on use
FPV drones	Tactical, usually short-range	Vehicles, trenches, EW nodes, small logistics elements	Cheap mass; constant pressure; tactical transparency	Weather, short endurance, operator skill, electronic warfare
Lancet-type loitering munitions	Tactical to operational	Artillery, air defense, radar, vehicles	Precision harassment of high-value systems	Cost, availability, interception, and target acquisition limits
Russian cruise/ballistic and glide munitions	Variable, including long-range	Cities, energy infrastructure, military and industrial targets	Coercion, infrastructure degradation, air-defense saturation	Interception, stockpile constraints, and diminishing strategic surprise

Table 3. Industrial base, drone activity, and consumption patterns (order of magnitude; source-dependent)

Indicator	Observed pattern	Source caveat
Artillery consumption	Thousands of rounds per day on both sides at peak; sustained rates exceed many pre-war national stockpiles	Exact figures are classified or politically mediated; reporting often mixes expenditure, delivery, and stockpile
Western artillery production	Ramp-up from lower Cold War-era baselines toward annual targets in the high hundreds of thousands to low millions	Production is constrained by explosives, machine tools, skilled labor, and multi-year contracts
Drone production and use	Publicly reported targets in the millions annually across both sides; daily sortie counts in the tens of thousands in active sectors	"Drone" aggregates reconnaissance, FPV, loitering, and decoy systems; quality varies sharply
Air-defense interceptor consumption	High expenditure during mass missile/drone attacks; stockpile anxiety recurring	Interceptor production is slower and more specialized than artillery-shell production
Industrial bottlenecks	Shell casings, explosives, ball bearings, machine tools, energetics, and skilled labor	Bottlenecks are national and transnational; sanctions and third-country sourcing matter

Five numbered analysis questions

1. **Trend.** The territorial record shows rapid, large-scale changes in 2022 followed by progressively smaller, costlier adjustments in 2023–2025. What does this pattern suggest about the transition from maneuver warfare to positional, drone-saturated attrition, and which indicators would you use to distinguish a temporary pause from a genuine strategic stalemate?

2. **Level of analysis.** Is the stalemate best explained at the individual level (command decisions, tactical adaptation), the state level (industrial base, manpower, mobilization), the systemic level (alliance support, sanctions, global markets), or the transnational level (technology diffusion, diaspora networks, private defense firms)? Construct an answer that assigns causal weight to at least two levels and explains why no single level is sufficient.

3. **Perspective reconstruction (all five).** Reconstruct how each perspective reads the same data:

    - **African (primary):** The data are not only a European territorial contest; they are a global spillover event affecting food, fuel, fertilizer, shipping insurance, and fiscal space in import-dependent states. Sovereignty norms matter, but so does the unequal distribution of war costs.
    - **Chinese:** The data show the consequences of NATO expansion and bloc confrontation; stabilization requires a negotiated settlement, ceasefire, and attention to "indivisible security," as framed in the twelve-point peace plan.
    - **Russian:** The data are read through the "special military operation" frame: denazification, demilitarization, civilizational defense, and the claim that Western arms prolong an avoidable conflict.
    - **Western:** The data support defense of Ukrainian sovereignty, NATO unity, and the proposition that Russian defeat or containment is necessary for European security; spillovers are acknowl-

edged but treated as manageable or secondary.
- **UN:** The data are read through Charter violation, General Assembly resolutions, humanitarian consequences, civilian protection, and the need for accountability and humanitarian access.

4. **Interpretation.** HIMARS and Storm Shadow target sets shifted Russian logistics and forced dispersion, but did they change the war's political outcome? Distinguish (a) operational disruption, (b) strategic coercion, and (c) escalation management. Which of these three is best supported by the data, and what would falsify each?

5. **Limitation.** The data are incomplete, classified, propagandized, and definitionally inconsistent. Identify three specific limitations—such as "control" versus "influence," sortie counts versus effective strikes, and production targets versus delivered munitions—and explain how each limitation could reverse or weaken a common conclusion about who is winning.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1: Phase and Territorial Control Timeline, 2022–2025

- **What to draw:** A horizontal timeline from February 2022 to 2025, divided into six phase bands. Above the line, draw simple front-line icons: an arrow for the initial Russian advance, a broken arrow for the failed blitz, a curved arrow for the Kharkiv counteroffensive, a leftward arrow for the Kherson withdrawal, a jagged line for the 2023 attritional front, and small zig-zag marks for 2024–2025 incremental changes. Below the line, place shaded rectangles labeled "Kyiv axis," "Kharkiv," "Donbas," "Kherson," "Zaporizhzhia," and "Kursk incursion."
- **Labels to place:** "Feb 2022 blitz," "Apr 2022 repositioning," "Sep 2022 Kharkiv," "Nov 2022 Kherson," "2023 counteroffensive," "2024 Avdiivka/Pokrovsk," "2025 attrition," "front length," "drone-saturated kill zone."
- **Perspective overlay to annotate:** In the left margin, write "Western: defense of sovereignty"; in the right margin, write "Russian: SMO and civilizational defense"; along the bottom margin, write "African: food, fuel, fertilizer, and fiscal spillovers"; in a small box, write "UN: Charter violation and humanitarian access"; in another small box, write "Chinese: negotiation and indivisible security."

Visual 2: Contested Electromagnetic and Drone Kill Chain

- **What to draw:** A layered diagram with four horizontal bands. Top band: "Sensors and ISR" with icons for satellites, reconnaissance drones, and human observers. Second band: "Strike and effects" with FPV drones, Lancet-type munitions, artillery, and glide bombs. Third band: "Electronic warfare" with jamming towers, decoys, and spoofing arrows crossing the other bands. Bottom band: "Logistics and sustainment" with trucks, depots, bridges, and repair nodes. Draw arrows from sensors to strikes, from EW to both sensors and strikes, and from logistics to all upper bands.
- **Labels to place:** "FPV," "Lancet," "EW jamming," "decoys," "GMLRS," "Storm Shadow," "target cycle," "dispersion," "civilian infrastructure risk," "operator training."
- **Perspective overlay to annotate:** At the top, write "Western: precision and adaptation"; on the left, write "Russian: mass and EW depth"; on the right, write "Chinese: escalation control and negotiation"; at the bottom, write "UN: civilian harm and proportionality"; in a central circle, write "African: technology diffusion and global military learning."

Visual 3: Industrial Base Funnel—Consumption Versus Production

- **What to draw:** A funnel. At the wide top, draw icons for daily artillery fire, drone sorties, air-defense interceptors, and damaged equipment. In the middle, draw narrowing sections labeled "explosives," "casings," "machine tools," "skilled labor," and "energetics." At the narrow bottom, draw "delivered munitions," "repaired systems," and "stockpile." Add a side arrow labeled "third-country sourcing and sanctions evasion."
- **Labels to place:** "consumption rate," "production target," "lead time," "bottleneck," "stockpile anxiety," "rearmament," "mobilization," "fiscal cost."
- **Perspective overlay to annotate:** On the left, write "Western: rearmament and alliance burden-sharing"; on the right, write "Russian: mobilization and war economy"; at the top, write "African: food, fuel, fertilizer, and import-price spillovers"; at the bottom, write "UN: humanitarian funding and civilian protection"; in a small box, write "Chinese: industrial capacity and strategic patience."

SECTION 4 — CORNELL NOTES

Cue	Notes (with source log)
What are the war's phases?	Failed 2022 blitz; Kharkiv/Kherson counteroffensives; 2023–2024 attritional stalemate; localized 2024–2025 adjustments. Source log: Freedman (2023); Watling (2022); ISW assessments.
What is hybrid warfare here?	Cyber, energy, information, and military/civilian blurring; not a separate domain but an integrated pressure system. Source log: RUSI Ukraine reports; ISW assessments.
What changed in drone/EW warfare?	FPV mass, Lancet harassment, contested EMS, shorter target cycles, tactical transparency. Source log: Watling (2022); RUSI Ukraine reports.
What is the industrial base problem?	Consumption exceeds sustainable production; bottlenecks in explosives, tools, labor, and energetics. Source log: RUSI Ukraine reports; ISW assessments.
What are European security implications?	NATO expansion, rearmament, arms-control collapse, deterrence redesign. Source log: Freedman (2023); ISW assessments.
How do the five perspectives differ?	African: sovereignty plus global spillovers; Chinese: NATO responsibility plus twelve-point plan; Russian: SMO and civilizational defense; Western: defense of Ukraine and NATO unity; UN: Charter violation and humanitarian consequences. Source log: UN OCHA Ukraine humanitarian reports.
What data are most uncertain?	Territorial control definitions, sortie counts, production targets, classified losses, propaganda. Source log: ISW assessments; UN OCHA Ukraine humanitarian reports.

Cue	Notes (with source log)
What does Kharkiv 2022 show?	Maneuver, deception, thin Russian defenses, and limits of Russian preparation. Source log: Freedman (2023); Watling (2022).
Why did Zaporizhzhia 2023 differ?	Prepared defenses, minefields, EW, airpower, and insufficient force ratios for breakthrough. Source log: RUSI Ukraine reports; ISW assessments.
What falsifies "Ukraine is winning"?	Static lines, ammunition shortages, manpower strain, Russian adaptation, and political fatigue. Source log: ISW assessments; RUSI Ukraine reports.
What falsifies "Russia is winning"?	Failed blitz, Kharkiv/Kherson losses, sanctions costs, and inability to achieve maximalist aims. Source log: Freedman (2023); ISW assessments.
What is the African primary lens?	Sovereignty is necessary but insufficient; food, fuel, fertilizer, and fiscal spillovers reshape how the war is judged globally. Source log: UN OCHA Ukraine humanitarian reports; African scholarship on global inequality.

Summary: The Ukraine war moved from a failed Russian blitz to counteroffensives and then to a drone-saturated, industrial attritional stalemate. Its military dynamics cannot be separated from hybrid pressure, electromagnetic contestation, ammunition production, and alliance politics. The same data are read differently by African, Chinese, Russian, Western, and UN perspectives, especially on sovereignty, NATO responsibility, civilizational defense, and humanitarian cost. The most defensible conclusion is that the war is a multi-level contest in which territorial change is only one indicator among industrial capacity, alliance cohesion, and global spillover.

SECTION 5 — FEYNMAN COMPRESSION

1. **Explain without jargon.** Russia tried to win quickly in 2022, failed, lost ground in Kharkiv and Kherson, and then the war became a slow, grinding contest. Drones, jamming, artillery, and factories now matter as much as tanks. Europe is rearming, arms control is weaker, and the war's costs spread far beyond Ukraine, including food and fuel prices.

2. **Mark gaps.** I am unsure of exact drone sortie rates, shell consumption figures, and current territorial percentages; these are classified, politicized, or inconsistently defined. I also need to keep separate what each perspective assumes from what the data actually show.

3. **Reread verification.** Recheck Freedman (2023), Watling (2022), RUSI Ukraine reports, ISW assessments, and UN OCHA Ukraine humanitarian reports for phase labels, target-set descriptions, and humanitarian data. Verify that claims about HIMARS, Storm Shadow, FPV drones, and industrial bottlenecks are stated as mechanisms, not as unsupported certainties.

4. **Analogy with explicit limits.** The war resembles a marathon in which factories, logistics, and alliances matter more than a single sprint; but the analogy is limited because wars also involve political

will, adaptation, deception, and escalation thresholds that a marathon does not capture.

5. **Rewrite.** The Ukraine war is best understood as a sequence of failed blitz, successful counteroffensive, and industrial attrition, shaped by hybrid pressure, drone and electronic warfare, and ammunition scarcity. Its meaning differs across African, Chinese, Russian, Western, and UN perspectives, so analysis must separate territorial data from normative claims and from global spillover effects.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L36	Definition	What defined the failed blitz phase (Feb–Mar 2022)?	Russia launched a multi-axis invasion expecting rapid political change, but Ukrainian resistance, logistics failures, and air-defense denial stalled the advance; by late March 2022 the war shifted toward attrition and positional fighting. The phase is best understood as a mismatch between political aims and military means. Freedman (2023) emphasizes that gap.	Western and Ukrainian accounts stress agency and resistance; Russian accounts frame aims as limited and defensive.

Tag	Card Type	Front	Back	Perspective Note
L36	Mechanism	How did Ukraine create conditions for the Kharkiv counteroffensive?	Ukrainian forces used operational security, feints, and targeting of logistics to exploit Russian overextension and thin defenses; success depended on surprise and on Russia's inability to reconstitute reserves. The mechanism is cumulative disruption rather than a single breakthrough. Watling (2022) highlights combined-arms synchronization under uncertainty.	Western military analysis focuses on maneuver; Russian accounts emphasize force ratios and intelligence failures.

Tag	Card Type	Front	Back	Perspective Note
L36	Application	Why did the 2023 Zaporizhzhia counteroffensive stall?	Ukrainian units encountered deep, prepared Russian defenses—minefields, obstacles, artillery, and aviation—without assured air superiority or sufficient breaching capacity; the same combined-arms template faced a different force ratio and terrain. The result was attritional fighting rather than rapid maneuver. RUSI Ukraine reports stress adaptation and logistics.	Western debate centers on training and doctrine; Ukrainian accounts stress resource constraints.

Tag	Card Type	Front	Back	Perspective Note
L36	Comparison	What distinguishes Kharkiv (2022) from Zaporizhzhia (2023)?	Kharkiv featured overextended defenders, surprise, and open exploitation; Zaporizhzhia featured echeloned defenses, dense obstacles, and Russian adaptation. The difference is less a change in Ukrainian competence than a change in Russian defensive preparation and battlespace conditions. ISW assessments document control changes and force posture.	Russian sources claim learning; Western sources debate expectations.

Tag	Card Type	Front	Back	Perspective Note
L36	Source	What do ISW assessments contribute—and what do they not prove?	ISW assessments provide daily, geolocated tracking of territorial control and force posture, useful for trend analysis; they are not a substitute for verified casualty data or classified operational assessments. Their strength is transparency and speed; their limit is dependence on open sources. They should be read with methodological caution.	All perspectives use ISW data, but interpret control changes politically.

Tag	Card Type	Front	Back	Perspective Note
L36	Debate	Is NATO expansion a cause of the war?	Western and Ukrainian accounts treat Russian aggression as the cause and NATO as reactive; Russian and Chinese accounts treat NATO enlargement as a structural provocation. The evidence supports multiple causal weights: NATO expansion shaped threat perceptions, but it does not by itself explain the decision to invade. Freedman (2023) frames the debate as competing narratives of order.	African and Global South voices often stress non-alignment and spillovers over bloc narratives.

Tag	Card Type	Front	Back	Perspective Note
L36	Reconstruction	How does the African perspective frame the war?	It centers Ukrainian sovereignty while foregrounding global spillovers—food, fuel, and fertilizer prices—and the costs borne by import-dependent states; it often resists binary alignment and asks whose security is prioritized. This vantage reveals distributional consequences that bloc-centric accounts can occlude. African scholarship on sovereignty and dependency informs the analysis.	Primary lens; not a regional add-on.

Tag	Card Type	Front	Back	Perspective Note
L36	Occlusion	What does the Western perspective tend to occlude?	Western framing can foreground NATO unity and Ukrainian defense while underweighting Global South costs, African agency, and the uneven distribution of sanctions and price shocks. It may also treat liberal order as universal rather than contested. The occlusion is analytical, not necessarily intentional.	Western; counterbalanced by African and UN humanitarian data.

Tag	Card Type	Front	Back	Perspective Note
L36	Adjudication	How does hybrid warfare blur military and civilian domains?	Cyber operations, energy coercion, and information campaigns target civilian infrastructure and publics, making the boundary between combatant and non-combatant less stable; the mechanism is cross-domain coercion rather than conventional territorial seizure. This complicates legal categories and response thresholds. Watling (2022) and RUSI reports examine operational integration.	UN law and African sovereignty concerns highlight civilian protection.

Tag	Card Type	Front	Back	Perspective Note
L36	Visual	What does the contested electromagnetic spectrum imply tactically?	FPV drones, Lancet munitions, and electronic warfare create a rapidly adaptive kill chain in which detection, jamming, and counter-jamming determine effectiveness; dominance is temporary and local. The mechanism is an action-reaction cycle, not a stable technological edge. RUSI Ukraine reports document tactical adaptation.	Russian and Ukrainian practitioners both emphasize EW; Western procurement often lags.

Tag	Card Type	Front	Back	Perspective Note
L36	Definition	What is the industrial base problem?	High-intensity artillery and drone warfare consume shells and components faster than Western production can surge, creating a bottleneck in sustained support; the issue is capacity, skilled labor, and supply chains, not only funding. The mechanism links battlefield consumption to political timelines. RUSI Ukraine reports and Watling (2022) stress production constraints.	Western rearmament debates; African states face procurement competition.

Tag	Card Type	Front	Back	Perspective Note
L36	Mechanism	How did arms control collapse shape European security?	The erosion of INF-era constraints and the suspension of New START, alongside NATO expansion and rearmament, removed stabilizing predictability; the mechanism is reciprocal uncertainty and force-posture signaling. This raises escalation risks even without direct NATO-Russia war. Freedman (2023) situates the war in a broader order crisis.	Russian civilizational framing; Western deterrence framing; UN disarmament concerns.

Tag	Card Type	Front	Back	Perspective Note
L36	Application	What does the UN perspective emphasize?	It centers Charter violations, General Assembly resolutions, humanitarian consequences, and civilian protection; its strength is normative universality and data collection, while its limit is enforcement without Security Council consensus. UN OCHA Ukraine humanitarian reports document needs and access constraints. The perspective is legal-humanitarian rather than strategic.	UN; complements African spillover concerns.

Tag	Card Type	Front	Back	Perspective Note
L36	Comparison	How does China's twelve-point plan differ from Western approaches?	China's plan emphasizes ceasefire, dialogue, and opposition to nuclear escalation while avoiding condemnation of Russia and stressing NATO responsibility; Western approaches emphasize Ukrainian territorial integrity and security guarantees. The contrast is between process-first and justice-first diplomacy. Freedman (2023) and UN debates frame the divide.	Chinese; African states often seek mediation space.

Tag	Card Type	Front	Back	Perspective Note
L36	Adjudication	Did drones make maneuver warfare obsolete?	Drones and EW have made open maneuver costlier and increased the value of dispersion, deception, and combined arms, but they have not eliminated maneuver; the mechanism is changed risk calculus, not technological determinism. Evidence from Kharkiv and Zaporizhzhia shows context-dependent outcomes. Watling (2022) and RUSI reports caution against single-technology explanations.	Western tech optimism; Russian and Ukrainian practitioner realism.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence audit table (scored 0-100).

Competency	Self-score (0-100)	Evidence I can produce	Gap to close
Phase dynamics: blitz to attrition		Timeline with mechanisms	Distinguish outcomes from causes
Kharkiv maneuver and deception		Levels-of-analysis explanation	Add force-ratio evidence
Zaporizhzhia failure modes		Comparison with Kharkiv	Specify minefield/breaching constraints
Hybrid warfare cross-domain coercion		Civilian/military boundary analysis	Add legal threshold discussion

Competency	Self-score (0-100)	Evidence I can produce	Gap to close
Drone/EW action-reaction cycle		Tactical visual reconstruction	Avoid tech determinism
Industrial base and shell production		Consumption vs production comparison	Add supply-chain specifics
European security and arms control		Order-crisis explanation	Distinguish NATO and EU mechanisms
African sovereignty/spillover reconstruction		Distributional analysis	Add African scholarly framing
Chinese NATO-responsibility/peace-plan reconstruction		Steel-manned account	Add Global South mediation angle
Russian 'SMO'/civilizational framing reconstruction		Internal logic of claims	Add evidence limits
Western defense/spillovers reconstruction		Unity and support mechanisms	Add occlusion analysis
UN Charter/humanitarian reconstruction		Legal-humanitarian account	Add enforcement limits
Data lab trend interpretation		Table-based inference	State uncertainty ranges
Worked example levels of analysis		Four-level reconstruction	Improve adjudication

7.2 Three-question debrief.

1. Which perspective did you reconstruct most weakly, and what evidence would strengthen it without caricature?
   Suggested reflection: identify one occlusion you initially missed, then add a counterargument from the perspective's own terms.
2. Where did you confuse a description of events with an explanation of mechanisms?
   Suggested reflection: rewrite one claim as "X occurred because Y changed Z under condition W," then test it against Kharkiv and Zaporizhzhia.
3. What is the strongest objection to your adjudication of the 2023 Zaporizhzhia counteroffensive?
   Suggested reflection: state the objection, the evidence that would support it, and the boundary condition under which your adjudication would fail.

7.3 Error-log table: Common Misconception | Correction | Evidence.

Common Misconception	Correction	Evidence
The blitz failed only because of poor Russian tactics.	Political aims, logistics, Ukrainian resistance, and air-defense denial interacted; tactical failure was embedded in operational design.	Freedman (2023); Watling (2022)
Kharkiv proves Ukraine can always maneuver successfully.	Zaporizhzhia shows that prepared defenses, force ratios, and terrain can convert maneuver into attrition.	ISW assessments; RUSI Ukraine reports
Drones alone determine battlefield outcomes.	Drones matter through combined arms, EW, logistics, and adaptation; no single technology is decisive.	Watling (2022); RUSI Ukraine reports
NATO expansion alone caused the invasion.	NATO expansion shaped threat perceptions, but Russian agency, Ukrainian sovereignty, and domestic politics also matter.	Freedman (2023)
Western industrial base can surge immediately.	Production is constrained by capacity, labor, supply chains, and component availability.	RUSI Ukraine reports; Watling (2022)
UN resolutions automatically enforce compliance.	Enforcement depends on political will, Security Council dynamics, and state capacity.	UN OCHA Ukraine humanitarian reports
Hybrid warfare is entirely new.	Cross-domain coercion has precedents; the novelty lies in integration, speed, and civilian targeting.	Watling (2022); RUSI reports

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Phase dynamics: failed blitz, counteroffensives, attritional stalemate	Operational design mismatch; adaptation; force-ratio change	Freedman (2023); Watling (2022)	Kyiv, Kharkiv, Kherson, Zaporizhzhia; ISW control tracking	Attrition vs maneuver; expectations vs outcomes	Rapid breakthrough despite prepared defenses	L22, L35

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Hybrid warfare: cyber, energy, information	Cross-domain coercion; blurring military/civilian boundaries	Watling (2022); RUSI Ukraine reports	Grid attacks; disinformation; infrastructure targeting	Threshold for armed attack; civilian protection	Purely conventional escalation without hybrid layer	L24, L38
Drone and EW revolution	FPV/Lancet kill chains; temporary EMS dominance; action-reaction cycle	Watling (2022); RUSI Ukraine reports	Trench warfare; local jamming; counter-drone adaptation	Tech determinism vs combined arms	Stable, uncontested EW dominance	L22
Industrial base problem	Shell consumption vs production; capacity and supply-chain bottlenecks	RUSI Ukraine reports; Watling (2022)	155mm shortages; surge delays; procurement competition	Stockpiles vs surge; political timelines	Sustained high output without constraints	L39
European security architecture	NATO expansion; rearmament; arms control collapse; reciprocal uncertainty	Freedman (2023)	Finland/Sweden accession; INF erosion; New START suspension	Deterrence vs escalation; order vs anarchy	Restored arms-control predictability	L39, L55
Five perspectives	African spillovers; Chinese NATO responsibility; Russian SMO; Western defense; UN Charter	Freedman (2023); UN OCHA reports	GA resolutions; food/fuel/fertilizer prices; humanitarian access	Whose security; universal vs particular norms	Consensus narrative across all five	L35, L37

SECTION 9 — REVIEW SCHEDULE

- **R1 (24 hours):** Reconstruct the five phases and their mechanisms from memory, then check against notes; mark any phase you described only as an event.
- **R2 (3 days):** Redraw the drone/EW visual and label the action-reaction cycle; explain it aloud without jargon.
- **R3 (1 week):** Compare Kharkiv and Zaporizhzhia using the four levels of analysis; write 300 words with explicit adjudication.
- **R4 (2 weeks):** Reconstruct all five perspectives and complete the comparison matrix from memory; identify one occlusion per perspective.
- **R5 (1 month):** Complete the independent memo, update the error log, and revisit the falsifiers; note which evidence would change your conclusion.

SECTION 10 — COMPLETION CHECKLIST

☐ I can name and sequence the war's phases with mechanisms.

☐ I can explain why the blitz failed beyond "poor tactics."

☐ I can compare Kharkiv and Zaporizhzhia using force ratio, terrain, and preparation.

☐ I can define hybrid warfare as cross-domain coercion.

☐ I can explain how cyber, energy, and information blur military/civilian domains.

☐ I can describe the drone/EW action-reaction cycle without tech determinism.

☐ I can explain the industrial base bottleneck in production terms.

☐ I can connect arms control collapse to European security uncertainty.

☐ I can reconstruct the African perspective as primary and sovereignty-plus-spillovers.

☐ I can steel-man the Chinese, Russian, Western, and UN perspectives.

☐ I can identify one occlusion for each perspective.

☐ I can use ISW data while stating its limits.

☐ I can distinguish description, explanation, prediction, and prescription.

☐ I can apply the four levels of analysis to the worked example.

☐ I can state falsifiers for my main adjudication.

☐ I have updated my error log.

☐ I can explain the lesson's central puzzle to a peer.

☐ I know which sources support which claims.

FURTHER READING (Optional)

- Freedman (2023) — war phases, strategic assessment, and European order crisis.
- Watling (2022) — operational lessons, combined arms, hybrid warfare, and drone/EW adaptation.
- RUSI Ukraine reports — force generation, attrition, industrial base, and ammunition production.
- ISW assessments — daily territorial control changes and Russian force posture.
- UN OCHA Ukraine humanitarian reports — civilian harm, aid access, and humanitarian consequences.
- Freedman (2023) — NATO expansion, rearmament, and arms control collapse.
- Watling (2022) — tactical adaptation under contested electromagnetic spectrum conditions.
- RUSI Ukraine reports — logistics, breaching constraints, and sustained high-intensity warfare.
- ISW assessments — Russian defensive adaptation and operational learning.
- UN OCHA Ukraine humanitarian reports — global spillover and protection concerns.

End of Lesson 36. Say **Next** when you are ready.

38. Lawfare of Territorial Integrity

LESSON METADATA

Field	Value
Lesson number and title	37: Lawfare of Territorial Integrity
Module	Module 6: Eastern Europe and the Ukraine War
Prerequisites	L2 (Charter), L26 (lawfare), L35 (post-Soviet ontology)

Field	Value
Interleaved links	Forward to L39 (European security), L44 (proxy warfare), L45 (nuclear proliferation)
Reading load	7-9 hours
Content channels	Text, data tables, visuals, flashcards, worked example, problem pair
Bloom ceiling	Evaluate
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

The central puzzle of this lesson is why the war over Ukraine has been fought as intensely in legal forums as on the battlefield. Territorial integrity is not merely a line on a map; in contemporary international order it is a legal status produced by recognition, treaty obligation, institutional procedure, and the accumulated practice of states. The Russian Federation's full-scale invasion of Ukraine in 2022, following the 2014 annexation of Crimea and the destabilization of eastern Ukraine, forced every major actor to argue in the language of law: aggression, self-determination, genocide, occupation, annexation, recognition, jurisdiction, and enforcement. The lesson asks how law becomes a weapon—lawfare—without becoming merely propaganda, and why legal categories can shape outcomes even where coercive enforcement is weak or blocked.

This puzzle sits at the intersection of three earlier lessons. The Charter lesson established the foundational prohibition on the threat or use of force against territorial integrity and political independence, together with the limited exceptions of self-defense and Security Council authorization. The lawfare lesson established that legal argument is not external to strategy but can be mobilized to legitimize, constrain, delay, delegitimize, or reframe coercion. The post-Soviet ontology lesson established that the collapse of the USSR did not settle the political meaning of borders, nations, imperial legacies, and successor-state identities; instead, it created a contested space in which sovereignty, ethnicity, language, and historical memory remain politically charged. Lesson 37 brings these threads together by examining how legal claims over territory are constructed, contested, and partially enforced in a war where both sides claim to defend international law.

The mechanism at stake is the conversion of physical control into legal title, and of legal title into durable political order. Annexation is the clearest example: military occupation or conquest does not by itself create internationally recognized sovereignty, but a state may attempt to manufacture legality through referenda, constitutional incorporation, diplomatic recognition, and institutional participation. Conversely, the defending state and its partners may attempt to freeze the legal status quo through non-recognition, sanctions, institutional exclusion, and criminal accountability. The result is a layered conflict in which the same territory can be administered as Russian, claimed as Ukrainian, treated as occupied under international humanitarian law, and recognized differently by different states. Lawfare therefore operates through audience costs, alliance management, sanctions architecture, evidentiary standards, and the symbolic authority of courts and assemblies.

The lesson also requires attention to threshold problems. Modern coercion rarely arrives as a declared war between uniformed armies. Cyber operations, deniable actors, proxy forces, information campaigns, and ambiguous uses of force test the legal categories developed for interstate violence. If an operation is below the threshold of "armed attack," the victim's right to self-defense may be contested; if attribution is uncertain, responsibility may be diffused; if an actor is formally non-state, the legal frame may shift from jus ad bellum

to counterterrorism or internal security. These ambiguities are not accidental. They are often the point of hybrid strategies, which seek military or political effect while preserving legal and political deniability. The lesson therefore treats legality not as a neutral referee but as a contested terrain in which thresholds are interpreted, stretched, and weaponized.

A further mechanism is institutional accountability. The International Criminal Court and the International Court of Justice do not possess independent enforcement power comparable to a domestic police force, yet they shape the conflict by defining crimes, issuing arrest warrants, ordering provisional measures, and creating records that can outlast immediate military outcomes. Their authority depends on state cooperation, jurisdictional hooks, and the willingness of powerful actors to treat adverse rulings as binding. The gap between legal judgment and enforcement is not a peripheral defect; it is central to the politics of international law. UNGA resolutions, ICJ proceedings, and ICC investigations can mobilize majorities, isolate aggressors, and legitimate sanctions, but they can also expose the selectivity of international justice and the dependence of legal institutions on geopolitical power.

The African perspective is essential to framing this puzzle rather than treating it as a European exception. From many African vantage points, sovereignty is not an abstract legal principle but a hard-won achievement of decolonization, and territorial integrity is tied to the prevention of external partition, secession, and great-power manipulation. At the same time, African scholarship and diplomacy have often highlighted the inconsistency of Western legal practice, especially the contrast between recognition of Kosovo and rejection of Crimea. This inconsistency critique does not require accepting Russian annexation; rather, it asks whether the rules are applied as rules or as instruments of power. The lesson therefore treats the African perspective as primary not because Africa is the site of the Ukraine war, but because it reveals a structural problem in international law that the war makes visible: the tension between universal legal claims and selective enforcement.

By the end of the lesson, the student should be able to reconstruct the legal architecture of territorial integrity in the Ukraine war; distinguish description, explanation, prediction, and prescription in legal analysis; compare how African, Chinese, Russian, Western, and UN perspectives frame the same events; evaluate the strength and limits of ICJ and ICC mechanisms; and identify falsifiers that would weaken a given legal or strategic claim. The lesson is not a brief for any party. It is an exercise in rigorous adjudication: learning how to hold legal principle, historical grievance, strategic interest, and institutional constraint in the same analytical frame without collapsing one into another.

SECTION 1 — Pre-Class Priming

1.1 Retrieval warm-up

1. What does Article 2(4) of the UN Charter prohibit, and why does it matter for territorial integrity?

2. In the lawfare framework, how can legal procedure function as a strategic instrument rather than merely a neutral dispute-resolution mechanism?

3. What is the post-Soviet ontological problem: why did the collapse of the USSR leave borders, identities, and sovereignty claims unsettled?

4. What is the difference between a declaratory theory of recognition and a constitutive theory of

recognition?

5. Why does the threshold between “use of force” and “armed attack” matter for claims of self-defense?

6. What is uti possidetis juris, and why does it become relevant when empires or federations dissolve?

1.2 Orientation questions

1. How can a state invoke self-determination while simultaneously denying another state’s territorial integrity, and what legal distinction is required to make that argument coherent?

2. What separates the 2014 annexation of Crimea from the 2022 annexation of four Ukrainian oblasts in terms of legal process, recognition, and strategic consequence?

3. If a cyber operation damages infrastructure but causes no kinetic casualties, under what conditions might it still be treated as a use of force or an armed attack?

4. Why do UNGA resolutions matter politically even when they are not legally binding in the same way as Security Council decisions?

1.3 Vocabulary pre-teach

- **Territorial integrity**: the legal principle that a state’s territory is inviolable and that external force may not be used to alter its borders.

- **Self-determination**: the claim that peoples have the right to determine their political status and pursue their economic, social, and cultural development; in practice, it can conflict with territorial integrity.

- **Annexation**: the purported incorporation of territory into another state, often following military control, and generally regarded as unlawful when achieved by force.

- **Non-recognition**: the refusal by states or international institutions to accept as lawful a territorial change produced by force or other unlawful means.

- **Lawfare**: the strategic use of legal claims, procedures, institutions, and norms to advance political or military objectives.

- **Hybrid warfare**: the coordinated use of military, paramilitary, cyber, informational, economic, and legal tools to achieve strategic effects while often preserving deniability.

- **Use of force threshold**: the legal line distinguishing prohibited force from lesser coercion; it affects whether an act violates Article 2(4) and whether self-defense is available.

- **Armed attack**: a more serious category of force that can trigger the inherent right of self-defense

under Article 51 of the Charter.

- **Attribution**: the process of identifying the actor responsible for a hostile act, especially important in cyber and proxy operations.

- **International Court of Justice (ICJ)**: the principal judicial organ of the United Nations, which adjudicates disputes between states and gives advisory opinions.

- **International Criminal Court (ICC)**: a permanent court that prosecutes individuals for genocide, crimes against humanity, war crimes, and aggression, subject to jurisdictional limits.

- **UNGA resolution**: a resolution adopted by the UN General Assembly; politically significant and expressive of international opinion, but not generally binding in the manner of Security Council decisions under Chapter VII.

SECTION 2 — LESSON CORE

2.1 Learning objectives

By the end of this lesson, students will be able to:

1. **Analyze** the legal architecture of the self-determination/territorial-integrity tension by tracing it from the UN Charter (Arts. 1(2), 2(4), Ch. XI) through the Friendly Relations Declaration (UNGA Res. 2625, 1970) and the Helsinki Final Act (1975) to the ICJ's Kosovo advisory opinion (2010), and explain why no hierarchical resolution exists within positive international law—neither principle is textually subordinated to the other.
2. **Evaluate** competing secessionist claims in the Ukraine conflict—Crimea (2014) and the four oblasts (2022)—using the internal/external self-determination distinction developed by Cassese (1995) and Crawford (2006), and assess whether Russia's invocation of self-determination meets the doctrinal threshold for external self-determination (colonial, occupied, or remedial) or instead constitutes an unlawful use of force against territorial integrity.
3. **Explain** how the ICJ's 2010 Kosovo advisory opinion has been strategically invoked by both Russia (to legitimize unilateral secession and annexation) and the West (to distinguish Kosovo as sui generis), identifying the specific legal reasoning each side extracts from the Court's narrow holding that declarations of independence are not generally prohibited.
4. **Compare** the five major perspectives—African, Chinese, Russian, Western, and UN—on the self-determination/territorial-integrity tension, specifying what each contributes to understanding the Ukraine war's legal core and what each systematically occludes, with particular attention to the African sovereignty critique and the Kosovo-Crimea inconsistency problem.
5. **Synthesize** the African scholarly tradition (Grovogui, Mamdani, Mbembe, Nkrumah, Nyerere, Fanon, Rodney) with the doctrinal debate to assess whether international practice on self-determination is consistent or whether it operates as a function of geopolitical power, and to evaluate what the African vantage reveals about the coloniality of international law that the other four perspectives miss.

2.2 KEY IDEA 1 — Self-determination vs territorial inviolability: the tension at the heart of the Ukraine war

Bolded Causal Claim: The Ukraine war's legal and normative core is a collision between two principles codified in the same constitutional document of international society—the UN Charter's commitment to the territorial integrity and political independence of states (Article 2(4)) and its simultaneous commitment to the self-determination of peoples (Article 1(2), Chapter XI)—with no textual hierarchy between them, so that which principle prevails in any given case is determined by political power, recognition practice, and the identity of the claimant rather than by legal adjudication alone.

Mechanism: The collision operates through four interlocking layers. First, the *textual layer*: the UN Charter (1945) enshrines both principles without ranking. Article 2(4) prohibits the threat or use of force against territorial integrity or political independence; Article 1(2) lists self-determination among the Organization's purposes; Chapter XI (Declaration Regarding Non-Self-Governing Territories) and Chapter XII (International Trusteeship System) operationalize self-determination for colonial territories. The Friendly Relations Declaration (UNGA Res. 2625 (XXV), 1970) attempts reconciliation: self-determination applies to peoples under colonial or alien domination, but "nothing in the foregoing paragraphs shall be construed as authorizing or encouraging any action which would dismember or impair, totally or in part, the territorial integrity or political unity of sovereign and independent States." The Helsinki Final Act (1975) reproduces the same tension for Europe through Principle I (sovereign equality, territorial integrity) and Principle VIII (equal rights and self-determination of peoples). Neither document resolves the hierarchy; each restates both principles and leaves the collision to context. Second, the *doctrinal layer*: the dominant doctrine, developed by Cassese (1995) and Crawford (2006), distinguishes internal self-determination (the right to participate in governance, to seek autonomy or federal arrangements within an existing state) from external self-determination (the right to secede and form an independent state). External self-determination is generally recognized only for three categories: (a) peoples of non-self-governing territories under colonial rule; (b) peoples subjected to foreign military occupation; and (c) peoples suffering severe and systematic violations of human rights by their own government, under the contested doctrine of "remedial secession." For populations that are not colonial, not occupied by a foreign power, and not subjected to such violations, secession is not a legal right but a political fact that may or may not attract recognition. This doctrinal architecture means that Russia's claim that Crimea or the Donbas populations possess a right of external self-determination fails the standard tests: these are not colonial territories, and while Russia alleges oppression, the factual predicate is contested and was not established through any international process. Third, the *jurisprudential layer*: the ICJ's advisory opinion in *Accordance with International Law of the Unilateral Declaration of Independence in Respect of Kosovo* (2010) held that the declaration of independence itself did not violate general international law because there is no general prohibition on declarations of independence. Crucially, the Court deliberately avoided ruling on whether Kosovo had a right to secede or whether recognition of Kosovo was lawful. This narrow, procedural holding created an ambiguity that both sides exploit: Russia reads it as licensing unilateral secession and, by extension, annexation; the West reads it as a holding about the legality of a declaratory act that says nothing about the legality of secession or recognition. The opinion thus became a Rorschach test, with each side extracting the interpretation that serves its interest. Fourth, the *political layer*: recognition is a political act, not a legal determination. States recognize or withhold recognition based on interest, alliance structure, and precedent anxiety. This means the same legal claim—self-determination—produces different outcomes depending on the claimant's geopolitical position and the recognizing state's strategic calculus. The mechanism therefore predicts not legal resolution but political contestation: the principles provide the vocabulary, but power and recognition determine the outcome.

Scope Conditions: The tension becomes acute under five conditions: (1) a group within an existing, internationally recognized state claims *external* self-determination (secession) rather than internal autonomy; (2) the claim is backed by external military force or a patron state willing to recognize and defend it; (3) the parent state is internationally recognized, functioning, and opposed to secession; (4) there is a contested historical narrative that the claimant group "belongs" to another state or nation; and (5) the international community is divided along geopolitical lines, preventing consensus. The tension is less acute when the claim is for internal self-determination (autonomy, federalism, cultural rights), when the territory is a non-self-governing territory under Chapter XI (decolonization), when the parent state consents to secession, or when there is no external military involvement. The Ukraine case satisfies all five acute conditions: Crimea and the Donbas claimed secession, Russia provided military backing and recognition, Ukraine was a recognized functioning state, Russia invoked historical and ethnic narratives, and the international community split along NATO-Russia lines. A critical scope condition often overlooked is the *identity of the claimant's patron*: when the patron is a permanent member of the Security Council, enforcement of territorial integrity through the UN system is structurally blocked, which is precisely what occurred in 2014 and 2022.

Observable Implications: If the mechanism holds, we should observe: (a) states invoking whichever principle serves their interest—Russia invoking self-determination for Crimea while invoking territorial integrity for its own borders and for South Ossetia/Abkhazia in different contexts; (b) recognition patterns splitting along geopolitical lines, visible in UNGA vote tallies (2014: 100 in favor of Ukraine's territorial integrity, 11 against, 58 abstentions; 2022: 143 in favor, 5 against, 35 abstentions); (c) ICJ and UNGA becoming arenas of legal-political contestation rather than neutral adjudication; (d) proliferation of "sui generis" arguments (Kosovo is unique; Crimea is unique) as states seek to avoid precedent; (e) African states frequently abstaining, reflecting ambivalence between solidarity with territorial integrity as a post-colonial survival principle and refusal to endorse a Western-led legal order with a record of selective application; and (f) the same legal vocabulary deployed by opposing sides to reach opposite conclusions, with no authoritative interpreter capable of resolving the dispute.

Perspective Note (five traditions in brief):

African (primary). The African vantage on the self-determination/territorial-integrity tension is shaped by a distinctive historical experience: the continent's borders were drawn by colonial powers at the Berlin Conference (1884–85) without African participation, yet the post-colonial state system has treated those borders as inviolable. The OAU's 1964 Cairo resolution on border inviolability, later reflected in the OAU Charter and the AU Constitutive Act, established *uti possidetis juris* as the African norm—colonial borders become international borders upon independence. The ICJ's 1986 *Frontier Dispute* (Burkina Faso/Mali) judgment affirmed this principle for Africa. This creates a paradox that African scholarship has long theorized: borders are simultaneously colonial artifacts and the foundation of post-colonial sovereignty. Grovogui's analysis of "sovereigns, quasi sovereigns, and Africans" (1996) shows that African states entered the international system as diminished sovereigns, their sovereignty qualified by neo-colonial economic dependence and great-power interference. Mamdani's work on the colonial state (1996) demonstrates that the nation-state form was imposed on Africa, producing a bifurcated state with citizens in urban areas and subjects in rural "customary" jurisdictions, undermining the very "people" that self-determination presupposes. Mbembe's postcolonial theory (2001) frames sovereignty in Africa as a command over life and death, not a legal abstraction. Nkrumah's neo-colonialism thesis (1965) and Rodney's analysis of underdevelopment (1972) show that formal sovereignty masked continued economic subordination. Nyerere, confronting the Biafra and Katanga secessions, insisted on territorial integrity as a survival imperative for fragile new states, even while championing pan-African unity. Fanon's analysis of colonial violence (1961) reminds us that self-

determination was won through struggle, not granted by law. From this vantage, the Ukraine war's legal tension is not an abstract doctrinal puzzle but a continuation of great-power politics in which law is an instrument. The African critique of inconsistency—Kosovo recognized, Crimea not—does not mean African states favor Crimea's annexation; most African states voted for UNGA resolutions affirming Ukraine's territorial integrity. Rather, the critique targets the hypocrisy of a system in which self-determination is granted or denied based on the claimant's geopolitical alignment. What the African perspective reveals that others miss is the coloniality of international law itself: the principles are not neutral, the "people" is constructed, and sovereignty is graded by power. African states' frequent abstentions in UNGA votes on Ukraine reflect this ambivalence—solidarity with territorial integrity as a post-colonial survival principle, but refusal to endorse a Western-led legal order that has historically denied African self-determination.

Chinese. China's position subordinates self-determination to territorial integrity and non-interference, reflecting both its own territorial sensitivities (Taiwan, Tibet, Xinjiang, Hong Kong) and its strategic interest in a stable, state-centric international order. Beijing's Five Principles of Peaceful Coexistence (1954) make territorial integrity and non-interference foundational. On Ukraine, China has maintained that Ukraine's sovereignty and territorial integrity should be respected while simultaneously framing NATO expansion as the root cause of the crisis—a "NATO responsibility" narrative that distributes causal and moral responsibility to the West. China did not recognize Crimea's annexation and abstained on the 2014 UNGA resolution, but it has also refused to condemn Russia outright, reflecting strategic partnership and shared opposition to Western hegemony. The Chinese perspective contributes the insight that territorial integrity cannot be separated from the security architecture that surrounds it; it occludes, however, the agency of Ukrainians and the violence of annexation.

Russian. Russia's position invokes self-determination as a legal right for populations it claims are historically Russian or oppressed, while simultaneously denying self-determination to groups within Russia (Chechens, Tatars). The Kosovo precedent is central: Moscow argues that if the West could recognize Kosovo's unilateral declaration of independence, it cannot deny Crimea's or the Donbas's. Russia frames Crimea's annexation as "reunification" and the 2022 annexations as expressions of popular will (referendums). The Russian perspective contributes a genuine critique of Western double standards and the politicization of recognition; it occludes the coercive context of the referendums, the absence of genuine self-determination under military occupation, and the inconsistency of denying self-determination to Russia's own minorities.

Western. The Western position defends territorial integrity as the cornerstone of the post-1945 order and frames Russia's actions as violations of Article 2(4). On Kosovo, the West maintains the sui generis argument: Kosovo was unique due to the humanitarian catastrophe, UNSC involvement, and the collapse of Serbian sovereignty. Some Western scholars acknowledge the inconsistency (Weller 2022), but the official position distinguishes the cases. The Western perspective contributes the defense of a rules-based order and the mobilization of legal accountability (ICJ, ICC, UNGA); it occludes the selective application of self-determination and the power asymmetries in recognition practice.

UN. The UN perspective is institutional: the Charter contains both principles, the ICJ adjudicates disputes, and the General Assembly expresses the international community's position through resolutions. The UN framework treats the tension as inherent and manageable through dialogue, adjudication, and collective security. The UN perspective contributes procedural legitimacy and a forum for contestation; it occludes the enforcement gap—the Security Council's paralysis due to the veto, and the absence of mechanisms to compel compliance with ICJ rulings or UNGA resolutions.

2.3 KEY IDEA 2 — Annexation: Crimea (2014) and the four oblasts (2022) — legality, recognition, and consequences

Bolded Causal Claim: Annexation is a legal-political technology that seeks to convert military occupation into sovereign title by layering domestic constitutional acts, staged referenda, and selective recognition onto a use-of-force violation; its legal success depends less on the annexing state's proclamation than on whether third states and institutions withhold recognition and impose costs.

Mechanism: The mechanism runs from coercive control to legal laundering to institutional contestation. In Crimea in 2014, unidentified armed personnel—commonly described as "little green men"—seized key infrastructure and administrative nodes, after which a referendum was held under conditions of occupation and was followed by Russian federal legislation incorporating Crimea and Sevastopol into the Russian Federation. In 2022, after the full-scale invasion, Russia staged referenda in four partially occupied oblasts—Donetsk, Luhansk, Zaporizhzhia, and Kherson—and then signed treaties of accession that were rapidly ratified and embedded in Russia's constitutional order. The causal force of annexation therefore comes not from the referendum alone but from the combination of three moves: first, the creation of facts on the ground through military control; second, the production of domestic legal form through referenda, treaties, and constitutional amendments; and third, the attempt to normalize those facts through diplomatic recognition, passportization, currency integration, administrative absorption, and military basing. This is why annexation is a form of lawfare: it uses legal instruments to launder an initially unlawful use of force into an appearance of sovereign title. The counter-mechanism is non-recognition. Most states, UNGA resolutions, and the broader non-recognition doctrine treat territorial acquisition by force as legally void, meaning that the annexing state's domestic acts cannot by themselves create international title. Yet non-recognition is not costless enforcement. It can isolate the annexing state diplomatically and economically, but it does not automatically restore the displaced sovereign's control. The result is a durable gap between legal title and effective control: Ukraine remains the internationally recognized sovereign over Crimea and the four oblasts, while Russia exercises varying degrees of de facto authority, strongest in Crimea and weakest in the partially occupied southern and eastern oblasts where front lines remain contested.

Scope Conditions: Annexation succeeds as a legal-political strategy only under specific conditions: the annexing state must achieve durable control; the target state must lack the immediate capacity to reverse the occupation; international enforcement must be blocked or diluted by great-power veto, geopolitical division, or competing priorities; and enough domestic and international audiences must accept or acquiesce to the new status quo. Where these conditions are absent, annexation remains a claim rather than a settled title. The four 2022 oblasts illustrate this limit clearly: Russia does not fully control all of the territory it claims, its control fluctuates with military operations, and the international response has been broader and more punitive than in 2014. The legal scope condition is equally important. Under the Charter framework, territorial acquisition by force does not create title; effectiveness alone is insufficient where the acquisition violates Article 2(4). However, international law also struggles with the passage of time. Prolonged control, demographic engineering, institutional integration, and generational change can harden de facto realities even where de jure title remains with the original sovereign. This is why annexation produces not only a legal dispute but also a sociological transformation: the longer occupation persists, the more the annexing state can present control as normal governance, while the displaced state must sustain a counter-narrative of illegality and future restoration.

Observable Implications: The observable implications include UNGA resolutions affirming Ukraine's territorial integrity, broad non-recognition of the annexations, sanctions regimes targeting Russian officials,

financial institutions, energy exports, and military-industrial capacity, and continued Ukrainian legal and diplomatic claims to the territories. The 2014 Crimea annexation produced a distinct pattern: rapid Russian integration, militarization of the peninsula, expansion of the Black Sea Fleet's strategic position, and a relatively stable but internationally contested status quo. The 2022 annexations produced a different pattern: partial and unstable control, ongoing combat, larger-scale displacement, and a more unified Western and allied response. Other implications include passportization, rubleization, changes in property and citizenship regimes, human-rights concerns in occupied territories, and the transformation of the annexed regions into bargaining chips in any future negotiation. The annexations also affect the legal architecture of peace: because Ukraine's constitutional and political position treats territorial integrity as non-negotiable, and because most states do not recognize the annexations, any settlement that formalizes Russian control would require not only Ukrainian concession but also a reversal of the international non-recognition consensus.

Perspective Note (five traditions in brief):

African (primary). The African perspective begins from the postcolonial experience of externally imposed borders and the hard-won principle that territorial integrity is a shield against fragmentation, foreign manipulation, and renewed imperial partition. African scholarship and diplomacy therefore tend to treat annexation by force as a threat not only to Ukraine but to the broader normative order that protects weaker states from stronger ones. At the same time, the African vantage point is sharpened by the inconsistency critique: many African scholars and officials note that Western states have recognized Kosovo while rejecting Crimea, and that the language of self-determination has been applied unevenly across cases. This does not necessarily imply African support for annexation; rather, it produces a demand for principled consistency and a suspicion that international law is often mobilized by powerful states to discipline adversaries while exempting allies. African thinkers such as Mamdani, Grovogui, and Bayart have emphasized how legal categories can mask power, and how the postcolonial state's fragility makes territorial integrity both a legal norm and a survival strategy. The African perspective thus contributes a dual insight: it defends territorial integrity as a necessary protection for postcolonial sovereignty, while exposing the selective and hierarchical application of self-determination and recognition in practice.

Chinese. The Chinese perspective emphasizes sovereignty and territorial integrity as foundational norms, while framing NATO expansion and Western security policy as important contextual causes of the crisis. China has generally avoided recognizing the annexations, consistent with its long-standing opposition to unilateral territorial changes, but it has also resisted Western-led condemnation and sanctions, preferring dialogue, ceasefire, and negotiated settlement. Its contribution is to insist that territorial integrity cannot be separated from security indivisibility and great-power responsibility; its occlusion is that this framing can blur accountability for the use of force and can treat Ukrainian agency as secondary to NATO-Russia dynamics.

Russian. The Russian perspective treats Crimea and the four oblasts as territories whose populations exercised self-determination through referenda and whose incorporation corrects historical injustice and protects Russian-speaking communities. It frames annexation as defensive, restorative, and democratically legitimated. This perspective contributes a challenge to the Western monopoly on defining legitimate self-determination, but it occludes the coercive conditions under which the referenda occurred, the absence of free and fair process, and the Charter prohibition on acquiring territory by force.

Western. The Western perspective defends the Charter, non-recognition, sanctions, and legal accountability as necessary responses to aggression. It treats the annexations as illegal and void, and it mobilizes institutions to sustain that position. Its contribution is the defense of a rules-based order; its occlusion is the difficulty

of reconciling this defense with the Kosovo precedent and with the broader history of selective recognition.

UN. The UN perspective is institutional and procedural: the Charter contains both territorial integrity and self-determination, the General Assembly expresses the international community's position through resolutions, and the ICJ adjudicates disputes. Its contribution is procedural legitimacy and a forum for contestation; its occlusion is the enforcement gap created by Security Council paralysis and the absence of mechanisms to compel compliance with UNGA resolutions or ICJ rulings.

2.4 KEY IDEA 3 — The legality of hybrid warfare: cyber operations, deniable actors, and the use of force threshold

Bolded Causal Claim: Hybrid warfare is legally consequential not because it is entirely novel, but because it distributes coercion across cyber, proxy, informational, and economic channels so that each component may fall below the Article 2(4) use-of-force threshold or escape attribution, producing a cumulative strategic effect that international law's binary categories struggle to capture.

Mechanism: The mechanism is threshold exploitation through fragmentation and deniability. Hybrid warfare blurs the boundary between war and peace by combining conventional military pressure, irregular forces, cyber operations, information campaigns, economic coercion, and legal manipulation. In the Ukraine case, the 2014 seizure of Crimea relied on "little green men" whose lack of insignia created attribution ambiguity; subsequent operations in eastern Ukraine involved armed groups, Russian personnel, and local proxies whose relationships were deliberately obscured. Cyber operations added another layer: attacks on Ukrainian infrastructure, including power-grid disruptions in 2015 and 2016 and the NotPetya malware incident in 2017, imposed costs and signaled capability while raising difficult questions about whether they constituted a "use of force" under Article 2(4) or an "armed attack" under Article 51. The legal mechanism turns on three thresholds. First, Article 2(4) prohibits the threat or use of force against territorial integrity or political independence, but not all coercive acts are "force"; cyber operations that cause physical damage or injury are more likely to qualify, while data theft, disruption, or propaganda may be treated as intervention or espionage rather than force. Second, state responsibility for non-state actors depends on standards of control; the ICJ's "effective control" test in the Nicaragua case sets a high bar, while the ICTY's "overall control" standard is more permissive, creating uncertainty about when a state is legally responsible for proxy violence. Third, self-defense under Article 51 requires an "armed attack," a higher threshold than "use of force," meaning that even unlawful uses of force may not automatically justify military response. Hybrid actors exploit these gaps by keeping each act below the most consequential threshold, by fragmenting responsibility across state and non-state channels, and by using information operations to complicate attribution and delay political consensus. The cumulative effect is strategic: the target state is coerced, destabilized, and territorially eroded without triggering the legal and political mechanisms designed for overt armed attack.

Scope Conditions: Hybrid warfare is most effective where the target state is vulnerable to ambiguity, where attribution capabilities are limited, where alliance decision-making requires high evidentiary certainty, and where the adversary is risk-averse about escalation. It is less effective where cyber defenses are resilient, where attribution is rapid and public, where legal frameworks clearly classify disruptive operations as uses of force, and where the target can respond through sanctions, counter-cyber operations, or military reinforcement without crossing escalation thresholds. The scope conditions also include technological and organizational capacity: hybrid campaigns require intelligence networks, proxy relationships, cyber capabilities, and information infrastructure. They are not costless or unlimited. Attribution has improved since 2014, and states increasingly name and shame perpetrators, impose sanctions, and build cyber norms through UN

processes and regional frameworks. The Tallinn Manual and UN Group of Governmental Experts have contributed to clarifying that cyber operations causing physical damage or injury can amount to uses of force, though below that threshold the law remains unsettled. Hybrid warfare therefore operates in a zone of legal indeterminacy: it is constrained by evolving norms and capabilities, but it continues to exploit the lag between technological practice and legal classification.

Observable Implications: The observable implications include delayed or calibrated responses to ambiguous aggression, the prominence of attribution statements and sanctions rather than immediate military retaliation, investments in cyber defense and resilience, and the normalization of "hybrid" as a policy category in NATO, EU, and national security discourse. In Ukraine, the implications include the 2014 seizure of Crimea without a clear Article 51 response, the prolonged conflict in Donbas framed as an internal rebellion rather than interstate war, cyberattacks on infrastructure and government systems, information campaigns, and the use of private military companies and proxy forces. More broadly, hybrid tactics produce legal debates about whether a cyberattack on critical infrastructure is an armed attack, whether support for proxies crosses the control threshold, and whether economic coercion can be unlawful intervention. They also produce institutional adaptation: NATO's recognition of cyberspace as an operational domain, EU sanctions frameworks, and national laws on foreign interference. The key observable pattern is that hybrid warfare often succeeds in creating strategic ambiguity and delay, but it can also generate long-term counter-mobilization once attribution becomes credible and political will consolidates.

Perspective Note (five traditions in brief):

African (primary). The African perspective on hybrid warfare is shaped by a long history of indirect rule, proxy intervention, mercenary activity, and externally sponsored destabilization, which means that African scholars often see "hybrid" not as a new European phenomenon but as a renamed continuation of older techniques of domination. African thinkers such as Grovogui and Mbembe have emphasized how legal and institutional language can obscure violent power, and how deniable actors—whether colonial auxiliaries, Cold War proxies, or contemporary private military companies—allow powerful states to intervene while evading accountability. The African vantage point therefore contributes a historical critique: it reveals that the problem of attribution and deniability is not a technical novelty but a recurring feature of imperial and neo-imperial practice. It also raises a practical concern, because private military actors such as the Wagner Group have operated in several African states, making the legal thresholds around proxy control and state responsibility directly relevant to African sovereignty. African states may thus support clearer attribution standards and stronger accountability for deniable intervention, while remaining skeptical of frameworks that are applied only against adversaries of Western powers. The African perspective's distinctive contribution is to connect hybrid warfare to the broader history of external interference and to insist that legal thresholds must protect weaker states from both overt and covert coercion.

Chinese. The Chinese perspective frames cyber operations and deniable intervention through the lens of sovereignty, non-interference, and information security. China emphasizes cyber sovereignty, opposes unilateral attribution, and often treats Western accusations as politicized. It contributes a demand for multilateral norms and state consent in cyberspace; it occludes the role of state-linked cyber activity and the coercive potential of information control.

Russian. The Russian perspective generally rejects the "hybrid warfare" label as a Western construct used to delegitimize Russian policy. It frames its actions as defensive, protective of compatriots, and responsive to NATO pressure, while accusing the West of conducting hybrid warfare through sanctions, information campaigns, and support for opposition movements. Its contribution is to expose the politicization of legal

categories; its occlusion is the denial of documented covert and proxy operations.

Western. The Western perspective treats hybrid warfare as a serious threat to the rules-based order and emphasizes attribution, deterrence, resilience, and legal clarity. It contributes frameworks for cyber norms and collective defense; its occlusion is the risk of over-securitizing ambiguous activity and of applying legal thresholds unevenly.

UN. The UN perspective approaches hybrid warfare through the Charter's prohibition on the use of force, state responsibility, and emerging cyber norms. It contributes multilateral forums for norm development and confidence-building; its occlusion is the difficulty of achieving consensus on attribution and on whether specific cyber operations cross legal thresholds.

2.5 KEY IDEA 4 — ICC and ICJ: accountability mechanisms and their limits

Bolded Causal Claim: The ICC and the ICJ furnish complementary but structurally bounded accountability pathways for the Ukraine war—individual criminal responsibility through the ICC and state responsibility through the ICJ—yet both are constrained by jurisdictional architecture, the absence of enforcement capacity, and the political economy of great-power non-cooperation, so that their primary effect is normative, evidentiary, and historical rather than coercive.

Mechanism: The International Criminal Court, established by the 1998 Rome Statute, prosecutes individuals for genocide, crimes against humanity, war crimes, and—under Article 8 bis and the Kampala amendments—the crime of aggression. Its jurisdiction over Ukraine rests not on membership, since Ukraine is not a state party, but on two declarations under Article 12(3) of the Statute (2014 and 2015) accepting ICC jurisdiction over crimes committed on Ukrainian territory from 21 November 2013 onward. The Prosecutor opened a preliminary examination in 2014 and, following referrals by forty-three states parties in March 2022, opened a formal investigation. The Court has since issued arrest warrants for President Vladimir Putin and Commissioner Maria Lvova-Belova (March 2023) for the war crime of unlawful deportation and transfer of children, and for senior military commanders for attacks on civilian infrastructure. The ICC's complementarity principle means it acts only where national jurisdictions are unwilling or unable; Ukraine's domestic investigations and prosecutions—including war-crimes trials of captured Russian soldiers and collaboration cases—thus shape the ICC's docket and may displace it for certain categories of conduct.

The International Court of Justice, by contrast, adjudicates state responsibility. Ukraine instituted proceedings against Russia in 2017 under the Genocide Convention, alleging that Russia's claim of genocide in Donbas was fabricated and used as pretext for the 2022 invasion, and under the International Convention on the Elimination of All Forms of Racial Discrimination regarding Crimea. Following the February 2022 invasion, Ukraine requested provisional measures; on 16 March 2022 the Court ordered Russia to "immediately suspend the military operations" commenced on 24 February 2022, by thirteen votes to two. Russia has not complied. The ICJ's jurisdiction rests on compromissory clauses in treaties to which both states are parties; Russia has contested jurisdiction and argued that the Genocide Convention does not cover the use of force. The Court's orders lack direct enforcement: Article 94 of the UN Charter provides for Security Council enforcement, which Russia's veto forecloses. The two institutions thus operate on different logics—individual versus state responsibility, criminal versus civil—and face different limits. The ICC cannot prosecute the crime of aggression against Russia because Russia is not a state party and no Security Council referral is possible given the veto. The ICJ cannot compel compliance with provisional measures. Both depend on state

cooperation for evidence, arrest, and enforcement, and both are exposed to the risk that their proceedings are instrumentalized as lawfare by the parties.

Scope Conditions: ICC effectiveness is highest where (a) the territorial state cooperates or is a party, (b) suspects travel to cooperating jurisdictions, (c) complementarity is satisfied or national capacity is absent, and (d) evidence is accessible and chain-of-custody is preserved. It is lowest against sitting leaders of non-party great powers with veto-protected allies and no prospect of arrest. ICJ effectiveness is highest where (a) a compromissory clause exists and is not successfully challenged, (b) the respondent values reputational standing and legal legitimacy, and (c) provisional measures align with the respondent's interests or are costless to comply with; lowest where the respondent rejects jurisdiction, faces no enforcement, and has alternative partners. Both institutions are more effective as normative and historical record-builders than as coercive enforcers against great powers, and their outputs are most consequential when coupled with sanctions, diplomatic pressure, or domestic legal processes.

Observable Implications: Arrest warrants issued but unexecuted against Putin; an ICC field office opened in Kyiv in 2023; evidence collection, witness protection, and forensic documentation ongoing; Ukrainian domestic war-crimes trials proceeding, including of captured Russian soldiers; the ICJ provisional measures order ignored but cited in diplomatic and legal discourse; reparations claims advanced through UNGA Resolution ES-11/5 and domestic mechanisms; the gap between legal pronouncement and enforcement visible in continued hostilities; and the use of ICC and ICJ outputs by third states to justify sanctions and arms transfers.

Perspective Note (five traditions in brief):

African (primary). The African perspective on ICC and ICJ accountability is shaped by a long and contested relationship with the Court that cannot be reduced to either enthusiasm or rejection. African states were among the earliest and most numerous ratifiers of the Rome Statute, and African civil society played a significant role in the Court's creation; the first situations referred to the ICC were self-referrals by African governments (Uganda, Democratic Republic of Congo, Central African Republic). Yet the ICC's early docket was overwhelmingly African, generating sustained critique—articulated by the African Union, by scholars such as Mahmood Mamdani, and by African jurists—that the Court functioned as a selective instrument targeting weak states while powerful actors escaped scrutiny. The 2016 withdrawal by Burundi, the threatened withdrawals by South Africa and Kenya, and the AU's 2017 decision calling for collective withdrawal (later softened into a strategy of reform) reflect this tension. The African Court on Human and Peoples' Rights and the Malabo Protocol's proposed African criminal court represent parallel efforts to build regional accountability capacity. From this vantage, the Ukraine case is read with ambivalence: African states largely supported UNGA resolutions condemning aggression, yet the rapid mobilization of ICC and ICJ mechanisms for Ukraine—contrasted with years of inaction on African situations such as Darfur, the Democratic Republic of Congo, and the Sahel—reinforces the perception of a two-tiered system. The African perspective thus contributes a powerful critique of selective enforcement and demands consistency across cases; its occlusion, if taken alone, would be the genuine legal distinctiveness of the Ukraine case (aggression by a permanent member against a neighbor, with extensive documentary evidence) and the real institutional effort to address it, which is not merely Western hypocrisy but a response to a distinctive violation.

Chinese. China's perspective emphasizes sovereignty, non-interference, and the principle that international judicial bodies must not be instrumentalized. Beijing has not joined the Rome Statute and views the ICC with suspicion, particularly after the 2023 arrest warrant for Putin, which China criticized as politicized and as undermining peace negotiations. China supports the ICJ as the principal judicial organ of the UN but stresses

that its jurisdiction requires state consent, that provisional measures should not prejudge the merits, and that judicial processes must not be used to escalate conflict. China's contribution is the insistence on consent-based jurisdiction and on the primacy of political settlement; its occlusion is the difficulty of reconciling non-interference with accountability for cross-border aggression, and the risk that sovereignty rhetoric shields violations.

Russian. Russia's perspective rejects ICC jurisdiction entirely—Russia withdrew its signature from the Rome Statute in 2016—and treats the arrest warrants as illegitimate, politically motivated, and unenforceable. Moscow frames the ICJ proceedings as biased and argues that the Genocide Convention case mischaracterizes Russia's stated rationale for intervention. Russia's contribution is the insistence on sovereign consent and non-party status as shields against external judicial authority; its occlusion is the evasion of accountability for documented conduct and the asymmetry of invoking legal norms (self-determination, genocide prevention) while rejecting the institutions that adjudicate them.

Western. The Western perspective treats the ICC and ICJ as essential pillars of the rules-based order, emphasizing accountability, deterrence, the historical record, and the moral obligation to victims. It supports the arrest warrants, provisional measures, and evidence collection, and frames non-compliance as further evidence of Russia's lawlessness. Its contribution is institutional investment and legal expertise; its occlusion is the risk of over-reliance on institutions that lack enforcement, the inconsistency of Western support for international justice across cases (notably Israel/Palestine), and the tendency to conflate legal authority with political power.

UN. The UN perspective centers on the Charter's framework: the ICJ as principal judicial organ, the Security Council's enforcement role (blocked by veto), and the General Assembly's complementary normative authority. It contributes institutional legitimacy, procedural regularity, and the Uniting for Peace mechanism. Its occlusion is the structural paralysis of enforcement when a permanent member is the respondent, and the gap between the UN's normative aspirations and its coercive capacity.

2.6 KEY IDEA 5 — The politics of international law: UNGA resolutions, ICJ proceedings, and the politics of enforcement

Bolded Causal Claim: In the Ukraine war, international law operates less as a self-executing constraint than as a political resource whose efficacy depends on coalition-building, institutional majorities, and the strategic deployment of legal forums; the gap between legal pronouncement and enforcement is a structural feature of the international legal order, not a malfunction, and is exploited by all parties through lawfare.

Mechanism: The UN General Assembly's emergency special session on Ukraine (ES-11, convened under the "Uniting for Peace" procedure after Russia's veto in the Security Council) produced six resolutions. ES-11/1 (2 March 2022) condemned aggression and demanded withdrawal (141–5–35). ES-11/2 (24 March 2022) addressed humanitarian consequences. ES-11/3 (7 April 2022) suspended Russia from the Human Rights Council (93–24–58). ES-11/4 (12 October 2022) rejected the annexation referenda and affirmed territorial integrity (143–5–35). ES-11/5 (14 November 2022) addressed reparations (94–14–73). ES-11/6 (23 February 2023) affirmed the principles of the Charter (141–7–32). These resolutions carry no binding force under Article 25, which binds Security Council decisions, but they generate normative pressure, legitimate sanctions, frame the conflict in legal terms, and provide a record of state positions that shapes diplomatic coalitions.

ICJ proceedings complement this: Ukraine's 2017 case under the Genocide Convention, expanded post-

2022, and the provisional measures order of March 2022 provide judicial articulation of legal norms even absent enforcement. The ICJ's 2010 advisory opinion on Kosovo's declaration of independence is invoked by both sides—by Russia to argue for consistency, by Western states to distinguish the cases. The politics of enforcement operates through alternative channels: unilateral and collective sanctions (freezing of central bank reserves, SWIFT exclusion, export controls), arms transfers, and domestic legal mechanisms (universal jurisdiction, asset seizure, and the Register of Damage for Ukraine established under the Council of Europe). Lawfare—defined in L26 as the strategic use of legal instruments to achieve political objectives—thus includes both the invocation of international law by Ukraine and its allies and Russia's counter-narratives (genocide claims, self-determination, historical sovereignty, and the Kosovo precedent).

The mechanism of enforcement failure is structural rather than incidental: the Security Council's veto, the ICJ's lack of enforcement machinery, the ICC's dependence on state cooperation, and the General Assembly's non-binding authority. This gap is constitutive of a system that privileges state sovereignty and great-power consent, and it is exploited by all parties. Russia exploits it by ignoring orders while citing legal norms; Western states exploit it by using legal forums to legitimize sanctions and arms transfers; Ukraine exploits it by building a legal record for future reparations and accountability.

Scope Conditions: UNGA resolutions are effective as normative and coalition-building tools when (a) majorities are large and stable, (b) they align with the material interests of key states, and (c) they are coupled with sanctions or other enforcement. They are ineffective as coercive instruments against determined great powers with alternative partners. ICJ proceedings are effective when (a) jurisdiction exists and is not successfully challenged, (b) the respondent values reputational standing, and (c) third states use rulings to justify measures. The politics of enforcement succeeds when coalitions are broad and material leverage exists; it fails when targeted states have alternative partners (China, India, and other Global South abstainers) and when enforcement costs are borne unevenly.

Observable Implications: Voting patterns reveal a stable coalition of roughly 140 states condemning aggression, but significant abstentions (China, India, South Africa, Brazil at various points) and declining support for reparations (94 votes); sanctions regimes implemented by Western and allied states; Russia's continued military operations despite legal condemnation; the use of legal arguments in diplomatic forums; the invocation of Kosovo by Russia and of Charter principles by Ukraine; and the Register of Damage as an institutionalized reparations mechanism.

Perspective Note (five traditions in brief):

African (primary). The African perspective on the politics of international law centers on the inconsistency critique and the demand for equal application, and it is the longest-developed of the five traditions on this point. African states have been among the most vocal critics of selective enforcement: the same legal frameworks invoked against Russia have been applied unevenly to other conflicts, including Israel/Palestine, Western Sahara, and the historical violence of colonialism. The abstentions of several African states on UNGA resolutions—South Africa, for instance, abstained on ES-11/1 and ES-11/4 while condemning aggression in principle—reflect not support for Russia but a refusal to endorse a legal order perceived as instrumentalized by Western powers. African scholarship, including the work of Siba Grovogui, Achille Mbembe, and Mahmood Mamdani, emphasizes that international law has historically served imperial projects and that its current deployment must be read against that genealogy. At the same time, African states have a deep interest in territorial integrity norms, given the continent's colonial borders and the African Union's strong stance against unconstitutional changes of government and secession. The AU's 2022 statement condemning Russia's recognition of Donetsk and Luhansk and its 2022–2023 diplomatic initiatives reflect this commitment.

The African perspective thus contributes both a critique of Western hypocrisy and a substantive commitment to sovereignty norms; its occlusion, if taken alone, would be the genuine distinctiveness of the Ukraine case as a cross-border aggression by a nuclear power, which does demand a response, and the risk that the inconsistency critique paralyzes necessary action.

Chinese. China's perspective frames the politics of international law around sovereignty, non-interference, and the responsibility of NATO expansion. Beijing abstained on key resolutions, arguing that they failed to address root causes and were one-sided. China contributes the argument that legal processes must be accompanied by political settlement, that enforcement must not be monopolized by Western coalitions, and that the selective application of international law undermines its legitimacy. Its occlusion is the difficulty of squaring non-interference with the condemnation of aggression, and the risk that sovereignty rhetoric shields violations.

Russian. Russia's perspective treats international law as a tool of Western hegemony and deploys counter-legal arguments: self-determination, historical sovereignty, genocide prevention, and the Kosovo precedent. Moscow frames UNGA resolutions as politicized and ICJ proceedings as biased. Russia's contribution is the exposure of Western inconsistency and the insistence that legal norms must be applied universally; its occlusion is the use of legal rhetoric to mask territorial conquest and the asymmetry of invoking norms while rejecting institutions.

Western. The Western perspective treats international law as a binding framework and the UNGA and ICJ processes as legitimate expressions of global consensus. It emphasizes the unprecedented scale of condemnation, the legal case for accountability, and the normative importance of territorial integrity. Its contribution is institutional investment and legal expertise; its occlusion is the risk of conflating legal authority with political power, underestimating the legitimacy costs of inconsistency, and treating abstentions as moral failure rather than as reasoned dissent.

UN. The UN perspective centers on the Charter's collective security framework, the General Assembly's role under Uniting for Peace, and the ICJ's judicial function. It contributes institutional procedures, normative standards, and the aspiration of universal membership. Its occlusion is the structural inability to enforce against permanent members, and the gap between the UN's normative aspirations and its coercive capacity.

2.7 FIVE PERSPECTIVES IN DEPTH

2.7.1 African Perspective (PRIMARY) The African vantage point on the lawfare of territorial integrity begins from a historical experience in which international law was not a neutral arbiter but an instrument of empire, partition, and racial hierarchy. For African states and scholars, the Ukraine war is not merely a European territorial dispute; it is a test of whether the post-1945 legal order can restrain great powers or whether it remains a language through which powerful states legitimize their preferences. The African perspective is therefore simultaneously legalist and skeptical: legalist because post-colonial sovereignty depends on the inviolability of borders, skeptical because the enforcement of that principle has been profoundly uneven. This duality is the perspective's distinctive contribution. It refuses both the Western tendency to treat international law as self-executing morality and the Russian tendency to treat law as mere rhetoric. Instead, it asks who has the power to name aggression, who bears the costs of enforcement, and whose territorial anxieties are recognized as security concerns.

At the level of the first key idea, the tension between self-determination and territorial inviolability is read

through the lens of decolonization rather than through the Euro-Atlantic vocabulary of minority rights. African political thought, from Nkrumah's critique of neo-colonialism to Fanon's analysis of colonial violence and Cabral's insistence that liberation must be rooted in the people's culture, treats self-determination primarily as the right of colonized peoples to sovereign statehood, not as a license for sub-state secession. Rodney's account of underdevelopment and Mamdani's analysis of the colonial state reinforce the point: African borders, however arbitrary, became the containers of post-colonial citizenship, and their disruption risks not liberation but fragmentation, warlordism, and external manipulation. Nyerere's defense of inherited colonial boundaries, later codified in the OAU's commitment to territorial integrity, reflects a pragmatic judgment that the alternative to *uti possidetis* is not justice but endless conflict. From this standpoint, Russia's invocation of self-determination for Crimea or the Donbas appears not as an emancipatory claim but as a great-power re-bordering exercise. Yet the African perspective also retains a critical memory of Western interventions justified by self-determination or human rights, from Libya to Kosovo, and therefore resists any simple alignment with NATO's legal narrative. The result is a position that defends territorial integrity as a shield for weak states while insisting that the principle's credibility depends on its universal application.

This is why the second key idea, annexation, carries particular weight. African states have direct experience of territorial seizure, settler colonialism, and externally engineered partition. The annexation of Crimea in 2014 and of four Ukrainian oblasts in 2022 is condemned not only because it violates Article 2(4) of the UN Charter but because it revives a colonial logic of territorial acquisition by force. The African Union's Constitutive Act and the broader post-colonial legal consensus treat territorial integrity as a condition of sovereign equality. At the same time, the African perspective cannot ignore the Kosovo precedent. Western recognition of Kosovo's independence in 2008, after NATO's 1999 intervention, is frequently cited by African governments and scholars as evidence that the West applies self-determination selectively. The inconsistency is not a minor diplomatic embarrassment; it is a structural problem for the normative order. If territorial integrity is absolute when Russia violates it but negotiable when Western powers or their allies are involved, then the norm becomes an instrument of geopolitical alignment rather than a rule of law. African scholarship on global governance, including work by Grovogui on the racialized foundations of international order and by Mbembe on the necropolitics of sovereignty, helps explain why this inconsistency is read not as hypocrisy alone but as a feature of an international system in which some states are treated as subjects of law and others as objects of management. The African perspective thus contributes a historical sociology of legal inconsistency: it shows that the Ukraine war's legal framing is inseparable from longer patterns of imperial and post-imperial power.

The third key idea, the legality of hybrid warfare, is approached from a position of vulnerability rather than abstraction. African states are not the primary theater of the Russia-Ukraine cyber and information war, but they are deeply affected by the broader ecology of deniable force: private military companies, disinformation campaigns, cyber intrusions, and proxy interventions. The Wagner Group's activities in parts of Africa, the manipulation of electoral information environments, and the use of economic coercion all illustrate that hybrid warfare is not a novel Euro-Atlantic problem but a familiar mode of external domination. From an African perspective, the legal debate over whether a cyber operation crosses the use-of-force threshold is not merely technical; it is a question of who gets to define the threshold and whose suffering counts as an armed attack. The Tallinn Manual-style frameworks, developed largely by Western experts, may be analytically useful, but they risk universalizing Euro-Atlantic strategic assumptions. African states often lack the forensic capacity to attribute attacks, the institutional capacity to respond, and the diplomatic leverage to have their attributions accepted. Deniable actors therefore exploit a legal gray zone that is especially dangerous for weaker states. The African contribution here is to insist that lawfare must be evaluated not

only by its doctrinal coherence but by its distributive consequences: a legal regime that permits powerful states to act through proxies while demanding restraint from weaker states reproduces hierarchy under the guise of rules.

The fourth key idea, accountability through the ICC and ICJ, exposes one of the sharpest tensions in the African perspective. On one hand, African states and scholars have been among the most vocal critics of the International Criminal Court, arguing that its docket has disproportionately targeted African situations and that it functions as a tool of Western political pressure. This critique is not a rejection of accountability; it is a demand for impartiality. The ICC's arrest warrants in the Ukraine context, including those against Russian officials, are therefore viewed with a complex mixture of support and suspicion. Support, because the principle that leaders can be held individually accountable for aggression and war crimes is essential to any credible legal order; suspicion, because the same institutions that now pursue Russian officials have been slow or unwilling to pursue accountability for Western or allied conduct in other theaters. The ICJ, by contrast, is often seen as more legitimate because it is a state-to-state forum rooted in the UN Charter and because African states have used it in territorial and maritime disputes. The ICJ case *Ukraine v. Russia*, brought under the Genocide Convention, is significant for African observers not only because of its legal arguments but because it tests whether a great power can be subjected to judicial process at all. The African perspective contributes a demand for consistency: accountability must not be a privilege of the powerful. At the same time, it recognizes the limits of judicialization. Courts cannot enforce their judgments against states that reject their jurisdiction or possess nuclear and conventional deterrents. The lesson is not that law is useless, but that law without political power is fragile, and law with political power risks becoming an instrument of domination.

The fifth key idea, the politics of international law, is where the African perspective is most distinctive and most uncomfortable for Western audiences. UNGA resolutions on Ukraine, from ES-11/1 through ES-11/6, are often cited as evidence of global consensus. The African perspective complicates this reading. Many African states voted in favor of resolutions condemning aggression and affirming territorial integrity, reflecting genuine commitment to the Charter. Yet a significant number abstained on later resolutions, particularly those perceived as escalating, punitive, or disconnected from African priorities. These abstentions are frequently misread in Western commentary as moral failure or Russian influence. The African perspective reframes them as acts of strategic autonomy and as protests against the selective application of international law. African governments ask why the UN system can mobilize emergency sessions, sanctions, and legal accountability for Ukraine but not for conflicts in Africa, Palestine, or other regions. They ask why the Security Council's permanent members can block enforcement when their interests are at stake. They ask why the same states that invoke the Charter in Ukraine have historically undermined it elsewhere. This is not whataboutism in the crude sense; it is a structural critique of the international legal order's legitimacy deficit. Oyěwùmí's critique of epistemic colonialism and Tamale's decolonial legal scholarship remind us that the categories of international law—sovereignty, aggression, self-defense—are not culturally neutral; they are produced within power-laden institutions. The African perspective therefore contributes a demand that lawfare be judged by its capacity to protect the weak, not merely to discipline the adversary of the moment.

What does this perspective occlude? It can understate the agency and suffering of Ukrainians by subordinating their experience to a global critique of Western power. It can risk false equivalence between Russia's annexation of Ukrainian territory and Western interventions that, however flawed, were not always territorially acquisitive in the same way. It can also obscure internal African divisions: African states are not unified, and their votes reflect diverse interests, dependencies, and security calculations. Moreover, by emphasizing

inconsistency, the perspective may inadvertently weaken the very norm of territorial integrity that protects African states. If every invocation of international law is met with a charge of hypocrisy, the normative force of the law erodes for everyone, including those who need it most. The African perspective's strongest counterargument, therefore, is that inconsistency should be a reason to strengthen and universalize the law, not to abandon it. Its enduring contribution is to show that the lawfare of territorial integrity cannot be separated from the politics of global inequality: the same legal principles that protect Ukraine also protect Africa, but only if they are applied without the hierarchies that have historically defined the international order.

2.7.2 Chinese Perspective The Chinese perspective on the lawfare of territorial integrity is anchored in a doctrine of sovereignty that is both principled and strategically calibrated. At its core is the insistence that territorial integrity and non-interference are foundational norms of the UN Charter, not optional constraints that can be waived when powerful states deem it necessary. From Beijing's standpoint, the Ukraine war is not simply a story of Russian aggression; it is also a story of a European security architecture that failed to accommodate legitimate security concerns and of a Western bloc that expanded its military alliance to Russia's borders while invoking international law selectively. This framing does not require endorsing annexation. China has repeatedly stated that the sovereignty and territorial integrity of all states should be respected, including Ukraine's, and it has not formally recognized Russia's annexation of Crimea or the four oblasts. Yet China's abstentions in key UNGA votes, including ES-11/1, and its opposition to sanctions reflect a judgment that the legal and political response to the war has been shaped by NATO's strategic interests rather than by neutral legal principle.

On the first key idea, China treats self-determination as subordinate to territorial integrity in the interstate context. Unlike Russia, which instrumentalizes self-determination to justify territorial change, China's own historical experience—Taiwan, Tibet, Xinjiang, Hong Kong—makes it deeply hostile to secessionist claims. It therefore shares with African states a strong interest in the inviolability of borders. But China also insists on the concept of indivisible security: the security of one state cannot be built at the expense of another. This is the mechanism through which Beijing reframes the war's origins. NATO expansion is presented not as a legal violation but as a political cause that made conflict predictable. The Chinese perspective thus contributes a structural critique of the European security order, arguing that lawfare focused on Russian conduct while ignoring the security dilemma is incomplete. Its occlusion is that this critique can blur the distinction between explaining a conflict and justifying aggression, and it risks treating Ukraine's sovereign choices as subordinate to great-power bargaining.

On annexation, China's position is deliberately ambiguous. It avoids explicit recognition of Russian territorial claims, preserving its legal commitment to territorial integrity, but it also avoids condemning Russia with the clarity that Western states demand. This ambiguity is not merely tactical; it reflects a broader Chinese view that territorial questions should be resolved through negotiation rather than through legal adjudication imposed by adversarial blocs. The Kosovo precedent is invoked, though less aggressively than by Russia, to suggest that Western states have themselves weakened the norm they now defend. China's contribution is to highlight the fragility of territorial integrity when great powers treat it as a tool rather than a rule. Its occlusion is that ambiguity in the face of annexation undermines the very norm China claims to uphold, and it signals to smaller states that Chinese support for their territorial integrity may be conditional on Beijing's strategic interests.

On hybrid warfare, China's perspective is shaped by its own cyber capabilities and its skepticism toward Western attribution practices. Beijing generally opposes the militarization of cyberspace and insists that cyber operations should not be used as pretexts for escalation. It is wary of legal frameworks that allow

powerful states to label deniable operations as armed attacks, because such frameworks can be used to justify intervention. At the same time, China recognizes that deniable actors and information operations are features of modern conflict. Its contribution is to emphasize that thresholds for the use of force must be defined multilaterally, not by Western legal experts alone. Its occlusion is that China's own cyber activities and its tolerance for Russian information operations weaken its credibility as a defender of legal restraint.

On accountability, China is not a party to the Rome Statute and has consistently criticized the ICC as politicized. It views the ICJ as more legitimate but remains cautious about cases that it sees as vehicles for Western political pressure. In *Ukraine v. Russia*, China's interest lies in preserving judicial independence and avoiding precedents that could be turned against itself or its partners. The Chinese perspective contributes a reminder that international courts derive their authority from state consent and that overreach can undermine their legitimacy. Its occlusion is that this skepticism can slide into a defense of impunity for powerful states, including Russia, and can weaken the accountability mechanisms that smaller states need.

On the politics of international law, China's position is that the UN Charter must be applied consistently and that enforcement must not be monopolized by a single bloc. It supports UNGA resolutions in principle but resists those it sees as one-sided or as pretexts for sanctions and intervention. The Chinese perspective reveals the extent to which international law is embedded in great-power competition: legal claims are filtered through alliance structures, and enforcement follows geopolitical fault lines. Its contribution is to insist that a multipolar order requires multilateral legal processes. Its occlusion is that multipolarity without accountability can become a license for all great powers, including China, to act with impunity.

2.7.3 Russian Perspective The Russian perspective on the lawfare of territorial integrity is built on a narrative of historical justice, security necessity, and Western hypocrisy. From Moscow's standpoint, the Ukraine war is not an unprovoked aggression but the culmination of a post-Cold War order in which NATO expanded eastward, Russia was marginalized, and the legal norms of sovereignty were applied in a manner that served Western interests. Russia frames its actions as defensive and restorative: Crimea is presented as historically Russian and as having been transferred to Ukraine in 1954 under Soviet administrative arrangements; the Donbas and southern oblasts are presented as territories whose populations exercised self-determination in the face of a Ukrainian state that, in Russia's telling, became hostile to Russian speakers and aligned with NATO. This narrative is not merely propaganda; it draws on real grievances about NATO expansion and on a legal vocabulary—self-determination, humanitarian intervention, remedial secession—that Western states themselves have invoked in other contexts.

On the first key idea, Russia inverts the usual hierarchy between territorial integrity and self-determination. It argues that Ukraine's territorial integrity cannot be absolute when the state allegedly denies the rights of Russian-speaking populations and when the post-2014 government is portrayed as illegitimate. The Kosovo precedent is central here: if the West could recognize Kosovo's independence after NATO's intervention, Russia argues, then it cannot deny the same logic to Crimea or the Donbas. This is a powerful rhetorical move because it exposes genuine inconsistency in Western practice. The Russian perspective contributes the insight that legal norms are not self-interpreting and that their application is shaped by power. Its occlusion is that it instrumentalizes self-determination to justify military intervention and annexation, and it treats the populations of contested territories as objects of geopolitical bargaining rather than as agents of free choice.

On annexation, Russia claims that the 2014 and 2022 annexations were validated by referenda and that they reflect the will of local populations. Legally, this argument fails under international law because annexation by force is prohibited and because referenda conducted under military occupation lack legitimacy. But the

Russian perspective is not primarily legal in the Western sense; it is historical and political. It treats territory as an extension of national identity and security, and it views the post-Soviet borders as contingent and unjust. The contribution of this perspective is to force a confrontation with the fact that many post-Soviet borders were drawn by imperial administrators and that their legitimacy is not self-evident. Its occlusion is that it replaces one form of imperial border-making with another, and that it denies Ukrainians the same right to territorial integrity that Russia claims for itself.

On hybrid warfare, Russia denies responsibility for many cyber and information operations attributed to it, while simultaneously treating information warfare as a legitimate domain of state competition. It frames Western accusations as lawfare designed to delegitimize Russia and to justify sanctions. The Russian perspective contributes a critique of attribution practices, noting that cyber operations are difficult to trace and that accusations often serve political purposes. Its occlusion is that denial and ambiguity are themselves tools of hybrid warfare, and that Russia's use of deniable actors, including private military companies and proxies, erodes the distinction between war and peace in ways that harm weaker states as well as Ukraine.

On accountability, Russia rejects the jurisdiction of the ICC and has withdrawn from or ignored international legal processes it deems politicized. It views the ICJ case *Ukraine v. Russia* as an abuse of the Genocide Convention and as an attempt to use law as a weapon. The Russian perspective contributes a skepticism toward judicialization that is shared, in different forms, by other non-Western states: courts are not neutral when they are embedded in a political order dominated by adversaries. Its occlusion is that this skepticism becomes a shield for impunity, and that rejecting accountability for aggression undermines the legal protections that Russia itself might need in other contexts.

On the politics of international law, Russia argues that the UN system has been captured by the West and that UNGA resolutions on Ukraine are expressions of bloc politics rather than universal law. It points to Western double standards on Kosovo, Iraq, Libya, and other cases. This critique has real force, but its occlusion is that Russia uses the charge of hypocrisy to justify its own violations rather than to demand consistent application of the law. The Russian perspective's contribution is to expose the politicization of international law; its danger is that it reduces law to power, leaving no normative ground for restraining any state, including Russia.

2.7.4 Western Perspective The Western perspective on the lawfare of territorial integrity presents the Ukraine war as a clear case of aggression against a sovereign state and as a test of whether the post-1945 legal order can survive great-power revisionism. From this standpoint, Russia's annexation of Crimea and the four oblasts is an unambiguous violation of Article 2(4) of the UN Charter, and the international community has a duty to defend Ukraine's territorial integrity through legal, diplomatic, and material means. The West's position is not that international law is perfect; it is that the alternative to defending legal norms is a world in which borders are changed by force. This perspective is strongest when it is self-critical, acknowledging that Western practice has not always lived up to its principles, particularly in Kosovo, Iraq, and Libya. But it insists that inconsistency does not invalidate the norm: the proper response to double standards is to correct them, not to abandon the law.

On the first key idea, the West generally prioritizes territorial integrity over self-determination in the interstate context, while maintaining that internal self-determination—minority rights, autonomy, democratic participation—is the appropriate framework for addressing grievances within states. This is the position articulated by scholars such as Weller (2022), who emphasize that self-determination in the post-colonial era has been largely internalized and that external self-determination leading to secession is exceptional and

heavily constrained. The Western perspective thus rejects Russia's claim that Crimea or the Donbas had a right to secede and join Russia. Its contribution is to provide a coherent legal framework that protects state stability. Its occlusion is that this framework can appear rigid when applied to states with contested legitimacy or severe minority grievances, and it can be perceived as protecting the territorial status quo even when that status quo is unjust.

On annexation, the West's position is unequivocal: annexation by force is illegal and will not be recognized. The non-recognition of Crimea and the four oblasts is a central pillar of Western policy, reinforced by sanctions and diplomatic isolation. The Kosovo precedent is the most difficult point for this perspective. Western states recognized Kosovo's independence after a NATO intervention that lacked Security Council authorization, and they justified it on humanitarian grounds. The West's self-critique, increasingly visible in legal scholarship, acknowledges that Kosovo weakened the consistency of the territorial integrity norm. But it distinguishes Kosovo from Crimea on several grounds: Kosovo followed a decade of repression and international administration; Crimea was annexed by a neighboring power through military force; and Kosovo's recognition was not accompanied by territorial absorption into another state. Whether these distinctions are persuasive outside the West is an open question. The Western perspective's contribution is to articulate a principled non-recognition policy; its occlusion is that this policy can appear as geopolitical enforcement rather than legal consistency.

On hybrid warfare, the West has invested heavily in legal and technical frameworks for attributing cyber operations and defining thresholds for the use of force. The Tallinn Manual process and national attribution statements reflect a belief that law can adapt to new domains. The Western perspective contributes expertise and institutional capacity. Its occlusion is that these frameworks are often developed by Western experts and applied to adversaries, while Western cyber operations are treated as lawful or unacknowledged. This asymmetry fuels the charge of lawfare and undermines the legitimacy of the legal order.

On accountability, the West has been the primary supporter of the ICC and ICJ in the Ukraine context. It views these institutions as essential to ending impunity and as mechanisms for documenting atrocities. The ICJ case *Ukraine v. Russia* and the ICC arrest warrants are seen as evidence that international law can reach even powerful states. Hathaway (2023) and other scholars have emphasized the importance of legal accountability for maintaining the normative order. The Western contribution is institutional investment and legal expertise. Its occlusion is the risk of conflating legal authority with political power, underestimating the legitimacy costs of inconsistency, and treating abstentions as moral failure rather than as reasoned dissent.

On the politics of international law, the West relies on UNGA resolutions, sanctions, and legal proceedings to build a global coalition in defense of Ukraine. It interprets high vote counts as evidence of international consensus. The Western perspective contributes a normative defense of the Charter and a commitment to multilateral institutions. Its occlusion is that it can underestimate the extent to which these institutions are perceived as Western-dominated, and it can mistake procedural majorities for genuine legitimacy. The lesson from the African and Chinese perspectives is that enforcement without legitimacy is fragile.

2.7.5 UN Perspective The UN perspective on the lawfare of territorial integrity is institutional rather than partisan. It begins from the Charter's dual commitments to sovereign equality and territorial integrity, and it seeks to manage the tension between self-determination and non-intervention through procedures rather than through the preferences of any single state. The UN system does not have a single voice on Ukraine; it contains the Security Council, where Russia's veto has blocked enforcement, and the General Assembly, where large majorities have condemned aggression and affirmed territorial integrity. The UN perspective is

therefore defined by a gap between normative aspiration and coercive capacity. It contributes the framework within which all other perspectives operate, but it also embodies the structural weaknesses that make lawfare possible.

On the first key idea, the UN Charter provides the legal vocabulary for both sides of the tension. Article 2(4) prohibits the use of force against territorial integrity, while the decolonization resolutions and human rights covenants affirm self-determination. The UN's historical practice has largely internalized self-determination within existing states, but it has not fully resolved the question of when, if ever, secession is permissible. The Ukraine war has exposed this ambiguity. The UN perspective contributes a procedural approach: disputes should be resolved through peaceful means, and unilateral territorial change by force is prohibited. Its occlusion is that procedures cannot resolve conflicts when a permanent member is a party and when the Security Council is paralyzed.

On annexation, the UN's position is clear in principle and weak in practice. The General Assembly has repeatedly affirmed Ukraine's territorial integrity and condemned annexation, most notably in ES-11/4 and related resolutions. But the Security Council cannot act against Russia because of its veto. This creates a situation in which the UN can name violations but cannot enforce its judgments. The UN perspective contributes the normative clarity of the Charter and the institutional forum of the General Assembly. Its occlusion is that without enforcement, resolutions risk becoming symbolic, and the gap between law and power becomes a source of cynicism.

On hybrid warfare, the UN has struggled to develop legal frameworks for cyber operations and deniable actors. The Group of Governmental Experts and the Open-Ended Working Group have produced norms for responsible state behavior in cyberspace, but these are non-binding and lack enforcement mechanisms. The UN perspective contributes a multilateral forum for developing norms. Its occlusion is that the pace of norm development lags behind technological change, and that powerful states can exploit this gap.

On accountability, the UN supports the ICJ and ICC as complementary mechanisms. The ICJ case *Ukraine v. Russia* is a significant test of the Court's ability to adjudicate disputes involving great powers. The UN perspective contributes institutional legitimacy and a commitment to the rule of law. Its occlusion is that the Court's judgments depend on state compliance, and that the UN cannot compel a nuclear-armed permanent member to submit to judicial authority.

On the politics of international law, the UN is both the arena and the victim of lawfare. UNGA resolutions on Ukraine, from ES-11/1 through ES-11/6, demonstrate the Assembly's ability to express global opinion, but they also reveal its limitations. The UN perspective contributes the aspiration of universal membership and the principle that all states are equal before the law. Its occlusion is the structural inability to enforce against permanent members, and the gap between the UN's normative aspirations and its coercive capacity. The lesson of the Ukraine war, from the UN perspective, is that international law requires not only norms and courts but also a political will to enforce them that the current institutional structure cannot generate.

2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Exposes the Kosovo–Crimea double standard; centers sovereignty as the post-colonial foundational norm; shows that inconsistent application of self-determination delegitimizes the entire rules-based order	May underweight Ukrainian popular agency and the specificity of each case; risks equating all territorial changes regardless of consent or coercion	Sovereignty and non-interference are paramount; self-determination must be applied consistently or it becomes an instrument of power	African states' abstentions in UNGA votes on Ukraine (2014, 2022); AU positions on Western Sahara; the contested reading of the Kosovo ICJ advisory opinion (2010)	Western: Kosovo was a sui generis case of humanitarian emergency and prolonged international administration, not a precedent for forcible annexation
Chinese	Territorial integrity as non-negotiable; NATO expansion as a security-dilemma root cause; "indivisible security" as a systemic principle	Understates Russian agency in choosing war; the NATO-responsibility framing can function as exculpation for aggression	Sovereignty and territorial integrity are foundational; one state's security cannot be purchased at another's expense	China's abstentions in UNGA ES-11 votes; position papers on Ukraine; the Global Security Initiative	Western/Russian: territorial integrity cannot shield aggression; NATO expansion was the sovereign choice of new members, not an imposed threat

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Russian	Historical claims to Crimea and the Donbas; self-determination referenda as legal justification; critique of Western double standards	Referenda held under military occupation; ignores Ukrainian sovereignty and the Budapest Memorandum guarantees	Historical justice and self-determination of Russian-speaking populations; multipolar order against Western hegemony	The 2014 Crimea referendum; Putin's addresses; Russia's ICJ arguments on jurisdiction	Western/UN: referenda under occupation violate international law; self-determination does not permit forcible annexation
Western	Defense of the Charter's prohibition on use of force; ICC/ICJ accountability mechanisms; sanctions as enforcement	Kosovo self-critique: the 1999 intervention and 2008 recognition created a precedent Russia exploits; selective application of international law	Rules-based international order; territorial integrity of Ukraine; accountability for aggression	UNGA ES-11/1 (141 votes); ICC arrest warrants for Putin and Lvova-Belova; ICJ provisional measures (March 2022)	African/Russian: the Kosovo precedent undermines claims of consistency; Western powers have themselves violated territorial integrity
UN	Charter framework; ICJ and ICC as accountability mechanisms; UNGA as forum for global opinion	Structural inability to enforce against permanent members; gap between normative aspiration and coercive capacity	Universal membership; equality of states before the law; peaceful settlement of disputes	UNGA resolutions ES-11/1 through ES-11/6; ICJ provisional measures order (March 2022); ICC arrest warrants	All perspectives: the UN cannot enforce its own norms against a permanent member; the Security Council is paralyzed by veto

2.8 WORKED EXAMPLE (I do)

Case: ICJ Ukraine v. Russia (2017–present) — the Genocide Convention case and its implications for territorial integrity

Levels of analysis. At the *individual* level, the case turns on the legal strategies of named litigators and judges, on the claims made by political leaders about genocide in the Donbas, and on the individual victims whose suffering is invoked by both sides as evidentiary grist. At the *state* level, Ukraine and Russia are the litigants: Ukraine seeks to use the Genocide Convention's compromissory clause to bring Russia before the Court and to delegitimize the factual predicate of the invasion, while Russia contests jurisdiction and argues that the Convention does not regulate the use of force. At the *systemic* level, the case is a test of the ICJ as an institution, of the Genocide Convention as a treaty regime, and of whether the post-1945 legal order can adjudicate a dispute between a permanent Security Council member and a state it has invaded. At the *transnational* level, the case is shaped by international civil society, by legal scholars and NGOs that file amicus-style interventions and commentary, by diaspora communities that mobilize around the proceedings, and by the broader community of states whose recognition practices and voting behavior in the UNGA constitute the political environment in which the judgment will land.

Mechanism section. The mechanism at work is lawfare: the strategic use of legal instruments to achieve objectives that are simultaneously legal, political, and military. Ukraine instituted proceedings in January 2017 under Article IX of the Genocide Convention, alleging that Russia had violated the Convention by falsely accusing Ukraine of committing genocide in the Donbas and by using that fabricated claim to justify its 2022 invasion. The legal architecture is deliberately asymmetrical. Ukraine does not need to prove that Russia committed genocide; it needs to establish that Russia's *claim* of genocide was false and that the Convention cannot be invoked to authorize the use of force. Russia's counter-strategy is jurisdictional: it argues that the Court lacks jurisdiction because the dispute is really about the use of force and territorial integrity, matters outside the Convention's scope, and that Ukraine's application is an abuse of process designed to litigate the war by other means. The mechanism therefore operates on two registers. On the legal register, it tests the interpretive boundaries of the Genocide Convention and the compromissory clause. On the political register, it shapes the narrative environment: a provisional measures order in March 2022 directing Russia to suspend military operations gave Ukraine a legal victory that could be cited in diplomatic forums even though it was not enforced. The mechanism is not adjudication in the domestic sense; it is the production of legal authority that can be mobilized in the political arena. The gap between the order and its enforcement is itself part of the mechanism, because it reveals the dependence of international law on state compliance and on the political will of other states to give legal rulings practical effect. Weller (2022) has argued that the Ukraine litigation exemplifies how states use international courts to crystallize legal norms even where coercive enforcement is unavailable, while Hathaway (2023) has emphasized that accountability mechanisms derive their force not from judicial power alone but from the political coalitions that sustain them.

Perspective reconstruction. The African perspective reads the case as a study in the selective activation of international law. From this vantage point, the Genocide Convention is a genuine legal instrument, but its invocation by Ukraine is intelligible only against the backdrop of a system in which powerful states have historically used legal categories to legitimize intervention while exempting their own conduct. The African critique does not deny that Russia's invasion violated the Charter; it insists that the credibility of the legal process depends on whether the same standards would be applied to Western interventions that have also involved contested claims about humanitarian necessity. The Kosovo precedent looms here: if the ICJ can be asked to adjudicate the legality of Russia's use of force, African jurists ask why no comparable judicial

process followed the 1999 NATO bombing or the 2003 Iraq invasion. The African perspective therefore treats the case as both a legitimate legal proceeding and a test of whether the international legal order can overcome its own history of asymmetric enforcement. It is the longest and most developed of the five perspectives because it alone frames the case as a question about the legitimacy of the legal order itself rather than about the conduct of one party.

The Chinese perspective treats the case as a legitimate but limited legal proceeding that should not be conflated with the political question of the war's origins. Beijing's position is that the Genocide Convention is a serious treaty and that the Court has a role in clarifying its scope, but that the case cannot resolve the underlying security dilemma that produced the conflict. China's abstentions in UNGA votes on Ukraine reflect a judgment that legal proceedings against Russia should not be weaponized to foreclose diplomatic settlement. The Chinese perspective contributes the insight that lawfare can harden positions and reduce the space for negotiation, and it occludes the possibility that legal accountability might itself be a precondition for durable peace.

The Russian perspective treats the case as an illegitimate exercise of lawfare by Ukraine and its Western backers. Moscow argues that the Court lacks jurisdiction, that the Genocide Convention does not cover the use of force, and that Ukraine's application is a political maneuver designed to obtain a legal stamp for a narrative that justifies continued Western military support. Russia's strongest argument is procedural: if the Convention's compromissory clause can be stretched to cover any dispute in which genocide is mentioned, then the clause becomes a general jurisdiction clause over the use of force, which the drafters did not intend. The Russian perspective contributes a genuine interpretive caution about treaty overreach, but it occludes the fact that Russia itself invoked genocide as a justification for invasion, thereby making the Convention's meaning directly relevant.

The Western perspective treats the case as a central pillar of the accountability architecture for the Ukraine war. From this vantage point, the ICJ proceedings complement the ICC's criminal investigations and the UNGA's political resolutions, forming a multi-layered legal response to aggression. The Western view emphasizes that the March 2022 provisional measures order, even if unenforced, established a legal record that Russia's military operations lacked a legal basis under the Genocide Convention. The Western perspective contributes the institutionalist conviction that law, even without immediate enforcement, shapes state behavior over time. Its occlusion is the Kosovo self-critique: the same states that now invoke the ICJ's authority declined to submit their own uses of force to comparable judicial scrutiny, and this asymmetry is visible to the rest of the world.

The UN perspective treats the case as an expression of the Charter's aspiration that disputes be settled by peaceful means, including judicial settlement. The Court's role is not to end the war but to clarify the law, and the UN framework assumes that legal clarification contributes to eventual resolution. The UN perspective contributes the normative commitment to universal judicial process and the principle that even permanent members are subject to legal scrutiny. Its occlusion is structural: the Court has no enforcement mechanism of its own, and its provisional measures depend on the Security Council, where Russia holds a veto. The UN perspective therefore reveals the paradox at the heart of the case: the legal order can produce a ruling against a permanent member, but it cannot compel compliance, and the gap between ruling and enforcement is the space in which lawfare operates.

Explicit adjudication. The Western perspective best explains the *institutional* logic of the case: the ICJ proceedings are intelligible as part of a deliberate strategy to build a multi-layered legal record against Russia, combining the Genocide Convention, the ICC, and UNGA resolutions into a cumulative accountability

architecture. The mechanism of lawfare is most clearly visible from this angle, because it shows how legal instruments are deployed in coordination with diplomatic and military strategy. However, the Western perspective misses what the African perspective captures: the case's legitimacy in the eyes of the global majority depends on whether the legal order can demonstrate that it applies the same standards to all states, including those that have historically used force without judicial consequence. The African perspective therefore provides the necessary corrective, not by denying the legal merits of Ukraine's claim, but by insisting that the case be read as a test of the international legal order's own credibility. The Chinese perspective adds a further caution: even a legally sound proceeding can become an obstacle to peace if it is treated as a substitute for diplomacy. The Russian perspective, despite its procedural objections, correctly identifies the risk of treaty overreach, though it undermines its own credibility by having invoked the very Convention it now seeks to exclude. The UN perspective captures the structural constraint: the case can clarify the law but cannot enforce it. The best-supported synthesis is that the ICJ case is simultaneously a genuine legal proceeding and an instrument of lawfare, and that its ultimate significance will be determined not by the judgment alone but by whether the international community can close the enforcement gap that the case has exposed.

SECTION 2.9 PROBLEM PAIR (We do)

Tasks:

1. **Mechanism identification.** State the precise legal mechanism Russia deploys when it argues that Western recognition of Kosovo but rejection of Crimea is inconsistent. Is it an argument about self-determination, about precedent, or about selective enforcement? Specify which, and identify the analogical structure it relies on.

2. **Scope condition.** The Western "sui generis" defense claims Kosovo is unique. Identify the three scope conditions Western lawyers cite (humanitarian emergency, loss of sovereign legitimacy, international administration) and state which of the five key ideas from this lesson each maps onto.

3. **Levels of analysis.** At which level—individual, state, systemic, or transnational—does the inconsistency argument carry the greatest explanatory weight, and why does it weaken at the other levels?

4. **ICJ advisory opinion.** The ICJ's 2010 advisory opinion on Kosovo held that the declaration of independence was not prohibited by international law. Does this ruling support Russia's position on Crimea? Adjudicate with evidence, specifying what the Court explicitly declined to address.

5. **African perspective.** How does the Kosovo/Crimea double standard affect African states' assessment of the international legal order's legitimacy, drawing on the African perspective's emphasis on sovereignty, consistency, and the critique of power-structured norms?

6. **Falsification.** What evidence would falsify the claim that Western policy is driven by geopolitical interest rather than legal principle? Specify one observable implication that, if observed, would weaken the geopolitical-interest hypothesis.

MODEL ANSWER (continuous prose):

The Kosovo-Crimea comparison is the most frequently invoked inconsistency argument in contemporary international law, and it requires careful disaggregation of legal mechanism, scope condition, and level of analysis. Russia's argument is not primarily about self-determination as a substantive right; it is about precedent

and selective enforcement. Moscow contends that the West established a precedent in 2008—recognizing a unilateral declaration of independence from a sovereign state without that state's consent—and cannot now invoke territorial integrity to deny the same outcome to Crimea. The mechanism is analogical: if Kosovo's secession was lawful or at least tolerated, then Crimea's must be too, absent a principled distinction. This is a legal-formal argument dressed in political rhetoric, and its force depends on whether the cases are genuinely comparable.

The Western "sui generis" defense rests on three scope conditions. First, Kosovo followed a humanitarian emergency: Serbian forces had engaged in ethnic cleansing, and NATO's 1999 intervention—however contested its legality—was framed as protecting a population from atrocities. Crimea in 2014 involved no comparable humanitarian crisis; the Russian-speaking population was not under threat of mass violence. Second, Serbia had forfeited sovereign legitimacy through systematic abuse, whereas Ukraine in 2014 was a functioning democracy with an elected government, however contested its legitimacy after the Maidan transition. Third, Kosovo was administered by the United Nations Interim Administration Mission in Kosovo (UNMIK) for nearly a decade before independence, embedding the process in an international legal framework; Crimea's referendum occurred under Russian military occupation, without international administration or meaningful observation. These scope conditions map onto the lesson's key ideas: the first onto the self-determination versus territorial inviolability tension; the second onto annexation's legality; the third onto the politics of enforcement.

At the level of analysis, the inconsistency argument carries greatest weight at the systemic level. Systemically, the international order's legitimacy depends on consistent application of rules; when powerful states apply self-determination selectively, weaker states perceive hypocrisy, eroding the normative foundation of territorial integrity. At the state level, the argument weakens because Ukraine and Serbia are not equivalent actors—Ukraine did not commit atrocities against its Russian-speaking population, and its territorial integrity was not forfeited. At the individual level, the argument is weakest: the lived experience of Kosovars under Serbian repression differs fundamentally from that of Crimeans under Ukrainian governance. The transnational level introduces complexity: diaspora communities and international civil society have contested both cases, but their influence has been asymmetric.

The ICJ's 2010 advisory opinion on Kosovo does not support Russia's position. The Court held narrowly that the declaration of independence itself was not prohibited by international law; it explicitly declined to address whether secession was lawful, whether recognition was required, or whether Kosovo's independence violated Serbia's territorial integrity. The opinion was procedural, not substantive. Russia's extrapolation—that the ICJ blessed Kosovo's secession and therefore must bless Crimea's—overreads the ruling. The Court's caution was deliberate: it avoided creating a general right of secession. Hathaway's analysis of the politics of international law underscores that advisory opinions are not binding and that their interpretive scope is contested; the Kosovo opinion has been invoked by both sides, but its actual holding favors neither a general right of secession nor a blanket prohibition.

From the African perspective, the Kosovo-Crimea double standard is not merely a legal puzzle but a legitimacy crisis. African states, many of which face secessionist pressures and whose borders were drawn by colonial powers, depend on the principle of territorial integrity for survival. When Western powers recognize Kosovo but condemn Crimea, African observers see not legal principle but geopolitical interest: the West supports self-determination when it serves its strategic goals and territorial integrity when it does not. This inconsistency reinforces the African critique—articulated by scholars such as Grovogui and Mamdani—that international law is not neutral but structured by power. The African vantage point reveals what Western

legalism occludes: the selective application of norms undermines the very order the West claims to defend. African states' abstentions and divided votes in UNGA resolutions on Ukraine partly reflect this skepticism, not sympathy for Russia's aggression.

Falsifying the geopolitical-interest thesis would require evidence that Western recognition decisions track legal criteria rather than strategic alignment. One observable implication: if a Western ally sought secession under conditions identical to Kosovo's (humanitarian emergency, international administration, loss of sovereign legitimacy), Western states would recognize it even at strategic cost; conversely, if a Russian adversary sought secession under Crimea-like conditions, Western states would refuse recognition even when strategically convenient. The absence of such counter-examples—no Western recognition of secession in a strategically costly case, no refusal in a strategically convenient one—would strengthen the geopolitical-interest hypothesis. The available record, including Western support for South Sudan's independence (strategically aligned) and opposition to Somaliland's (strategically inconvenient despite democratic governance), suggests the hypothesis is not easily falsified.

SECTION 2.10 INDEPENDENT MEMO (You do)

(a) Case description (150–200 words):

In 2023, a non-recognized entity in the South Caucasus—governed by a local administration with de facto control since a 1990s war, home to a population that shares ethnicity and language with a neighboring great power—holds a referendum on accession to that great power. The great power's military forces are present in the territory, officially designated as "peacekeepers" under a 2020 ceasefire agreement. The local administration cites the Kosovo precedent and the principle of self-determination; the parent state, internationally recognized, condemns the referendum as illegal and demands territorial integrity. Western states denounce the move as annexation and threaten sanctions; the great power defends it as an exercise of popular will. The ICJ has been requested to issue an advisory opinion. Your memo must determine whether this case is legally closer to Kosovo or to Crimea, and what follows for recognition policy.

(b) Required memo headings (respond to each as a prompt):

- **Mechanism:** Identify the legal mechanism at stake (self-determination vs. territorial integrity) and specify how the presence of foreign military forces affects the threshold analysis for use of force and annexation.
- **Perspective reconstruction:** Reconstruct the positions of African, Chinese, Russian, Western, and UN perspectives on this case, steel-manning each from within its own premises.
- **Historical analogue:** Compare this case to Kosovo (2008) and Crimea (2014), specifying which scope conditions match and which diverge, and state whether the analogy to either is legally sound.
- **Falsifiers:** State what evidence would falsify your conclusion about whether this case is closer to Kosovo or Crimea, including one observable implication at the systemic level.

(c) Self-check line: Did you distinguish description (what happened) from explanation (why it happened), prediction (what will happen), and prescription (what should be done)?

SECTION 2.11 HINGE QUESTION

Question: Which of the following best captures the legal distinction that Western states invoke to justify recognizing Kosovo but rejecting Crimea?

A. Kosovo's declaration of independence was approved by the UN Security Council, while Crimea's was not.

B. Kosovo followed a humanitarian emergency and international administration, whereas Crimea involved annexation by force without comparable conditions.

C. The ICJ ruled that Kosovo's secession was lawful, but has not ruled on Crimea.

D. Russia consented to Kosovo's independence but not to Crimea's.

Correct answer: B

Distractor diagnoses:

- **A is wrong** because the UN Security Council never approved Kosovo's independence; Russia and China opposed it, and the declaration was made unilaterally. This option confuses Security Council authorization with the absence of a veto, misidentifying the institutional mechanism at stake.
- **C is wrong** because the ICJ's 2010 advisory opinion explicitly declined to rule on whether secession was lawful; it addressed only whether the declaration of independence itself violated international law. Treating the opinion as a substantive endorsement of secession overreads its narrow, procedural holding.
- **D is wrong** because Russia opposed Kosovo's independence and continued to recognize it as part of Serbia; Russian consent is not the operative variable. The distinction Western states draw concerns humanitarian conditions and international administration, not the consent of the annexing power.

SECTION 2A — DATA LAB

Table 1 — UNGA Resolutions on Ukraine and Territorial Integrity (2014–2023)

Resolution	Adopted	Vote (Yes / No / Abstain)	Core legal claim
68/262 — Territorial integrity of Ukraine	27 Mar 2014	100 / 11 / 58	Affirms Ukraine's territorial integrity within its internationally recognized borders; declares the 16 Mar 2014 Crimea referendum invalid
ES-11/1 — Aggression against Ukraine	2 Mar 2022	141 / 5 / 35	Deplores the aggression; demands immediate Russian withdrawal; reaffirms sovereignty and territorial integrity

Resolution	Adopted	Vote (Yes / No / Abstain)	Core legal claim
ES-11/2 — Humanitarian consequences	24 Mar 2022	140 / 5 / 38	Demands protection of civilians; calls for humanitarian corridors
ES-11/3 — Suspension of Russia from the Human Rights Council	7 Apr 2022	93 / 24 / 58	Suspends Russia's membership in the HRC
ES-11/4 — Furtherance of remedy and reparation	14 Nov 2022	94 / 14 / 73	Recognizes the need for an international mechanism for reparations for damage caused by the aggression
ES-11/5 — Principles of the Charter of the United Nations	23 Feb 2023	141 / 7 / 32	Reaffirms the principles of the Charter, including territorial integrity and the prohibition on the use of force

Vote figures are as recorded in the official UNGA records; minor discrepancies across secondary tabulations exist.

Table 2 — ICJ Proceedings Involving Ukraine and Russia

Case (short title)	Filed	Provisional measures	Disposition / status
Ukraine v. Russia (CERD/ICSFT) — *Application of the International Convention for the Suppression of the Financing of Terrorism and of the International Convention on the Elimination of All Forms of Racial Discrimination*	16 Jan 2017	Order, 19 Apr 2017 (partial)	Judgment on the merits, 31 Jan 2024 (claims partially upheld; several dismissed)

Case (short title)	Filed	Provisional measures	Disposition / status
Ukraine v. Russia (Genocide Convention) — *Allegations of Genocide under the Convention on the Prevention and Punishment of the Crime of Genocide*	26 Feb 2022	Order, 16 Mar 2022 (Russia must immediately suspend military operations)	Pending; jurisdiction and admissibility phase; Russia has not complied with the provisional-measures order
Russia v. Ukraine (counter-claim, Genocide Convention)	Filed in response	—	Dismissed / not entertained as a separate case; Russia's allegations of genocide in Donbas rejected by the Court's preliminary findings

Table 3 — ICC Arrest Warrants and Recognition Status of Annexed Territories

Item	Date	Status / count
ICC arrest warrant — Vladimir Putin	17 Mar 2023	Outstanding; alleged responsibility for unlawful deportation of children
ICC arrest warrant — Maria Lvova-Belova	17 Mar 2023	Outstanding; same alleged crimes
States recognizing Crimea as part of Russia	2014–present	A small number (Russia, Syria, North Korea, and a few others); near-universal non-recognition
States recognizing the four annexed oblasts (Donetsk, Luhansk, Kherson, Zaporizhzhia)	2022–present	Effectively only Russia and a handful of aligned states; near-universal non-recognition
States that voted "no" on ES-11/1 (2 Mar 2022)	—	5 (Belarus, North Korea, Eritrea, Russia, Syria)

Table 4 — Selected Hybrid-Warfare Incidents (Cyber and Deniable Actors), 2014–2022

Incident	Year	Attribution (public)	Legal characterization contested
NotPetya destructive malware	2017	Attributed to Russian military intelligence (GRU) by multiple states	Whether it constitutes a "use of force" under Article 2(4) UN Charter

Incident	Year	Attribution (public)	Legal characterization contested
Ukraine power-grid cyberattacks	2015, 2016	Attributed to Russian state-linked actors	Whether cyber operations below kinetic threshold trigger self-defense
"Little green men" / unmarked forces in Crimea	2014	Russian special forces (later acknowledged by Putin)	Whether deniable deployment constitutes "armed attack" under Article 51
Pre-invasion cyber operations against Ukrainian government sites	Feb 2022	Attributed to Russian state actors	Whether preparatory cyber operations are part of an armed attack

Analysis Questions

1. **Trend.** The UNGA vote in favor of territorial-integrity resolutions rose from 100 (68/262, 2014) to 141 (ES-11/1, 2022) and held at 141 (ES-11/5, 2023), while "no" votes fell from 11 to 5–7. What does this trajectory suggest about the breadth of the coalition supporting the legal norm of territorial integrity, and what does the persistence of a stable bloc of abstentions (32–58) suggest about the limits of that consensus?

2. **Level of analysis.** The ICJ issued a provisional-measures order on 16 March 2022 requiring Russia to suspend military operations, yet Russia did not comply and the case remains pending. Is this enforcement gap best explained at the state level (Russia's refusal), the systemic level (absence of Security Council enforcement under Chapter VII), or the transnational level (the role of non-state legal advocacy and civil-society documentation)? Justify your answer with evidence from the tables.

3. **Perspective reconstruction (all five).** Reconstruct how each of the five perspectives reads the *same* UNGA vote of 141–5–35 on ES-11/1: (a) African — sovereignty plus the inconsistency critique (Kosovo vs. Crimea); (b) Chinese — territorial integrity plus the NATO-responsibility framing; (c) Russian — self-determination plus historical claims; (d) Western — international-law defense plus the Kosovo self-critique; (e) UN — Charter, ICJ, and the failure of enforcement. For each, state what the vote *confirms* and what it *occludes*.

4. **Interpretation.** Does the near-consensus UNGA vote create a binding legal obligation on states to non-recognize the annexed territories, or does it remain a political expression of opinio juris? Distinguish the legal status of UNGA resolutions (recommendatory under Articles 10–14) from the customary-international-law status of the non-recognition principle, citing the 1970 Declaration on Principles of International Law and the ICJ's *Namibia* advisory opinion as the relevant doctrinal anchors.

5. **Limitation.** The tables capture formal votes, judicial filings, and arrest warrants, but they do not capture: (a) the volume of state practice of non-recognition in bilateral treaties and diplomatic correspondence; (b) the economic and military assistance flows that constitute the material enforcement of the norm; (c) the domestic legal proceedings in third states. What is the most important thing these

data *cannot* tell us about whether the law of territorial integrity is actually being enforced?

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — "The Territorial-Integrity Triangle" **What to draw.** A large equilateral triangle on a white-board or page. At each vertex, place a bold label: top vertex — "TERRITORIAL INVIOLABILITY (Art. 2(4))"; bottom-left vertex — "SELF-DETERMINATION (Art. 1(2), ICCPR Art. 1)"; bottom-right vertex — "EFFECTIVE CONTROL / FACTS ON THE GROUND." Draw the three sides as thick lines. Inside the triangle, draw a smaller, shaded triangle labeled "LAWFARE ZONE — where legal claims are deployed to legitimize or contest control." Place a small circle at the centroid labeled "UKRAINE 2014–2024."

How to label it. Along the left side, write "Kosovo 2008 (West: self-determination prevails)"; along the right side, write "Crimea 2014 (Russia: self-determination prevails)"; along the base, write "Donbas 2022 (Russia: historical/ethnic claim)." Add arrows showing which vertex each case pulls toward.

Perspective overlay to annotate. In a margin box labeled "AFRICAN (primary)," write: "The triangle is not neutral — the vertex that 'wins' depends on who controls the Security Council and the recognition practice of former colonial powers. Kosovo and Crimea are structurally identical claims adjudicated by power, not by principle." In smaller margin boxes: "CHINESE: all three vertices must yield to sovereignty and non-interference"; "RUSSIAN: self-determination vertex is underweighted in Western practice"; "WESTERN: effective control must never ripen into title (Stimson Doctrine)"; "UN: the Charter is the triangle's frame; enforcement is the missing side."

Visual 2 — "UNGA Vote Map (ES-11/1, 2 March 2022)" **What to draw.** A simple world map (Mercator or Robinson projection) on a large sheet. Shade countries in three colors: dark green for "Yes" (141), red for "No" (5), and light gray for "Abstain" (35). Use a legend in the bottom-left corner. Draw a small inset box listing the five "No" votes: Belarus, North Korea, Eritrea, Russia, Syria.

How to label it. Title the map "ES-11/1: Aggression against Ukraine — 141-5-35." Add a subtitle: "The largest UNGA majority on a use-of-force question since the Korean War era." Place a callout over Africa noting the abstention pattern (several African states abstained, reflecting non-alignment and the Kosovo-inconsistency critique). Place a callout over Asia noting China's abstention and its "NATO responsibility" framing.

Perspective overlay to annotate. Draw five small flag-icons or lettered boxes around the map's border: "A — African: the map shows sovereignty consensus but hides the Kosovo double standard"; "C — Chinese: abstention is not neutrality; it is a vote against unilateral sanctions logic"; "R — Russian: the five 'no' votes are the honest minority"; "W — Western: the green majority is the rules-based order speaking"; "U — UN: the map is a snapshot of political will, not a measure of enforceable law." Add a final annotation: "What the map cannot show: the 35 abstentions include states that reject the aggression but refuse to endorse a resolution they read as Western-led."

Visual 3 — "The Lawfare Stack" **What to draw.** A vertical stack of five horizontal bands, bottom to top, each a different color: (1) bottom band — "UN CHARTER (Arts. 2(4), 51, 2(7)) — the constitutional floor"; (2) "CUSTOMARY LAW (non-recognition, *Namibia* advisory opinion, Stimson Doctrine)"; (3) "TREATY LAW (Genocide Convention, CERD, ICSFT, Geneva Conventions)"; (4) "JUDICIAL BODIES (ICJ, ICC)

— adjudication without enforcement"; (5) top band — "POLITICAL BODIES (UNGA, Security Council) — resolutions and vetoes." Draw vertical arrows between bands labeled "claim" (upward) and "enforcement gap" (downward, dashed). On the right side, draw a bracket labeled "WHERE LAWFARE OPERATES" spanning bands 3–5.

How to label it. On the left, annotate each band with the relevant case: Charter → "Russia's Art. 51 self-defense claim (rejected)"; Customary → "Non-recognition of Crimea"; Treaty → "Ukraine v. Russia (Genocide Convention)"; Judicial → "ICC arrest warrants (unexecuted)"; Political → "ES-11/1 through ES-11/6." Add a small "LEAK" icon (dashed circle) at the junction between bands 4 and 5 labeled "Enforcement leak: no Chapter VII resolution possible (veto)."

Perspective overlay to annotate. Bottom margin: "AFRICAN (primary): the stack is hierarchical in theory but flat in practice — the top band (Security Council) is captured by the P5, so the lower bands carry the normative weight for the Global South." Side margin: "CHINESE: the stack must be read with the NATO-expansion layer added beneath the Charter"; "RUSSIAN: the stack's treaty band is weaponized against Russia while Western violations (Kosovo) are shielded"; "WESTERN: the stack is the rules-based order; the leak is a design flaw, not a feature"; "UN: the stack is the system's architecture; the leak is the system's central pathology."

SECTION 4 — CORNELL NOTES

Cue (prompt)	Notes (with source log)
What is the core tension in the Ukraine war's legal architecture?	Self-determination (Art. 1(2) UN Charter; ICCPR Art. 1) vs. territorial inviolability (Art. 2(4)). Both are Charter principles; neither is hierarchically superior in the text. The tension is resolved in practice by power and recognition, not by adjudication. *Source: UN Charter; Weller (2022).*
What makes Crimea's 2014 annexation legally distinct from Kosovo's 2008 independence?	Crimea: annexation by a neighboring state following military intervention; rejected by UNGA 68/262 (100-11-58). Kosovo: unilateral declaration of independence after NATO intervention; recognized by ~100 states, rejected by Russia, China, and others. The structural difference (annexation vs. secession) is the Western legal distinction; the African critique is that both are products of great-power intervention. *Source: UNGA 68/262; Weller (2022).*

Cue (prompt)	Notes (with source log)
What is the "use of force" threshold problem in hybrid warfare?	Cyber operations and deniable actors (little green men, GRU-linked malware) sit below the kinetic threshold of Art. 2(4) and Art. 51. The Tallinn Manual 2.0 framework (not a treaty) proposes that cyber operations causing physical damage may constitute use of force, but state practice is unsettled. Deniability breaks the attribution chain required for self-defense. *Source: Tallinn Manual 2.0 (Schmitt, ed.); Hathaway (2023).*
What did the ICJ order on 16 March 2022?	Provisional measures: Russia must immediately suspend military operations in Ukraine. Russia did not comply. The order is binding but lacks enforcement absent Security Council action (blocked by veto). *Source: ICJ, Ukraine v. Russia (Genocide Convention), Order of 16 Mar 2022.*
What is the Genocide Convention case's actual legal theory?	Ukraine alleges Russia abused the Genocide Convention by falsely claiming genocide in Donbas to justify invasion. The case is about misuse of a treaty, not about adjudicating whether genocide occurred. This is a lawfare strategy: using the Convention's compromissory clause (Art. IX) to bring a use-of-force dispute before the ICJ. *Source: ICJ pleadings; Hathaway (2023).*
What are the ICC arrest warrants (Mar 2023)?	Warrants for Putin and Lvova-Belova for alleged unlawful deportation of children. Outstanding; execution depends on state cooperation. Russia is not a Rome Statute party and rejects jurisdiction. *Source: ICC, Pre-Trial Chamber II, 17 Mar 2023.*
How does the African perspective frame the lawfare of territorial integrity?	Sovereignty is non-negotiable (post-colonial imperative), but the Kosovo/Crimea inconsistency reveals that legal outcomes track power, not principle. African states' abstentions reflect refusal to endorse a selectively enforced norm. *Source: Grovogui; Mamdani; Nkrumah (cited in lesson framework).*
How does the Chinese perspective frame it?	Territorial integrity is affirmed, but the root cause is NATO expansion and Western disregard for Russian security concerns. China abstained on ES-11/1 and opposes sanctions as unilateral. *Source: Chinese MFA statements; UN voting record.*

Cue (prompt)	Notes (with source log)
How does the Russian perspective frame it?	Self-determination of Russian-speaking populations; historical claims to Crimea and Donbas; Kosovo as precedent; Western hypocrisy. *Source: Russian MFA; Putin speeches (2014, 2022).*
How does the Western perspective frame it?	Defense of the rules-based order; Kosovo is sui generis (remedial secession after atrocities); Crimea is annexation by force. Western self-critique acknowledges the Kosovo precedent is exploited by Russia. *Source: Weller (2022); Hathaway (2023).*
What is the UN perspective's central diagnosis?	The Charter provides the normative framework (Arts. 2(4), 51, 2(7)), the ICJ and ICC provide adjudication, but enforcement fails because the Security Council is paralyzed by the veto. The system's legitimacy depends on UNGA moral authority and state practice of non-recognition. *Source: UN Charter; ICJ/ICC records.*
What is the "Stimson Doctrine" and its relevance?	The 1932 doctrine of non-recognition of territorial changes achieved by force. Revived in the Ukraine context: states refuse to recognize Crimea and the four oblasts. It is customary law, not treaty law, and its enforcement is political. *Source: Stimson (1932); ICJ Namibia advisory opinion (1971).*

Source log: UN Charter (1945); UNGA Resolutions 68/262, ES-11/1–ES-11/6; ICJ, Ukraine v. Russia (Genocide Convention), Order 16 Mar 2022; ICJ, Ukraine v. Russia (CERD/ICSFT), Judgment 31 Jan 2024; ICC Pre-Trial Chamber II, 17 Mar 2023; Weller (2022); Hathaway (2023); Tallinn Manual 2.0; ICJ Namibia advisory opinion (1971).

Summary (3–5 sentences). The lawfare of territorial integrity in the Ukraine war turns on an unresolved Charter tension between self-determination and territorial inviolability, adjudicated through ICJ and ICC proceedings that lack enforcement, and legitimized or contested through UNGA resolutions whose near-unanimous majorities mask a stable bloc of abstentions. The Kosovo precedent is the central rhetorical weapon in this lawfare, exploited by Russia and acknowledged as a vulnerability by Western scholars. Hybrid warfare (cyber, deniable actors) exploits the gap between the use-of-force threshold and attribution requirements. The African perspective reframes the entire debate as a question of selective enforcement by former colonial powers, while the UN perspective diagnoses a structural enforcement failure rooted in the Security Council veto.

SECTION 5 — FEYNMAN COMPRESSION

Step 1 — Explain without jargon. Imagine two neighbors. One neighbor has a fence around a garden. The other neighbor says, "That garden used to belong to my family, and the people inside want to join me." The

first neighbor says, "The fence is the law; you cannot cross it." Both neighbors can quote rules. The rules say "don't cross fences" and also "people can choose their government." The Ukraine war is this argument scaled to states: Russia says it is protecting Russian-speakers and that Crimea voted to join Russia; Ukraine and most of the world say the fence (the border) is sacred and cannot be moved by force. Courts exist to settle this, but the courts have no police. So the argument is settled by who has more friends and more power, while everyone pretends it is settled by law.

Step 2 — Mark gaps. My explanation leaves out: (a) the specific legal instruments (UN Charter Articles 2(4) and 51, the Genocide Convention's compromissory clause); (b) why the ICJ case is about *misuse* of the Genocide Convention rather than about genocide itself; (c) the hybrid-warfare layer (cyber, deniable actors) that makes the "fence" metaphor too simple; (d) the African critique that the fence was drawn by colonial powers and is enforced selectively; (e) the enforcement gap (veto) that makes court orders non-binding in practice.

Step 3 — Reread verification. Re-reading the core material confirms: the ICJ's 16 March 2022 order required Russia to suspend military operations and was not complied with; the Genocide Convention case turns on Russia's alleged abuse of the Convention as a pretext; UNGA ES-11/1 passed 141-5-35; only five states voted "no"; the Kosovo precedent is acknowledged by Western scholars as a rhetorical vulnerability; hybrid warfare operates below the Article 2(4) threshold. The Feynman explanation captured the structural tension but underweighted the hybrid and enforcement dimensions.

Step 4 — Analogy with explicit limits. The fence analogy works for the territorial-inviolability vs. self-determination tension and for the enforcement gap (courts without police). It fails on three points: (1) it treats borders as natural rather than as products of historical violence and colonial cartography, which the African perspective insists upon; (2) it cannot represent hybrid warfare, where the "fence" is attacked by invisible means (cyber, deniable actors) that do not look like fence-crossing; (3) it implies a bilateral dispute, whereas the Ukraine war is a systemic crisis involving NATO, the EU, the Global South, and the UN architecture. The analogy is a pedagogical scaffold, not a theory.

Step 5 — Rewrite. The lawfare of territorial integrity is the use of legal instruments — Charter principles, treaty clauses, ICJ and ICC proceedings, UNGA resolutions — to contest or legitimize control over territory in the Ukraine war. The core tension is between self-determination and territorial inviolability, both Charter principles, neither hierarchically superior. Russia deploys self-determination and historical claims; Ukraine and its allies deploy territorial inviolability and the Stimson Doctrine of non-recognition. The ICJ and ICC provide adjudication without enforcement, because the Security Council veto blocks Chapter VII action. Hybrid warfare (cyber operations, deniable actors) exploits the gap between the use-of-force threshold and attribution requirements. The Kosovo precedent is the central rhetorical weapon, exploited by Russia and acknowledged by Western scholars as a vulnerability. The African perspective reframes the entire debate as selective enforcement by former colonial powers; the Chinese perspective adds NATO responsibility; the Russian perspective asserts self-determination; the Western perspective defends the rules-based order while self-critiquing Kosovo; the UN perspective diagnoses a structural enforcement failure. The data show near-unanimous UNGA support (141-5-35) for territorial integrity, but a stable bloc of abstentions and non-compliance with ICJ orders reveal that legal consensus does not equal enforcement.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L37	Definition	What is the core tension between self-determination and territorial inviolability in the Ukraine war?	Self-determination claims a people's right to choose its political status, while territorial inviolability protects existing borders; the Ukraine war forces a choice between them because Russia invokes self-determination for Russian-speakers and Ukraine invokes territorial integrity for its 1991 borders.	African scholars read this as a colonial-era double standard: the same powers that enforced borders in Africa now invoke self-determination selectively.
L37	Mechanism	How does annexation convert military control into legal claim?	Annexation is the formal incorporation of territory into a state's sovereign domain, typically via domestic legislation and referendum; it attempts to transform de facto control into de jure title, but under international law it is void if achieved by force.	Western and UN perspectives treat annexation by force as per se illegal under Article 2(4); Russia treats it as an expression of popular will.

Tag	Card Type	Front	Back	Perspective Note
L37	Application	What legal status did the international community assign to Crimea's 2014 annexation?	The annexation was rejected as illegal by UNGA Resolution 68/262 and by most states, which continued to recognize Crimea as Ukrainian territory; only a handful of states recognized Russian sovereignty.	African states largely supported 68/262, framing it as defense of the anti-colonial norm that borders should not be changed by force.
L37	Application	What happened legally when Russia annexed four Ukrainian oblasts in September 2022?	Russia declared Donetsk, Luhansk, Kherson, and Zaporizhzhia part of its territory after referenda held under occupation; UNGA Resolution ES-11/4 condemned the move and demanded reversal, and most states refused recognition.	Chinese and African perspectives stressed that referenda under occupation lack legal validity, while Russia cited self-determination.
L37	Source	What is the ICJ Ukraine v. Russia (2017) case about?	Ukraine alleged that Russia violated the Genocide Convention and financed terrorism in eastern Ukraine and Crimea; the ICJ issued provisional measures in 2017 and later addressed jurisdiction and merits in stages.	The case illustrates how lawfare converts territorial disputes into legal proceedings, though enforcement depends on state compliance.

Tag	Card Type	Front	Back	Perspective Note
L37	Debate	What is the use-of-force threshold problem in hybrid warfare?	Cyber operations and deniable actors may fall below the Article 2(4) threshold of "armed attack," creating legal ambiguity about when self-defense is triggered and who bears responsibility.	Western lawyers debate attribution standards; Russia exploits ambiguity through proxies; the UN Charter framework struggles to keep pace.
L37	Reconstruction	How does the African perspective frame the Ukraine war's legal dimensions?	African scholarship emphasizes sovereignty as a hard-won post-colonial achievement and critiques the inconsistency of Western powers that recognized Kosovo but reject Crimea, revealing lawfare as geopolitically selective.	This is the primary lens: it shows what Western legalism occludes about the politics of recognition.
L37	Occlusion	What does the Chinese perspective occlude in its Ukraine stance?	China's emphasis on territorial integrity and NATO responsibility occludes its own strategic interest in non-interference norms and its reluctance to condemn a partner, narrowing the space for accountability.	Chinese framing contributes the NATO-expansion critique but underweights Russian agency.

Tag	Card Type	Front	Back	Perspective Note
L37	Adjudication	What do UNGA resolutions on Ukraine demonstrate about international law?	Resolutions ES-11/1 through ES-11/6 show broad but not universal condemnation of aggression and annexation, revealing law as a political instrument whose enforcement depends on power and coalition-building.	UN perspective: resolutions express collective will but lack binding force absent Security Council action.
L37	Visual	What are the four levels of analysis applied to the ICJ case?	Individual (leaders' decisions), state (Ukraine and Russia's legal strategies), systemic (UN Charter order), and transnational (alliances, sanctions, third-party support) all shape the case's trajectory.	Each perspective weights levels differently: African stresses systemic inequality, Western stresses state compliance.
L37	Definition	What is lawfare in the territorial-integrity context?	Lawfare is the use of legal instruments and processes as tools of conflict, including litigation, sanctions, and recognition politics, to achieve strategic objectives without or alongside military force.	All five perspectives use lawfare, but assign legitimacy differently.

Tag	Card Type	Front	Back	Perspective Note
L37	Mechanism	How do ICC arrest warrants function as lawfare?	ICC warrants, such as those issued for Russian officials, create legal and diplomatic pressure, restrict travel, and stigmatize targets, but depend on state cooperation for execution.	Western perspective sees accountability; Russian perspective sees politicization; African perspective notes selective enforcement.
L37	Application	Why is the Kosovo precedent central to the lawfare debate?	Western recognition of Kosovo's 2008 independence is cited by Russia to justify Crimea, while the West distinguishes Kosovo as a remedial secession after atrocities and NATO intervention.	The inconsistency is the African and Russian critique's sharpest weapon.
L37	Source	What does Weller (2022) contribute to this debate?	Weller analyzes the legal dimensions of the Ukraine conflict, including self-determination, territorial integrity, and the limits of international legal order under great-power contestation.	Provides a Western-legalist framework that African scholars critique for underweighting power asymmetry.

Tag	Card Type	Front	Back	Perspective Note
L37	Source	What does Hathaway (2023) add?	Hathaway examines how international law is invoked, contested, and enforced in the Ukraine war, highlighting the gap between legal norms and political enforcement.	Bridges Western legalism and realist skepticism about enforcement.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence Audit (score 0–100)

Competency	Self-rated confidence (0–100)	Evidence of mastery you can cite
Explain the self-determination vs territorial inviolability tension		
Analyze the legality of Crimea's 2014 annexation		
Analyze the legality of the four oblasts' 2022 annexation		
Assess the use-of-force threshold in hybrid warfare		
Evaluate ICC and ICJ mechanisms and their limits		
Reconstruct all five perspectives on territorial-integrity lawfare		
Apply the framework to the Kosovo precedent		
Interpret UNGA resolution voting patterns		
Distinguish description, explanation, prediction, prescription		

7.2 Three-Question Debrief

1. Which of the five perspectives did you find hardest to steel-man from within, and what specific claim within it resisted your reconstruction?
2. State one mechanism from this lesson that you can now explain without notes, and identify the scope condition that most limits it.

3. What single piece of evidence, if it emerged, would most strongly falsify your current conclusion about whether international law constrains great-power territorial aggression?

7.3 Error-Log

Common Misconception	Correction	Evidence
"UNGA resolutions are legally binding on all states."	UNGA resolutions express collective political will but are not binding under the Charter; enforcement requires Security Council action or state practice.	Charter Articles 10–14; ES-11/1 through ES-11/6 adopted under Uniting for Peace but still non-binding.
"The ICJ can enforce its judgments against Russia."	The ICJ lacks enforcement power; compliance depends on state will and Security Council referral, which is blocked by veto.	ICJ Ukraine v. Russia provisional measures; Article 94 of the Charter.
"Kosovo and Crimea are legally identical cases."	Kosovo involved prolonged atrocities, NATO intervention, and a UN administration; Crimea involved covert military intervention and a rapid referendum under occupation.	Weller (2022); differing factual predicates and international responses.
"Self-determination always justifies secession."	Self-determination is primarily an internal right; external secession is exceptional and contested, especially where it violates territorial integrity.	ICJ Kosovo advisory opinion (2010); Charter Article 2(4).
"Hybrid warfare is entirely outside international law."	Cyber and proxy operations are increasingly addressed by state practice and Tallinn Manual frameworks, though thresholds remain unsettled.	Hathaway (2023); evolving attribution standards.
"ICC arrest warrants guarantee accountability."	Warrants depend on state cooperation for arrest and surrender; non-party states and political resistance limit execution.	ICC Rome Statute Articles 86–89; Russian officials remain at large.
"African states uniformly support Russia."	African positions are heterogeneous; many supported UNGA resolutions condemning aggression while criticizing Western inconsistency.	ES-11/1 voting records; African Union statements.

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Self-determination; territorial inviolability; annexation; lawfare; hybrid warfare; recognition politics	Annexation converts control to claim via domestic law; ICC warrants create diplomatic pressure; UNGA resolutions mobilize collective condemnation; cyber operations exploit force thresholds	Weller (2022); Hathaway (2023); Grovogui; Mbembe; Mamdani; Nkrumah	Crimea 2014; four oblasts 2022; ICJ Ukraine v. Russia; ICC warrants; UNGA ES-11/1–ES-11/6; Kosovo 2008	Kosovo vs Crimea consistency; binding force of UNGA resolutions; hybrid warfare thresholds; ICC selectivity	A binding enforcement mechanism emerging; universal recognition of annexed territories; ICC execution of warrants; consistent application of self-determination	L2 Charter; L26 lawfare; L35 post-Soviet ontology; L39 European security; L44 proxy warfare; L45 nuclear proliferation

SECTION 9 — REVIEW SCHEDULE

- **R1 (Day 1, 20 min):** Re-read Section 2.2 and 2.3; recite the self-determination vs territorial inviolability tension and the annexation mechanism aloud without notes.
- **R2 (Day 3, 30 min):** Complete the Problem Pair (Kosovo precedent) from memory, then compare with the model answer; log gaps in the error-log.
- **R3 (Day 7, 45 min):** Reconstruct all five perspectives on the ICJ case in writing, 3–5 sentences each, and check against Section 2.8.
- **R4 (Day 14, 60 min):** Re-run the Data Lab tables; explain one trend, one level of analysis, and one limitation without consulting notes.
- **R5 (Day 30, 90 min):** Write a 500-word memo applying the framework to a new case (e.g., a hypothetical annexation), including mechanism, perspective reconstruction, historical analogue, and falsifiers.

SECTION 10 — COMPLETION CHECKLIST

☐ I can define self-determination and territorial inviolability and state their tension.
☐ I can explain the annexation mechanism and its legal voidness under force.
☐ I can analyze Crimea 2014 and the four oblasts 2022 with dates and resolutions.
☐ I can assess the use-of-force threshold problem in hybrid warfare.
☐ I can evaluate ICC and ICJ mechanisms and their enforcement limits.
☐ I can reconstruct the African perspective as primary and longest.
☐ I can steel-man the Chinese, Russian, Western, and UN perspectives.
☐ I can apply the framework to the Kosovo precedent.

☐ I can interpret UNGA ES-11/1 through ES-11/6 voting patterns.
☐ I can distinguish description, explanation, prediction, and prescription.
☐ I have completed the Problem Pair and checked against the model answer.
☐ I have drafted the Independent Memo with all four required headings.
☐ I have answered the Hinge Question and diagnosed my distractor.
☐ I have filled in the confidence audit with evidence.
☐ I have updated the error-log with at least one new entry.
☐ I can draw the three visuals from Section 3 from memory.
☐ I can recite the five key ideas in order.
☐ I have scheduled R1–R5 in my calendar.

FURTHER READING (Optional)

Legal foundations and Charter order - ICJ, *Application of the International Convention for the Suppression of the Financing of Terrorism and of the International Convention on the Elimination of All Forms of Racial Discrimination (Ukraine v. Russian Federation)*, provisional measures (2017) and subsequent orders. - United Nations General Assembly, Resolutions ES-11/1 through ES-11/6 (2022–2023).

Annexation and recognition - Weller, M. (2022), *The Ukraine Crisis and International Law*. - Hathaway, O. (2023), *International Law and the Ukraine War*.

Self-determination and territorial integrity - ICJ, *Accordance with International Law of the Unilateral Declaration of Independence in Respect of Kosovo*, Advisory Opinion (2010). - Crawford, J. (2006), *The Creation of States in International Law*.

Hybrid warfare and use of force - Schmitt, M. (ed.) (2017), *Tallinn Manual 2.0 on the International Law Applicable to Cyber Operations*. - Hathaway, O. and Shapiro, S. (2017), *The Internationalists*.

African and post-colonial perspectives - Grovogui, S. (1996), *Sovereigns, Quasi Sovereigns, and Africans*. - Mamdani, M. (2009), *Saviors and Survivors*. - Nkrumah, K. (1965), *Neo-Colonialism: The Last Stage of Imperialism*.

39. Political Economy of Coercion: Sanctions, Energy, and Supply Chains

LESSON METADATA

Field	Value
Lesson number and title	Lesson 38: Political Economy of Coercion: Sanctions, Energy, and Supply Chains
Module	Module 6: Eastern Europe and the Ukraine War
Prerequisites	L18 (Weaponized Interdependence), L19 (Energy), L36 (Ukraine War)
Interleaved links	Forward to L39 (European Security), L46 (Hydrocarbons), L52 (Semiconductors)

Field	Value
Reading load	7-9 hours
Content channels	Text, data tables, worked example, problem pair, independent memo, visuals, flashcards
Bloom ceiling	Evaluate / Create
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

The central puzzle of this lesson is deceptively simple: why did the most comprehensive coercive economic package assembled in modern history—the 2022 sanctions regime against Russia—produce results that were simultaneously devastating and disappointing? On one side of the ledger, the European Union cut its dependence on Russian pipeline gas from roughly forty percent of total imports to under ten percent within eighteen months; Russian central-bank reserves were frozen; the ruble initially collapsed; and Moscow was expelled from the SWIFT messaging system for most of its major banks. On the other side, Russian GDP contracted by far less than the double-digit declines forecast in early 2022; Russian oil export revenues recovered to near-pre-war levels within a year through shadow-fleet tankers and price discounts to India and China; and the Russian state found ways to import semiconductors, machine tools, and dual-use components through parallel trade corridors running through Turkey, the United Arab Emirates, and Central Asia. The puzzle is not whether sanctions "worked" in some binary sense, but how to theorize a form of power that is simultaneously structural and self-undermining, that redistributes costs to parties who never chose to be targets, and that accelerates the very fragmentation of the global economy it was meant to police. This lesson teaches you to hold that puzzle in analytical suspension rather than resolving it prematurely into either triumphalism or cynicism.

The lesson sits at a hinge point in the curriculum. Prerequisites L18 on weaponized interdependence and L19 on energy established the theoretical vocabulary: Farrell and Newman's argument that global networks create chokepoints which states can weaponize, and the broader insight that interdependence is not merely a constraint on conflict but a resource for coercion. L36 on the Ukraine war supplied the triggering event. What this lesson adds is the political economy of how coercion is actually designed, implemented, adapted to, and evaluated—moving from the abstract claim that networks are weaponizable to the concrete question of what happens when a great power tries to weaponize all of them at once. The forward links to L39 on European security, L46 on hydrocarbons, and L52 on semiconductors mean that the mechanisms studied here are not self-contained; they reappear in European defense planning, in global energy-market restructuring, and in the US-China technology competition. You should read this lesson as a node in a network of lessons, not as a standalone module.

The theoretical stakes are high because the 2022 experience has become a Rorschach test for competing paradigms in international political economy. Liberals who emphasized interdependence as a peace-inducing force have had to confront the weaponization of that same interdependence; realists who predicted that sanctions would fail because Russia could reroute trade have had to explain why European decoupling happened so fast; constructivists who focused on normative stigma have had to account for the rapid normalization of Russian oil purchases by non-Western buyers. Nicholas Mulder's historical work on sanctions in the interwar period reminds us that the gap between economic pressure and political capitulation is not a bug but a feature

of coercive diplomacy: sanctions compress the target's economy, but compression does not automatically translate into the specific political concession the sender demands. Elizabeth Ashford's more recent analysis of sanctions effectiveness argues that the design question—targeted versus comprehensive, unilateral versus multilateral, with or without humanitarian carve-outs—matters as much as the magnitude of pressure. The lesson therefore trains you to disaggregate "sanctions" into design choices, each with its own causal logic and its own failure modes.

Energy is the domain where these abstractions become most concrete and most costly. The Nord Stream pipelines were not merely infrastructure; they were the physical embodiment of a thirty-year European bet that economic integration with Russia would produce political moderation. When that bet failed, the physical infrastructure became a liability: the September 2022 sabotage of Nord Stream 1 and 2 turned a gradual de-coupling into an abrupt rupture, and European gas prices spiked to levels that threatened deindustrialization in Germany's chemical sector. The oil price cap—set at sixty dollars per barrel and enforced through maritime insurance and shipping services controlled by the G7—represented an attempt to thread a needle: reduce Russian revenue without removing Russian oil from global markets and thereby spiking prices for everyone. Whether this needle was successfully threaded is one of the empirical questions you will adjudicate using the data in Section 2A. What is already clear is that energy weaponization is bidirectional: Russia's attempt to use gas as leverage accelerated the very diversification that destroyed its European market, while Europe's attempt to cap Russian oil revenue depended on continued Russian production and on the cooperation of a shadow fleet operating outside Western jurisdiction.

The financial dimension reveals a deeper structural dynamic. SWIFT exclusion was the most dramatic single measure, yet its long-term significance may lie less in the immediate disruption it caused than in the incentive it created for non-Western states to build parallel payment systems. Russia's SPFS and China's CIPS existed before 2022 but were marginal; the sanctions shock gave them strategic urgency. Farrell and Newman's 2023 analysis of the "weaponized interdependence" framework itself acknowledges that overuse of chokepoints can trigger "de-risking" by targets and third parties, eroding the very network centrality that made coercion possible in the first place. This is a mechanism you must learn to recognize: coercion that succeeds in the short term can fail in the medium term by destroying the structural conditions of its own efficacy. The lesson asks you to evaluate whether the 2022 financial sanctions accelerated de-dollarization in a durable way or merely produced a temporary, costly workaround that will fade as the immediate crisis recedes.

The African and broader Global South perspective is not a regional footnote to this story; it is the vantage point from which the entire coercive architecture looks different. When Russian fertilizer exports were disrupted and Ukrainian grain was blockaded, the price of bread in Cairo, Lagos, and Nairobi moved before any Russian city felt the squeeze. UNCTAD's trade and development reports documented the transmission: food price indices spiked, import bills ballooned for net-food-importing African states, and fiscal space that might have funded health or education was diverted to subsidies. The Black Sea Grain Initiative, brokered by Turkey and the UN, was a partial and temporary remedy that expired in July 2023, after which Russian attacks on Ukrainian port infrastructure resumed. From the African perspective, the lesson's central puzzle reframes itself: not "did sanctions compel Russia?" but "who paid for the attempt, and was that distribution of costs ever politically acknowledged by the sanctioning states?" This perspective reveals what the Western framing of sanctions as targeted and proportionate occludes: the structural position of the Global South in global commodity markets means that any disruption to Russian or Ukrainian supply chains is automatically a shock to African food security, regardless of whether African states had any role in the conflict. The lesson's longest and most developed perspective section is devoted to this reconstruction, drawing on African scholarship that treats the international economic order itself as a site of coercion rather than a neutral background against

which coercion occurs.

By the end of this lesson, you will be able to perform five analytical operations that you could not perform before. First, you will be able to decompose a sanctions package into its design components—asset freezes, trade restrictions, financial messaging exclusion, price caps, export controls—and specify the causal mechanism and scope condition of each. Second, you will be able to trace the energy-weaponization sequence from Nord Stream through European decoupling to the oil price cap, identifying at each stage who gained leverage and who lost it. Third, you will be able to evaluate the claim that SWIFT exclusion accelerated parallel financial architecture, distinguishing durable structural shift from temporary adaptation. Fourth, you will be able to apply the "small yard, high fence" logic of export controls to the Russian case and assess whether Russian adaptation through parallel imports and domestic substitution has breached the fence. Fifth, and most importantly, you will be able to reconstruct the African, Chinese, Russian, Western, and UN perspectives on the entire coercive episode, steel-manning each, and adjudicate between them on the basis of evidence rather than defaulting to the perspective most familiar to you. The worked example, problem pair, and independent memo are designed to force you to practice these operations under conditions of uncertainty, with incomplete data, and with the explicit requirement to distinguish description from explanation, prediction from prescription.

SECTION 1 — Pre-Class Priming

1.1 Retrieval Warm-Up

Answer each question from memory before reading the lesson. These draw on L18, L19, and L36.

1. **Weaponized interdependence (L18).** Define weaponized interdependence in Farrell and Newman's terms, and identify the two structural features of global networks—hubs and chokepoints—that make it possible. Give one pre-2022 example of a state weaponizing a network chokepoint.

2. **Energy and interdependence (L19).** Explain how European dependence on Russian pipeline gas developed after the Cold War, and identify the two mechanisms—contractual lock-in and infrastructure specificity—that made it difficult to reverse quickly.

3. **Ukraine war economic shock (L36).** What were the three most significant immediate economic consequences of the February 2022 invasion for Ukraine's economy, and how did they differ in their time horizons (immediate, medium-term, structural)?

4. **Sanctions taxonomy.** Distinguish targeted (smart) sanctions from comprehensive sanctions, and explain why the shift from comprehensive to targeted sanctions after the 1990s Iraq experience was considered a humanitarian improvement. What problem did targeted sanctions introduce in its place?

5. **Network centrality and coercion.** In network terms, why does the weaponizer's power depend on the target's inability to reroute? What happens to coercive power when the target develops alternative pathways—a process sometimes called "de-risking" or "friend-shoring"?

6. **Fertilizer and food linkages.** Why is Russia a critical node in global fertilizer markets, and how does a disruption to Russian fertilizer exports transmit to African food prices? Identify at least two intermediate steps in the causal chain.

1.2 Orientation Questions

These questions frame the analytical work of the lesson. You need not answer them fully now; use them to orient your reading.

1. The 2022 Russia sanctions package included an oil price cap rather than a full embargo. What does this design choice reveal about the limits of Western coercive power, about the structure of global oil markets, and about the political economy of sanctioning states' own energy costs?
2. Russian adaptation to sanctions—shadow-fleet oil tankers, parallel imports of technology through third countries, SPFS and CIPS for payments—was faster and more effective than many Western analysts predicted. What does this adaptation imply for the theory of weaponized interdependence, and does it mean the theory is wrong or merely scope-limited?
3. The sanctions regime externalized substantial costs to the Global South through food, fuel, and fertilizer price spikes. How does the African perspective reframe the question of sanctions "effectiveness," and what does it reveal about the distributional assumptions embedded in Western coercive diplomacy?
4. Export controls on semiconductors and dual-use technology were described as a "small yard, high fence" strategy. How do these controls interact with energy sanctions and financial sanctions to form a single coercive architecture, and what does Russian adaptation tell us about the permeability of that fence?

1.3 Vocabulary Pre-Teach

Provisional definitions to be refined through the lesson. Each term will be developed with mechanism, scope conditions, and perspective notes in Section 2.

- **Sanctions (economic coercive measures):** State-imposed restrictions on trade, finance, or investment intended to compel a change in target-state behavior. Mechanism: raise the target's cost of non-compliance. Scope condition: effectiveness depends on multilateral coordination and the target's inability to substitute.
- **Targeted (smart) sanctions:** Measures aimed at specific individuals, entities, or sectors rather than entire economies, developed after the humanitarian disasters of comprehensive sanctions in Iraq in the 1990s. Mechanism: concentrate pain on decision-makers while sparing civilians. Scope condition: requires accurate targeting intelligence and enforcement capacity; prone to leakage and evasion.
- **Comprehensive sanctions:** Economy-wide restrictions on trade and finance with a target state, historically associated with high civilian costs. Mechanism: maximize economic pressure across all sectors. Scope condition: rare post-1990s due to humanitarian concerns; used when targeted measures are deemed insufficient.
- **Asset freeze:** The legal immobilization of a state's or individual's foreign-held assets, preventing their use or transfer. Mechanism: deny the target liquidity and financial maneuvering room. Scope condition: requires jurisdiction over the assets' location; effectiveness erodes if assets are moved preemptively.
- **Oil price cap:** A mechanism setting a maximum price at which Russian oil can be sold using Western maritime services (insurance, shipping), enforced through the G7 and EU. Mechanism: reduce Russian

revenue while keeping oil on global markets. Scope condition: depends on enforcement through service providers and on the target's inability to fully bypass Western shipping infrastructure.

- **SWIFT (Society for Worldwide Interbank Financial Telecommunication):** The messaging network that enables cross-border bank payments; exclusion from it disrupts a state's ability to conduct international financial transactions. Mechanism: sever the information layer of financial flows. Scope condition: effectiveness depends on the target's reliance on SWIFT and on the availability of alternative messaging systems.
- **SPFS (System for Transfer of Financial Messages):** Russia's domestic alternative to SWIFT, developed after 2014. Mechanism: provide a parallel messaging channel for ruble and non-dollar transactions. Scope condition: limited international adoption; useful for bilateral trade with willing partners but not a full substitute.
- **CIPS (Cross-Border Interbank Payment System):** China's payment system for cross-border renminbi transactions. Mechanism: enable settlement outside the dollar-dominated correspondent-banking network. Scope condition: growing but still small relative to SWIFT; adoption accelerated by sanctions risk.
- **Weaponized interdependence:** The strategic exploitation of a state's position in global networks—particularly as a hub or chokepoint—to coerce other states. Mechanism: leverage structural centrality to impose costs on targets. Scope condition: power erodes if targets and third parties reroute around the chokepoint.
- **Chokepoint:** A node in a network through which a large share of flows must pass, giving the controlling actor leverage. Mechanism: control over transit creates bargaining power. Scope condition: chokepoints are contestable; their value declines as alternatives are developed.
- **Small yard, high fence:** A strategy of restricting a narrow set of critical technologies (the small yard) with very strong controls (the high fence), rather than broad restrictions. Mechanism: concentrate enforcement resources on the most strategically significant items. Scope condition: requires accurate identification of critical technologies and prevention of leakage through third countries.
- **Parallel imports:** The import of goods into a target country through third-country intermediaries, circumventing direct trade restrictions. Mechanism: reroute supply chains around sanctions. Scope condition: raises costs and delays but can substantially blunt technology controls.
- **Shadow fleet:** Tankers operating outside Western insurance and regulatory frameworks to transport sanctioned oil. Mechanism: bypass the service-based enforcement of price caps. Scope condition: raises shipping costs and safety risks but sustains export volumes.
- **De-dollarization:** The process of reducing reliance on the US dollar in trade, reserves, and payments. Mechanism: diversify currency exposure to reduce vulnerability to US financial sanctions. Scope condition: incremental and contested; dollar dominance persists due to liquidity and network effects.
- **Black Sea Grain Initiative:** The July 2022 agreement brokered by Turkey and the UN to allow Ukrainian grain exports through the Black Sea. Mechanism: create a humanitarian corridor to reduce global food price pressure. Scope condition: dependent on Russian and Ukrainian cooperation; expired July 2023.

- **Humanitarian carve-out:** Provisions in sanctions regimes exempting food, medicine, and humanitarian goods from restrictions. Mechanism: reduce civilian harm and legal liability for senders. Scope condition: often undermined by over-compliance and banking de-risking.

End of Section 1. Section 2 follows in the next chunk.

SECTION 2 — LESSON CORE

2.1 Learning objectives

By the end of this lesson, the student will be able to:

1. **Analyze** the causal mechanisms behind the evolution of sanctions design—from comprehensive embargoes to targeted measures, asset freezes, sectoral sanctions, and oil price caps—by identifying the network chokepoints, legal instruments, and enforcement technologies that make each design feasible, and the adaptation strategies that erode it. This objective requires distinguishing sender learning from target adaptation rather than treating sanctions as a static instrument.
2. **Compare** the intended and observed effects of asset freezes, financial exclusion, export controls, and energy price caps on Russia's macroeconomy, fiscal capacity, and war financing, using evidence on exchange-rate movements, trade rerouting, discount structures, and shadow-fleet growth. The student should be able to separate accounting effects (frozen reserves, discounted oil) from behavioral effects (policy change, military production).
3. **Evaluate** the scope conditions under which coercive economic measures alter a target state's cost-benefit calculus rather than merely redistribute costs to third parties, with special attention to import-dependent economies in the Global South. This includes assessing multilateral coordination, sender self-harm, target substitutability, regime type, and enforcement capacity.
4. **Reconstruct** how African, Chinese, Russian, Western, and UN perspectives assign causality and responsibility for food, fuel, and fertilizer spillovers, and **adjudicate** among them using mechanism-based evidence rather than moral assertion. The student should identify what each perspective reveals and what it systematically occludes.
5. **Apply** the "small-yard-high-fence" logic and the countermeasures of parallel financial architecture to a novel case, specifying falsifiable indicators of sanctions leakage, adaptation, and unintended humanitarian harm. The student should be able to state what evidence would weaken each causal claim.

2.2 KEY IDEA 1 — Sanctions design and evolution: from targeted to comprehensive, from asset freezes to oil price caps

Bolded Causal Claim: Sanctions are not a single instrument but an evolving architecture of economic coercion whose effectiveness depends on the sender's control over network chokepoints; the shift from comprehensive embargoes to targeted asset freezes and then to oil price caps reflects learning about humanitarian costs, elite vulnerability, and the need to preserve supply while cutting revenue.

Mechanism: The theoretical lineage begins with economic statecraft and coercive bargaining: sanctions

raise the target's cost of noncompliance, signal resolve, and seek to alter a cost-benefit calculus without direct military force. Early comprehensive sanctions, most infamously against Iraq in the 1990s, demonstrated that broad trade embargoes could devastate civilian welfare, undermine legitimacy, and generate humanitarian catastrophe without necessarily changing regime behavior. That experience produced the "smart" or targeted sanctions agenda, which narrowed coercion to individuals, entities, sectors, and financial nodes in order to reduce civilian harm while preserving pressure on decision-makers. The mechanism of targeted sanctions depends on jurisdictional reach: if elites hold assets, use correspondent banking, or rely on Western legal and financial services, asset freezes and travel bans can impose concentrated costs. Farrell and Newman's (2019, 2023) weaponized-interdependence framework explains why this works: states with centrality in global networks—especially finance, clearing, insurance, and information—can convert structural position into coercive leverage. The 2022 Russia sanctions package applied this logic at scale by freezing central-bank reserves, restricting access to SWIFT for selected banks, and targeting oligarchic wealth. The oil price cap then represented a further design innovation. Rather than a full embargo that might spike global prices and enrich Russia through higher prices on reduced volumes, the cap used Western dominance in maritime services—insurance, shipping, brokering, and finance—to condition access to those services on purchase at or below a ceiling price. The mechanism is a two-tier market: compliant buyers receive Western services; above-cap cargoes must rely on costlier, less reliable alternatives. Mulder (2022) situates this evolution in a longer history in which sanctions repeatedly oscillate between broad economic warfare and more discriminating coercion, with each design generating countermeasures. Ashford (2023) helps frame the contemporary debate: sanctions are most effective when demands are clear, coalitions are broad, enforcement is credible, and the target's adaptation options are limited; they are least effective when they become open-ended, when humanitarian exemptions are poorly designed, or when the sender's own economic dependence creates self-harm. The causal chain therefore runs from network centrality to cost imposition, from cost imposition to target adaptation, and from adaptation to further design innovation.

Scope Conditions: Sanctions bite when the target is deeply integrated into sender-controlled networks and lacks ready substitutes; when the sender coalition controls critical nodes such as dollar clearing, maritime insurance, or advanced technology inputs; when elite assets are located in sender jurisdictions; when demands are limited and credible; when enforcement capacity is strong; and when the sender can tolerate its own economic costs. They are more likely to influence behavior in regimes where elites are politically consequential and materially vulnerable, and less likely in highly insulated, personalist, or autarkic systems. The oil price cap has additional scope conditions: Western maritime services must remain indispensable, monitoring must be feasible, and the shadow fleet must not scale faster than enforcement. Sanctions fail or backfire when the target has powerful alternative partners, can reroute trade, builds parallel financial architecture, or when broad civilian harm produces humanitarian backlash and "rally round the flag" effects. They also weaken when coalitions fragment, when third countries profit from arbitrage, or when the sender's energy, food, or inflation costs undermine domestic political support. In short, the same network centrality that makes sanctions powerful also creates incentives for decentralization and evasion.

Observable Implications: If the sanctions architecture is biting, one should observe currency depreciation and inflation in the target, fiscal stress, import compression, capital flight, concentrated losses among targeted elites, discounted export prices, and trade rerouting through intermediaries. For the oil price cap specifically, observable implications include Russian crude selling at a sustained discount to Brent, increased Asian purchases, continued use of Western shipping and insurance for compliant cargoes, growth of a shadow fleet for noncompliant cargoes, false documentation, and enforcement actions against violators. For targeted sanctions, one should observe asset freezes, delistings, legal challenges, and evasion through shell companies or

third-country proxies. For comprehensive or sectoral measures, one should observe trade collapse, supply shortages, and humanitarian indicators. Leakage should appear as transshipment, re-exports, alternative insurance providers, and increased use of non-Western currencies. Data such as USD/RUB movements, EU gas imports by source, Russian oil export revenues, and African food price indices can help distinguish direct effects from global spillovers, though no single indicator proves causation because commodity markets, weather, and war damage also move prices.

Perspective Note (five traditions in brief):

African (primary): From within African political economy, sanctions are not merely an instrument applied to Russia; they are an external shock transmitted through import dependence, dollarized trade, and concentrated global commodity markets. African scholars such as Rodney and Nkrumah frame this vulnerability as structural: colonial and postcolonial specialization left many economies dependent on imported food, fuel, and fertilizer, so a sanctions shock in the North becomes a cost-of-living crisis in the South. The African vantage point stresses non-targeted burdens: even "smart" sanctions can raise shipping, insurance, and commodity prices; humanitarian carve-outs are often bureaucratically inaccessible; and African states are frequently asked to enforce measures they did not design. It also highlights agency and non-alignment: African governments may resist automatic compliance, seek waivers, or diversify partners not out of support for the target but to protect sovereignty and food security. The structural critique asks whether sanctions reproduce a hierarchy in which powerful states weaponize global networks while weaker states absorb spillovers. This perspective reveals what Western debates often occlude: the distributional geography of coercion.

Chinese: Sanctions are interpreted as economic warfare and as overreach of U.S. financial power; China emphasizes sovereignty, non-interference, and the risks of politicizing trade and finance. It sees SWIFT exclusion and asset freezes as accelerating de-dollarization and as motivating parallel systems such as CIPS and bilateral currency settlement. Chinese analysis often stresses that sanctions harm global supply chains and developing countries, while also creating opportunities for Chinese firms and energy purchases at discounts. It may understate its own leverage and the ways Chinese compliance with some controls affects enforcement.

Russian: Sanctions are framed as illegitimate aggression and an attempt to destroy Russia; resilience is emphasized through import substitution, capital controls, fiscal buffers, and redirection of trade to Asia. The narrative highlights adaptation: shadow fleet, alternative payment systems, and discounted but sustained oil exports. It may occlude the real costs—inflation, technology gaps, and long-term growth constraints—and the dependence on Chinese markets and intermediaries.

Western: Sanctions are coercive diplomacy designed to raise the costs of aggression while avoiding direct military escalation; targeted measures aim to minimize civilian harm and preserve humanitarian channels. There is significant self-critique: spillovers to the Global South, enforcement gaps, and the risk that sanctions become permanent without clear end states. Western debates focus on effectiveness, leakage, and the balance between pressure and escalation.

UN: The UN perspective centers humanitarian law and carve-outs: sanctions should not impede food, medicine, or humanitarian assistance; the Black Sea Grain Initiative exemplified efforts to mitigate spillovers. It emphasizes multilateral legitimacy, monitoring, and the need to protect vulnerable populations, while recognizing that unilateral sanctions fall outside UN frameworks and can create legal and operational ambiguity.

SECTION 2.3 KEY IDEA 2 — Energy weaponization: Nord Stream, the price cap, and Europe's decoupling from Russian gas

Bolded Causal Claim: Russia's pre-invasion gas leverage and post-2022 supply manipulation converted dense energy interdependence into coercive power; Europe's subsequent decoupling reduced but did not eliminate that leverage, because substitution, storage, and the oil price cap altered market incentives while infrastructure lock-in, contract rigidities, and global arbitrage preserved channels for Russian revenue.

Mechanism: The mechanism is network weaponization in the sense developed by Farrell and Newman: states that occupy central nodes in production or transit networks can convert commercial dependence into political leverage by threatening or executing disruption. Before 2022, Russian pipeline gas supplied a large share of European consumption, especially in Germany and Central Europe, and long-term contracts plus pipeline infrastructure created sunk costs that made rapid substitution expensive. After the invasion, supply reductions through Nord Stream 1, the non-certification of Nord Stream 2, and the September 2022 pipeline leaks transformed a latent vulnerability into an active shock. European governments responded through demand reduction, accelerated LNG contracting, storage mandates, and diversification; the G7/EU oil price cap added a financial chokepoint by conditioning maritime insurance and shipping services on sales below a threshold. The cap's logic was not to ban Russian oil outright but to compress the price Russia received while keeping volumes in the market, thereby limiting revenue without triggering a global supply shock. Yet the mechanism is mediated by global oil markets: if Russian crude is rerouted to Asia at a discount, if shadow fleets evade insurance requirements, or if OPEC+ production decisions tighten supply, the cap's effect on Russian fiscal capacity weakens. Decoupling is therefore a process of partial reconfiguration rather than a clean break.

Scope Conditions: This causal chain holds under several conditions: high pre-war import dependence; physical pipeline infrastructure that cannot be quickly repurposed; limited short-run LNG regasification capacity; a global market in which alternative suppliers can expand output; and enforcement capacity over maritime services. It is weaker where states have diversified suppliers, domestic production, or storage; where sanctions are not coordinated; or where third-party states are willing to absorb discounted Russian hydrocarbons. It also depends on weather and industrial demand: a mild winter and demand destruction can mask structural vulnerability, while a cold winter or industrial rebound can re-expose it. The price cap in particular assumes that Western control over insurance, classification, and shipping finance remains a binding chokepoint; if parallel services emerge, the cap becomes a price signal rather than a hard constraint.

Observable Implications: Observable implications include European gas storage levels and TTF benchmark prices; the share of Russian gas in EU imports; LNG import volumes and regasification utilization; the Urals-Brent discount; Russian federal budget oil and gas revenues; the growth of shadow-fleet tanker activity; and European industrial output in gas-intensive sectors. If weaponization and decoupling are operating as theorized, one should observe a sharp initial price spike, followed by declining Russian gas market share in Europe, rising LNG share, persistent discounts on Russian crude, and partial recovery of European storage security, alongside continued Russian revenue from non-European buyers. One should also observe political contestation over industrial competitiveness, as energy-intensive firms face cost disadvantages relative to competitors with cheaper gas.

Perspective Note (five traditions in brief): African perspective: From an African vantage point, European energy weaponization and decoupling are not merely a bilateral Russia-Europe contest; they are a shock transmitted through global prices, shipping, and fiscal space. African economies that are net fuel importers face higher import bills, currency depreciation, and inflation, while fertilizer and food costs rise through

gas-linked production. The African critique, articulated in structural terms by scholars such as Grovogui and Bayart, stresses that the global energy order reproduces dependency: African states are price takers in markets shaped by Northern security priorities, and emergency European LNG demand can crowd out African access or raise costs. There is also a justice dimension: European states that long relied on Russian gas are now subsidizing rapid transition, while African states with energy poverty are asked to decarbonize without comparable finance. African governments and scholars therefore tend to emphasize not only market adjustment but equitable access, debt relief, and technology transfer, and they often view sanctions spillovers as a reminder that coercive economic measures designed in the North are experienced as price shocks in the South.

Chinese perspective: China reads energy weaponization as evidence that interdependence is a strategic vulnerability and that the West uses financial and logistical chokepoints to discipline rivals. It benefits from discounted Russian oil and gas, strengthens energy security through overland pipelines and non-dollar settlement, and presents itself as a stabilizing buyer. Beijing criticizes the price cap as market distortion and extraterritorial coercion, while using the crisis to advance de-dollarization narratives and BRICS energy cooperation.

Russian perspective: Russia frames sanctions and supply cuts as defensive responses to Western hostility, arguing that energy is a sovereign resource and that Europe's decoupling is self-harming. It emphasizes pivot-to-Asia resilience, new buyers, and the failure of sanctions to collapse the economy. The anti-Western narrative presents the price cap as illegitimate interference in trade and highlights Western hypocrisy in seeking Russian energy while condemning Moscow.

Western perspective: Western governments treat energy weaponization as proof that economic interdependence with authoritarian suppliers creates security risks. They justify decoupling as necessary to reduce coercion and fund Ukraine's defense, while acknowledging self-critique: price spikes, industrial pain, enforcement gaps, and the risk that decoupling is slower and costlier than planned. Debates center on whether the price cap effectively reduced revenue or merely rerouted trade.

UN perspective: The UN perspective emphasizes energy access as a development and humanitarian issue, warning that price shocks burden vulnerable populations and that emergency measures must preserve access to fuel, food, and medicine. It supports mitigation, transparency, and multilateral coordination, while recognizing that unilateral energy sanctions and countermeasures can create legal ambiguity and uneven protection for non-target states.

SECTION 2.4 KEY IDEA 3 — SWIFT exclusion and the parallel financial architecture (SPFS, CIPS)

Bolded Causal Claim: Excluding selected Russian banks from SWIFT raised transaction costs and fragmented payment channels, but it did not financially isolate Russia because alternative messaging systems, third-country intermediaries, and commodity demand allowed partial reconstitution of trade finance; the deeper effect was to accelerate financial fragmentation and contestation over dollar centrality.

Mechanism: SWIFT is a messaging cooperative, not a settlement system; exclusion therefore works by increasing search, verification, and compliance costs rather than by freezing all payments. Farrell and Newman's weaponized interdependence framework explains why: the United States and its allies occupy central nodes in financial messaging and clearing, so excluding a target from those nodes can disrupt its access to global markets. In 2022, selected Russian banks were removed from SWIFT, while Russia's domestic SPFS and China's CIPS offered alternative messaging rails. The mechanism of adaptation is threefold: first, Rus-

sian banks and exporters shifted to bilateral arrangements and non-Western correspondent banks; second, energy and commodity trade continued to generate foreign exchange, reducing the need for Western financial intermediation; third, capital controls and interest-rate hikes stabilized the ruble after the initial shock. Parallel architecture matters because messaging alternatives reduce the marginal cost of evasion over time, especially when combined with local-currency invoicing and barter-like arrangements. However, SPFS and CIPS remain smaller, less interoperable, and less trusted than SWIFT; their growth is a signal of fragmentation, not proof of a fully parallel system.

Scope Conditions: The causal effect of SWIFT exclusion is strongest when the target is heavily dependent on Western correspondent banking, when alternative systems lack scale, when third countries fear secondary sanctions, and when trade is not dominated by commodities with inelastic demand. It weakens when the target has large commodity exports, when non-Western banks are willing to intermediate, when capital controls can stabilize the currency, and when enforcement is uneven. It also depends on the scope of exclusion: partial exclusion of selected banks leaves channels open, while comprehensive exclusion would be more disruptive but harder to coordinate and more likely to accelerate alternatives. The mechanism further assumes that financial messaging is a binding chokepoint; if settlement occurs through bilateral central-bank arrangements or commodity-backed barter, messaging exclusion becomes less decisive.

Observable Implications: Observable implications include the number and type of Russian banks excluded; SPFS and CIPS participation and transaction volumes; the share of Russian trade invoiced in non-dollar currencies; ruble exchange-rate volatility and recovery; Russian current-account and trade balances; payment delays reported by importers and exporters; and enforcement actions against third-country intermediaries. If the theory holds, one should observe an initial payment shock, ruble collapse, and trade disruption, followed by stabilization through capital controls and alternative channels, plus gradual growth in non-Western financial infrastructure. One should also observe Western concern about leakage and secondary sanctions, reflecting recognition that partial exclusion creates incentives for evasion.

Perspective Note (five traditions in brief): African perspective: For African states and scholars, SWIFT exclusion is a reminder that global financial infrastructure is politically governed and that access can be weaponized. The African critique emphasizes that African economies are deeply integrated into dollar-based payment systems and are therefore exposed to extraterritorial enforcement, compliance overreach, and de-risking by Western banks. When sanctions on Russia raise compliance costs, African importers of grain, fertilizer, and fuel can face delayed payments, higher transaction costs, or exclusion from trade finance even when transactions are legally permitted. African scholarship on structural dependency—drawing on Rodney's analysis of underdevelopment and on contemporary work by Aning and Danso on security governance—highlights that financial fragmentation is not neutral: it can reproduce hierarchy by forcing African states to navigate competing payment blocs without sovereign control over either. The African vantage point thus stresses humanitarian carve-outs, payment-system resilience, and the need for African institutions to reduce vulnerability to external financial coercion, rather than treating SWIFT exclusion as a purely technical instrument.

Chinese perspective: China views SWIFT exclusion as proof of Western financial hegemony and as a catalyst for de-dollarization. It promotes CIPS, RMB settlement, and bilateral currency swaps, while presenting itself as a defender of trade openness against unilateral sanctions. Beijing's critique focuses on extraterritoriality and the long-term risk that dollar infrastructure can be used coercively, but it also benefits from continued access to Western markets and from Russia's dependence on Chinese financial channels.

Russian perspective: Russia frames SWIFT exclusion as economic aggression and evidence of Western

unreliability. It emphasizes SPFS, capital controls, and the ruble's recovery as proof of resilience, while portraying alternative financial architecture as a necessary defense against sanctions. The anti-Western narrative presents financial fragmentation as a multipolar correction rather than a cost of aggression.

Western perspective: Western governments see SWIFT exclusion as a high-impact but bounded coercive tool: it raises costs, signals resolve, and complicates Russian war financing, but it is not a total blockade. Self-critique focuses on leakage, third-country intermediation, and the risk that overuse of financial sanctions accelerates de-dollarization. Debates center on whether partial exclusion is sufficient or whether broader secondary sanctions are needed.

UN perspective: The UN perspective emphasizes that financial sanctions must not obstruct humanitarian assistance, food trade, or development finance. It highlights the need for clear carve-outs, predictable payment channels, and monitoring of unintended effects on vulnerable populations. The UN also stresses multilateral legitimacy, noting that unilateral financial measures can create legal uncertainty and uneven protection for non-target states.

2.5 KEY IDEA 4 — Export Controls on Technology: The Small-Yard-High-Fence Strategy and Russian Adaptation

Bolded Causal Claim: Export controls on advanced technology can degrade a target state's military-industrial capacity by denying access to chokepoint inputs and production equipment while preserving broader trade, but their coercive effect depends on allied coordination, enforcement capacity, and the target's ability to substitute, stockpile, or reroute supply.

Mechanism: Export controls are not comprehensive embargoes; they are item-specific licensing regimes that operate through production bottlenecks. The "small yard" identifies a narrow set of goods with high military or strategic value—advanced semiconductors, lithography and etching equipment, aerospace-grade materials, precision machine tools, certain chemicals, software, and technical data—while the "high fence" raises compliance barriers around those items through entity lists, end-use and end-user controls, license denials, and extraterritorial rules such as foreign direct product restrictions. The causal mechanism is not that the target stops producing weapons, but that production becomes slower, costlier, less reliable, and more dependent on inferior substitutes. Modern weapons systems are complex assemblies whose performance depends on components manufactured through concentrated global supply chains; denying access to Western-designed chips, machine tools, and specialized materials forces redesign, extends lead times, and degrades quality. The mechanism also operates through information and maintenance: controlled software updates, technical support, spare parts, and calibration services can be as important as physical components. Allied coordination is essential because unilateral controls create arbitrage opportunities; when the United States, European Union, Japan, South Korea, and other suppliers align lists and licensing standards, substitute supply shrinks. Enforcement then determines whether controls bind in practice. Customs data, corporate compliance programs, financial tracking, intelligence on diversion networks, and post-shipment verification all shape the gap between legal restriction and material effect. Russian adaptation has included pre-war stockpiling, parallel imports through third countries, reverse engineering, substitution with lower-grade or non-Western components, domestic production campaigns, and procurement through front companies and intermediary firms. The mechanism is therefore dynamic: controls impose friction; adaptation reduces friction; enforcement and intelligence determine the equilibrium. The "small yard" also has a political function: by limiting the scope of controlled items, policymakers aim to reduce collateral damage to legitimate commerce,

preserve business support, and avoid the overbreadth that can undermine coalitions. The "high fence" then compensates for narrow scope by making evasion expensive and risky. In practice, however, the boundary between military-relevant and civilian technology is porous, especially for dual-use goods, and enforcement must constantly update classifications as targets adapt.

Scope Conditions: Export controls are most effective when the controlled item has few technically equivalent substitutes; when production requires specialized equipment, intellectual property, or standards concentrated in sanctioning jurisdictions; when allies share lists and enforcement practices; when end users can be identified with reasonable confidence; and when financial and logistics channels are monitored. They are weaker when technology is mature, widely produced, or easily reverse-engineered; when third-country intermediaries have weak compliance capacity or incentives; when the target has accumulated stockpiles; when controls are announced with long grace periods; or when private actors can exploit ambiguity in classification. Scope conditions also include legal precision: controls must be specific enough to avoid capturing ordinary civilian trade, because overbreadth can harm non-target economies, raise costs for sanctioning states, and erode political support. Another condition is time. Controls may have limited immediate effect if stockpiles exist, but their impact can grow as inventories deplete and as the target faces the cost of redesigning systems around unavailable inputs. Conversely, over time targets may develop alternative suppliers or domestic substitutes, reducing the long-term coercive effect. The effectiveness of controls also depends on the target's industrial structure: a state with a large, diversified, and technologically sophisticated economy can adapt more readily than one dependent on imported high-end components. Finally, controls require continuous maintenance. Static lists become obsolete as technology diffuses and as adversaries learn to route procurement through new intermediaries.

Observable Implications: If the mechanism is operating, one should observe price premiums for controlled components in Russian procurement markets; longer production cycles for weapons and aerospace systems; quality failures or downgraded performance; increased customs seizures and enforcement actions; growth of intermediary firms in Turkey, the United Arab Emirates, Central Asia, China, and other transit jurisdictions; shifts in trade statistics by partner country and harmonized system code; component teardowns showing older, non-Western, or lower-grade parts; and Russian claims of import substitution that may mask continued dependence. One should also observe allied policy updates, such as expanded entity lists, new licensing requirements, and enforcement guidance. Conversely, if controls are ineffective, one would expect stable production rates, minimal price premiums, and little change in component sourcing. The observable record is rarely unambiguous because procurement networks are deliberately opaque, but triangulation across customs data, corporate disclosures, enforcement cases, and technical analysis can reveal adaptation patterns. A further implication is that controls may produce "leakage" without total failure: even partial denial can raise costs and slow production, while complete elimination of access is unlikely. Analysts should therefore distinguish between degradation and collapse, and should avoid treating continued Russian military production as proof that controls have no effect.

Perspective Note (five traditions in brief):

African perspective: From an African vantage point, export controls on technology are often interpreted through the lens of asymmetric global governance rather than as a neutral security instrument. African scholars and policymakers may note that the same supply-chain chokepoints used against Russia also shape African access to semiconductors, pharmaceuticals, medical equipment, agricultural machinery, and green technologies. The small-yard-high-fence strategy can appear less as precision policy than as an extension of technological hierarchy: African states are rarely designers of control regimes but are frequently subject

to their spillovers, including higher prices, delayed equipment, and costly compliance obligations. There is also concern that enforcement against diversion can criminalize ordinary trade, push African firms into expensive due-diligence regimes, or make African intermediaries scapegoats for systemic leakage. Yet some African security actors may welcome constraints on weapons proliferation if controls are transparent, multilateral, and non-discriminatory. The key African contribution is to ask who governs chokepoints, whose development is collateralized, and whether technological denial regimes reproduce dependency rather than merely target aggressors. This perspective also highlights that African industrialization depends on access to imported technology, so control regimes that are too broad or unpredictably enforced can constrain development even when Africa is not the target. The African vantage point thus reframes export controls as a question of global technological justice: security for some must not become permanent underdevelopment for others.

Chinese perspective: China views technology controls as part of a broader U.S.-led strategy of containment and decoupling, not merely a Russia-specific measure. Beijing emphasizes that extraterritorial export controls politicize supply chains, incentivize indigenous innovation, and accelerate parallel technological ecosystems. It may support Russian adaptation indirectly by providing non-controlled components and by framing controls as illegitimate economic coercion. China's perspective highlights the tension between security and development: controls can slow targeted states but also fragment global innovation, raise costs for all, and encourage the creation of alternative standards and supply chains. It also stresses sovereignty: states have the right to develop technology without external veto. At the same time, this perspective can occlude China's own use of economic leverage and its role in sustaining Russian access to certain goods.

Russian perspective: Russia frames export controls as economic warfare and evidence of Western intent to permanently weaken Russian industry. It emphasizes adaptation through stockpiles, parallel imports, import substitution, and partnerships with non-Western suppliers. Moscow argues that controls are porous and that Russian military production continues, albeit with delays and quality trade-offs. This perspective highlights sovereignty and resilience, and it treats technological denial as proof that the West seeks not merely to end the war but to degrade Russia's long-term capacity. It occludes, however, the extent to which adaptation raises costs, degrades performance, and depends on foreign intermediaries. It also tends to understate the role of pre-war stockpiles and the limits of domestic substitution in advanced manufacturing.

Western perspective: Western governments view export controls as precision instruments that reduce collateral damage compared with comprehensive embargoes. They emphasize allied coordination, legal clarity, and targeting of military-relevant inputs. The small-yard-high-fence concept reflects a belief that narrowly scoped but strictly enforced controls can impose strategic costs without severing all commercial exchange. Self-critique acknowledges enforcement gaps, third-country diversion, and the risk that controls incentivize long-term technological decoupling. Debates focus on whether the yard is too small—leaving loopholes that sustain Russian production—or too large—harming legitimate commerce, innovation, and relations with non-target states. Western analysts also debate whether controls should be paired with secondary sanctions or whether such measures would accelerate de-dollarization and alienate partners.

UN perspective: The UN perspective stresses that export controls must include humanitarian and development exemptions, avoid obstructing access to medical, agricultural, and civilian technologies, and be implemented with transparency and due process. It highlights risks to non-target states' development and calls for monitoring of unintended consequences, capacity-building for compliance, and safeguards against overreach. The UN also emphasizes multilateral legitimacy: controls imposed by a subset of states may create legal uncertainty and uneven protection for countries not involved in their design. From this vantage point,

the key issue is not only whether controls constrain a target's military capacity, but whether they preserve space for civilian development and humanitarian access.

2.6 KEY IDEA 5 — Global Spillovers: Food, Fuel, Fertilizer, and the Burden on the Global South

Bolded Causal Claim: The Russia-Ukraine war and associated sanctions transmitted shocks through global commodity markets, raising prices and disrupting supplies of food, fuel, and fertilizer in ways that imposed disproportionate costs on import-dependent countries in the Global South, especially in Africa, even though those countries were not the intended targets.

Mechanism: The mechanism operates through linked global commodity markets and the physical disruption of trade. Russia's invasion disrupted Ukrainian grain exports through port blockades, mined waters, damaged infrastructure, and labor shortages. Sanctions and self-sanctioning affected Russian exports of energy, fertilizer, and grain, while also raising transaction costs through payment frictions, insurance premiums, shipping risks, and corporate overcompliance. Because food, fuel, and fertilizer markets are globally integrated, localized disruptions became price shocks. The three commodities are structurally linked: fertilizer production depends heavily on natural gas; fuel affects transport, mechanization, and irrigation; and food prices reflect both input costs and availability. Import-dependent countries therefore faced a triple squeeze: higher food import bills, higher energy costs, and higher fertilizer costs that reduced future agricultural yields. The mechanism also includes second-order effects. Reduced fertilizer application lowers yields in subsequent seasons; export restrictions by other producers amplify scarcity; hoarding and speculative behavior can exaggerate price movements; and currency depreciation in import-dependent economies raises the local-currency cost of dollar-denominated commodities. Fiscal stress follows: governments must choose between subsidizing consumption, cutting other spending, or allowing prices to rise, each with political and welfare consequences. The Black Sea Grain Initiative partially restored Ukrainian grain flows and reduced some price pressure, but it did not eliminate volatility, fully restore pre-war export volumes, or resolve inequalities in access. Sanctions design included humanitarian carve-outs for food and fertilizer, yet private actors often overcomplied because of legal uncertainty, payment-channel difficulties, and reputational risk. Thus the mechanism is not simply "sanctions caused hunger"; it is a chain in which war, sanctions, market structure, financial frictions, and pre-existing vulnerabilities combined to shift costs onto non-target populations.

Scope Conditions: The severity of spillovers depends on import dependence, foreign-exchange reserves, subsidy regimes, social safety nets, domestic production capacity, alternative suppliers, and exchange-rate flexibility. Countries with large grain reserves, diversified suppliers, or strong fiscal capacity are less exposed. Countries with high food-import shares, limited foreign exchange, weak safety nets, and currency depreciation are more exposed. The effect also depends on whether sanctions explicitly exempt food and fertilizer and whether financial channels remain open; legal exemptions do not automatically translate into market access if banks and insurers avoid transactions. Global market structure matters: concentrated fertilizer markets, in which a few suppliers dominate, amplify shocks more than diversified grain markets. Time horizon matters as well. Short-term price spikes affect consumption and fiscal balances; longer-term effects operate through reduced fertilizer use, lower yields, and debt distress. Finally, domestic policy choices—such as export bans, price controls, or targeted subsidies—can either buffer or amplify global shocks.

Observable Implications: If the mechanism is operating, one should observe increases in the FAO Food Price Index and regional food price indices; rising import bills for food, fuel, and fertilizer; currency depreciation in import-dependent economies; reduced fertilizer application rates; declining agricultural yields in subsequent seasons; increased malnutrition indicators; fiscal deficits or subsidy cuts; and social unrest or

protests. One should also observe changes in Black Sea export volumes, shipping insurance premiums, and the behavior of private banks and insurers. Country-level variation should correlate with import dependence and fiscal capacity rather than with direct involvement in the war. If spillovers are minimal, one would expect stable food prices, unchanged import volumes, and no deterioration in nutrition indicators. The observable record should also distinguish between price effects and availability effects: a country may face high prices even when physical supply exists, if foreign exchange or credit is constrained. Analysts should therefore examine both market prices and household access.

Perspective Note (five traditions in brief):

African perspective: The African perspective frames global spillovers as a structural injustice rather than an unfortunate side effect of great-power conflict. African economies bore costs of a European war and Western sanctions despite having limited agency in either, and despite the fact that many African states were not parties to the conflict. Scholars and policymakers emphasize that food and fuel price spikes are not mere market accidents but reflect global hierarchies in trade, finance, energy, and agriculture. African vulnerability is rooted in colonial and post-colonial structures: import dependence, limited agro-industrial capacity, debt burdens, and exposure to dollar-denominated commodity markets. Sanctions and war exposed these vulnerabilities rather than creating them from nothing. The burden is also unevenly distributed within societies: women, rural households, and informal workers often face the sharpest food insecurity and have the least capacity to absorb price shocks. African actors have demanded humanitarian carve-outs, grain corridors, debt relief, and investment in local production, while also critiquing the moral asymmetry in which African lives are treated as collateral in great-power competition. The African vantage point reveals that sanctions analysis must include non-target welfare, not just target coercion, and that global economic governance must be judged by how it protects those outside the conflict. It also highlights the need for African agency in shaping commodity, finance, and food systems rather than merely receiving emergency relief.

Chinese perspective: China emphasizes that sanctions and war disrupt global supply chains and harm developing countries, reinforcing its narrative that Western policy choices generate global economic instability. It highlights de-dollarization, alternative payment systems, and South-South cooperation as responses to Western financial dominance. China may position itself as a stabilizing trade partner and advocate for dialogue, while also benefiting from discounted Russian energy and expanded commodity trade. Its perspective draws attention to the vulnerability of developing economies to externally imposed shocks and to the need for diversified supply chains. At the same time, this perspective can occlude China's own role in commodity markets, its geopolitical competition with the West, and the ways in which its economic interests shape its framing of sanctions and spillovers.

Russian perspective: Russia frames global spillovers as consequences of Western sanctions and Ukrainian or NATO actions, arguing that restrictions on fertilizer and energy harm global food security. It presents itself as a reliable supplier willing to export if restrictions are lifted, and uses spillovers to mobilize sympathy in the Global South. This perspective highlights the real costs of sanctions and the importance of keeping food and fertilizer trade open. It occludes, however, Russia's blockade of Ukrainian ports, its own export restrictions and quotas, and its role in initiating the war. It also tends to treat all sanctions as illegitimate while minimizing the distinction between targeted restrictions and humanitarian exemptions. The Russian framing is therefore politically effective but analytically incomplete.

Western perspective: Western governments acknowledge spillovers and emphasize humanitarian carve-outs, the Black Sea Grain Initiative, and development assistance. They argue that Russia's invasion, not sanctions,

is the primary cause of disruption, and that sanctions regimes explicitly exempt food and fertilizer. Self-critique focuses on payment frictions, insurance gaps, overcompliance by private actors, and the difficulty of translating legal exemptions into market access. Debates center on how to reduce unintended harm while maintaining pressure on Russia, including through clearer guidance, dedicated payment channels, and monitoring of humanitarian impacts. Western analysts also debate whether more aggressive secondary measures would worsen spillovers or whether insufficient enforcement prolongs the war and its costs. This perspective contributes a focus on policy design and accountability but can understate the structural vulnerability of import-dependent economies.

UN perspective: The UN perspective centers on humanitarian protection, food security, and multilateral coordination. It highlights the Black Sea Grain Initiative, humanitarian exemptions, and monitoring of price and access impacts. The UN stresses that non-target populations must not bear disproportionate costs and calls for predictable trade channels, debt relief, and support for vulnerable countries. It also emphasizes the need to protect humanitarian space: sanctions and counter-sanctions should not obstruct food, fertilizer, or energy flows essential to survival. From this vantage point, the key issue is not only whether sanctions are legally justified, but whether global institutions can prevent war-related shocks from becoming hunger crises. The UN perspective contributes a human-security lens and a focus on vulnerable populations, though it may be constrained by the political interests of member states and the limits of humanitarian diplomacy.

2.7.1 African Perspective (PRIMARY)

The African vantage point on the political economy of coercion in the Ukraine war is not a regional footnote to a European crisis; it is a structurally distinct reading of how sanctions, energy shocks, and supply-chain ruptures travel through a world economy that was already unequal before February 2022. From within African political economy, the central puzzle is not whether sanctions on Russia are justified in legal or moral terms, but why the costs of a war fought between two European states are so disproportionately absorbed by populations that had no voice in its outbreak and no seat at the tables where sanctions were designed. This perspective is anchored in a long tradition of African scholarship that treats the global economy not as a neutral market but as a historically constructed hierarchy of extraction, dependency, and asymmetric vulnerability. Walter Rodney's *How Europe Underdeveloped Africa* (1972) remains the foundational statement: the underdevelopment of the continent was not a natural condition but an active process produced by the integration of African economies into European capitalism on subordinate terms. Julius Nyerere's Arusha Declaration and Kwame Nkrumah's *Neo-Colonialism: The Last Stage of Imperialism* (1965) extended this to the post-independence period, arguing that formal sovereignty masked continued structural subordination through trade, finance, and commodity dependence. Frantz Fanon's *The Wretched of the Earth* (1961) added the psychological and political dimension: the colonial subject is produced by a system that reserves the full exercise of violence and sovereignty for the metropole while distributing vulnerability to the periphery. These are not decorative citations; they supply the analytical grammar through which African scholars read the 2022 sanctions regime.

The mechanism begins with commodity structure. African economies are, with significant variation, net importers of food, fuel, and fertilizer. The continent imports roughly 80 percent of its food in some subregions, and fertilizer import dependence is acute: Russia and Belarus together supplied a substantial share of global potash and nitrogen exports, and Ukraine and Russia were major grain exporters. When sanctions, war damage, and Black Sea port blockades disrupted these flows, the price effects were transmitted not

through diplomatic channels but through global commodity markets where African states are price-takers. The UNCTAD trade and development reports documented the resulting terms-of-trade shock: food and fuel prices spiked, import bills ballooned, and foreign-exchange reserves depleted. The African Development Bank and the World Bank recorded rising debt distress across the continent, with several states spending more on debt service than on health or education. The mechanism is not that sanctions were designed to harm Africa; it is that a sanctions architecture built by and for the G7 did not internalize the price elasticity of demand in low-income, import-dependent economies. This is what Siba Grovogui, in *Sovereigns, Quasi Sovereigns, and Africans* (1996), identifies as the deeper pattern: international law and global governance structures are constructed around the interests of powerful states, and the sovereignty of weaker states is recognized formally while being hollowed out materially.

The energy dimension compounds this. Europe's decoupling from Russian gas, however necessary from a European security perspective, reshaped global LNG markets. African gas producers such as Nigeria, Algeria, and Mozambique faced new demand from Europe, but the infrastructure, financing, and contractual terms of that demand were set by European buyers and international oil companies, not by African industrial planners. The result was a familiar pattern: African resources mobilized to solve European problems while African domestic energy access remained unaddressed. This is the extraversion dynamic that Jean-François Bayart analyzed in *The State in Africa* (1993): African states are compelled to orient their economies outward toward external patrons and markets, with domestic accumulation subordinated to external demand. The sanctions-energy nexus thus reproduced, rather than disrupted, the structural position of African economies in the global division of labor.

The financial channel is equally consequential. SWIFT exclusion of Russian banks and the freezing of Russian central-bank reserves demonstrated the weaponization of financial infrastructure that African scholars had long warned about. Mahmood Mamdani's work on the post-colonial state and on the politics of naming and categorization, and Oyèrónkẹ́ Oyěwùmí's critique of the universalization of Western epistemologies in *The Invention of Women* (1997), both point to a broader pattern: the categories and infrastructures through which global governance operates are not neutral but carry the imprint of their origins. For African central banks and finance ministries, the lesson of 2022 was that dollar-denominated reserves and SWIFT-dependent payment systems are instruments of potential coercion, not merely technical plumbing. This accelerated interest in alternative settlement mechanisms, in gold accumulation, and in bilateral currency arrangements, though the practical capacity to escape dollar dependence remains limited. The parallel financial architecture being built by China and Russia is thus read in Africa with a mixture of interest and caution: interest because it promises reduced vulnerability to Western financial coercion; caution because substituting one external dependency for another does not resolve the underlying asymmetry.

The fertilizer and food crisis reveals the sharpest edge of the African critique. When Russian fertilizer exports were disrupted by sanctions and self-sanctioning by shipping and insurance firms, and when Ukrainian grain was blockaded, African food prices rose sharply. The World Food Programme warned of acute food insecurity across the Horn of Africa, the Sahel, and parts of Southern Africa. The African perspective does not deny that Russia's invasion caused the disruption; it insists, however, that the sanctions response was designed without adequate safeguards for non-target populations and that the humanitarian carve-outs proved insufficient in practice. The Black Sea Grain Initiative, brokered by Turkey and the UN, was welcomed but seen as fragile and as treating African food security as a byproduct of great-power bargaining rather than as a priority in its own right. The UNCTAD reports on the crisis emphasized the need for debt relief, predictable trade channels, and support for vulnerable countries, but African scholars noted that these recommendations were not matched by corresponding commitments from the G7.

The structural critique extends to the normative framing. African governments and intellectuals have pointed to what they perceive as double standards: the rapid and comprehensive mobilization of sanctions against Russia contrasted with the absence of comparable measures against other aggressors or occupiers. This is not merely a rhetorical point; it goes to the legitimacy of the sanctions regime as a whole. If sanctions are understood as an expression of international law and collective security, their selective application undermines the claim that they serve universal norms rather than particular interests. This connects to Mamdani's analysis in *When Victims Become Killers* (2001) and *Saviors and Survivors* (2009): the international community's interventions are shaped by geopolitical hierarchies, and the language of human rights and humanitarianism can obscure rather than challenge those hierarchies. The African perspective thus treats the Ukraine sanctions not as an isolated policy episode but as a revelation of the architecture of global power: who gets to sanction, who gets sanctioned, and who pays the price.

African agency is not absent from this picture, though it is often underrecognized in Western and UN accounts. African states have pursued a range of strategies: abstentions and non-alignment at the UN, diplomatic mediation efforts, pursuit of grain and fertilizer deals with both Russia and Ukraine, and participation in forums such as the African Union's peace initiatives. The African Union's 2023 grain deal with Russia, and the diplomatic visits by African leaders to Kyiv and Moscow, illustrate an effort to assert African interests rather than simply accept the terms set by others. Emmanuel Aning and Kwesi Aning's work on African security governance, and Kwesi Aning's analyses of the African Peace and Security Architecture, emphasize that African actors are not merely recipients of global shocks but are developing their own frameworks for managing them. Similarly, Sylvia Tamale's work on African feminism and decoloniality, and the broader decolonial scholarship associated with the "pluriverse" agenda, insist that African knowledge systems and political traditions offer resources for rethinking global order that are not reducible to Western liberal internationalism or to great-power realism.

What the African perspective contributes that the other four cannot is a structural and historical depth that treats the 2022 crisis as a moment in a longer arc of unequal integration. It reveals that the costs of coercion are not distributed according to the logic of the conflict but according to the pre-existing structure of the global economy. It shows that sanctions, even when legally justified and multilaterally coordinated, can function as a transfer of burden from the sanctioning coalition to non-target populations in the Global South. It insists that the legitimacy of any coercive economic measure depends not only on its target but on its distributional consequences and on the voice of those affected in its design. And it offers a normative framework—rooted in anti-colonial thought, in the demand for economic sovereignty, and in the critique of extraversion—that challenges both the Western assumption of normative leadership and the great-power assumption that the periphery is merely a theater of competition.

What it occludes is also important. The African perspective can, in its structural emphasis, understate the agency of African elites who have themselves contributed to food insecurity through governance failures, corruption, and underinvestment in agriculture. It can romanticize non-alignment as a principled stance when it sometimes reflects opportunism or dependence on Russian arms and diplomatic support. It can treat "Africa" as a more unified actor than it is, eliding the divergent interests of oil exporters and oil importers, of grain producers and grain consumers, of states with strong ties to Russia and those aligned with the West. And it can risk a functionalism in which every global shock is read as a reproduction of colonial structures, leaving less room for contingency, for genuine change, or for the possibility that some African states have benefited from the diversification of partnerships that the crisis accelerated. The strongest version of the perspective, however, does not deny these complexities; it incorporates them by insisting that structural analysis and agency are not opposites but are dialectically related, and that the task is to understand how

African actors navigate constraints that they did not create.

2.7.2 Chinese Perspective

The Chinese perspective on the political economy of coercion in the Ukraine war is shaped by a dual identity: China is simultaneously the world's second-largest economy and a state that frames itself as the leading voice of the Global South, and it is a strategic partner of Russia that has refused to join Western sanctions while also avoiding direct material support for the war. From within this vantage point, sanctions are read primarily as an instrument of economic warfare waged by the United States and its allies to preserve hegemony, and the appropriate response is not compliance but the construction of alternative institutions that reduce vulnerability to Western financial and technological coercion.

The mechanism of concern is weaponized interdependence. Farrell and Newman's framework, developed in *Weaponized Interdependence* (2019) and extended in *Underground Empire* (2023), is taken seriously in Chinese strategic discourse, though with a different normative valence: where Western scholars often treat weaponized interdependence as a tool to be wielded responsibly, Chinese analysts treat it as a threat to be neutralized. The freezing of Russian central-bank reserves and the SWIFT exclusion of Russian banks are read as demonstrations that dollar hegemony and control over financial messaging infrastructure can be turned against any state that defies Washington. This has accelerated Chinese efforts to internationalize the renminbi, expand the Cross-Border Interbank Payment System (CIPS), and promote bilateral currency settlement. The mechanism is defensive: reduce exposure to a weapon that has been demonstrated to work.

The energy dimension is read through the lens of security and diversification. China is the world's largest energy importer, and the disruption of Russian gas flows to Europe reshaped global LNG markets, raising prices and tightening supply. Chinese analysts note that Europe's decoupling from Russian pipeline gas increased competition for LNG cargoes, raising costs for Asian importers including China. At the same time, China benefited from discounted Russian oil and gas, as Russia redirected exports eastward. This created a complex position: China gained commercially from Russia's distress while facing higher global energy prices and the risk of secondary sanctions. The small-yard-high-fence export control strategy, particularly US restrictions on advanced semiconductors and semiconductor manufacturing equipment, is read as the technological counterpart of financial sanctions—a targeted but expanding effort to constrain China's development. Chinese discourse frames this as "containment" and "decoupling," and the response has been a massive state-led push for technological self-sufficiency, import substitution, and the cultivation of alternative supply chains.

The global spillover dimension is addressed through a narrative of Western responsibility. Chinese official statements and state media have consistently attributed global food and fuel price spikes to sanctions and to the war itself, while emphasizing China's role as a provider of stability: grain exports, fertilizer production, and infrastructure investment through the Belt and Road Initiative. The Chinese perspective contributes a powerful critique of the extraterritorial reach of Western sanctions and a practical agenda for building parallel institutions. It also highlights the ways in which sanctions can accelerate the fragmentation of the global economy into competing blocs, a process that Chinese analysts view with concern but also as an opportunity to advance multipolarity.

What the Chinese perspective occludes is significant. It tends to understate China's own use of economic coercion, as in the case of Australia, Lithuania, and South Korea, and it presents China's rise as inherently benign and non-hegemonic, a claim that is contested by its neighbors. It also downplays the extent to which China's economic interests are served by Russia's isolation, which has made Russia a junior partner depen-

dent on Chinese markets and technology. The framing of sanctions as purely Western aggression can obscure the agency of the Russian state in choosing war and in weaponizing energy exports. And the emphasis on de-dollarization, while analytically serious, can overstate the near-term viability of alternatives to the dollar system, given the depth of dollar liquidity, the rule of law in US financial markets, and the absence of a fully convertible renminbi. The strongest version of the Chinese perspective, however, is not merely propaganda; it is a coherent structural critique of US financial hegemony that has gained traction well beyond Beijing, particularly among states that have experienced or fear Western sanctions.

2.7.3 Russian Perspective

The Russian perspective on the political economy of coercion is defined by a narrative of resilience in the face of an unprecedented sanctions assault, framed as an act of economic warfare by a hostile West seeking to destroy Russia. From within this vantage point, the sanctions regime is not a legitimate tool of coercive diplomacy but an illegal and illegitimate attempt to subjugate a sovereign state, and Russia's survival and adaptation demonstrate the limits of Western power and the emergence of a multipolar world.

The mechanism of resilience is multifaceted. Russia entered the sanctions period with substantial foreign-exchange reserves, a low debt-to-GDP ratio, a current-account surplus driven by energy exports, and a banking system that had been partially insulated from Western finance since 2014. The initial shock—ruble collapse, capital flight, and the freezing of roughly half of Russia's reserves—was severe, but the imposition of capital controls, the mandatory conversion of export revenues into rubles, and the redirection of energy exports to Asia stabilized the currency and restored fiscal revenues. The ruble's recovery in 2022, while partly artificial, was presented as proof of economic sovereignty. The mechanism of adaptation includes import substitution, parallel imports through third countries, the development of domestic payment systems (Mir, SPFS), and the construction of a "shadow fleet" of tankers to circumvent the oil price cap. Russian officials and analysts emphasize that the economy did not collapse, that GDP contracted less than initially projected, and that unemployment remained low.

The energy weaponization narrative is inverted: Russia is not the aggressor using energy as a weapon but the victim of European decisions to sever long-standing commercial relationships. The Nord Stream sabotage, which Russia attributes to Western actors, is cited as evidence of Western willingness to destroy infrastructure to maintain the sanctions regime. The oil price cap is framed as a market-distorting intervention that violates free-trade principles and that Russia has successfully evaded through discounted sales to China and India. The mechanism of price-cap evasion—selling above the cap through opaque intermediaries, blending, and ship-to-ship transfers—demonstrates, in the Russian view, the futility of trying to control global commodity markets through administrative fiat.

The global spillover dimension is addressed through a counter-narrative: Russia denies weaponizing food and attributes global hunger to Western sanctions and to Ukrainian mining of Black Sea ports. The Black Sea Grain Initiative is acknowledged but framed as a concession by Russia to demonstrate its humanitarian concern, while the West is accused of failing to deliver on promises to facilitate Russian fertilizer and grain exports. Russian discourse emphasizes that sanctions on Russian fertilizer and banking channels have disrupted global food supply, and that the burden falls on the poorest countries. This is not merely deflection; it contains a partial truth, in that sanctions on Russian banks did complicate fertilizer trade finance, and the UN and Western governments have acknowledged the need for humanitarian carve-outs.

What the Russian perspective occludes is substantial. It systematically understates the economic costs of sanctions: the loss of access to Western technology, the brain drain, the contraction of non-energy sectors,

the dependence on China, and the long-term degradation of industrial capacity. It ignores the role of the invasion in causing the initial disruption and in making Russia an international pariah. It presents the ruble's recovery as a sign of strength rather than as the product of draconian capital controls and forced conversion. It denies or minimizes war crimes and civilian harm. And it treats the "multipolar world" as an accomplished fact rather than as an aspiration. The strongest version of the Russian perspective, stripped of its propaganda elements, is a serious claim about the limits of sanctions: that a large, resource-rich, relatively self-sufficient economy with willing buyers in Asia can withstand even comprehensive sanctions, and that the attempt to coerce such an economy may accelerate the very fragmentation of the global order that the sanctioning states seek to prevent.

2.7.4 Western Perspective

The Western perspective on the political economy of coercion in the Ukraine war is rooted in the tradition of coercive diplomacy and economic statecraft, updated for an era of weaponized interdependence. From within this vantage point, sanctions are a legitimate and necessary response to an act of aggression that violated the foundational norms of the post-1945 international order, and the central challenge is to design sanctions that are effective, targeted, and attentive to global spillovers.

The mechanism of sanctions design has evolved significantly. The shift from comprehensive sanctions, as in Iraq in the 1990s, to targeted or "smart" sanctions in the 2000s, and then to the unprecedented measures of 2022—asset freezes, SWIFT exclusion, export controls, and the oil price cap—reflects a learning process. Nicholas Mulder's *The Economic Weapon* (2022) traces the genealogy of sanctions from the League of Nations to the present, showing how the ambition to use economic coercion as a substitute for war has repeatedly collided with the reality that sanctions harm civilians and can entrench rather than weaken target regimes. The 2022 package was designed with this history in mind: targeted at the Russian state and its elites, with humanitarian carve-outs, and with the oil price cap intended to reduce Russian revenues without removing Russian oil from global markets. The mechanism of the price cap is novel: rather than prohibiting the purchase of Russian oil, it prohibits the use of Western shipping, insurance, and finance for transactions above a set price, leveraging Western dominance in maritime services to enforce a global price ceiling.

The energy dimension is read as a story of painful but necessary decoupling. Europe's dependence on Russian gas was recognized as a strategic vulnerability long before 2022, but the political will to address it was lacking. The war forced the issue, and the result—rapid LNG diversification, demand reduction, and the construction of new infrastructure—was achieved at significant economic cost but without the catastrophic shortages that had been feared. Western analysts credit market flexibility, policy coordination, and the mild winter of 2022-23, while acknowledging that the adjustment was uneven and that some sectors and countries suffered more than others.

The financial and technological dimensions are read as demonstrations of Western structural power. Farrell and Newman's weaponized interdependence framework is central here: the United States and its allies control the key nodes of the global financial and technological infrastructure, and the 2022 sanctions demonstrated the capacity to weaponize these nodes against a major power. The export control strategy—described as "small yard, high fence"—aims to restrict Russia's access to advanced technology, particularly semiconductors, while minimizing disruption to global supply chains. The mechanism is to identify chokepoints where Western firms dominate and to deny access through licensing and extraterritorial application of US law.

The global spillover dimension is where the Western perspective is most self-critical. Western policymakers

and analysts have acknowledged that sanctions on Russia contributed to global food and fuel price spikes, that the burden fell disproportionately on the Global South, and that the humanitarian carve-outs were insufficient in practice. The Black Sea Grain Initiative is credited as a partial remedy, and there is recognition that more needs to be done on debt relief, fertilizer access, and food security. Emma Ashford's work, including her 2023 analysis of sanctions, has been influential in pushing the Western debate toward greater realism about the limits and costs of sanctions. The Western perspective contributes a serious engagement with the design and effectiveness of coercive economic measures, a willingness to learn from past failures, and an institutional capacity for coordination and innovation. It also contributes a normative framework—human rights, democracy, territorial integrity—that, whatever its inconsistencies, provides a language for holding aggressors accountable.

What the Western perspective occludes is its own complicity in the structures that make sanctions possible and costly. It tends to treat Western financial and technological dominance as a natural feature of the global economy rather than as a product of historical power. It can underestimate the resentment generated by the extraterritorial application of US law, which affects not only targets but also third parties. It sometimes frames Global South concerns as implementation problems to be managed rather than as structural critiques to be engaged. And it can overstate the effectiveness of sanctions in changing target-state behavior, while understating their role in accelerating the fragmentation of the global economy. The strongest version of the Western perspective is one that takes these critiques seriously: that sanctions are a tool of last resort, that their legitimacy depends on proportionality and on attention to non-target populations, and that the long-term challenge is to build a global economic order in which coercion is less necessary because the underlying grievances are addressed through diplomacy and institutional reform.

2.7.5 UN Perspective

The UN perspective on the political economy of coercion in the Ukraine war is organized around the protection of civilians, the preservation of humanitarian space, and the mitigation of global spillovers, particularly food and energy insecurity. From within this vantage point, the central issue is not the legitimacy of sanctions per se but whether the international community can prevent a war between two states from becoming a hunger and energy crisis for the world's most vulnerable populations.

The mechanism of concern is the transmission of war-related shocks through global markets. The UN, through agencies such as the World Food Programme, the Food and Agriculture Organization, and UNCTAD, has documented how the disruption of Ukrainian grain exports and Russian fertilizer exports drove up global food prices, with disproportionate effects on import-dependent countries in Africa, the Middle East, and Asia. The UNCTAD trade and development reports have provided the most systematic analysis of these spillovers, tracking price indices, trade volumes, and debt distress. The mechanism is not sanctions alone but the interaction of war, sanctions, self-sanctioning by private firms, and the pre-existing vulnerability of low-income countries. The UN perspective insists on disaggregating these causes rather than attributing all harm to any single actor.

The Black Sea Grain Initiative is the centerpiece of the UN's practical response. Brokered by Turkey and the UN in July 2022, the initiative created a safe corridor for Ukrainian grain exports through the Black Sea, with inspections in Istanbul to address Russian concerns about arms smuggling. The initiative facilitated the export of over 30 million tonnes of grain and foodstuffs before Russia withdrew in July 2023. The UN also worked to facilitate Russian fertilizer and grain exports, recognizing that sanctions and self-sanctioning had created obstacles even where humanitarian exemptions existed. The mechanism here is humanitarian

diplomacy: using the UN's convening power to create ad hoc arrangements that protect civilian populations without resolving the underlying conflict.

The financial and energy dimensions are addressed through calls for debt relief, predictable trade channels, and support for vulnerable countries. The UN has emphasized that the global financial architecture is ill-equipped to handle simultaneous shocks to food, fuel, and fertilizer prices, and that low-income countries face a triple crisis of debt, inflation, and currency depreciation. The UN's advocacy for the extension of the Black Sea Grain Initiative, for the removal of obstacles to Russian fertilizer exports, and for increased humanitarian funding reflects a consistent prioritization of human security over geopolitical alignment.

The normative framework is multilateral and legalistic. The UN stresses that sanctions must comply with international law, including humanitarian law, and that non-target populations must not bear disproportionate costs. It calls for humanitarian exemptions that are clear, predictable, and actually implemented, and for monitoring of price and access impacts. It emphasizes the need to protect humanitarian space: sanctions and counter-sanctions should not obstruct food, fertilizer, or energy flows essential to survival. From this vantage point, the key issue is not only whether sanctions are legally justified, but whether global institutions can prevent war-related shocks from becoming hunger crises. The UN perspective contributes a human-security lens and a focus on vulnerable populations, though it may be constrained by the political interests of member states and the limits of humanitarian diplomacy. It also contributes a data and monitoring function that is essential for evidence-based policy, and a convening role that no other actor can replicate. What it occludes is the power asymmetry among member states: the UN's effectiveness depends on the cooperation of the very powers whose actions it seeks to moderate, and its humanitarian framing can sometimes depoliticize structural inequalities that require political, not merely humanitarian, solutions.

SECTION 2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African	Centers the sanctions package's externalities in food, fuel, and fertilizer markets; treats African import dependence, foreign-exchange shortages, and debt as part of the causal chain rather than background noise; demands humanitarian carve-outs and structural support	Can flatten variation among African states and may understate Russian agency in generating the initial shock; sometimes treats all Western policy as uniformly extractive	Human security, sovereign equality, and anti-collateral-damage: coercion against an aggressor must not be financed by hunger in non-target states	African food price indices, fertilizer import dependence, and UNCTAD trade and development reports on commodity shocks	Western: costs to third parties are spillovers, not intent, and targeted design plus carve-outs already mitigate them
Chinese	Shows how sanctions weaponize interdependence and dollar hegemony; documents parallel financial architecture and trade rerouting; frames controls as accelerants of multipolar fragmentation	May overstate US decline and understate China's own use of economic leverage; can treat Russian adaptation as proof of systemic shift rather than costly improvisation	Sovereignty, non-interference, and multipolarity; opposition to extraterritorial coercion	Expansion of alternative payment channels, bilateral currency settlement, and Sino-Russian trade growth	Western: alternatives remain shallow and dollar dominance persists; adaptation is evidence of pressure, not failure

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Russian	Documents adaptation—parallel imports, shadow fleet, discounted Asian sales, ruble invoicing—and frames sanctions as illegal economic warfare	Obscures the war's causal role; ignores domestic inflation, technological degradation, and civilian costs; overstates Western decline	Anti-hegemony and sovereign resistance; sanctions are illegitimate coercion	Continued oil exports, ruble stabilization after the initial shock, and trade redirection	African/Western: resilience is financed by war revenues and borne partly by Russian civilians; adaptation does not legitimate aggression
Western	Explains design logic: asset freezes, SWIFT exclusion, export controls, and price cap as calibrated coercion; includes self-critique on spillovers and efficacy	May overestimate control over global markets; understate Global South costs; assumes liberal-order legitimacy	Rules-based order and accountability for aggression; coercion must be targeted and lawful	2022 sanctions package, oil price cap, and export-control enforcement	African: third-party costs are structural, not incidental; Russian: measures are extraterritorial overreach
UN	Humanitarian carve-outs, Black Sea Grain Initiative, monitoring, and convening; human-security lens	Constrained by member-state power; may depoliticize structural inequality; limited enforcement	Humanitarian neutrality, multilateralism, protection of civilians	BSGI documentation, UNCTAD reports, food price monitoring	African: humanitarianism without structural reform is insufficient; Western: carve-outs may blunt coercive pressure

SECTION 2.8 WORKED EXAMPLE (I do)

Case. The 2022 Russia sanctions package, from the initial asset freezes and SWIFT exclusions through the December 2022 oil price cap, is best understood not as a single embargo but as a sequenced attempt to convert Western control over financial and maritime chokepoints into coercive leverage, followed by Russian adaptation through parallel trade, discounted energy sales, and alternative shipping and payment channels.

Levels of analysis. At the individual level, the package worked through incentives and constraints on central bankers, oligarchs, commodity traders, shipowners, insurers, and farmers in import-dependent states; each actor recalculated risk, liquidity, and compliance costs in real time. At the state level, Russian fiscal-military capacity, European energy dependence, and G7 coordination determined both the sanctions' reach and their political durability. At the systemic level, the case tested dollar hegemony, alliance cohesion, the legal architecture of the UN Charter, and the legitimacy of extraterritorial economic coercion. At the transnational level, the decisive action occurred in shipping lanes, insurance markets, grain corridors, parallel import networks, and currency settlement systems that no single state fully controlled.

Mechanism. The mechanism is chokepoint activation followed by evasion and market rerouting. Asset freezes immobilized a large share of Russia's foreign reserves, reducing its ability to defend the ruble and finance imports. SWIFT exclusions raised transaction costs and pushed trade toward slower, more expensive settlement channels. Export controls denied Russia access to advanced semiconductors, machine tools, and energy technology, degrading long-term productive capacity. The oil price cap then used Western dominance in maritime insurance, finance, and classification services to permit Russian oil sales only below a threshold, aiming to reduce revenue without removing volume from global markets. Russia adapted by selling discounted crude to Asian buyers, using a shadow fleet, rerouting trade through third countries, and invoicing in non-dollar currencies. The result was not collapse but a costly reconfiguration of trade geography: Western leverage remained real, yet its efficacy depended on the continued concentration of financial and maritime services and on the willingness of third parties to absorb discounted Russian commodities.

Perspective reconstruction. The African perspective reads the package as a global market shock whose costs were distributed far beyond the target state. It notes that food, fuel, and fertilizer prices rose in import-dependent economies, that foreign-exchange shortages and debt-service pressures intensified, and that the Black Sea Grain Initiative provided only partial and temporary relief. It treats humanitarian carve-outs as necessary but insufficient because they do not restore purchasing power or repair sovereign balance sheets. It also frames the episode as evidence that sanctions design must include non-target states as stakeholders rather than afterthoughts. Finally, it insists that African agency—through the African Union, regional economic communities, and diplomatic mediation—should shape any future coercive regime, rather than merely absorbing its consequences. The Chinese perspective interprets the same package as economic warfare that accelerates de-dollarization and multipolar fragmentation; it points to the expansion of alternative payment channels and to Sino-Russian trade growth as evidence that coercion can undermine the very interdependence on which it depends. The Russian perspective frames sanctions as illegal and illegitimate coercion, emphasizing adaptation through parallel imports, shadow shipping, and ruble invoicing as proof of resilience and sovereign resistance. The Western perspective defends the package as calibrated coercive diplomacy in response to aggression, while also acknowledging self-critique about spillovers, enforcement gaps, and uncertain long-term efficacy. The UN perspective centers humanitarian carve-outs, the Black Sea Grain Initiative, monitoring, and convening, treating the case as a test of whether global institutions can prevent war-related shocks from becoming hunger crises.

Explicit adjudication. The Western perspective best explains the design and strategic logic of the package,

because it captures why policymakers sequenced asset freezes, SWIFT exclusion, export controls, and the price cap as instruments of calibrated coercion. The Russian and Chinese perspectives best explain adaptation and the partial erosion of Western leverage, because they identify the shadow fleet, parallel imports, and alternative settlement channels that blunted the initial shock. The UN perspective best explains the institutional attempt to manage humanitarian fallout, though it remains constrained by the power of member states. Yet the African perspective best explains the case as a whole, because the package's most consequential effects were transnational market transmissions rather than bilateral coercion alone: the sanctions mattered globally because food, fuel, and fertilizer prices moved through integrated markets, and because import-dependent states bore costs they did not choose. What the African perspective misses is the security imperative that motivated the package and the extent to which Russian adaptation was itself costly, technologically degrading, and dependent on the continued willingness of third parties to absorb discounted commodities. A complete explanation therefore requires the African lens for distributional outcomes, the Western lens for coercive intent, and the Russian-Chinese lens for evasion and systemic counter-adaptation.

SECTION 2.9 PROBLEM PAIR (We do)

1. **Mechanism mapping.** Distinguish four channels through which the 2022–23 crisis reached African food markets: (a) direct legal prohibitions on food or fertilizer trade; (b) indirect financial, insurance, shipping, and port frictions; (c) war effects such as the Black Sea blockade and Ukrainian export collapse; and (d) market expectations and futures-price amplification. Which channel was most important for African wheat and fertilizer prices, and what evidence would separate them?

2. **Level-of-analysis diagnosis.** Explain how the crisis operated at the individual level (household food insecurity and coping strategies), the state level (import dependence, subsidy capacity, and foreign-exchange constraints), the systemic level (global commodity markets, dollar invoicing, and energy costs), and the transnational level (grain traders, insurers, banks, and shipping firms). Which level offers the strongest leverage for policy intervention?

3. **Perspective reconstruction.** In three to four sentences each, reconstruct the African, Chinese, Russian, Western, and UN readings of the food crisis. For each, identify one contribution and one occlusion, especially regarding whether sanctions, war, or market structure should be treated as the primary cause.

4. **Historical analogue.** Compare the 2022–23 crisis with either the 1973–74 food crisis or the sanctions-era humanitarian debates around Iraq. What is genuinely analogous, and what differs because of targeted sanctions, financial de-risking, and the Black Sea Grain Initiative?

5. **Falsification.** State two pieces of evidence that would weaken the claim that Western sanctions were the principal cause of African food insecurity, and two pieces that would strengthen it. Be explicit about the difference between correlation in price indices and demonstrated causal mechanism.

6. **Policy evaluation.** Assess the Black Sea Grain Initiative and humanitarian carve-outs in sanctions regimes. What metric—such as African food price indices, fertilizer import volumes, Ukrainian grain exports, or shipping insurance premia—best indicates whether these instruments worked, and for whom?

MODEL ANSWER

The 2022–23 food crisis is best explained as a compound shock in which war disruption and market amplification were primary, while sanctions contributed through indirect financial and logistical channels rather than through direct prohibitions on food or fertilizer trade. The causal chain ran from the Black Sea port closure and Ukrainian export collapse to global wheat futures; from Russian fertilizer export friction, including payment-channel difficulties, insurance constraints, and port logistics, to higher input costs for African agriculture; from energy price spikes to fertilizer production costs; and from dollar appreciation to larger import bills for African states. Even where no legal ban existed, compliance overreach and risk aversion by banks and shippers raised transaction costs, so the relevant mechanism was often de-risking rather than statutory prohibition. The oil price cap attempted to reduce Russian revenue while preserving supply, but its effectiveness depended on enforcement, the growth of shadow-fleet shipping, and the discounts accepted by buyers. African states therefore faced a double squeeze: higher food import prices and higher fertilizer prices, combined with limited fiscal space and constrained access to concessional finance.

At the individual level, households experienced price spikes because wheat, fertilizer, and fuel are imported and often dollar-denominated, forcing coping strategies such as reduced dietary diversity or asset sales. At the state level, import-dependent governments with limited foreign-exchange reserves could not fully subsidize consumption, so price shocks translated quickly into political and social stress. At the systemic level, Black Sea supply uncertainty, energy costs, and post-pandemic inflation fed futures markets and amplified spot prices. At the transnational level, grain traders, insurers, banks, and shipping firms repriced risk, sometimes withdrawing services from transactions that were legally permissible but commercially unattractive. The strongest policy leverage therefore lies at the transnational and systemic levels: humanitarian carve-outs must be made operationally credible to private actors, and emergency finance must address foreign-exchange constraints rather than merely condemning price spikes.

The African perspective correctly centers the burden on non-targets and treats the crisis as an exposure of structural import dependence, dollarized food systems, and limited policy space. It also warns against reducing African states to passive victims, because strategic reserves, regional trade, and fertilizer subsidy choices matter. Its occlusion can be an underestimation of Russian agency in the Black Sea blockade and in Russia's own export restrictions. The Chinese perspective frames sanctions as economic warfare and a catalyst for de-dollarization; it usefully highlights financial weaponization but may overstate the inevitability of alternative payment systems and understate China's own market power. The Russian perspective emphasizes resilience and Western self-harm; it accurately notes that sanctions did not stop Russian exports entirely and that price caps created arbitrage opportunities, but it occludes Russia's role in restricting Ukrainian exports and its own fertilizer export limits. The Western perspective treats sanctions as coercive diplomacy with unintended spillovers; its self-critique acknowledges the need for humanitarian carve-outs and better calibration, but it sometimes conflates Russian propaganda with legitimate Global South grievance. The UN perspective focuses on humanitarian access, the Black Sea Grain Initiative, and carve-outs; it provides institutional mitigation but cannot resolve the underlying conflict or structural inequality.

Compared with the 1973–74 food crisis, which was driven by oil shocks and transitions in agricultural productivity, the 2022–23 crisis combined a major grain exporter's war, financial sanctions, and post-pandemic inflation. The Iraq sanctions analogy warns of humanitarian harm from comprehensive sanctions, but the 2022 architecture was more targeted; nevertheless, financial de-risking produced broad effects that resembled comprehensive pressure in practice. The Black Sea Grain Initiative increased Ukrainian exports and moderated prices, but its suspension showed that humanitarian corridors remain dependent on geopolitical bargaining. Humanitarian carve-outs were necessary but insufficient because private actors still over-complied when legal risk, reputational risk, and insurance costs were high.

Adjudication should rest on timing and counterfactual evidence. If African food prices rose before the full implementation of financial restrictions and if non-sanctioned suppliers also raised prices, then war disruption and market panic were primary. If fertilizer shipments faced documented payment, insurance, or shipping frictions even where trade was legally permitted, then sanctions were an important amplifying and conditioning factor. The bounded verdict is therefore that sanctions were not the sole or necessarily dominant cause of African food insecurity, but they were a significant transmission mechanism that worsened an already severe shock. African vulnerability reflected the interaction of global disruption, market structure, and domestic dependence. Falsifiers include stable African prices despite sanctions, or price spikes in the absence of war-related Black Sea disruption; conversely, evidence that fertilizer exports fell mainly because of financial friction rather than Russian policy would strengthen the sanctions-centered claim.

SECTION 2.10 INDEPENDENT MEMO (You do)

(a) Case description: A mid-sized East African grain-importing state in 2022 faces a 40 percent increase in wheat prices, fertilizer shortages, currency depreciation, and rising urban food protests. Its finance ministry attributes the crisis primarily to Western sanctions on Russia, while its agriculture ministry blames the Black Sea blockade and global market panic. You are advising a regional economic community secretariat on whether to request sanctions carve-outs, emergency grain finance, or both. The memo must be analytical rather than polemical and must distinguish mechanisms from accusations.

(b) Required memo headings as prompts:

- **Mechanism:** Identify the causal chain from war, sanctions architecture, and market behavior to African food and fertilizer prices; specify which links are direct, indirect, and contingent.
- **Perspective reconstruction:** Reconstruct the African, Chinese, Russian, Western, and UN readings in steel-man form, noting what each contributes and what each occludes.
- **Historical analogue:** Compare the case with one earlier food or sanctions crisis, stating what is analogous and what differs in financial architecture, commodity markets, or humanitarian instruments.
- **Falsifiers:** List evidence that would weaken or strengthen your central claim, and state the threshold at which you would revise your recommendation.

(c) Self-check: Before submitting, verify that you have clearly distinguished description, explanation, prediction, and prescription, and that no empirical claim is presented as a normative conclusion.

SECTION 2.11 HINGE QUESTION

Which of the following is the most defensible causal claim about the 2022–23 food crisis and African food security?

A. Western sanctions were the sole cause of African food insecurity because they legally prohibited Russian grain and fertilizer exports.
B. The crisis was primarily a war-driven supply shock amplified by market expectations, with sanctions acting mainly through indirect financial and logistical frictions.
C. The Black Sea Grain Initiative eliminated African food insecurity by restoring Ukrainian exports to pre-war levels.
D. African food insecurity was caused entirely by domestic policy failures, since global prices did not affect local markets.

Distractor diagnoses

- **A** is wrong because it conflates legal prohibition with financial de-risking; sanctions generally did not ban food or fertilizer trade, and it ignores the Black Sea blockade and market amplification.

- **C** is wrong because the initiative mitigated but did not eliminate price pressure, and its suspension demonstrated continued dependence on geopolitical bargaining.

- **D** is wrong because it denies the transmission of global prices into import-dependent, dollarized food systems, although domestic policy did mediate the severity of the shock.

SECTION 2A — DATA LAB

Table 1. Russia's oil export revenues and the ruble exchange rate, 2021–2024 (approximate)

Year	Oil export revenue (USD bn, approx.)	USD/RUB (annual average, approx.)	Key policy marker
2021	~110	~74	Pre-war baseline; no price cap
2022	~120–140	~68 (range 55–135)	G7 price cap adopted Dec 2022; capital controls imposed
2023	~90–100	~85	Urals traded at steep discount; cap enforcement tightened
2024	~80–90	~92	Shadow-fleet expansion; partial price recovery

Sources: approximate figures drawn from IEA oil-market reporting and Russian Ministry of Finance fiscal data as summarized in UNCTAD trade and development reports; exact values vary by definition (crude only vs. crude plus petroleum products).

Table 2. EU natural gas imports by source, share of total imports (%)

Source	2021	2022	2023	2024 (est.)
Russia	~40	~20	~8	~10
Norway	~20	~25	~30	~28
United States (LNG)	~6	~12	~18	~20
Algeria	~8	~10	~12	~11
Other (Qatar, Azerbaijan, etc.)	~26	~33	~32	~31

Sources: approximate shares from IEA and Eurostat gas-import data as reported in energy analyses; 2024 figures are estimates.

Table 3. African food-price stress indicators, 2021–2023

Indicator	2021	2022 peak	2023
FAO Food Price Index (2014–16 = 100)	~125	159.3 (Mar 2022)	~124
Wheat price (USD/tonne, approx.)	~280	~450	~260
Share of wheat imports from Russia/Ukraine (selected African importers)	30–60%	30–60%	declining
African countries in acute food crisis (IPC Phase 3+)	~20	~28	~25

Sources: FAO Food Price Index; UNCTAD trade and development reports; WFP/IPC assessments.

Analysis questions

1. **Trend.** Between 2021 and 2024, Russia's oil export revenues (Table 1) did not collapse in proportion to the severity of the sanctions package. Identify the three mechanisms—price, volume, and routing—that explain why revenues fell only modestly in 2022 and then stabilized, and state which mechanism dominated in which year.

2. **Level of analysis.** Table 2 shows a rapid reconfiguration of EU gas supply. At which level of analysis (individual, state, systemic, transnational) is the most powerful explanation located, and why does a purely state-level account (e.g., "Germany chose to diversify") understate the role of transnational LNG markets and infrastructure bottlenecks?

3. **Perspective reconstruction (all five).** Using Tables 1–3, reconstruct in 3–5 sentences each how (a) an African analyst, (b) a Chinese analyst, (c) a Russian analyst, (d) a Western analyst, and (e) a UN analyst would read the same data. Which table would each treat as the most important, and which would each treat as a distraction?

4. **Interpretation.** The FAO Food Price Index peaked in March 2022 (Table 3) before the G7 oil price cap was adopted in December 2022. Does this timing support or undermine the claim that Western sanctions were the primary driver of the 2022 global food crisis? What alternative or complementary mechanisms must be weighed?

5. **Limitation.** What do these three tables *not* capture that would be necessary to adjudicate between the Western claim ("sanctions are targeted and include humanitarian carve-outs") and the African claim ("sanctions function as a tax on non-targeted importers")? Name at least two missing variables and the data source that would supply them.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — "The Sanctions Escalation Ladder"

- **What to draw:** A staircase of five ascending steps on the left side of the page, each step a horizontal rectangle. Step 1 (bottom): "Targeted asset freezes (2014, post-Crimea)"; Step 2: "Sectoral sanctions (2014–2021)"; Step 3: "Comprehensive financial sanctions + SWIFT exclusion (Feb 2022)"; Step 4: "Export controls on technology (2022)"; Step 5 (top): "Oil price cap + shadow-fleet countermeasures (Dec 2022–2024)". Draw a thick arrow curving upward along the right edge of the staircase labeled "Escalation".
- **Labels to place:** On each step, small icons: a padlock (asset freeze), a bank (SWIFT), a microchip (export controls), an oil barrel with a price tag (price cap). At the top, a flag labeled "Russia" with a dashed line showing "adaptation" (shadow fleet, SPFS, CIPS, parallel imports).
- **Perspective overlay to annotate:** In red ink on the left margin, write "Western frame: coercive diplomacy, calibrated escalation." In green ink on the right margin, write "African frame: each step raises import costs for non-targets; humanitarian carve-outs are porous." Draw a bracket connecting Steps 3–5 labeled "Global spillover zone."

Visual 2 — "Europe's Gas Decoupling, 2021–2024"

- **What to draw:** A simplified map of Europe and the North Atlantic. Draw the Nord Stream 1 and 2 pipelines as thick lines from Russia to Germany, then cross them out with a large red "X" (sabotage/cessation, Sept 2022). Draw LNG terminals as small triangles on the coasts of the Netherlands, Germany, France, and Spain. Draw arrows from Norway (north), the United States (west, across the Atlantic), and Algeria (south) into these terminals. Shade Russia in grey.
- **Labels to place:** "Russia: ~40% → ~8% of EU gas imports"; "Norway: ~20% → ~30%"; "US LNG: ~6% → ~18–20%". Add a small box in the corner: "Storage: 90% full by Nov 2022 (EU target)".
- **Perspective overlay to annotate:** In blue ink, annotate along the pipelines: "Russian frame: energy weapon / supply leverage." In orange ink, annotate along the LNG arrows: "European frame: diversification and resilience." In purple ink, annotate at the bottom: "Transnational frame: global LNG market price transmission to Global South."

Visual 3 — "Parallel Financial Architecture"

- **What to draw:** Two parallel horizontal lanes. Top lane: a large circle labeled "SWIFT (Western-dominated)" with arrows to "USD clearing", "Euro clearing", and "G7 banks". Bottom lane: two smaller circles labeled "SPFS (Russia)" and "CIPS (China)" connected by a dashed line labeled "interoperability talks". Between the lanes, draw a thick vertical barrier labeled "Sanctions wall (2022)". On the right side, draw a ship icon labeled "Shadow fleet (~600 vessels, 2024)" carrying oil barrels with a "discounted Urals" price tag.
- **Labels to place:** "SWIFT exclusion: 7 Russian banks, Feb 2022"; "SPFS: ~400 participants (mostly Russian)"; "CIPS: ~1,400 participants (global)"; "Shadow fleet: price-cap evasion".
- **Perspective overlay to annotate:** In red ink above the top lane: "Western frame: financial containment." In green ink below the bottom lane: "Chinese/Russian frame: de-dollarization and multipolarity." In black ink across the barrier: "African frame: payment friction raises transaction costs for all non-Western trade."

SECTION 4 — CORNELL NOTES

Cue (Prompt)	Notes (with source log)
What is "weaponized interdependence" and who coined it?	Farrell and Newman (2019): states leverage chokepoints in global networks (SWIFT, dollar clearing, semiconductor supply chains) for coercive ends. Scope: requires network centrality and target dependence. Critique: overstates Western control; underestimates adaptation.
How did sanctions on Russia evolve 2014–2024?	2014 Crimea: targeted asset freezes. 2022: comprehensive financial sanctions, SWIFT exclusion (7 banks), export controls. Dec 2022: G7 oil price cap ($60/bbl). 2023–24: enforcement tightening, shadow-fleet countermeasures. Source: Ashford (2023); Mulder (2022) on sanctions history.
What happened to Nord Stream?	Nord Stream 1/2 pipelines sabotaged/ceased Sept 2022. EU gas imports from Russia fell from ~40% (2021) to ~8% (2023). Replacement: Norway, US LNG, Algeria, demand reduction, storage. Source: IEA energy analyses.
What is SPFS and CIPS?	SPFS: Russian alternative to SWIFT, ~400 participants (mostly domestic). CIPS: Chinese cross-border interbank system, ~1,400 participants. Both grew post-2022 but remain small vs. SWIFT. Mechanism: parallel architecture reduces but does not eliminate dollar dependence.
What is "small yard, high fence"?	US export-control strategy: restrict a narrow set of critical technologies (semiconductors, AI, quantum) with high barriers. Applied to Russia 2022 (chips, aerospace). Russian adaptation: parallel imports via third countries (Turkey, UAE, Central Asia).
How did the Black Sea Grain Initiative work?	UN/Turkey-brokered deal, July 2022: safe corridor for Ukrainian grain exports. Suspended July 2023 by Russia. Effect: temporary price relief; African importers benefited. Source: Black Sea Grain Initiative documentation.
What were the global spillovers?	Food, fuel, fertilizer price spikes 2022. African food insecurity rose (IPC Phase 3+ countries ~20→28). Fertilizer (ammonia, potash) supply disrupted; Russia/Belarus major exporters. UNCTAD reports document trade and development impacts.

Cue (Prompt)	Notes (with source log)
How does the African perspective frame sanctions?	Structural critique: sanctions are a tax on non-targets; humanitarian carve-outs porous; food/fuel/fertilizer shocks hit import-dependent economies. Calls for compensation, carve-out clarity, and Global South voice in sanctions design. Scholars: Grovogui, Mbembe, Bayart, Mamdani, Rodney, Nkrumah, Nyerere, Cabral, Fanon, Aning, Danso, Tamale, Oyěwùmí.
How does the Chinese perspective frame sanctions?	Sanctions as economic warfare; accelerates de-dollarization; CIPS/SPFS growth; "long-arm jurisdiction" critique. Supports multipolarity; avoids joining Western sanctions.
How does the Russian perspective frame sanctions?	Resilience narrative: adaptation via shadow fleet, parallel imports, new markets (India, China). Anti-Western framing: sanctions as aggression; "fortress Russia" discourse.
How does the Western perspective frame sanctions?	Coercive diplomacy to degrade Russian war capacity; self-critique on global spillovers and enforcement gaps. Debate: effectiveness vs. humanitarian cost.
How does the UN perspective frame sanctions?	Humanitarian carve-outs, Black Sea Grain Initiative, food-security diplomacy. Emphasis on protecting civilian populations and trade flows.

Source log: Farrell and Newman (2019, 2023); Ashford (2023); Mulder (2022); Black Sea Grain Initiative documentation; UNCTAD trade and development reports; IEA energy analyses; FAO Food Price Index.

Summary: Sanctions on Russia evolved from targeted 2014 measures to a comprehensive 2022 package spanning finance, energy, and technology, with the G7 oil price cap as a novel market-mechanism instrument. Russia adapted through shadow-fleet routing, parallel imports, and alternative payment systems, while Europe decoupled from Russian gas via LNG and Norwegian supply. The same instruments generated severe global spillovers in food, fuel, and fertilizer, concentrating costs on import-dependent economies in the Global South. The five perspectives disagree on whether sanctions are coercive diplomacy, economic warfare, resilience tests, or structural violence, and on whether adaptation or containment will dominate over the medium term.

SECTION 5 — FEYNMAN COMPRESSION

1. **Explain without jargon.** Sanctions are a way for powerful countries to punish an aggressor by cutting it off from money, technology, and markets. After Russia invaded Ukraine in 2022, the West froze Russian assets, kicked some Russian banks off the global payment system, capped the price of Russian oil, and blocked advanced technology exports. Russia fought back by selling oil to India and China at

a discount, using a "shadow fleet" of tankers, and finding backdoor routes for banned goods. Europe stopped buying Russian gas and bought liquefied gas from America and Norway instead. But the shockwaves hit everyone: food, fuel, and fertilizer prices spiked, and countries in Africa that import wheat and fertilizer suffered the most even though they were not part of the war.

2. **Mark gaps.** I am unsure about the exact share of Russian oil now sold above the price cap via the shadow fleet; I am unsure whether SPFS and CIPS can actually interoperate at scale; I am unsure how much of the 2022 food-price spike came from sanctions versus the war itself blocking Ukrainian ports; and I am unsure whether the "small yard, high fence" export controls have measurably slowed Russian military production or merely raised its costs.

3. **Reread verification.** Re-reading the data lab: Table 1 shows revenues did not collapse, confirming that adaptation (discounts, rerouting) offset the cap; Table 2 shows EU decoupling succeeded on the gas side; Table 3 shows African food stress peaked before the oil cap, which weakens a simple "sanctions caused the food crisis" claim and points to the war and port blockades as proximate causes, with sanctions as a compounding factor. The African perspective's structural critique survives this check because even non-sanctions shocks (war, port closure) are amplified by import dependence that sanctions-era financial friction worsens.

4. **Analogy with explicit limits.** Sanctions are like a siege: the besieger tries to starve the target of resources, but the target builds tunnels and alternative supply lines, and the siege also raises prices for bystanders who trade with both sides. The analogy's limit: a siege is territorial and binary, whereas sanctions are networked and partial—Russia still sells oil, just at a discount, and the "bystanders" (African importers) are not neutral but structurally dependent on the same global markets the sanctions disrupt.

5. **Rewrite.** Sanctions on Russia in 2022 combined financial exclusion, an oil price cap, and technology export controls into the most comprehensive coercive package since the Cold War. The package degraded but did not cripple Russian revenues, because adaptation—shadow-fleet routing, parallel imports, and Asian demand—offset Western leverage. Europe's gas decoupling succeeded faster than expected, yet the global spillovers in food, fuel, and fertilizer fell hardest on import-dependent economies in Africa and the wider Global South. Whether sanctions are judged effective depends on the metric chosen (Russian war capacity vs. global welfare vs. African food security) and on the time horizon, since adaptation erodes leverage while spillovers persist. The five perspectives—African, Chinese, Russian, Western, and UN—each capture one dimension of this trade-off and none captures all of it.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L38	Definition	What is weaponized interdependence in the sanctions context?	It is the use of control over critical nodes in global economic networks—such as payment systems, shipping insurance, or technology standards—to coerce states that depend on those networks. Farrell and Newman argue that network position, not only market size, creates coercive leverage. Its scope is limited where targets can reroute through alternative nodes.	African: reveals how Global South states are often collateral nodes in networks they do not control.

Tag	Card Type	Front	Back	Perspective Note
L38	Mechanism	How does SWIFT exclusion transmit coercion?	Removing banks from SWIFT raises transaction costs, delays payments, and complicates trade finance, especially for energy and commodities. It does not by itself freeze assets, but it narrows the channels through which a state can settle international trade. Adaptation occurs through bilateral arrangements, alternative messaging systems, and clearing workarounds.	Russian: frames it as financial blockade; Western: frames it as targeted pressure.

Tag	Card Type	Front	Back	Perspective Note
L38	Application	What is the G7 oil price cap mechanism?	The cap permits maritime services for Russian oil only if the sale price is at or below a set threshold, aiming to reduce Russian revenue while keeping oil flowing. It relies on enforcement through insurers, shippers, and price attestations. Its effectiveness depends on compliance, shadow-fleet growth, and the gap between capped and market prices.	Western: revenue denial; Russian: market distortion.

Tag	Card Type	Front	Back	Perspective Note
L38	Comparison	How do targeted and comprehensive sanctions differ?	Targeted sanctions aim at elites, firms, or sectors to limit civilian harm, while comprehensive sanctions restrict broad economic activity and risk wider welfare costs. The post-2022 Russia package mixed both: asset freezes and export controls were targeted in design but had economy-wide effects. The distinction matters for legality, legitimacy, and humanitarian assessment.	UN: emphasizes carve-outs and proportionality.
L38	Source	What is Farrell and Newman's core claim?	States occupying central positions in global networks can weaponize those positions because others cannot easily exit. The 2022 sanctions showed both the power and the limits of that leverage as Russia rerouted trade and finance. The framework is structural, not merely about bilateral power.	Chinese: supports the de-dollarization critique.

Tag	Card Type	Front	Back	Perspective Note
L38	Debate	Do economic sanctions reliably change target behavior?	Sanctions can impose costs and signal resolve, but their coercive success depends on target vulnerability, sender unity, time horizon, and adaptation. Mulder's historical work warns that sanctions often escalate conflict or harm third parties rather than compel. The 2022 case shows cost imposition without immediate policy reversal.	Western self-critique: acknowledges uncertain efficacy.

Tag	Card Type	Front	Back	Perspective Note
L38	Reconstruction	How does China interpret sanctions on Russia?	China tends to view broad sanctions as economic warfare that politicizes trade and accelerates fragmentation of the global economy. It supports selective engagement, alternative payment channels, and sovereignty-based objections to extraterritorial measures. At the same time, Chinese firms often comply partially to avoid secondary sanctions.	Chinese: de-dollarization and multipolarity.

Tag	Card Type	Front	Back	Perspective Note
L38	Occlusion	What does the Western perspective often understate?	Western accounts may foreground coercive intent and understate third-party costs, especially food, fuel, and fertilizer shocks in import-dependent economies. They may also overstate target isolation while underestimating adaptation through non-Western markets. Self-critique has grown around global spillovers and sanctions fatigue.	African: centers non-target burdens.

Tag	Card Type	Front	Back	Perspective Note
L38	Adjudication	How did sanctions affect African food security in 2022–23?	The crisis reflected war disruption, export restrictions, shipping and insurance costs, fertilizer price spikes, and pre-existing import dependence—not sanctions alone. Sanctions on Russian finance and logistics compounded access problems for some African importers. The strongest evidence points to multiple causal channels rather than a single sanctions effect.	African: demands disaggregation of causes.
L38	Visual	What does an energy-decoupling diagram show?	It maps EU gas imports shifting from Russian pipeline dominance toward LNG, Norwegian pipeline gas, and demand reduction. The visual should distinguish volume, price, and infrastructure constraints. It also reveals that decoupling is partial and price-mediated, not instantaneous.	Western/EU: security diversification; Russian: market loss.

Tag	Card Type	Front	Back	Perspective Note
L38	Definition	What is the small-yard-high-fence strategy?	It is a strategy of tightly controlling a narrow set of critical technologies while keeping broader trade open. In the Russia case, it meant restricting semiconductors, advanced manufacturing inputs, and dual-use goods rather than all commerce. The aim is to maximize strategic impact while minimizing self-harm and allied friction.	Western: precision coercion; Chinese: technology containment.
L38	Mechanism	How do parallel financial architectures reduce sanctions leverage?	Systems such as SPFS and CIPS, plus bilateral currency arrangements, create alternative messaging and settlement routes. They do not replace SWIFT's scale, but they lower the cost of partial exit and create bargaining space for sanctioned actors. Their growth is incremental and politically contingent.	Russian/Chinese: resilience; Western: limited but real.

Tag	Card Type	Front	Back	Perspective Note
L38	Application	What was the Black Sea Grain Initiative?	It was a UN- and Türkiye-brokered arrangement to allow Ukrainian grain exports through designated Black Sea corridors, alongside efforts to facilitate Russian fertilizer and food exports. It reduced immediate food-price pressure but remained fragile and politically conditional. Its suspension and revival illustrate how humanitarian logistics depend on war diplomacy.	UN: humanitarian carve-out; African: food access.

Tag	Card Type	Front	Back	Perspective Note
L38	Comparison	How does de-dollarization differ from dollar dominance?	De-dollarization refers to efforts to reduce reliance on the dollar in trade and reserves, while dollar dominance reflects the depth, liquidity, and network effects of dollar markets. Sanctions accelerated political interest in alternatives, but structural advantages of the dollar persist. The gap between rhetoric and settlement data is analytically important.	Chinese/Russian: strategic shift; Western: overstated near-term change.
L38	Source	What does Mulder (2022) add to sanctions theory?	Mulder traces sanctions as a tool of modern economic warfare and emphasizes their historical tendency to broaden, escalate, and impose costs on civilians and third parties. This cautions against treating sanctions as a low-cost substitute for military force. It frames the 2022 package within a longer history of economic coercion.	African: validates burden-on-non-targets critique.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence audit table (scored 0-100).

Concept / Skill	Self-score (0-100)	Calibration note
Weaponized interdependence		Can you explain network-node leverage without examples only?
SWIFT exclusion mechanism		Can you distinguish messaging disruption from asset freezing?
Oil price cap enforcement		Can you identify insurers, shippers, and attestation roles?
Export controls / small-yard-high-fence		Can you name controlled inputs and leakage channels?
Global spillovers (food, fuel, fertilizer)		Can you separate war effects from sanctions effects?
African perspective reconstruction		Can you state the structural critique in its own terms?
Chinese perspective reconstruction		Can you steel-man de-dollarization without endorsing it?
Russian perspective reconstruction		Can you explain resilience claims and their limits?
Western perspective reconstruction		Can you include Western self-critique on spillovers?
UN perspective reconstruction		Can you distinguish humanitarian carve-outs from sanctions relief?
Adjudication across perspectives		Can you rank claims by evidence rather than sympathy?
Data interpretation (oil, FX, gas, food prices)		Can you specify level of analysis for each trend?

7.2 Three-question debrief.

1. Which perspective did you reconstruct least charitably, and what evidence would force you to revise that reconstruction?
2. Did you confuse cost imposition with behavioral change when evaluating sanctions efficacy?
3. Which data trend—Russian oil revenue, USD/RUB, EU gas imports by source, or African food price indices—most challenges your prior assumption, and why?

7.3 Error-log table.

Common Misconception	Correction	Evidence
Sanctions alone caused the 2022–23 food crisis.	The crisis reflected war disruption, export restrictions, shipping and insurance costs, fertilizer price spikes, and pre-existing import dependence; sanctions were one compounding channel among several.	UNCTAD trade and development reports; Black Sea Grain Initiative documentation
SWIFT exclusion is the same as an asset freeze.	SWIFT is a messaging network; asset freezes involve legal custody and blocking of funds. They can reinforce each other but operate through different mechanisms.	Farrell and Newman (2019, 2023)
The oil price cap eliminated Russian oil exports.	The cap aimed to reduce revenue while sustaining flows; exports rerouted through non-Western buyers and shadow-fleet logistics.	Russia oil export revenue data, 2021–2024
Targeted sanctions have no civilian or third-party effects.	Sectoral, financial, and export controls can transmit through prices, supply chains, and fiscal capacity, producing economy-wide and cross-border spillovers.	2022 Russia sanctions package; Mulder (2022)
De-dollarization has already displaced dollar dominance.	Political momentum for alternatives increased, but dollar depth, liquidity, and network effects remain structurally significant.	Settlement and clearing comparisons; Farrell and Newman (2023)
Sanctions are costless for senders and the global economy.	Senders absorb energy-price, inflation, industrial-adjustment, and alliance-coordination costs; non-targets absorb food, fuel, and fertilizer shocks.	EU gas import shifts; African food price indices; UNCTAD reports

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Sanctions design and evolution	Targeted vs. comprehensive measures; asset freezes; oil price cap; export controls	Mulder (2022); Ashford (2023)	2022 Russia sanctions package; G7 price cap	Efficacy vs. spillovers	No revenue decline; no target adaptation	L18, L36
Weaponized interdependence	Control of network nodes; chokepoints; exit costs	Farrell and Newman (2019, 2023)	SWIFT; insurance; technology standards	Structural power vs. agency	Targets exit networks cheaply	L18
Energy weaponization	Pipeline cutoff; LNG substitution; price cap enforcement	Energy security and interdependence theory	Nord Stream; EU gas imports by source	Decoupling speed vs. cost	No source shift; persistent price spike	L19, L39, L46
Parallel financial architecture	SPFS; CIPS; bilateral settlement; currency swaps	Monetary power and network theory	Russia–China trade settlement	De-dollarization pace	Dollar share unchanged; systems unused	L18
Export controls	Small-yard-high-fence; licensing; end-use monitoring	Strategic trade control theory	Semiconductors and dual-use inputs to Russia	Precision vs. leakage	No supply disruption; rapid substitution	L52
Global spillovers	Food, fuel, fertilizer shocks; import dependence; shipping and insurance costs	Political economy of coercion	African food price indices; Black Sea Grain Initiative	Humanitarian carve-outs vs. pressure	No price change; no access improvement	L36, L46

SECTION 9 — REVIEW SCHEDULE

Review	Timing	Concrete action
R1	Day 0, 20 minutes	Re-read the flashcards and annotate one African-case example for each of the five key ideas.
R2	Day 2, 30 minutes	Reconstruct all five perspectives from memory, then compare against Section 2.7 and correct omissions.
R3	Day 7, 45 minutes	Redo the problem-pair food-crisis task and compare your answer with the model answer.
R4	Day 14, 60 minutes	Use the data lab focus to sketch trends in Russian oil revenue, USD/RUB, EU gas imports, and African food prices; write a 300-word adjudication.
R5	Day 30, 90 minutes	Write a full memo on a new sanctions case using the four required headings, then run the self-check on description, explanation, prediction, and prescription.

SECTION 10 — COMPLETION CHECKLIST

- ☐ I can define weaponized interdependence and identify its network-node mechanism.
- ☐ I can distinguish SWIFT exclusion from asset freezes and explain adaptation.
- ☐ I can explain the oil price cap and its enforcement chain.
- ☐ I can compare targeted and comprehensive sanctions using the 2022 Russia case.
- ☐ I can explain the small-yard-high-fence strategy and its leakage risks.
- ☐ I can describe SPFS, CIPS, and bilateral settlement as partial alternatives.
- ☐ I can reconstruct the African perspective on food, fuel, and structural burden.
- ☐ I can reconstruct the Chinese perspective on sanctions as economic warfare.
- ☐ I can reconstruct the Russian perspective on resilience and anti-Western framing.
- ☐ I can reconstruct the Western perspective including self-critique on spillovers.
- ☐ I can reconstruct the UN perspective on humanitarian carve-outs and the Black Sea Grain Initiative.
- ☐ I can adjudicate competing claims using evidence rather than perspective sympathy.
- ☐ I can interpret at least one data trend at the correct level of analysis.
- ☐ I can identify falsifiers for sanctions-efficacy claims.
- ☐ I can distinguish description, explanation, prediction, and prescription in a memo.
- ☐ I can state the strongest counterargument to my preferred view.
- ☐ I can connect this lesson to L18, L19, L36, L39, L46, and L52.

40. European Security Architecture and Strategic Autonomy

LESSON METADATA

Field	Value
Lesson number and title	Lesson 39: European Security Architecture and Strategic Autonomy
Module	Module 6: Eastern Europe and the Ukraine War
Prerequisites	L35–L38 (Ukraine), L6 (institutionalism), L14 (contemporary transition)
Interleaved links	Forward to L40 (wider Eastern Europe), L47–L48 (US–China, Indo-Pacific), L49 (Global South)
Reading load	7–9 hours
Content channels	Text, data tables, visual anchors, flashcards, worked example, problem pair
Bloom ceiling	Evaluate / Create
Estimated study time	7–9 hours

SECTION 0 — Why This Lesson Exists

The central puzzle of this lesson is whether Europe can simultaneously rearm at speed, decouple from Russian energy, build an autonomous defense-industrial base, and preserve the transatlantic security bond that made three decades of underinvestment in defense politically tolerable — or whether these four imperatives are, in important respects, mutually contradictory. For thirty years after the Cold War, the European security order rested on a tacit division of labor: the United States provided the hard-security guarantee through NATO, while European states specialized in economic integration, soft power, and crisis management. That arrangement produced the "peace dividend," a sustained decline in European defense spending as a share

of GDP, and a defense-industrial landscape fragmented along national lines. The 2022 Russian invasion of Ukraine did not merely shock that order; it exposed its structural fragility. Germany's *Zeitenwende*, Finland and Sweden's accession to NATO, the European Union's first-ever use of the European Peace Facility to finance lethal weapons deliveries, and the scramble to replace Russian pipeline gas with liquefied natural gas all represent responses to a single underlying condition: the recognition that the European continent could no longer treat security as a service imported from across the Atlantic. Yet the very urgency of rearmament has reopened questions that the post-Cold War period had papered over — about who pays, who produces, who decides, and whose interests the emerging architecture ultimately serves.

This lesson places that puzzle inside the curriculum's broader arc. Lessons 35–38 traced the Ukraine war's origins, conduct, and consequences; Lesson 6 supplied the institutionalist toolkit for analyzing alliances, collective action, and path dependence; Lesson 14 framed the "contemporary transition" in global order, including the erosion of unipolarity and the rise of multipolar competition. Lesson 39 now asks what happens when a regional security order must be rebuilt under conditions of great-power war, energy shock, and uncertain American commitment. It is the hinge between the Eastern European theater and the wider questions of global order taken up in Lessons 40, 47–48, and 49. The student who masters this lesson should be able to move from describing events — summits, spending figures, pipeline closures — to explaining the mechanisms that connect them, predicting where institutional friction will appear, and prescribing policy responses that are sensitive to the trade-offs between autonomy and alliance, speed and efficiency, and European and transatlantic interests.

The theoretical stakes are substantial and genuinely contested. From an institutionalist perspective, NATO's post-2022 revitalization and the EU's parallel defense initiatives (PESCO, the European Defence Fund, the Strategic Compass) can be read as evidence that external threat produces institutional deepening: organizations that appeared moribund acquire new purpose when the environment changes. The mechanism runs through threat perception, alliance solidarity, and the sunk costs of existing institutional infrastructure. From a realist perspective, the same developments look less like institutional deepening than like classic balance-of-power behavior: European states are arming because the distribution of power has shifted, and the institutional forms are epiphenomenal to the underlying material imperative. A liberal reading emphasizes interdependence and the gains from cooperation — joint procurement, shared standards, integrated supply chains — while a constructivist reading stresses identity change, the redefinition of "European security" from a post-national project to a hard-power enterprise. The lesson does not treat any of these as settled; it requires the student to adjudicate among them on the basis of evidence, specifying scope conditions and identifying what would falsify each claim.

The African perspective is not an afterthought to this European story; it reframes it. European rearmament is not occurring in a vacuum. It competes for fiscal resources, political attention, and military assets with commitments elsewhere, including in the Sahel, the Horn of Africa, and the Mediterranean. The EU's energy decoupling from Russia has redirected demand toward African gas and critical minerals, reproducing patterns of extractive dependency that African scholars have long criticized. The militarization of European foreign policy — through the European Peace Facility, the expansion of EU military missions, and the hardening of border externalization — interacts with African security dynamics in ways that European policy documents rarely acknowledge. Reconstructing the African vantage point reveals what the Western, Chinese, Russian, and UN perspectives each tend to occlude: that European security architecture is also an African security architecture, whether Europeans intend it or not, and that the "strategic autonomy" debated in Brussels and Paris has material consequences for states and populations far from the continent's eastern frontier.

The five perspectives developed in this lesson — African, Chinese, Russian, Western, and UN — each capture a genuine dimension of the problem and each carries characteristic blind spots. The Chinese perspective treats NATO expansion as a destabilizing force and European rearmament as evidence of a bloc mentality that undermines multipolarity; it contributes a systemic, great-power lens but occludes the agency of smaller European states and the defensive motivations behind their choices. The Russian perspective frames NATO expansion as an existential threat and European militarization as confirmation of a hostile encirclement; it captures the security-dilemma logic but systematically understates Russian agency in producing the very outcomes it decries. The Western perspective emphasizes unity, rearmament, and the autonomy debate as a healthy internal discussion; it captures institutional momentum but risks conflating European interests with American preferences. The UN perspective situates the entire development within the Charter framework of collective security, sovereignty, and the prohibition on the use of force; it contributes legal and normative standards but struggles to address the power-political realities that drive state behavior. The African perspective, developed at greatest length, shows what all four miss: the global distributional consequences of European security choices.

By the end of this lesson, the student will be able to: specify the mechanisms linking threat perception to institutional change in NATO and the EU; evaluate the competing claims of strategic autonomy and transatlantic dependency using evidence from spending, procurement, and force-posture data; reconstruct each of the five perspectives in its strongest form and identify its characteristic occlusion; apply the analytical framework to the AUKUS submarine deal as a case of transatlantic strain; and articulate falsifiable predictions about the durability of the post-2022 European security consensus. The lesson's worked example walks through the 2022–2024 NATO rearmament and the EU Strategic Compass as an institutional response, modeling the levels-of-analysis approach and explicit adjudication that the student is expected to replicate. The problem pair and independent memo then transfer these skills to new cases, with the hinge question testing whether the student can distinguish description from explanation, prediction from prescription — a distinction that runs through the entire module and that this lesson, with its mix of urgent policy debate and contested theory, is designed to sharpen.

SECTION 1 — Pre-Class Priming

1.1 Retrieval Warm-Up Answer each question from memory before checking your notes. These draw on Lessons 35–38 (Ukraine), Lesson 6 (institutionalism), and Lesson 14 (contemporary transition).

1. **Security dilemma.** Define the security dilemma and explain how it applies to the debate over NATO's eastward expansion after 1999. What is the difference between a security dilemma and a spiral model of conflict?

2. **Institutional persistence.** According to institutionalist theory, why did NATO survive the end of the Cold War when many predicted its obsolescence? Identify at least two mechanisms (e.g., path dependence, sunk costs, institutional lock-in) and give one concrete example from the 1990s.

3. **Contemporary transition.** What does Lesson 14 mean by the "contemporary transition" in global order? Name two indicators that the unipolar moment has eroded and one that suggests it persists.

4. **Minsk and deterrence.** What were the Minsk agreements (2014–2015), and what do their failure tell us about the limits of diplomatic settlement when underlying power distributions are contested?

5. **Burden-sharing.** What is the NATO 2% of GDP defense spending guideline, when was it adopted, and what does the "free-rider" problem imply for alliance cohesion? Cite one pre-2022 European case of chronic under-spending.
6. **Constructivism and identity.** How does constructivism treat national identity in alliance politics? Give one example of how a state's self-conception as a "civilian power" or "neutral" state shaped its defense policy before 2022.

1.2 Orientation Questions These questions frame the lesson's central puzzle. You are not expected to answer them fully before reading; use them to guide your attention.

1. Is European strategic autonomy compatible with NATO primacy, or does it require a degree of institutional and operational decoupling from the United States? What evidence would distinguish these two positions?
2. Does rapid rearmament strengthen or weaken the European Union's claim to normative power — the idea that the EU leads by values and rules rather than by force? Can a polity be both a "normative power" and a hard-power actor?
3. How does energy decoupling from Russia reshape Europe's geopolitical dependencies rather than eliminate them? Which new suppliers and chokepoints replace the old ones, and with what strategic consequences?
4. What would falsify the claim that the 2022 invasion produced a durable European security consensus? Identify at least two observable developments that would indicate fragmentation rather than consolidation.

1.3 Vocabulary Pre-Teach Provisional definitions to be refined as you read. Each term will be revisited in the lesson core with theoretical precision.

Term	Provisional Definition
Strategic autonomy	The European Union's stated capacity to act independently in security and defense when necessary, without relying on the United States; contested between those who see it as complementary to NATO and those who see it as a step toward decoupling.
Burden-sharing	The distribution of defense costs, risks, and responsibilities among alliance members; in NATO, measured partly by the 2% of GDP spending guideline and the 20% equipment-spending target.
PESCO	Permanent Structured Cooperation: an EU treaty mechanism (Article 42.6 TEU) allowing willing member states to deepen defense cooperation in capability development and operations.

Term	Provisional Definition
European Defence Fund (EDF)	An EU budget instrument financing collaborative defense research and development, intended to reduce fragmentation and incentivize joint procurement.
Strategic Compass	The EU's 2022 strategic document setting out a shared threat assessment and a roadmap for defense capability development, rapid deployment, and resilience.
REPowerEU	The European Commission's 2022 plan to end dependence on Russian fossil fuels through energy savings, diversification of supply, and accelerated renewables deployment.
Zeitenwende	German for "turning point": Chancellor Olaf Scholz's February 2022 declaration signaling a break with post-Cold War defense restraint, including a €100 billion special fund for the Bundeswehr.
Defense industrial base	The network of firms, skills, infrastructure, and supply chains capable of producing and sustaining military equipment; its health determines whether spending translates into capability.
Fragmentation	The duplication of national defense programs and industries across European states, leading to inefficiency, interoperability problems, and higher unit costs.
Transatlantic relationship	The security, economic, and political ties between the United States and Europe, anchored in NATO but extending to trade, technology, and intelligence cooperation.
Deterrence by denial	A strategy of making aggression infeasible by forward defense and resilience, as opposed to deterrence by punishment (threatening retaliation); central to NATO's eastern-flank posture post-2022.
Interoperability	The ability of allied forces to operate together effectively, requiring common standards, equipment, and procedures; a persistent challenge given fragmented European procurement.
Ammunition production gap	The shortfall between European artillery ammunition consumption rates in high-intensity war and domestic production capacity, exposed by the Ukraine war and addressed (partially) by the EU's ASAP and EDIRPA instruments.

SECTION 2 — LESSON CORE

2.1 Learning objectives

By the end of this lesson, the student will be able to:

1. **Analyze** the causal chain linking Russia's February 2022 full-scale invasion of Ukraine to NATO's institutional adaptation across the Madrid (June 2022), Vilnius (July 2023), and Washington (July 2024) summits, distinguishing immediate triggers from enabling conditions (pre-existing alliance structures, US extended deterrence) and identifying which summit outcomes were symbolic versus materially consequential. (Bloom: Analyze)
2. **Evaluate** the tension between European strategic autonomy and transatlantic dependency by comparing the EU's PESCO, EDF, and Strategic Compass instruments with NATO's capability targets, identifying where the two frameworks complement and where they compete, and assessing what the AUKUS episode revealed about the limits of European autonomy. (Bloom: Evaluate)
3. **Explain** the mechanism by which energy decoupling from Russia reshaped Europe's geopolitical geography, including the infrastructure investments, supplier diversification, and price shocks that reconfigured European energy security between 2022 and 2024, with attention to differential impacts across member states. (Bloom: Explain)
4. **Assess** the fragmentation problem in Europe's defense industrial base, using evidence on ammunition production shortfalls, procurement duplication, and interoperability gaps to judge whether current reform efforts (NATO's Defense Production Action Plan, the EU's ASAP program) are sufficient to close the capability gap. (Bloom: Assess)
5. **Reconstruct** the five perspectives (African, Chinese, Russian, Western, UN) on European security architecture as a whole, identifying what each reveals and what each occludes, with particular attention to how the African vantage point reframes European rearmament as a global resource reallocation with consequences for Sahel and Horn of Africa security, and adjudicate between competing explanations of NATO expansion's consequences. (Bloom: Reconstruct/Evaluate)

2.2 KEY IDEA 1 — NATO expansion and rearmament: from the 2022 Madrid Summit to the 2024 Washington Summit

Bolded Causal Claim: Russia's full-scale invasion of Ukraine in February 2022 functioned as a permissive shock that converted latent NATO institutional capacity into active rearmament and territorial expansion, producing the most significant transformation of European security architecture since the end of the Cold War; however, the depth and durability of that transformation remain contingent on threat perception, US political commitment, and European fiscal and industrial capacity, not on the invasion alone.

Mechanism: The mechanism operates through three linked channels. First, threat perception: the invasion collapsed the post-Cold War assumption that major interstate war in Europe was obsolete, an assumption that had underwritten two decades of defense underinvestment across the alliance. This perceptual shift is measurable in NATO defense expenditure data: in 2014, only three allies met the 2% of GDP guideline; by 2024, twenty-three of thirty-two allies were projected to meet or exceed it (NATO, 2024). Second, institutional

adaptation: the alliance's Madrid Summit in June 2022 produced a new Strategic Concept that designated Russia as "the most significant and direct threat" to allied security and, for the first time, identified China as posing "systemic challenges" to Euro-Atlantic security. The concept also invited Finland and Sweden to join, reversing the post-1991 pattern of eastward expansion limited to former Warsaw Pact states. Third, force posture: NATO moved from a tripwire deterrence model—small multinational battlegroups in the Baltic states and Poland—toward a forward defense model, with brigade-sized formations, pre-positioned equipment, and enhanced air and missile defense. The Vilnius Summit in July 2023 approved new regional defense plans and a Defense Production Action Plan; the Washington Summit in July 2024 marked the 75th anniversary and focused on sustaining support for Ukraine and expanding defense industrial capacity. The mechanism is not automatic. It requires US leadership (the United States provides roughly two-thirds of NATO's defense spending), European political will (budgetary commitments must survive electoral cycles and coalition politics), and industrial capacity (ammunition production cannot be surged without capital investment, skilled labor, and supply-chain reconfiguration). Howorth (2019) and Biscop (2021) had long argued that European defense underinvestment was structurally unsustainable; the war validated their warnings but did not by itself resolve the underlying industrial and fiscal constraints they identified.

Scope Conditions: The rearmament trajectory holds under several conjunctural conditions: (a) sustained Russian threat perception among European publics and elites, which is itself sensitive to battlefield developments and ceasefire prospects; (b) continued US commitment to extended deterrence, which is contingent on American domestic politics and the outcome of US elections; (c) fiscal space in European economies, which varies sharply—Poland and the Baltic states spend above 3% of GDP, Germany's Zeitenwende remains partially implemented, and France faces binding fiscal constraints; (d) industrial capacity to convert spending into deployable capability, which is currently bottlenecked in ammunition, air defense interceptors, and long-range fires. The mechanism weakens if any of these conditions fail: a US administration that questions Article 5 commitments would undermine the entire structure; a ceasefire in Ukraine that reduces threat perception could slow spending; and industrial bottlenecks mean that money alone does not produce capability. The scope condition is therefore conjunctural—rearmament is overdetermined by threat perception but underdetermined by capacity and political will.

Observable Implications: If the causal claim holds, we should observe: (i) rising defense spending as a share of GDP across the alliance, concentrated in frontline states but spreading to core Western European economies; (ii) expansion of NATO's membership to include Finland (April 2023) and Sweden (March 2024), adding approximately 1,300 kilometers of NATO-Russia border; (iii) transformation of force posture from tripwire to forward defense, with brigade-level deployments in the east; (iv) new defense industrial initiatives, including NATO's Defense Production Action Plan and the EU's ASAP ammunition program; (v) persistent gaps between spending commitments and deployable capability, particularly in air defense, long-range fires, and ammunition stockpiles. Data from the IISS Military Balance 2023-2024 confirm the spending trajectory while also documenting the capability gaps: European NATO members' combined defense spending rose substantially, but ammunition production remained far below consumption rates observed in Ukraine. The observable implication that would falsify the claim is a sustained decline in European defense spending combined with NATO force posture contraction despite continued Russian aggression—evidence that the rearmament was a temporary shock response rather than a structural shift.

Perspective Note (five traditions in brief):

African (primary): From the African vantage point, European rearmament appears not as a self-contained regional adjustment but as a global resource reallocation with cascading consequences. The surge in Euro-

pean defense spending—projected to exceed $400 billion annually across NATO Europe by 2024—occurs in a context where European development assistance, peacekeeping contributions, and diplomatic attention to African security crises in the Sahel, the Horn of Africa, and the Great Lakes are simultaneously contracting. The mechanism is fiscal and attentional: defense budgets are not infinitely elastic, and the political salience of Ukraine has displaced Africa from European strategic agendas. African scholars such as Adekeye Adebajo and Paul Williams have documented how European security priorities shape African security outcomes through arms flows, peacekeeping deployments, and diplomatic engagement. The African perspective reveals what the Western narrative occludes: that European "unity" in response to Ukraine has been purchased partly through the neglect of African security architectures, and that the militarization of European foreign policy may reproduce patterns of external intervention in Africa under the guise of counter-terrorism partnerships. The African vantage point also questions the universality of the "rules-based order" that NATO claims to defend, noting that the same states now mobilizing against Russian aggression have historically supported or tolerated interventions and arms transfers that destabilized African states. What the African perspective contributes is a reframing of European security not as a regional public good but as a competitor for finite global resources, with distributional consequences that fall disproportionately on regions outside the Euro-Atlantic core.

Chinese: Beijing interprets NATO expansion and rearmament as evidence of a US-led strategy to consolidate alliance structures in both Europe and the Indo-Pacific, with the ultimate aim of containing China. The Chinese perspective treats NATO's 2022 Strategic Concept designation of China as a "systemic challenge" as a provocation that extends the alliance's remit beyond its North Atlantic geographic mandate, violating the principle that regional organizations should not target third parties. Chinese analysts argue that NATO expansion eastward was a proximate cause of the Ukraine war, and that European rearmament serves American strategic interests by locking Europe into a US-led security architecture that forecloses strategic autonomy. The Chinese vantage point emphasizes the apparent hypocrisy of Western condemnation of Russian sphere-of-influence thinking while NATO itself expands. What this perspective occludes is the agency of Central and Eastern European states in seeking NATO membership, which was driven by their own threat perceptions rather than American imposition, and the defensive character of NATO's posture prior to 2022.

Russian: Moscow's narrative frames NATO expansion as an existential threat and a violation of post-Cold War assurances, treating the alliance's eastward enlargement as the root cause of the Ukraine conflict. Russian officials and state media have consistently argued that NATO's 2008 Bucharest summit promise of eventual membership for Ukraine and Georgia, combined with the alliance's military infrastructure approaching Russian borders, left Moscow with no security margin. The Russian perspective treats the 2022 invasion as defensive, aimed at preventing NATO's further encroachment. This narrative has been central to Russian domestic legitimation of the war and to its diplomatic outreach to the Global South. What the Russian perspective occludes is the voluntary nature of NATO membership applications, the absence of any binding treaty commitment not to enlarge, and the fact that NATO's military posture in Eastern Europe prior to 2022 was minimal—rotational battlegroups rather than permanent bases. The narrative also ignores that Russia's own actions, including the 2014 annexation of Crimea and support for Donbas separatists, were the immediate catalysts for NATO's enhanced forward presence.

Western: The Western perspective, dominant in NATO capitals and EU institutions, treats the rearmament as a necessary and overdue response to Russian aggression, framing it as the restoration of deterrence after a period of dangerous underinvestment. Proponents argue that the 2% target, long treated as aspirational, has finally acquired political force; that Finland and Sweden's accession strengthens the alliance's northern flank; and that the new regional defense plans represent a genuine operational transformation rather than

symbolic adjustment. Western analysts such as Howorth (2019) and Biscop (2021) had long argued that European defense underinvestment was unsustainable, and the war validated their warnings. The Western perspective emphasizes alliance unity—twenty-three allies meeting the 2% target by 2024, compared to three in 2014—as evidence of a durable strategic shift. What this perspective tends to occlude is the gap between spending and capability, the dependence on US industrial and military leadership, and the opportunity costs for other global commitments, including in Africa and the Indo-Pacific.

UN: The UN perspective situates NATO rearmament within the framework of the UN Charter, particularly Article 51 (the inherent right of individual and collective self-defense) and Chapter VIII (regional arrangements). From this vantage point, NATO's response to Russian aggression is legally defensible as collective self-defense, but the broader question is whether the rearmament contributes to or undermines international peace and security. UN officials and member states have expressed concern about arms races, the erosion of arms control frameworks (including the suspension of the New START treaty and the collapse of the Conventional Armed Forces in Europe treaty), and the diversion of resources from development and peacebuilding. The UN perspective also highlights the tension between NATO's regional mandate and its global partnerships—the Indo-Pacific four (Australia, Japan, New Zealand, South Korea)—which risk globalizing a regional conflict. What the UN perspective occludes is the practical reality that the Security Council is paralyzed by the Russian veto, making collective security through the UN impossible and leaving regional arrangements as the only viable response.

2.3 KEY IDEA 2 — European strategic autonomy: from French concept to EU policy (PESCO, EDF, the Strategic Compass)

Bolded Causal Claim: European strategic autonomy became an institutional project rather than a French slogan because the 2022 invasion of Ukraine and the prospect of American retrenchment converted a long-standing debate about dependence into a set of binding EU defense instruments; yet autonomy remains partial because member states still privilege NATO for deterrence and national sovereignty for procurement.

Mechanism: The mechanism is not a single decision but a layered causal chain. First, the invasion collapsed the post-Cold War assumption that large-scale territorial war in Europe was obsolete; this raised the expected cost of relying on a single external guarantor. Second, the uneven American response—strong under Biden but shadowed by Trump-era threats to condition Article 5 and by congressional delays in aid—introduced strategic uncertainty into European planning, making "autonomy" a hedge rather than a replacement for NATO. Third, EU institutional actors, especially the European Commission and the High Representative, used the crisis to advance pre-existing agendas: the European Defence Fund (EDF), Permanent Structured Cooperation (PESCO), and the Strategic Compass. The EDF provides EU budget money for collaborative research and development; PESCO creates legally binding commitments among participating states; the Strategic Compass, adopted in March 2022, supplies a shared threat assessment and capability targets, including an EU Rapid Deployment Capacity. Fourth, the mechanism depends on member-state bargaining: France has historically framed autonomy as global strategic sovereignty, Germany has treated it as complement to NATO, and Central and Eastern European states have insisted that autonomy must not dilute American deterrence. The resulting compromise is "strategic autonomy in the European security and defense policy space," not an independent European army. Fifth, industrial politics matter: autonomy requires a defense industrial base, but European procurement remains fragmented by national champions, offset requirements, and divergent standards; thus the mechanism produces institutional ambition faster than industrial consol-

idation. Howorth (2019) and Biscop (2021) provide the conceptual baseline: autonomy is the capacity to decide and act, sometimes with partners, not autarky. In short, the war created demand for autonomy, EU institutions supplied frameworks, and member-state heterogeneity limited the supply response.

Scope Conditions: The autonomy agenda advances under three conditions: (i) a proximate, high-intensity threat that makes capability gaps salient; (ii) credible doubt about the reliability or capacity of the United States; and (iii) EU institutional capacity to pool resources without requiring unanimity on every project. It stalls when any of these fail. If Washington reaffirms unconditional extended deterrence and funds European deployments, the incentive to build parallel structures falls. If member states treat defense as a national industrial policy—protecting domestic firms through juste retour—joint procurement cannot achieve economies of scale. If fiscal rules or debt constraints dominate, defense spending rises rhetorically but not in deployable capability. The concept also has a semantic scope condition: "strategic autonomy" is not "strategic independence." Under the narrower definition, autonomy can coexist with NATO; under the French maximalist definition, it implies a European pole capable of autonomous intervention. The post-2022 EU policy mostly adopts the narrower definition, which is why it has been politically acceptable to Atlanticist members. Scope also varies by domain: autonomy is more advanced in economic statecraft (sanctions, energy) than in high-end military capability, where US systems, intelligence, and logistics remain indispensable. It is further constrained by legal scope: Article 42.7 of the Treaty on European Union provides mutual assistance, but operational command still depends on national contributions and NATO planning.

Observable Implications: If the mechanism is operating, one should observe rising European defense expenditure, more collaborative EU-funded projects, and new procurement initiatives, but not a displacement of NATO command structures. Observable indicators include: increased national defense budgets toward or above the NATO 2 percent guideline; EDF project portfolios in areas such as air defense, cyber, and unmanned systems; PESCO projects moving from planning to capability delivery; the Strategic Compass's Rapid Deployment Capacity and hybrid threat response; and EU-level ammunition and procurement initiatives responding to Ukraine's consumption rates, including the Act in Support of Ammunition Production and common procurement instruments. One should also observe persistent gaps: continued reliance on US strategic enablers (intelligence, surveillance, reconnaissance, strategic lift, missile defense), national vetoes over foreign policy, and industrial duplication (multiple main battle tank and fighter programs). The implication is not that Europe has become self-sufficient, but that it has begun to price dependence into its institutional design. A useful falsifier would be a sustained rise in European capability without corresponding EU institutionalization—for example, purely national rearmament that bypasses Brussels—because that would indicate that autonomy is being pursued as national sovereignty rather than collective capacity.

Perspective Note (five traditions in brief): The African perspective, which must be read as primary rather than peripheral, sees European strategic autonomy as a rearrangement of power that does not automatically enlarge African agency. African scholars and policymakers have long argued that European security debates are conducted over African heads: the Sahel, the Horn, and the Mediterranean are treated as theaters for European risk management rather than as regions with their own political projects. From this vantage, autonomy can cut both ways. On one hand, a less US-dependent Europe might pursue more independent Africa policies, potentially reducing the securitization of migration and the outsourcing of border control. On the other hand, European rearmament can deepen the militarization of African spaces, sustain arms flows, and divert diplomatic attention and development finance from African priorities. The African perspective therefore asks not whether Europe is autonomous from Washington, but whether autonomy produces accountability to African states and populations. It also notes that African states are not passive objects of European strategy; they navigate among European, Chinese, Russian, and Gulf actors, and European autonomy may

create openings for African bargaining. What this perspective occludes if ignored is the internal diversity of African positions—some governments welcome European security assistance, others resist it—and the fact that African security challenges are often rooted in domestic political settlements rather than external sponsorship alone.

The Chinese perspective treats European strategic autonomy as a potentially stabilizing deconcentration of Western power, but remains skeptical that it will reduce NATO's global posture. Beijing's official discourse frames NATO as a Cold War relic and a source of instability; European autonomy that weakens transatlantic cohesion could be welcomed as reducing US capacity to coordinate pressure on China. Yet Chinese analysts also recognize that a more capable Europe may still align with Washington on technology, sanctions, and Indo-Pacific issues. The Russian perspective interprets autonomy through the lens of alliance fracture: Moscow has historically sought to exploit transatlantic divisions, and a Europe that speaks with one voice on defense could be more, not less, threatening. Russian narratives emphasize NATO expansion as an existential threat; European autonomy that preserves NATO's core while adding EU capacity is read as militarization rather than emancipation. The Western perspective, especially in Washington and Atlanticist capitals, supports European capability but worries about duplication and political decoupling; it treats autonomy as acceptable when it strengthens the alliance and dangerous when it creates parallel structures. The UN perspective situates autonomy within the Charter framework: regional arrangements are permitted under Chapter VIII, but they must not undermine collective security or arms control; the UN view highlights the risk that competitive rearmament erodes the normative and legal constraints on the use of force.

2.4 KEY IDEA 3 — Energy decoupling: REPowerEU, LNG infrastructure, and the new energy geography

Bolded Causal Claim: Europe's rapid reduction of Russian gas dependence after 2022 was achieved by combining demand destruction, emergency LNG infrastructure, and accelerated renewable targets; the result is a structurally altered energy geography that reduces Moscow's coercive leverage but substitutes new dependencies on global LNG suppliers and imposes uneven economic costs.

Mechanism: The mechanism begins with a supply weaponization shock: Russia reduced and then largely halted pipeline deliveries through Nord Stream and other routes, converting energy interdependence into coercion. European governments responded through three channels. First, demand reduction: industrial curtailment, efficiency measures, fuel switching, and mild weather reduced gas consumption, demonstrating that demand is more elastic in a crisis than in normal planning; EU member states agreed to reduce gas demand by 15 percent over the winter of 2022-23. Second, supply substitution: floating storage and regasification units, new LNG terminals, pipeline reversals, and interconnectors allowed non-Russian gas—especially from the United States, Norway, Qatar, Algeria, and Azerbaijan—to reach Central and Eastern Europe; Germany commissioned FSRUs at Wilhelmshaven, Brunsbüttel, and Lubmin, while the Baltic Pipe and interconnector upgrades reduced bottlenecks. Third, structural acceleration: REPowerEU, presented in March 2022, raised renewable and efficiency targets, streamlined permitting, and framed decarbonization as security policy. The mechanism is path-dependent: pipeline gas created physical lock-in and long-term contracts; LNG creates a different lock-in based on terminal capacity, shipping, and global spot prices. The shift from a regional pipeline system to a global LNG market also changes price formation: European prices become tied to Asian demand and shipping availability, not just to Russian contract terms. A further mechanism is political: energy decoupling required EU-level coordination on storage mandates, joint purchasing, and price caps, but implementation remained national, producing uneven protection for industry and house-

holds. Thus the war did not simply remove Russia; it reorganized Europe's energy system around liquidity, infrastructure, and global markets.

Scope Conditions: Decoupling succeeds when three conditions hold: (i) global LNG supply is available at prices Europe can absorb; (ii) infrastructure can be built or repurposed quickly; and (iii) demand reduction is politically tolerable. It is constrained when global LNG markets are tight, when terminal construction faces local opposition or financing gaps, and when industrial users cannot pass through costs. The mechanism also depends on weather and on the behavior of third suppliers: Qatar's long-term contracts, US export capacity, and Norwegian field maintenance all matter. Scope conditions include distributional ones: decoupling that protects households through subsidies may strain public finances; decoupling that exposes industry to high prices may accelerate deindustrialization or relocation. There is also a temporal condition: emergency measures (FSRUs, demand cuts) can be implemented in months, but structural decoupling (renewables, grid expansion, hydrogen) takes years. Finally, the concept of "decoupling" should not be overstated: Europe reduced dependence on Russian pipeline gas dramatically, but Russian LNG still enters some markets, and global oil and gas markets remain interconnected, so price effects persist even where physical flows stop.

Observable Implications: If the mechanism is operating, one should observe a collapse in Russian pipeline gas's share of EU imports, a rise in US and Norwegian supply, new terminal capacity in previously dependent states, and a measurable reduction in EU gas demand. One should also observe price volatility, industrial stress in gas-intensive sectors, and political contestation over subsidy regimes. Observable implications include: diversification of supply contracts; storage levels managed through EU-mandated targets; accelerated renewable permitting; and new geopolitical relationships with LNG exporters. A falsifier would be a return to pre-war dependence patterns without a corresponding collapse in Russian supply—for example, if European buyers quietly resumed large-scale Russian gas purchases through intermediaries—because that would indicate that decoupling was tactical rather than structural. Another falsifier would be a failure of renewable acceleration despite high fossil prices, suggesting that security framing did not overcome planning and grid constraints.

Perspective Note (five traditions in brief): The African perspective is primary and reveals that European energy decoupling is not a self-contained regional adjustment but a redistribution of energy demand and investment with global consequences. African states have been positioned both as potential suppliers and as competitors for LNG cargoes; when Europe bid aggressively for LNG in 2022, some developing economies faced higher prices or supply shortages. African scholars and policymakers have also framed European decarbonization and gas demand as a form of "green colonialism" when it accelerates extraction in African territories without corresponding local industrialization or energy access. At the same time, Europe's search for alternatives creates opportunities for African gas producers—Algeria, Nigeria, Senegal, Mozambique, Tanzania—but these opportunities are constrained by infrastructure, financing, and security risks. The African vantage point thus highlights a double standard: Europe's energy security is treated as urgent, while African energy poverty is treated as a development issue. It also insists that climate justice cannot be separated from security policy; if Europe's transition relies on African resources without technology transfer, the result is a new dependency rather than a partnership. What this perspective occludes if ignored is the heterogeneity of African energy interests—exporters versus importers, fossil-dependent versus renewable-rich states—and the agency of African governments in negotiating terms.

The Chinese perspective sees European decoupling as evidence that energy interdependence can be weaponized, reinforcing Beijing's emphasis on self-reliance and diversified supply routes. Chinese analysts may view Europe's turn to US LNG as replacing one dependency with another, while also noting opportu-

nities for Chinese renewable technology exports and infrastructure investment. The Russian perspective frames decoupling as a costly European self-harm that has not eliminated Russia's global energy role; Moscow argues that Europe pays more for less secure supply and that Russian resources will find other markets, especially in Asia. The Western perspective treats decoupling as a strategic success that reduced Russian leverage and aligned climate and security goals, though it acknowledges price and competitiveness costs. The UN perspective emphasizes energy access, climate commitments, and the risk that crisis-driven fossil investment locks in emissions; it also stresses that global energy markets must serve development needs, not only European security.

2.5 KEY IDEA 4 — Defense industrial base: ammunition production, procurement reform, and the fragmentation problem

Bolded Causal Claim: Europe's defense-industrial base was optimized for low-intensity, expeditionary, and peacetime procurement, so the Ukraine war's high-intensity consumption exposed a structural inability to produce, stockpile, and sustain munitions at scale; closing that gap requires not merely money but a politically difficult shift from nationally fragmented demand to aggregated, multi-year, interoperable procurement.

Mechanism: The causal chain runs through several linked mechanisms. First, post-Cold War force structures and industrial planning assumed short, limited wars with precision munitions and minimal attrition; stockpiles were reduced and production lines idled. Second, European defense markets remained nationally segmented: procurement ministries bought from national champions, often with offset requirements, producing multiple variants of similar systems and preventing economies of scale. Third, supply chains were optimized for cost rather than surge, with single-source components, long-lead items, and limited skilled labor. Fourth, donation of existing stocks to Ukraine depleted European inventories faster than production could replace them, especially for 155mm artillery shells, air-defense interceptors, and armored vehicle spare parts. Fifth, price signals arrived late: until governments signed multi-year contracts with volume guarantees, firms would not invest in new capacity because defense markets are monopsonistic and capital-intensive. Sixth, EU-level instruments such as the Act in Support of Ammunition Production, the European Defence Industry Reinforcement through Common Procurement Act, and the proposed European Defence Industry Programme attempt to aggregate demand and co-finance capacity, but they operate within competition law, national sovereignty over procurement, and industrial policy disputes. The result is a lag between political urgency and physical output: money can be appropriated quickly, but machine tools, energetics, propellants, and trained workers cannot.

Scope Conditions: This mechanism is strongest under conditions of prolonged high-intensity conventional war in Europe, where consumption rates exceed Cold War planning assumptions. It weakens if the conflict freezes or de-escalates, because political urgency and funding commitments fade. It also depends on US and non-European supply: if Washington provides munitions or if global suppliers fill gaps, European shortfalls are less visible. Conversely, if a simultaneous Indo-Pacific contingency diverts US production, European dependency on domestic capacity becomes acute. The mechanism is further conditioned by national industrial structure: states with existing ammunition plants can scale faster than those without, while small states remain dependent on imports. EU regulatory flexibility matters: if state aid and procurement rules are interpreted strictly, joint programs stall; if relaxed, consolidation accelerates. Finally, the mechanism assumes that political leaders accept trade-offs between efficiency and sovereignty; if they insist on national champions, fragmentation persists despite spending increases.

Observable Implications: Several observable implications follow. One is the gap between announced spending and delivered capability: rising defense budgets do not immediately translate into shells, interceptors, or vehicles. Another is the proliferation of national and EU initiatives alongside bilateral and minilateral deals. A third is industrial behavior: new plants, expanded shifts, and acquisitions by major primes, but also bottlenecks in energetics, machine tools, and skilled labor. A fourth is price inflation and delivery delays for systems such as air defense and artillery. A fifth is the continued diversity of European platforms: even as spending rises, the number of distinct tank, fighter, and frigate programs remains high, indicating that fragmentation is a stock problem as well as a flow problem. A sixth is the political salience of strategic autonomy rhetoric: governments increasingly justify industrial policy in security terms, but implementation remains uneven. Data from the IISS Military Balance and national procurement announcements can track these trends, though output figures are often classified or commercially sensitive.

Perspective Note (five traditions in brief):

African (primary): European rearmament has direct and indirect consequences for African security that are often treated as externalities in European debates. The first is fiscal and political attention: as European governments redirect budgets toward ammunition, air defense, and force posture, development, peacekeeping, and security-assistance commitments to Africa face tighter scrutiny. This does not mean automatic cuts, but it changes the burden of proof for African programs and can accelerate a shift from long-term state-building support to transactional counterterrorism or migration control. The second is industrial priority: when European defense firms operate at capacity for European orders, African customers may face longer delivery times, higher prices, or reduced access to systems and spare parts, especially for states that rely on European suppliers. The third is arms-market dynamics: a rearmed Europe may increase surplus equipment transfers to partners, but such transfers can also flood fragile markets, complicate stockpile security, and empower non-state actors if end-use monitoring is weak. The fourth is normative: African scholars and diplomats have long argued that European security crises absorb global institutional bandwidth; the Ukraine war's industrial mobilization reinforces a hierarchy in which European territorial defense is treated as existential while African conflicts are managed as chronic. Yet the African perspective is not simply oppositional. It also notes that European defense-industrial fragmentation offers lessons for African regional integration: without aggregated demand and shared standards, African defense industries will remain dependent and small-scale. Moreover, some African states may benefit from diversification of suppliers as Europe, the United States, and others compete for markets. The core claim is that European rearmament is not merely a European story; it reshapes global arms availability, aid politics, and the distribution of security attention, and African agency requires tracking those shifts rather than accepting them as background.

Chinese: China interprets European defense-industrial mobilization as part of a broader US-led militarization of the international system. From Beijing's vantage point, NATO's push for higher output and standardization is not a neutral response to aggression but an institutionalization of bloc confrontation, with potential spillovers into the Indo-Pacific through interoperability, technology sharing, and alliance expectations. Chinese analysts often argue that European rearmament is fiscally unsustainable and risks an arms race that undermines post-Cold War arms-control norms. At the same time, China has commercial interests in European markets for dual-use technologies, components, and industrial inputs; export controls and de-risking therefore create friction. The perspective also notes that a more capable European defense industry could, in principle, reduce European dependence on the United States, which Beijing sometimes views as a stabilizing diversification rather than a threat. Its occlusion is the tendency to treat all European security cooperation as US-directed, understating European agency and the genuine security shock of Russia's invasion.

Russian: Russia's perspective treats European rearmament as confirmation of a long-standing narrative that NATO and the EU are inherently hostile and that Moscow's security concerns were ignored. From this view, increased ammunition production, joint procurement, and industrial planning are not defensive adjustments but preparations for a prolonged confrontation, justifying Russia's own military expansion and economic mobilization. Russian commentary often emphasizes European dependency on US enablers to argue that European autonomy rhetoric is hollow, while also warning that a rearmed Europe could become a more dangerous adversary over time. The perspective occludes Russia's own role in triggering the mobilization through the invasion of Ukraine and tends to conflate defensive rearmament with offensive intent. It also understates the degree to which European industrial fragmentation limits rapid capability growth, a point that would complicate the image of an imminent European military threat.

Western: The Western perspective, especially in NATO and EU policy documents, frames defense-industrial recovery as a necessary correction after decades of underinvestment. It emphasizes that ammunition shortfalls and platform diversity are solvable through aggregated demand, multi-year contracts, and industrial consolidation, and it treats rearmament as compatible with, not opposed to, strategic autonomy. Proponents argue that a stronger European industrial base supports burden-sharing, reduces vulnerability to supply shocks, and strengthens deterrence. The perspective's strength is its focus on measurable capacity and institutional reform; its occlusion is the risk of overestimating how quickly sovereign procurement habits can change and of underestimating the political costs of consolidation for smaller member states and defense firms.

UN: The UN perspective situates European rearmament within the Charter framework of self-defense and collective security, while emphasizing that arms production and transfers must be accompanied by transparency, end-use monitoring, and respect for international humanitarian law. It warns that rapid industrial mobilization can increase diversion risks, illicit trafficking, and the long-term availability of weapons in conflict zones. It also stresses that rearmament should not displace disarmament, non-proliferation, and arms-control efforts, and that security spending must be balanced against development and climate commitments. The perspective's contribution is to insist that capacity is not the same as legitimacy; its occlusion is that it offers limited guidance on how to reconcile urgent defense needs with procedural arms-control timelines.

2.6 KEY IDEA 5 — The transatlantic relationship: burden-sharing, American retrenchment scenarios, and Europe's strategic dependency

Bolded Causal Claim: Europe's security architecture remains structurally dependent on US military capabilities and political commitment; record European spending and new EU instruments improve resilience but cannot quickly replace American enablers, so transatlantic burden-sharing is an asymmetric alliance in which European strategic autonomy is bounded by retrenchment risk.

Mechanism: The mechanism begins with capability asymmetry: the United States provides nuclear deterrence, strategic intelligence and surveillance, air and missile defense, strategic lift, logistics, command and control, and space-based assets that European forces cannot independently generate at scale. European militaries have improved readiness and spending since 2014 and especially since 2022, but procurement remains fragmented and many critical systems are US-origin or US-dependent. Second, alliance politics create a commitment mechanism: NATO's integrated command structure, standardization, and interoperability raise the cost of US withdrawal, but also create sunk-cost dependency. Third, burden-sharing is measured by input metrics such as defense spending as a share of GDP and investment in equipment rather than output

metrics such as deployable brigades and enablers, allowing both sides to claim progress while capability gaps persist. Fourth, US retrenchment scenarios—driven by domestic polarization, Asia-first prioritization, or a future administration skeptical of alliances—would not necessarily end NATO but could reduce force posture, enabler availability, and political reassurance. Fifth, European responses are constrained by time: strategic autonomy initiatives such as PESCO, the European Defence Fund, and the Strategic Compass can build capacity over a decade, but cannot close gaps in the near term. Sixth, the relationship is also political: US leadership provides agenda-setting power, while European dependence creates leverage for Washington on issues ranging from China policy to defense procurement. The result is a stable but asymmetric interdependence: Europe needs the US more than the US needs Europe for territorial defense, yet the US benefits from European bases, markets, and diplomatic support.

Scope Conditions: This mechanism is strongest when the US faces competing strategic priorities, especially a major contingency in the Indo-Pacific, and when European threat perceptions are high but capabilities lag. It weakens if the US reaffirms long-term commitment through force posture and industrial cooperation, or if Europe achieves rapid consolidation in enablers. It is also conditioned by nuclear politics: as long as European non-nuclear states rely on US extended deterrence, full autonomy is structurally impossible; France's independent deterrent provides partial but not alliance-wide coverage. The mechanism depends on political cycles in both Europe and the US: a US administration committed to NATO can mask dependency, while a skeptical one exposes it. It is less applicable to low-intensity operations where European forces can act independently, and more applicable to high-intensity, large-scale territorial defense. Finally, if Russia's threat diminishes, the political willingness to sustain dependency may decline, but the capability gap would remain.

Observable Implications: Observable implications include the persistence of US-origin systems in European inventories, the continued US role in NATO command and enablers, and European efforts to develop alternatives such as future combat air systems, next-generation fighter programs, and European air and missile defense initiatives. Another is the gap between European spending increases and deployable capability: more money does not automatically mean less dependency. A third is diplomatic signaling: NATO summit language on burden-sharing, US force posture announcements, and EU strategic documents that simultaneously affirm transatlantic partnership and autonomy. A fourth is industrial cooperation and friction: joint programs, technology transfer disputes, and buy-European pressures. A fifth is public opinion and elite discourse: debates over whether strategic autonomy means complementing or replacing US leadership. A sixth is scenario planning: exercises and contingency plans that assume US reinforcement, revealing dependency in planning assumptions. Data from the IISS Military Balance, NATO defense expenditure reports, and US posture statements can track these trends, though political intentions remain uncertain.

Perspective Note (five traditions in brief):

African (primary): The transatlantic debate is often framed as an internal Western question, but it has significant implications for African states and for the global distribution of security attention. First, if the United States prioritizes Europe and the Indo-Pacific, African security partnerships may receive fewer resources, less high-level attention, and more transactional engagement, especially in the Sahel and Horn of Africa. African governments then face a more crowded and competitive security marketplace, with European, Turkish, Russian, Gulf, and Chinese actors offering different packages of arms, training, and political support. Second, European strategic dependency on the United States can shape African policy indirectly: when European states seek to demonstrate autonomy or alliance loyalty, they may adjust deployments, aid, or diplomatic positions in Africa. Third, the African perspective highlights a structural parallel: just as Europe

debates dependency on Washington, many African states debate dependency on external security providers, and the vocabulary of strategic autonomy resonates with long-standing African calls for self-reliance and non-alignment. Fourth, a more autonomous Europe could, in principle, be a more consistent partner for African-led security initiatives, less subject to US political swings; but it could also be more inward-looking and protectionist. The African vantage point thus reveals that transatlantic burden-sharing is not only about European capability gaps; it is about how great-power priorities cascade into regions that are not at the center of the debate but bear the consequences of resource shifts and alliance politics.

Chinese: China views the transatlantic relationship as the central pillar of US hegemony and sees European strategic autonomy as both an opportunity and a risk. Beijing's official discourse often encourages European independence from Washington, especially on trade and technology, while warning against NATO's expansion or Asia-Pacificization. Chinese analysts argue that US retrenchment scenarios are plausible because of domestic polarization and overstretch, and that a more autonomous Europe could reduce global bloc confrontation. At the same time, China fears that European rearmament under US pressure will produce a more capable NATO, tighter technology controls, and greater alignment with US China policy. The perspective occludes the extent to which European autonomy debates are driven by genuine security concerns about Russia rather than by US manipulation, and it sometimes overstates Europe's willingness to distance itself from Washington on core security issues.

Russian: Russia's perspective treats transatlantic friction as a strategic opportunity and evidence of Western incoherence. Moscow's narrative emphasizes US dominance over Europe, arguing that European states are subordinated to American interests and that strategic autonomy is largely rhetorical. Russian analysts also suggest that US retrenchment or political instability could weaken NATO's credibility, creating openings for Russia to exploit divisions. At the same time, Russia fears a rearmed and more autonomous Europe because it could sustain confrontation without US leadership. The perspective's occlusion is its failure to acknowledge that Russia's invasion of Ukraine is the primary driver of European rearmament and transatlantic cohesion; it also understates the institutional and material depth of US-European military integration, which cannot be quickly dissolved by political rhetoric.

Western: The Western perspective treats the transatlantic relationship as indispensable and burden-sharing as a success story in progress. It points to increased European defense spending, new EU instruments, and NATO's 2022 Strategic Concept as evidence that the alliance is adapting. Proponents of strategic autonomy argue that it strengthens, rather than weakens, the transatlantic bond by making Europe a more capable partner. Skeptics warn that autonomy rhetoric can become decoupling in practice, undermining interoperability and US trust. The perspective's strength is its institutional realism: it recognizes that US enablers cannot be replaced quickly. Its occlusion is a tendency to measure progress by spending and summit declarations rather than by deployable capability, and to understate how US domestic politics can abruptly alter alliance expectations.

UN: The UN perspective frames transatlantic security arrangements within the Charter's collective security system and emphasizes that regional alliances must not undermine universal principles or escalate arms races. It stresses the importance of dialogue, confidence-building, and arms control, and warns that a fragmented security order—whether US-led, European-autonomous, or multipolar—can weaken global governance. The UN vantage point also highlights that burden-sharing debates among wealthy states occur alongside unmet needs for peacekeeping, development, and humanitarian funding elsewhere. Its contribution is to insist on legitimacy and inclusivity; its occlusion is that it has limited leverage over alliance politics and cannot resolve the capability asymmetries that drive dependency.

2.7.1 African Perspective (PRIMARY)

The African vantage point on European security architecture begins from a structural position that the other four perspectives systematically under-theorize: Africa is not a passive theater onto which European security dynamics spill over, but a co-constitutive space in which European power has historically been produced, tested, and legitimated. From this position, the post-2022 rearmament of NATO and the EU's pursuit of strategic autonomy appear not as a regional European adjustment to Russian aggression but as the latest phase in a longer arc of militarized global ordering in which African territories, resources, and populations are instrumentalized. The African perspective therefore does not ask whether European strategic autonomy is desirable for Europeans; it asks what autonomy means when it is built on supply chains, mineral extraction, and security partnerships that reproduce African dependency.

This framing draws on a lineage of African political thought that treats international order as an extension of colonial and neo-colonial power. Rodney's analysis of how Europe underdeveloped Africa established the foundational claim that European industrial and military capacity was historically subsidized by African labor and resources; Nkrumah's concept of neo-colonialism extended this to the post-independence period, arguing that formal sovereignty masked continued economic and military subordination. Fanon's insistence that colonial violence is not an aberration but the constitutive grammar of the colonial order provides the theoretical warrant for reading contemporary European rearmament not as a defensive reaction but as a continuation of militarized accumulation. These thinkers do not merely add African examples to Western theory; they invert the epistemic hierarchy, treating European security discourse as an object of critique rather than a neutral framework.

Mbembe's concept of necropolitics is particularly apt for analyzing the consequences of European rearmament for Africa. If sovereignty in the colonial and postcolonial world has been exercised through the power to decide who may live and who must die, then the diversion of European attention, resources, and military capacity toward the eastern flank has direct lethal consequences in African theaters where European states were already engaged—whether through counterterrorism operations in the Sahel, peacekeeping commitments, or maritime security in the Gulf of Guinea. The withdrawal of French forces from Mali, Burkina Faso, and Niger between 2022 and 2024, and the broader contraction of European military engagement in West Africa, cannot be separated from the re-prioritization of European defense toward Ukraine. From an African vantage point, this is not a neutral reallocation but a demonstration that African security is contingent on European threat perception, and that European strategic autonomy is being constructed partly through the abandonment of African commitments. The Sahel cases are instructive: France's Operation Barkhane ended in 2022, the European Takuba Task Force dissolved, and the EU Training Mission in Mali was suspended, all while European defense budgets surged. African governments that had built security strategies around European partnerships found themselves exposed, and the resulting vacuum contributed to the wave of military coups and the expansion of Russian (Wagner/Africa Corps) influence across the region. The African perspective reads this not as an unfortunate side effect but as a structural feature of a security order in which African stability is instrumental to European priorities rather than valued intrinsically.

Bayart's analysis of the "criminalization of the state" and the externalization of European border control adds a further dimension. European rearmament is not only about tanks and artillery; it is about the militarization of migration governance, the fortification of the Mediterranean, and the delegation of border control to African states through compacts that trade security cooperation for development assistance. The EU's pursuit of strategic autonomy in energy and defense has been accompanied by intensified pressure on North

and West African states to manage migration flows, effectively extending European security architecture southward without corresponding African agency in its design. The EU's 2023-2024 migration partnerships with Tunisia, Egypt, and Mauritania, which exchanged financial support for border enforcement, exemplify this pattern. Grovogui's critique of "sovereigns, quasi-sovereigns, and Africans" captures this asymmetry: African states are treated as quasi-sovereign partners in security arrangements they did not author, while European states retain the prerogative to define threats, allocate resources, and exit commitments. The African perspective thus insists that any evaluation of European strategic autonomy must account for the coercive externalization of European security onto African territory.

The energy decoupling dimension reveals another layer. REPowerEU and the rapid expansion of LNG infrastructure have reconfigured global energy geography in ways that directly affect African producers. On one hand, European demand for non-Russian gas has created opportunities for African LNG exporters—Nigeria, Algeria, Mozambique, Senegal—to position themselves as alternative suppliers. On the other hand, the same reconfiguration has intensified competition for African gas, accelerated project timelines that bypass environmental and community safeguards, and locked in long-term extraction contracts that may reproduce the resource-curse dynamics Rodney and Nkrumah identified. The Mozambique LNG project in Cabo Delgado, where European energy security interests intersect with insurgency, displacement, and militarized security responses, illustrates how European decoupling can deepen African insecurity. The African perspective thus sees European energy security not as a technical transition but as a reordering of extractive relationships in which African states risk being recast as emergency suppliers rather than strategic partners, and in which the benefits of the transition accrue disproportionately to European consumers while the costs—environmental degradation, community displacement, militarized extraction—are borne locally.

Mamdani's distinction between "citizen and subject" and his critique of the "savior" complex in international interventions is relevant to the defense industrial base and procurement debates. European efforts to consolidate defense production and reduce fragmentation are framed in Brussels as efficiency measures, but from an African standpoint they occur within a global arms market in which European defense firms are major suppliers to African conflicts. The fragmentation that Europeans lament is, in part, the same fragmentation that allows multiple European suppliers to compete for African procurement contracts, often with limited transparency or accountability. Consolidation may reduce European costs while concentrating the power of a smaller number of firms over African security markets. The proliferation of European small arms and light weapons across African conflict zones, documented by UN panels of experts, is a direct consequence of an arms industry whose export practices are shaped by European commercial interests rather than African security needs. Tamale's decolonial feminist scholarship and Oyěwùmí's critique of the coloniality of knowledge further remind us that the categories through which European security is discussed—"burden-sharing," "strategic autonomy," "deterrence"—are not universal but culturally specific, and that their application to African contexts often erases indigenous security practices and gendered dimensions of conflict. African women's experiences of militarization, displacement, and resource extraction are largely invisible in European security discourse, yet they constitute a significant share of the human cost of the reordering that European rearmament produces.

Aning and Danso's work on African security governance points to an alternative that the European perspective typically occludes: the African Peace and Security Architecture (APSA), the African Standby Force, and the principle of "African solutions to African problems." European rearmament and strategic autonomy debates rarely engage with these institutions as equals; instead, African security is treated as a downstream concern to be managed through development aid, migration control, or counterterrorism partnerships. The African perspective thus contributes a demand for reciprocity: if Europe is to claim strategic autonomy, it

must also respect African strategic autonomy, including the right of African states and regional organizations to define their own security priorities without European conditionality. The AU's Silencing the Guns initiative and the African Continental Free Trade Area's security implications are examples of African-led frameworks that European security architecture should engage with as partners rather than as objects of assistance.

The African perspective also interrogates the discourse of "burden-sharing" that dominates Western debates. From an African standpoint, the question is not whether Europeans are spending enough on defense relative to the United States, but whether the global distribution of security resources reflects a hierarchy in which African lives are valued less. The fact that NATO members can mobilize hundreds of billions of euros for European defense while peacekeeping budgets, humanitarian assistance, and development finance for Africa stagnate or decline is read as evidence of a racialized global security order. This is not merely a moral claim; it is an analytical one, grounded in the observation that the institutional mechanisms for allocating security resources—NATO's defense planning process, the EU's budgetary frameworks—are designed by and for wealthy states, and that African states have no voice in decisions that profoundly affect their security environment.

What the African perspective occludes, or at least underweights, is the genuine security dilemma that European states face. The Russian invasion of Ukraine is not a European invention, and African scholarship that treats all European militarization as neo-colonial risks flattening the distinction between defensive and offensive postures. Nyerere's non-alignment and Cabral's revolutionary internationalism both acknowledged that anti-colonial solidarity did not require ignoring real threats. A rigorous African perspective must therefore distinguish between European rearmament as a response to aggression and European rearmament as a project of hegemonic consolidation, recognizing that the two are entangled but not identical. The African vantage point also sometimes underweights the agency of African states that actively seek European security partnerships—whether for counterterrorism, maritime security, or arms procurement—treating these as coerced rather than chosen. Bayart's concept of extraversion reminds us that African elites have historically instrumentalized external relationships for domestic purposes, and that African security policy is not simply imposed from outside. African governments have their own strategic calculations, and some have welcomed European re-engagement or sought to leverage great-power competition for domestic gain.

In sum, the African perspective reveals that European security architecture is not a self-contained regional project but a global ordering practice with distributional consequences that fall disproportionately on Africa. It contributes an insistence on historical accountability, on the material foundations of European military capacity, and on the right of African institutions to co-author security arrangements. Its occlusion is a tendency to understate European security dilemmas and African elite agency. The perspective is indispensable not because it is "correct" in a simple sense, but because without it, the other four perspectives treat European security as a problem internal to the transatlantic or Eurasian space, erasing the African lives, resources, and institutions that make that space possible.

2.7.2 Chinese Perspective

The Chinese perspective on European security architecture and strategic autonomy is shaped by a strategic worldview in which NATO is not a defensive alliance but a vehicle for US hegemony and a source of global instability. From Beijing's vantage point, the post-2022 rearmament of NATO and the EU's pursuit of strategic autonomy are read through the lens of great-power competition: European efforts to build autonomous defense capacity are seen as potentially reducing US leverage over Europe, which China regards as favorable, while simultaneously deepening the militarization of the continent in ways that reinforce a US-led bloc

politics China opposes.

China's official position, articulated in successive policy documents and diplomatic statements, holds that NATO's eastward expansion was a root cause of the Ukraine crisis—a claim that aligns with Russian narratives but is deployed by Beijing for its own purposes. The 2022 NATO Strategic Concept's designation of China as a "systemic challenge" confirmed Chinese suspicions that the alliance was expanding its remit beyond the North Atlantic to contain China. From this perspective, European rearmament is not merely a response to Russia; it is part of a broader US strategy to consolidate a global network of alliances directed against China, encompassing AUKUS, the Quad, and enhanced NATO-Asia Pacific partnerships. The Chinese perspective thus interprets European strategic autonomy debates as a secondary theater in a primary US-China competition.

At the same time, Beijing has a nuanced interest in European autonomy. A Europe that is less dependent on the United States for security could, in principle, pursue a more independent foreign policy, including greater economic engagement with China and less automatic alignment with US sanctions and technology controls. Chinese analysts have noted that French advocacy for strategic autonomy and the EU's pursuit of "de-risking" rather than "decoupling" from China create space for continued Chinese-European economic interdependence. The Chinese perspective therefore does not uniformly oppose European autonomy; it distinguishes between autonomy that reduces US dominance (welcome) and autonomy that is directed against China (unwelcome).

On energy decoupling, China views European efforts to diversify away from Russian gas with mixed interest. The redirection of global LNG flows toward Europe has tightened global gas markets, affecting Chinese energy security and pricing. More broadly, China sees European energy transition and rearmament as accelerating a global competition for critical minerals—lithium, cobalt, rare earths—in which Chinese firms are deeply embedded and in which European "strategic autonomy" often translates into efforts to reduce dependence on Chinese supply chains. The Chinese perspective thus reads European strategic autonomy as partly an anti-Chinese economic project, not merely a Russia-focused security adjustment.

The defense industrial base dimension reinforces this reading. European efforts to consolidate defense production and reduce fragmentation are seen as strengthening a competitor defense industry that China must contend with in global arms markets, particularly in the Middle East, Africa, and Southeast Asia. Chinese analysts note that European defense firms, freed from US competition through procurement preferences, could become more aggressive exporters, challenging Chinese market share. At the same time, European fragmentation has historically created openings for Chinese defense and dual-use technology exports; consolidation may close these.

What the Chinese perspective contributes is a systemic, great-power framing that situates European security within global competition rather than treating it as a regional matter. It highlights the ways in which European rearmament is entangled with US strategy toward China and draws attention to the economic and technological dimensions of security autonomy. What it occludes is the genuine European security dilemma posed by Russian aggression, which Chinese discourse tends to minimize or attribute to NATO expansion. It also underweights the internal European debate about values, sovereignty, and democratic accountability, treating European states as instruments of US strategy rather than autonomous actors with their own threat perceptions. The Chinese perspective is thus most useful as a corrective to Western self-narratives of defensive necessity, but least useful when it reduces all European agency to great-power maneuvering.

2.7.3 Russian Perspective

The Russian perspective on European security architecture is organized around a single, deeply held claim: that NATO expansion constitutes an existential threat to Russian security and that the post-2022 rearmament of Europe confirms a long-standing pattern of encirclement. From Moscow's vantage point, the 2022 Madrid Summit and the 2024 Washington Summit are not defensive adjustments but the culmination of a thirty-year project to subordinate Russia's security interests to a US-led order. The Russian narrative treats the Ukraine war not as unprovoked aggression but as a preemptive response to an intolerable strategic environment.

This perspective has deep roots in Russian strategic culture. The concept of "strategic depth," the historical memory of invasions from the west, and the Soviet-era understanding of NATO as an anti-Russian alliance all inform Moscow's reading of European rearmament. Russian officials and analysts have consistently argued that NATO's 1999, 2004, and 2007 enlargements violated informal assurances given at the end of the Cold War—a claim that Western scholars dispute but that Russian discourse treats as established fact. The 2022 invasion is framed within this narrative as a last resort to prevent Ukraine's integration into NATO and to secure Russia's southwestern flank.

The Russian perspective interprets European strategic autonomy with ambivalence. On one hand, Moscow has historically viewed European autonomy from the United States as potentially favorable, since a more independent Europe might be less willing to participate in sanctions, military buildups, or forward deployment. French Gaullist traditions and German Ostpolitik have been seen in Moscow as counterweights to Atlanticist hardliners. On the other hand, the post-2022 trajectory has demonstrated that European autonomy, when it materializes, is being directed against Russia rather than against US dominance. The EU's Strategic Compass, PESCO, and EDF are read in Moscow as evidence that Europe is finally developing the military capacity to act independently—but in service of a confrontational agenda that includes support for Ukraine, sanctions, and forward deterrence. Russian analysts note that European strategic autonomy, in practice, has meant autonomy to fight Russia more effectively, not autonomy to pursue a distinct European interest.

Energy decoupling is interpreted in Moscow as economic warfare. REPowerEU and the rapid construction of LNG infrastructure are seen as deliberate efforts to sever the energy interdependence that had constrained European willingness to confront Russia. Russian discourse frames this as a self-defeating policy that harms European competitiveness while enriching US LNG exporters—a claim that has some empirical basis in the price differentials between US and European gas markets. The Russian perspective thus sees European energy security policy as serving US economic interests at European expense, reinforcing the argument that European "autonomy" is illusory.

The defense industrial base dimension is read as confirmation of a militarized European turn. Russian analysts point to ammunition production shortfalls, procurement fragmentation, and the slow pace of European rearmament as evidence that Europe remains dependent on the United States, but also warn that sustained investment will eventually produce a more capable European military. The Russian perspective treats European rearmament as a long-term threat that must be countered through Russia's own military buildup, nuclear modernization, and deepening partnership with China.

What the Russian perspective contributes is a reminder that security dilemmas are genuinely perceived, not merely invented, and that the expansion of military alliances can produce counter-mobilization regardless of intent. It highlights the ways in which European security architecture has been constructed without Russian participation, creating a zero-sum dynamic. What it occludes is the agency of Ukraine and other Eastern European states, which are treated as objects of great-power competition rather than as actors with their own security preferences. It also systematically underweights Russian responsibility for the collapse of the post-

Cold War security order, including the annexation of Crimea in 2014 and the full-scale invasion of 2022. The Russian perspective is indispensable for understanding Moscow's threat perception and escalation calculus, but it cannot be accepted as an objective account of causation.

2.7.4 Western Perspective

The Western perspective—encompassing the United States, NATO, and the EU mainstream—frames European security architecture as a necessary and largely successful response to Russian aggression. From this vantage point, the 2022 Madrid Summit and the 2024 Washington Summit represent a historic recommitment to collective defense, the revitalization of NATO, and the emergence of a more capable European pillar within the alliance. The Western narrative treats strategic autonomy not as an alternative to the transatlantic relationship but as a complement to it: a stronger Europe is a better partner for the United States.

This perspective is grounded in institutionalist and liberal internationalist theory. NATO is understood as a community of democracies bound by shared values and mutual defense commitments; its expansion is framed as the voluntary accession of sovereign states seeking security, not as encirclement. The Western perspective emphasizes that NATO's open-door policy is a principle, not a strategy of aggression, and that the alliance's post-2022 rearmament was triggered by Russia's invasion, not the reverse. The 2022 Strategic Concept's designation of Russia as "the most significant and direct threat" and China as a "systemic challenge" reflects a threat assessment that Western policymakers regard as evidence-based.

On strategic autonomy, the Western perspective is internally divided but broadly convergent. The EU's Strategic Compass, PESCO, and EDF are seen as welcome developments that address long-standing capability gaps, but there is persistent concern—particularly in Washington and among Eastern European allies—that European autonomy could fragment the alliance or duplicate NATO structures. The prevailing Western view holds that strategic autonomy should be "NATO-compatible" and should not create parallel command structures. Howorth's analysis of European security and defense policy and Biscop's work on European strategy are frequently cited in this context to argue that autonomy and alliance are not mutually exclusive but require careful institutional design.

Energy decoupling is framed as a strategic success. REPowerEU and the rapid expansion of LNG infrastructure are presented as evidence of European resilience and of the capacity of democracies to adapt to coercion. The Western perspective emphasizes that Europe reduced its dependence on Russian gas from roughly 40 percent of imports in 2021 to under 15 percent by 2023, and that this was achieved without catastrophic economic disruption. The new energy geography—LNG terminals in Germany, the Netherlands, and the Baltic states—is treated as a permanent strategic asset that enhances European freedom of action.

The defense industrial base is acknowledged as a persistent weakness. Western analysts point to ammunition production shortfalls, the fragmentation of European defense markets, and the slow pace of procurement reform as evidence that Europe's industrial base has not kept pace with its strategic ambitions. The Western perspective treats these as soluble problems requiring political will and investment, not as structural failures. The IISS Military Balance data on European defense spending—showing a sustained increase since 2014 and a sharp acceleration after 2022—is cited as evidence of a genuine rearmament trend.

What the Western perspective contributes is a coherent account of institutional adaptation and collective action under pressure. It demonstrates that alliances can regenerate capacity when threatened and that European states can overcome historical fragmentation. What it occludes is the extent to which European security is still structurally dependent on the United States—for nuclear deterrence, intelligence, logistics, and high-end capabilities—and the possibility that American retrenchment scenarios, whether driven by domestic politics

or Indo-Pacific prioritization, could expose these dependencies. The Western perspective also tends to underweight the global South consequences of European rearmament, including the diversion of attention and resources from African and Middle Eastern theaters. Its strongest counterargument, internal to the tradition, comes from scholars who warn that treating NATO as a permanent fixture risks neglecting the political foundations of alliance cohesion and the possibility of US disengagement.

2.7.5 UN Perspective

The UN perspective frames European security architecture within the Charter's collective security system and emphasizes that regional alliances must not undermine universal principles or escalate arms races. It stresses the importance of dialogue, confidence-building, and arms control, and warns that a fragmented security order—whether US-led, European-autonomous, or multipolar—can weaken global governance. The UN vantage point also highlights that burden-sharing debates among wealthy states occur alongside unmet needs for peacekeeping, development, and humanitarian funding elsewhere. Its contribution is to insist on legitimacy and inclusivity; its occlusion is that it has limited leverage over alliance politics and cannot resolve the capability asymmetries that drive dependency.

The UN perspective draws on the Charter's provisions for regional arrangements under Chapter VIII, which permit regional organizations to address security matters but subordinate them to the Security Council's authority. From this standpoint, NATO and the EU's defense initiatives are legitimate insofar as they operate within the Charter framework, but they become problematic when they bypass or undermine the UN's universal security architecture. The UN perspective is particularly concerned with the erosion of arms control regimes—the suspension of the New START treaty, the collapse of the INF Treaty, and the absence of a successor framework for European conventional arms control—and with the risk that European rearmament could trigger a broader arms race.

On strategic autonomy, the UN perspective is agnostic about institutional form but insistent on normative constraints. Whether Europe achieves autonomy through NATO, the EU, or a combination, the UN framework requires that security arrangements respect sovereignty, non-intervention, and the peaceful settlement of disputes. The UN perspective thus evaluates European security architecture not by its efficiency or cohesion but by its compliance with international law and its contribution to global stability. This produces a distinctive critique: even a successful European rearmament could be destabilizing if it is not accompanied by dialogue with Russia and by arms control measures.

The energy decoupling dimension is viewed through the lens of sustainable development. The UN perspective welcomes the reduction of fossil fuel dependence but warns that the scramble for LNG and critical minerals can undermine environmental standards and the rights of communities in producing countries, including in Africa. The UN's sustainable development agenda and climate commitments create a tension with the security-driven acceleration of extractive projects.

On the defense industrial base, the UN perspective is concerned with the proliferation implications of increased European arms production. Higher output and looser export controls could increase the flow of weapons to conflict zones, including in Africa and the Middle East. The UN arms trade treaty framework and the work of UNODA (Office for Disarmament Affairs) provide the institutional basis for this concern.

What the UN perspective contributes is a universalist counterweight to regional security logic, insisting that European security cannot be pursued in isolation from global stability. What it occludes is the reality that the Security Council is paralyzed by great-power rivalry and that the UN has limited capacity to enforce its norms against major powers. The UN perspective is thus most valuable as a normative framework and least

valuable as a practical guide to European security policy.

SECTION 2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Shows that European rearmament reallocates fiscal, industrial, and diplomatic capacity with opportunity costs for African security; links arms production to proliferation risks and energy decoupling to African markets.	May underweight the immediate threat perceptions of Eastern European states and the legal basis of collective self-defense.	Security is indivisible and historically accountable; European rearmament must not externalize costs to Africa.	Increased European defense spending and arms production alongside sustained un-derinvestment in African security partnerships; Sahel instability and arms-diversion risks.	Western: rearmament is a lawful and necessary response to aggression; African costs do not negate the right of self-defense.
Chinese	Frames NATO rearmament as bloc consolidation and questions the legitimacy of US-led alliance politics; highlights risks of escalation and reduced multipolar cooperation.	Downplays Russian agency and Ukrainian sovereignty; treats European demand for protection as US manipulation.	Security should be indivisible and non-exclusive; bloc confrontation should be avoided.	NATO 2022 Strategic Concept's treatment of China; Washington Summit emphasis on Indo-Pacific linkages.	Western: NATO expansion reflects sovereign choices by threatened states, not imposed bloc politics.

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Russian	Articulates a security-dilemma narrative around NATO expansion and insists on great-power security guarantees.	Obscures Ukrainian agency and the coercive nature of Russian intervention; validates NATO's purpose through its own actions.	Great-power spheres of influence and buffer zones are legitimate; NATO expansion violates indivisible security.	Russian official framing of NATO as existential threat; 2022 invasion justification.	Western: sovereignty and self-determination trump sphere-of-influence claims; NATO is defensive.
Western	Explains institutional adaptation, burden-sharing, and deterrence; provides metrics of rearmament and alliance cohesion.	Underestimates industrial bottlenecks, long-term costs, and externalities for Africa and the Global South; may overstate unity.	Collective defense and liberal order require credible deterrence and institutional solidarity.	NATO spending increases, Finnish and Swedish accession, EU Strategic Compass, PESCO, and EDF.	African: rearmament externalizes costs and distracts from global security; Chinese: bloc politics escalates.
UN	Provides universalist legal framework; insists European security be linked to Charter principles, arms control, and global stability.	Security Council paralysis and limited enforcement capacity; regional security often proceeds outside UN.	Security must be pursued within international law and with attention to global consequences.	UN Charter, UNODA, and arms-trade treaty framework.	Western: UN paralysis makes regional self-help and deterrence necessary.

SECTION 2.8 WORKED EXAMPLE (I do)

Case: The 2022-2024 institutional response to Russia's full-scale invasion of Ukraine, centered on NATO rearmament and the EU Strategic Compass.

Levels of analysis. At the individual level, the response was shaped by leaders' beliefs, rhetoric, and do-

mestic incentives. Olaf Scholz's Zeitenwende speech, Emmanuel Macron's evolving strategic-autonomy rhetoric, Joe Biden's alliance-management priorities, and Jens Stoltenberg's framing of NATO as the indispensable forum all mattered for timing and emphasis. Yet individual agency was constrained by bureaucratic routines, alliance procedures, and industrial realities; leaders could accelerate agendas but could not instantly generate capability. At the state level, threat perception varied sharply: Poland and the Baltic states treated Russian aggression as existential and pushed for maximum deterrence; France sought to preserve European agency within NATO; Germany combined rearmament with energy and industrial adjustment; the United States sought burden-sharing without abandonment. Defense budgets, procurement systems, and national industrial bases mediated how commitments became deployable forces, making the state level the place where the gap between political promises and military capability is most visible. At the systemic level, the war transformed the European security order from a post-Cold War cooperative framework into a competitive one. NATO's role as the primary security provider was reinforced, Russia was reclassified as an acute threat in NATO's 2022 Strategic Concept, and the transatlantic alliance regained centrality; US-China competition increasingly linked European and Indo-Pacific security debates. This level explains why rearmament was broad rather than isolated, but it can obscure the agency of smaller states that demanded protection. At the transnational level, the response operated through NATO and EU institutions, defense-industry networks, energy markets, and supply chains. The EU Strategic Compass (2022) set capability and resilience goals; PESCO and the European Defence Fund channeled collaborative projects; ammunition and air-defense initiatives attempted to aggregate demand; LNG markets and infrastructure reshaped energy geography. This level explains how commitments were institutionalized, but it also reveals fragmentation, since national procurement preferences, divergent threat perceptions, and industrial bottlenecks limited integration.

Mechanism: from threat shock to institutional rearmament. The causal chain can be described in five stages. First, the February 2022 invasion functioned as an exogenous shock that collapsed the post-Cold War peace-dividend assumption and created a shared, if uneven, threat perception. Second, agenda compression occurred: NATO's Madrid Summit in June 2022 adopted a new Strategic Concept, while the EU had already approved the Strategic Compass in March 2022; both reframed Russia as the principal threat and called for greater capability. Third, commitment mechanisms followed: NATO's 2% of GDP guideline hardened from aspiration toward floor, many allies increased spending, and the EU expanded PESCO and EDF activity. Fourth, capability translation became the binding constraint, because political commitments had to pass through procurement systems, industrial capacity, skilled labor, raw materials, and logistics. Assessments in the IISS Military Balance 2023-2024 highlighted that production and stockpile shortfalls persisted even where budgets rose. Fifth, feedback effects altered preferences and institutions: Finland and Sweden joined NATO, the EU developed a defense industrial strategy, and debates over strategic autonomy intensified. As Howorth (2019) and Biscop (2021) argued before the war, European strategic autonomy was already contested; the invasion accelerated rather than created this debate. The mechanism is conditional: it works when threat perception remains high and US leadership is present; it weakens if threat perception declines, if industrial capacity cannot scale, or if domestic politics shift. It also generates secondary effects, including greater European arms production that can increase proliferation risks beyond Europe.

Perspective reconstruction. From an African vantage point, the 2022-2024 rearmament is not simply a European answer to Russian aggression; it is a global reallocation of fiscal, industrial, and diplomatic capacity with uneven consequences. European governments that had presented Africa as a priority for stabilization, development, and migration management redirected political attention and resources toward the eastern flank, while increased ammunition and weapons production raised the risk of diversion into African conflict zones through weak export-control enforcement. Energy decoupling reconfigured LNG and hydro-

carbon markets, creating both opportunities and vulnerabilities for African producers and consumers. At the same time, African actors are not merely affected; the African Union and regional economic communities continue to articulate their own security agendas and to renegotiate partnerships in light of the crisis. The African perspective therefore treats European rearmament as a global event whose costs and benefits are distributed unevenly, and it insists that European security cannot be evaluated solely by European threat perceptions. Its limitation is that it may understate the genuine security dilemma faced by Eastern European states and the legal and moral basis of NATO's collective defense.

The Chinese perspective reads the rearmament as evidence that NATO is evolving from a regional defense alliance into a global security bloc, reinforcing Beijing's argument that US-led alliance politics destabilize rather than stabilize. It points to NATO's 2022 Strategic Concept and the Washington Summit's emphasis on China as proof that European security is being subordinated to US strategic competition. It also stresses that sanctions, energy decoupling, and industrial mobilization accelerate bloc formation and reduce space for multipolar cooperation. What it occludes is the agency of European states that sought NATO protection after Russia's invasion and the fact that many European governments distinguish between deterring Russia and containing China.

The Russian perspective frames NATO rearmament as confirmation of its long-standing claim that the alliance is an offensive, expansionist structure threatening Russian security. It interprets Finnish and Swedish accession, increased defense spending, and the Strategic Compass as evidence of Western encirclement and regime-change intentions. It also uses the rearmament to justify its own military buildup and to portray the war as a defensive struggle against NATO. What it occludes is Ukrainian sovereignty, the coercive nature of Russian intervention, and the fact that NATO's eastern expansion was driven by demand from states fearing Russian power rather than by unilateral Western imposition.

The Western perspective treats the 2022-2024 rearmament as a necessary restoration of deterrence after a period of underinvestment and strategic complacency. It emphasizes alliance unity, the accession of Finland and Sweden, increased defense spending, and the EU's new defense instruments as evidence of institutional adaptation. It also frames the Strategic Compass as a step toward European strategic responsibility without abandoning the transatlantic link. What it occludes is the uneven distribution of costs, the industrial bottlenecks that limit capability delivery, and the possibility that rearmament could lock Europe into long-term dependency on US security guarantees.

The UN perspective evaluates the rearmament through the Charter framework, emphasizing that collective self-defense is lawful while warning that arms racing and alliance polarization can undermine global stability. It highlights the risk that increased European arms production will complicate arms-control and non-proliferation efforts, particularly in regions already affected by conflict. It also stresses the need for diplomatic channels and humanitarian protection alongside military deterrence. What it occludes is the Security Council's paralysis and the limited capacity of UN institutions to provide credible deterrence against a nuclear-armed aggressor.

Explicit adjudication. On balance, the Western perspective provides the strongest explanation of the institutional outputs of 2022-2024, because rearmament was driven by alliance politics, shared threat perception, and bureaucratic adaptation within NATO and the EU. It best accounts for why commitments were made, why Finland and Sweden joined, and why the EU developed new defense instruments. However, it misses the African perspective's demonstration that European security mobilization reallocates global resources and attention, and it underweights the Chinese and Russian insight that rearmament can be interpreted as bloc consolidation, which may intensify security dilemmas rather than resolve them. The most complete

explanation therefore combines the Western account of institutional adaptation with the African account of externalized costs and the systemic accounts of escalation risk.

SECTION 2.9 PROBLEM PAIR (We do)

1. Reconstruct the AUKUS announcement of September 2021 and its immediate diplomatic consequences for France, the European Union, and Australia.

2. Identify the mechanism through which a submarine procurement decision became a crisis of European strategic autonomy rather than merely a commercial dispute.

3. Apply the four levels of analysis—individual, state, systemic, and transnational—to explain why the same event produced different reactions in Paris, Berlin, Warsaw, Canberra, and Washington.

4. Reconstruct the five perspectives (African, Chinese, Russian, Western, UN) on AUKUS and state what each reveals and what each occludes.

5. Propose one historical analogue for the strain on the transatlantic relationship and one falsifier that would weaken your explanation.

6. Adjudicate whether AUKUS permanently weakened transatlantic relations or revealed a manageable hierarchy within the Western alliance.

MODEL ANSWER: The AUKUS announcement in September 2021 strained European strategic autonomy and the transatlantic relationship through a mechanism that was less about the submarines themselves than about the distribution of trust, technology, and strategic priority inside the Western alliance. Australia's decision to abandon a French contract for conventional submarines in favor of US-UK nuclear-powered boats was, at the capability level, a procurement choice. At the political level, it signaled that Washington would privilege a trilateral Indo-Pacific arrangement over consultation with a major European ally, while London would join that arrangement even at the cost of Franco-British and EU-Australian relations. France's reaction—recalling ambassadors from Washington and Canberra—was not merely commercial pique; it reflected a view that strategic autonomy requires not only European capability but also reliable access to high-end technology and predictable alliance consultation. The EU's subsequent expressions of solidarity with France, and the temporary stall in EU-Australia trade negotiations, showed that the shock traveled from a bilateral contract dispute into a broader question about whether European partners are treated as co-architects or as secondary theaters in US strategy.

The transatlantic strain operated through two channels. First, the security-guarantee channel: European states, especially on NATO's eastern flank, continued to depend on US extended deterrence, so they could not simply convert anger into estrangement; yet the episode fed a French-led argument that dependency creates vulnerability. Second, the industrial channel: AUKUS reinforced the perception that the most advanced defense technologies circulate within an Anglophone core, while European firms face fragmented demand and national procurement rules. This matters for strategic autonomy because autonomy is not only political will but also production capacity; if Europe cannot build, maintain, and upgrade complex systems without US or UK participation, then autonomy remains rhetorical. The episode therefore exposed a gap between the

EU's ambition to act as a geopolitical actor and its continued reliance on transatlantic industrial ecosystems.

Reconstructed from five vantage points, the episode looks different. From an African perspective, AUKUS illustrated how great-power competition can redirect attention and resources away from African security priorities, while also showing that European autonomy debates are partly about who controls the agenda of global security. From a Chinese perspective, AUKUS appeared as an attempt to build a containment architecture in the Indo-Pacific, with European autonomy debates secondary to US-China rivalry. From a Russian perspective, the episode could be read as evidence of Western disunity, though that reading overstates the case because NATO cohesion later intensified. From a Western perspective, AUKUS was alliance management under competing regional priorities: the United States sought to deter China, Britain sought global relevance, Australia sought capability, and France sought recognition. From a UN perspective, the episode raised nonproliferation and Charter questions about nuclear-powered submarines and the balance between collective security and exclusive clubs. Adjudicating among these, the strongest explanation is that AUKUS strained autonomy by exposing hierarchy and capability asymmetry, but it did not sever the transatlantic bond; the subsequent Ukraine war made the costs of estrangement too high for both sides.

The strain was real but bounded. NATO's response to Russia's 2022 invasion of Ukraine demonstrated that the transatlantic security community could still mobilize rapidly, and France's later diplomatic repair with the United States showed that alliance management can absorb shocks. Yet AUKUS left a durable residue: it strengthened the case for European defense-industrial consolidation, made the Indo-Pacific a competing claimant on US attention, and reminded EU institutions that strategic autonomy is tested not only by adversaries but by allies. In that sense, AUKUS was a stress test of European autonomy rather than its cause; it revealed that autonomy is constrained by capability gaps, alliance hierarchy, and the absence of a single European strategic culture.

SECTION 2.10 INDEPENDENT MEMO (You do)

(a) Case description: In March 2024, a mid-sized EU member state announces that it will purchase a complete long-range air-defense system from a non-EU supplier rather than join a PESCO project intended to build a comparable European system. The government argues that the non-EU system is cheaper, available sooner, and interoperable with NATO standards. Several EU partners object that the decision undermines the European Defense Fund, fragments demand, and rewards an outside supplier. The state replies that its security timeline and budget constraints cannot wait for European industrial consolidation. The dispute reaches the European Council and NATO's Defense Planning Process at the same time.

(b) Required memo headings as prompts:

Mechanism:
Perspective reconstruction:
Historical analogue:
Falsifiers:

(c) Self-check: Did you distinguish description, explanation, prediction, and prescription in your memo?

SECTION 2.11 HINGE QUESTION

Which of the following best explains why AUKUS strained European strategic autonomy without destroying the transatlantic relationship?

A. AUKUS proved that the United States had abandoned Europe and that NATO was therefore obsolete.
B. AUKUS exposed hierarchy and capability asymmetry within the Western alliance, but the Ukraine war later raised the cost of estrangement for both sides.
C. AUKUS was primarily a commercial dispute over submarines and had no strategic significance beyond France's lost contract.
D. AUKUS showed that European strategic autonomy had already been achieved and that France no longer needed US security guarantees.

Distractor diagnoses:
- A is wrong because it treats a shock to consultation and trust as proof of alliance abandonment; NATO's post-2022 mobilization and continued US force posture in Europe contradict the claim that the United States had left Europe.
- C is wrong because it reduces a trilateral Indo-Pacific arrangement to a contract dispute; the strategic significance lay in technology circulation, alliance hierarchy, and competing regional priorities.
- D is wrong because it confuses ambition with capability; AUKUS revealed that Europe still depended on US and UK high-end technology and therefore had not achieved full strategic autonomy.

SECTION 2A — DATA LAB

Table 1 — NATO European Defense Spending, 2014 vs. 2024 (selected allies)

Ally	Defense spending % of GDP, 2014	Defense spending % of GDP, 2024	Defense spending USD bn, 2014	Defense spending USD bn, 2024
Poland	~1.9	~4.1	~10	~35
Estonia	~2.0	~3.4	~0.5	~1.3
Latvia	~0.9	~3.2	~0.2	~1.1
Lithuania	~1.0	~2.8	~0.4	~1.8
Finland	~1.5	~2.4	~3.5	~6.5
Germany	~1.2	~2.1	~44	~86
France	~1.8	~2.1	~53	~58
United Kingdom	~2.1	~2.3	~60	~75
Italy	~1.1	~1.5	~22	~30
Spain	~0.9	~1.3	~11	~18
NATO Europe + Canada (aggregate)	~1.4	~2.0+	~250	~430+

Source: NATO Secretary General annual reports and IISS, The Military Balance 2023–2024. Figures are approximate, rounded to one decimal; USD figures at constant 2023 prices where available. The 2% of

GDP guideline was reaffirmed at the 2014 Wales Summit and treated as a floor by the 2023 Vilnius Summit communiqué.

Table 2 — EU Gas Import Mix by Source, 2021 vs. 2023 (share of total EU gas imports)

Source	Share 2021 (%)	Share 2023 (%)	Direction of change
Russia (pipeline + LNG)	~45	~12	Collapse
Norway	~24	~30	Rise
United States (LNG)	~5	~19	Sharp rise
Algeria	~11	~13	Modest rise
Qatar (LNG)	~3	~5	Modest rise
Other (incl. Azerbaijan, UK, LNG spot)	~12	~21	Rise

Source: IEA, Gas Market Report; Eurostat energy balances; Bruegel European natural gas imports tracker. Percentages are approximate shares of total EU gas imports (pipeline plus LNG) and may not sum to 100 due to rounding. The 2022 inflection reflects the REPowerEU plan adopted in May 2022 and the Nord Stream sabotage of September 2022.

Table 3 — US Force Posture in Europe and EU Defense Industrial Indicators, 2021–2024

Indicator	2021 (pre-invasion)	2022–2024 (post-invasion)	Notes
US troops stationed in Europe	~60,000	~100,000	Reinforcement of V Corps forward HQ (Poland), additional ABCT rotations, F-35 deployments
US brigade combat teams in Europe (rotational + permanent)	2	4+	Includes enhanced forward presence in Poland and the Baltic states
EU aggregate defense spending (EU-27)	~€198 bn	~€240 bn (2023)	European Defence Agency (EDA) Defence Data
EDF budget (2021–2027)	€8 bn total envelope	Ongoing disbursement	European Defence Fund; supports collaborative R&D
PESCO projects (cumulative)	~47	60+	Permanent Structured Cooperation; includes ammunition, air defense, cyber

Indicator	2021 (pre-invasion)	2022–2024 (post-invasion)	Notes
EU artillery ammunition production capacity	~1.0M shells/yr	Target ~2.0M shells/yr by end-2025	Act in Support of Ammunition Production (ASAP), 2023
EU LNG regasification capacity	~160 bcm/yr	~210+ bcm/yr	New terminals in Germany (Wilhelmshaven, Brunsbüttel), Netherlands, Finland

Source: US European Command statements; EDA Defence Data 2023; European Commission ASAP regulation (EU) 2023/1525; IISS Military Balance 2023–2024. Figures are approximate and, for industrial indicators, reflect announced targets rather than verified output.

Analysis Questions

1. **Trend.** Between 2014 and 2024 NATO European defense spending roughly doubled in aggregate and the share of allies meeting the 2% GDP guideline rose from 3 to 23. Identify the two distinct inflection points in this trend (2014 Wales and 2022 Madrid) and explain what changed in the *causal mechanism* linking the pledge to actual expenditure at each point. Was the 2014–2021 period a story of compliance or of free-riding, and what evidence in Table 1 supports your reading?

2. **Level of analysis.** The 2% GDP target is a state-level commitment negotiated at a systemic (alliance) forum. At which level of analysis—individual (leader), state (domestic politics/bureaucracy), systemic (alliance structure/threat), or transnational (defense industry, energy markets)—is the *variation* in compliance across allies best explained? Use Table 1 to compare Poland/Estonia with Italy/Spain and argue which level dominates.

3. **Perspective reconstruction (all five).** Read Table 2 and Table 3 together and reconstruct how each of the five perspectives interprets the same data:

    - **African (primary):** What does the surge in European rearmament and US force posture imply for African security partnerships, arms availability, and the diversion of diplomatic attention?
    - **Chinese:** How does Beijing read the NATO spending curve and the US troop reinforcement in Europe?
    - **Russian:** How does Moscow narrate the same numbers?
    - **Western:** How does the Western reading frame the data as success?
    - **UN:** What does the Charter framework say about the legality and legitimacy of this buildup?

4. **Interpretation.** Table 3 shows EU ammunition production capacity roughly doubling toward a 2 million shell target while US troops in Europe rose by two-thirds. Does this pattern indicate (a) genuine European strategic autonomy, (b) transatlantic burden-sharing with continued US primacy, or (c) a hybrid "European pillar within NATO"? Adjudicate using the data and specify what additional evidence would discriminate among the three.

5. **Limitation.** These tables measure spending, import shares, troop numbers, and announced industrial targets. What do they *not* capture that is essential to assessing European security architecture—readiness, interoperability, stockpile depth, sustainment, political will, or industrial bottlenecks (e.g., explosives, machine tools, skilled labor)? Identify the single most important missing variable and explain how its absence could reverse the optimistic reading of the data.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — "The European Security Architecture, 2024: Concentric Rings and Flows" What to draw. On an A4 landscape sheet, draw three concentric circles centered on Brussels. Inner circle (radius ~3 cm): label "EU core — PESCO, EDF, Strategic Compass." Middle circle (radius ~6 cm): label "NATO ring — 32 allies, 2% pledge, integrated command." Outer circle (radius ~9 cm): label "Partner arc — Ukraine, Moldova, Georgia, Western Balkans, North Africa." Draw the Atlantic Ocean to the left with an arrow labeled "US force posture ~100,000 troops" pointing into the middle ring. Draw a pipeline/LNG arrow from Norway (top) and a tanker arrow from the US Gulf (bottom-left) into the inner ring, labeled "REPowerEU energy flows." Draw a dashed red arrow from Russia (right) labeled "threat perception / nuclear signaling."

Labels to place. Inside inner ring: "Strategic autonomy ambition." Between rings: "burden-sharing gap." Outside: "Global South spillover."

Perspective overlay to annotate. In the four corners, write one-line perspective tags: top-left (African): "rearmament diverts attention and arms from Africa"; top-right (Chinese): "NATO as destabilizing, US-led bloc politics"; bottom-left (Russian): "existential threat, encirclement"; bottom-right (Western): "unity and deterrence"; center-bottom (UN): "Charter Art. 51 self-defense, Art. 2(4) prohibition on force."

Visual 2 — "The Strategic Autonomy Gap: Spending vs. Industrial Capacity" What to draw. A scatter plot on graph paper. X-axis: "Defense spending as % of GDP (2024)" from 0 to 5. Y-axis: "Defense industrial output index (2024, 2014=100)" from 80 to 200. Plot points for Poland (high x, mid y), Germany (mid x, mid-high y), France (mid x, high y), Italy (low-mid x, mid y), Spain (low x, low y), and an "EU aggregate" diamond. Draw a diagonal "autonomy frontier" line from bottom-left to top-right labeled "spending matched by capacity." Shade the area below the line in light red labeled "dependency zone (buy American/off-the-shelf)." Shade above in light green labeled "autonomy zone."

Labels to place. Annotate Poland: "high spend, capacity lagging." Annotate France: "capacity leader, spend plateau." Annotate Germany: "Zeitenwende, industrial catch-up." Draw a horizontal dashed line at y=100 labeled "2014 baseline — no net growth."

Perspective overlay to annotate. Along the right margin write: "African: who buys the surplus arms?"; "Chinese: market opportunity for PLA-linked firms?"; "Russian: overstretch narrative"; "Western: pillar within NATO"; "UN: arms-trade transparency (ATT)."

Visual 3 — "Energy Decoupling: From Russian Pipeline to US LNG" What to draw. A Sankey-style flow diagram. Left column (2021): a thick blue arrow labeled "Russian pipeline gas ~45%" flowing right; thinner arrows for Norway ~24%, Algeria ~11%, LNG ~20%. Right column (2023): the Russian arrow shrinks to a thin red sliver ~12%; Norway arrow widens ~30%; a new thick green arrow labeled "US LNG ~19%" appears; Qatar ~5%; other ~21%. In the middle, draw a box labeled "REPowerEU + new LNG

terminals (Wilhelmshaven, Brunsbüttel, Eemshaven)" with arrows showing rerouting. Add a small sun/wind icon labeled "renewables acceleration."

Labels to place. Top: "EU gas import geography, 2021 → 2023." Bottom: "New dependency: US LNG; price volatility; infrastructure lock-in."

Perspective overlay to annotate. Bottom-left (African): "African gas (Mozambique, Senegal, Nigeria) as alternative not yet scaled"; bottom-right (Chinese): "BRI energy corridors bypassed"; top (Russian): "weaponized interdependence reversed"; center (Western): "resilience achieved"; right (UN): "energy as human right, just transition."

SECTION 4 — CORNELL NOTES

Cue (prompt)	Notes (with source log)
What triggered the 2022 NATO rearmament inflection?	Russia's full-scale invasion of Ukraine (Feb 2022) converted the 2014 Wales 2% pledge from aspirational to operational; Madrid Summit (June 2022) adopted new Strategic Concept naming Russia as "most significant and direct threat." Source: NATO Strategic Concept 2022.
What is European strategic autonomy?	French concept (Macron, 2017 Sorbonne speech) of capacity to act independently; EU institutionalization via PESCO (2017), EDF (2021), Strategic Compass (2022). Source: Howorth (2019); Biscop (2021); EU Strategic Compass (2022).
What is the Strategic Compass?	EU's first white paper on security/defense (March 2022); sets 2030 horizon, Rapid Deployment Capacity 5,000 troops, hybrid toolbox, space/cyber domains. Source: EU Strategic Compass (2022).
What is REPowerEU?	Commission plan (May 2022) to end Russian fossil-fuel dependence: diversify supply, accelerate renewables, save energy; LNG terminal build-out. Source: European Commission REPowerEU.
What is the ammunition problem?	EU pledged 1M shells to Ukraine by Mar 2024; delivered ~500k–600k; ASAP targets 2M/yr by end-2025. Fragmented national procurement. Source: IISS Military Balance 2023–2024; EU ASAP regulation.
What is the transatlantic dependency?	Europe relies on US for strategic enablers (ISR, air/missile defense, nuclear umbrella, logistics); "strategic dependency" persists despite spending. Source: Howorth (2019); Biscop (2021).

Cue (prompt)	Notes (with source log)
What is burden-sharing?	Distribution of costs/risks within alliance; US share of NATO defense spending ~68% in 2024 (down from ~72% in 2016). Source: NATO.
What is PESCO?	Permanent Structured Cooperation (TEU Art. 42.6/46); 60+ projects; legally binding commitments among willing states. Source: EU.
What is the EDF?	European Defence Fund; €8bn 2021–2027 for collaborative defense R&D and capability development. Source: European Commission.
What is the fragmentation problem?	27 national defense markets, duplicative systems, lack of economies of scale; European Defence Industrial Strategy (2024) attempts consolidation. Source: European Commission EDIS 2024.
How does the African perspective read this?	Rearmament diverts arms, attention, and finance from African theaters; EU migration-security nexus; resource extraction for energy transition. Source: Grovogui; Mbembe; Aning.
What is the UN Charter frame?	Art. 2(4) prohibition on force; Art. 51 self-defense; collective security via UNSC (blocked by Russia veto); NATO as regional arrangement under Art. 52. Source: UN Charter.

Summary (3–5 sentences). European security architecture after 2022 is defined by a simultaneous NATO rearmament surge and an EU push for strategic autonomy, neither of which has closed the gap between ambition and industrial capacity. Energy decoupling from Russia succeeded in diversifying supply but created new dependencies on US LNG and price volatility. The transatlantic relationship remains structurally asymmetric: Europe spends more but still depends on US strategic enablers. From an African vantage point, the European buildup reallocates attention and materiel away from African security while deepening extractive energy and mineral linkages. The UN Charter provides the legal frame but cannot adjudicate the competing claims because the Security Council is paralyzed by the Russian veto.

SECTION 5 — FEYNMAN COMPRESSION

Step 1 — Explain without jargon. Imagine a neighborhood where one big house (the United States) has been paying for the alarm system for decades. After a break-in next door (Ukraine, 2022), all the neighbors buy new locks and cameras (NATO rearmament), and the homeowners' association (the EU) writes a plan to make its own security company (strategic autonomy). But the new locks are made in the big house's factory, the cameras need the big house's electricity (US strategic enablers), and the neighborhood's gas bill now comes from a different supplier (US LNG). So the neighbors are safer but not independent, and the plan is real but unfinished.

Step 2 — Mark gaps. I am unsure whether "strategic autonomy" means autonomy *from* the US or autonomy

within NATO; the sources disagree (Howorth vs. Biscop). I am unsure of the exact EU ammunition delivery figure (~500k vs. ~600k). I cannot yet explain why Italy and Spain remain below 2% despite the threat. I do not know whether the 2 million shell target is achievable given explosives/bottleneck constraints.

Step 3 — Reread verification. Re-reading NATO Strategic Concept 2022 confirms Russia named as "most significant and direct threat" and China as "systemic challenge." EU Strategic Compass 2022 confirms Rapid Deployment Capacity and 2030 horizon. IISS Military Balance 2023–2024 confirms European spending surge and ammunition shortfall. Howorth (2019) and Biscop (2021) confirm the autonomy debate predates 2022. Gaps on exact delivery figures remain; I flag them rather than assert.

Step 4 — Analogy with explicit limits. The neighborhood-alarm analogy captures dependency and partial autonomy but fails on three points: (1) alliances are not households—states have sovereignty and can exit; (2) the "big house" is also a competitor in some domains (trade, tech), not just a protector; (3) energy decoupling is not just a supplier switch but a restructuring of physical infrastructure with decades-long lock-in. The analogy also occludes the African perspective: the neighborhood's new security spending is financed partly by resources extracted from outside the neighborhood.

Step 5 — Rewrite. European security after 2022 is a story of rapid but incomplete adaptation: NATO rearmament raised spending and troop levels, the EU launched its first defense strategy, and energy imports were rerouted away from Russia. Yet strategic autonomy remains aspirational because industrial capacity, strategic enablers, and political cohesion lag behind spending. The transatlantic relationship is thus neither pure dependency nor pure partnership but a contested "European pillar" project. From an African vantage point, this European turn absorbs diplomatic bandwidth and materiel while leaving African security architectures under-resourced, revealing that "European" security is never only European.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L39	Definition	What is European strategic autonomy?	It is the capacity of European actors to decide and act, alone or with partners, in security and defense when necessary; it is not autarky and does not require severing the transatlantic alliance.	African scholars often read autonomy rhetoric as Eurocentric unless it accounts for externalized security costs in Africa.

Tag	Card Type	Front	Back	Perspective Note
L39	Mechanism	What changed at the 2022 Madrid and 2024 Washington NATO summits?	They consolidated a post-2022 rearmament agenda: higher defense-spending targets, expanded eastern-flank deployments, and Finland and Sweden's accession, while reaffirming NATO as the primary collective-defense framework.	Russian narratives frame these steps as proof of NATO encirclement; Western narratives frame them as deterrence restoration.
L39	Source	What does the NATO Strategic Concept (2022) identify as principal threats?	It identifies Russia as the most significant and direct threat to Euro-Atlantic security and China as a systemic challenge, while reaffirming collective defense and resilience.	Chinese perspectives reject the "systemic challenge" label as ideological containment.
L39	Mechanism	What do PESCO, the EDF, and the Strategic Compass do?	PESCO coordinates capability projects, the EDF co-finances defense research and development, and the Strategic Compass sets threat analysis, capability, and partnership priorities for EU security and defense.	EU institutionalism emphasizes capability-building; critics stress duplication with NATO.

Tag	Card Type	Front	Back	Perspective Note
L39	Mechanism	What is REPowerEU trying to change?	It aims to reduce dependence on Russian fossil fuels through diversification, LNG infrastructure, energy efficiency, and accelerated renewables deployment.	Energy decoupling reshapes import geography and can shift geopolitical leverage toward new suppliers.
L39	Mechanism	Why does Europe's defense industrial base remain fragmented?	National procurement preferences, duplicated platforms, small production runs, and fragmented demand limit economies of scale and slow ammunition replenishment.	Industrial fragmentation is a structural cause of capability gaps even where spending rises.
L39	Comparison	How does strategic autonomy differ from strategic sovereignty?	Strategic autonomy concerns capacity to act; strategic sovereignty concerns legal and political control over decisions; the two overlap but are not identical.	Conflating them exaggerates Europe's independence from US logistics and intelligence.

Tag	Card Type	Front	Back	Perspective Note
L39	Application	How did AUKUS strain European strategic autonomy?	It bypassed France in a major submarine and technology arrangement, exposing trust deficits and raising questions about allied consultation and industrial access.	The case shows that autonomy debates are also about recognition and industrial status, not only budgets.
L39	Debate	What is the burden-sharing debate?	It concerns whether European allies spend, deploy, and sustain enough capability to reduce disproportionate US contributions to NATO defense.	Western hawks stress free-riding; European autonomists stress strategic choice and industrial capacity.
L39	Reconstruction	What is the African perspective on European rearmament?	It foregrounds opportunity costs, diversion of attention and resources from African security crises, and the risk that European threat inflation normalizes militarized responses.	This perspective is primary because it asks whose security is centered and whose is rendered peripheral.
L39	Occlusion	What does the Chinese perspective occlude?	It often occludes Russian agency in the Ukraine war and the security fears of Central and Eastern European states.	It contributes a critique of NATO expansion and US hegemony but can flatten local threat perceptions.

Tag	Card Type	Front	Back	Perspective Note
L39	Adjudication	How should one adjudicate NATO unity versus European autonomy?	NATO provides immediate collective defense and US extended deterrence; EU instruments build longer-term capacity; the evidence supports complementarity, not substitution, in the near term.	The strongest objection is that complementarity may still leave Europe dependent on US enablers.
L39	Visual	What are the four levels of analysis for this lesson?	Individual, state, systemic, and transnational levels; each changes which causes and actors are visible in European security outcomes.	African and Global South critiques often require transnational and historical levels.
L39	Source	What does IISS Military Balance 2023-2024 help establish?	It provides comparative data on defense spending, force structure, and capability trends, allowing assessment of whether rearmament is producing usable capacity.	Data can show spending without proving strategic effectiveness.

Tag	Card Type	Front	Back	Perspective Note
L39	Mechanism	What is Europe's strategic dependency on the United States?	It includes extended nuclear deterrence, intelligence, strategic lift, missile defense, and high-end enablers that European forces cannot yet fully replace.	Dependency is the central constraint on autonomy claims.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence audit table (scored 0-100)

Concept or skill	Confidence (0-100)	Evidence of mastery
NATO rearmament from Madrid to Washington		Can name summits, accession effects, and spending debates
EU strategic autonomy instruments		Can distinguish PESCO, EDF, and Strategic Compass
Energy decoupling and LNG geography		Can explain REPowerEU mechanisms and limits
Defense industrial fragmentation		Can link procurement structure to capability gaps
Transatlantic dependency and burden-sharing		Can identify US enablers Europe lacks
African perspective reconstruction		Can state its central critique in its own terms
Worked-example adjudication		Can compare institutional responses across levels
Hinge-question reasoning		Can identify distractor logic

7.2 Three-question debrief

1. Which mechanism in this lesson most directly converts political commitment into military capability, and what evidence would show that it is failing?

2. Which of the five perspectives most changes the evaluation of NATO rearmament, and what does it force the other perspectives to answer?

3. What single falsifier would most weaken the claim that European strategic autonomy is becoming operationally meaningful?

7.3 Error-log table

Common Misconception	Correction	Evidence
Strategic autonomy means Europe can replace the United States in NATO.	It means capacity to act when necessary; NATO remains central to European defense in the near term.	EU Strategic Compass (2022) frames autonomy as complementary to NATO.
NATO expansion alone caused the Ukraine war.	Russian agency, imperial narratives, and Ukrainian choices matter; NATO expansion is one contested factor among several.	NATO Strategic Concept (2022) and Russian official narratives offer competing causal accounts.
REPowerEU ended Russian gas dependence immediately.	Decoupling is gradual and constrained by infrastructure, contracts, and storage.	REPowerEU planning documents and LNG terminal timelines.
Higher European defense spending equals higher military effectiveness.	Fragmented procurement and industrial bottlenecks can absorb spending without producing usable capability.	IISS Military Balance 2023-2024 and EDA capability reviews.
AUKUS was only a submarine procurement dispute.	It also involved alliance consultation, industrial trust, and strategic signaling.	French and Australian government reactions in 2021.
The African perspective is merely a regional application of Western theory.	It reconstructs security from African historical experience and centers externalized costs.	African scholarship on extraversion, dependency, and militarization.

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Strategic autonomy; NATO rearmament; energy decoupling; defense industrial base; transatlantic dependency	Madrid/Washington summit commitments; PESCO/EDF/Strategic Compass; REPowerEU and LNG diversification; procurement reform; burden-sharing pressures	Institutionalism (L6); Howorth (2019); Biscop (2021); NATO Strategic Concept (2022); EU Strategic Compass (2022); IISS Military Balance 2023-2024	Ukraine war response; Finland/Sweden accession; AUKUS; REPowerEU; ammunition shortages	Autonomy versus alliance dependence; NATO expansion causality; free-riding versus sovereignty; militarization versus development	Sustained capability gaps despite spending; renewed Russian gas dependence; EU procurement centralization failure; US retrenchment without European replacement	L35-38 Ukraine; L40 Eastern Europe; L47-48 US-China/Indo-Pacific; L49 Global South

SECTION 9 — REVIEW SCHEDULE

- **R1 (24 hours):** Re-read the five key ideas and recite the causal claims without notes; check the flashcards tagged "mechanism."
- **R2 (3 days):** Reconstruct all five perspectives in 150 words each, then compare your African reconstruction with the lesson's primary treatment.
- **R3 (1 week):** Redo the Problem Pair from memory, explicitly separating description, explanation, prediction, and prescription.
- **R4 (2 weeks):** Re-examine the Data Lab tables and identify one trend, one level-of-analysis error, and one perspective occlusion.
- **R5 (1 month):** Write a one-page adjudication of whether European strategic autonomy is becoming operationally meaningful, using at least two falsifiers.

SECTION 10 — COMPLETION CHECKLIST

☐ I can state the five key ideas in order.

☐ I can distinguish NATO rearmament from EU strategic autonomy.

☐ I can explain PESCO, EDF, and the Strategic Compass separately.

☐ I can describe REPowerEU's mechanisms and limits.

☐ I can explain why defense spending does not equal capability.

☐ I can reconstruct the African perspective in its own terms.

☐ I can steel-man the Chinese, Russian, Western, and UN perspectives.

☐ I can apply the four levels of analysis to the worked example.

☐ I can complete the Problem Pair without notes.

☐ I can identify at least two falsifiers for autonomy claims.

☐ I can interpret the Data Lab tables.

☐ I can draw or describe the three visuals.

☐ I can use Cornell cues to self-test.

☐ I can compress the lesson in five Feynman steps.

☐ I can score my confidence honestly.

☐ I can update my error log after mistakes.

☐ I can link this lesson to L35-38, L40, L47-48, and L49.

☐ I can answer the hinge question and diagnose distractors.

FURTHER READING (Optional)

- **NATO rearmament:** NATO Strategic Concept (2022); NATO Madrid Summit Declaration (2022); NATO Washington Summit Declaration (2024).
- **European strategic autonomy:** Howorth (2019); Biscop (2021); EU Strategic Compass (2022).
- **Energy decoupling:** European Commission, REPowerEU Plan (2022); LNG infrastructure and diversification reports.
- **Defense industrial base:** European Defence Agency, Coordinated Annual Review on Defence (CARD); IISS Military Balance 2023-2024.
- **Transatlantic relationship:** NATO burden-sharing debates; US force posture in Europe assessments.
- **Perspective reconstruction:** African scholarship on extraversion, dependency, and militarization; Chinese and Russian strategic narratives on NATO.

End of Lesson 39. Say **Next** when you are ready.

41. Wider Eastern Europe and the Caucasus

LESSON METADATA

Field	Value
Lesson number and title	Lesson 40 — Wider Eastern Europe and the Caucasus
Module	Module 6: Eastern Europe and the Ukraine War
Prerequisites	L35–L39 (Ukraine, European security)
Interleaved links	Forward to L41 (West Asia), L49 (Global South), L50 (non-state actors)
Reading load	7-9 hours
Content channels	Text, data tables, visual anchor, flashcards, worked example
Bloom ceiling	Evaluate / Create
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

The wider Eastern European and Caucasus space — Belarus, Moldova, the Western Balkans, Georgia, Armenia, and Azerbaijan — is not a peripheral theater orbiting the Ukraine war. It is the very architecture within which the post-Cold War European order was built, contested, and is now being dismantled. The central puzzle of this lesson is why a belt of conflicts that erupted in the early 1990s, were frozen by ceasefires and peacekeeping missions, and were subsequently managed through diplomatic frameworks for three decades, have not been resolved but instead have become durable instruments of statecraft. The question is not why these conflicts persist in a passive sense; it is how they are actively maintained, leveraged, and periodically reactivated by regional and great powers to structure the distribution of power, territory, and sovereignty across a zone stretching from the Baltic to the Caspian. Understanding this requires moving beyond the vocabulary of "unresolved disputes" toward an analysis of frozen conflicts as strategic technologies — mechanisms that convert territorial ambiguity into bargaining leverage, that convert peacekeeping presence into sphere-of-influence projection, and that convert the absence of final status into a permanent condition of managed instability.

The historical layering matters. The collapse of the Soviet Union in 1991 and the earlier disintegration of Yugoslavia produced a contiguous zone of contested sovereignty. In the Caucasus, the First Nagorno-Karabakh War (1991–1994) ended with Armenian forces controlling not only Nagorno-Karabakh but seven surrounding Azerbaijani districts, producing a ceasefire brokered by Russia through the Bishkek Protocol but no peace treaty. In Moldova, the Transnistria War of 1992 ended with a Russian-brokered ceasefire and the deployment of Russian peacekeepers along the Dniester, leaving a strip of territory east of the river

under the control of a separatist administration in Tiraspol. In Georgia, the wars in Abkhazia and South Ossetia (1992–1993) produced Russian-mediated ceasefires and, eventually, Russian peacekeeping and later military bases. In the Balkans, the Dayton Accords of 1995 froze Bosnia and Herzegovina into a complex constitutional architecture of two entities and three constituent peoples, while the 1999 Kosovo war and subsequent UN administration produced a contested independence that Serbia has never recognized. Each of these outcomes shared a common feature: the cessation of large-scale violence without the resolution of underlying sovereignty claims, producing what the literature calls "frozen conflicts" — a term that itself conceals the degree to which these arrangements are actively heated and cooled by external actors.

The Second Nagorno-Karabakh War of 2020 demonstrated that frozen conflicts can be forcibly unfrozen. Azerbaijan, leveraging Turkish-supplied Bayraktar TB2 drones, Israeli loitering munitions, and a military modernization program funded by hydrocarbon revenues, recovered most of the territories lost in 1994 in a six-week campaign. The November 9, 2020 trilateral ceasefire statement brokered by Russia deployed approximately 2,000 Russian peacekeepers to the Lachin corridor and Nagorno-Karabakh itself, reinserting Moscow as the indispensable security guarantor even as it had failed to prevent the war. This sequence — military revision of the status quo followed by great-power peacekeeping that ratifies the new facts on the ground — is not unique to the Caucasus. It is the operating logic of the wider region: force creates new realities, and external powers convert those realities into institutionalized arrangements that serve their interests. The 2020 war thus functions as the central worked example of this lesson because it compresses into a single case the mechanisms that operate more slowly and less visibly across Belarus, Moldova, and the Balkans.

Belarus and Moldova present contrasting modalities of the same underlying dynamic. Belarus under Alyaksandr Lukashenko has, since 1994, constructed a regime that is simultaneously authoritarian and deeply dependent on Russian economic subsidies, energy pricing, and security guarantees. The 2020 presidential election crisis — in which mass protests followed a disputed vote and were suppressed with Russian backing — accelerated Belarus's integration into Russian military and economic structures, including the deployment of Russian tactical nuclear weapons and the use of Belarusian territory as a staging ground for the February 2022 invasion of Ukraine. The 2021 migration crisis at the Polish and Lithuanian borders, in which Belarusian authorities facilitated the movement of migrants from the Middle East toward EU frontiers, demonstrated the weaponization of human mobility as a hybrid instrument against the European Union. Moldova, by contrast, has pursued a trajectory of European integration, receiving EU candidate status in June 2022 and opening accession negotiations in 2023, yet remains structurally vulnerable through its dependence on Russian gas (historically supplied via Gazprom and the Transnistrian route), its unresolved Transnistrian conflict, and the presence of Russian troops in the breakaway region. The two cases illustrate how the same regional order produces divergent state strategies — authoritarian consolidation through Russian dependence versus democratic reform through European integration — while both remain constrained by the frozen conflict architecture.

The Western Balkans constitute the third major sub-region, and here the central tension is between the promise of EU enlargement and the reality of enlargement fatigue. Bosnia and Herzegovina remains governed by the Dayton constitutional framework, which has preserved peace since 1995 but has also entrenched ethnic party systems, produced chronic governmental dysfunction, and prevented the development of a functional state capable of meeting EU accession criteria. Kosovo's 2008 declaration of independence, recognized by a majority of UN member states but not by Serbia, Russia, China, or five EU members, created a partially recognized state whose sovereignty is contested in ways that directly affect its Euro-Atlantic trajectory. Serbia, meanwhile, has pursued a multi-vector foreign policy that balances EU accession aspirations

with close ties to Russia and China, including arms purchases and infrastructure investment. The EU's own enlargement strategy has been characterized by inconsistent conditionality, shifting geopolitical priorities, and a growing gap between the rhetoric of integration and the institutional capacity to absorb new members. The result is a region that is neither fully integrated into the European order nor fully detached from it, suspended in a condition of permanent candidacy that itself becomes a source of political instability.

The theoretical and analytical stakes of this lesson extend well beyond regional studies. Frozen conflicts are not merely Balkan or Caucasian phenomena; they are a modality of international order that appears wherever great-power competition intersects with contested sovereignty and weak state capacity. The mechanisms at work — external sponsorship of separatist entities, peacekeeping as sphere-of-influence projection, energy dependence as political leverage, migration weaponization, and the strategic use of non-recognition — are transferable across contexts. The lesson therefore frames the wider Eastern European and Caucasus space as a laboratory for understanding how international order is produced and reproduced at its margins. The African perspective, developed at length in Section 2.7, reveals that frozen conflicts bear structural similarities to the colonial partition and externally imposed boundaries that African states have navigated since independence, and that the vocabulary of "frozen conflict" itself may obscure the agency of local actors who use great-power competition to advance their own claims. The Chinese, Russian, Western, and UN perspectives each illuminate different dimensions of the same phenomenon, and the lesson's central analytical task is to adjudicate among them using evidence rather than to adopt any single frame. By the end of this lesson, the student will be able to identify the mechanisms that sustain frozen conflicts, reconstruct five distinct analytical perspectives on any given case, specify the scope conditions under which each perspective applies, and produce an evidence-based adjudication that distinguishes description, explanation, prediction, and prescription.

SECTION 1 — Pre-Class Priming

1.1 Retrieval Warm-Up Answer the following questions from memory before reading further. These draw on Lessons 35–39.

1. What were the principal causes of the 2014 annexation of Crimea, and how did the Minsk agreements (2014–2015) attempt to manage the conflict in eastern Ukraine?
2. How did NATO's 2008 Bucharest summit decision regarding Georgian and Ukrainian membership aspirations shape the security environment in the Black Sea region?
3. What is the "security dilemma" as applied to NATO enlargement, and which scholars have offered the strongest articulations of this argument?
4. How did the 2022 full-scale Russian invasion of Ukraine alter the European security architecture, particularly with respect to Finland and Sweden?
5. What role did energy dependence — specifically German reliance on Russian natural gas — play in shaping European responses to Russian aggression prior to 2022?
6. How does the concept of "hybrid warfare" apply to Russian operations in the post-Soviet space, and what distinguishes it from conventional military conflict?

1.2 Orientation Questions

1. Why do some conflicts remain "frozen" for decades while others are resolved or reignited, and what

distinguishes the strategic function of a frozen conflict from a merely unresolved dispute?
2. How does the Second Nagorno-Karabakh War of 2020 illustrate the relationship between military technology, great-power peacekeeping, and the reconfiguration of regional order?
3. In what ways does Belarus's deepening dependence on Russia since 2020 differ from Moldova's pursuit of European integration, and what structural constraints do both states share?
4. What does the Western Balkans' experience with EU enlargement reveal about the limits of conditionality-based integration as a tool for conflict resolution?

1.3 Vocabulary Pre-Teach

Term	Provisional Definition
Frozen conflict	A conflict in which large-scale violence has ceased but no peace treaty or final political settlement has been reached, leaving contested sovereignty, territorial ambiguity, and often external peacekeeping or military presence as durable features of the regional order.
Near abroad	The Russian foreign-policy doctrine, articulated in the 1990s, asserting a privileged sphere of influence over the former Soviet republics, justified by historical ties, ethnic Russian populations, and security interests.
Sphere of influence	A geographic region in which a great power claims predominant political, economic, or military authority, often at the expense of the formal sovereignty of states within that region.
Peacekeeping	The deployment of military or civilian personnel by an international or regional organization (or a single state) to monitor ceasefires, separate combatants, and maintain stability in a conflict zone; in the post-Soviet space, frequently Russian-led and serving strategic interests.
De facto state	An entity that exercises effective control over a territory and population but lacks widespread international recognition, such as Transnistria, Abkhazia, South Ossetia, or Nagorno-Karabakh prior to 2023.
Enlargement fatigue	The declining political will among existing EU member states to absorb new members, driven by institutional capacity concerns, domestic opposition, and competing priorities, particularly after the 2004 and 2007 enlargements.

Term	Provisional Definition
Hybrid warfare	The coordinated use of military and non-military instruments — including cyber operations, disinformation, economic coercion, and migration weaponization — to achieve strategic objectives below the threshold of conventional armed conflict.
Migration weaponization	The deliberate instrumentalization of human mobility by a state to exert political pressure on another state or bloc, as in Belarus's facilitation of migrant flows toward EU borders in 2021.
Dayton Accords	The 1995 peace agreement ending the Bosnian War, which established a complex constitutional structure dividing Bosnia and Herzegovina into two entities (the Federation of Bosnia and Herzegovina and Republika Srpska) with a weak central government.
Conditionality	The practice of linking the provision of benefits — such as EU membership, financial assistance, or trade access — to the fulfillment of specified political, economic, or legal reforms by the recipient state.
Non-recognition	The refusal by states or international organizations to acknowledge the sovereignty or independence of an entity, used as a diplomatic tool to delegitimize de facto states and maintain the territorial integrity of parent states.
Energy vulnerability	A state's exposure to political or economic leverage arising from dependence on external energy supplies, particularly when those supplies transit through or originate in a potentially hostile state.

SECTION 2 — LESSON CORE

2.1 Learning Objectives

After mastering this lesson, the student will be able to:

1. **Analyze** the causal chain linking authoritarian consolidation in Belarus to Russian strategic dependence and the instrumentalization of migration flows, identifying intermediate mechanisms—regime insecurity, patron-client bargaining, and border weaponization—rather than treating outcomes as automatic or overdetermined. (Bloom: Analyze)
2. **Explain** how the 2021 Belarus–EU border crisis functioned as coercive diplomacy, specifying the conditions under which a small state can convert control over human mobility into leverage against a larger political bloc, and the structural limits of that leverage once the target adapts. (Bloom: Explain)

3. **Evaluate** competing theoretical explanations—realist patron-client theory, liberal institutionalism, and constructivist identity accounts—for Belarus's post-2020 trajectory, adjudicating among them using evidence from energy politics, military integration, diplomatic alignment, and the timing of migration flows. (Bloom: Evaluate)
4. **Compare** the Belarus case with other instances of authoritarian clientelism and migration weaponization (for example, Turkey–EU bargaining, Morocco–Spain border politics) to identify genuine scope conditions and to distinguish structurally similar from merely superficially similar cases. (Bloom: Compare)
5. **Synthesize** the five international perspectives (African, Chinese, Russian, Western, UN) on Belarus's sovereignty trade-offs, producing a reasoned judgment about which perspective best captures the distributional and normative stakes for populations on both sides of the border and for the migrants themselves. (Bloom: Synthesize)

2.2 KEY IDEA 1 — Belarus: Lukashenko's Regime, Russian Dependence, and the Migration Weaponization

Bolded Causal Claim: Lukashenko's post-2020 survival strategy converted Belarus from a nominally sovereign buffer state into a Russian security dependency, and that dependency in turn made the weaponization of migration across the EU border a rational, low-cost coercive instrument rather than an aberration of authoritarian irrationality.

Mechanism: The mechanism runs through four linked stages, each of which is contingent rather than automatic. First, the August 2020 presidential election and the mass protests that followed eroded Lukashenko's domestic legitimacy and his residual Western ties; the violent crackdown foreclosed the European option and made regime survival contingent on external backing. The protests were not merely an electoral dispute—they represented a broad social mobilization that the regime could not absorb through its usual patronage networks, forcing a binary choice between concession and coercion. Second, Russia—facing its own strategic anxieties about NATO enlargement, color revolutions, and the loss of a buffer—provided that backing through security guarantees, financial support, and energy subsidies, but on terms that progressively hollowed out Belarusian autonomy: the 2021–2022 constitutional amendments, the deployment of Russian troops and air-defense assets, the hosting of tactical nuclear weapons, and the integration of command structures. Third, with Western sanctions biting and alternative revenue streams closed, Lukashenko's regime faced a fiscal and legitimacy deficit that it could not close through domestic reform; the border with the EU became one of the few remaining assets in a shrinking portfolio. Fourth, the regime orchestrated the movement of migrants—primarily from the Middle East and Africa—toward the Polish, Lithuanian, and Latvian borders in 2021, using state airlines, visa facilitation, and security-service escorts, converting human mobility into a coercive signal aimed at extracting sanctions relief and political recognition. The mechanism is not simply "dictatorship causes aggression"; it is a specific sequence in which regime insecurity produces patron dependence, patron dependence forecloses exit options, and the resulting desperation converts border control from a public good into a weapon. Each link is contingent: without Russian backing, the crackdown might have collapsed; without EU sanctions, the migration lever might not have been pulled; without the geographic fact of a shared land border with Schengen, the coercion would have lacked bite. The EU Eastern Partnership documentation, which had framed Belarus as a partner in gradual reform, illustrates how quickly the institutional framework was overtaken by events once the regime chose coercion over conditionality.

Scope Conditions: This mechanism operates where (a) an authoritarian regime faces an acute legitimacy crisis that cannot be resolved domestically through co-optation or reform; (b) a great-power patron with revisionist or buffer-state interests is willing and able to provide security guarantees at a price the client can pay; (c) the target state shares a land border with the coercing state and is embedded in a legal regime (Schengen, EU asylum law) that makes uncontrolled arrivals politically costly; and (d) the coercing state retains sufficient bureaucratic capacity to move people without triggering uncontrolled domestic backlash. It does not operate where the regime retains domestic legitimacy, where no patron is available, where borders are maritime or heavily fortified, or where the target's asylum system is insulated from political pressure. The strongest counterargument comes from liberal institutionalism: EU conditionality and sanctions can still shape Belarusian behavior by raising costs and denying legitimacy. The evidence is mixed—sanctions have constrained but not reversed integration with Russia, suggesting that once patron dependence crosses a threshold, external pressure on the client reinforces rather than weakens the patron-client bond, because the patron becomes the only available lifeline.

Observable Implications: If the mechanism holds, we should observe (i) deepening military-technical integration (joint exercises, air-defense unification, nuclear hosting) following each escalation in EU pressure; (ii) migration flows spiking in temporal proximity to diplomatic confrontations or sanctions rounds, not to seasonal or purely economic drivers; (iii) Belarusian foreign-policy statements tracking Russian positions with decreasing lag; (iv) EU border infrastructure investment rising as a direct response; and (v) Lukashenko's rhetoric shifting from balancing to explicit alignment. Falsifiers would include: a sustained period of Belarusian policy divergence from Moscow despite continued EU pressure; migration flows decoupled from diplomatic events; or a restoration of Western economic ties without Russian retaliation. The mechanism also implies that the migration weaponization should attenuate if the EU hardens its border sufficiently to remove the political cost of arrivals, or if Russia withdraws its backing and the regime faces a new survival calculus.

Perspective Note (five traditions in brief):

African (primary): From an African vantage point, the Belarus case is not primarily about European security architecture but about the recurring structure of sovereignty under external pressure—a structure African states know intimately. African international-relations scholarship, from Nkrumah's analysis of neocolonialism through Mamdani's distinction between citizen and subject, has long argued that formal sovereignty often masks substantive dependence: the postcolonial state inherits borders and institutions designed for extraction, and its rulers trade autonomy for regime survival. Grovogui's work on sovereignty as practice rather than status suggests that Lukashenko's "sovereignty" was always performative—negotiated with Moscow and Brussels rather than rooted in popular authorization. Mbembe's concept of necropolitics illuminates how both the Belarusian regime and the EU border regime manage populations as disposable: migrants pushed into forests become, in Mbembe's terms, bodies subjected to the power of death, while the regime's own citizens face a different but related calculus of expendability. The African perspective thus sees the migration weaponization not as a novel European pathology but as a variant of a global pattern in which weak states and powerful blocs alike instrumentalize human mobility—echoing how African borders were drawn and policed under colonial rule and how contemporary African states are pressured to serve as Europe's external border guards. Bayart's "politics of the belly" helps explain Lukashenko's calculus: regime survival through patronage and coercion, with the population as resource rather than sovereign. Yet the African perspective also carries a distinctive normative emphasis: Nyerere's and Cabral's insistence that liberation must be self-directed, and Fanon's warning that dependence on an external patron reproduces subjugation even when it preserves the ruler. From this angle, the tragedy is not only that Belarusians lose autonomy but

that the EU's border externalization exports the costs of European security to populations—many of them African—who have no voice in the bargain. The African vantage point therefore foregrounds questions that Western security discourse often backgrounds: who pays for the "stability" of the border, whose mobility is criminalized, and whether the language of sovereignty is being used to legitimize domination rather than to protect self-determination. It also cautions against reading the crisis solely through a Russia-versus-West lens, because that framing erases the agency and suffering of the migrants themselves and the longer history of border violence that predates this particular confrontation.

Chinese: China approaches Belarus through the lens of non-interference and economic connectivity. Beijing has invested in the Great Stone industrial park near Minsk as a flagship Belt and Road node and has consistently treated Belarus's internal politics as a sovereign matter. Chinese commentary frames Western sanctions as illegitimate interference and emphasizes stability and development over political conditionality. The Chinese perspective contributes an insistence that economic engagement should not be held hostage to political reform, and it highlights the material costs of sanctions for third parties. It occludes, however, the domestic repression that preceded Russian dependence and tends to treat "stability" as an unqualified good, understating the agency of Belarusian protesters and the coercive dimensions of the migration crisis. From Beijing's vantage, the crisis is a symptom of great-power confrontation rather than a consequence of authoritarian breakdown.

Russian: Russian discourse frames Belarus as an integral part of the "Russian world" and the Union State, and treats Western engagement with Minsk as encroachment on a legitimate sphere of influence. The near-abroad doctrine holds that Russia has special security interests in post-Soviet space, and the 2020 crisis is read as a Western-backed color revolution averted by Russian support. The migration crisis is either denied, minimized, or framed as a legitimate response to EU sanctions. This perspective contributes a reminder that NATO enlargement and EU conditionality are themselves coercive instruments that reshape the strategic environment. It occludes the extent to which Russian backing enabled authoritarian consolidation and the human costs of the border weaponization, and it treats Belarusian sovereignty as derivative of Russian security rather than as an independent value.

Western: Western analysis treats Belarus as a case of failed democratization and Russian subversion, emphasizing the 2020 election fraud, repression, and the subsequent loss of Belarusian autonomy. EU and US policy has combined sanctions, support for civil society, and border hardening. The Western perspective contributes a normative commitment to democratic governance and human rights, and it has generated substantial documentation of abuses. Its self-critique—visible in debates about enlargement fatigue and the slow response to 2020—acknowledges that inconsistent engagement (welcoming Lukashenko when convenient, sanctioning when not) may have accelerated dependence on Moscow. It occludes, however, the extent to which EU border externalization and asylum policy created the very vulnerability that migration weaponization exploited, and it sometimes underestimates the structural constraints on Belarusian agency.

UN: The UN perspective centers on Charter principles—sovereignty, non-intervention, human rights—and on the protection of migrants and refugees. UNHCR and IOM have documented conditions at the border and called for access and humane treatment. The UN contributes a legal framework that transcends great-power competition and insists on the dignity of individuals regardless of geopolitical context. It occludes, in practice, the enforcement gap: without Security Council consensus, UN mechanisms cannot compel state behavior, and the migration crisis has been managed primarily by regional actors. The UN vantage thus highlights both the normative resources and the institutional limits of multilateralism in a polarized environment.

2.3 KEY IDEA 2 — Moldova: Transnistria, EU Accession, and Energy Vulnerability

Bolded Causal Claim: Moldova's European integration is blocked not by a single veto but by a layered sovereignty deficit—Transnistria's de facto statehood, Russian military presence, and energy dependence—that EU conditionality can manage but not resolve without a settlement of the 1992 conflict.

Mechanism: The mechanism operates through three interlocking channels. First, territorial: the Transnistrian Moldovan Republic (TMR), established after the 1992 war and sustained by Russian military backing, controls roughly twelve percent of Moldovan territory and a significant share of industrial capacity. The presence of the Operational Group of Russian Forces (OGRF), successor to the Soviet 14th Army, provides both a security guarantee for TMR authorities and a standing threat that constrains Chisinau's policy space. Second, energy: Moldova's gas supply historically transited through Ukraine and was contracted with Gazprom; Moldovagaz is fifty percent plus one share owned by Gazprom, giving Moscow leverage over pricing and supply. The 2021–2022 energy crisis, when Gazprom reduced deliveries and demanded debt repayment, demonstrated how energy dependence translates into political pressure. Third, institutional: EU accession requires the acquis communautaire across all territory, but Chisinau cannot enforce standards in TMR; this creates a "sovereignty gap" that the EU's own rules cannot bridge. The EU's response—financial support, the Iasi-Ungheni pipeline, and the "energy solidarity" mechanism—addresses symptoms but not the structural condition. The mechanism is thus cumulative: each channel reinforces the others, and progress on one (for example, energy diversification) does not automatically unlock progress on the others (territorial reintegration). De Waal's analysis of frozen conflicts emphasizes that such arrangements persist precisely because they serve multiple actors' interests simultaneously: Russia retains leverage, TMR elites retain power, and Moldovan governments avoid the costs of confrontation.

Scope Conditions: This mechanism applies most strongly to small, post-Soviet states with unresolved territorial disputes, energy import dependence, and proximity to Russia. It is weaker where the disputed territory is economically marginal, where alternative energy routes exist, or where the great-power patron has withdrawn. Moldova's case is intensified by its landlocked position, its remittance-dependent economy, and the fact that Transnistria hosts significant industrial assets (steel, electricity generation at Cuciurgan). The mechanism also depends on the EU's willingness to advance accession despite unresolved conflicts—a willingness that has grown since 2022 but remains contested among member states. Cornell's work on Eurasian security underscores that the "frozen" quality of these conflicts is not accidental but structurally produced by the absence of a hegemonic settlement.

Observable Implications: If the mechanism holds, we should observe: (a) Moldovan governments pursuing EU integration while avoiding direct confrontation with TMR or Russia; (b) energy crises recurring during periods of geopolitical tension; (c) EU financial support increasing without corresponding territorial progress; (d) TMR authorities maintaining alignment with Moscow while seeking economic ties with Chisinau; (e) Gagauzia's autonomy becoming a secondary flashpoint. These patterns are visible in the 2020–2024 period: Sandu's election, the 2021 gas crisis, the 2022 EU candidacy, the 2023 opening of negotiations, and continued OGRF presence.

Perspective Note (five traditions in brief):

African (primary): The African vantage treats Moldova's predicament as a case of incomplete decolonization and externalized sovereignty. From this perspective, the Transnistrian conflict is not merely a post-Soviet anomaly but an instance of how imperial powers (here, Russia) retain leverage over nominally independent states through territorial fragments and economic dependencies. African scholars such as Mamdani and

Grovogui have analyzed how sovereignty in the post-colonial world is often "shared" or "delegated" to external actors, producing states that are formally independent but substantively constrained. The African lens highlights what Western frameworks often miss: that Moldova's energy dependence is not just a technical problem but a structural feature of unequal exchange, and that EU accession may reproduce dependency in new forms—replacing Russian leverage with Brussels conditionality. The African perspective also draws attention to the human costs: Moldovan workers migrating to Russia and the EU, remittances sustaining households, and the gendered dimensions of labor migration. It insists that sovereignty must be measured not by treaty signatures but by the capacity of a state to determine its own energy, labor, and territorial futures. This vantage is the longest because it reframes the entire debate: Moldova is not a "frontline state" in a Western sense but a post-colonial society negotiating multiple dependencies, and its experience resonates with African states that have faced similar externalized sovereignty.

Chinese: China's perspective emphasizes non-interference and economic engagement. Beijing has not taken a strong position on Transnistria, preferring to avoid entanglement in European security disputes. Chinese interests in Moldova are modest—some trade and infrastructure interest—but the broader principle matters: China opposes the use of territorial disputes to justify external intervention or to condition economic relations. The Chinese vantage sees EU accession conditionality as a form of political interference that exceeds the economic sphere, and it worries that the Moldovan case could legitimate similar conditionality in other contexts. It occludes the security dimension: China's framework does not address how Russian military presence affects Moldovan sovereignty.

Russian: Russia's perspective frames Transnistria as a protectorate of Russian-speaking populations and a strategic asset. Moscow argues that the 1992 conflict was caused by Moldovan nationalism and that TMR's existence protects a community that would otherwise be marginalized. The Russian vantage treats OGRF as a peacekeeping force (though it is not OSCE-mandated) and insists that any settlement must account for TMR's "statehood." It occludes the coercive dimension: the military presence and energy leverage are not framed as instruments of influence but as natural expressions of historical ties. The Russian perspective also uses Moldova as a cautionary tale about EU expansion, arguing that Brussels absorbs states without resolving their internal conflicts.

Western: The Western perspective centers on Euro-Atlantic integration, democratic reform, and the containment of Russian influence. It treats Moldova's EU candidacy as a strategic gain and supports Chisinau's reform agenda. The Western vantage emphasizes the 2022 candidacy and 2023 negotiations as milestones and frames energy diversification as a success story. It occludes, in its more triumphalist variants, the unresolved territorial problem and the risk that accession without settlement could create a "Cyprus problem" in the EU—importing an unresolved conflict into the Union. Western self-critique, increasingly present since 2022, acknowledges that earlier enlargement strategies underestimated the security dimension and that the Eastern Partnership lacked the tools to resolve frozen conflicts.

UN: The UN perspective emphasizes Charter principles, the 1992 ceasefire, and the OSCE-led mediation (the 5+2 format). The UN supports Moldova's sovereignty and territorial integrity while calling for a peaceful settlement. It occludes the enforcement gap: the 5+2 format has been stalled since 2019, and without great-power consensus, UN mechanisms cannot compel progress. The UN vantage highlights the normative framework but also its institutional limits in a polarized environment.

2.4 KEY IDEA 3 — The Balkans: Bosnia's Frozen Conflict, Kosovo-Serbia, and EU Enlargement Fatigue

Bolded Causal Claim: The Western Balkans remain trapped in a "stabilization without integration" equilibrium because EU enlargement fatigue, unresolved sovereignty disputes, and ethno-nationalist political entrepreneurs have converted post-conflict institutions into mechanisms for perpetuating division rather than transcending it.

Mechanism: The mechanism operates through institutional path dependence and incentive structures. In Bosnia and Herzegovina, the Dayton Accords (1995) created a complex power-sharing system that froze wartime ethnic divisions into constitutional categories. The Office of the High Representative (OHR) retains "Bonn powers" to impose legislation, but its authority has eroded as EU and US attention shifted eastward. The result is a state where ethnic parties have no incentive to build cross-cutting coalitions: the electoral system rewards ethnic outbidding, and the constitutional structure allows any of the three constituent peoples to block decisions. In Kosovo-Serbia relations, the 2008 declaration of independence and Serbia's non-recognition create a parallel sovereignty gap. The EU-facilitated dialogue (since 2011) has produced agreements (the 2013 Brussels Agreement) but not implementation, because neither side has sufficient incentive to compromise without a credible EU membership prospect. The mechanism is thus: EU conditionality requires reforms that threaten incumbent elites; elites therefore perform reform rhetorically while blocking substantively; the EU, facing its own enlargement fatigue and internal divisions, cannot credibly threaten exclusion or promise accession; the equilibrium stabilizes at a sub-optimal level. This is reinforced by external actors—Russia supports Serbia and Republika Srpska; Turkey and Gulf states engage in cultural and economic diplomacy; China invests in infrastructure—creating a multi-polar environment where no single external actor can impose convergence. King's analysis of the Caucasus and Balkans emphasizes how external powers have historically used regional divisions as instruments of influence, and the current multi-polarity reproduces that pattern.

Scope Conditions: This mechanism applies where (a) post-conflict institutions encode ethnic or communal divisions; (b) the external patron (EU) has lost credibility or capacity; (c) local elites benefit from the status quo; and (d) alternative external partners provide resources without conditionality. It is weaker where a single external actor has overwhelming leverage, where institutions are designed for integration rather than division, or where economic interdependence creates cross-cutting interests. The Balkans case is intensified by the region's small size, its location between competing spheres, and the legacy of the 1990s wars. The mechanism also depends on the EU's internal cohesion: when member states disagree on enlargement (as France and Bulgaria have), the conditionality loses credibility.

Observable Implications: If the mechanism holds, we should observe: (a) repeated crises in Bosnia (secessionist rhetoric from Republika Srpska, blockage of state institutions); (b) Kosovo-Serbia dialogue producing agreements that are not implemented; (c) EU member states disagreeing on enlargement (France's skepticism, Bulgaria's veto on North Macedonia); (d) local leaders using external partnerships to hedge against EU pressure; (e) youth emigration and brain drain. These patterns are visible throughout the 2010s and 2020s, including the 2021–2022 Bosnian crisis, the 2023 Kosovo-Serbia tensions over license plates and municipal elections, and the continued stagnation of accession negotiations.

Perspective Note (five traditions in brief):

African (primary): The African perspective reads the Balkan frozen conflicts through the lens of post-colonial statecraft and the politics of externally imposed settlements. African scholars, from Fanon to Mam-

dani to Mbembe, have analyzed how colonial and post-colonial states are constructed through violence and then stabilized through institutional arrangements that freeze rather than resolve group divisions. The Dayton Accords, from this vantage, resemble the colonial "indirect rule" systems that Mamdani identified in Africa: they recognize and empower communal leaders as the legitimate representatives of groups, thereby incentivizing ethnic entrepreneurship and foreclosing cross-cutting politics. The African perspective also highlights the racialized and civilizational hierarchies embedded in EU enlargement discourse—the notion that the Balkans are "European but not quite," perpetually in need of tutelage. This resonates with African experiences of conditionality and the "development" discourse that treats non-Western (or semi-Western) societies as deficient. The African vantage insists that the Balkan problem is not primarily a failure of local elites but a failure of the international order to create conditions for genuine self-determination: the OHR's Bonn powers, the EU's conditionality, and NATO's presence all represent forms of external sovereignty that constrain democratic politics. It also draws attention to the economic dimensions: deindustrialization, unemployment, and emigration that make ethnic politics a rational strategy for survival. The African perspective is longest here because it offers a fundamental critique: the Balkans are not a "European problem" to be solved by more Europe; they are a case of how international intervention, however well-intentioned, can produce durable dependency and frozen conflict, and this insight travels directly from African post-colonial experience.

Chinese: China's perspective emphasizes economic development and non-interference. Beijing has invested in Balkan infrastructure (the "16+1" format, later "14+1" after Baltic withdrawals) and treats the region as a node in the Belt and Road Initiative. China does not take positions on Kosovo's status or Bosnia's constitutional arrangements, preferring to engage all parties economically. The Chinese vantage sees EU enlargement fatigue as an opportunity for deeper economic engagement and worries that geopolitical competition (Western pressure to exclude Chinese firms) undermines development. It occludes the security and identity dimensions: China's framework does not address how ethnic politics or historical grievances shape the region, and its economic focus can be read as ignoring the very conflicts that make development fragile.

Russian: Russia's perspective treats the Balkans as a historic sphere of influence and a front in the contest with NATO. Moscow supports Serbia's position on Kosovo, backs Republika Srpska's autonomy, and opposes NATO expansion in the region. The Russian vantage frames the 1999 NATO bombing of Yugoslavia as an original sin and uses it to delegitimize Western claims to moral authority. It occludes its own destabilizing role: Russian support for ethno-nationalist entrepreneurs is not framed as interference but as solidarity with "traditional" allies. The Russian perspective also uses the Balkans to argue that Western intervention produces chaos, contrasting it with Russia's (self-proclaimed) respect for sovereignty—while simultaneously undermining sovereignty in practice.

Western: The Western perspective centers on Euro-Atlantic integration, democratic consolidation, and the prevention of renewed conflict. It treats the Balkans as a "European" region that must eventually join the EU and NATO, and it frames the 1990s interventions as necessary humanitarian actions. The Western vantage has shifted from the confident enlargement of the 2000s to a more anxious "stabilization" mode, acknowledging that the "European perspective" has lost credibility. Western self-critique, increasingly prominent, recognizes that the EU's conditionality was too technocratic, that it underestimated the political economy of ethnic elites, and that the 2008 financial crisis and subsequent crises diverted attention. The Western perspective occludes, in its more self-critical variants, the extent to which Western powers themselves designed the institutions (Dayton, the Ahtisaari plan) that now constrain progress.

UN: The UN perspective emphasizes Charter principles, the ICTY's legacy, and peacekeeping (UNMIK in

Kosovo, EUFOR in Bosnia). The UN supports territorial integrity and peaceful dispute resolution, and it has invested heavily in transitional justice. It occludes the enforcement gap: UN mechanisms depend on Security Council consensus, which is absent on Kosovo (Russia and China oppose recognition). The UN vantage highlights the normative and legal framework but also its institutional limits in a region where great powers disagree fundamentally on the status of territories.

2.5 KEY IDEA 4 — Georgia, Armenia, Azerbaijan: the Second Karabakh War (2020), Russian peacekeeping, and the shifting regional order

Bolded Causal Claim: The Second Karabakh War of September–November 2020 was a regional-order shock rather than a contained bilateral conflict: Azerbaijan's military victory, enabled by Turkish support and a transformed force structure, broke the post-1994 stalemate, exposed the conditional nature of Russia's security guarantees to Armenia, and inserted Turkey and Russia as joint arbiters of the South Caucasus, while leaving Georgia's own frozen conflicts and Euro-Atlantic aspirations embedded in a more multipolar and less predictable environment.

Mechanism: The war's outcome rested on several interacting mechanisms. First, military-technological asymmetry: Azerbaijan invested hydrocarbon revenues in drones, precision-guided munitions, and combined-arms coordination, while Armenia's defenses remained anchored in Soviet-era equipment and static trench lines that proved vulnerable to aerial reconnaissance and strike. Second, alliance signaling: Russia's CSTO commitments to Armenia did not translate into intervention against Azerbaijan, because Moscow sought to preserve leverage over both parties and avoid a direct clash with Turkey; Armenia's expectation of patron protection was therefore disappointed. Third, domestic legitimation: Azerbaijan's leadership framed territorial recovery as national restoration, while Armenia's post-2018 political transition under Nikol Pashinyan created both reformist energy and military vulnerability. Fourth, postwar institutionalization: the November 9, 2020 ceasefire deployed Russian peacekeepers along the Lachin corridor and established Turkish-Russian monitoring, converting battlefield gains into a new, externally managed status quo. Fifth, regional diffusion: the war demonstrated that frozen conflicts could be "unfrozen" when power balances shift, encouraging other actors to reconsider military options and prompting Georgia to reassess its own dependence on Western rhetorical support without comparable security guarantees. The subsequent Azerbaijani consolidation of control in 2023 and the withdrawal of Russian peacekeepers by 2024 further showed that peacekeeping mandates can be overtaken by facts on the ground when the patron's broader capacity is strained. The war also revealed the importance of Turkey's defense-industrial base, Iran's anxieties about Turkish and Israeli-linked influence near its borders, and Georgia's role as a transit state whose value rises when north-south routes are politicized.

Scope Conditions: This mechanism applies where a state has sufficient fiscal and technological capacity to overcome entrenched defensive positions, where the patron's commitment is ambiguous or subordinated to wider geopolitical balancing, where domestic politics reward territorial recovery, and where external powers prefer a managed postwar order to continued fighting. It does not imply that all frozen conflicts are militarily reversible: Georgia's Abkhazia and South Ossetia remain under Russian military protection and recognition, making a similar reversal far costlier and more escalatory. It also does not imply that military victory resolves underlying legitimacy or minority-security questions; Azerbaijan's 2023 reintegration ended Armenian self-rule in Karabakh but produced mass displacement and unresolved questions of rights, property, and reconciliation. The mechanism is further bounded by energy markets, alliance structures, and the

willingness of regional powers to absorb escalation risks.

Observable Implications: Observable implications include Azerbaijan's territorial recovery and expanded state capacity; Armenia's political crisis and subsequent foreign-policy diversification; Turkey's emergence as a South Caucasus security actor; Russia's retention of a peacekeeping role but loss of exclusive mediator status; Georgia's heightened exposure to a multipolar neighborhood and its continued, but complicated, Euro-Atlantic orientation; and the growing salience of east-west transit routes, including the Middle Corridor, as alternatives to Russian-controlled north-south routes after 2022. One should also observe increased militarization, refugee and displacement flows, and the fragility of externally brokered ceasefires when local and great-power interests diverge. Armenia's questioning of CSTO reliability and its search for additional security partners, as well as Georgia's receipt of EU candidate status in December 2023 amid domestic political contestation, further illustrate how the regional shock reverberated beyond the battlefield.

Perspective Note (five traditions in brief): *African (primary):* The African vantage treats the South Caucasus not as a distant European periphery but as a familiar post-imperial landscape in which colonial and imperial borders, ethnic federalism, and external patronage produce durable insecurity. African scholarship on sovereignty, state formation, and the politics of recognition—associated with thinkers such as Mamdani, Mbembe, and Grovogui—highlights how great powers define which territorial claims are legitimate and which populations are expendable. From this perspective, Russian peacekeeping can be read not as neutral stabilization but as a form of tutelage that preserves leverage; Turkish and Azerbaijani assertions of sovereignty can be read as anti-imperial recovery, yet they also risk reproducing exclusionary majoritarianism. The African perspective foregrounds displacement, the human cost of "frozen" and "unfrozen" conflicts, and the gap between international legal language and lived security. It also cautions against treating Western or Russian frameworks as the only available grammars of order, insisting that local agency and historical experience of externally imposed borders matter. This makes the African reading longer and more skeptical of all external guarantors, including those claiming humanitarian or civilizational missions.

Chinese: The Chinese perspective emphasizes non-interference, territorial integrity, and connectivity. Beijing generally supports Azerbaijan's territorial integrity and opposes external military intervention, while seeking stable transit routes for the Belt and Road Initiative. It occludes ethnic and human-rights dimensions and avoids security commitments that could entangle it in regional rivalries.

Russian: The Russian perspective frames the South Caucasus as part of its "near abroad," where Moscow claims a privileged mediator and security role. It presents peacekeeping as stabilizing and territorial integrity as negotiable only within a Russia-managed order. It occludes its own contribution to militarization and the erosion of its credibility after 2022.

Western: The Western perspective emphasizes Euro-Atlantic integration, democracy, and territorial integrity, and it has supported Georgia's and Armenia's reform agendas. It occludes the limits of its security commitments and the extent to which Western powers outsourced mediation to Russia in the 1990s and 2000s.

UN: The UN perspective stresses Charter principles, peaceful settlement, and the legal framework of territorial integrity and self-determination. It supports mediation and humanitarian protection but occludes the enforcement gap created by Security Council divisions and the absence of a robust UN peacekeeping role in the region.

2.6 KEY IDEA 5 — Frozen conflicts as strategic instruments: how unresolved disputes structure regional order

Bolded Causal Claim: Frozen conflicts are not simply diplomatic failures or humanitarian tragedies; they are often strategically maintained arrangements in which ambiguity about sovereignty, borders, and status serves the interests of local elites, regional patrons, and great powers, thereby structuring regional order through buffer zones, militarized lines of contact, and permanently incomplete sovereignty.

Mechanism: The mechanism operates at four levels. First, strategic ambiguity: an unresolved status allows patrons to retain leverage over both the de facto and de jure authorities without committing to full recognition or reintegration. Second, institutionalization of the freeze: ceasefires, peacekeeping missions, and contact lines create durable facts on the ground that make reversal costly and normalize a "no war, no peace" condition. Third, elite instrumentalization: local leaders in both the parent state and the breakaway entity use the conflict to consolidate power, justify militarization, and deflect from governance failures. Fourth, great-power concert and rivalry: external powers may prefer a frozen conflict to outcomes that would empower a rival, alter alliance structures, or create precedents for secession. These mechanisms are reinforced by legal stalemate—tensions between territorial integrity and self-determination, uti possidetis, and Security Council vetoes—and by economic incentives, including control of transit routes, sanctions evasion, and resource rents. The result is a regional order in which conflict is managed rather than resolved, and in which periodic flare-ups serve as reminders of latent violence without necessarily producing settlement. The freeze can also become a resource in itself: it generates external funding, military assistance, and diplomatic attention that would diminish under a final settlement, giving both local and external actors incentives to preserve ambiguity.

Scope Conditions: This argument applies where military balances prevent decisive victory, where at least one external patron benefits from the status quo, where local elites derive political or economic rents from continued confrontation, and where international mediation lacks enforcement capacity. It does not apply to all unresolved disputes: some are genuinely intractable due to identity, territory, or resource competition without being strategically maintained; others may be frozen primarily by exhaustion rather than design. The mechanism also assumes a minimum of institutional continuity—ceasefire monitoring, diplomatic channels, and elite bargaining—that can sustain ambiguity without collapsing into full-scale war. Where that continuity breaks down, as in 2008 Georgia or 2020 Karabakh, the freeze gives way to rapid reconfiguration. The argument is therefore probabilistic and conditional, not a claim that every unresolved dispute is a deliberately engineered instrument.

Observable Implications: Observable implications include persistent ceasefire lines and militarized borders; long-term displacement and refugee populations; underdevelopment in conflict zones; repeated but inconclusive negotiation formats; external military bases justified by "stabilization"; and the use of conflict status as leverage in broader diplomatic bargaining. One should also observe sudden collapses of frozen orders when power balances shift, followed by new rounds of displacement and recognition disputes. The mechanism predicts that "peace" in such settings will be procedural and reversible rather than transformative. It also predicts that external mediators will often measure success by the absence of large-scale violence rather than by political settlement, and that local populations will bear the costs of this lowered ambition.

Perspective Note (five traditions in brief): *African (primary):* The African perspective is especially attuned to frozen conflicts because many African states live with unresolved territorial and sovereignty disputes inherited from colonial borders and post-colonial state formation. Scholarship by Mamdani, Mbembe, Bayart, and others emphasizes that the state in Africa has often been experienced as an external apparatus,

and that sovereignty is contested from within as well as from outside. From this vantage, a "frozen conflict" is not an anomaly but a modality of rule: it allows external powers and local elites to govern through exception, emergency, and selective recognition. African cases such as Western Sahara, Somaliland, and the Sudans illustrate how international recognition regimes can freeze injustice as effectively as they freeze violence. The African perspective foregrounds displacement, the political economy of war, and the ways in which international law's categories—territorial integrity, self-determination, uti possidetis—often reproduce colonial boundaries while denying democratic legitimacy to affected populations. It is therefore skeptical of both Western liberal peacebuilding and Russian-style tutelage, insisting that durable order must address historical injustice and material inequality rather than merely manage ceasefires.

Chinese: The Chinese perspective emphasizes stability, non-interference, and development. It supports territorial integrity and opposes unilateral secession, while viewing frozen conflicts as risks to trade corridors and investment. It occludes human-rights and democratic-governance dimensions and prefers quiet diplomacy to public conditionality.

Russian: The Russian perspective treats frozen conflicts in the "near abroad" as security buffers and instruments of influence. It presents peacekeeping and mediation as stabilizing, while using ambiguity to retain leverage over neighboring states. It occludes the costs borne by local populations and the ways in which frozen conflicts perpetuate militarization.

Western: The Western perspective emphasizes territorial integrity, human rights, and liberal peacebuilding, and it has often sought to resolve frozen conflicts through conditionality and integration. It occludes its own inconsistent engagement, the limits of conditionality, and the ways in which Western-designed settlements can institutionalize stalemate.

UN: The UN perspective stresses Charter principles, mediation, and peacekeeping, and it provides the legal and institutional vocabulary for managing frozen conflicts. It occludes the enforcement gap created by Security Council divisions and the tendency of UN mechanisms to prioritize procedural stability over substantive justice.

2.7 FIVE PERSPECTIVES IN DEPTH

2.7.1 African Perspective (PRIMARY)

The African perspective on wider Eastern Europe and the Caucasus begins not with the post-Soviet space but with the colonial genealogy of the state system itself. For African international-relations scholars, the frozen conflicts of the Caucasus and the Balkans are not exotic pathologies of a distant region; they are recognizable instances of a recurring pattern in which imperial powers draw borders, collapse, and leave behind contested sovereignties that are then managed, exploited, or frozen by successor states and external patrons. The African vantage point thus reframes the lesson's central topic: not as a regional security problem to be solved by Euro-Atlantic integration or by Russian sphere-of-influence management, but as a manifestation of the deeper politics of sovereignty, recognition, and imperial afterlives that African states have lived since independence. This reframing is not a denial of the specificity of the post-Soviet experience; it is an insistence that the analytical categories through which that experience is understood have been shaped by a particular, Eurocentric history of state formation that African scholarship has spent decades deconstructing.

At the core of this perspective is the understanding that sovereignty is an achievement rather than a given.

Robert Jackson's distinction between juridical and empirical sovereignty, developed in the context of post-colonial Africa, is directly applicable: African states entered independence possessing recognized borders and international legal personality while often lacking effective control over their territories. The frozen conflicts of Eastern Europe — Abkhazia, South Ossetia, Transnistria, Northern Cyprus, Kosovo — present structurally similar configurations: entities exercising de facto control without broad international recognition, or states possessing de jure sovereignty without full empirical control. Mahmood Mamdani's analysis of colonialism's "define and rule" strategies shows how imperial powers constructed ethnic and tribal categories that hardened into political identities and administrative boundaries; the Soviet nationalities policy, with its titular republics and autonomous regions, performed an analogous function, creating national categories whose territorialization became explosive upon imperial collapse. The African perspective thus reads frozen conflicts not as eruptions of primordial hatred but as products of imperial categorization — a reading that shifts attention from the passions of local populations to the structural conditions that make such conflicts possible and profitable.

This structural reading generates a sharp critique of the selective application of territorial integrity. African states have lived through secessionist crises — Biafra, Katanga, Eritrea, Somaliland, South Sudan — and have observed the international community's inconsistent responses: Eritrea recognized after a long war, Somaliland unrecognized despite decades of relative stability, South Sudan recognized after mass violence, Biafra crushed. Siba Grovogui's work on sovereignty and international law argues that the norms governing recognition and territorial integrity were constructed to protect European empires and were only later universalized, carrying their colonial asymmetries with them. Applied to Eastern Europe, this produces a skepticism that African diplomats and scholars frequently voice: Western insistence on Ukraine's territorial integrity, while Kosovo's independence was recognized, appears to African observers as power politics dressed in legalism. This skepticism does not translate into support for aggression; rather, it reflects a lived experience of an international order in which principles are enforced by the powerful against the weak. African states' frequent abstentions or opposition in UN votes on Ukraine are thus better understood as assertions of non-alignment and distrust of Western-led order than as endorsements of Russian policy — a distinction that Western commentary often fails to grasp.

The African perspective also illuminates the material and political economies that sustain frozen conflicts. Jean-François Bayart's concept of extraversion — the strategy by which African elites leverage external resources and patrons to maintain domestic power — travels well to the post-Soviet space. Belarus's dependence on Russian subsidies and security guarantees, Moldova's energy vulnerability, the Balkan states' EU conditionality — these are forms of extraversion in which local elites convert external dependence into domestic authority. Walter Rodney's analysis of underdevelopment as a relational process, in which the development of some regions is structurally linked to the underdevelopment of others, suggests that frozen conflicts are not merely local failures but are embedded in regional and global hierarchies of power and extraction. Achille Mbembe's concept of necropolitics — the power to dictate who may live and who must die — captures the condition of populations in frozen conflict zones, where sovereignty is suspended, violence is routine, and accountability is absent. The African perspective thus centers the costs borne by ordinary people, not the security dilemmas of great powers, and insists that any analysis of frozen conflicts that does not account for these costs is analytically incomplete.

Regional organization provides a further point of comparison. The African Union's principle of uti possidetis — the inheritance of colonial borders — and its peace and security architecture, including the Peace and Security Council and the African Standby Force, represent an attempt to manage contested sovereignty through regional mechanisms rather than great-power diktat. African experience with regional mediation

— ECOWAS in Liberia and Sierra Leone, the AU in Darfur and the Great Lakes — demonstrates both the possibilities and the limits of such approaches: regional actors possess local knowledge and legitimacy but often lack resources and are themselves implicated in the conflicts they mediate. Applied to Eastern Europe, the African perspective asks why the OSCE and the EU have failed to resolve frozen conflicts, and whether the answer lies partly in the hegemonic character of Western-led institutions, which smaller states experience as instruments of great-power interest rather than neutral forums. It also notes that African regionalism, for all its weaknesses, has at least the virtue of being owned by its members, whereas Eastern European security architecture has been shaped by external powers whose interests do not always align with those of the region's populations.

African feminist scholarship adds a dimension that the other four perspectives largely neglect. Sylvia Tamale's work on African feminism and decolonization insists that sovereignty must be understood not only at the state level but in terms of bodily autonomy, gendered violence, and the everyday experience of insecurity. Oyèrónkẹ́ Oyěwùmí's critique of the colonial imposition of gender categories suggests that the ethnic and national identities mobilized in frozen conflicts are themselves constructed through colonial epistemologies that naturalize difference. Applied to the Balkans and the Caucasus, this perspective would note that the consociational power-sharing arrangements imposed by Western peacebuilders — most notoriously at Dayton — institutionalized ethnic categories that had been politically mobilized during war, effectively freezing not only territorial disputes but also gendered and ethnic hierarchies. The African feminist contribution is thus to insist that peace processes that exclude women and marginalized groups, or that treat ethnicity as a natural rather than constructed category, reproduce the very conditions that generate conflict.

What the African perspective contributes uniquely, then, is fourfold. First, it denaturalizes borders and sovereignty, revealing them as political constructs with colonial histories rather than as neutral legal facts. Second, it exposes the selectivity of international legal principles, showing that territorial integrity and self-determination are applied according to power rather than law. Third, it centers the material and everyday costs of frozen conflicts on populations rather than on state security, and it provides a vocabulary — extraversion, necropolitics, underdevelopment — for understanding how conflicts are sustained by elite interests and global hierarchies. Fourth, it insists on non-alignment as a legitimate strategic posture, not as neutrality or appeasement, but as a refusal to be conscripted into great-power competition on terms set by others. These contributions are not merely academic; they shape how African states vote in international forums, how they negotiate with external powers, and how they conceptualize their own security.

The African perspective also has significant occlusions that must be acknowledged. It may understate the specific nuclear and conventional military dimensions of the post-Soviet space, where the risk of escalation between nuclear-armed powers is qualitatively different from most African conflicts. It may over-analogize colonial and Soviet experiences, obscuring differences in state capacity, ideological legitimation, and the role of nationalism in Eastern Europe. It may not fully engage with the agency of Eastern European states that seek Euro-Atlantic integration as a genuine security choice rather than as a form of extraversion — a choice driven by historical experience of Russian domination that African analogies can flatten. It risks romanticizing non-alignment in a context of active aggression, where abstention can functionally benefit the aggressor. And its focus on colonialism as the master frame may not adequately capture the distinct dynamics of Russian imperial revival, which draws on pre-Soviet as well as Soviet legacies and operates through different mechanisms than Western colonialism. These limitations do not invalidate the perspective; they define its scope conditions. The African vantage point is most powerful when it is used not to replace other analyses but to unsettle their assumptions — to ask questions that the other four perspectives, embedded

as they are in the very order they analyze, are structurally disinclined to ask.

2.7.2 Chinese Perspective

The Chinese perspective on wider Eastern Europe and the Caucasus is anchored in the principle of non-interference in internal affairs, the primacy of state sovereignty and territorial integrity, and the pursuit of stability conducive to economic connectivity. From Beijing's vantage point, the frozen conflicts of the post-Soviet space are primarily problems of regional stability that threaten trade routes, energy corridors, and the broader project of Eurasian integration under the Belt and Road Initiative. China does not seek to resolve these conflicts through political conditionality or military intervention; instead, it engages pragmatically with all parties, including de facto authorities, in pursuit of commercial access and logistical continuity. This approach reflects a deeper strategic logic: China's rise depends on a stable Eurasian landmass, and frozen conflicts are tolerated so long as they do not disrupt the flows of goods, energy, and capital that sustain Chinese growth.

On the specific cases, China has consistently supported the territorial integrity of Ukraine, Georgia, Moldova, and Azerbaijan in principle, while simultaneously maintaining economic relations with Russia and engaging with breakaway entities where commercially useful. In the Second Karabakh War, China remained officially neutral, calling for restraint and offering to mediate, but did not challenge Azerbaijan's military victory or Russia's peacekeeping deployment. In the Balkans, China has invested heavily in infrastructure — the Belgrade-Budapest railway, port developments in Greece and the Adriatic — without taking sides in the Kosovo-Serbia dispute, treating both as potential partners. In Belarus, China has cultivated economic ties, including the Great Stone industrial park, while avoiding entanglement in the political crisis of 2020. This pattern reflects a consistent preference for bilateral economic engagement over multilateral political commitment.

The Chinese perspective contributes a distinctive emphasis on connectivity and development as alternatives to security-centric framings. It suggests that frozen conflicts are partly sustained by economic underdevelopment and that integration into broader trade networks can create constituencies for peace. The BRI's emphasis on infrastructure, energy, and digital connectivity offers a model in which regional order is built through material interdependence rather than through military alliances or political conditionality. Chinese scholars and officials frequently contrast this approach with Western interventionism, arguing that development-oriented engagement is more sustainable than externally imposed settlements.

What the Chinese perspective occludes is equally significant. Its commitment to non-interference can function as a shield for authoritarian partners, and its economic pragmatism can legitimate de facto authorities without addressing the human rights and governance deficits that sustain conflicts. The perspective tends to treat smaller states as nodes in a connectivity network rather than as agents with their own security preferences, and it underestimates the security dilemma: infrastructure projects can be perceived as strategic threats by neighboring states, as the BRI's reception in the Balkans and Central Asia demonstrates. China's reluctance to challenge Russia's sphere of influence in the post-Soviet space, despite its formal commitment to sovereignty, reveals a hierarchy of interests in which great-power relations take precedence over small-state security. Finally, the Chinese perspective offers little by way of mechanism for resolving frozen conflicts; it manages their symptoms through economic engagement but does not address their political roots. The result is a stabilizing but not transformative contribution: China can dampen escalation and create economic incentives for restraint, but it cannot by itself reconfigure the political orders that produce frozen conflicts.

2.7.3 Russian Perspective

The Russian perspective on wider Eastern Europe and the Caucasus is organized around the doctrine of the "near abroad" — the claim that the post-Soviet space constitutes a sphere of privileged Russian interests in which Moscow retains legitimate security, political, and cultural stakes. This doctrine, articulated in various forms since the early 1990s, treats the dissolution of the Soviet Union not as a clean break but as a reconfiguration of a historically integrated space in which Russia remains the central power. From this vantage point, NATO and EU expansion into Eastern Europe and the Caucasus is not merely a geopolitical inconvenience but an existential threat to Russian security, and frozen conflicts are instruments through which Moscow manages the boundaries of its influence and prevents the consolidation of hostile alignments on its periphery.

The mechanisms are well documented. Russia has maintained military bases in Armenia, Georgia's breakaway regions, Moldova's Transnistria, and Belarus, and has deployed peacekeepers in Nagorno-Karabakh following the 2020 war. It has used energy supplies, trade restrictions, and political support for friendly elites as levers of influence. In Belarus, Lukashenko's regime survives through Russian economic and security backing, and the 2020 migration crisis on the Polish border demonstrated how Belarus could be used as an instrument of pressure against the EU. In the Balkans, Russia has cultivated ties with Serbia, supported Bosnian Serb leaders, and opposed Kosovo's independence, positioning itself as a counterweight to Western influence. The Russian perspective frames these activities not as aggression but as defensive measures to protect compatriots, maintain stability, and resist Western encroachment.

The intellectual foundations of this perspective draw on a long tradition of Russian geopolitical thought, from nineteenth-century pan-Slavism to Soviet-era concepts of the socialist camp, adapted to post-Cold War conditions. Russian scholars and officials frequently invoke the Monroe Doctrine as a precedent for sphere-of-influence claims, arguing that all great powers assert privileged interests in their neighborhoods. The protection of Russian-speaking populations is framed as a humanitarian and legal obligation, drawing on the concept of "compatriots abroad" (sootechestvenniki) developed in the 1990s. The narrative of NATO betrayal — the claim that Western leaders promised not to expand eastward in 1990 — serves as a foundational grievance that legitimizes resistance to further enlargement.

What the Russian perspective occludes is substantial. It systematically understates the agency of neighboring states, which have their own security preferences shaped by historical experience of Russian domination rather than by Western manipulation. It treats frozen conflicts as management tools while obscuring the human costs borne by displaced populations and the ways in which these conflicts perpetuate militarization and corruption. It invokes international law selectively, defending sovereignty when it serves Russian interests while violating it through annexation and intervention. It also underestimates the counterproductive effects of its own policies: the 2008 war in Georgia and the 2022 invasion of Ukraine have accelerated rather than prevented NATO and EU expansion, suggesting that the sphere-of-influence strategy has been self-defeating. Finally, the Russian perspective struggles to account for the genuine appeal of Euro-Atlantic integration to populations in the region, which cannot be reduced to Western propaganda or elite manipulation. The perspective is thus most coherent as a description of Russian interests and fears, and least coherent as a normative framework for regional order, because it cannot reconcile its claims of defensive necessity with the evident costs imposed on neighboring societies.

2.7.4 Western Perspective

The Western perspective on wider Eastern Europe and the Caucasus is built on the twin pillars of Euro-Atlantic integration and the liberal international order: territorial integrity, human rights, democratic governance, and the rule of law. From this vantage point, the frozen conflicts of the post-Soviet space and the

Balkans are obstacles to the consolidation of stable, democratic states aligned with Western institutions, and their resolution requires the extension of EU and NATO norms, standards, and conditionality to the region. The Western approach has been most fully articulated through the EU's Eastern Partnership, launched in 2009, and through NATO's open-door policy, both of which treat integration as a transformative process that can overcome historical divisions through institutional reform and economic modernization.

The mechanisms of Western influence include association agreements, visa liberalization, financial assistance, and the promise of eventual membership. In Moldova, the EU has supported reform efforts and energy diversification, while in the Balkans, accession negotiations have been used to incentivize democratic consolidation and regional reconciliation. In the Caucasus, Western engagement has been more limited, constrained by Russian presence and by the complexity of the conflicts, but the EU and the US have supported Georgia's Euro-Atlantic aspirations and have mediated between Armenia and Azerbaijan. The Western perspective also encompasses a significant peacebuilding and state-building enterprise, most visibly in Bosnia, where the Dayton Accords created a complex consociational structure designed to end war but which has since become a source of political paralysis.

Self-critique is an increasingly prominent feature of the Western perspective. Scholars and policymakers have acknowledged the limits of conditionality, the fatigue of enlargement, and the strategic overreach of treating integration as a universal solution. The 2008 war in Georgia prompted debates about whether Western encouragement of Georgian NATO aspirations contributed to escalation. The 2022 invasion of Ukraine forced a reckoning with the gap between rhetorical commitments and material support. In the Balkans, enlargement fatigue has undermined the credibility of the EU's transformative promise, while in the Caucasus, Western engagement has been criticized as too little, too late. This self-critique is not merely tactical; it reflects a deeper uncertainty about whether the liberal international order can be extended to regions where great-power competition, historical grievances, and weak institutions create conditions that institutional reform alone cannot address.

What the Western perspective occludes is its own inconsistent engagement and the ways in which its frameworks can institutionalize stalemate. The Dayton Accords froze Bosnia's ethnic divisions into constitutional structures that have proven resistant to reform. The recognition of Kosovo's independence, while legally defensible on humanitarian grounds, created a precedent that Russia has exploited to justify its own interventions. Western conditionality has often been applied unevenly, rewarding geopolitical allies while punishing others, undermining the credibility of normative claims. The perspective also tends to underestimate the security dilemma: NATO expansion, however defensive in intent, is perceived as threatening by Russia, and the failure to address this perception has contributed to escalation. Finally, the Western perspective can occlude the agency of local populations, treating them as beneficiaries of integration rather than as actors with their own visions of order. The result is a perspective that is normatively compelling but strategically contested, and whose effectiveness depends on conditions — local ownership, great-power restraint, institutional capacity — that are frequently absent in the regions it seeks to transform.

2.7.5 UN Perspective

The UN perspective on wider Eastern Europe and the Caucasus is grounded in the Charter principles of sovereign equality, territorial integrity, non-use of force, and the peaceful settlement of disputes. From this vantage point, frozen conflicts are violations of the international legal order that require mediation, peacekeeping, and the gradual restoration of state authority, all conducted within the framework of international law and with respect for the rights of affected populations. The UN has been involved in the region through peacekeeping missions — UNPROFOR in Bosnia, UNOMIG in Georgia, UNMIK in Kosovo —

and through mediation efforts, including the Geneva International Discussions on Georgia and the Minsk Group on Nagorno-Karabakh, though the latter's effectiveness has been limited by great-power divisions.

The UN perspective contributes a legal and institutional vocabulary that is indispensable for managing frozen conflicts. It provides the framework for ceasefires, monitoring missions, and humanitarian access, and it establishes norms — on refugees, on the protection of civilians, on the illegality of the use of force — that constrain even powerful states. The UN's human rights mechanisms, including the Human Rights Council and treaty bodies, document violations in conflict zones and provide a basis for accountability. The UN also serves as a forum in which smaller states can assert their claims against great-power pressure, and its General Assembly resolutions on Ukraine's territorial integrity, for example, have provided a measure of international legitimacy for positions that might otherwise be dismissed as Western.

The mechanisms of UN engagement include mediation by the Secretary-General's special representatives, peacekeeping and observer missions, humanitarian coordination through OCHA, and the work of specialized agencies. In the Balkans, the UN played a central role in the 1990s, though its record was marred by failures — most notably at Srebrenica — that damaged its credibility. In Georgia, UNOMIG monitored the ceasefire until 2009, when Russia's veto forced its closure. In Nagorno-Karabakh, the UN has been largely sidelined, with Russia and Turkey dominating the post-2020 settlement. This pattern illustrates a structural feature of the UN perspective: it is most effective when great powers agree, and least effective when they do not.

What the UN perspective occludes is the enforcement gap created by Security Council divisions and the tendency of UN mechanisms to prioritize procedural stability over substantive justice. The UN can monitor ceasefires but cannot enforce them against the will of a permanent member. It can mediate but cannot compel parties to accept settlements that threaten their interests. Its peacekeeping missions are often deployed with mandates too weak to protect civilians, and its mediation efforts can become exercises in managing rather than resolving conflicts. The UN perspective also tends to treat frozen conflicts as discrete disputes amenable to technical solutions, rather than as symptoms of deeper structural inequalities and great-power competition. Its emphasis on neutrality, while necessary for legitimacy, can obscure power asymmetries and can privilege the status quo over justice. Finally, the UN's institutional design — particularly the veto power of the permanent members — means that its capacity to act is inversely related to the severity of the conflict when great powers are involved. The result is a perspective that is essential for establishing norms and providing forums but that is structurally incapable of resolving the conflicts it addresses when those conflicts implicate the interests of its most powerful members.

2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Reveals frozen conflicts as instruments of external power projection that reproduce dependency; centers sovereignty as lived, substantive self-determination rather than legal abstraction; exposes racialized hierarchies in whose conflicts receive sustained international attention	May underweight the agency of local elites who instrumentalize frozen conflicts for domestic legitimation; can overstate the coherence of "external" versus "internal" actors; risks romanticizing pre-colonial regional orders	Sovereignty as substantive self-determination, not merely formal statehood; opposition to great-power imposition of "stability" that freezes injustice and locks in dependency	Differential international response to Nagorno-Karabakh versus African conflicts (e.g., Western Sahara, eastern DRC); Russian peacekeeping as sovereignty-constraining rather than sovereignty-protecting; the instrumental use of migration by Belarus	Western: underweights the role of local ethnic nationalism and elite manipulation in perpetuating conflicts; African framing can flatten intra-regional power asymmetries

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Chinese	Highlights non-interference as a normative principle against humanitarian intervention-ism; emphasizes economic connectivity (BRI, Middle Corridor) as an alternative to military confrontation; demonstrates that great-power competition can be managed through development rather than force	Ignores how non-interference serves as cover for supporting authoritarian status quo; underweights minority protection and human rights; BRI can create debt dependency and infrastructure leverage that constrains sovereignty in practice	State sovereignty and territorial integrity as paramount; opposition to external intervention; preference for economic over military solutions; "win-win" development as conflict prevention	China's consistent support for Azerbaijan's territorial integrity at the UN; BRI investments in Georgian and Azerbaijani transit infrastructure; China's refusal to recognize Kosovo	Western: non-interference is selectively applied and enables authoritarian consolidation; African: economic connectivity without political conditionality reproduces dependency under new management

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Russian	Reveals the security-dilemma logic of the "near abroad"; shows how frozen conflicts serve as buffers, leverage, and instruments of influence; demonstrates the material and strategic interests behind peacekeeping deployments	Naturalizes Russian hegemony; treats sovereignty of neighboring states as conditional on Russian security interests; obscures the coercive dimensions of "protection"; conflates Russian security with regional stability	Sphere of influence as legitimate security architecture; "near abroad" as zone of privileged interests; stability through managed ambiguity; great-power responsibility for regional order	Russian peacekeeping in Nagorno-Karabakh (2020–2024); military bases in Armenia (Gyumri), Moldova (Transnistria), Georgia (pre-2008); the "passportization" policy in South Ossetia and Abkhazia	Western: legitimizes imperialism and denies agency to smaller states; African: reproduces colonial logics of "protection" that constrain genuine sovereignty
Western	Emphasizes Euro-Atlantic integration as a peace project; highlights self-determination and human rights; provides institutional frameworks (EU, NATO, OSCE) for conflict resolution and democratic consolidation	Enlargement fatigue and inconsistent application; can be blind to how Western policies (NATO expansion, Kosovo recognition) contributed to security dilemmas; overestimates institutional capacity; self-critique often arrives too late	Liberal international order; rules-based system; democracy and human rights as universal; self-determination within territorial integrity; conditionality as reform incentive	EU Eastern Partnership (2009); NATO's role in Balkan stabilization; OSCE Minsk Group mediation (1992–2020); EU accession negotiations with Moldova and Ukraine	Russian: Western enlargement provoked insecurity and violated implicit post-Cold War understandings; African: selective attention and racialized hierarchy of concern

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
UN	Provides legal frameworks (Charter, international law); mediation forums; peacekeeping as neutral third party; normative baseline for territorial integrity and self-determination in balance	Veto paralysis when great powers are involved; treats conflicts as technical rather than structural; neutrality can privilege status quo over justice; institutional design inversely relates capacity to act to severity of conflict	Charter principles; peaceful settlement of disputes; territorial integrity and self-determination in balance; impartiality; consent-based peacekeeping	UNSC resolutions supporting Azerbaijan's territorial integrity (e.g., 822, 853, 874, 884); UN mediation efforts in Georgia; UN peacekeeping in Cyprus as comparator	African: neutrality obscures power asymmetries and serves great-power interests; Russian: UN is Western-dominated instrument; Western: UN is structurally incapable of enforcement

2.8 WORKED EXAMPLE (I do)

The Second Karabakh War (2020): Azerbaijan's Military Victory, Russian Peacekeeping, and the Reconfiguration of the South Caucasus

The Second Karabakh War, fought between September 27 and November 10, 2020, represents the most significant territorial reconfiguration in the South Caucasus since the collapse of the Soviet Union. Azerbaijan, having recovered approximately 7,000 square kilometers of territory including the strategically vital city of Shusha, achieved a military victory that reversed the outcomes of the First Karabakh War (1988–1994). The subsequent Russian-brokered ceasefire introduced a 1,960-strong Russian peacekeeping contingent along the Lachin corridor and in Nagorno-Karabakh itself, while Turkey secured a monitoring role through a joint observation center. The war and its aftermath reconfigured not only the territorial map but also the regional order: Armenia's defeat triggered a domestic political crisis, Azerbaijan's confidence surged, Russia's role shifted from distant arbiter to direct military presence, and Turkey emerged as a consequential regional power. Understanding this case requires moving across four levels of analysis, each of which captures a distinct causal mechanism.

Levels of Analysis

At the *individual* level, the war was shaped by the leadership calculations of three key figures. Ilham Aliyev, Azerbaijan's president since 2003, had spent over a decade building military capacity and diplomatic lever-

age, positioning the war as the fulfillment of a national mission. Nikol Pashinyan, Armenia's prime minister, came to power in the 2018 Velvet Revolution with limited security experience and faced a legitimacy deficit that constrained his ability to make concessions in negotiations; his domestic vulnerability made him both unable to compromise before the war and unable to sustain the war effort once it began. Recep Tayyip Erdoğan, Turkey's president, saw in the conflict an opportunity to project Turkish power into the Caucasus, consolidate his nationalist base, and demonstrate the efficacy of Turkish military technology—particularly Bayraktar TB2 drones. At the *state* level, Azerbaijan's military modernization—funded by hydrocarbon revenues and accelerated by Turkish training and equipment—created a capability asymmetry that Armenia, dependent on Russian arms and constrained by its alliance with Moscow, could not match. Armenia's strategic doctrine, built around the assumption of Russian security guarantees and the defensive advantages of mountainous terrain, proved inadequate against combined-arms operations integrating drones, artillery, and special forces. Turkey's intervention, while not direct military participation in combat, provided decisive enabling capabilities. At the *systemic* level, the war occurred during a period of Russian retrenchment and American disengagement from the Caucasus. The United States, absorbed by domestic politics and the Middle East, had reduced its diplomatic footprint; the OSCE Minsk Group, co-chaired by the US, Russia, and France, had produced no substantive progress in nearly three decades. Russia, while still the dominant external power, was increasingly focused on Ukraine and Syria, and its relationship with Turkey—complicated by Syria, Libya, and energy cooperation—created incentives for accommodation rather than confrontation. The multipolar transition meant that no single power could impose order; instead, regional powers (Turkey, Russia) competed and cooperated in a fluid arrangement. At the *transnational* level, the Armenian diaspora—particularly in France, the United States, and Russia—lobbied for international recognition of Artsakh and for sanctions against Azerbaijan, but proved unable to translate moral claims into material support. Turkish-Azerbaijani ethnic and linguistic solidarity provided a transnational basis for Turkey's intervention that went beyond strategic calculation. Energy transit routes—the Baku-Tbilisi-Ceyhan pipeline and the Southern Gas Corridor—gave Azerbaijan economic leverage and connected the conflict to European energy security. The proliferation of drone warfare technology, developed in Turkey and deployed by Azerbaijan, represented a transnational military-technical shift that rendered obsolete Armenia's defensive doctrine.

Mechanism

The causal mechanism linking these levels can be specified as follows. Azerbaijan's military victory was produced by the interaction of three conditions: (1) a capability asymmetry created by Turkish-Azerbaijani military cooperation and hydrocarbon-funded modernization; (2) Russian non-intervention, which reflected Moscow's calculation that Armenia's defeat was acceptable if it preserved Russian influence through peacekeeping; and (3) Armenian political and military unpreparedness, rooted in the 2018 revolution's disruption of security institutions and Pashinyan's inability to negotiate from strength. The ceasefire mechanism—Russian peacekeeping in exchange for territorial concessions—then locked in the new status quo: Azerbaijan recovered most of its lost territory, Russia inserted a direct military presence that it had previously lacked, Turkey gained a monitoring role and expanded influence, and Armenia lost territory and strategic depth while retaining a reduced Armenian-populated enclave under Russian protection. The mechanism is not simply "military victory" but "military victory converted into political settlement through great-power brokerage," where the broker (Russia) extracted a presence that it could not have obtained through diplomacy alone.

Perspective Reconstruction

The African perspective, as the primary lens, reveals what the other four miss about the structural logic of the conflict. From this vantage point, the Second Karabakh War is not primarily about ethnicity or territory but

about the reproduction of dependency through externally imposed "stability." The frozen conflict that preceded the war—maintained for nearly three decades by Russian, American, and French mediation—served not to resolve the underlying dispute but to lock in a status quo that benefited external powers: Russia retained leverage over both Armenia and Azerbaijan, the West maintained a fiction of multilateral engagement, and the populations of the region lived under the shadow of renewed violence. The war's outcome, in which Russia inserted peacekeepers and Turkey gained a monitoring role, reproduces the colonial pattern in which African and post-Soviet territories are managed by external powers whose "peace" is indistinguishable from control. The African perspective also notes the racialized hierarchy of attention: the international community mobilized diplomatic energy for Nagorno-Karabakh that it has never mobilized for comparable or more severe conflicts in Africa, suggesting that the "international community" is not a neutral arbiter but a structure of power that allocates concern according to geopolitical interest. Sovereignty, from this perspective, is not the formal recognition of statehood but the substantive capacity to determine one's own future without external military presence; by that standard, neither Armenia nor Azerbaijan achieved sovereignty in 2020, and the Russian peacekeeping contingent is evidence of continued subordination.

The Chinese perspective emphasizes non-interference and the primacy of territorial integrity. China supported Azerbaijan's position throughout, consistent with its principle that territorial integrity is paramount and that secessionist movements—whether in Nagorno-Karabakh, Taiwan, or elsewhere—must not be legitimized. Beijing's interest in the conflict was primarily economic: the Middle Corridor, connecting China to Europe through the Caucasus, requires stability and predictable transit, and China has invested in Georgian and Azerbaijani infrastructure. China did not intervene militarily or diplomatically in a visible way, consistent with its non-interference doctrine, but its economic presence creates a form of influence that is less visible than Russian military bases or Turkish drones. The Chinese perspective would view the Russian peacekeeping deployment with ambivalence: it stabilizes the region (good for trade) but introduces a military presence that could constrain Chinese economic expansion (bad for sovereignty). China's strongest contribution is its demonstration that economic connectivity can provide an alternative to military confrontation; its occlusion is its failure to address how non-interference can serve as cover for supporting authoritarian status quo and its silence on minority protection.

The Russian perspective frames the war and its outcome as a vindication of the "near abroad" doctrine. From Moscow's viewpoint, the Minsk Group's failure demonstrated that Western-led mediation was ineffective; Russia's unilateral brokerage produced a ceasefire within six weeks where three decades of multilateral effort had failed. The peacekeeping deployment secured Russian military presence in a region where it had been losing influence to Turkey, and the ceasefire terms—while conceding territory to Azerbaijan—preserved a Russian role as arbiter and protector of the remaining Armenian population. Russia's calculation, as de Waal (2022) has analyzed, was that Armenia's defeat was acceptable if it preserved Russian influence; a prolonged war or Armenian victory would have been worse, as it would have strengthened Turkey and potentially drawn in NATO. The Russian perspective's contribution is its candor about great-power interests; its occlusion is its naturalization of hegemony and its treatment of Armenian and Azerbaijani sovereignty as conditional on Russian security.

The Western perspective emphasizes the failure of the liberal international order's conflict-resolution mechanisms. The OSCE Minsk Group, co-chaired by the US, Russia, and France, produced no substantive progress in twenty-eight years; the 2020 war demonstrated that the "frozen conflict" framework was not a solution but a deferral. Western self-critique, articulated by scholars such as Cornell (2011) and de Waal (2018), acknowledges that the West's emphasis on "stability" over justice, and its reluctance to pressure either party, contributed to the conditions for war. The West's strongest contribution is its insistence on human rights,

minority protection, and the principle that territorial disputes must be resolved through negotiation rather than force; its occlusion is its failure to recognize how Western policies—including NATO expansion and the Kosovo precedent—contributed to the security dilemmas that made the war more likely, and its persistent overestimation of institutional capacity.

The UN perspective centers on the legal framework: UNSC resolutions 822, 853, 874, and 884 (1993) affirmed Azerbaijan's territorial integrity and demanded Armenian withdrawal from occupied territories. The UN's contribution is the establishment of a normative baseline that Azerbaijan could invoke; the war's outcome, in which Azerbaijan recovered territory consistent with UNSC resolutions, can be read as a vindication of international law. However, the UN's occlusion is severe: the Security Council was paralyzed by great-power disagreement throughout the conflict, the UN played no role in the ceasefire, and the peacekeeping deployment was Russian, not UN. The UN's emphasis on neutrality and consent-based peacekeeping meant that it could not address the power asymmetries that determined the outcome. The UN perspective is essential for establishing norms but structurally incapable of enforcing them when great powers are involved.

Explicit Adjudication

Which perspective best explains the Second Karabakh War? The systemic-level analysis—combining Russian retrenchment, Turkish assertiveness, and American disengagement—provides the most complete causal account: the war became possible because the great-power equilibrium that had frozen the conflict for three decades shifted, and the outcome was determined by which powers were willing to act (Turkey, Russia) and which were not (US, France). However, this systemic account, while powerful, misses what the African perspective captures: the war was not merely a great-power chess game but a reproduction of dependency in which the populations of the region—Armenian and Azerbaijani alike—were denied substantive sovereignty. The Russian peacekeeping deployment, celebrated in Moscow as a diplomatic triumph, is from the African vantage point evidence that the "resolution" of the conflict is in fact its continuation under new management. The Western perspective's self-critique is valuable but arrives too late and remains focused on institutional failure rather than structural inequality. The Chinese perspective's emphasis on economic connectivity offers a genuine alternative but is silent on the military and political dimensions. The UN perspective provides the legal baseline but is structurally incapable of enforcement. The best explanation, therefore, is a synthesis: the systemic perspective explains *why the war happened when it did*, the state-level perspective explains *why Azerbaijan won*, and the African perspective explains *what the "resolution" actually means for the people who live there*. No single perspective is sufficient; the African perspective's contribution is to insist that the question "who won?" must be answered not only in terms of territory and power but in terms of whether the outcome expanded or contracted the substantive sovereignty of the populations involved. By that standard, the Second Karabakh War produced a victor in Azerbaijan, a loser in Armenia, and a continued subordination for both under Russian and Turkish regional management.

SECTION 2.9 PROBLEM PAIR (We do)

Tasks:

1. **Mechanism identification.** Explain how the August 2008 war transformed Georgia's security environment from a contested but intact territorial state into one with two Russian-recognized breakaway entities, and identify which causal channel—military defeat, diplomatic recognition, or institutional lock-in—most durably constrained Tbilisi's subsequent options.

2. **Perspective reconstruction (Russian).** Steel-man the Russian claim that the war was a defensive response to Georgian aggression against South Ossetia, and identify what this perspective occludes about the pre-war militarization of the conflict zone and the passportization of South Ossetian residents.
3. **Perspective reconstruction (Western).** Reconstruct the Western self-critique that NATO's Bucharest summit promise of eventual membership (April 2008) created a commitment gap that encouraged Georgian risk-taking without delivering security guarantees, and state the scope condition under which this explanation holds.
4. **African perspective application.** Using the sovereignty-plus-frozen-conflicts lens, analyze how Georgia's experience resembles or diverges from African cases of externally guaranteed partition, with attention to the politics of recognition and external patronage.
5. **Prediction and falsifiers.** Given the 2008 outcome, predict the most likely trajectory of Georgia's Euro-Atlantic aspirations over the following decade, and specify at least two pieces of evidence that would falsify your prediction.
6. **Adjudication.** Weigh the competing explanations—Russian revisionism, Western overreach, and Georgian agency—and state which best fits the evidence, with explicit scope conditions and a note on what each explanation occludes.

Model Answer:

The August 2008 war between Georgia and Russia over South Ossetia and Abkhazia constitutes a critical juncture in the post-Soviet Eurasian order, and its consequences for Georgian foreign policy illustrate how military defeat can be converted into diplomatic realignment under specific scope conditions. The mechanism operates through three sequential channels. First, military defeat: Georgian forces, having initiated operations against Tskhinvali on 7-8 August, were rapidly pushed back by Russian intervention, resulting in the loss of effective control over both breakaway regions within days. Second, diplomatic recognition: Russia's subsequent recognition of Abkhazia and South Ossetia as independent states internationalized the partition, converting a de facto frozen conflict into a legally contested one and foreclosing Georgian territorial recovery through negotiation alone. Third, institutional lock-in: the EU-brokered ceasefire of 12 August and the deployment of the EU Monitoring Mission (EUMM) created a stabilization framework that, while preventing renewed large-scale war, also froze the territorial status quo in Russia's favor and established a new baseline for all subsequent diplomacy.

The Russian perspective frames the war as a defensive humanitarian intervention to protect South Ossetian civilians and Russian peacekeepers from Georgian aggression. This narrative draws on the immediate trigger—Georgian artillery fire on Tskhinvali—and positions Moscow as responding to a provocation rather than initiating a war of choice. What this perspective occludes, as de Waal's analysis of the Caucasus emphasizes, is the longer-term militarization of the conflict zone, the distribution of Russian passports to South Ossetian residents that created a pretext for intervention, and the strategic interest in preventing Georgian NATO accession. The perspective is internally coherent but incomplete: it treats the immediate trigger as the cause while backgrounding the structural conditions that made escalation likely.

The Western perspective, particularly in its self-critical variant, acknowledges that the NATO Bucharest summit promise of eventual membership (April 2008) created a dangerous commitment gap. Georgia received rhetorical assurance of future accession without Article 5 protection, potentially emboldening Tbilisi to attempt a fait accompli in South Ossetia while leaving it exposed to Russian retaliation. This self-critique does

not absolve Russia of aggression but identifies Western policy incoherence as a permissive condition. The scope condition for this explanation is that it applies most strongly to the 2008 case, where the temporal proximity of the Bucharest promise and the August war is striking; it applies less well to cases where no such commitment gap existed.

The African perspective, reconstructed from within rather than fitted to Western theory, illuminates the sovereignty paradox at the heart of Georgia's experience. Georgia's territorial integrity was violated by an external power invoking protection of co-ethnics, a pattern familiar in African contexts where external patronage sustains de facto states and where the international recognition regime privileges certain claims over others. The frozen conflict framework—unresolved disputes that structure regional order—operates similarly across both regions, though the African vantage point emphasizes how the politics of recognition, rather than merely the fact of partition, determines which entities survive. Mamdani's analysis of the colonial legacy of indirect rule and the production of sub-national identities offers a comparative lens: external powers often manufacture or amplify such identities to justify intervention, and the resulting entities persist not because of popular legitimacy but because of patronage.

For Georgia's Euro-Atlantic aspirations, the war produced a paradoxical outcome that reshaped its foreign policy for the following decade. In the short term, it accelerated Georgia's Western alignment: the EU Association Agreement and Deep and Comprehensive Free Trade Area (DCFTA) followed in 2014, and NATO-Georgia cooperation deepened through the Substantial NATO-Georgia Package and the NATO-Georgia Joint Training and Evaluation Centre. Yet the territorial loss also made full NATO membership practically impossible, since Article 5 cannot extend to contested territory without risking direct confrontation with Russia. The trajectory thus shifted from accession to integration-without-membership—a pattern that persisted through 2024, when Georgia's EU candidacy was granted but membership remained distant.

Falsifiers of this prediction would include: (a) a Russian withdrawal from the breakaway regions and restoration of Georgian territorial control, which would reopen the accession path; (b) NATO extending Article 5 guarantees to pre-2008 Georgian territory while explicitly excluding the breakaway regions, a legally and politically fraught option; or (c) Georgia abandoning Euro-Atlantic aspirations in favor of neutrality or Russian alignment, which would indicate that the integration strategy had failed. None of these materialized through 2024, supporting the integration-without-membership thesis, though the 2024 Georgian Dream government's rhetorical shift toward "peace" and criticism of Western "war parties" introduced new uncertainty.

Adjudicating among competing explanations, Russian revisionism best explains the military intervention and recognition decisions, but Western overreach and Georgian agency are necessary to explain the timing and escalation. The scope condition is that this explanation holds for the 2008 case specifically; it does not generalize to all post-Soviet conflicts, where local dynamics vary considerably. The African perspective adds the insight that the recognition regime itself is a political instrument, not a neutral arbiter, and that frozen conflicts persist because they serve the interests of external patrons rather than local populations.

SECTION 2.10 INDEPENDENT MEMO (You do)

Case description (150-200 words):

In September 2023, Azerbaijan launched a military operation in Nagorno-Karabakh that resulted in the dissolution of the self-declared Republic of Artsakh and the exodus of over 100,000 ethnic Armenians to Armenia. The operation followed Azerbaijan's 2020 victory in the Second Karabakh War and the deployment of Russian peacekeepers under the November 2020 ceasefire agreement. By 2023, Russian peacekeepers were

unable or unwilling to prevent the Azerbaijani advance, and Armenia's government, having lost faith in Russian security guarantees, pivoted toward Western partners while remaining formally in the CSTO. The case raises questions about the durability of Russian-brokered ceasefires, the role of energy politics in shaping great-power responses, the humanitarian consequences of military solutions to frozen conflicts, and whether any externally backed peace process can deliver sustainable outcomes. Students should analyze this case using the four levels of analysis and all five perspectives.

Required memo headings (respond to each as a prompt):

- **Mechanism:** Identify the causal channel—military, diplomatic, institutional, or economic—through which the September 2023 operation reconfigured the South Caucasus order, and specify the scope conditions under which that channel operates.
- **Perspective reconstruction:** Steel-man all five perspectives (African, Chinese, Russian, Western, UN) on the operation and its aftermath, stating for each what it contributes and what it occludes.
- **Historical analogue:** Identify one comparable case of a frozen conflict resolved by military force backed by an external patron, and state the limits of the analogy.
- **Falsifiers:** Specify at least two pieces of evidence that would disconfirm your central explanatory claim.

Self-check: Did you distinguish description (what happened) from explanation (why it happened), prediction (what will happen next), and prescription (what should be done)?

SECTION 2.11 HINGE QUESTION

Question: Which of the following best explains why frozen conflicts in the post-Soviet space persist as strategic instruments rather than being resolved through negotiation?

A. The United Nations lacks the enforcement capacity to impose settlements on unwilling parties.

B. External patrons benefit from the status quo and local elites derive legitimacy and resources from the unresolved dispute.

C. Ethnic hatreds in the region are primordial and therefore intractable.

D. EU enlargement has proceeded too rapidly, destabilizing the regional balance.

Distractor diagnoses:

- **Option A** is wrong because it mistakes an institutional weakness for a causal mechanism; the UN's limited enforcement is a background condition, not an explanation for why specific actors prefer frozen conflicts to resolution. It also ignores that some frozen conflicts persist precisely because powerful states—not the UN—prefer them.
- **Option C** is wrong because it relies on a primordialist account of ethnicity that the lesson's theoretical framework explicitly rejects; ethnic identities in these conflicts are politically constructed and instrumentalized by elites and external patrons, not ancient and immutable.
- **Option D** is wrong because it reverses the causal arrow and overstates EU agency; enlargement fatigue and hesitation, not excessive speed, characterize the post-2008 period, and the persistence of frozen

conflicts predates and outlasts specific EU policy phases.

- **Option B** is correct because it identifies the mechanism—external patron interest plus local elite legitimation—that the lesson's five key ideas and the African perspective in particular emphasize; frozen conflicts persist when they serve the strategic interests of powerful states and the political survival of local actors.

SECTION 2A — DATA LAB

Table 1 — Frozen conflict zones in wider Eastern Europe and the Caucasus (indicative, 2024)

Zone	De facto authority	External patron / guarantor	Core unresolved issue	Strategic / energy relevance
Transnistria (Moldova)	Transnistrian Moldovan Republic	Russia: Operational Group of Russian Forces; political backing	Sovereignty, demilitarization, status of Russian speakers, withdrawal of forces	Dniester corridor; Moldova's territorial integrity; EU border management; Cobasna ammunition depot
Abkhazia (Georgia)	Republic of Abkhazia	Russia: military bases, diplomatic recognition, economic subsidies	Status, return of displaced Georgians, security guarantees, property rights	Black Sea coastline; north–south transit; Russian forward position
South Ossetia (Georgia)	Republic of South Ossetia	Russia: military bases, diplomatic recognition	Status, borders, security guarantees, humanitarian access	Roki Tunnel; North–South corridor; leverage over Tbilisi
Nagorno-Karabakh / Artsakh (Azerbaijan–Armenia)	Azerbaijani control after 2023; formerly Armenian-majority de facto entity	Russia: peacekeeping force 2020–2024; Turkey: military and diplomatic support to Azerbaijan	Rights and security of Armenian population, border delimitation, connectivity, accountability for displacement	Proximity to Southern Gas Corridor; Caspian–Turkey–Europe energy route; regional balance

Table 2 — Russian military presence by country (indicative, 2024)

Country	Russian military presence	Political / legal status	Function in regional order
Belarus	Rotational Russian forces; nuclear-sharing announced in 2023	Union State integration; hosting under bilateral arrangements	Forward position, sanctions-evasion space, pressure on NATO's eastern flank, migration leverage
Armenia	Russian base at Gyumri; peacekeepers withdrew from Nagorno-Karabakh in 2024	CSTO member; contested domestic debate over security dependence	Deterrence against Azerbaijan/Turkey; leverage over Yerevan's foreign-policy choices
Georgia (Abkhazia and South Ossetia)	Bases in Sokhumi and Tskhinvali	Occupied territories in Georgian and Western legal framing; recognized by Russia	Buffer, leverage over Tbilisi, demonstration effect for other post-Soviet states
Moldova (Transnistria)	Operational Group of Russian Forces, roughly 1,500 personnel	No consent of Chisinau; unresolved since 1992	Blocks reintegration; maintains ammunition stockpile; complicates EU accession
Ukraine (occupied territories)	Large-scale occupation forces	Illegal annexation claims rejected by most states	War of attrition; Black Sea access; restructuring of European security

Table 3 — EU accession status and energy exposure (indicative, 2024)

Country	EU status	Energy transit / vulnerability	Interpretive note
Ukraine	Candidate (2022)	Major transit route for Russian gas to the EU, now diminished by war; wartime infrastructure damage	Security conditionality dominates accession politics
Moldova	Candidate (2022)	High dependence on imported electricity and gas; vulnerability linked to Transnistria and to supply routes	Reform conditionality plus territorial conditionality
Georgia	Candidate (2023, with conditions)	Transit state for Caspian oil and gas via BTC and South Caucasus Pipeline	Democratic-backsliding concerns complicate accession
Armenia	CEPA (2018); no accession path	Limited transit role; dependence on Russian energy and remittances	Balancing Russia, Turkey, and EU

Country	EU status	Energy transit / vulnerability	Interpretive note
Azerbaijan	No accession path; strategic energy partner	Major oil and gas exporter to the EU through Southern Gas Corridor	Authoritarian stability traded for energy security
Serbia	Negotiating	Diversification efforts; continued Russian gas dependence	Kosovo conditionality and geopolitical hedging
Bosnia and Herzegovina	Candidate (2022)	Fragmented energy governance under Dayton	Institutional paralysis slows reform

Analysis questions

1. **Trend.** What trend do the tables suggest about the relationship between Russian military presence and EU accession status?
   Answer guide: The tables show a clustering pattern rather than a simple inverse relationship. States with Russian military presence on their territory—Moldova and Georgia—are EU candidates but face territorial and reform conditionality. States with no Russian military presence but with unresolved disputes or authoritarian governance—Serbia, Bosnia and Herzegovina—also face accession delays. Energy exporters such as Azerbaijan have no accession path but possess strategic leverage. The trend is therefore not "Russian presence blocks EU membership automatically"; rather, Russian presence converts territorial disputes into accession conditionality, while EU enlargement fatigue and domestic reform gaps create additional veto points.

2. **Level of analysis.** Which level of analysis best explains why frozen conflicts persist, and which level is most often neglected?
   Answer guide: The state level explains institutional incentives: governments use unresolved disputes to mobilize nationalism, delay reform, or justify security spending. The systemic level explains great-power competition: Russia's "near abroad" doctrine, NATO/EU enlargement, and Turkey's regional ambitions. The transnational level explains energy markets, diaspora politics, and cross-border patronage. The individual level—leaders such as Lukashenko, Putin, Aliyev, Pashinyan, and Sandu—is often neglected but matters because frozen conflicts are sustained by elite bargains, not only by structural forces. A full explanation requires all four levels; reducing the problem to "Russian imperialism" or "local nationalism" alone is analytically insufficient.

3. **Perspective reconstruction (all five).** Reconstruct how each perspective reads the data.
   Answer guide:

   - **African (primary):** The tables reveal a sovereignty gap: de facto authorities exist where international recognition is withheld, echoing colonial-era distinctions between legal sovereignty and effective control. The African vantage point asks who gets to decide which authority is legitimate and why some self-determination claims are recognized while others are frozen.

   - **Chinese:** The data show infrastructure and connectivity stakes; Beijing reads frozen conflicts

as risks to BRI corridors and as arguments for non-interference, because external intervention can destabilize trade routes.

- **Russian:** The tables display a security perimeter: Russian bases and peacekeepers are framed as stabilizing facts on the ground and as protection of Russian speakers or compatriots.

- **Western:** The data show enlargement conditionality and energy diversification; frozen conflicts are treated as obstacles to Euro-Atlantic integration and as vulnerabilities created by incomplete post-Cold War settlement.

- **UN:** The tables show gaps between Charter principles and practice: territorial integrity, self-determination, and peaceful settlement are all invoked, but enforcement depends on Security Council politics and consent-based peacekeeping.

4. **Interpretation.** Do the data support the claim that "frozen conflicts are static"?
   Answer guide: No. The tables are snapshots, but the underlying processes are dynamic. Nagorno-Karabakh moved from frozen conflict to war in 2020 and to Azerbaijani reintegration in 2023. Belarus's migration weaponization in 2021 turned a domestic authoritarian crisis into a transnational border crisis. Moldova's energy vulnerability shifted after Russia's full-scale invasion of Ukraine. The term "frozen" is therefore a diplomatic convenience: it describes the absence of a final settlement, not the absence of change. The data show that these conflicts are managed, militarized, and periodically reactivated.

5. **Limitation.** What are the most important limitations of these tables?
   Answer guide: The tables compress contested political realities into administrative categories. Recognition status is disputed; troop numbers are opaque and politically manipulated; EU accession status changes with Council decisions; energy data fluctuate with war, sanctions, and infrastructure repair. The tables also risk reifying "frozen conflict" as a natural category rather than a policy choice. They do not capture informal power, patronage networks, or the lived experience of displacement. Finally, they are Western-centric in their sourcing if drawn from EU and NATO documents, so they may understate African, Chinese, or Russian interpretive frameworks.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — Hand-drawn map of wider Eastern Europe and the Caucasus **What to draw:** Draw a simplified outline map from the Baltic Sea to the Caspian Sea. Include the Black Sea as a large shaded body of water. Mark capitals with small circles: Minsk, Chisinau, Tbilisi, Yerevan, Baku, Belgrade, Sarajevo, Pristina. Draw country borders lightly. Shade four frozen-conflict zones with diagonal hatching: Transnistria, Abkhazia, South Ossetia, and Nagorno-Karabakh. Draw Russian military bases as small triangles inside or beside the hatched zones. Draw the EU's eastern border as a thick dark line. Draw major energy routes as dashed lines: BTC pipeline, South Caucasus Pipeline, and a diminished Druzhba line. Add a legend in the corner.

How to label it: Label each hatched zone "de facto authority / disputed status." Label Russian triangles "Russian base / peacekeeping." Label the thick line "EU border / enlargement frontier." Label dashed lines

"energy transit." Add small arrows showing direction of gas or oil flow.

Perspective overlay to annotate: In the margin, write four short labels: "African lens: whose sovereignty is recognized?"; "Chinese lens: which corridors are at risk?"; "Russian lens: where is the security perimeter?"; "Western lens: where is the integration frontier?" This keeps the map from appearing as a neutral geographic fact and shows that the same territory is read through different normative frameworks.

Visual 2 — Causal chain: frozen conflict as strategic instrument **What to draw:** Draw five boxes in a horizontal chain, connected by arrows: (1) Unresolved sovereignty claim; (2) External patron guarantees; (3) Military asymmetry; (4) Negotiation deadlock; (5) Regional order structured by ambiguity. Above the chain, draw a smaller box labeled "Energy vulnerability" with arrows pointing into boxes 2 and 5. Below the chain, draw a smaller box labeled "Displacement and non-recognition" with arrows pointing into boxes 1 and 4. Use solid arrows for direct causation and dashed arrows for feedback loops.

How to label it: Label box 1 "No final settlement"; box 2 "Russia / Turkey / EU as guarantors"; box 3 "Local forces + external bases"; box 4 "Talks without recognition"; box 5 "Managed instability." Label the top box "Pipelines, gas, electricity"; label the bottom box "Refugees, IDPs, contested citizenship."

Perspective overlay to annotate: Place perspective tags beside the boxes: "Russian: near abroad" beside box 2; "Western: enlargement conditionality" beside box 4; "UN: Charter principles vs consent" beside box 5; "African: sovereignty without recognition" beside box 1; "Chinese: corridor security" beside the energy box. This visualizes how the same mechanism is interpreted differently by each tradition.

Visual 3 — Matrix of EU integration depth and Russian military presence **What to draw:** Draw a two-axis scatterplot. X-axis: "EU integration depth" with categories none, association, candidate, negotiating. Y-axis: "Russian military presence" with categories none, limited/rotational, occupation/bases. Plot countries as labeled dots: Azerbaijan (none / none), Armenia (association / limited), Georgia (candidate / occupation), Moldova (candidate / limited-occupation), Ukraine (candidate / occupation), Serbia (negotiating / none), Bosnia and Herzegovina (candidate / none). Add a shaded diagonal band labeled "High tension zone." Add a separate small cluster labeled "Energy exporters."

How to label it: Label axes clearly. Label each dot with the country name. Add a legend: dot = state; shaded band = high tension; dashed circle = energy exporters. Add a note: "Positions are indicative and change with Council decisions."

Perspective overlay to annotate: Annotate the matrix with three perspective notes: "Western: accession is the anchor"; "Russian: presence is the anchor"; "African: the matrix itself privileges Euro-Atlantic categories and may obscure non-Western security orders." This prevents the visual from being read as an objective map of progress.

SECTION 4 — CORNELL NOTES

Cue (prompt)	Notes (with source log)
What is a "frozen conflict"?	A conflict that lacks a final peace settlement but is managed through ceasefires, de facto authorities, and external guarantors. The term is diplomatic shorthand, not a description of stasis. Source log: de Waal (2018); Cornell (2011).
Why is Transnistria "frozen"?	Russian-backed de facto authority since 1992; Operational Group remains; Moldova cannot reintegrate territory without security guarantees and demilitarization. Source log: EU Eastern Partnership documentation.
What did the 2020 Karabakh war change?	Azerbaijan regained territory; Russia deployed peacekeepers; Turkey gained influence; Armenia's security dependence was exposed. Source log: de Waal (2022).
How does Belarus weaponize migration?	Lukashenko's regime used border pressure against Poland and the EU after the 2020 protests and Russian support, turning domestic authoritarian survival into transnational leverage. Source log: general IR literature on migration weaponization.
What is the EU Eastern Partnership?	EU framework for Armenia, Azerbaijan, Belarus, Georgia, Moldova, and Ukraine; combines association, reform conditionality, and differentiation. Source log: EU Eastern Partnership documentation.
Why is Moldova energy-vulnerable?	Dependence on imported electricity and gas, exposure to Transnistria, and supply-route politics; vulnerability increased after Russia's invasion of Ukraine. Source log: EU Eastern Partnership documentation.
What is Bosnia's Dayton problem?	The 1995 settlement ended war but created a fragmented state; ethnic veto points and parallel structures block reform and EU accession. Source log: general IR literature on post-conflict institutional design.
What is the Kosovo–Serbia deadlock?	Kosovo declared independence in 2008; Serbia does not recognize it; EU-facilitated dialogue has not produced mutual recognition; five EU states do not recognize Kosovo. Source log: EU Eastern Partnership documentation; general IR literature.

Cue (prompt)	Notes (with source log)
What is Russia's "near abroad" doctrine?	A post-Soviet security framing that treats former Soviet space as a privileged sphere of influence; used to justify bases, peacekeeping, and intervention. Source log: King (2008); de Waal (2018).
What does the African perspective add?	It foregrounds the gap between legal sovereignty and effective control, questions selective recognition, and treats frozen conflicts as continuations of imperial ordering rather than merely regional disputes. Source log: Grovogui; Mbembe; Mamdani (general arguments).
What does the Chinese perspective add?	It emphasizes non-interference, corridor security, and BRI connectivity; it reads instability as a threat to trade routes rather than as a sovereignty crisis. Source log: general IR literature on Chinese foreign policy.
What does the UN perspective add?	It invokes Charter principles—territorial integrity, self-determination, peaceful settlement—but is constrained by Security Council politics and consent-based peacekeeping. Source log: UN Charter; general IR literature.

Summary (3–5 sentences): Wider Eastern Europe and the Caucasus are structured by unresolved conflicts that are "frozen" in name but dynamic in practice. Russian military presence, EU accession conditionality, and energy transit routes convert local disputes into regional order. Each of the five perspectives—African, Chinese, Russian, Western, and UN—identifies a different mechanism and a different blind spot. The data show correlation between unresolved status and external patronage, but they do not prove that any single actor controls outcomes. A rigorous analysis must combine state, systemic, transnational, and individual levels of explanation.

SECTION 5 — FEYNMAN COMPRESSION

1. **Explain without jargon.**
   Some wars end without a real peace. One side keeps the land, the other keeps the claim, and a powerful neighbor sends troops to "keep order." The result is not peace but a managed pause. Belarus, Moldova, Georgia, Armenia, and Azerbaijan all show versions of this: a dispute stays open because someone benefits from it staying open. Energy pipelines and EU membership talks make the pause more valuable, not less.

2. **Mark gaps.**
   My first explanation is too Russia-centered. It underplays Armenian agency, Azerbaijani military modernization, Turkish influence, and EU conditionality. It also treats "frozen" as if nothing changes,

which the 2020 and 2023 Karabakh events contradict. I need to separate description (what exists), explanation (why it persists), prediction (what could reactivate it), and prescription (what should be done).

3. **Reread verification.**
   After rereading the data tables and perspective notes, the corrected claim is: frozen conflicts persist where three conditions overlap—no mutually recognized sovereignty, an external patron with military capacity, and an economic or strategic asset that makes ambiguity profitable. This is a scope condition, not a universal law. It does not explain every case equally well, and it may overstate material incentives while understating identity and trauma.

4. **Analogy with explicit limits.**
   A frozen conflict is like a divorce in which one partner keeps the house, the other keeps the legal claim, and a relative moves in as "mediator" but actually protects the occupant. The analogy helps show why formal agreements fail when power and property are misaligned. Its limit is severe: states are not persons, violence is institutionalized, and "mediators" may be parties to the dispute. The analogy should not be used to predict behavior.

5. **Rewrite.**
   Frozen conflicts in wider Eastern Europe and the Caucasus are unresolved sovereignty disputes sustained by external patronage, military asymmetry, and strategic economic value. They are not static; they are periodically reactivated by war, migration pressure, or energy politics. Russian, Western, Chinese, UN, and African perspectives each capture part of the mechanism but none captures all of it. The best analysis treats "frozen" as a political label for managed ambiguity, not as an empirical description of peace.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L40	Definition	What is a “frozen conflict” in the post-Soviet space?	A protracted territorial dispute in which active hostilities have ceased but no political settlement has been reached, leaving de facto entities, ceasefire lines, and often Russian peacekeepers in place; examples include Transnistria, Abkhazia, South Ossetia, and Nagorno-Karabakh before 2020.	African scholars read frozen conflicts through colonial borders and sovereignty; Chinese view them as internal affairs; Russian as near-abroad management; Western as Euro-Atlantic security gaps; UN as Charter violations requiring mediation.
L40	Mechanism	How did Belarus weaponize migration in 2021?	Minsk facilitated the movement of Middle Eastern and African migrants to the EU border (Poland/Lithuania) as retaliation for sanctions, using human flows as coercive leverage; the EU responded with sanctions and border fortification.	African perspective highlights the racialized treatment of migrants; Western frames it as hybrid warfare; Russian as legitimate statecraft; UN as a human-rights concern; Chinese as a sovereignty issue.

Tag	Card Type	Front	Back	Perspective Note
L40	Application	Why is Moldova's energy vulnerability tied to Transnistria?	Moldova historically depended on Russian gas transiting through Ukraine and on electricity from the Cuciurgan plant in Transnistria; Gazprom debt disputes and the 2022 cutoffs exposed this structural dependence, accelerating EU integration efforts.	Western/EU frames this as energy security; Russian as market leverage; African as resource dependency echoing post-colonial patterns; Chinese as infrastructure geopolitics; UN as develop-ment/humanitarian.
L40	Comparison	How do Western and Russian positions on Kosovo and Karabakh differ?	Western states recognized Kosovo's independence (2008) citing remedial secession; Russia opposed it but later recognized Abkhazia/South Ossetia; Russia backed Azerbaijan's territorial integrity in Karabakh until 2020, then brokered ceasefire; Western states largely supported Azerbaijan's territorial integrity post-2020.	African states often resist secession precedents (AU principle); Chinese supports territorial integrity; UN Charter ambiguity persists.

Tag	Card Type	Front	Back	Perspective Note
L40	Source	What is Cornell's (2011) core argument about the South Caucasus?	Svante Cornell argues the South Caucasus is a region of overlapping security complexes where unresolved conflicts and great-power competition (Russia, Turkey, Iran, US/EU) create persistent instability, and that Western engagement has been inconsistent.	Western academic framing; African scholars might critique the Eurocentric security lens; Russian sees sphere of influence.
L40	Debate	What is "enlargement fatigue" and how does it affect the Balkans?	After the 2004/2007 enlargements, EU member states grew skeptical of further expansion; this slowed accession for Western Balkan states (Serbia, Bosnia, North Macedonia, Albania, Montenegro, Kosovo), creating reform stagnation and vulnerability to Russian/Chinese influence.	Western self-critique; Balkan states feel abandoned; Russian exploits; Chinese offers alternative via BRI; African parallels with AU integration struggles.

Tag	Card Type	Front	Back	Perspective Note
L40	Mechanism	What role did Russian peacekeepers play after the 2020 Karabakh war?	Under the November 2020 trilateral ceasefire, roughly 2,000 Russian peacekeepers deployed along the Lachin corridor and contact line for five years; they became the guarantor of the new status quo but their authority was contested and later undermined by Azerbaijan's 2023 offensive.	Russian frames as stabilizer; Western as occupation; Armenian as betrayal; Azerbaijani as temporary; UN as unauthorized force.
L40	Reconstruction	How do African scholars like Grovogui or Mamdani frame frozen conflicts?	They situate frozen conflicts within the colonial inheritance of arbitrary borders and the post-Cold War reconfiguration of sovereignty; emphasize that "frozen" is a misnomer masking ongoing violence, economic extraction, and humanitarian harm; and critique great-power mediation that privileges stability over justice.	Primary African lens; challenges Western conflict-resolution paradigms.

Tag	Card Type	Front	Back	Perspective Note
L40	Occlusion	What does China's non-interference stance occlude in the Caucasus?	It occludes accountability for human rights abuses, the agency of smaller states seeking security guarantees, and the role of external arms transfers in altering military balances; it prioritizes BRI corridor stability over conflict resolution.	Chinese frames as sovereignty respect; others see abdication.
L40	Adjudication	How do Western and Russian explanations of the 2008 Georgia war differ?	Western accounts emphasize Russian provocation and disproportionate response; Russian accounts frame Georgian aggression against South Ossetia and NATO expansion as root cause; evidence supports both Georgian initiation of shelling and Russian pre-positioning, requiring multi-causal adjudication.	Adjudication requires separating immediate trigger from structural causes.

Tag	Card Type	Front	Back	Perspective Note
L40	Visual	What would a map of post-Soviet frozen conflicts show?	Shaded de facto entities (Transnistria, Abkhazia, South Ossetia, Nagorno-Karabakh pre-2020/2023) with ceasefire lines, Russian military bases, and EU/NATO borders; reveals the spatial logic of Russian forward presence and Western institutional frontiers.	Visual literacy; African cartographic critique of colonial borders.
L40	Debate	Why did Armenia's CSTO membership fail to protect it in 2020/2022?	CSTO's collective defense clause was not invoked during Azerbaijan's 2020 offensive or 2022 incursions because the alliance is Russia-dominated and Armenia's conflicts were framed as border disputes; this exposed the hollowness of Russian security guarantees and pushed Armenia toward Western diversification.	Russian sphere-of-influence limits; Western opportunity; Armenian agency.

Tag	Card Type	Front	Back	Perspective Note
L40	Mechanism	What is the EU Eastern Partnership and its limitation?	Launched in 2009, it offers association agreements, DCFTAs, and visa liberalization to six post-Soviet states; its limitation is that it demands reforms without offering membership timelines, creating "integration without accession" and leaving states exposed to Russian pressure.	Western self-critique; Russian sees encirclement; African parallels with EU-Africa partnerships.
L40	Source	What does de Waal (2018, 2022) contribute to understanding Caucasus conflicts?	Thomas de Waal provides granular, field-based analysis of Nagorno-Karabakh and the South Caucasus, emphasizing local agency, the failure of international mediation (OSCE Minsk Group), and the 2020 war's transformation of the regional order.	Western scholarship with local grounding; African scholars may note absence of post-colonial framing.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence audit table (scored 0-100)

Skill / Concept	Confidence (0-100)	Evidence of mastery	Gap to close
Defining "frozen conflict" and listing post-Soviet cases			

Skill / Concept	Confidence (0-100)	Evidence of mastery	Gap to close
Explaining Belarus migration weaponization as coercion			
Tracing Moldova's energy dependence to Transnistria			
Comparing Kosovo and Karabakh recognition politics			
Reconstructing the 2008 Georgia war from five perspectives			
Explaining CSTO non-invocation in 2020/2022			
Mapping EU Eastern Partnership limits			
Applying African sovereignty lens to frozen conflicts			
Identifying what each perspective occludes			
Distinguishing description, explanation, prediction, prescription			

7.2 Three-question debrief

1. Which of the five perspectives did you find hardest to steel-man from within, and what specific assumption of yours blocked it?
2. Where did you conflate a description of a ceasefire line with an explanation of why the conflict persists?
3. Which falsifier in your memo would most seriously challenge your preferred causal claim, and did you treat it fairly?

7.3 Error-log table

Common Misconception	Correction	Evidence
"Frozen conflicts are actually frozen."	They are protracted, low-intensity contests with periodic flare-ups, economic extraction, and humanitarian harm; "frozen" is a diplomatic convenience.	de Waal (2018, 2022); Grovogui/Mamdani framing of ongoing violence.

Common Misconception	Correction	Evidence
"Russian peacekeepers are neutral stabilizers."	They are instruments of Russian influence, deployed without UN mandate, and their presence locks in Russian leverage over the host state.	2020 trilateral ceasefire; subsequent Azerbaijan 2023 offensive.
"EU enlargement is automatic once reforms are met."	Enlargement fatigue and member-state veto politics mean reforms are necessary but not sufficient; Western Balkans remain stalled.	EU Eastern Partnership documentation; Balkan accession timelines.
"CSTO guarantees Armenian security."	CSTO's collective defense was not invoked in 2020 or 2022; the alliance is Russia-dominated and treats Armenia's conflicts as bilateral border disputes.	Armenian government statements; CSTO summit records.
"China's non-interference is neutral."	It systematically favors territorial integrity and BRI stability, occluding human rights and smaller-state agency.	Chinese foreign ministry statements on Caucasus; BRI corridor priorities.
"The 2008 Georgia war was unprovoked Russian aggression."	Evidence supports Georgian shelling of Tskhinvali as immediate trigger alongside Russian pre-positioning and NATO-expansion context; multi-causal.	EU fact-finding mission (Tagliavini) findings; King (2008).

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Frozen conflict; de facto state; ceasefire line; migration weaponization; energy vulnerability; enlargement fatigue	Coercive leverage via human flows; gas transit dependence; peacekeeping as influence; reform-without-accession; territorial integrity vs. remedial secession	Cornell (2011) overlapping security complexes; de Waal (2018, 2022) local agency; King (2008) Georgia war; Grovogui/Mamdani sovereignty critique; EU Eastern Partnership docs	Belarus 2021 border crisis; Moldova/Transnistria energy; Bosnia/Kosovo; 2020 & 2023 Karabakh; 2008 Georgia war; CSTO non-invocation	Whether frozen conflicts are stabilizing or destabilizing; whether EU enlargement fatigue is reversible; whether Russian peacekeeping is legitimate	A CSTO invocation in a future Armenia-Azerbaijan clash; EU granting accession dates to Balkans; China mediating a Caucasus settlement; Belarus ending migration facilitation	L35-39 Ukraine/European security; L41 West Asia; L49 Global South; L50 non-state actors

SECTION 9 — REVIEW SCHEDULE

- **R1 (Day 1, 20 min):** Re-read flashcards 1-7; recite the five perspectives' core stances on frozen conflicts from memory; check against Section 2.7.
- **R2 (Day 3, 30 min):** Redraw the frozen-conflict map from memory (visual card); annotate Russian bases and EU borders; compare with your original.
- **R3 (Day 7, 45 min):** Reconstruct the 2008 Georgia war worked example using all four levels of analysis; write a 200-word adjudication paragraph.
- **R4 (Day 14, 60 min):** Complete the independent memo (Section 2.10) under timed conditions; score against the self-check line; log errors.
- **R5 (Day 30, 90 min):** Full synthesis: explain how the five key ideas interact to structure regional order in Eastern Europe/Caucasus; present to a peer or record a 5-minute audio.

SECTION 10 — COMPLETION CHECKLIST

☐ I can define "frozen conflict" and list five post-Soviet cases.
☐ I can explain Belarus's 2021 migration weaponization as coercive leverage.
☐ I can trace Moldova's energy vulnerability to Transnistria and Russian gas.
☐ I can compare Western and Russian positions on Kosovo and Karabakh.
☐ I can reconstruct the 2008 Georgia war from all five perspectives.
☐ I can explain why CSTO did not protect Armenia in 2020/2022.
☐ I can state the limits of the EU Eastern Partnership.
☐ I can apply the African sovereignty lens to frozen conflicts.
☐ I can identify what each of the five perspectives occludes.

☐ I can distinguish description, explanation, prediction, and prescription in a memo.
☐ I can draw and label a frozen-conflict map.
☐ I have completed the confidence audit honestly.
☐ I have logged at least three errors in the error-log.
☐ I have written the independent memo under timed conditions.
☐ I have scheduled R1-R5 in my calendar.
☐ I can name Cornell, de Waal, and King and their core claims.
☐ I can explain enlargement fatigue and its Balkan effects.
☐ I can state the strongest counterargument to my preferred causal claim.

FURTHER READING (Optional)

- **Frozen conflicts and sovereignty:** Cornell (2011); de Waal (2018, 2022); King (2008).
- **Belarus and migration weaponization:** EU Eastern Partnership documentation; reports on the 2021 border crisis.
- **Moldova and energy:** EU-Moldova Association Agreement texts; Gazprom-Moldovagaz disputes.
- **Balkans and enlargement:** EU Commission enlargement reports; Western Balkans summit conclusions.
- **South Caucasus:** OSCE Minsk Group records; 2020 trilateral ceasefire text.
- **African perspectives:** Grovogui on sovereignty; Mamdani on colonial borders; Fanon on violence and liberation.
- **Chinese perspectives:** BRI corridor documentation; Chinese foreign ministry statements on Caucasus.
- **Russian perspectives:** "near abroad" doctrine texts; CSTO charter and summit communiqués.
- **UN perspectives:** UN Charter Chapter VI/VII; UN mediation support unit materials.
- **Comparative:** EU fact-finding mission (Tagliavini) report on Georgia 2008.

End of Lesson 40. Say **Next** when you are ready.

---

42. The West Asian State System: Ottoman Legacy, Sykes-Picot, Oil, and Rentierism

LESSON METADATA

Field	Value
Lesson number and title	Lesson 41: The West Asian State System: Ottoman Legacy, Sykes-Picot, Oil, and Rentierism
Module	Module 7: West Asia and Iranian Geopolitics
Prerequisites	L9 (sovereignty), L10 (imperialism), L11 (mandate system)
Interleaved links	Forward to L42 (Iran), L43 (sectarian), L44 (proxy warfare), L46 (hydrocarbons)
Reading load	7-9 hours

Field	Value
Content channels	Text, tables, visuals, flashcards, worked example, problem pair, data lab
Bloom ceiling	Evaluate / Create
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

The central puzzle of this lesson is deceptively simple: why does the state system of West Asia (the Middle East and North Africa, understood here as the post-Ottoman Arab and Iranian core) exhibit such persistent fragility, and why do its borders, regimes, and political economies remain objects of contestation more than a century after their creation? The answer is not that the region is culturally or religiously predisposed to disorder; that explanation is both empirically false and analytically lazy. The answer is that the modern West Asian state system was constructed, not evolved. It was assembled in a compressed period between 1916 and the early 1930s by imperial powers acting on strategic calculations that had little to do with the societies they were partitioning, and it was subsequently locked in place by hydrocarbon rents that insulated rulers from their populations. Understanding the region therefore requires understanding the architecture: the Ottoman inheritance that preceded it, the European mandate system that replaced it, the oil economy that sustained it, and the ideological challenges—pan-Arabism, pan-Islamism, and most recently the 2011 uprisings—that have repeatedly tested its legitimacy. This lesson teaches you to reconstruct that architecture as a causal system rather than as a catalogue of crises.

The Ottoman Empire is the indispensable starting point because it supplied both the institutional raw material and the geopolitical vacuum that made the modern system possible. For four centuries the Ottomans governed the Arab provinces through a flexible arrangement of provincial administration, religious millets, and local notables, never fully homogenizing the territories they controlled. When the empire collapsed in 1918, it left behind not a set of nation-states waiting to be born but a patchwork of administrative units, tribal confederations, sectarian communities, and commercial networks. The European powers—Britain and France above all—did not discover pre-existing nations; they invented them, or at least froze certain administrative boundaries into international borders. Fromkin's account of the Paris settlement emphasizes that the diplomats of 1919-1922 were improvising, often ignorant of local conditions, and driven by imperial rivalry as much as by any principle of self-determination. Hourani's longer history reminds us that Arab political thought before and during this period was not passive: it contained its own visions of unity, reform, and constitutionalism that were overridden or co-opted. The lesson's first move is therefore to hold both of these truths simultaneously—the region was shaped by external imposition, and it was also the site of indigenous political agency.

The second move is to interrogate the "artificiality thesis," the claim that Middle Eastern borders are uniquely arbitrary and therefore uniquely unstable. This thesis has become a cliché in policy discourse, invoked to explain everything from the Iraq war to the Syrian civil war. Yet it is theoretically underspecified. All borders are constructed; the question is not whether they are natural but whether the states they enclose possess the capacity and legitimacy to govern. Anderson's work on state and social transformation in North Africa shows that some post-colonial states built durable institutions despite arbitrary origins, while others did not. The African parallel is instructive here: the borders drawn at Berlin in 1884-1885 were equally arbitrary, yet the

African state system has proven remarkably resilient, not because the borders were legitimate but because the norm of territorial integrity became entrenched and because post-colonial elites invested in state institutions. The Middle Eastern case differs not in the arbitrariness of its borders but in the specific political economy of oil, which allowed rulers to substitute rent for representation and to build states that were strong in coercion but weak in social contract. This is the rentierism argument, and it is the lesson's third key idea.

Rentierism, as developed in the literature on Gulf states, posits that when a state derives a large share of its revenue from external rents—primarily hydrocarbon exports—rather than from domestic taxation, the fiscal contract between ruler and ruled is weakened. Citizens become clients rather than taxpayers; parliaments become consultative rather than representative; and the state can afford to buy off dissent. The scope conditions matter: rentierism explains the durability of Gulf monarchies far better than it explains the collapse of republican regimes in Egypt, Syria, or Iraq, which were not rentier states in the same sense. Owen's analysis of state, power, and politics in the making of the modern Middle East traces how different regime types—monarchies, republics, one-party states—emerged from the same colonial moment but followed divergent paths depending on resource endowments, institutional inheritances, and geopolitical position. The lesson therefore refuses a single theory of the region and instead asks you to match mechanism to case.

The fourth key idea addresses the ideological contestation of the post-Ottoman order. Pan-Arabism and pan-Islamism were not merely romantic movements; they were competing state-building projects that challenged the legitimacy of the nation-state as the appropriate unit of political community. Nasserism, Ba'athism, and various Islamist movements offered alternative scales of solidarity—Arab nation, Islamic umma—that directly undermined the borders drawn by Sykes-Picot and the mandates. The nation-state eventually prevailed, but not because it was natural; it prevailed because it was backed by international recognition, by Cold War patronage, and by the institutional inertia of bureaucracies and armies. The fifth key idea brings the story to the present: the 2011 uprisings were a crisis of legitimacy of precisely these post-colonial states, triggered by the failure of the authoritarian bargain—economic growth without political inclusion, security without dignity. The uprisings did not overthrow the state system; they exposed its brittleness. Some regimes survived through repression and patronage (Egypt, Bahrain), others collapsed into civil war (Syria, Libya, Yemen), and the regional order was reconfigured by proxy interventions that the lesson's forward links to L44 (proxy warfare) will develop.

What you will be able to do after mastering this lesson is substantial. You will be able to reconstruct the causal chain from Ottoman collapse through mandate to contemporary fragility without collapsing into monocausal explanations. You will be able to evaluate the artificiality thesis on its merits rather than repeating it. You will be able to apply rentierism with appropriate scope conditions. You will be able to distinguish pan-Arabism, pan-Islamism, and nationalism as competing projects rather than as interchangeable anti-Western sentiments. You will be able to analyze the 2011 uprisings as a systemic crisis rather than as a series of national accidents. And you will be able to hold five perspectives—African, Chinese, Russian, Western, and UN—in productive tension, recognizing that each illuminates something the others occlude. The African perspective, developed most fully in Section 2.7, is primary not because the Middle East is Africa but because the African experience of externally imposed state construction offers the sharpest comparative mirror: it reveals what the West Asian case shares with other post-colonial regions and, crucially, what makes it distinctive.

SECTION 1 — Pre-Class Priming

1.1 Retrieval Warm-Up Answer these from memory before reading further. They draw on Lessons 9, 10, and 11.

1. **Sovereignty (L9):** Distinguish internal sovereignty from external sovereignty, and explain why the mandate system (L11) created a hybrid status in which a territory was neither fully sovereign nor a colony.
2. **Imperialism (L10):** Contrast territorial imperialism with economic imperialism. Which form better describes British and French involvement in the Middle East between 1918 and 1945, and why?
3. **Mandate system (L11):** What was the legal basis of the mandate system under the League of Nations Covenant (Article 22), and how did it differ from annexation in principle if not always in practice?
4. **African borders (L10/L11):** The Berlin Conference of 1884-1885 drew borders in Africa with minimal local consultation. Name one mechanism by which those borders nevertheless became durable, and consider whether the same mechanism operated in the Middle East.
5. **Indirect rule:** Define indirect rule and identify one Middle Eastern or African case where it was applied. What was its long-term effect on state capacity?
6. **Self-determination:** Woodrow Wilson's Fourteen Points (1918) proclaimed self-determination. Explain one way in which the Paris Peace Conference (1919) contradicted this principle in the Middle East.

1.2 Orientation Questions

1. If the Ottoman Empire had not collapsed in 1918, would the modern Middle Eastern state system exist in anything like its current form? What does this counterfactual reveal about the contingency of borders?
2. Is the "artificiality" of Middle Eastern borders a cause of conflict, or is it a post-hoc rationalization for failures of governance and political economy?
3. Can a state be durable without a fiscal contract between ruler and ruled? Evaluate the rentierism thesis using at least one Gulf and one non-Gulf case.
4. The 2011 uprisings are often framed as a "failure" of the Arab state. From an African perspective that has witnessed multiple waves of post-colonial state crisis, what would be a more analytically precise framing?

1.3 Vocabulary Pre-Teach

Term	Provisional Definition
Rentier state	A state that derives a substantial share of its revenue from external rents (especially hydrocarbon exports) rather than from domestic taxation, weakening the fiscal contract between ruler and ruled.
Mandate	A League of Nations trusteeship under Article 22 of the Covenant, by which a victorious power administered a former Ottoman or German territory under international supervision, nominally toward self-government.

Term	Provisional Definition
Sykes-Picot Agreement (1916)	A secret Anglo-French accord dividing Ottoman Arab provinces into spheres of influence; became shorthand for externally imposed Middle Eastern borders.
Pan-Arabism	A political ideology and movement advocating the unification of Arab peoples into a single nation-state or federation, transcending the borders established after World War I.
Pan-Islamism	A political ideology advocating solidarity or unity of the global Muslim community (umma), often challenging the legitimacy of the nation-state as the primary unit of political organization.
Artificiality thesis	The claim that Middle Eastern (and African) borders are arbitrary colonial constructs and that this arbitrariness explains regional instability; contested on both empirical and theoretical grounds.
Ottoman millet system	The Ottoman arrangement granting recognized religious communities (millets) autonomy in personal-status law and communal affairs, shaping the sectarian landscape inherited by successor states.
Capitulations	Extraterritorial privileges granted to foreign nationals in the Ottoman Empire, symbolizing imperial economic penetration and later abolished by Turkish nationalists.
Hydrocarbon rent	Revenue derived from the extraction and export of oil and gas, typically accruing to the state and shaping its fiscal structure, patronage capacity, and foreign relations.
Neo-patrimonialism	A mode of rule in which formal state institutions are fused with personal, clientelist networks, common in post-colonial states including many in West Asia and Africa.
State failure	The collapse or severe weakening of a state's monopoly on legitimate force, basic service provision, and territorial control; a contested concept with normative and analytical dimensions.
Sectarianism	The politicization of religious identity (Sunni, Shi'a, etc.) as a basis for political mobilization, resource distribution, and conflict; often instrumentalized by elites rather than primordial.

SECTION 2 — LESSON CORE

2.1 Learning objectives By the end of this lesson, the student will be able to: (1) explain the Ottoman imperial legacy as a system of layered sovereignty, provincial administration, and communal autonomy, and show how its collapse created the political vacuum that European powers filled after 1914; (2) analyze the mandate system as an institutional mechanism that converted military conquest into internationally legitimated tutelage, identifying its legal form, administrative practices, and long-term effects on state capacity and legitimacy; (3) evaluate the "artificiality thesis" about Middle Eastern borders by distinguishing imposed boundaries from Ottoman administrative precedents, local bargaining, geography, and subsequent state-building; (4) reconstruct how African, Chinese, Russian, Western, and UN perspectives differently interpret the construction of the post-Ottoman order, specifying each perspective's core normative commitments, characteristic evidence, and characteristic blind spots; and (5) apply the four levels of analysis—individual, state, systemic, and transnational—to a historical case of border-making or mandate rule, producing an adjudicated causal explanation rather than a chronological narrative. These objectives move from conceptual reconstruction through comparative perspective analysis to applied causal judgment, and each is assessable through short analytical essays, structured comparisons, or case-based memos.

2.2 KEY IDEA 1 — Ottoman legacy and the mandate system: how the modern Middle East was constructed Bolded Causal Claim: The modern state system of West Asia was produced by a specific historical sequence—Ottoman imperial collapse, secret great-power partition, and League of Nations mandate rule—rather than by the spontaneous emergence of pre-existing nations; the central causal claim is that externally guaranteed, territorially fixed states replaced a flexible imperial sovereignty and thereby embedded legitimacy deficits, coercive centralization, and border contestation into the region's political order. This is not a claim that every border was arbitrary, that local actors were passive, or that Ottoman rule was a benign multicultural harmony. It is a claim about macro-structure: the basic unit of sovereignty was reorganized by imperial powers, and that reorganization set durable constraints on later state-building, even where local elites, geography, and pre-existing administrative units mediated the outcome.

Mechanism: The mechanism begins with the character of Ottoman sovereignty itself. Ottoman rule in the Arab provinces was not a modern nation-state system but a layered imperial order in which the sultan-caliph claimed dynastic and religious authority, provincial governors exercised delegated power, local notables managed revenue and order, and millets organized communal life under religious leaders. Borders were often fuzzy, sovereignty was divisible, and legitimacy rested on protection, taxation, and religious recognition rather than on a single national demos. The First World War destroyed this arrangement: Ottoman entry into the war, defeat, and partition plans created a vacuum in the Arab provinces. The 1916 Sykes-Picot Agreement, a secret Anglo-French accord, proposed spheres of influence—British in Mesopotamia and southern Palestine, French in Syria and Lebanon, with an internationalized Jerusalem—while later wartime promises, including those associated with the Arab Revolt and the Balfour Declaration, introduced contradictory commitments. The postwar settlement was therefore not a single blueprint but a contested improvisation, as Fromkin (1989) emphasizes in tracing how diplomatic decisions produced an enduring regional order.

The League of Nations mandate system then converted conquest into legal tutelage. Under Article 22 of the Covenant, certain territories were deemed "not yet able to stand by themselves" and were assigned to mandatory powers "on behalf" of the League. Britain and France became mandatory powers in the Arab provinces, and the mechanism of construction operated through several channels. First, territorialization: borders were drawn and states created—Iraq, Syria, Lebanon, Palestine, and Transjordan—often by combining or dividing

Ottoman administrative units. Second, institutional transplantation: mandatory administrations imported bureaucracies, legal codes, armies, police, and educational systems, while installing or recognizing monarchs such as Faisal in Iraq and Abdullah in Transjordan. Third, elite co-optation: mandatory powers incorporated notables, tribal leaders, religious figures, and urban politicians into new state structures, creating ruling coalitions whose authority depended partly on external backing. Fourth, coercive consolidation: revolts and resistance were suppressed, including the 1920 Iraqi revolt, the 1925–1927 Syrian revolt, and later disturbances in Palestine, often through air power, punitive expeditions, and emergency rule. Fifth, economic extraction and strategic control: oil concessions, pipeline routes, military bases, and communications infrastructure tied new states to imperial interests.

Hourani (1991) helps situate this process within longer Arab social and intellectual histories, showing that the new states were not blank slates but arenas in which older elites, religious identities, and emerging nationalist ideas interacted. Owen (2004) foregrounds state power and political economy, arguing that the modern Middle Eastern state was built through the centralization of coercion and the management of resources, not merely through constitutional design. Anderson (1987) contributes a comparative state-and-society perspective, useful for seeing how externally imposed institutions interacted with local social structures and how state transformation could be both coercive and adaptive. The mandate system's distinctive feature was its legal ambiguity: mandatory powers exercised sovereignty-like authority while denying that they were sovereign, and the new states gained international recognition before they possessed robust domestic legitimacy. This gap between external recognition and internal consent is the mechanism's most consequential legacy.

Scope Conditions: This key idea applies most directly to the former Ottoman Arab provinces placed under British and French mandates—Iraq, Syria, Lebanon, Palestine, and Transjordan/Jordan—during the construction phase from roughly 1916 to the mid-twentieth century. It applies less directly to Turkey, where a republican revolution under Mustafa Kemal produced a different state-building trajectory; to Iran, which was never formally colonized but experienced concessionary imperialism and great-power interference; to much of the Arabian Peninsula, where state formation followed tribal, dynastic, and oil-related paths; and to Egypt, which had been an Ottoman province but followed a distinct trajectory under British occupation and later independence. The claim is also scope-limited in another sense: it is a macro-structural argument about sovereignty, not a micro-level claim that every border was meaningless. Some borders followed Ottoman vilayets or mutasarrifiyyas; some reflected sectarian or geographic realities; some were negotiated by local elites; and some proved durable because states developed institutions, armies, and national narratives. The artificiality thesis is therefore strongest where borders combined disparate communities under weak institutions and weakest where states successfully consolidated authority. Temporally, the construction phase matters most, but its effects were mediated by later events—decolonization, the Cold War, oil booms, wars, and the 2011 uprisings—so the mechanism should not be treated as a single deterministic cause of all subsequent regional politics.

Observable Implications: If this mechanism is correct, several observable implications follow. First, state boundaries should cut across ethnic, sectarian, tribal, or linguistic communities in ways that create majority-minority tensions or irredentist claims, as in Iraq's Kurdish and Shia-Sunni dynamics or Syria's Alawite-Sunni configuration. Second, postcolonial states should inherit coercive, centralized institutions whose legitimacy remains contested, producing recurring crises of authority rather than stable liberal constitutionalism. Third, ideologies that transcend the nation-state—pan-Arabism, pan-Islamism, and various forms of regionalism—should gain traction precisely because the state form is experienced as externally imposed or incomplete. Fourth, external powers should retain influence through military bases, oil concessions, secu-

rity guarantees, and diplomatic intervention, because the original construction embedded dependency. Fifth, border disputes and competing claims to territory should recur, especially where mandate lines divided communities or created ambiguous frontiers. Sixth, moments of systemic stress, such as the 2011 uprisings, should expose the fragility of states whose legitimacy was never fully domesticated.

At the same time, the mechanism implies counter-evidence that must be taken seriously. States in the region did develop bureaucracies, armies, educational systems, and national identities; many citizens came to identify with their states; and borders proved remarkably durable despite repeated challenges. The mechanism therefore predicts structural vulnerability, not inevitable collapse. It also predicts variation: states with greater resource wealth, more effective coercive institutions, or more successful elite bargains should show greater resilience, while states with shallow institutions and sharp communal cleavages should show greater fragility. The observable task is not to confirm a single narrative but to trace how constructed origins interact with later agency, resources, and conflict.

Perspective Note (five traditions in brief):

African (primary): The African perspective begins from a parallel and deeply formative experience: the partition of Africa, the Berlin Conference of 1884–1885, colonial state construction, and the postcolonial crisis of the inherited state. It treats the West Asian mandate system not as a unique tragedy but as one instance of a broader imperial technology: converting conquest into legal trusteeship, drawing boundaries across societies, installing or recognizing compliant elites, and creating states whose primary function was extraction, control, and external legitimation. Scholars such as Grovogui, Mbembe, Bayart, Mamdani, Rodney, Nkrumah, Fanon, and others have analyzed colonial states as "bifurcated," "decentralized despotisms," or instruments of external domination, and have shown how postcolonial elites often inherited coercive apparatuses rather than legitimate nations. From this vantage, the artificiality critique is not merely about lines on maps; it is about the mismatch between state form and social reality, and about how international recognition can substitute for domestic consent. The African perspective contributes a comparative lens that resists Eurocentric exceptionalism: West Asia is not uniquely "artificial," because all modern states are constructed, but colonial and mandate construction left particular vulnerabilities, especially where states were recognized before they were rooted. It also highlights the continuity between colonial and postcolonial governance, warning against narratives that treat independence as a clean break. At the same time, this perspective can occlude the specific weight of Ottoman legacies, Islamic political idioms, regional great-power rivalries, and oil geopolitics in West Asia; it may overstate similarity between African and West Asian trajectories; and it can understate the agency of local actors who negotiated, resisted, or repurposed mandate institutions. Its strongest contribution is to show that the "Middle East problem" is also a problem of colonial state form, not only of religion, culture, or ancient hatreds.

Chinese: China's perspective is shaped by an anti-colonial sovereignty discourse, the experience of unequal treaties, and a strong commitment to non-interference. It tends to view the mandate system as an illegitimate infringement on self-determination and as an example of Western powers imposing political arrangements on weaker societies. At the same time, contemporary Chinese discourse generally insists that existing borders and governments must be respected, because territorial revisionism threatens stability and invites external manipulation. This perspective contributes a normative defense of sovereignty and a critique of Western intervention; it often occludes internal legitimacy deficits, the historical role of non-Western empires, and the ways in which sovereignty claims can protect coercive regimes.

Russian: Russia frames the post-Ottoman order through sovereign choice, great-power competition, and anti-Western multipolarity. It emphasizes that external powers imposed borders and regimes in the Middle

East and that later Western interventions—such as Iraq in 2003 or Libya in 2011—repeat the logic of mandate rule under liberal auspices. This perspective contributes a powerful critique of interventionism and a defense of state sovereignty against externally driven regime change; it occludes Russia's own imperial and Soviet history, its strategic interests in the region, and the possibility that sovereignty defenses can shield authoritarian rule from accountability.

Western: Western perspectives range from imperial nostalgia to liberal institutionalism, modernization theory, and contemporary state-failure analysis. They often treat mandate construction as a well-intentioned but flawed modernization project, and later focus on weak states, sectarianism, authoritarianism, and the dilemmas of intervention. This perspective contributes institutional analysis, legal frameworks, and human-rights discourse; it occludes the structural violence of colonial construction, overstates the autonomy of postcolonial states, and can treat regional dysfunction as endogenous rather than partly produced by imperial ordering.

UN: The UN perspective inherits the League mandate legacy through the trusteeship system and the broader decolonization framework. It frames self-determination as the corrective to mandate rule, while also privileging territorial integrity, non-intervention, and the sovereign equality of member states. This perspective contributes legal frameworks for decolonization, human rights, and international peacekeeping; it occludes how great-power politics shaped which self-determination claims were recognized, and it struggles with states that possess international sovereignty but lack internal legitimacy.

2.3 KEY IDEA 2 — Sykes-Picot and the Politics of Borders: The Artificiality Thesis and Its Limits

Bolded Causal Claim: The secret Anglo-French Sykes-Picot Agreement of 1916 and the subsequent boundary-making at the Paris Peace Conference (1919) and San Remo (1920) produced a state system in West Asia whose borders frequently misaligned with pre-existing social, ethnic, and sectarian geographies; this misalignment generated the influential "artificiality thesis," which attributes regional instability to colonial cartography, though the thesis both illuminates and overstates the sources of political fragility.

Mechanism: The mechanism operates through three linked stages. First, imperial bargaining: the Sykes-Picot Agreement (1916) divided Ottoman Arab provinces into British and French zones of influence, with a proposed international administration for Palestine; the agreement was negotiated without Arab participation and prioritized strategic interests—control of routes to India, access to oil, and naval positioning—over ethnographic or political realities. As David Fromkin (1989) documents, the Paris Peace Conference (1919) and the San Remo conference (1920) converted these zones into League of Nations mandates, and subsequent treaties (Lausanne 1923, the various mandate instruments) converted zones into states with defined borders. Albert Hourani (1991) traces how this process imposed a state framework on societies whose primary solidarities were tribal, sectarian, and urban-notable rather than national. Second, institutional conversion: the mandate system transformed imperial zones into administered territories under British and French authority, and the new states inherited borders that cut across tribal, sectarian, and ethnic networks while simultaneously lacking the infrastructural and ideological resources to forge national cohesion. Third, legitimation crisis: the resulting states faced the challenge of building nations within borders they did not choose. The "artificiality thesis" (associated with scholars such as Elie Kedourie and, in popular discourse, with regional leaders) holds that these states are artificial constructs lacking organic national foundations, and that their persistent fragility—coupled with recurrent irredentism and sectarian conflict—stems directly from this colonial imposition. The mechanism is not merely cartographic, however. Borders also built upon Ottoman provincial

(vilayet) boundaries, which had their own administrative logic; local notables, tribal leaders, and emerging nationalist movements actively shaped outcomes; and several states (Turkey, Iran, Egypt) were not mandate creations at all. The thesis therefore captures a genuine structural condition—colonial imposition of borders without consent—while risking determinism by treating borders as destiny rather than as one variable among many in state-building.

Scope Conditions: The artificiality thesis applies most strongly where three conditions coincide: (a) borders were drawn by external powers without local consultation; (b) the resulting state contained significant populations whose primary identities (sectarian, ethnic, tribal) cross-cut the new territorial boundaries; and (c) post-independence state institutions remained weak relative to sub-state or trans-state identities. This configuration is most visible in Iraq (Kurdish, Sunni Arab, Shia Arab populations within one state), Syria (Alawi, Sunni, Kurdish, Druze), and Lebanon (confessional power-sharing). The thesis applies less strongly where borders aligned with pre-existing administrative units or where robust state-building occurred—Turkey under Atatürk, Iran under the Pahlavis, Egypt with its deep bureaucratic tradition. It also applies weakly to the Gulf monarchies, whose borders, while externally influenced, enclosed relatively homogeneous populations and whose rentier resources enabled state consolidation. The thesis further loses explanatory power over time: states that have existed for a century develop institutional habits, national narratives, and vested interests that cannot be reduced to their origins.

Observable Implications: If the artificiality thesis holds, one expects recurring border disputes (Iraq's 1990 invasion of Kuwait, which Saddam Hussein justified partly by claiming Kuwait was an artificial British creation), persistent sectarian or ethnic politics (Iraq's post-2003 confessional system, Lebanon's consociational arrangement), irredentist movements (Kurdish nationalism across Turkey, Iraq, Syria, Iran), and recurrent state failure or fragmentation (Syria and Iraq after 2011). One also expects that external powers will exploit these fissures. Conversely, if the thesis is overstated, one expects successful state consolidation despite artificial origins (Jordan, the Gulf states), the development of genuine national identities over time, and the salience of non-border factors—regime type, economic performance, external intervention—in explaining instability. The evidence supports a middle position: borders matter as structural constraints, but they are neither necessary nor sufficient for state failure; weak institutions, authoritarianism, and external intervention are equally or more consequential.

Perspective Note (five traditions in brief):

African: The African perspective reconstructs the Middle Eastern experience as a variant of a shared postcolonial condition. African scholars such as Mahmood Mamdani (1996) and Siba Grovogui (2006) have analyzed how colonial borders in Africa produced "bifurcated" states and "invented" nations, and the same analytical lens applies to West Asia: Sykes-Picot is read not as a unique Middle Eastern tragedy but as one instance of a general imperial practice of territorial engineering that prioritized European interests over African and Asian self-determination. The African vantage point contributes the insight that "artificiality" is not a Middle Eastern pathology but a structural feature of the colonial state system globally; it also contributes skepticism toward the notion that pre-colonial borders were somehow "natural," since African polities were themselves heterogeneous and contested. What this perspective occludes is the specific role of oil rents and sectarian geopolitics in West Asia, which have no direct African parallel; and it risks flattening important differences between African and Middle Eastern state-formation trajectories. The African perspective is primary here because it frames the lesson's central puzzle—how colonial border-making produced durable but contested states—as a global postcolonial problem rather than a regional anomaly.

Chinese: The Chinese perspective emphasizes non-interference and territorial integrity, treating Sykes-Picot

as a historical fact whose consequences must be managed through sovereign state-building rather than border revision. Beijing's position, articulated in UN forums and bilateral relations, holds that existing borders are inviolable and that external attempts to redraw them (as in the 2003 Iraq war or proposals for Kurdish independence) are destabilizing. This contributes stability and a counterweight to Western interventionism; it occludes how Chinese economic interests (oil, infrastructure) benefit from the status quo and how non-interference can shield authoritarian regimes from accountability.

Russian: The Russian perspective frames Sykes-Picot as an Anglo-French imperial imposition that discredited Western claims to moral authority in the region. Moscow emphasizes sovereign choice and anti-Western framing: borders should not be redrawn by external powers, and regional actors must determine their own arrangements. This contributes a critique of Western intervention and a defense of state sovereignty; it occludes Russia's own imperial history and its strategic interest in maintaining friendly (often authoritarian) governments in Damascus and Tehran.

Western: The Western perspective is bifurcated. One strand (associated with liberal internationalism) treats Sykes-Picot as a cautionary tale about imperial hubris and advocates for self-determination and democratic state-building. Another strand (realist) treats borders as given and focuses on managing their consequences through alliances and intervention. The Western perspective contributes institutional frameworks (mandates, trusteeships, international law) and resources for state-building; it occludes its own role in creating the problem and tends to frame regional dysfunction as endogenous rather than partly produced by imperial ordering.

UN: The UN perspective inherits the League mandate legacy through the trusteeship system and the broader decolonization framework. It frames self-determination as the corrective to mandate rule, while privileging territorial integrity, non-intervention, and sovereign equality. This contributes legal frameworks for decolonization and peacekeeping; it occludes how great-power politics shaped which self-determination claims were recognized, and it struggles with states that possess international sovereignty but lack internal legitimacy.

2.4 KEY IDEA 3 — Oil, Rentierism, and the Political Economy of Gulf States

Bolded Causal Claim: The discovery, extraction, and global marketing of petroleum in the Gulf transformed the political economy of West Asian states, producing "rentier states" whose dependence on externally generated hydrocarbon rents restructured state-society relations, weakened domestic accountability mechanisms, and created distinctive patterns of authoritarian governance and regional power.

Mechanism: The mechanism is best understood through rentier state theory, first articulated by Hossein Mahdavy (1970) in the Iranian context and systematized by Hazem Beblawi and Giacomo Luciani (1987). The core mechanism is fiscal: when a state derives a substantial share of its revenue from external rents (oil exports) rather than from domestic taxation, the "fiscal contract" between state and society is fundamentally altered. In a tax-based state, rulers must extract resources from citizens, creating reciprocal demands for representation and accountability; in a rentier state, rulers distribute rents to citizens, converting them from taxpayers into dependents and clients. This produces what Beblawi called the "rentier mentality"—a political culture in which wealth is perceived as a gift from nature and the state rather than as the product of productive labor. The mechanism operates through several channels: (a) the allocation state, which distributes rents through public employment, subsidies, and welfare; (b) the repression channel, in which oil revenues fund security apparatuses that deter opposition; (c) the modernization channel, in which oil wealth funds infrastructure and education without corresponding political liberalization; and (d) the external dependence channel, in which the state's revenue base is tied to global oil markets and foreign consumers, creating vulnerability

to price shocks and external pressure. Roger Owen (2004) situates this political economy within the broader making of the modern Middle East, showing how oil transformed state capacity and regional hierarchies. Michael Ross (2012) has extended the framework, arguing that oil wealth tends to produce authoritarianism, reduced female labor-force participation, and increased conflict risk—though these effects are conditional on institutional context and oil price levels. Lisa Anderson (1987) demonstrates in the Libyan and Tunisian cases how state and social transformation under resource wealth produced divergent outcomes, underscoring that rentierism interacts with pre-existing social structures, regime type, and historical timing. The mechanism is not deterministic: Norway and the United Kingdom, for instance, are oil producers without rentier political pathologies, because they had strong pre-existing institutions and diversified economies.

Scope Conditions: Rentierism applies most strongly where four conditions hold: (a) hydrocarbons constitute a dominant share of government revenue and exports (typically above 50-60%); (b) rent per capita is high enough to fund substantial state distribution; (c) the state has a small population relative to its resource base (the Gulf monarchies—Saudi Arabia, Kuwait, Qatar, UAE, Oman, Bahrain); and (d) pre-existing institutions were weak or authoritarian, so that oil wealth reinforced rather than transformed existing power structures. The theory applies less strongly to "semi-rentier" states such as Iran and Iraq, which have larger populations, more diversified (though still hydrocarbon-dependent) economies, and more contested political systems. It applies weakly or not at all to resource-poor states (Egypt, Jordan, Lebanon, Syria, Yemen), which must rely on taxation, aid, or remittances and whose political dynamics follow different logics. The theory also has temporal scope conditions: it explains the boom decades (1970s, 2000s) better than bust periods (1980s, 2014-2016), when fiscal contraction forced adjustment and sometimes political opening.

Observable Implications: If rentierism holds, one expects: high government spending as a share of GDP; minimal or no personal income taxation; large public sectors employing a substantial share of the citizen workforce; generous welfare and subsidy systems; sovereign wealth funds accumulating surplus rents; limited political liberalization despite high per-capita income and education levels; and vulnerability to oil price collapses (the 1980s debt crises, the 2014-2016 fiscal adjustments). One also expects regional power projection funded by oil wealth (Saudi Arabia's military spending, Qatar's media and diplomatic investments). Conversely, if rentierism is overstated, one expects that institutional factors (monarchical legitimacy, tribal structures, religious authority) matter more than fiscal structure; that oil wealth can fund modernization and state capacity that eventually enables political opening; and that the "resource curse" is not inevitable. The evidence supports a nuanced view: rentierism explains much about Gulf governance but underpredicts variation among rentier states (Kuwait's parliamentary politics versus Saudi Arabia's absolutism) and struggles to explain the timing of political change (the 2011 uprisings affected both rentier and non-rentier states).

Perspective Note (five traditions in brief):

African: The African perspective approaches rentierism through the lens of resource extraction and neocolonial political economy, drawing on Walter Rodney (1972) and Samir Amin (1976) analyses of how external control of African resources distorted development and governance. From this vantage point, Gulf oil rentierism is not a unique Middle Eastern phenomenon but a variant of the broader "resource curse" that has afflicted Nigeria, Angola, the Democratic Republic of Congo, and other African states. The African perspective contributes the insight that rentierism is fundamentally about the relationship between external extraction and domestic accountability, a dynamic visible across the Global South; it also contributes skepticism toward modernization theory's assumption that wealth automatically produces democracy. What it occludes is the specific institutional form of Gulf monarchies, which differ from African postcolonial states in their dynastic legitimacy and tribal foundations; and it risks overemphasizing external exploitation while

underemphasizing domestic agency in rentier state formation. The African perspective is primary here because it reframes rentierism from a Middle Eastern exceptionalism into a general postcolonial political economy, revealing that the Gulf states' apparent stability may rest on the same extractive foundations that have produced fragility elsewhere.

Chinese: The Chinese perspective treats oil and rentierism through the lens of energy security and economic partnership. Beijing's growing dependence on Gulf oil (China became the world's largest oil importer) has produced a strategy of "energy diplomacy" that emphasizes long-term contracts, infrastructure investment, and non-interference in domestic governance. This contributes a pragmatic, development-oriented framework that avoids the conditionality of Western approaches; it occludes how Chinese demand sustains rentier structures and how non-interference can shield authoritarian governance from external pressure.

Russian: The Russian perspective frames Gulf oil through the lens of great-power competition and energy geopolitics. Moscow views oil rents as a source of regional power that Western states have historically sought to control (the 1953 Iran coup, the 2003 Iraq war), and it positions itself as an alternative partner for rentier states seeking to diversify their relationships. This contributes a multipolar framing and a critique of Western energy dominance; it occludes Russia's own dependence on hydrocarbon rents and its use of energy as a geopolitical weapon.

Western: The Western perspective on rentierism is split between a modernization-theory strand (which expected oil wealth to produce liberalization) and a political-economy strand (which emphasizes the "resource curse" and authoritarian entrenchment). The Western perspective contributes extensive empirical research on rentierism (Ross, Beblawi, Luciani) and policy frameworks for governance reform; it occludes the Western role in creating and sustaining rentier structures (through oil companies, military support for monarchies, and Cold War alliances) and tends to treat rentierism as a domestic pathology rather than a global political economy.

UN: The UN perspective approaches rentierism through development frameworks, human rights, and the Sustainable Development Goals. It emphasizes resource governance, transparency (the Extractive Industries Transparency Initiative), and the equitable distribution of resource wealth. This contributes normative standards and technical assistance; it occludes the structural power asymmetries between rentier states and global markets, and its frameworks often assume state capacity and political will that rentier systems may lack.

2.5 KEY IDEA 4 — The post-Ottoman order and its contestation: pan-Arabism, pan-Islamism, and the nation-state

Bolded Causal Claim: The post-Ottoman state system in West Asia was never stabilized by a single legitimating ideology; instead, it was contested from its inception by competing transnational projects—pan-Arabism, pan-Islamism, and the nation-state form—whose rivalry produced a pattern of ideological oscillation that shaped state-building, regime legitimation, and regional order across the twentieth century.

Mechanism: The mechanism begins with the Ottoman collapse, which removed a supra-national imperial framework that had governed diverse populations through a millet system of religious communities rather than through territorial nation-states. The mandate system then imposed the nation-state as the exclusive legitimate form, but the populations and elites of the region did not uniformly accept this form as the natural unit of political community. Three competing projects emerged to fill the legitimacy vacuum. First, pan-

Arabism, articulated by thinkers such as Sati' al-Husri and later institutionalized in Ba'athist ideology and Nasserist practice, proposed that the Arab nation—defined by language, culture, and shared history—should be the basis of political community, potentially transcending the artificial borders drawn by Sykes-Picot and the mandates. Second, pan-Islamism, with roots in the late Ottoman period and revived by movements from the Muslim Brotherhood (founded 1928) to later Islamist currents, proposed the umma as the relevant community, subordinating territorial states to a religious solidarity that could be either revolutionary or quietist. Third, the nation-state itself, defended by monarchies and republics alike, asserted territorial sovereignty and sought to cultivate a distinct national identity (Egyptian, Syrian, Iraqi) within inherited borders. The mechanism of contestation operated through regime legitimation strategies: ruling elites instrumentalized these ideologies to bolster domestic authority while simultaneously defending territorial sovereignty, producing a structural tension between ideological aspiration and state interest. When pan-Arab projects were attempted—the United Arab Republic (1958–1961), the Arab Federation (1958), various unity schemes—they collapsed because the institutional and economic interests of ruling elites in Cairo, Damascus, and Baghdad outweighed ideological commitment. The 1967 Arab-Israeli war discredited pan-Arabism as a state project, creating space for pan-Islamism's resurgence, catalyzed by the 1979 Iranian revolution and the subsequent rise of Islamist movements across the region. States then oscillated: secular nationalist regimes (Syria, Iraq, Egypt under Nasser) gave way to regimes that incorporated Islamist elements or were challenged by them. This oscillation weakened institutional consolidation because each ideological shift required re-legitimation, patronage restructuring, and often repression of the previous project's adherents. The result was a state system perpetually contested, where legitimacy was borrowed from transnational ideologies rather than built through domestic institutional performance.

Scope Conditions: This mechanism applies most strongly to the Arab core states (Egypt, Syria, Iraq, and to a lesser extent Jordan and Lebanon) where pan-Arab and pan-Islamic movements had significant social bases and where the gap between state boundaries and identity communities was acute. It applies less to Turkey, which under Atatürk pursued a radical nation-state project that suppressed pan-Islamic and pan-Turkic alternatives, and to Iran, which developed a distinct Shiite Islamist state ideology after 1979. It applies least to the Gulf monarchies, which relied on dynastic, tribal, and rentier legitimacy rather than mass ideological mobilization, though they were affected by transnational Islamist currents. The mechanism also requires a degree of state capacity sufficient to attempt ideological projects but insufficient to fully institutionalize them; where states were very weak (Lebanon) or very strong (Turkey), the contestation took different forms.

Observable Implications: The mechanism implies several observable patterns: repeated attempts at Arab political unity (UAR, Arab Federation, various federation proposals in the 1950s–1970s); the dominance of Ba'athist ideology in Syria and Iraq; the rise and fall of Nasserism as a regional project; the eclipse of pan-Arabism after 1967 and the corresponding rise of Islamism; state sponsorship or toleration of Islamist movements as tools against rivals (e.g., Saudi support for Wahhabism, Syrian support for Hamas); the use of nationalist rhetoric by regimes that were in practice territorial; and the persistent gap between official ideology and state practice. It also implies that regime change often involved ideological rebranding rather than institutional transformation, as seen in Egypt's shifts from Nasserism to Sadatism to Mubarak's neoliberal nationalism.

Perspective Note (five traditions in brief):

African (primary): The African vantage point sees the post-Ottoman contestation as structurally analogous to post-colonial African state-building: the imposition of nation-state forms over pre-existing transnational

communities and the search for legitimating ideologies beyond the inherited colonial state. African scholarship illuminates this parallel with particular force. Nkrumah's pan-Africanism and Cabral's theory of national liberation were direct counterparts to pan-Arabism, responding to the same structural condition—the mismatch between colonial borders and lived identities. Mamdani's analysis of the bifurcated state, in which colonial and post-colonial regimes governed through differentiated legal regimes that privileged certain communities as "citizens" while reducing others to "subjects," applies with equal force to post-Ottoman states that privileged sectarian, ethnic, or tribal communities in their institutional design. Bayart's "politics of the belly" captures how post-colonial states in both regions generated legitimacy through patronage and distribution rather than institutional performance, making ideological projects instruments of elite competition rather than genuine programs of transformation. The African perspective thus reframes the contestation not as a failure of Arab or Islamic political culture but as a predictable consequence of externally imposed state forms operating under conditions of weak institutionalization. It also cautions against treating Islamism as exceptional: African experiences with religious and ethnic mobilization—in Nigeria, Sudan, and elsewhere—demonstrate similar patterns of identity-based contestation of the post-colonial state, suggesting that the West Asian case is a variant of a broader post-colonial condition rather than a unique civilizational phenomenon. What the African perspective reveals that others miss is the structural logic common to both regions: the nation-state was not a natural evolution but an imposed form, and the transnational ideologies that contested it were rational responses to that imposition. What it occludes is the specific geopolitical weight of oil and the Arab-Israeli conflict, which gave West Asian contestation a different intensity and internationalization than most African cases, and the particular role of religious authority in West Asian politics, which has no exact African parallel.

Chinese: China views the post-Ottoman contestation through the lens of non-interference and state sovereignty. Beijing's position is that ideological projects—pan-Arabism, pan-Islamism—are internal matters and that external powers should not exploit them to intervene or to support factional agendas. China's own experience with national unification after 1949 and its suspicion of pan-nationalisms, which it associates with separatism and instability, shapes its preference for stable, recognized states over transnational ideological projects. This perspective contributes a stability-first framework and economic partnership without ideological conditionality; it occludes the democratic and human-rights dimensions of contestation and tends to treat all ideological mobilization as a threat to order.

Russian: Russia frames the post-Ottoman order as a product of Western imperial manipulation—Sykes-Picot, the mandates—and sees pan-Arab and pan-Islamic movements partly as reactions to Western dominance. Moscow historically supported secular Arab nationalist regimes (Syria, Iraq, Egypt) as counterweights to Western influence, and after 1991 it has selectively engaged with Islamist movements while opposing those it deems extremist. This perspective contributes a critique of Western intervention and a defense of state sovereignty; it occludes Russia's own imperial history and its instrumental use of ideological movements for geopolitical advantage.

Western: The Western perspective treats the post-Ottoman order through modernization theory and state-building frameworks: the problem is weak institutions, authoritarianism, and the failure to develop liberal democratic nation-states. It contributes institutional analysis, democratization agendas, and civil-society frameworks; it occludes the role of Western powers in creating and sustaining authoritarian regimes and in drawing the borders that made nation-state consolidation difficult, and it tends to treat transnational ideologies as obstacles to modernization rather than as responses to structural conditions.

UN: The UN perspective frames contestation through self-determination, decolonization, and human rights.

It emphasizes the right of peoples to choose their political arrangements and the illegitimacy of externally imposed solutions. It contributes normative frameworks and international law; it occludes the gap between legal sovereignty and effective self-determination, and its frameworks often assume a nation-state template that may not fit the region's social realities.

2.6 KEY IDEA 5 — The 2011 uprisings as a crisis of the post-colonial state system

Bolded Causal Claim: The 2011 Arab uprisings were not merely protests against authoritarian rulers but a systemic crisis of the post-colonial state form in West Asia, exposing the exhaustion of the legitimacy formulas—nationalism, Islamism, rentierism, and coercion—that had sustained post-independence regimes, and triggering divergent trajectories of state collapse, authoritarian restoration, and civil war.

Mechanism: The mechanism operates at multiple levels. At the structural level, post-independence regimes had relied on an "authoritarian bargain" in which citizens exchanged political rights for economic security, nationalist pride, and stability. This bargain was sustained by rentier revenues (in the Gulf and oil states), by state-led development (in Egypt, Syria, Iraq), and by repression. By the 2000s, the bargain was eroding: demographic youth bulges (over 60 percent of the Arab population under 30), high unemployment, corruption, and the visible failure of state services undermined the economic pillar; the nationalist pillar was weakened by the stagnation of pan-Arab projects and the humiliation of the Arab-Israeli conflict; and the coercive pillar, while still formidable, faced new challenges from the diffusion of information via satellite television and social media, which reduced the state's monopoly on narrative. The trigger was the self-immolation of Mohamed Bouazizi in Tunisia in December 2010, which catalyzed protests that toppled Ben Ali within weeks. The demonstration effect then spread the protests across the region—Egypt, Libya, Syria, Yemen, Bahrain, and beyond—because the underlying conditions were shared. The mechanism of contagion was not merely imitation but the revelation that regimes were more fragile than assumed: the fall of Ben Ali and then Mubarak shattered the aura of invincibility that had deterred collective action. Regime responses then determined outcomes. Where regimes conceded quickly and the military withdrew support (Tunisia), transition occurred. Where regimes combined concession with repression and the military intervened (Egypt 2013), authoritarian restoration followed. Where regimes militarized the response and external actors intervened (Libya, Syria, Yemen), civil war and state collapse resulted. Where regimes offered preemptive reform and had greater distributive capacity (Morocco, Jordan), protests were contained. The uprisings thus functioned as a stress test of the post-colonial state's capacity to generate consent; where consent was absent and coercion insufficient or counterproductive, states fractured. The deeper mechanism is that the post-colonial state, built on external recognition and resource extraction rather than domestic institutional legitimacy, could not absorb a shock to its legitimating formulas without either transforming or collapsing.

Scope Conditions: This mechanism applies most strongly to Arab republics with weak institutionalization and semi-rentier or non-rentier economies (Tunisia, Egypt, Syria, Libya, Yemen). It applies less to Gulf monarchies, which possessed greater distributive capacity, dynastic legitimacy, and smaller populations, allowing them to contain protests through reform and co-optation (Bahrain being a partial exception, where sectarian dynamics complicated the picture). It applies differently to Turkey and Iran, which experienced their own protest waves (Gezi 2013, Green Movement 2009) but within different state structures and with different outcomes. The mechanism also requires a degree of media openness and transnational connectivity that was present in 2011 but not in earlier decades, which is why similar conditions in the 1980s or 1990s did not produce comparable uprisings.

Observable Implications: The mechanism implies: the rapid fall of long-entrenched rulers (Ben Ali after

23 years, Mubarak after 30); the spread of protests across multiple countries within months; the divergence of outcomes (Tunisian transition, Egyptian restoration, Syrian/Libyan/Yemeni civil war); the rise of ISIS in the vacuum of state collapse; massive refugee flows; the reassertion of authoritarianism in Egypt and elsewhere; and the internationalization of conflicts through external intervention (NATO in Libya, Russian and Iranian intervention in Syria, Saudi-led coalition in Yemen). It also implies that the uprisings would be followed by a "counter-revolution" as regimes and external actors moved to restore order, which is what occurred after 2013.

Perspective Note (five traditions in brief):

African (primary): The African vantage point sees the 2011 uprisings as part of a broader post-colonial crisis of the state, paralleling African experiences of "democratic transitions" and state fragility in the 1990s and 2000s. African scholarship illuminates this with particular force. Mamdani's analysis of the post-colonial state as a "bifurcated" structure—governing citizens through civil law and subjects through customary/communal law—captures the legitimacy deficit that the uprisings exposed: states that had never fully incorporated their populations as citizens could not generate consent when tested. Mbembe's concept of "necropolitics" describes how post-colonial states exercise power through the management of death and violence, a framework that illuminates the militarized responses in Syria, Libya, and Yemen. Bayart's "politics of the belly" explains how patronage networks, rather than institutional performance, sustained regimes, making them vulnerable when distributive capacity faltered. The African perspective highlights continuities that Western frameworks miss: the 2011 wave resembles African "second liberation" movements of the 1990s, and the subsequent authoritarian restoration in Egypt parallels African "democratic rollback" (Zimbabwe, Egypt's own trajectory). It also reveals that the uprisings were not simply demands for "democracy" in a liberal sense but for dignity (karama) and social justice, echoing African struggles against structural adjustment and authoritarianism. The African perspective further cautions against treating state collapse (Libya, Syria) as purely internal failure; it reflects the internationalization of post-colonial crises, as in Africa (Congo, Somalia), where external intervention and resource competition compound state fragility. What the African perspective reveals that others miss is the structural commonality: the post-colonial state in both regions is a "gatekeeper state" (Cooper) whose legitimacy depends on external recognition and resource extraction rather than domestic consent, and whose crisis is therefore predictable rather than exceptional. What it occludes is the specific role of sectarianism and the Arab-Israeli conflict in shaping West Asian outcomes, and the particular impact of oil wealth in cushioning some regimes.

Chinese: China views the uprisings with alarm, seeing them as evidence of the dangers of rapid political change and of Western intervention, particularly the NATO operation in Libya. Beijing's narrative emphasizes stability and gradual reform; it supports incumbent governments and opposes external regime change. This perspective contributes a stability-first framework and economic engagement without political conditionality; it occludes democratic aspirations and human rights abuses, and it tends to conflate all protest movements with threats to order.

Russian: Russia frames the uprisings as partly engineered by Western powers through "color revolution" techniques and opposes regime change, especially after the Libyan intervention, which Moscow views as a betrayal of the UN mandate. It supports the Assad government in Syria as a bulwark against chaos and extremism. This perspective contributes a sovereignty-based critique of intervention and a defense of state continuity; it occludes authoritarian repression and the agency of protesters, and it instrumentalizes the uprisings for geopolitical competition.

Western: The Western perspective oscillates between supporting democratic transitions (initially, in Tunisia

and Egypt) and prioritizing stability and security (later, especially after the rise of ISIS). It contributes human rights frameworks, democratization agendas, and intervention debates; it occludes the West's own role in sustaining authoritarian regimes and the consequences of intervention (Libya), and it tends to treat the uprisings as a demand for Western-style liberal democracy rather than for dignity and social justice.

UN: The UN perspective frames the uprisings through human rights, the Responsibility to Protect (R2P), and humanitarian law. It emphasizes the protection of civilians and accountability for atrocities. It contributes normative standards and humanitarian frameworks; it occludes the political economy of intervention and the limits of international law in civil wars, and its frameworks often assume a state capacity and political will that collapsing states lack.

2.7.1 African Perspective (PRIMARY)

The African vantage point on the West Asian state system begins from a structural homology rather than a regional analogy: the modern states of West Asia and the modern states of Africa were produced by the same imperial technology — the colonial mandate and the protectorate — and they inherit the same foundational problem, namely the disjuncture between the territorial state and the social formations it claims to govern. From this standpoint, the West Asian state system is not a unique civilizational failure but one regional variant of a global colonial state-making project whose African counterpart is better documented in the scholarly record. The African perspective therefore does not treat Sykes-Picot as an exceptional sin; it treats it as one instance of a general practice of imperial cartography that also produced the Berlin Conference boundaries of 1884–85, the Anglo-French partition of West Africa, and the Italian and Belgian colonial borders of Central Africa. The lesson's central puzzle — why the post-Ottoman order proved so fragile — is, from this vantage, a special case of the broader puzzle of postcolonial state fragility that African scholarship has theorized for half a century.

The theoretical lineage begins with Fanon's analysis of the colonial state in *The Wretched of the Earth* (1961). Fanon argued that the colonial state was not a state in the European sense — a rational-legal apparatus mediating between society and authority — but a "police state" whose function was the maintenance of racial hierarchy through violence. The postcolonial state, Fanon warned, risked becoming a "caricature" of the colonial state if national liberation stopped at political independence without social transformation. Applied to West Asia, Fanon's framework suggests that the mandate states (Iraq, Syria, Lebanon, Transjordan, Palestine) inherited not merely borders but a mode of rule: a state whose primary relationship to society was coercive, whose legitimacy was external (derived from the mandatory power and the League of Nations), and whose internal legitimacy was purchased through sectarian or tribal brokerage. The 2011 uprisings, on this reading, are a Fanonian moment: a revolt not merely against authoritarianism but against the postcolonial state's failure to become a state in the substantive sense — one that delivers dignity, recognition, and material welfare.

Mamdani's *Citizen and Subject* (1996) provides the most precise mechanism. Mamdani argued that the colonial state in Africa was "bifurcated": it operated through direct rule in the urban centers (where citizens enjoyed civil rights) and indirect rule in the rural areas (where subjects were governed through "customary" authorities). This bifurcation produced a state that was simultaneously modern and pre-modern, and it meant that the postcolonial state inherited two incompatible logics of rule. The African vantage suggests that the mandate states of West Asia were similarly bifurcated: the mandatory powers (Britain and France) ruled the cities through direct administration and the countryside through tribal, sectarian, or dynastic intermediaries.

The Hashemite monarchies, the Alawite officer corps in Syria, the Maronite political dominance in Lebanon, and the tribal confederations of Iraq were not pre-modern survivals but colonial technologies of rule. The "artificiality" thesis — that borders drawn by Sykes-Picot caused the region's problems — is, on Mamdani's account, a misdiagnosis: the problem is not where the borders are but how the state rules across them. Borders can be made to work; modes of rule are harder to transform. This is the African perspective's central corrective to the Western "artificiality" discourse.

Bayart's *The State in Africa* (1993) adds the dimension of political economy. Bayart's concept of "extraversion" — the dependence of African states on external resources, whether colonial subsidies, Cold War aid, or commodity rents — maps directly onto the rentier state literature on the Gulf. The Gulf states are, in Bayart's terms, the limiting case of extraversion: states whose entire fiscal base is external (oil rents), whose ruling bargains are purchased with rent rather than taxation, and whose sovereignty is therefore structurally dependent on global commodity markets and the security guarantees of external powers. But Bayart's framework also applies to the non-oil states of West Asia (Egypt, Syria, Jordan, Lebanon), which have historically depended on external aid, remittances, and strategic rents (Suez Canal revenues, US aid, Gulf remittances). The African perspective thus reveals that rentierism is not a Gulf pathology but a variant of a broader post-colonial condition: the state as a site of resource capture rather than social contract. Rodney's *How Europe Underdeveloped Africa* (1972) reinforces this: underdevelopment is not a natural state but an active process of extraction, and the West Asian states' apparent "failure" is, in part, the success of a global system that extracts their resources (oil) while leaving them with weak institutions.

Nkrumah's *Neo-Colonialism* (1965) provides the framework for understanding the gap between formal and substantive sovereignty. Nkrumah argued that political independence without economic independence was a "sham" — that the former colonial powers retained control through multinational corporations, military bases, and financial institutions. Applied to West Asia, Nkrumah's framework illuminates the mandate system's legacy: Iraq gained formal independence in 1932 but remained under British military and economic influence; Syria and Lebanon gained independence in the 1940s but remained within the French sphere; the Gulf states gained independence in the 1960s and 1970s but remained dependent on Western security guarantees and oil markets. The "post-colonial" state system of West Asia is, on this reading, a neo-colonial system: formally sovereign, structurally dependent.

Grovogui's *Sovereigns, Quasi Sovereigns, and Africans* (1996) adds the international legal dimension. Grovogui argued that international law constructed a hierarchy of sovereignty in which European states were "sovereigns" and non-European states were "quasi-sovereigns" — granted formal recognition but denied substantive equality. The mandate system was the legal technology of this hierarchy: the League of Nations mandates were not colonies in name but were colonies in practice, and the "sacred trust of civilization" was a legal fiction that legitimized continued imperial control. The African perspective thus reveals that the West Asian state system's legitimacy crisis has roots in the international legal order itself: the states were born as "quasi-sovereigns," and their subsequent struggles for full sovereignty (against Western intervention, against Israeli occupation, against great-power manipulation) are struggles against a legal order that never fully recognized them as equals. This is a contribution the other perspectives cannot make, because they tend to treat the international legal order as a neutral framework rather than a historically constructed hierarchy.

Oyěwùmí's *The Invention of Women* (1997) and Tamale's *Decolonization and Afro-Feminism* (2020) add the dimension of colonial categories. Oyěwùmí argued that colonialism imposed European categories — including gender, ethnicity, and "tribe" — on African societies that had organized social life differently. Ap-

plied to West Asia, this framework illuminates how the mandatory powers codified and rigidified sectarian identities: the French mandatory power's communalist policies in Lebanon (which institutionalized sectarian representation), the British use of tribal and sectarian intermediaries in Iraq, and the broader colonial practice of "divide and rule" that transformed fluid religious identities into fixed political categories. The 2011 uprisings, on this reading, were not simply "sectarian" conflicts waiting to happen; they were the explosion of categories that colonial and postcolonial states had constructed and instrumentalized. Tamale's decolonial feminism adds that the uprisings were also gendered: women played central roles in the protests (in Egypt, Tunisia, Syria, Yemen), and the subsequent authoritarian backlash and civil wars disproportionately targeted women's bodies and rights. The African feminist perspective thus reveals a dimension of the crisis that the Western "democracy vs. authoritarianism" framing and the UN "human rights" framing both occlude: the gendered nature of state violence and the gendered costs of state collapse.

Cabral's *Unity and Struggle* (1979) and Nyerere's *Ujamaa* (1968) provide the comparative dimension of regional integration. Cabral argued that national liberation required not just political independence but the creation of a new social order, and that this required class analysis and mass mobilization. Nyerere argued for African socialism and regional integration as alternatives to both capitalism and Soviet communism, and he was a key architect of the East African Community and the Organization of African Unity. Applied to West Asia, these frameworks suggest that pan-Arabism and pan-Islamism were not merely ideological projects but attempts to solve the problem of the small, weak, postcolonial state through regional unity — and that their failure (like the failure of pan-Africanism to achieve full economic integration) reflects the structural obstacles to regional integration in a world of sovereign states and great-power competition. The African perspective thus contributes a comparative lesson: regional integration is possible (the AU, ECOWAS, SADC demonstrate this) but requires political will, economic complementarity, and insulation from great-power manipulation — conditions that the West Asian state system has rarely enjoyed.

Mbembe's *On the Postcolony* (2001) and "Necropolitics" (2003) add a final theoretical layer. Mbembe argued that the postcolonial state is characterized by a "commandement" — a mode of authority that operates through the private appropriation of public resources and the blurring of the public/private distinction. The postcolonial state, on this account, is not a failed Weberian state but a different kind of state: one that governs through "private indirect government" and the distribution of favors. Applied to West Asia, Mbembe's framework illuminates the "deep state" phenomena in Egypt, the sectarian patronage networks in Lebanon, and the tribal and familial networks that structure Gulf politics. Mbembe's "necropolitics" — the sovereign power to decide who lives and who dies — is visible in the West Asian state system's most extreme forms: the Assad regime's barrel bombs, the Saudi-led coalition's war in Yemen, the Israeli occupation of Palestine. The African perspective thus contributes a theory of state violence that is not reducible to "authoritarianism" or "state failure" but that recognizes the postcolonial state's distinctive mode of sovereignty.

Aning and Danso's work on African security governance adds a final dimension: the principle of "African solutions to African problems," which holds that regional organizations should take primary responsibility for regional security, with external powers in a supporting role. Applied to West Asia, this suggests that the Arab League and the Gulf Cooperation Council (GCC) should be the primary security actors, and that Western and Russian military interventions (in Iraq, Syria, Libya) have undermined rather than strengthened regional order. The African perspective thus contributes a normative stance: the West Asian state system's problems should be addressed by West Asian actors, not by external powers whose interventions have repeatedly made things worse.

What the African perspective occludes: it may understate the specific role of religion and sectarianism in

West Asia, which has no exact African parallel (though African states have religious dimensions, they are not typically organized around sectarian political identities in the same way). It may over-analogize: the Ottoman legacy is not identical to European colonialism (the Ottomans were a regional empire, not an overseas one, and their legacy includes institutions and cultural ties that European colonialism did not produce). It may not fully engage with the unique scale of oil rents in the Gulf, which creates a political economy without African parallel (though Nigeria and Angola are partial parallels). And it may, in its emphasis on structural and historical factors, understate the agency of West Asian actors and the genuine achievements of state-building in the region (Jordan, the UAE, Qatar). These occlusions are real, but they do not diminish the African perspective's central contribution: the recognition that the West Asian state system is not an exceptional failure but a regional variant of a global postcolonial condition, and that the theories developed to understand that condition in Africa are directly applicable to West Asia.

2.7.2 Chinese Perspective

The Chinese perspective on the West Asian state system is shaped by three commitments: the Five Principles of Peaceful Coexistence (mutual respect for sovereignty and territorial integrity, mutual non-aggression, non-interference in internal affairs, equality and mutual benefit, peaceful coexistence), articulated at the 1955 Bandung Conference and enshrined in Chinese foreign policy; the priority of economic development and stability over political reform; and China's own experience of state-building and its self-image as a non-colonial power with historical ties to the region through the Silk Road. From this standpoint, the West Asian state system's problems are not primarily the result of artificial borders or colonial legacies but of external interference — particularly Western intervention — that has destabilized states and created power vacuums filled by extremism.

The Chinese perspective's central causal claim is that the 2011 uprisings and their aftermath were caused not by the internal failures of the postcolonial state but by external interference, particularly Western military intervention (Libya 2011) and covert support for regime change (Syria). China's abstention on UNSC Resolution 1973 (Libya) and its subsequent veto of Western-backed resolutions on Syria reflect this conviction: that the "responsibility to protect" is a Trojan horse for regime change, and that the collapse of the Libyan state (and the subsequent spread of weapons and fighters across the Sahel and West Asia) is the direct consequence of Western intervention. The Chinese perspective thus contributes a powerful corrective to the Western narrative: it insists that the cure (intervention) has been worse than the disease (authoritarianism), and that the West Asian state system's crisis is, in significant part, an iatrogenic condition produced by external powers.

On oil and rentierism, the Chinese perspective is pragmatic rather than normative. China is the world's largest importer of crude oil, and the Gulf states (Saudi Arabia, Iraq, Iran, Oman, the UAE) are critical suppliers. China's interest is in stable supply, not in political reform. The "China's Arab Policy Paper" (2016) emphasizes "win-win cooperation," infrastructure investment, and energy partnerships, and it explicitly avoids political conditionality. The Chinese perspective thus treats rentierism as a fact of the political economy, not a problem to be solved: the Gulf states' wealth is a source of stability (they can buy social peace) and of partnership (they have capital to invest in Chinese infrastructure). The Chinese vantage occludes the political consequences of rentierism — the absence of taxation, the weakness of representative institutions, the vulnerability to commodity price shocks — because these are seen as internal matters that do not affect China's core interests.

The Chinese perspective also draws on a historical narrative of non-colonial engagement. Unlike the Eu-

ropean powers, China did not colonize West Asia; its historical presence was commercial (the Silk Road) and cultural. This self-image supports China's claim to be a neutral, non-threatening partner — a claim that resonates with West Asian states seeking alternatives to Western dominance. The Belt and Road Initiative (BRI) extends this logic: infrastructure investment, port development, and energy partnerships that create mutual dependence without political conditionality. Yan Xuetong's work on Chinese strategic thought (2011) suggests that China's approach is rooted in a Confucian-inspired preference for stability and harmony over ideological transformation.

What the Chinese perspective contributes: a critique of Western interventionism that is empirically grounded (Libya's collapse, Syria's devastation); a model of economic partnership without political conditionality that appeals to authoritarian and semi-authoritarian states; and a reminder that the West Asian state system's problems cannot be solved by external powers, however well-intentioned. What it occludes: the political repression and human rights abuses that non-interference enables; the debt and dependency that BRI projects can create; the authoritarian complicity of supporting regimes that lack popular legitimacy; and the possibility that stability purchased through repression is not stability but deferred crisis. The Chinese perspective also tends to treat the 2011 uprisings as entirely externally driven, which underestimates the genuine domestic grievances (corruption, unemployment, dignity) that fueled them. Qin Yaqing's relational theory (2018) suggests that China's approach is rooted in a relational ontology that prioritizes harmony over justice — a philosophical commitment that can legitimate the status quo.

2.7.3 Russian Perspective

The Russian perspective on the West Asian state system is shaped by the legacy of Soviet engagement with the region, the post-Soviet search for great-power status, and the Primakov doctrine of multipolarity. Russia views the West Asian state system through the lens of great-power competition: the region is a theater in which the US-led unipolar order is being challenged, and Russia's role is to defend state sovereignty, oppose Western intervention, and protect its own strategic and economic interests (energy, arms sales, naval access). The Russian perspective shares with the Chinese a commitment to non-interference and state sovereignty, but it is more explicitly geopolitical and more willing to use military force (as in Syria 2015).

The historical foundation is Soviet support for Arab nationalism and anti-colonial movements. The USSR backed Nasser's Egypt, the Ba'ath regimes in Syria and Iraq, the PLO, and various leftist movements. This legacy gives Russia credibility in the region as a power that supported Arab independence against Western imperialism. The post-Soviet period saw a retreat (Yeltsin), but Putin's Russia has re-engaged, driven by the perception that the US invasion of Iraq (2003) and the Arab uprisings (2011) created opportunities for Russian influence. The intervention in Syria (2015) — Russia's first major military operation outside the former Soviet space since the Cold War — was framed as defending the Syrian state against terrorism and Western-backed regime change, and it succeeded in preserving the Assad regime and securing Russian naval and air bases (Tartus, Hmeimim).

The Russian perspective's central causal claim is that the West Asian state system's crisis is the result of Western hubris: the US invasion of Iraq (2003) destroyed the regional balance, the Arab uprisings were exploited by Western powers and Gulf monarchies to overthrow regimes, and the result has been state collapse, terrorism, and humanitarian catastrophe. Russia's role, on this account, is to restore order by supporting sovereign states against both internal rebellion and external intervention. This framing is not merely rhetorical: it reflects a genuine Russian conviction that state sovereignty is the foundation of international order, and that the Western "responsibility to protect" is a destabilizing doctrine that has produced more harm than

good.

On oil and rentierism, Russia's perspective is shaped by its own status as a petrostate. Russia is the world's largest exporter of natural gas and a major oil producer; it understands the political economy of hydrocarbons from the inside. The Russian perspective does not critique rentierism as a governance failure; it treats it as a normal feature of resource-rich states. Russia's interest in the Gulf is in managing oil prices (through OPEC+ cooperation with Saudi Arabia), selling arms, and competing with the US for influence. The Russian perspective thus contributes an insider's understanding of the political economy of oil, but it occludes the governance and development consequences of rentierism because Russia itself is a rentier state.

What the Russian perspective contributes: a critique of Western interventionism that is backed by military action (Syria); a defense of state sovereignty that resonates with authoritarian regimes; and a multipolar framing that challenges US hegemony. What it occludes: the authoritarian nature of the regimes it supports (Assad's Syria); the human rights abuses committed by those regimes; the geopolitical self-interest behind the anti-imperialist rhetoric; and the possibility that supporting authoritarian stability merely defers and intensifies the underlying crisis. The Russian perspective also tends to treat all opposition to authoritarian regimes as Western-backed or terrorist, which erases the genuine domestic grievances that fueled the 2011 uprisings. Trenin's analysis (2016) of Russian foreign policy suggests that Russia's approach is driven by a combination of great-power ambition, security concerns, and a genuine belief in state sovereignty — but that it lacks a positive vision for the region beyond the preservation of the status quo.

2.7.4 Western Perspective

The Western perspective on the West Asian state system is the most internally diverse of the five, spanning liberal internationalism, realism, and neoconservatism, but it shares certain common premises: that the state system is in crisis; that the crisis has both internal (governance failure, sectarianism, rentierism) and external (intervention, great-power competition) causes; and that Western powers have both interests and responsibilities in the region. The Western perspective is also the most self-critical, because the West's own role in constructing and sustaining the state system — through Sykes-Picot, the mandate system, Cold War alliances, and the 2003 Iraq invasion — is a central subject of Western scholarship.

The theoretical lineage includes Fromkin's *A Peace to End All Peace* (1989), which argued that the modern Middle East was created by the Great Powers at the Paris Peace Conference (1919) and that the resulting state system was inherently unstable because it did not correspond to the region's social and political realities. Hourani's *A History of the Arab Peoples* (1991) provided a more nuanced account, emphasizing the region's internal dynamics and the agency of Arab actors. Owen's *State, Power and Politics in the Making of the Modern Middle East* (2004) analyzed the political economy of the state, including rentierism. Anderson's "The State in the Middle East" (1987) examined the "robustness" of Middle Eastern states — their ability to survive despite apparent weakness — and argued that the region's states were more durable than the "failed state" literature suggested.

The Western perspective's central causal claim is that the West Asian state system's crisis is the result of a combination of internal governance failures (authoritarianism, corruption, sectarianism, rentierism) and external shocks (the 2003 Iraq invasion, the Arab uprisings, great-power competition). The 2011 uprisings are interpreted as a crisis of legitimacy: populations demanding dignity, accountability, and economic opportunity from states that had failed to deliver. The Western response has been divided: liberal internationalists supported intervention (Libya 2011, Syria), realists opposed it (fearing state collapse and extremism), and neoconservatives supported regime change (Iraq 2003). The result has been policy incoherence: interven-

tion in Libya, non-intervention in Syria, support for authoritarian allies (Egypt, Saudi Arabia), and a general retreat from the "freedom agenda" of the 2000s.

On oil and rentierism, the Western perspective has produced the most extensive scholarship. The rentier state theory (Beblawi and Luciani, 1987) argues that states deriving a large share of revenue from external rents (oil) develop distinctive political dynamics: weak taxation, weak representation, strong state autonomy, and a "rentier mentality" that discourages productive economic activity. This framework has been applied extensively to the Gulf states and has influenced Western policy: the recognition that oil wealth sustains authoritarianism has led to debates about whether to promote diversification, governance reform, or democratization. The Carter Doctrine (1980) — that the US would use military force to protect its interests in the Gulf — reflects the Western perspective's core interest: ensuring the free flow of oil at reasonable prices.

What the Western perspective contributes: the most extensive empirical scholarship on the region; a self-critical tradition that acknowledges Western responsibility; and a set of policy debates (intervention vs. non-intervention, democracy promotion vs. stability) that, however flawed, engage seriously with the region's problems. What it occludes: the West's own role in sustaining authoritarian regimes (US support for Mubarak, Saudi Arabia, the Shah of Iran); the consequences of intervention (Iraq 2003, Libya 2011); the tendency to treat the uprisings as a demand for Western-style liberal democracy rather than for dignity and social justice; and the assumption that Western models of governance are universally applicable. The Western perspective also tends to treat "state failure" as a technical problem solvable by better governance, which may underestimate the structural and historical factors that the African and other perspectives emphasize.

2.7.5 UN Perspective

The UN perspective on the West Asian state system is shaped by the organization's dual identity as both the inheritor of the mandate system (through the League of Nations' legacy) and the primary forum for decolonization, human rights, and collective security. The UN's engagement with the region spans the entire post-1945 period: the partition of Palestine (UNGA Resolution 181, 1947), the creation of Israel, the Arab-Israeli wars, the oil crises, the Iran-Iraq war, the Gulf War (1990-91), the sanctions regime on Iraq, the 2003 Iraq invasion (which the UN did not authorize), the 2011 Libya intervention (authorized by UNSC Resolution 1973), and the ongoing Syria conflict. The UN perspective is thus not a single viewpoint but a composite of legal frameworks, humanitarian mandates, and political compromises among member states.

The UN perspective's central causal claim is that the West Asian state system's crisis is a crisis of international order: the failure of the UN system to prevent conflict, protect civilians, and promote self-determination. The mandate system's legacy — the UN's predecessor, the League

---

2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Reconstructs mandates and borders as imperial statecraft; parallels African partition; highlights artificiality and anti-colonial legitimacy	May overstate border determinism; underweights local agency, oil, and institutional variation	Anti-colonial self-determination; borders should not legitimate domination	Mandate texts; African partition analogies; postcolonial state crises	Western institutionalist view that institutions and coalitions matter more than border lines
Chinese	Sovereignty/non-interference lens; frames Sykes-Picot as great-power collusion; supports decolonization	Downplays internal repression and regional power competition; economic interests	State sovereignty and non-intervention	Anti-colonial diplomacy; support for Arab states	UN/humanitarian view that sovereignty cannot shield mass atrocities
Russian	Anti-Western/imperial critique; support for Arab nationalism; exposes capitalist motives	Obscures Russian/Soviet great-power interests; reduces local complexity	Anti-hegemony and multipolarity	Soviet backing of Arab states; opposition to mandates	Western view that Russian policy also instrumentalizes regional conflicts
Western	Institutional and strategic analysis; distinguishes myth from actual border-making; explains variation	Can normalize imperial violence; underplays coercion and racial hierarchy	Order, stability, reform through institutions	Archival diplomatic history; state capacity comparisons	African/postcolonial view that "order" often means domination

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
UN	Legal/decolonization framework; mandates as trusteeship; self-determination norms	Retrospective; UN did not exist in 1919; often powerless	International law and human rights	League mandate texts; UN Charter; decolonization resolutions	Russian/Chinese view that UN is Western-dominated and selectively applied

2.8 WORKED EXAMPLE (I do)

Levels of Analysis

At the individual level, the case turns on the agency and misjudgment of specific diplomats and leaders. Sir Mark Sykes and François Georges-Picot negotiated a secret partition of Ottoman Arab provinces in 1916, producing a map shaped by imperial assumption rather than ethnographic knowledge. At Paris, Woodrow Wilson, David Lloyd George, Georges Clemenceau, and Faisal ibn Hussein pursued divergent aims: Wilsonian self-determination, British strategic and emerging oil interests, French security and Levantine claims, and Arab independence. British officials simultaneously promised Hussein an Arab kingdom, accepted Sykes-Picot zones, and endorsed a Jewish national home in Palestine through the Balfour Declaration. These contradictions were products of individual diplomacy under wartime uncertainty, and although Faisal and T. E. Lawrence exercised agency, power asymmetry prevented Arab leaders from enforcing promises.

At the state level, Britain and France acted as imperial states seeking territorial, strategic, and economic gains, while the Ottoman state's collapse created a vacuum. The mandate system converted military occupation into internationally legitimated administration: Britain took Iraq and Palestine/Transjordan, while France took Syria and Lebanon. State interests included control of routes to India, naval bases, and emerging oil concessions, especially the Mosul dispute. Borders were adjusted to strategic, sectarian, and resource concerns rather than communal boundaries, as seen in the enlargement of Lebanon, the creation of Transjordan, and the incorporation of Mosul into Iraq. State-level analysis explains much of the map, but it cannot fully explain why some mandates stabilized while others fractured.

At the systemic level, World War I destroyed the Ottoman order and reconfigured the international system. The League of Nations mandate system supplied a new legal vocabulary—tutelage toward self-government—while preserving imperial control. The Paris settlement was shaped by the wartime alliance system and by the Bolshevik publication of secret treaties, which discredited secret diplomacy and strengthened Wilsonian norms. Systemically, the collapse of one empire and the victory of others created a hierarchical order in which sovereignty was graded, with mandates described as territories "not yet able to stand by themselves." This hierarchy explains why Arab independence claims were subordinated to great-power security, though systemic analysis risks treating the Middle East as a passive object unless combined with local and transnational dynamics.

At the transnational level, Arab nationalism, Zionism, and pan-Islamism circulated across imperial borders before and after 1916. The Hussein-McMahon correspondence appealed to a transnational Arab identity,

while the Balfour Declaration mobilized Jewish transnational networks. After 1919, mandates became arenas for transnational contestation, as revolts in Iraq in 1920, Syria in 1925, and Palestine in 1936 linked local grievances to regional ideologies. Oil concessions, missionary networks, and diaspora communities also crossed borders. Transnational analysis shows that borders were immediately contested by movements that did not accept them, though it can overstate ideological coherence because many revolts were local and factional.

Mechanism

The central mechanism is imperial state construction through contradictory legitimation. First, wartime exigency produced overlapping promises to different constituencies: Arabs, Zionists, French officials, and British imperial strategists. Second, military victory allowed Britain and France to convert those promises into territorial control. Third, the League mandate system supplied legal form, reframing occupation as tutelage and deferring sovereignty. Fourth, borders were adjusted to strategic, sectarian, and resource logics, creating states whose populations did not neatly correspond to territorial units. Fifth, these states were institutionalized through colonial administration, local collaborators, and international recognition, making later revision costly. The mechanism is not that Sykes-Picot alone drew all borders; rather, it established the principle that great powers could partition and allocate territories, while later bargains such as San Remo in 1920 and the Cairo Conference in 1921 filled in the map. The result was a set of states whose legitimacy was contested from inception, providing a structural condition for later crises, including pan-Arabism, coups, sectarian politics, and the 2011 uprisings.

Perspective Reconstruction

African (primary): African scholarship on colonial statecraft treats Sykes-Picot as part of a wider imperial practice of partitioning territories and populations without consent. From this vantage, the mandate system resembles the civilizing mission and indirect rule analyzed in African contexts: external powers create states, empower intermediaries, and defer self-government indefinitely. The artificiality critique—familiar from debates over African borders—highlights that Middle Eastern states were also assembled from imperial convenience, producing mismatches between political boundaries and social geographies. Yet African perspectives also caution against border fetishism: Mamdani's argument that the colonial state's bifurcated power, not merely lines on a map, explains durable authoritarianism suggests that mandates created structures of rule that outlasted formal empire. Applied to the Middle East, this implies that Sykes-Picot's significance lies less in exact borders than in the institutionalization of externally controlled states, though this can underweight oil, Zionism, and sectarian politics.

Chinese: Chinese perspectives emphasize sovereignty and non-interference, reading Sykes-Picot as an illegitimate great-power bargain that violated self-determination. From this standpoint, mandates were colonialism under international legal cover, and the proper remedy is respect for territorial integrity and non-intervention. Chinese diplomacy historically supported Arab states' sovereignty and opposed Western military intervention, while pursuing economic partnerships rather than political restructuring. This perspective contributes a clear normative defense of postcolonial states against external partition, but it occludes internal authoritarianism and underplays transnational and sectarian dynamics.

Russian: Russian and Soviet perspectives frame Sykes-Picot as capitalist imperialism and great-power collusion against Arab self-determination. Soviet support for Arab nationalism, anti-Zionism, and state-led development positioned Moscow as an alternative patron, exposing Western hypocrisy in invoking self-determination while partitioning territories. This perspective highlights material and strategic motives behind

mandates and challenges Western claims to benevolent tutelage. However, it occludes Russia's own imperial and great-power interests and can reduce complex local politics to anti-imperial struggle.

Western: Western perspectives, especially diplomatic history, stress that Sykes-Picot was a secret wartime expedient, not a comprehensive blueprint, and that actual borders emerged through later negotiations, local resistance, and strategic recalculation. Scholars such as Fromkin emphasize contingency, misjudgment, and the gap between plans and outcomes, while Hourani situates the settlement in longer Ottoman and Arab political traditions. This perspective explains variation among mandates and warns against the artificial borders monocausal thesis. Its occlusion is a tendency to normalize imperial power by focusing on intentions and constraints, understating coercion, racial hierarchy, and the violence of occupation.

UN: The UN perspective is retrospective: the League mandate system is seen as a precursor to UN trusteeship, with mixed legacies. It emphasizes legal evolution from tutelage to self-determination, and frames the post-1945 order as an attempt to correct mandate-era abuses through decolonization and human rights. The UN view highlights that mandates created international obligations, not merely bilateral empire, and that their legitimacy was contested even at the time. Yet the UN did not exist in 1919, so this perspective risks anachronism and occludes power politics that limit enforcement of self-determination.

Explicit Adjudication

The African/postcolonial perspective best explains the case's central mechanism: the construction of states by external powers through contradictory promises and legal tutelage. It captures the legitimacy deficit that haunted the post-Ottoman order and connects Middle Eastern partition to a broader colonial pattern. However, it is incomplete if it treats borders as destiny; the Western diplomatic-historical perspective correctly shows that borders were revised, that local actors shaped outcomes, and that institutional choices mattered. The best explanation is therefore a synthesis: imperial construction created the structural conditions of contested legitimacy, while subsequent state-building, resource politics, and social coalitions determined which states endured or fractured. The Chinese and Russian perspectives add valuable normative critiques of intervention and hypocrisy but are less explanatory of the 1916-1919 process itself; the UN perspective is most useful for tracing legal legacies rather than causal origins. Thus, for this case, the African perspective has the strongest explanatory power at the level of origins, and the Western perspective has the strongest corrective power against determinism; neither alone is sufficient.

2.9 PROBLEM PAIR (We do)

1. **Mechanism identification.** Using the five key ideas, identify the causal mechanism linking the Ottoman mandate legacy to the 2011 legitimacy crisis. Specify whether the mechanism operates at the state, systemic, or transnational level of analysis, and state one observable implication that would falsify your claim.

2. **Rentierism vs. sectarianism.** Two explanations compete for the 2011 uprisings: rentier-state theory (Owen 2004) and sectarian-identity mobilization (L43). Adjudicate between them for the cases of Tunisia (non-rentier, non-sectarian) and Bahrain (rentier, sectarian). Which theory survives the comparison, and what scope condition must be added?

3. **African parallel.** Reconstruct the African perspective: how does the 2011 West Asian crisis illuminate the parallel construction of the African state system (Berlin Conference, mandate/trusteeship legacies)? What does the African vantage point reveal that the Western "state failure" framing occludes?

4. **Artificiality thesis test.** The Sykes-Picot "artificiality thesis" claims that externally drawn borders produced illegitimate states. Evaluate this claim against the evidence of which states collapsed (Libya, Syria, Yemen) versus which survived (Egypt, Tunisia, Morocco). What does the pattern imply about the thesis's scope conditions?

5. **Rentier vulnerability ranking.** Using rentier-state indicators (hydrocarbon rents as share of GDP, state employment share, subsidy burden), rank the Gulf monarchies by vulnerability to a 2011-style legitimacy crisis. Identify the state that the model predicts should have been most vulnerable and explain why it was not.

6. **UN prescription.** From the UN perspective (mandate legacy plus decolonization framework), prescribe a response to a hypothetical 2025 legitimacy crisis in a rentier monarchy. State two falsifiers that would show your prescription failed.

MODEL ANSWER

The 2011 uprisings exposed a legitimacy crisis rooted in the post-colonial state system constructed after the Ottoman collapse. The mechanism runs through three linked stages. First, the mandate system (Fromkin 1989; Hourani 1991) installed states whose boundaries and institutions were designed for imperial convenience rather than indigenous political community, producing a structural deficit of legitimacy. Second, oil rents allowed ruling elites to substitute distribution for representation, creating what Owen (2004) identifies as rentier political economies in which the social contract is fiscal rather than participatory. Third, the 2011 shock tested this contract: where rents were sufficient and institutions cohesive, as in the Gulf monarchies, the system absorbed protest; where rents were thin or institutions brittle, as in Tunisia, Egypt, Libya, Syria, and Yemen, it fractured. The mechanism operates primarily at the state level but is conditioned by systemic factors, including the regional diffusion of protest frames and transnational sectarian networks.

Adjudicating rentierism against sectarianism requires case comparison. Tunisia, lacking significant hydrocarbon rents and lacking a salient sectarian cleavage, still experienced the first and most consequential uprising, which suggests rentierism is sufficient but not necessary for crisis. Bahrain, by contrast, combined rentier wealth with sectarian polarization, yet survived through external Gulf Cooperation Council intervention, indicating that sectarianism can be instrumentalized by regimes rather than operating as an independent cause. The scope condition that must be added is that rentierism predicts vulnerability only where the fiscal contract is already eroding through demographic pressure, youth unemployment, or subsidy retrenchment, and where no external patron guarantees regime survival.

The African perspective reframes the crisis as a parallel instance of externally constructed state systems confronting legitimacy deficits. Just as African states inherited colonial boundaries and institutional forms that privileged extraction over representation, West Asian states inherited mandate structures. The African vantage point reveals what the Western "state failure" framing occludes: the problem is not the absence of a state but the presence of a state form designed for purposes other than popular sovereignty. Mamdani's (1996) distinction between citizen and subject, developed for the African case, travels to West Asia, since mandate states governed through differentiated legal categories that persist in contemporary citizenship regimes. The Western framing treats collapse as pathology; the African framing treats it as a predictable consequence of a particular mode of state construction.

The artificiality thesis fares poorly as a general explanation. If externally drawn borders caused illegitimacy, all mandate states should have been equally vulnerable. Yet Egypt and Morocco, states with equally artificial

origins, survived, while Libya and Syria, whose borders were also externally drawn, collapsed. The pattern suggests that border artificiality is a constant across the region and cannot explain variation in outcomes. What varies is institutional capacity, rent availability, and the presence of external patrons. The thesis retains limited validity: it explains why no state in the region enjoys deep historical legitimacy, but not why some collapsed in 2011 and others did not. Its scope condition is that it operates as a background condition rather than a triggering cause.

Rentier vulnerability ranking produces a counterintuitive result. By standard indicators, hydrocarbon rents as a share of GDP, state employment share, and subsidy burden, the Gulf monarchies appear highly vulnerable because their economies are undiversified and their populations are rent-dependent. Yet they were the most stable in 2011. The resolution lies in the distinction between rent availability and rent distribution: Gulf states possess sufficient rents to maintain the fiscal contract, and their small citizen populations make per-capita distribution affordable. The model predicts Saudi Arabia or Kuwait should have been most vulnerable due to large youth populations and sectarian fault lines; instead, Bahrain, smaller, more sectarian, and with thinner rents, was the site of sustained protest, contained only by Gulf Cooperation Council intervention. The falsifying observation is that rentier theory alone cannot predict which rentier state collapses without incorporating external patronage and sectarian demography.

From the United Nations perspective, the mandate legacy imposes a responsibility to support state capacity without reproducing imperial tutelage. A prescription for a 2025 legitimacy crisis in a rentier monarchy would emphasize transitional support for institutional reform rather than regime change, multilateral frameworks for subsidy reform that protect vulnerable populations, and avoidance of unilateral intervention that replicates mandate-era imposition. Two falsifiers apply: first, if reform support correlates with increased regime repression rather than liberalization, the prescription failed; second, if multilateral frameworks are captured by great-power interests, as occurred in the 2003 Iraq intervention, the United Nations framework has been instrumentalized and the prescription is void.

2.10 INDEPENDENT MEMO (You do)

(a) Case description. In 2024 a Gulf monarchy announces subsidy cuts and partial political liberalization in response to declining oil revenues. Protests erupt in the capital and in a Shia-majority eastern province. Regional powers offer competing mediation, and the United Nations Security Council debates a resolution. Your memo must assess whether this crisis is best explained by rentier-state theory, by sectarian mobilization, or by the mandate-legacy legitimacy deficit, and must prescribe a response.

(b) Required memo headings (use exactly these as prompts):

- **Mechanism:** Identify the causal mechanism linking the announced reforms to the outbreak of protest, specifying the level of analysis and one falsifier.
- **Perspective reconstruction:** Reconstruct how the African, Chinese, Russian, Western, and United Nations perspectives would each interpret the crisis, in three to five sentences per perspective.
- **Historical analogue:** Identify one historical case from the post-Ottoman or African state-system experience that illuminates the present crisis, and state the limits of the analogy.
- **Falsifiers:** State two observable implications that would show your preferred explanation is wrong.

(c) Self-check: Before submitting, verify that you have distinguished description (what happened), explanation (why it happened), prediction (what will happen next), and prescription (what should be done), and that no single sentence conflates two of these.

2.11 HINGE QUESTION

Which of the following best explains why some post-colonial West Asian states collapsed in 2011 while others survived, according to the lesson's adjudication?

A. Externally drawn borders under Sykes-Picot made all mandate states equally illegitimate and therefore equally likely to collapse. B. Rentierism is sufficient but not necessary for crisis; institutional capacity, rent availability, and external patronage explain the variation in outcomes. C. Sectarian identity mobilization was the primary driver across all cases, with rentierism playing only a minor role. D. The United Nations mandate framework provided enough legitimacy to prevent collapse in states that accepted its norms.

Distractor diagnoses:

- **A** is wrong because it confuses a background condition with a triggering cause. Border artificiality is constant across the region and cannot explain why Egypt and Morocco survived while Libya and Syria collapsed; it explains the absence of deep historical legitimacy, not variation in outcomes.
- **C** is wrong because it overstates sectarianism. The Tunisian case, which lacked a salient sectarian cleavage yet experienced the first and most consequential uprising, falsifies the claim that sectarian mobilization was primary across all cases; sectarianism is better understood as a resource regimes can instrumentalize.
- **D** is wrong because it misattributes legitimacy to the United Nations framework. The mandate system was an imperial instrument of control, not a source of popular legitimacy, and no evidence suggests that acceptance of its norms prevented collapse in 2011.
- **B** is correct because it captures the lesson's adjudication: rentierism predicts vulnerability where the fiscal contract erodes, but Tunisia shows it is not necessary, while Gulf survival shows rent availability and external patronage are decisive scope conditions.

SECTION 2A — DATA LAB

Table 1 — From Ottoman provinces to post-1920 political units (indicative; boundaries were contested and changed over time)

Late Ottoman unit (approx.)	Geography	Post-1920 outcome	Governing framework
Vilayet of Syria (with Lebanon, Palestine, Transjordan)	Greater Syria	French mandate Syria; French mandate Lebanon; British mandate Palestine/Transjordan	League of Nations mandate system
Vilayet of Aleppo	Northern Syria	French mandate Syria	League mandate
Vilayet of Beirut	Coastal Levant	Incorporated into French mandate Syria/Lebanon	League mandate
Vilayets of Baghdad, Basra, Mosul	Mesopotamia	British mandate Iraq	League mandate
Vilayet of Hejaz	Western Arabia	Hashemite kingdom, later Saudi consolidation	Sovereign/contested
Anatolian provinces	Turkey	Republic of Turkey	Sovereign (post-1923)

Late Ottoman unit (approx.)	Geography	Post-1920 outcome	Governing framework
Egypt (Ottoman province; British protectorate)	Nile Valley	British-protected Egypt, later independence	Protectorate/sovereign transition

Table 2 — Indicative hydrocarbon profile of West Asian and North African states (2020s, rounded/qualitative; not exact production statistics)

State/territory	Hydrocarbon role	Approx. global position	Rentier indicator (qualitative)
Saudi Arabia	Very high crude producer; OPEC leader	Top-tier producer	Very high rent dependence
Iraq	High crude producer; conflict-constrained	Major producer	High rent dependence
Iran	High producer; sanctions-constrained	Major producer	High rent dependence
UAE	High producer; diversified economy	Major producer	High but diversifying
Kuwait	High per-capita producer	Significant producer	Very high rent dependence
Qatar	Gas-dominant; LNG exporter	Major gas producer	Very high rent dependence
Oman	Medium producer; diversification push	Mid-level producer	Medium-high rent dependence
Libya	Medium producer; volatile output	Mid-level producer	High rent dependence
Algeria	Medium producer; gas exporter	Mid-level producer	Medium-high rent dependence
Egypt	Low-medium producer; mixed producer-importer	Lower-tier producer	Lower rent dependence

Table 3 — Rentier-state indicators and their interpretive limits

Indicator	What it measures	Typical high-rentier pattern	Key limitation
Hydrocarbon share of exports	External revenue concentration	Very high share	Ignores non-hydrocarbon services and remittances
Hydrocarbon share of government revenue	Fiscal dependence on rent	Very high share	Accounting conventions vary across states

Indicator	What it measures	Typical high-rentier pattern	Key limitation
State/public-sector employment share	State as distributor of rent	Large public payroll	Does not capture informal or military employment
Citizen taxation level	Fiscal contract between state and society	Low direct taxation	Indirect taxes and fees may be hidden
Subsidy and transfer burden	Rent distribution to population	Broad subsidies	Reform politics can trigger backlash
Sovereign wealth fund size	Intergenerational rent management	Large fund	Fund governance and transparency vary

Analysis Questions

1. **Trend:** From 1914 to 1946, how did the number and type of sovereign or quasi-sovereign units in the former Ottoman Arab provinces change? Does the shift from imperial provinces to mandates to independent states show fragmentation, centralization, or recombination, and what does that imply for the "artificial borders" debate?
2. **Level of analysis:** Is rentierism best explained at the state level (fiscal structure and regime type), the systemic level (oil markets, OPEC, and great-power demand), or the transnational level (corporate extraction, financial circuits, and labor migration)? Specify the mechanism that links your chosen level to regime stability or instability.
3. **Perspective reconstruction (all five):** How would the African, Chinese, Russian, Western, and UN perspectives each interpret (a) the 1920 border settlement and (b) the 2011 uprisings? Identify one contribution and one occlusion for each perspective.
4. **Interpretation:** Does hydrocarbon wealth stabilize or destabilize post-colonial states? Compare high-rent Gulf monarchies with lower-rent republics such as Egypt, Syria, or Iraq, and explain whether the difference is better explained by rent level, regime type, or external intervention.
5. **Limitation:** What data would be required to test the claim that "artificial borders cause conflict"? Identify at least three confounding variables (for example, regime type, oil location, Cold War alignment, or sectarian demography) and explain how they complicate causal inference.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — "Ottoman provinces to mandates" (hand-drawn map sketch)
What to draw: Draw a large rectangle labeled "Ottoman Arab provinces, 1914." Inside it, sketch five smaller boxes or irregular regions labeled "Syria," "Aleppo," "Beirut," "Mesopotamia (Baghdad/Basra/Mosul)," and "Hejaz/Palestine." Draw arrows from each box to a second row of boxes labeled "French mandate Syria," "French mandate Lebanon," "British mandate Iraq," "British mandate Palestine/Transjordan," and "Saudi/Hashemite successor states."
Labels to place: "vilayet," "mandate," "Sykes-Picot line (1916)," "League of Nations," "sovereignty deferred."

Perspective overlay to annotate: In the margin, write "African perspective: partition logic resembles colonial boundary-making elsewhere; 'artificiality' is not unique to the Middle East." Add a second note: "Western perspective: mandates as tutelage; UN perspective: mandate legacy as incomplete decolonization."

Visual 2 — "Rentier circuit" (hand-drawn flow diagram)
What to draw: Draw a circle labeled "Oil/Gas Rent." From it, draw arrows to four boxes: "State Revenue," "Public Employment," "Subsidies/Transfers," and "Sovereign Wealth Fund." Draw a dashed arrow from "State Revenue" back to "Regime Stability," and a dashed arrow from "Low Citizen Taxation" to "Weak Fiscal Contract." Place a small break symbol on the arrow between "Rent" and "Diversification" to show blockage.
Labels to place: "rentier state," "fiscal contract," "distribution," "diversification gap," "OPEC/systemic market."
Perspective overlay to annotate: Write "Chinese perspective: economic partnership and non-interference; state capacity matters more than regime type." Write "Russian perspective: sovereign choice; external pressure is the destabilizer." Write "Western perspective: rentierism as authoritarian bargain; reform as conditionality."

Visual 3 — "Crisis of the post-colonial state system, 1916–2011" (hand-drawn timeline)
What to draw: Draw a horizontal timeline from 1916 to 2011. Mark nodes: 1916 Sykes-Picot; 1919 Paris Peace Conference; 1920 mandates; 1945 UN/Arab League; 1956 Suez; 1967 war; 1979 Iranian revolution; 1991 Gulf War; 2003 Iraq War; 2011 uprisings. Above the timeline, draw a wavy line labeled "legitimacy of post-colonial state order." Below it, draw a wavy line labeled "contestation: pan-Arabism, pan-Islamism, nationalism, sectarianism."
Labels to place: "mandate," "independence," "Nasserism," "oil shocks," "sanctions," "uprising."
Perspective overlay to annotate: Write "African perspective: crisis of the post-colonial state, not only Middle Eastern exceptionalism." Write "UN perspective: mandate legacy and decolonization unfinished." Write "Western perspective: state failure and intervention dilemma."

SECTION 4 — CORNELL NOTES

Cue	Notes
What is the central puzzle of Lesson 41?	How the modern West Asian state system was constructed from Ottoman collapse, how borders and oil shaped it, and why 2011 exposed a crisis of legitimacy. Sources: Fromkin (1989); Hourani (1991).
What did the Ottoman legacy leave behind?	Administrative provinces, millet/communal legacies, uneven centralization, and a region later reorganized by external powers. Source: Hourani (1991).
What was Sykes-Picot?	1916 Anglo-French agreement on spheres of influence; not a final border map by itself, but a symbol of externally imposed order. Source: Sykes-Picot Agreement (1916); Fromkin (1989).

Cue	Notes
What is the "artificiality thesis"?	Claim that Middle Eastern states are externally imposed and therefore lack natural legitimacy; must be tested against historical state formation elsewhere. Source: Anderson (1987).
What are the limits of the artificiality thesis?	Many states are historically constructed; borders alone do not explain regime stability or conflict. Source: Anderson (1987).
What is rentierism?	State reliance on external rent, especially hydrocarbons, rather than domestic taxation; affects state-society relations. Source: Owen (2004).
How does oil shape politics?	Oil concentrates revenue in the state, funds distribution, reduces taxation, and can strengthen authoritarian bargains while complicating diversification. Source: Owen (2004).
What contested the post-Ottoman order?	Pan-Arabism, pan-Islamism, nationalism, and the nation-state competed to define political legitimacy. Source: Hourani (1991).
What was the 2011 crisis?	Uprisings challenged post-colonial regimes and revealed weaknesses in legitimacy, institutions, and regional order. Source: general post-2011 scholarship; not a single canonical citation.
How do the five perspectives differ?	African: parallel construction and critique of exceptionalism; Chinese: non-interference and partnership; Russian: sovereignty and anti-Western framing; Western: state failure and intervention; UN: mandate legacy and decolonization.
What is a key falsifier?	If border "artificiality" alone predicted conflict, all similarly constructed states would be equally unstable; they are not.
What cross-links matter?	L10 imperialism, L11 mandate system, L9 sovereignty, L42 Iran, L43 sectarianism, L44 proxy warfare, L46 hydrocarbons.

Summary (3–5 sentences): The modern West Asian state system emerged from Ottoman collapse and was reorganized through mandates, agreements, and later independence, not from a single map. Oil and rentierism then reshaped state-society relations by concentrating revenue and weakening fiscal contracts. The post-Ottoman order was contested by pan-Arab, pan-Islamic, and nationalist projects, and the 2011 uprisings exposed a crisis of legitimacy in that order. The African perspective is essential because it frames this as part of broader post-colonial state construction rather than Middle Eastern exceptionalism. Each of the five perspectives contributes a partial explanation and also occludes something important.

SECTION 5 — FEYNMAN COMPRESSION

1. **Explain without jargon:** The modern Middle East was not simply "drawn on a map" in one moment. It was built in layers: first the Ottoman Empire collapsed, then outside powers organized the region through mandates and agreements, then oil made some states very rich, and finally many of those states faced a legitimacy crisis in 2011. Borders matter, but they do not by themselves explain why some states survive and others fracture.

2. **Mark gaps:** I need to be careful not to say Sykes-Picot alone created all borders; it was one agreement among several. I also need to avoid treating rentierism as a universal law; it is a tendency with exceptions. I am less certain about exact oil-production rankings and should keep them qualitative unless verified.

3. **Reread verification:** Rechecking the canonical sources confirms that Fromkin emphasizes the construction of the modern Middle East after Ottoman collapse, Hourani stresses historical depth and ideological contestation, Anderson cautions against overusing the artificiality thesis, Owen links oil to political economy, and the Sykes-Picot Agreement itself was a wartime diplomatic arrangement rather than a complete settlement.

4. **Analogy with explicit limits:** Think of the region like a house built on an old foundation: the Ottoman foundation was removed, new walls were added by outside builders, oil money furnished some rooms lavishly, and 2011 revealed cracks in the structure. The analogy helps show layered construction, but it is limited because states are not houses: they have armies, ideologies, and transnational ties that a building metaphor cannot capture.

5. **Rewrite:** The West Asian state system is a layered post-imperial order: Ottoman administrative legacies were reorganized through mandates and diplomacy, oil rents transformed state-society bargains, and competing ideologies challenged the nation-state. The 2011 uprisings showed that legitimacy crises can expose the fragility of that order. No single factor—borders, oil, or ideology—explains outcomes; the explanation depends on level of analysis and perspective.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L41	definition	What is the "mandate system" in the post-Ottoman context?	The mandate system was the League of Nations framework under which former Ottoman territories were administered by Britain and France as "sacred trusts of civilisation," formalising imperial control behind a legal veneer of tutelage. It converted wartime conquest into internationally recognised authority.	African perspective: mandates are read as a template for later trusteeship and indirect rule, revealing continuity between Middle Eastern and African colonial state construction.
L41	mechanism	How did Sykes-Picot (1916) actually shape borders?	Sykes-Picot was a secret Anglo-French agreement dividing Ottoman Arab provinces into spheres of influence; its lines were later modified at San Remo and Lausanne, so borders emerged from bargaining among imperial powers, local elites, and the League, not from the agreement alone.	Western perspective treats Sykes-Picot as a founding sin; African perspective notes similar secret partitions (Berlin 1884-85) and warns against over-attributing causality to a single document.

Tag	Card Type	Front	Back	Perspective Note
L41	application	What is a "rentier state" and which Gulf states exemplify it?	A rentier state derives a large share of government revenue from external rent (oil) rather than domestic taxation, weakening the fiscal contract between state and society; Saudi Arabia, Kuwait, Qatar, and the UAE are classic cases.	Chinese perspective emphasises commercial partnership with rentier states; Russian perspective stresses sovereign resource control; both occlude questions of domestic accountability.
L41	comparison	How does the "artificiality thesis" differ from the "institutional path-dependence" view of Middle East borders?	The artificiality thesis claims borders are externally imposed and therefore illegitimate; path-dependence argues that even arbitrary lines generate constituencies, institutions, and identities that make them durable and meaningful over time.	Western and Arab nationalist traditions favour artificiality; African scholarship (Mamdani, Bayart) stresses how colonial lines become lived political realities.

Tag	Card Type	Front	Back	Perspective Note
L41	source	What does Fromkin (1989) argue about the making of the modern Middle East?	Fromkin argues that the modern Middle East was largely created by British and French decisions during and after WWI, with the collapse of the Ottoman Empire producing a new regional order shaped by great-power improvisation.	Western historiography; African readers note the parallel with Scramble-for-Africa narratives and the risk of erasing local agency.
L41	debate	Was pan-Arabism a failure of the nation-state or its precondition?	Pan-Arabism challenged the legitimacy of post-Ottoman nation-states by positing a single Arab nation; yet it also provided the ideological vocabulary through which those states consolidated, and its decline after 1967 entrenched the nation-state as the default unit.	Arab nationalist perspective; UN perspective reads pan-Arabism as a regional self-determination movement comparable to pan-Africanism.

Tag	Card Type	Front	Back	Perspective Note
L41	reconstruction	How does the African perspective reconstruct the "artificiality" debate?	African scholarship treats border artificiality as a universal colonial condition, not a Middle Eastern exception, and stresses that post-colonial states everywhere inherited arbitrary lines that became politically productive through elite bargaining and popular identification.	Primary perspective: Grovogui, Mamdani, Bayart; shows what Western "failed state" discourse occludes about state-making under constraint.
L41	occlusion	What does the rentier-state thesis occlude about Gulf politics?	The thesis foregrounds fiscal structure and predicts weak accountability, but it can occlude tribal and kinship networks, religious legitimacy, gendered citizenship, and the role of migrant labour in sustaining the social contract.	African perspective adds that rentierism parallels post-colonial resource states (Nigeria, Angola) where oil also distorts accountability.

Tag	Card Type	Front	Back	Perspective Note
L41	adjudication	How should one adjudicate between "state failure" and "state transformation" readings of the 2011 uprisings?	Evidence of institutional collapse in Libya, Syria, and Yemen supports failure; evidence of regime adaptation in Egypt, Tunisia, and the Gulf supports transformation; the better reading is that 2011 exposed variegated state capacities rather than a uniform collapse.	Western "state failure" framing vs. African "state transformation under constraint" framing; adjudication requires disaggregating cases.
L41	visual	What does a "before/after 1920" border map of the Middle East show?	It shows the shift from Ottoman provincial boundaries to League-mandated state borders, highlighting both continuity (some provincial lines) and rupture (new international borders, especially in Iraq, Syria, and Palestine).	UN perspective: maps as legal instruments of decolonisation; African perspective: maps as tools of partition comparable to African boundary commissions.

Tag	Card Type	Front	Back	Perspective Note
L41	mechanism	What mechanism links oil rents to authoritarian durability in the Gulf?	Oil rents fund patronage, security apparatuses, and welfare without taxation, reducing the need for representative institutions; the mechanism is fiscal (no taxation, no representation) mediated by coercive capacity and distributive legitimacy.	Russian perspective: sovereign resource control as legitimate; Western perspective: rents as corruption; African perspective: parallels with petro-states in Nigeria and Angola.
L41	application	How did the 2011 uprisings challenge the post-colonial state system?	They challenged the legitimacy of post-colonial regimes by mobilising cross-sectarian, cross-class demands for dignity and accountability, exposing the gap between formal sovereignty and popular sovereignty across the region.	UN perspective: popular sovereignty and human rights; African perspective: echoes of African "second liberation" movements.

Tag	Card Type	Front	Back	Perspective Note
L41	debate	Is "Sykes-Picot" a useful analytical category or a myth?	It is a useful shorthand for great-power partition but a myth if treated as the single cause of regional disorder; borders were renegotiated repeatedly (San Remo 1920, Lausanne 1923, local revolts), and agency of local actors mattered.	Western media often reifies Sykes-Picot; African and Russian perspectives stress local and great-power agency beyond one document.
L41	reconstruction	What does the UN perspective contribute to understanding mandate legacy?	The UN frames mandates as an early, flawed attempt at international trusteeship that evolved into decolonisation norms; it stresses legal continuity from League mandates to UN trust territories and self-determination.	UN perspective: legal-institutional; occludes the violence of mandate rule and the selectivity of decolonisation.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence Audit (score 0–100)

Concept / Claim	Confidence (0–100)	Evidence Basis	Gap to Close
Ottoman provincial boundaries vs. post-1920 state borders	0–100	Fromkin (1989); Hourani (1991)	Verify specific provincial lines (vilayets) and their correspondence to modern states
Sykes-Picot as cause vs. shorthand	0–100	Sykes-Picot Agreement (1916); Anderson (1987)	Check San Remo and Lausanne modifications

Concept / Claim	Confidence (0–100)	Evidence Basis	Gap to Close
Rentier-state mechanism (fiscal contract)	0–100	Owen (2004); Beblawi & Luciani (1987)	Compare Gulf cases with non-Gulf oil states (Iran, Iraq)
Artificiality thesis and its limits	0–100	Anderson (1987); Mamdani (1996)	Test with specific border disputes (Kuwait-Iraq, Western Sahara analogy)
2011 uprisings as crisis of post-colonial state system	0–100	Owen (2004); Bayart (2009)	Distinguish regime collapse (Libya, Syria) from regime adaptation (Egypt, Gulf)
African parallel state construction	0–100	Mamdani (1996); Grovogui (2006)	Map African mandate/trusteeship cases to Middle Eastern ones
Chinese non-interference in West Asia	0–100	General IR literature	Verify specific Chinese diplomatic positions 2011–2020
Russian sovereign-choice framing	0–100	General IR literature	Check Russian statements on Syria and Libya
UN mandate-to-decolonisation legal arc	0–100	UN Charter; League Covenant	Trace specific trust territories in Africa/Middle East

7.2 Three-Question Debrief

1. Which of the five perspectives did you initially treat as the "default" or "neutral" view, and what evidence from the lesson destabilises that assumption?
2. Identify one mechanism you can now state with its scope conditions; identify one you still cannot. What is the specific missing evidence?
3. Where did your prior knowledge of "Sykes-Picot" come from (media, prior coursework, political discourse), and how does the lesson's adjudication change its analytical status?

7.3 Error-Log

Common Misconception	Correction	Evidence
"Sykes-Picot drew all modern Middle East borders."	Sykes-Picot was a secret 1916 agreement modified by San Remo (1920) and Lausanne (1923); borders emerged from multi-actor bargaining, not one document.	Sykes-Picot Agreement (1916); Fromkin (1989)

Common Misconception	Correction	Evidence
"Rentier states are automatically authoritarian and unstable."	Rentierism weakens the fiscal contract but durability depends on coercive capacity, distributive legitimacy, and social structure; some rentier states have proven resilient.	Owen (2004); Beblawi & Luciani (1987)
"Middle East borders are uniquely artificial."	Colonial border artificiality is a global condition; African scholarship shows such lines become politically productive over time.	Mamdani (1996); Bayart (2009)
"The 2011 uprisings uniformly destroyed post-colonial states."	Outcomes varied: state collapse in Libya, Syria, Yemen; regime adaptation in Egypt, Tunisia, Gulf monarchies.	Owen (2004); Anderson (1987)
"Pan-Arabism failed because Arabs rejected unity."	Pan-Arabism was undermined by state-building interests of ruling elites and by the 1967 defeat, not simply popular rejection; it also shaped the nation-states it opposed.	Hourani (1991); Anderson (1987)
"Oil wealth guarantees regime survival."	Oil rents help but are mediated by institutional capacity, social coalitions, and external support; rentier states have faced serious challenges (Iran 1979, Iraq 2003).	Ross (2012); Owen (2004)

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Mandate system; rentier state; artificiality thesis; pan-Arabism; post-colonial state crisis	Great-power partition → League mandates → state formation; oil rent → weak fiscal contract → authoritarian durability; border imposition → institutional path dependence; uprisings → legitimacy crisis → variegated outcomes	Fromkin (1989) — great-power creation of Middle East; Hourani (1991) — Arab political thought; Owen (2004) — state, power, and politics; Anderson (1987) — imagined communities and nationalism; Mamdani (1996) — citizen and subject; Bayart (2009) — politics of the belly	Sykes-Picot (1916); San Remo (1920); Lausanne (1923); Gulf rentier states (Saudi Arabia, Kuwait, Qatar, UAE); 2011 uprisings (Tunisia, Egypt, Libya, Syria, Yemen); African parallels (Nigeria, Angola)	Artificiality vs. path dependence; state failure vs. state transformation; pan-Arabism as failure vs. precondition; rentierism as determinism vs. contingency	If borders showed no institutional persistence post-1920, artificiality thesis strengthened; if rentier states democratise without tax reform, fiscal-contract mechanism weakened; if 2011 produced uniform collapse, state-failure reading strengthened	L10 (imperialism); L11 (mandate system); L9 (sovereignty); L42 (Iran); L43 (sectarian); L44 (proxy warfare); L46 (hydrocarbons)

SECTION 9 — REVIEW SCHEDULE

- **R1 (Day 1, 20 min):** Re-read Section 2.2 and 2.3; redraw the before/after 1920 border map from memory; check against the Data Lab table.
- **R2 (Day 3, 30 min):** Reconstruct the five perspectives on Sykes-Picot in one paragraph each without notes; compare to Section 2.7.
- **R3 (Day 7, 45 min):** Write a 300-word memo applying the rentier-state mechanism to one Gulf state and one African petro-state; identify one falsifier.
- **R4 (Day 14, 60 min):** Complete the Problem Pair case (2011 uprisings) under timed conditions; grade against the model answer.
- **R5 (Day 30, 90 min):** Full lesson re-synthesis: explain all five key ideas to an imaginary peer, then take the hinge question cold; log errors in Section 7.3.

SECTION 10 — COMPLETION CHECKLIST

- ☐ I can state the five key ideas in order without notes.
- ☐ I can distinguish the Sykes-Picot agreement from the San Remo and Lausanne settlements.
- ☐ I can define "rentier state" and give its fiscal mechanism.
- ☐ I can name at least three Gulf rentier states and one African parallel.
- ☐ I can explain the artificiality thesis and its strongest counterargument.
- ☐ I can reconstruct the African perspective on border artificiality in 3–5 sentences.
- ☐ I can reconstruct the Chinese, Russian, Western, and UN perspectives in 3–5 sentences each.
- ☐ I can adjudicate between "state failure" and "state transformation" readings of 2011.
- ☐ I can identify scope conditions for the rentier-state mechanism.
- ☐ I can name at least two falsifiers for the rentier-state thesis.
- ☐ I have completed the Data Lab analysis questions.
- ☐ I have drawn or annotated at least one of the three visuals.
- ☐ I have filled in Cornell notes cues and summary.
- ☐ I have completed the Feynman compression steps.
- ☐ I have reviewed all flashcards at least once.
- ☐ I have scored my confidence audit and logged at least one error.
- ☐ I can link this lesson to L10, L11, L9, L42, L43, L44, and L46.
- ☐ I can answer the hinge question and diagnose each distractor.

43. The Iranian State: Velayat-e Faqih and Strategic Logic

LESSON METADATA

Field	Value
Lesson number and title	Lesson 42: The Iranian State: Velayat-e Faqih and Strategic Logic
Module	Module 7: West Asia and Iranian Geopolitics
Prerequisites	L41 (West Asia state system), L7 (ontological security)
Interleaved links	Forward to L43 (sectarian), L44 (proxy warfare), L45 (nuclear)
Reading load	7-9 hours
Content channels	Text, data lab, visuals, flashcards, memo exercise
Bloom ceiling	Analyze, evaluate, and create
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

The central puzzle of this lesson is not whether the Islamic Republic of Iran is "revolutionary" or "pragmatic"—those labels are too thin to carry explanatory weight—but how a state can sustain a constitutional order built on clerical guardianship while simultaneously operating as a strategically calculating actor in a hostile regional and international environment. Since 1979, Iran has combined a political theology that locates sovereignty in the jurist-guardian with institutions that look, from the outside, like a conventional security state: parallel military forces, intelligence networks, economic conglomerates, and diplomatic bargaining. The puzzle is therefore mechanistic: what institutional and ideological arrangements allow revolutionary claims to be converted into durable state capacity, and under what conditions do those same arrangements generate vulnerability? The question matters because Iran is not merely a case of authoritarian resilience; it is a test of whether revolutionary ideology can be routinized without being emptied of content, and whether a state under sustained sanctions can convert isolation into strategic depth. The lesson treats the Islamic Republic as a political system whose logic must be reconstructed from its own categories—Velayat-e Faqih, the Guardian Council, the Islamic Revolutionary Guard Corps (IRGC), the Basij, and the resistance economy—rather than as a deviation from a presumed Western liberal template.

This lesson sits at the intersection of three prior threads in the curriculum. Lesson 41 on the West Asian state system established that regional order is shaped by colonial borders, rentier political economies, sectarian geopolitics, and great-power penetration; Iran's state must be read against that regional field, not as an isolated unit. Lesson 7 on ontological security established that states seek continuity of self-identity and may treat threats to identity as existential even when material survival is not immediately at stake; this is essential for understanding why the Islamic Republic frames external pressure not only as a security problem but as an assault on its revolutionary selfhood. The forward links to Lessons 43–45 mean that this lesson is deliberately foundational: sectarian geopolitics, proxy warfare, and nuclear bargaining all presuppose an accurate model of the Iranian state's decision-making architecture. If one misidentifies where authority lies—between the Supreme Leader, the president, the IRGC, the clerical establishment, and elected institutions—then every subsequent judgment about escalation, deterrence, or diplomacy will be distorted. The lesson therefore begins with institutional mapping before moving to strategic interpretation.

By the end of the lesson, the student should be able to perform four operations that are often conflated in public debate. First, description: specify the formal and informal institutions of the Islamic Republic, including

the Supreme Leader, Guardian Council, Assembly of Experts, president, parliament, IRGC, Artesh, Basij, and the judiciary, and explain how they interact. Second, explanation: identify mechanisms through which these institutions produce outcomes such as sanctions resilience, regional influence, or domestic repression. Third, prediction: state scope conditions under which a given mechanism is likely to hold or fail, for example when oil revenues collapse, when protests cross class lines, or when succession uncertainty rises. Fourth, prescription: evaluate policy options without confusing analytic claims with normative commitments. The lesson's assessment logic is built around this distinction; a strong memo will not merely assert that the regime is "fragile" or "stable" but will specify the evidence, level of analysis, and falsifiers that would change the conclusion.

The theoretical stakes are high because Iran exposes the limits of several standard frameworks. Liberal institutionalism struggles to explain durable cooperation under sanctions; realism struggles to explain why a state with formidable conventional vulnerabilities invests in ideological export and proxy networks; constructivism can explain identity but risks circularity if every policy is read back into "revolutionary identity." The lesson therefore adopts a mechanism-based approach: it asks how Velayat-e Faqih shapes incentives, how parallel security institutions solve or create coordination problems, how defensive realism and revolutionary ideology are combined rather than treated as alternatives, how the resistance economy and smuggling networks convert pressure into adaptation, and how Persian nationalism, Shia identity, and martyrdom politics supply both legitimacy and mobilization. Each key idea is presented with scope conditions and counterarguments, because the same institution can be stabilizing under one set of conditions and destabilizing under another.

A central methodological commitment is that the African perspective is not an afterthought but a primary vantage point. African scholarship on revolutionary states, sovereignty norms, and post-colonial statecraft—ranging from Nkrumah's and Nyerere's reflections on self-determination to later analyses of parallel power structures and external intervention—reveals dimensions that Western, Chinese, Russian, and UN frameworks often occlude. In particular, the African vantage highlights how a state can be simultaneously anti-imperial and internally hierarchical, how sovereignty claims can be both emancipatory and disciplinary, and how external sanctions can strengthen rather than weaken nationalist narratives. This does not mean treating Iran as an African case; it means using African theoretical resources to ask questions that Eurocentric IR often suppresses, such as who defines "legitimacy," whose security is being secured, and how revolutionary states manage the tension between mass mobilization and institutional control.

Finally, the lesson is explicit about evidence limits. Public opinion data on Iran are politically sensitive and methodologically contested; GAMAAN surveys, for example, provide valuable but not definitive insight into attitudes toward the regime, compulsory hijab, and political alternatives. Economic data are distorted by sanctions evasion, multiple exchange rates, and opaque IRGC-linked enterprises. Strategic intentions are inferred from behavior and rhetoric, not from transparent deliberation. The student is therefore expected to treat all claims as provisional and to specify falsifiers. The lesson's central question can be stated as follows: under what conditions does Velayat-e Faqih generate strategic capacity rather than paralysis, and when does the Islamic Republic's combination of ideological legitimacy and coercive capacity begin to decouple? Answering that question requires moving beyond the binary of "regime change" versus "regime stability" toward a nuanced account of institutional adaptation, elite cohesion, social contract erosion, and regional opportunity structures.

SECTION 1 — Pre-Class Priming

1.1 Retrieval warm-up

1. From L41, what is the difference between a state's formal sovereignty and its effective capacity in a rentier political economy?
2. From L41, how do colonial borders in West Asia complicate the alignment of state boundaries with national identities?
3. From L7, define ontological security and explain why a state might prioritize identity continuity over short-term material gain.
4. From L7, how can external recognition or misrecognition affect a state's sense of self?
5. From earlier work on levels of analysis, what is the difference between an individual-level and a systemic-level explanation of foreign policy?
6. From earlier work on sanctions, what is the difference between coercive pressure and strategic strangulation, and why does the distinction matter?

1.2 Orientation questions

1. How does Velayat-e Faqih distribute authority among the Supreme Leader, elected institutions, and clerical bodies?
2. What functions do the IRGC, Artesh, and Basij perform, and how does their coexistence shape civil-military relations?
3. Is Iran's regional behavior better explained by defensive realism, revolutionary ideology, or a combination whose weights vary by issue?
4. Do the 2009 Green Movement and 2022 Mahsa Amini protests demonstrate a legitimacy crisis, a policy crisis, or a succession crisis?

1.3 Vocabulary pre-teach

- **Velayat-e Faqih**: doctrine of guardianship of the Islamic jurist; in Iran, the Supreme Leader's overarching authority over state and society, justified by Twelver Shia jurisprudence and revolutionary ideology.
- **Marja'-e Taqlid**: senior Shia cleric emulated by followers; a source of religious authority that can exist independently of state office.
- **Guardian Council**: body of clerics and jurists that vets legislation and candidates, guarding conformity with Islamic law and the constitution.
- **IRGC**: parallel military-security institution created after 1979 to protect the revolution; controls missile, naval, Quds Force, and extensive economic interests.
- **Artesh**: conventional armed forces; professional military with a more limited political role than the IRGC.
- **Basij**: paramilitary mobilization network embedded in society; used for internal security, social control, and wartime mobilization.
- **Resistance economy**: policy framework emphasizing self-sufficiency, sanctions evasion, and reduced vulnerability to external economic pressure.
- **Rentier state**: state deriving substantial revenue from external rents, especially hydrocarbons, shaping state-society relations and accountability.

- **Ontological security**: a state's need for stable self-identity and biographical continuity; threats to identity can be treated as existential.
- **Defensive realism**: theory that states seek security and survival rather than unlimited expansion, with power treated as instrumental to safety.
- **Shia identity**: religious and communal identity centered on Twelver Shiism, martyrdom narratives, and historical experience of marginalization.
- **Martyrdom (shahadat)**: in Iranian political discourse, sacrificial death for faith or nation; used to mobilize legitimacy and moral authority.

SECTION 2 — LESSON CORE

2.1 Learning Objectives

By the end of this lesson, the student will be able to:

1. **Analyze** the constitutional architecture of the Islamic Republic by tracing how the doctrine of *Velayat-e Faqih* was translated from Khomeini's 1970 lectures into the 1979 Constitution and its 1989 revisions, identifying the specific veto points (Guardian Council, Supreme Leader, Assembly of Experts) through which clerical authority constrains elected institutions. (Bloom: Analyze)

2. **Evaluate** the claim that Iran's institutional structure constitutes a "parallel state" by comparing the formal chain of command of the Artesh with the IRGC's autonomous economic, intelligence, and political networks, and by assessing whether this duality is better explained by revolutionary consolidation theory or by praetorian-state theory. (Bloom: Evaluate)

3. **Explain** the mechanism by which Iran's strategic logic combines defensive realism (territorial security, deterrence, balance-of-power) with revolutionary ideology (export of revolution, anti-imperialism, Shia solidarity), and identify the scope conditions under which one logic dominates the other in foreign-policy decision-making. (Bloom: Explain)

4. **Interpret** quantitative evidence on Iranian economic resilience under sanctions — including oil export volumes, inflation rates, and IRGC economic holdings — by distinguishing between aggregate state capacity and household welfare, and by identifying which metrics are most vulnerable to perspective bias. (Bloom: Interpret)

5. **Reconstruct** the five perspectives (African, Chinese, Russian, Western, UN) on the Iranian state as a whole, and **adjudicate** between them on the basis of specified evidence, demonstrating awareness of what each perspective reveals and what it systematically occludes. (Bloom: Reconstruct/Adjudicate)

2.2 KEY IDEA 1 — The Islamic Republic's Political Theology: *Velayat-e Faqih*, the Guardian Council, and Clerical Authority

Bolded Causal Claim: The Islamic Republic's political theology of *Velayat-e Faqih* institutionalizes clerical sovereignty as the foundational constitutional principle, such that the Supreme Leader's authority derives from a divine mandate rather than popular consent, producing a dual state in which elected institutions operate under unelected clerical veto.

Mechanism: The mechanism operates through three nested layers. First, the doctrinal layer: Ayatollah Ruhollah Khomeini's 1970 lectures at Najaf, published as *Islamic Government* (Hukumat-e Islami), argued that in the absence of the Twelfth Imam, the most qualified Islamic jurist (*faqih*) must exercise guardianship (*velayat*) over the Muslim community, including over political and military affairs. This was not merely advisory; Khomeini insisted that the jurist's authority superseded that of any elected body, because divine law could not be subordinated to popular will. Second, the constitutional layer: the 1979 Constitution (revised 1989) embedded this doctrine in Article 5 (the Supreme Leader as *faqih*) and Article 110 (the Leader's enumerated powers over the armed forces, judiciary, state broadcasting, and the Expediency Discernment Council). The 1989 revision abolished the office of Prime Minister and concentrated executive power in the presidency, but left the Leader's authority intact and arguably expanded it by removing the requirement that the Leader be a *marja'* (source of emulation), thereby broadening the pool of eligible clerics. Third, the institutional layer: the Guardian Council (Shura-ye Negahban), composed of six clerics appointed by the Leader and six jurists nominated by the judiciary and approved by parliament, exercises a double veto — it approves or disqualifies all candidates for the presidency, the Assembly of Experts, and parliament, and it reviews all legislation for conformity with Islamic law and the Constitution. The Assembly of Experts, an elected body of clerics, formally selects and (in theory) supervises the Supreme Leader, but in practice its role has been ceremonial; no Leader has ever been removed. The Expediency Discernment Council, created in 1988, resolves disputes between parliament and the Guardian Council, but its members are appointed by the Leader, ensuring that the final arbiter remains within the clerical orbit. The result is a "dual state" (Abrahamian, 2008): a republican facade of elections, parliament, and presidency layered over a theocratic core of clerical institutions that hold ultimate sovereignty.

The mechanism's causal force depends on the *fiqh* (jurisprudential) claim that the jurist's authority is *takwini* (constitutive) rather than *tashri'i* (legislative) — that is, the *faqih* does not merely interpret law but embodies the political will of the Hidden Imam. This theological move is what distinguishes *Velayat-e Faqih* from mere clerical influence in other Muslim-majority states. It also explains why the doctrine generated internal Shia opposition: Grand Ayatollah Mohammad Kazem Shariatmadari and later Grand Ayatollah Hossein-Ali Montazeri argued that the doctrine conflated spiritual authority with political power, violating the traditional Shia separation of religious and temporal spheres. Montazeri's 1997 house arrest after criticizing Supreme Leader Ali Khamenei demonstrated that the doctrine's institutionalization was enforced not only by theology but by coercion.

Scope Conditions: The doctrine's institutional dominance holds under three conditions. First, **clerical cohesion**: the *marja'iyyat* (source of emulation) must remain sufficiently unified that no rival cleric can claim superior religious authority; the 1994 death of Grand Ayatollah Mohammad Reza Golpayegani and the subsequent consolidation around Khamenei's *marja'iyyat* illustrate this. Second, **external threat perception**: the Iran-Iraq War (1980–1988) and subsequent sanctions regimes provided a rally-around-the-flag effect that legitimized clerical wartime leadership and suppressed internal dissent. Third, **repression capacity**: the IRGC and Basij must retain the coercive capability to suppress mass mobilization, as in 1999, 2009, and 2022. The doctrine's dominance weakens when these conditions erode: clerical fragmentation (as in the 2009 election crisis, when senior clerics like Montazeri's successors questioned Khamenei's legitimacy), sustained economic crisis that undermines the "resistance economy" narrative, or mass mobilization that exceeds repression capacity. The doctrine does not predict automatic regime collapse; rather, it predicts that challenges will be framed in constitutional-theological terms (e.g., "where is my vote?" in 2009 invoked the republican element against the theocratic element) rather than purely secular ones.

Observable Implications: If the causal claim holds, we should observe: (a) candidate disqualification rates

by the Guardian Council rising during periods of perceived threat (the 2004 and 2012 parliamentary elections saw mass disqualification of reformist candidates); (b) legislation passed by parliament being routinely returned or amended by the Guardian Council (approximately 20–30% of bills face objection in any given term); (c) the Supreme Leader's public interventions preceding major policy shifts (Khamenei's 2015 "red lines" on the nuclear deal); (d) the Assembly of Experts functioning as a ratification body rather than a supervisory one (no Leader has been dismissed since 1979); and (e) clerical rhetoric framing political disputes in theological terms (e.g., the 2009 "sedition" (*fitna*) framing). Conversely, if the doctrine were merely decorative, we would expect elected institutions to routinely override clerical bodies, which the record does not show.

Perspective Note (five traditions in brief):

African (primary): The African vantage point reads *Velayat-e Faqih* through the lens of post-colonial sovereignty and the problem of "invented traditions" in state-building. African scholars such as Mahmood Mamdani and Achille Mbembe have analyzed how post-colonial states deploy cultural or religious authenticity as a legitimation strategy against Western-imposed modernity. From this perspective, the Islamic Republic's political theology is not an exotic theocracy but a variant of a broader post-colonial pattern: the fusion of anti-imperial nationalism with a particularist cultural claim to sovereignty. The African perspective notes that Iran's 1979 revolution, like many African liberation movements, combined anti-Western grievance with a promise of authentic self-rule, and that the clerical state's survival reflects the same "politics of the belly" (Bayart) and neo-patrimonial consolidation that characterize many post-colonial regimes. What this perspective reveals is the *functional* similarity between clerical sovereignty and other forms of post-colonial authoritarian legitimation; what it occludes is the specifically Shia jurisprudential content of *Velayat-e Faqih*, which cannot be reduced to generic authoritarianism. The African perspective also highlights that Iran's anti-imperial stance resonates with African non-alignment traditions (Nkrumah, Nyerere), even as Iran's regional interventions complicate that solidarity.

Chinese: The Chinese perspective treats *Velayat-e Faqih* as an internal constitutional matter and applies the principle of non-interference. Beijing's engagement with Tehran is framed through strategic partnership and economic interest, not through evaluation of Iran's domestic legitimacy. The Chinese view recognizes the doctrine as a source of regime cohesion that produces predictable (if adversarial) behavior, which is preferable to instability. What this perspective occludes is the human-rights and democratic-accountability dimensions of clerical veto power, which Beijing's own sovereignty doctrine renders invisible.

Russian: The Russian perspective frames *Velayat-e Faqih* as a legitimate expression of Iranian civilizational sovereignty against Western universalism. Moscow sees the doctrine as producing a reliable anti-Western ally whose ideological consistency reduces transaction costs in strategic coordination. The Russian view tends to treat clerical authority as a stabilizing factor that prevents Iran from becoming a Western client state. What it occludes is the internal contestation within Iran over the doctrine's legitimacy, which Russian analysis often subordinates to geopolitical utility.

Western: The Western perspective has historically oscillated between treating *Velayat-e Faqih* as a totalitarian ideology (early post-1979) and as a pragmatic authoritarian system (post-2000s). The "irrationality" critique — that clerical sovereignty produces unpredictable, ideologically driven foreign policy — has been challenged by scholars (Takeyh, 2009) who argue that the doctrine is compatible with strategic calculation. What the Western perspective reveals is the tension between republican and theocratic elements; what it occludes is the doctrine's internal Shia legitimacy and its resonance with anti-imperial traditions outside the West.

UN: The UN perspective frames *Velayat-e Faqih* through the Charter's sovereignty principle (Article 2.1) and human-rights instruments. The doctrine is not directly addressed by UN resolutions, but the Guardian Council's candidate vetting has been criticized by UN human-rights mechanisms as inconsistent with political participation rights. The UN perspective reveals the gap between Iran's constitutional sovereignty and international human-rights norms; what it occludes is the theological specificity that makes the doctrine internally coherent to its adherents.

SECTION 2.3 KEY IDEA 2 — Iran's institutional structure: IRGC, Artesh, Basij, and the parallel security apparatus

Bolded Causal Claim: Iran's post-revolutionary security order is organized as a dual state in which the Islamic Revolutionary Guard Corps (IRGC), the conventional Artesh, the Basij, and competing intelligence services operate in parallel under the Supreme Leader, so that revolutionary guardianship is institutionally privileged over constitutional regularity; this redundancy protects the regime from coups and external pressure but also fragments command, diffuses accountability, and embeds coercive power in the economy.

Mechanism: The 1979 revolution destroyed the Shah's military and forced the new republic to build coercion from revolutionary fragments. The constitution's Article 150 recognizes the IRGC as guardian of the revolution, while Article 143 preserves the Artesh for territorial defense, producing a legal dualism that became an operational dualism. The IRGC developed ground, naval, aerospace, and Quds Force branches; the Artesh retained conventional army, navy, and air force functions. The Basij, originally a wartime volunteer militia, became a permanent paramilitary and social-control network embedded in neighborhoods, universities, workplaces, and mosques. Intelligence functions split between the Ministry of Intelligence and Security (MOIS) and the IRGC Intelligence Organization, creating overlapping surveillance and competing chains of reporting. The Supreme Leader sits atop both military and intelligence structures through appointments, representatives, and ideological oversight. The resilience mechanism is redundancy: no single coercive institution can seize power alone, each monitors the others, ideological screening reduces defection, and parallel chains of command mean that presidents and parliaments cannot easily redirect the gun. The fragmentation mechanism is equally important: procurement, doctrine, and operations are duplicated; the IRGC's economic conglomerate, Khatam al-Anbiya, competes with state ministries and private firms; Basij local commanders may act with considerable autonomy; and intelligence rivalry produces competing arrests, narratives, and policy advice. The IRGC's wartime experience, missile forces, and regional operations gave it strategic primacy, while the Artesh became a professional but politically secondary military. The Basij provides mass mobilization and low-cost coercion, especially during unrest. Together these institutions form a security ecosystem rather than a unified military, and that ecosystem is designed to make regime survival less dependent on any single officer corps.

Scope Conditions: The parallel apparatus strengthens the regime when external threat is high, as during the Iran-Iraq War or periods of intense U.S. pressure; when the Supreme Leader can arbitrate among institutions; when oil rents fund patronage and procurement; and when revolutionary ideology remains cohesive enough to legitimate sacrifice. It is more likely to weaken the regime when economic contraction reduces rents, when succession uncertainty pits institutions against one another, when the IRGC becomes so economically powerful that it crowds out state capacity, or when sustained protests require repeated coercion and expose the brutality of Basij and IRGC units. The mechanism also assumes that the Supreme Leader's authority remains effective; if that authority fragments, parallel structures can become rival fiefdoms rather

than complementary guardians. Sanctions can paradoxically strengthen the IRGC by increasing the value of smuggling networks, procurement monopolies, and black-market rents, but over time they can also strain the patronage base that keeps Basij and IRGC personnel loyal. The model does not imply that the Artesh is irrelevant; rather, it suggests that the Artesh's professional role is subordinated to a revolutionary security logic that privileges loyalty and redundancy over efficiency.

Observable Implications: The dual state should be visible in institutional appointments, budget opacity, and operational division of labor. Observable indicators include IRGC commanders in cabinet and strategic posts; Khatam al-Anbiya's prominence in construction, energy, and engineering contracts; Basij presence in universities and workplaces; IRGC naval incidents in the Gulf; Quds Force operations in Iraq, Syria, Lebanon, and Yemen; limited Artesh access to advanced strategic weapons; and arrests or intelligence actions by both MOIS and IRGC Intelligence. During domestic unrest, Basij and IRGC units rather than the Artesh are typically used for internal repression, preserving the Artesh's external role and reducing the risk that a conventional military coup will follow a crackdown. The model also implies that Iran's military parades and force structure will display Artesh and IRGC as separate organizations, with the IRGC controlling missiles, drones, and asymmetric capabilities. Data on IRGC economic holdings should therefore be read not merely as corruption but as a mechanism of institutional autonomy: economic resources allow the Guard to sustain operations, patronage, and procurement even when the civilian budget is constrained.

Perspective Note (five traditions in brief):

African (primary): African scholarship on postcolonial militarization treats parallel security structures as a familiar pattern rather than an Iranian anomaly. From this vantage, the IRGC resembles presidential guards, revolutionary militias, and shadow armies that post-revolutionary regimes create to prevent coups and to discipline society. Thinkers such as Bayart on the "politics of the belly" and Mbembe on the militarization of sovereignty help frame the IRGC's economic role as part of a broader pattern in which coercive institutions become accumulation machines. Grovogui's emphasis on contested sovereignty is also useful: revolutionary states often build parallel coercive orders because their sovereignty is challenged by external powers, and the resulting "state of exception" can stabilize rule while corroding public accountability. The African perspective reveals that Iran's parallel apparatus is rational coup-proofing under perceived encirclement, not simply ideological fanaticism; what it occludes, unless supplemented by Iranian and UN sources, is the specific Shia theological legitimacy that makes the IRGC internally coherent to its members.

Chinese: The Chinese perspective treats Iran's institutional structure as an internal matter and emphasizes stability, state capacity, and non-interference. It may view the IRGC's economic role as a form of state-led development and strategic self-reliance, especially under sanctions, while remaining concerned about regional escalation that could threaten energy flows and Belt and Road interests. It tends to occlude questions of human-rights accountability and the coercive use of Basij networks.

Russian: The Russian perspective frames the IRGC as a legitimate allied security institution and a partner in anti-Western resistance. It supports military-technical cooperation and sees parallel structures as defensive responses to U.S. pressure. This perspective reveals the geopolitical logic of Iranian deterrence but occludes internal repression, intelligence rivalry, and the economic costs of IRGC autonomy.

Western: The Western perspective often frames the IRGC as a praetorian and terrorist-designated actor, emphasizing sanctions, accountability, and human rights. It reveals the coercive and destabilizing dimensions of the parallel state but frequently occludes the defensive motivations, coup-proofing logic, and internal legitimacy that sustain the institution.

UN: The UN perspective approaches the parallel security apparatus through human-rights mechanisms, sanctions compliance, and the Charter's sovereignty framework. It highlights arbitrary detention, use of force against protesters, and accountability gaps, but it occludes the theological and revolutionary context that makes the IRGC meaningful to its supporters.

SECTION 2.4 KEY IDEA 3 — Iran's strategic logic: defensive realism plus revolutionary ideology

Bolded Causal Claim: Iran's strategic behavior is best explained by the interaction of defensive realism and revolutionary ideology: a security-seeking state uses revolutionary institutions and transnational networks to compensate for conventional inferiority and encirclement, producing an offensive-defensive posture that is structurally rational but ideologically inflected in its means.

Mechanism: Defensive realism begins from the premise that states seek security rather than expansion, and that Iran's strategic environment is shaped by repeated experiences of vulnerability: the 1953 coup, the Iran-Iraq War, U.S. military bases around its periphery, sanctions, and regional coalitions. Conventional military inferiority pushes Iran toward deterrence through missiles, drones, cyber capabilities, and proxy networks. Revolutionary ideology, rooted in 1979, supplies anti-imperialism, Shia transnationalism, and the language of resistance; it legitimates support for allied movements and frames regional interventions as defense of the oppressed. The interaction is the key mechanism. Ideology provides mobilization, legitimacy, and low-cost force multipliers; defensive realism sets limits by prioritizing regime survival and avoiding direct war with superior powers. The result is "forward defense": threats are engaged in Lebanon, Syria, Iraq, and Yemen rather than at Iran's borders. Asymmetric deterrence imposes costs on adversaries without requiring conventional parity. Nuclear hedging maintains threshold capability and bargaining leverage without necessarily crossing the weaponization line. Strategic patience calibrates responses so that retaliation signals resolve while avoiding escalation that could threaten the regime. Ideology is also instrumentalized domestically: the resistance narrative consolidates legitimacy and reframes economic hardship as sacrifice. Thus the posture is neither purely defensive nor purely revolutionary; it is a security strategy that uses revolutionary tools to manage an unfavorable balance of power.

Scope Conditions: Defensive realism is more likely to dominate when regime survival is directly threatened, when sanctions are severe, when conventional gaps are large, or when succession politics require caution. Revolutionary ideology is more likely to dominate when regional opportunities open, as during the Arab uprisings; when proxy gains are cheap; when domestic legitimacy needs reinforcement; or when IRGC commanders have greater autonomy. The interaction holds best when the Supreme Leader can balance security and ideology, and when proxy networks remain controllable. It weakens when proxies become liabilities, as prolonged commitments in Syria or Yemen can drain resources; when ideology provokes counter-balancing, as regional states align more closely with the United States or Israel; or when economic collapse undermines both deterrence and revolutionary legitimacy. The model also has an important boundary: Iran's interventions are concentrated in spaces with Shia, allied, or strategically vital characteristics, not in a global program of conquest. To describe the posture as "offensive-defensive" is therefore not to claim that Iran seeks unlimited expansion; it is to claim that defensive goals are pursued through means that adversaries experience as offensive.

Observable Implications: The combined model predicts a distinctive pattern of behavior: heavy investment in missiles, drones, and asymmetric capabilities; sustained support for proxy and partner forces; avoidance of direct war with the United States despite provocations and crises; nuclear hedging rather than overt weaponization; calibrated retaliation that signals resolve but preserves escalation control; and rhetoric that

frames interventions as defensive resistance. The 2020 killing of Qassem Soleimani and Iran's subsequent missile strike on U.S. forces in Iraq illustrate this pattern: a forceful but bounded response designed to restore deterrence without triggering full-scale war. More recent direct strikes demonstrate that Iran's escalation ladder has widened, but they do not by themselves refute the model if they remain accompanied by signaling intended to limit all-out conflict. The model also predicts that Iran will accept tactical compromises, such as the 2015 nuclear agreement, when they improve security and economic conditions, while retaining long-term hedging options. Publicly, the regime should continue to emphasize resistance even when it engages in pragmatic diplomacy, because ideology remains a source of domestic and regional legitimacy.

Perspective Note (five traditions in brief):

African (primary): African scholarship on anti-colonialism, non-alignment, and revolutionary statecraft gives Iran's strategic logic a recognizable lineage. Thinkers such as Nkrumah, Cabral, and Fanon framed imperialism as a structural condition requiring solidarity, self-reliance, and sometimes armed struggle; from this vantage, Iran's resistance discourse and support for allied movements can be read as part of a broader postcolonial repertoire rather than as sui generis fanaticism. The African perspective also highlights the tension between revolutionary legitimacy and developmental outcomes: resistance may mobilize populations, but it does not automatically produce prosperity or accountable governance. It reveals parallels between Iran's "forward defense" and the rear-base strategies of liberation movements, while occluding the sectarian specificity of Iran's Shia networks unless read alongside Middle Eastern sources.

Chinese: The Chinese perspective generally interprets Iran's posture as rational security-seeking under pressure. It emphasizes sovereignty, non-interference, and the stabilizing value of the 2015 nuclear agreement, while supporting Iran's integration into Eurasian economic networks. China values Iran as a partner in multipolarity and energy security, and it tends to occlude proxy warfare and human-rights concerns in favor of diplomatic and commercial engagement.

Russian: The Russian perspective frames Iran as an allied state in an anti-Western multipolar order. It supports Iran's deterrence capabilities, opposes unilateral sanctions, and sees Iranian regional influence as a counterweight to U.S. hegemony. This perspective reveals the geopolitical logic of resistance but occludes the costs of proxy entanglements and the internal authoritarian dimensions of the Iranian state.

Western: The Western perspective often treats Iran as an adversarial and potentially irrational actor, emphasizing nuclear risk, proxy violence, and ideological hostility. It reveals genuine security concerns and the coercive effects of Iranian policy, but it frequently occludes defensive motivations, the trauma of the Iran-Iraq War, and the internal legitimacy that revolutionary ideology provides.

UN: The UN perspective frames Iran's strategic behavior through the Charter's prohibition on the use of force, sovereignty norms, sanctions regimes, and IAEA safeguards. It reveals the legal constraints on both Iranian and adversarial actions and highlights the importance of negotiated settlements, but it occludes the asymmetry of power and the political context that makes deterrence appear necessary to Iranian leaders.

2.5 KEY IDEA 4 — Sanctions resilience: the resistance economy, smuggling networks, and Chinese partnerships

Bolded Causal Claim: International sanctions have not produced economic collapse or regime change in Iran; instead, they have restructured the economy around a state-directed "resistance economy" in which

sanctions rents are captured by security and parastatal elites, while costs are displaced onto households, informal labor, and non-connected firms.

Mechanism: The causal chain begins with an external shock—multilateral or unilateral sanctions targeting oil exports, banking, shipping, insurance, and technology. The Iranian state responds not with liberalization but with a combination of import substitution, price controls, subsidy reallocation, currency management, and parallel trade channels. The Islamic Revolutionary Guard Corps (IRGC) and bonyads (parastatal foundations) become central intermediaries because they possess the organizational capacity, coercive reach, and transnational networks needed to move goods and capital across sanctioned borders. The resistance economy is therefore not merely a slogan; it is an institutional project that militarizes economic governance and rewards actors capable of operating in legal gray zones.

Smuggling networks through the Persian Gulf, Iraq, Turkey, Afghanistan, and the Caspian basin convert border porosity into a rent-generating system. Sanctioned goods are imported at inflated prices, while oil and petrochemicals are exported through ship-to-ship transfers, false documentation, front companies, and discounted sales to willing buyers. The IRGC's engineering and construction arms, especially Khatam al-Anbiya, and bonyads with tax-exempt, politically connected status expand into sectors vacated by foreign firms. This creates a feedback loop: sanctions increase the premium on evasion, evasion increases the value of IRGC and bonyad networks, and those networks then acquire stakes in preserving the sanctioned order that sustains their rents.

Chinese demand is pivotal because it provides a large, partially sanctions-resistant market for Iranian crude. Chinese buyers, including state-owned and private refiners, have often purchased Iranian oil at a discount through indirect channels, barter arrangements, or long-term credit structures. This does not eliminate sanctions pressure, but it prevents the total revenue collapse that a fully enforced embargo would imply. Currency depreciation and inflation then redistribute income: exporters, rent-seekers, and connected intermediaries gain, while wage earners and fixed-income households lose purchasing power. The state partially compensates through subsidies and cash transfers, but these are fiscally constrained and often captured or diluted by politically connected intermediaries. Over time, the economy becomes more militarized, less transparent, and more dependent on informal trade, with the IRGC's economic role expanding not despite sanctions but partly because of them. This is not autarky; it is a reconfiguration of state-capital relations under external pressure.

Scope Conditions: Sanctions resilience is conditional rather than automatic. It is strongest when oil prices are high enough to finance imports and subsidies; when enforcement is fragmented, allowing smuggling and third-country laundering; when a major buyer such as China maintains demand; and when the regime retains coercive capacity to suppress unrest and manage elite cohesion. It weakens when sanctions are multilateral and tightly enforced, when oil prices fall, when inflation erodes the real value of subsidies, when protests escalate beyond localized grievances, or when elite factions fracture over rent distribution. The resistance economy also assumes a state willing to absorb long-term efficiency losses; if technological isolation degrades oil infrastructure, if capital flight accelerates, or if skilled labor emigrates, resilience can become stagnation. Finally, the model depends on geographic and social conditions: porous borders, ethnic trading communities, informal labor markets, and hawala-style transfer systems make smuggling possible, but they also create spaces of autonomy that the state cannot fully control.

Observable Implications: If this mechanism operates, one should observe sustained Iranian oil exports despite sanctions, often through opaque shipping and discount pricing; rising IRGC and bonyad participation in construction, energy, telecommunications, and import sectors; widening gaps between official and market

exchange rates; high inflation and currency volatility; growth in informal trade with neighboring states; and periodic protests driven by cost-of-living pressures rather than by sanctions alone. One should also observe Chinese firms and banks navigating sanctions risk through indirect channels, and Iranian officials framing economic hardship as evidence of Western aggression. GAMAAN surveys and other public-opinion instruments can be used to test whether economic pain is attributed to sanctions, regime mismanagement, or both, though online and diaspora-skewed samples require methodological caution.

Conversely, if sanctions were fully effective, one would expect a sustained collapse in oil revenue, fiscal crisis, and rapid regime concession; the absence of such outcomes supports the resilience thesis, though it does not prove that sanctions have no coercive effect. Data on IRGC economic holdings, oil export volumes, inflation, GDP, and household welfare can be used to test whether resilience is concentrated in state-security networks or broadly shared. A useful diagnostic is whether sanctions relief would primarily benefit ordinary households or would be captured by the same parastatal networks that currently manage evasion.

Perspective Note (five traditions in brief):

African (primary): From an African vantage point, sanctions on Iran are read less as neutral law enforcement than as a coercive instrument of great-power economic statecraft, echoing the experience of sanctions, structural adjustment, and resource conditionalities imposed on African states. The perspective emphasizes sovereignty, the right to independent development, and the hypocrisy of sanctioning states that themselves benefit from Iranian oil or arms markets. It also recognizes, however, that sanctions can be captured by domestic elites: the resistance economy may protect state autonomy while reproducing rentier inequality, a pattern familiar in postcolonial political economies where external pressure strengthens security apparatuses and weakens civilian institutions. Thus the African lens contributes both solidarity with anti-imperial economic sovereignty and a critical warning about authoritarian rent capture.

Chinese: The Chinese perspective treats Iran as a strategic partner and energy supplier within a broader Eurasian connectivity agenda. It emphasizes non-interference, commercial pragmatism, and the illegitimacy of unilateral sanctions not authorized by the UN Security Council. Chinese actors are understood to pursue discounted oil, infrastructure contracts, and long-term market access while managing sanctions exposure through indirect trade and financial channels. This perspective reveals the material foundations of Iranian resilience but tends to occlude the domestic political costs of the partnership and the opacity of Chinese commercial practices.

Russian: The Russian perspective frames sanctions as an instrument of Western hegemony and Iran as a fellow target of coercive economic pressure. It emphasizes anti-Western solidarity, arms and technology cooperation, and the strategic value of an Iran that distracts and constrains US power in West Asia. This lens highlights the geopolitical logic of partnership but often occludes Russian opportunism, including competition with Iran in energy markets and the limits of Moscow's willingness to absorb sanctions risk on Tehran's behalf.

Western: The Western perspective, especially in US and European policy discourse, treats sanctions as coercive diplomacy aimed at constraining Iran's nuclear program, regional activities, and human-rights abuses. It emphasizes legal authority, enforcement, and the cumulative economic pressure that sanctions impose on regime decision-making. This perspective reveals the coercive intent and some measurable economic effects, but it often overstates the likelihood of economic collapse, understates Iranian adaptive capacity, and occludes the humanitarian and political costs borne by ordinary Iranians.

UN: The UN perspective frames sanctions through Charter-based authority, Security Council resolutions,

and the distinction between multilateral and unilateral measures. It emphasizes legal process, humanitarian exemptions, and the need to balance nonproliferation or security objectives with human-rights and development concerns. This lens reveals the importance of legitimacy and procedural constraint but can occlude the asymmetry between powerful sanctioning states and targeted economies, as well as the political incentives that drive enforcement beyond formal mandates.

2.6 KEY IDEA 5 — Iranian identity: Persian nationalism, Shia identity, and the politics of martyrdom

Bolded Causal Claim: Iranian political mobilization and regime legitimation are shaped by a layered identity field in which Persian nationalism, Shia religious symbolism, and martyrdom politics interact; these resources can sustain revolutionary authority and also supply the moral vocabulary for dissent.

Mechanism: The mechanism operates through three overlapping identity registers. First, Persian nationalism provides a civilizational narrative of antiquity, language, and statehood that predates both the Islamic Republic and the 1979 revolution. It allows the regime to present itself as defender of an ancient nation against foreign domination, while also giving opposition movements a non-sectarian language of dignity, culture, and historical pride. Second, Shia identity supplies a moral cosmology centered on justice, suffering, and resistance to tyranny, most powerfully expressed through the Karbala narrative of Imam Hussein's martyrdom. The regime uses this to sacralize the state, frame enemies as Yazid-like oppressors, and legitimize sacrifice in war and revolution. Third, martyrdom politics converts death into political capital: the graves of war dead, revolutionary figures, and protesters become sites of memory and contestation. Basij recruitment, state commemorations, and opposition funerals all draw on this symbolic economy.

The interaction is not additive but dialectical. The same symbols that authorize state violence can be turned against the state when citizens perceive hypocrisy, corruption, or repression. A regime that claims to embody the justice of Karbala becomes vulnerable when its conduct is read as Yazid-like. Similarly, Persian nationalism can be mobilized by the state as anti-imperial pride or by protesters as a claim to modern dignity and cultural freedom. Martyrdom politics requires a credible narrative of sacrifice; if the state is seen as corrupt or indifferent, commemoration becomes critique rather than legitimation. Thus identity is not a fixed trait but a contested resource whose mobilization depends on political context, generational change, and the credibility of those who claim to embody it.

Scope Conditions: This identity mechanism is strongest where religious institutions retain social authority, where war memory remains salient, and where the state can control commemorative spaces. It weakens under secularization, generational turnover, ethnic marginalization, and economic crisis. Persian nationalism can unify but also exclude non-Persian communities such as Kurds, Baluch, Arabs, and Azeris, whose grievances may be expressed through ethnic rather than national frames. Shia identity can mobilize cross-class solidarity but can also be challenged by demands for gender equality, secular governance, or minority rights. The mechanism also depends on media and ritual infrastructure: mosques, state television, schools, and digital platforms shape which identity narratives circulate and which are suppressed. In periods of economic stress, identity claims may be displaced by material grievances, but they often return as the language through which those grievances are interpreted.

Observable Implications: If this mechanism is operative, one should observe the regime's continued use of revolutionary and religious symbolism in official rhetoric, military recruitment, and foreign policy; the prominence of martyrdom commemorations; and the persistence of Persian cultural nationalism in both state and opposition discourse. One should also observe protests that invoke justice, dignity, and anti-tyranny themes resonant with Shia moral vocabulary, as well as ethnic and gender-based mobilizations that challenge

the regime's claim to represent a unified national-religious community.

The 2009 Green Movement and the 2022 protests following Mahsa Amini's death illustrate how identity resources can be mobilized against the state: demonstrators drew on universalist claims of dignity and rights while also invoking Iranian national belonging. If identity were purely top-down, protests would not adopt national symbols; if it were purely oppositional, the regime would not retain significant constituencies. The coexistence of both supports the layered-identity thesis. GAMAAN surveys and other opinion research can help assess how Iranians rank national, religious, and civic identities, though such data should be interpreted with attention to sampling limits and political sensitivity.

Perspective Note (five traditions in brief):

African (primary): The African perspective recognizes in Iranian identity politics a familiar postcolonial dynamic: the fusion of cultural nationalism, religious moral vocabulary, and anti-imperial sacrifice in the construction of a revolutionary state. Scholars of African liberation movements have analyzed how martyrdom, cultural authenticity, and anti-colonial struggle become sources of legitimacy and also of later contestation. From this vantage point, Iran's politics of martyrdom is not exotic but comparable to the sacralization of liberation struggles elsewhere, while its ethnic and gender exclusions echo the limits of postcolonial nation-building. The African lens thus contributes a comparative theory of revolutionary legitimacy and a warning that identity-based state projects often reproduce hierarchies they claim to overcome.

Chinese: The Chinese perspective treats Iranian identity as an internal matter and emphasizes stability, sovereignty, and non-interference. It is attentive to civilizational narratives and to the role of religion in social order, but it generally subordinates identity questions to strategic and economic interests. This perspective reveals the external limits of identity-based foreign policy but tends to occlude the domestic conflicts that identity politics can generate.

Russian: The Russian perspective frames Iran as a civilizational state resisting Western liberal universalism. It emphasizes shared opposition to US hegemony, the value of religious and cultural traditionalism, and the strategic utility of an Iran that challenges Western norms. This lens highlights the geopolitical function of identity but often occludes the internal diversity and dissent within Iranian society, as well as the costs of aligning with an authoritarian partner.

Western: The Western perspective often interprets Iranian identity through the lens of ideology and threat, emphasizing revolutionary Islam, anti-Americanism, and the potential irrationality of a state guided by religious doctrine. It also foregrounds human-rights concerns, especially regarding women, minorities, and political dissent. This perspective reveals genuine repression and the instrumental use of identity by the state, but it frequently occludes the defensive and postcolonial dimensions of Iranian nationalism and the agency of Iranians who mobilize identity for emancipatory ends.

UN: The UN perspective frames identity-related issues through human rights, cultural rights, minority protection, and freedom of religion or belief. It emphasizes legal standards and the protection of individuals and groups against discrimination or coercion. This lens reveals the importance of pluralism and accountability but can occlude the political and historical context in which identity claims are made, as well as the asymmetry between international norms and local power structures.

SECTION 2.7 FIVE PERSPECTIVES IN DEPTH

2.7.1 African Perspective (PRIMARY)

From an African vantage point, the central puzzle of the Iranian state is not why a theocracy persists in a modernizing society, but how a revolutionary state born of anti-imperial mobilization sustains sovereignty, security, and legitimacy under conditions of external coercion and internal contestation. African political thought has long treated the state not as a neutral administrative container but as a historically produced arena of domination, negotiation, and survival. In this register, Iran's combination of Velayat-e Faqih, the Guardian Council, the Islamic Revolutionary Guard Corps (IRGC), the regular army (Artesh), and the Basij appears less as an exotic constitutional anomaly than as a variant of the postcolonial problem: how to build a sovereign political order after a rupture with an imperial-backed regime, while facing sanctions, covert intervention, and regional insecurity. The 1979 revolution, in this reading, belongs to the same broad historical family as anti-colonial revolutions, even though Iran was not formally colonized in the same manner as much of Africa. The 1953 coup against Mohammad Mossadegh, the Shah's dependence on Western powers, and the subsequent revolutionary overthrow of that order provide the anti-imperial grammar through which many African scholars would approach Iran. The African perspective therefore begins by refusing the premise that Iran's political theology is merely irrational or pre-modern; instead, it asks what work Velayat-e Faqih performs in consolidating a post-revolutionary order, disciplining competing elites, and asserting autonomy from a Western-dominated international system. This does not require endorsing the doctrine. It requires taking seriously the possibility that clerical authority, like other postcolonial ideologies, can function as a language of sovereignty and collective self-definition. The African lens is especially attentive to the gap between formal sovereignty and substantive autonomy, a gap that Nkrumah (1965) named neo-colonialism: the continuation of external control through economic, financial, and technical means rather than direct rule. From this standpoint, sanctions against Iran are not simply policy instruments; they are mechanisms of structural coercion that reproduce hierarchy in the international order. Grovogui's (1996) analysis of quasi-sovereignty is directly relevant: some states possess juridical sovereignty while being denied the substantive capacity to make autonomous decisions, particularly in security and economic domains. Iran's insistence on nuclear latency, ballistic missiles, and regional alliances can be read, in part, as an attempt to convert juridical sovereignty into substantive autonomy. The African perspective thus contributes a vocabulary for understanding why Iranian leaders may experience sanctions not as neutral enforcement but as an existential challenge to post-revolutionary self-determination.

The institutional structure of the Islamic Republic also becomes intelligible through African scholarship on the bifurcated and hybrid state. Mamdani's (1996) account of the colonial state distinguished between citizens in urban, "civil" domains and subjects in rural, "customary" domains, producing a state that governed through differentiated legal regimes. Although Iran is not a colonial state in the African sense, the concept of bifurcation travels: the Islamic Republic maintains parallel institutions that divide authority between elected and unelected bodies, between the regular military and the IRGC, and between national and revolutionary claims to legitimacy. The Guardian Council's vetting power, the Supreme Leader's authority, and the IRGC's economic and security roles create a layered sovereignty that is not unique to Iran. Many postcolonial African states have relied on presidential guards, party militias, intelligence services, and informal networks that coexist with formal militaries and parliaments. Aning and Danso's work on African security governance emphasizes that hybrid security arrangements often emerge where states face insurgencies, coups, or external threats, and where formal institutions are perceived as insufficiently loyal or capable. From this perspective, the IRGC is not simply a praetorian guard or a terrorist organization, as Western adversarial narratives often assert; it is a revolutionary security institution whose legitimacy derives from its role in defending the 1979

order, fighting the Iran-Iraq war, and managing internal dissent. The Basij, similarly, can be understood as a mass mobilization structure that links state power to neighborhood, mosque, and workplace networks, resembling other forms of popular militia or party-based mobilization in postcolonial settings. This lens reveals the functional logic of parallel institutions: they provide redundancy, ideological reliability, and social penetration. Yet it also exposes their costs. Mamdani's warning that bifurcated states can undermine democratic citizenship applies with force: when unelected bodies override elected ones, and when security institutions acquire economic empires, the result is not merely revolutionary vigilance but a contraction of public accountability. Maloney's (2015) analysis of Iran's political economy since the revolution underscores that the IRGC's economic holdings are not incidental; they shape resource allocation, privilege, and the distribution of state rents. The African perspective therefore contributes a structural explanation for why parallel institutions persist, while its own critical traditions—Bayart's (1993) emphasis on the "politics of the belly" and Mbembe's (2001) analysis of the postcolony—warn that such institutions can become vehicles for elite capture, predation, and the privatization of public power.

Sanctions resilience, the fourth key idea, is where the African perspective is perhaps most distinctive. Rather than treating Iran's "resistance economy" as a slogan or a failure, African scholarship on self-reliance and extraversion can illuminate both its achievements and its contradictions. Nyerere's (1968) articulation of ujamaa and self-reliance was rooted in the conviction that political independence without economic autonomy remains fragile. Iran's resistance economy rhetoric, especially under intensified sanctions, echoes this logic: reduce dependence on hostile powers, develop domestic capacity, and build alternative trade relationships. Rodney's (1972) analysis of underdevelopment is also pertinent. Rodney argued that African underdevelopment was not a natural condition but a historical product of extraction and unequal exchange. Applied to Iran, this suggests that sanctions do not merely punish policy choices; they operate within a global economic structure in which control over finance, shipping, insurance, and technology is concentrated in Western hands. The African perspective thus interprets smuggling networks, barter arrangements, and Chinese partnerships not as mere criminality or dependency, but as adaptive strategies within an unequal system. Bayart's (1993) concept of extraversion adds nuance: African states have historically derived power from their position in external networks, sometimes turning dependency into leverage. Iran's partnerships with China and Russia can be read similarly, as attempts to convert geopolitical position into economic and strategic room for maneuver. Yet Bayart's framework also warns that extraversion can reproduce elite dependence on external patrons and distort domestic development. The resistance economy may protect regime survival while imposing severe costs on ordinary Iranians, including inflation, unemployment, and shortages. GAMAAN surveys and other public opinion data, though methodologically contested, indicate significant dissatisfaction with economic conditions and governance, suggesting that resilience at the state level does not equate to welfare at the societal level. The African perspective therefore reveals the political economy of sanctions: they are experienced as collective punishment, but their evasion can also deepen inequality and strengthen security elites. It occludes, however, the specific mechanisms of Iran's oil sector, its technological constraints, and the precise role of Chinese firms, which require sectoral and financial analysis beyond the African comparative frame.

Identity is the fifth key idea, and here African scholarship offers both illumination and caution. Fanon's (1961) analysis of colonialism emphasized that national culture and identity become weapons of liberation, but also warned that post-revolutionary elites can freeze culture into an instrument of domination. Cabral's (1973) insistence on "return to the source" similarly treated culture as a terrain of struggle, not a fixed essence. Iran's Persian nationalism and Shia identity can be understood in this way: as resources for collective mobilization against imperial intervention and for the construction of a post-revolutionary citizen. The politics of martyrdom, especially during and after the Iran-Iraq war, created a sacred economy of sacrifice that binds

citizens to the state through blood and memory. Mbembe's (2003/2019) work on necropolitics is useful but must be applied carefully. Mbembe argues that sovereignty in the postcolony often operates through the power to determine who may live and who must die. Iran's martyrdom discourse can be interpreted as a mobilization of death for sovereignty, in which the state sacralizes sacrifice and demands loyalty through the memory of the fallen. Yet this is not identical to Mbembe's colonial and postcolonial African cases; Iranian martyrdom also draws on specifically Shia narratives of Karbala and resistance to tyranny. The African perspective contributes a comparative language for understanding how states use death, memory, and sacrifice to produce political community. It also warns, through Mbembe and Fanon, that such mobilizations can become coercive and exclusionary. Oyěwùmí's (1997) feminist critique of the "invention of women" and Tamale's (2020) decolonial Afro-feminism are essential here. They caution against treating gender as a natural category and against imposing Western liberal feminist frameworks on non-Western societies. Applied to Iran, this means recognizing that Iranian women's protests, including those following the death of Mahsa Amini in 2022, are acts of political agency rooted in local histories, not simply demands to replicate Western modernity. At the same time, Tamale's decolonial feminism insists that anti-imperial sovereignty cannot be invoked to silence gendered violence or patriarchal authority. The African feminist lens thus reveals both the emancipatory potential of Iranian women's mobilization and the risk that all sides—state, opposition, and external actors—may instrumentalize women's bodies and identities. This perspective occludes, however, the specific theological debates within Shia jurisprudence, the internal diversity of Iranian feminism, and the regional sectarian implications of Iranian identity politics, which require closer attention to West Asian history.

The African perspective's greatest contribution is its refusal to separate Iran's domestic order from the international hierarchy that shapes it. Western adversarial accounts often treat Velayat-e Faqih as the independent variable explaining Iranian behavior, while Chinese and Russian accounts may treat Iran as a strategic asset. The African lens, by contrast, foregrounds the co-constitution of internal authority and external coercion. It suggests that the Guardian Council, the IRGC, and the resistance economy are not merely products of ideology but responses to a history of intervention, sanctions, and regional insecurity. This is particularly important for understanding the 1979 revolution and its aftermath. Abrahamian (2008) and Takeyh (2009) document the revolutionary coalition's diversity and the subsequent consolidation of clerical power; an African reading would emphasize that post-revolutionary consolidation often narrows the revolutionary coalition, as Fanon predicted, and that the resulting state may reproduce domination in new forms. The African perspective also helps explain why Iranian leaders frame nuclear and missile programs as matters of dignity and sovereignty rather than mere security. In a world where some states' sovereignty is routinely qualified, technological autonomy becomes a marker of full membership in international society. Yet this perspective must not become an apology for authoritarianism. African scholarship is itself deeply critical of postcolonial states: Bayart's extraversion, Mbembe's postcolony, and Mamdani's bifurcation are not celebratory concepts. They describe pathologies as much as strategies. Applied to Iran, they warn that revolutionary states can become predatory, that anti-imperial rhetoric can mask elite enrichment, and that parallel security institutions can outgrow their original purpose. The 2009 Green Movement and the 2022 protests, viewed through this lens, are not simply evidence of regime illegitimacy or Western subversion; they are recurring moments in the cycle of postcolonial state-society contestation, in which citizens demand that revolutionary promises of justice and dignity be honored. GAMAAN surveys, while imperfect, suggest that many Iranians distinguish between national sovereignty and regime performance, a distinction that the African perspective is well placed to capture because it separates anti-imperial legitimacy from democratic accountability. The perspective's central occlusion is its tendency to over-analogize: Iran's revolutionary state, its Shia political

theology, and its position in West Asia are not reducible to African postcolonial experiences. To treat them as identical would erase the specificity of Iranian history, the role of Shia jurisprudence, and the regional sectarian dynamics that shape Iranian strategy. The African vantage point is therefore most powerful when used comparatively and critically, not as a master narrative.

2.7.2 Chinese Perspective

The Chinese perspective approaches the Iranian state through the lenses of strategic partnership, civilizational respect, and non-interference. In Beijing's official and scholarly discourse, Iran is not primarily a theocratic anomaly or a revolutionary threat but a major West Asian power, an energy supplier, and a partner in the construction of a multipolar order. This perspective begins from the premise that the internal constitutional arrangements of a state—whether Velayat-e Faqih, the Guardian Council, or the IRGC's role—are sovereign matters that external actors have no right to prescribe. Non-interference, a core principle of Chinese foreign policy, functions here as both norm and interest: it protects China's own sovereignty claims while allowing engagement with states whose domestic orders differ sharply from liberal democratic models. From this vantage point, the Iranian state's political theology is treated as a domestic source of legitimacy and stability, not as a variable to be reformed by external pressure. The IRGC and Basij are understood as security institutions that maintain order in a volatile region, and the Artesh as a conventional military; the distinction between them matters less than the overall capacity of the Iranian state to prevent collapse or externally imposed regime change. Chinese analysts often emphasize Iran's strategic location along the Belt and Road Initiative's western corridors and its role in connecting Central Asia, the Caucasus, and the Gulf. This materialist framing foregrounds trade, infrastructure, energy, and logistics rather than ideology. Iran's sanctions resilience is therefore not a puzzle of irrational defiance but a problem of supply-chain adaptation: Chinese purchases of Iranian oil, barter arrangements, and the use of non-Western financial channels sustain a relationship that both sides find valuable. The resistance economy is seen as a rational, if costly, strategy of autonomy under coercion, and Chinese partnerships are framed as South-South cooperation rather than dependency. This perspective contributes an important corrective to Western narratives by showing that Iran is not isolated; it has major-power relationships that dilute the impact of unilateral sanctions and provide diplomatic cover in multilateral forums. It also highlights the agency of the Iranian state in negotiating these relationships, rather than treating Iran as merely a passive target of pressure.

Yet the Chinese perspective also has significant occlusions. Its commitment to non-interference can flatten internal political dynamics, treating the 2009 Green Movement and the 2022 protests as domestic disturbances rather than indicators of a legitimacy crisis. It tends to understate the human rights implications of Velayat-e Faqih, the Guardian Council's exclusionary vetting, and the IRGC's economic and coercive power. Because China's own strategic interests favor stability and continuity, this lens may overestimate the resilience of the Islamic Republic and underestimate the depth of societal discontent captured, however imperfectly, by GAMAAN surveys. It also occludes the regional consequences of Iranian strategy: support for allied militias, missile proliferation, and sectarian mobilization may be treated as sovereign security policy rather than as sources of instability for neighboring states. The Chinese perspective is strongest when explaining the material and diplomatic dimensions of Iran's survival under sanctions; it is weakest when assessing the normative and legitimacy dimensions of the Iranian state. Its strategic logic is essentially defensive-realist from Beijing's point of view: Iran balances against US hegemony, and China benefits from a multipolar West Asia in which no single power dominates. But this can lead to an instrumental view of Iran as a partner of convenience rather than a society undergoing profound internal contestation. In sum, the Chinese lens reveals the geopolitical economy of Iranian resilience and the limits of Western coercion, while occluding the internal fractures and regional externalities that other perspectives foreground.

2.7.3 Russian Perspective

The Russian perspective frames Iran as an allied or quasi-allied state in a broader anti-Western and multipolar project. Moscow's view is shaped by its own experience of sanctions, its perception of NATO expansion, and its interest in preventing any single power from dominating West Asia. From this standpoint, the Iranian state's revolutionary ideology is less important than its geopolitical function: Iran is a counterweight to US influence, a partner in energy and arms markets, and a node in a network of states resisting Western hegemony. Velayat-e Faqih is treated as an internal matter, and the IRGC is assessed primarily through its strategic capabilities rather than its domestic role. Russian analysts often emphasize Iran's defensive realism: its missile program, regional alliances, and nuclear hedging are interpreted as responses to encirclement, the 1953 coup, the Iran-Iraq war, and decades of sanctions. This perspective contributes a historical memory of intervention that resonates with Iranian narratives and challenges Western claims of Iranian irrationality. It also highlights the practical dimensions of sanctions resilience: Russia and Iran share techniques of import substitution, alternative payment systems, and parallel trade networks. The resistance economy is thus seen not as autarky but as a form of strategic adaptation within a hostile international environment. Identity, in the Russian framing, is often subordinated to civilizational partnership: Iran is a historic Eurasian power with which Russia shares interests in stability, non-interference, and resistance to liberal internationalism. Shia identity may be acknowledged but is not central; Persian nationalism is treated as a source of state cohesion rather than a sectarian project.

The occlusions of the Russian perspective are substantial. Its anti-Western framing can lead to an overestimation of ideological convergence between Moscow and Tehran. Russia and Iran have divergent interests in Syria, the Caucasus, Central Asia, and energy markets; their partnership is better described as a marriage of convenience than as an alliance of values. The Russian lens tends to understate the internal legitimacy crisis suggested by the 2009 and 2022 protests, and it may treat Iranian society as a passive object of state control. It also occludes the sectarian and regional dimensions of Iranian strategy, particularly the impact of Iran's network of allied militias on neighboring states. By framing Iran primarily as an anti-Western asset, Russian analysis risks ignoring the ways in which Iranian power projection generates insecurity among Arab states and Israel, thereby fueling arms races and proxy conflicts. Furthermore, the Russian perspective's emphasis on state sovereignty can obscure the gendered and ethnic dimensions of Iranian politics, including the grievances of women and minorities that surfaced in recent protests. Its strongest contribution is to expose the double standards of Western sanctions policy and to provide a geopolitical context for Iranian defensive behavior; its weakest is its tendency to instrumentalize Iran and to overlook the fragility of a revolutionary state whose legitimacy is contested from within. In adjudicating between perspectives, the Russian view is most useful for understanding the strategic logic of Iran's external alignments, but it must be supplemented by attention to internal Iranian politics and regional security dilemmas.

2.7.4 Western Perspective

The Western perspective, particularly in US and European policy discourse, frames the Iranian state as an adversarial, revisionist power whose behavior is driven by a combination of revolutionary ideology and strategic ambition. Velayat-e Faqih is treated not merely as a domestic constitutional doctrine but as the source of an expansionist and non-negotiable worldview. The Supreme Leader, the Guardian Council, and the IRGC are seen as a parallel power structure that undermines democratic accountability and channels resources toward regional militancy. This perspective emphasizes Iran's support for armed non-state actors, its missile program, its nuclear opacity, and its human rights record. Strategic logic is interpreted through a mix of offensive and defensive realism: Iran is said to exploit regional instability to expand its

influence, while also responding to genuine security fears. The "irrationality" critique—often implicit rather than explicit—suggests that a state governed by clerical authority may not respond to standard deterrence or cost-benefit calculations. This critique has been challenged by scholars such as Takeyh (2009), who argue that Iranian behavior is more pragmatic and strategically calculating than ideological caricatures suggest, but it remains influential in policy circles. Sanctions resilience is acknowledged but framed as temporary and brittle: maximum pressure is expected to erode the resistance economy, expose elite corruption, and generate popular discontent. Abrahamian (2008) and Maloney (2015) provide more nuanced accounts of Iran's political economy and revolutionary history, yet policy discourse often compresses these complexities into a narrative of rogue-state behavior. The Western perspective contributes a necessary focus on repression, nuclear risk, and regional destabilization. It documents the IRGC's role in suppressing dissent, the Guardian Council's exclusion of reformist candidates, and the state's treatment of women and minorities. It also insists on the importance of human rights and non-proliferation norms, which other perspectives may subordinate to sovereignty or strategy.

However, the Western perspective's occlusions are equally significant. Its adversarial framing often underweights the historical roots of Iranian insecurity, including the 1953 coup, the Iran-Iraq war, and decades of sanctions. By treating Velayat-e Faqih as the primary cause of Iranian behavior, it risks ignoring the defensive and postcolonial dimensions of Iranian nationalism. The "irrationality" critique can function as an ethnocentric device that denies Iranian leaders strategic agency and rationality. It may also overstate the coherence of Iranian strategy, treating a complex, factionalized state as a unitary actor. On sanctions, Western analysis frequently underestimates the adaptability of Iranian networks and the humanitarian costs of economic pressure. GAMAAN surveys complicate the assumption that sanctions will straightforwardly produce regime change: they suggest deep dissatisfaction with governance, but also significant attachment to national sovereignty and resistance to foreign intervention. The Western perspective is strongest in identifying the coercive and illiberal features of the Islamic Republic and the risks of its regional policies; it is weakest when it treats these features as self-explanatory and ignores the international context that shapes Iranian choices. A rigorous adjudication requires distinguishing between the Islamic Republic's genuine repression and the strategic exaggeration of threat that can justify coercive policies with their own human costs. The Western lens therefore remains indispensable but must be corrected by historical and comparative perspectives that take Iranian sovereignty claims seriously.

2.7.5 UN Perspective

The UN perspective frames the Iranian state through the Charter system, international law, non-proliferation, human rights, and humanitarian protection. In this view, sovereignty is not absolute but qualified by obligations under the UN Charter, the Nuclear Non-Proliferation Treaty, IAEA safeguards agreements, and international human rights law. Velayat-e Faqih and the Guardian Council are internal constitutional arrangements, but their operation is assessed against standards of political participation, freedom of expression, freedom of religion or belief, and gender equality. The IRGC and Basij are not judged by their revolutionary legitimacy but by their compliance with international humanitarian law and human rights norms. Strategic logic is evaluated through the lens of collective security: Iran's security concerns are legitimate, but its pursuit of nuclear capability, missile development, and regional alliances must be reconciled with non-proliferation and the security of other states. Sanctions are understood as enforcement measures when authorized by the Security Council, but unilateral sanctions raise questions of legality, proportionality, and humanitarian impact. The UN perspective thus contributes a legal and institutional framework that can mediate between adversarial and defensive narratives. It insists that coercion must have a legal basis and that civilian populations must be protected from excessive harm. On identity, the UN lens emphasizes minority rights, cultural

rights, and freedom of religion or belief, including the rights of Sunni minorities, Kurds, Baluch, Arabs, and religious minorities such as Baha'is. It also foregrounds gender equality and the protection of women from discrimination and violence. This perspective reveals the importance of legal standards and multilateral accountability, and it provides mechanisms—IAEA inspections, human rights reporting, humanitarian exemptions—through which Iranian behavior can be monitored and constrained without necessarily resorting to force.

Yet the UN perspective has its own occlusions. The Security Council's structure reflects power asymmetries that can undermine the legitimacy of sanctions and enforcement, particularly when permanent members have divergent interests. The IAEA's technical mandate can become politicized, and its findings may be interpreted through geopolitical lenses. Human rights mechanisms often lack enforcement power, and their reports may be dismissed by states as Western-biased. The UN perspective can also be overly legalistic, treating political conflicts as compliance problems and underestimating the historical and strategic contexts that drive Iranian behavior. Sanctions, even when multilaterally authorized, can have severe humanitarian consequences that legal exemptions do not fully mitigate. The UN lens may occlude the ways in which sanctions strengthen security elites and weaken civil society, a dynamic that GAMAAN-type surveys and economic data can illuminate. On identity, its universalist categories may not capture the specific political meanings of Persian nationalism, Shia martyrdom, or revolutionary citizenship. Nevertheless, the UN perspective remains essential because it provides a shared vocabulary of sovereignty, rights, and security that all other perspectives must engage. It is strongest in establishing normative boundaries and humanitarian safeguards; it is weakest in resolving power asymmetries and enforcing compliance. In the case of Iran, it offers a framework for managing nuclear risk and protecting civilians, but it cannot by itself resolve the deeper contest between revolutionary sovereignty and international order.

SECTION 2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Reconstructs Iran as a postcolonial sovereignty rupture and anti-imperial state; highlights external patronage, popular legitimacy, and the dangers of militarized revolutionary consolidation	May understate clerical authoritarianism, sectarian regional effects, and IRGC institutional power	Revolutionary self-determination, anti-domination, and Global South sovereignty	Shah's dependence on US/UK support; mass mobilization; post-revolutionary sovereignty claims	Western/Russian: ideology, regime survival, and power politics, not only anti-imperialism, drove outcomes
Chinese	Pragmatic non-interference; long-term strategic partnership; economic resilience under sanctions	Domestic repression, human rights, and revolutionary export	Sovereignty, stability, mutual benefit, and multipolarity	Oil trade, infrastructure cooperation, long-term strategic agreements	Western: partnership empowers a destabilizing and proliferating actor
Russian	Anti-Western alignment; arms, energy, and diplomatic cooperation; multipolar resistance	Democratic deficits, regional escalation, and dependence on Tehran	Great-power balance and resistance to US hegemony	Syria cooperation, arms transfers, diplomatic cover at the UN	UN/Western: undermines Charter norms, nonproliferation, and regional stability
Western	Alliance history; security dilemma; nuclear and proxy concerns; human rights advocacy	Domestic grievances against the Shah; legitimacy of anti-imperial claims	Liberal order, nonproliferation, human rights, and alliance credibility	Hostage crisis, proxy attacks, nuclear program, sanctions architecture	African: treats a US-backed autocracy as the natural or legitimate order

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
UN	Charter framework, sanctions, IAEA verification, humanitarian and legal boundaries	Power asymmetries, enforcement gaps, and political selectivity	Sovereignty plus international security, rights, and nonproliferation	Security Council resolutions, IAEA reports, diplomatic frameworks	Russian/Chinese: enforcement is Western-dominated and selectively applied

SECTION 2.8 WORKED EXAMPLE (I do)

Case: The 1979 Islamic Revolution — how the Shah's overthrow produced the Islamic Republic and reshaped regional order.

Levels of analysis. At the individual level, the revolution was shaped by the Shah's declining health and indecisive leadership, Ayatollah Khomeini's charismatic authority and exile sermons, President Carter's human rights rhetoric, and the hesitation of senior military commanders. At the state level, the Pahlavi regime combined rapid modernization with coercive repression, oil-rentier financing, SAVAK surveillance, and a narrow social base, while revolutionary actors mobilized bazaar merchants, clerics, students, workers, and urban poor through mosques and neighborhood networks. At the systemic level, the Cold War made Iran a US pillar state, the 1973 oil shock altered fiscal expectations, Soviet intervention in Afghanistan heightened regional insecurity, and Arab monarchies watched the collapse of a fellow authoritarian regime with alarm. At the transnational level, clerical networks linking Najaf and Qom, diaspora activism, global oil markets, international media coverage, and transnational human-rights norms all influenced both the revolution's mobilization and its international reception.

Mechanism. The revolution succeeded through a chain rather than a single uprising: economic grievance and political exclusion produced a cross-class coalition; the Shah's coercive apparatus lost coherence as strikes, protests, and elite defections accumulated; the military's February 1979 neutrality removed the regime's final coercive backstop; and Khomeini's ideological framing through *Velayat-e Faqih* supplied a unifying alternative to both liberal constitutionalism and leftist revolution. The provisional government of Mehdi Bazargan was then outmaneuvered by revolutionary committees, clerical institutions, and the emerging Islamic Revolutionary Guard Corps, which captured the coercive and administrative remnants of the state. The 1979–1981 hostage crisis radicalized the revolution, marginalized moderates, and consolidated clerical control, while the 1980 Iraqi invasion militarized the new republic and fused regime survival with national defense. Regionally, Iran shifted from a US-aligned pillar to a revolutionary adversary; Gulf monarchies perceived an existential threat of ideological export; the United States moved toward containment; and the Iran-Iraq War entrenched a security architecture in which Iran's revolutionary identity became inseparable from its strategic posture. The result was not merely a change of regime but a reordering of West Asian politics around an adversarial, ideologically charged, and institutionally militarized Islamic Republic.

Perspective reconstruction. From an African vantage, the 1979 revolution is best read as a postcolonial rup-

ture in which a Western-backed monarch was overthrown by a coalition claiming popular sovereignty against external domination. Scholars such as Grovogui and Mamdani would emphasize that the Shah's regime was sustained by imperial patronage and coercive modernization, so its collapse exposed the fragility of externally anchored states. Bayart's notion of extraversion helps explain how Pahlavi Iran was inserted into Western security and economic networks, while the revolutionary state sought to reorient authority inward. Yet African observers would also warn that revolutionary sovereignty can harden into new authoritarian forms, especially when clerical and military institutions monopolize power. The case therefore illustrates both the emancipatory promise and the institutional dangers of anti-imperial revolution in the Global South. Beijing viewed the revolution through pragmatic non-interference: the fall of a US ally created opportunities for engagement without endorsing Iran's ideology. China later built a strategic partnership based on energy and infrastructure, treating Iran as a sovereign actor in a multipolar order. This perspective captures material interests but tends to occlude domestic repression and regional escalation. It also assumes that economic interdependence can stabilize a revolutionary state. Moscow initially feared Islamist contagion but soon found Iran useful as an anti-American force. Russian policy later framed Tehran as a partner in resisting Western hegemony, especially in Syria and energy politics. This lens highlights great-power balancing but underplays Iran's autonomous revolutionary agenda. It also risks treating Iran as an instrument rather than a sovereign actor with its own strategic logic. The Western perspective centers on the loss of a modernizing ally and the subsequent security threat posed by a revolutionary, anti-American state. It explains US hostility, sanctions, and alliance with Gulf monarchies, but often treats the revolution as irrational or purely ideological. This occludes the domestic grievances and anti-imperial claims that mobilized Iranians against the Shah. It is strongest on alliance politics and weakest on Iranian legitimacy. The UN perspective frames 1979 through Charter principles: sovereignty, non-intervention, and the prohibition on the use of force. The hostage crisis violated diplomatic immunity, while later sanctions and IAEA processes sought to manage nuclear risk. This provides a shared normative vocabulary but struggles with enforcement and power asymmetry. It is strongest on legal boundaries and weakest on resolving revolutionary legitimacy.

Explicit adjudication. Taken together, the African/postcolonial perspective best explains the revolutionary rupture because it captures the anti-imperial and sovereignty claims that Western and Russian accounts reduce to ideology or power politics. However, it underexplains the clerical capture of the state, the institutional role of the IRGC, and the regional security spiral that followed. A full explanation requires combining the African lens on sovereignty with state-level institutional analysis and systemic security-dilemma theory.

SECTION 2.9 PROBLEM PAIR (We do)

Case: Compare the 2009 Green Movement and the 2022 protests following the death of Mahsa Amini. Does the Islamic Republic face a legitimacy crisis, or are these better understood as recurring episodes of authoritarian contention?

Tasks

1. Define the difference between a legitimacy crisis, a political crisis, and a revolutionary situation, and apply each concept to 2009 and 2022.
2. Map both protest waves across the four levels of analysis—individual, state, systemic, and transnational—and identify which level best explains diffusion and repression.
3. Compare the triggering mechanisms: the disputed 2009 presidential election and elite fracture versus

the 2022 death of Mahsa Amini in morality-police custody and gendered public-order enforcement.
4. Audit the evidence: identify three findings that would support a legitimacy-crisis interpretation and three that would support a resilient-authoritarianism interpretation, using GAMAAN opinion data, electoral participation trends, IRGC cohesion, and sanctions-era economic performance.
5. Test the 1979 analogue: which necessary conditions for revolution are absent today (clerical defection, unified opposition, military fracture, external shock), and which are present (economic grievance, youth alienation, women's mobilization)?
6. Reconstruct the African, Chinese, Russian, Western, and UN interpretations of the protests, then adjudicate whether the regime's central problem is legitimacy, capacity, or both.

MODEL ANSWER

The question should be reframed before it is answered: legitimacy is not a binary condition, and the Islamic Republic has never rested on a single source of authority. It combines revolutionary, electoral, religious, and nationalist claims, so a crisis occurs when one of those claims is visibly contradicted by practice rather than when all authority collapses. On that standard, 2009 and 2022 are not the same kind of event. The Green Movement emerged from a disputed presidential election and was led, at least initially, by reformist elites who demanded that the republican promise be honored. Its vocabulary remained constitutional: votes should be counted, institutions should function, and the Supreme Leader should arbitrate rather than predecide. That made 2009 a crisis of electoral legitimacy and of intra-elite trust, but not necessarily a crisis of the regime's foundational right to rule. The state responded with repression, house arrests, and the consolidation of principlist control, while the IRGC and Basij remained cohesive. The movement lacked a unified alternative state project, and no major clerical or military faction defected. In Weberian terms, belief in the regime's legitimacy was damaged among urban, educated, and reformist constituencies, but the regime retained both coercive capacity and a plausible claim to revolutionary continuity.

The 2022 protests were different in both trigger and social composition. The death of Mahsa Amini in morality-police custody turned a specific incident of gendered state violence into a national uprising that linked compulsory hijab, police impunity, and the broader authority of Velayat-e Faqih. The slogan "Woman, Life, Freedom" challenged not merely an election result but the cultural and theological grammar of the state. The protests were geographically dispersed and socially heterogeneous, involving women, students, workers, ethnic minorities, and segments of the middle class. That breadth matters because it suggests a challenge to ideological legitimacy rather than a narrow policy grievance. Yet breadth alone does not make a revolution. The protests still lacked durable national leadership, a unified opposition platform, and, crucially, fractures within the coercive apparatus. The state's response—internet restrictions, arrests, executions, and localized repression—demonstrated that capacity remained intact even where legitimacy was visibly contested.

Evidence must therefore be weighed rather than counted. GAMAAN surveys have repeatedly found substantial dissatisfaction with the political system and declining attachment to clerical rule and compulsory hijab among significant segments of the population, which supports the legitimacy-crisis reading. Declining participation in some electoral contests and the visible alienation of younger cohorts point in the same direction. But the resilient-authoritarianism reading is also strong: the IRGC remains cohesive, the Artesh has not fractured, elite factions have not produced a rival center of power, and the "resistance economy" plus Chinese partnerships have allowed oil exports and state revenue to recover partially despite sanctions. Economic grievance is real, but grievance without organizational dual power does not by itself produce regime change. The African perspective is especially useful here because it treats the Islamic Republic as a post-revolutionary sovereignty project whose legitimacy derives partly from anti-imperial autonomy and

mass mobilization; from that vantage, the protests are not simply a demand for liberal transition but a contest over who now embodies the revolutionary promise of justice and dignity. That perspective highlights distributional and gendered grievances that Western "regime change" narratives often flatten. The Chinese perspective emphasizes stability, non-interference, and partnership, treating protests as an internal matter and occluding rights-based claims. The Russian perspective frames Iran as an allied anti-Western state and risks reducing domestic dissent to external manipulation. The Western perspective often overreads protest waves as imminent collapse and applies an "irrationality" critique to the regime, occluding its social bases and adaptive capacity. The UN perspective centers rights, due process, sanctions, and the IAEA framework, which can illuminate accountability but may underweight geopolitical context.

The 1979 analogue clarifies the gap between crisis and revolution. In 1979, the Shah faced a broad coalition that included clerics, bazaar merchants, leftists, and nationalists; the military fractured; the United States withdrew support; and Khomeini provided a unifying symbolic authority. None of those conditions is fully present today. The opposition is fragmented, the security apparatus remains loyal, and no external patron has abandoned the regime. What is present—economic pressure, youth alienation, women's mobilization, and declining ideological attachment—is serious but insufficient without elite defection and coercive fracture.

Adjudication: the Islamic Republic faces a chronic legitimacy deficit that becomes acute during protest waves, particularly around gendered state violence and electoral manipulation. It is not, on current evidence, a revolutionary crisis, because capacity and elite cohesion remain intact. The regime's problem is therefore both legitimacy and capacity, but in different registers: legitimacy is eroding in cultural and generational terms, while capacity remains robust in coercive and economic terms. The scope condition for a genuine crisis is the convergence of mass mobilization with elite fracture and security-force defection; absent that convergence, protests are likely to be contained, even as the underlying legitimacy deficit deepens.

SECTION 2.10 INDEPENDENT MEMO (You do)

Case description: In 2024, following the death of President Ebrahim Raisi, Iran held snap presidential elections amid low turnout, continued sanctions pressure, regional escalation, and public debate over compulsory hijab enforcement. Analysts disagreed over whether the outcome demonstrated regime adaptability and managed succession or revealed a deepening legitimacy deficit among younger and urban voters. Your memo should assess this episode using the frameworks developed in this lesson.

Required memo headings (respond to each as a prompt):

- **Mechanism:** Identify the causal mechanism linking the leadership transition, electoral process, coercive capacity, and public legitimacy; specify what would have to change for the outcome to indicate systemic crisis rather than managed adaptation.
- **Perspective reconstruction:** Reconstruct how the African, Chinese, Russian, Western, and UN perspectives would interpret the 2024 transition, and identify what each perspective reveals and occludes.
- **Historical analogue:** Compare the 2024 transition with at least one earlier episode—such as 1979, 2009, or 2022—and state which similarities are superficial and which are structurally meaningful.
- **Falsifiers:** List three observable developments that would falsify your main conclusion, and specify the evidence that would be required to claim falsification.

Self-check: Did you distinguish description, explanation, prediction, and prescription in your memo?

SECTION 2.11 HINGE QUESTION

Question: Which evidence pattern would most strongly support the claim that Iran's 2022 protests constituted a legitimacy crisis of the Islamic Republic rather than a contained cycle of authoritarian protest?

A. Large protests occurred, but the IRGC remained cohesive and no elite faction defected.
B. Protests were geographically widespread and included women, youth, workers, and ethnic minorities, while surveys showed declining attachment to Velayat-e Faqih and compulsory hijab; yet the state retained coercive capacity.
C. Western governments condemned the crackdown and imposed additional sanctions.
D. Protest slogans focused exclusively on economic grievances and demanded only wage increases.

Distractor diagnosis:

- **A** is wrong because cohesion of the IRGC and absence of elite defection are evidence of retained capacity; they support a contained-protest or resilient-authoritarianism reading, not a legitimacy crisis.

- **C** is wrong because external condemnation and sanctions measure international reaction, not domestic belief in the regime's right to rule; they cannot by themselves establish a legitimacy crisis.

- **D** is wrong because exclusively economic demands would indicate a routine distributional protest cycle rather than a challenge to the ideological and theological foundations of the state.

SECTION 2A — DATA LAB

Table 1 — Iranian Crude Oil Exports, 2010–2024 (million barrels per day, approximate)

Year	Exports (mbd)	Principal driver
2010	2.3	Pre-sanctions baseline
2012	1.5	EU/US sanctions bite
2015	1.1	Maximum pre-JCPOA pressure
2017	2.1	JCPOA relief
2019	0.5	"Maximum pressure" campaign
2021	1.0	Partial Biden-era easing
2023	1.5	Chinese purchases via shadow fleet
2024	1.6	Continued Chinese demand

Source: OPEC Annual Statistical Bulletin; U.S. EIA; Kpler tanker-tracking estimates. Figures are approximate and vary by methodology.

Table 2 — Inflation, GDP Growth, and Unemployment (approximate annual figures)

Year	Inflation (%)	GDP growth (%)	Unemployment (%)
2010	10	6.2	11
2012	31	–6.8	12
2015	14	0.9	11
2018	31	–4.8	12
2020	36	–5.0	11
2022	49	3.8	9
2024	35	4.0	8

Source: World Bank; IMF; Statistical Center of Iran. Approximate; official Iranian figures are contested.

Table 3 — Public Opinion on the Islamic Republic (GAMAAN surveys, selected indicators)

Indicator	2022 (post-Mahsa Amini)	2023
Support Islamic Republic	15%	18%
Oppose / want systemic change	77%	74%
Neutral / no opinion	8%	8%
Trust in IRGC	12%	14%
Trust in Artesh (regular army)	58%	55%

Source: GAMAAN (Group for Analyzing and Measuring Attitudes in Iran) online surveys. Internet-based sampling skews urban and younger; margins of error apply.

Table 4 — IRGC Economic Footprint (estimates, contested)

Sector	Estimated IRGC-affiliated position
Construction / engineering (Khatam al-Anbiya)	Dominant in large state projects
Telecommunications	Significant (via Mobin Trust)
Energy / petrochemicals	Substantial
Banking / finance	Growing
Overall GDP share (estimates)	20–30% (various, unaudited)

Source: Maloney (2015); Ehteshami (2017); journalistic estimates. No audited transparency; figures are contested.

Five Analysis Questions

1. **Trend.** Describe the trend in Iranian oil exports between 2010 and 2024. What does the 2019 trough and the 2023–24 recovery indicate about the effectiveness and limits of unilateral U.S. sanctions?

2. **Level of analysis.** At which level of analysis (individual, state, systemic, transnational) does the GAMAAN data on regime support primarily operate, and what does it fail to capture about regime durability?
3. **Perspective reconstruction (all five).** How would the African, Chinese, Russian, Western, and UN perspectives each read the 2022 Mahsa Amini protests and the regime's response? Identify one contribution and one occlusion per perspective.
4. **Interpretation.** Does the combination of high inflation, recovered oil exports, and low regime support indicate a "legitimacy crisis" or "authoritarian resilience"? Adjudicate using the data and specify the mechanism.
5. **Limitation.** What are the methodological limitations of GAMAAN online surveys and of IRGC economic-share estimates, and how do these limitations constrain the inferences a researcher can draw?

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — "Concentric Circles of the Iranian State"

What to draw: Five concentric circles on a large sheet, centered on a small innermost circle. Use a compass or freehand; label each ring.

- **Center circle (smallest):** "Velayat-e Faqih — Supreme Leader (Khamenei)." Shade dark.
- **Ring 1 (inner):** "Guardian Council" and "Assembly of Experts" — label as vetting and succession bodies.
- **Ring 2:** "IRGC" with two sub-labels: "Quds Force (external)" and "Basij (domestic mobilization)."
- **Ring 3:** "Artesh (regular army)," "Bonyads (parastatal foundations)," "Judiciary."
- **Ring 4 (outermost):** "Elected institutions — President, Majlis (parliament)."

Arrows: Draw arrows from Ring 4 inward labeled "policy execution"; arrows from Ring 1 outward labeled "veto / disqualification." Draw a dashed arrow from Ring 2 to Ring 4 labeled "parallel power."

Perspective overlay (annotate in margins): - African (primary): "Parallel revolutionary state — sovereignty defended through dual structure." - Chinese: "Stable partner; non-interference in internal rings." - Russian: "Anti-Western ally; IRGC as reliable interlocutor." - Western: "Theocratic authoritarianism; IRGC as spoiler." - UN: "Sanctions target Ring 2; Charter questions on coercion."

Visual 2 — "Sanctions Resilience Pipeline"

What to draw: A horizontal flowchart with three columns: Inputs → Process → Outputs.

- **Inputs (left, three boxes):** "Oil exports (shadow fleet)," "Chinese purchases (yuan/barter)," "Resistance economy (domestic production)."
- **Process (middle, two boxes):** "IRGC smuggling networks (Khatam al-Anbiya, ports)" and "Bonyad distribution (subsidies, welfare)."
- **Outputs (right, three boxes):** "Regime survival," "Inflation (30–50%)," "Welfare compression for poor/middle class."

Arrows: Thick arrows from inputs to process; thin arrows from process to outputs. Add a feedback loop arrow from "Regime survival" back to "IRGC networks" labeled "patronage."

Perspective overlay (annotate): - African: "Sovereignty under economic coercion; resistance as anti-imperial practice." - Chinese: "Market opportunity; non-interference preserved." - Russian: "Proof of Western overreach; validates multipolarity." - Western: "Sanctions leakage; need for secondary sanctions." - UN: "Humanitarian impact; Charter proportionality debate."

Visual 3 — "Identity Triangle"

What to draw: An equilateral triangle. At each vertex place a labeled circle:

- **Top vertex:** "Persian nationalism (pre-Islamic, linguistic, territorial)."
- **Bottom-left vertex:** "Shia identity (Twelver, clerical, revolutionary)."
- **Bottom-right vertex:** "Politics of martyrdom (Karbala, Iran-Iraq War, Qasem Soleimani)."

Center of triangle: "Iranian state legitimacy (contested)."

Edges: Label each edge with a tension: - Top–bottom-left: "Secular vs. clerical" - Top–bottom-right: "Ethnic vs. universalist" - Bottom-left–bottom-right: "Clerical authority vs. popular sacrifice"

Perspective overlay (annotate outside triangle): - African: "Identity as resource for sovereignty and resistance." - Chinese: "Internal matter; stability preferred." - Russian: "Shared anti-Western civilizational framing." - Western: "Ideology as source of irrationality critique." - UN: "Minority rights; cultural rights under Charter."

SECTION 4 — CORNELL NOTES

Cue (Question / Prompt)	Notes (with source log)
What is Velayat-e Faqih?	Doctrine of "Guardianship of the Jurist"; Khomeini's 1970 lectures; Supreme Leader holds ultimate authority over state. Source: Abrahamian (2008).
What is the Guardian Council?	12-member body (6 clerics + 6 jurists) vetting candidates and legislation; veto power over parliament. Source: Takeyh (2009).
What is the IRGC?	Islamic Revolutionary Guard Corps; parallel military; Quds Force (external), Basij (domestic). Source: Maloney (2015).
How does Artesh differ from IRGC?	Artesh = regular army; professional, less ideological; IRGC = revolutionary, ideological, economic actor. Source: Ehteshami (2017).
What is the "resistance economy"?	Khamenei's 2012 concept; domestic production, sanctions circumvention, self-reliance. Source: Maloney (2015).
What is the bonyad system?	Parastatal foundations (e.g., Mostazafan) controlling assets; welfare + patronage + IRGC links. Source: Ehteshami (2017).

Cue (Question / Prompt)	Notes (with source log)
What is defensive realism in Iran's strategy?	Survival-focused, threat-perception driven; proxy networks as deterrence. Source: Takeyh (2009).
What is the "irrationality critique"?	Western claim that ideology makes Iran unpredictable; counter: strategic rationality within ideological frame. Source: Maloney (2015).
What do GAMAAN surveys show?	Low regime support (15–18%), high opposition (74–77%); urban/online skew. Source: GAMAAN surveys.
What is the African perspective on Iran?	Parallel revolutionary state; sovereignty norms; anti-imperial solidarity; occludes internal repression. Source: Grovogui; Mbembe (general).
What is the Chinese perspective?	Strategic partnership; non-interference; oil purchases; 25-year cooperation agreement. Source: Ehteshami (2017).
What is the Russian perspective?	Allied state; anti-Western framing; Syria cooperation; S-400/defense ties. Source: Takeyh (2009).

Summary (3–5 sentences): The Iranian state is organized around Velayat-e Faqih, concentrating authority in the Supreme Leader and the Guardian Council while maintaining a parallel IRGC security apparatus alongside elected institutions. Its strategic logic combines defensive realism with revolutionary ideology, producing proxy networks and a resistance economy that has partially insulated it from sanctions. Identity politics weave Persian nationalism, Shia clericalism, and martyrdom into a contested legitimacy project. Data show recovered oil exports alongside high inflation and low regime support, suggesting resilience and fragility coexist. Each of the five perspectives captures part of this picture while occluding others.

SECTION 5 — FEYNMAN COMPRESSION

Step 1 — Explain without jargon. Iran is run by a religious leader who has final say over everything, backed by a special military force that also controls big businesses. The country faces heavy sanctions but keeps selling oil to China and makes things at home to survive. Most Iranians, according to online surveys, do not support the government, yet the government has not collapsed. The state mixes Persian pride, Shia religion, and stories of sacrifice to justify its rule.

Step 2 — Mark gaps. I am unsure how much of the IRGC's economic power is accurately measured; the 20–30% GDP figure is unaudited. I am also unsure whether low GAMAAN support translates into organized opposition capacity, since the surveys are online and urban-skewed. I have not fully resolved whether "defensive realism" or "ideological expansionism" better explains Iran's regional behavior.

Step 3 — Reread verification. Re-reading Maloney (2015) and Ehteshami (2017) confirms that the IRGC's economic role is substantial but opaque, and that the resistance economy is a deliberate strategy, not merely improvisation. Abrahamian (2008) confirms the clerical structure's origins in Khomeini's theory. GAMAAN data confirm low support but with sampling caveats. The gap on opposition capacity remains; no source

resolves it definitively.

Step 4 — Analogy with explicit limits. Iran resembles a fortress with a moat: the IRGC and Basij are the walls, oil sales to China are the supply line, and the resistance economy is the granary. The analogy captures resilience but breaks down on legitimacy: a fortress does not need popular consent, whereas the Islamic Republic's ideology claims popular and divine mandate, and the GAMAAN data suggest that claim is contested. The analogy also cannot capture the transnational Shia network.

Step 5 — Rewrite. The Iranian state is a theocratic-republican hybrid whose survival rests on a dual security apparatus (IRGC/Artesh), a resistance economy partially shielded by Chinese oil purchases, and an identity narrative blending Persian nationalism, Shia clericalism, and martyrdom. Sanctions have hurt the economy (high inflation, GDP volatility) but have not collapsed the regime, partly because the IRGC controls key economic nodes and distributes patronage. Public opinion data indicate low regime support, especially among urban youth, yet organized opposition remains fragmented. Whether this constitutes a "legitimacy crisis" depends on whether one measures legitimacy by popular consent (Western/GAMAAN reading) or by institutional and coercive capacity (state-centric reading). The African perspective adds that Iran's experience of sanctions and revolutionary state-building resonates with post-colonial sovereignty struggles, while occluding internal repression; the Chinese perspective treats Iran as a stable partner; the Russian as an anti-Western ally; the Western as an adversarial theocracy; and the UN as a sanctions and Charter problem.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L42	Definition	What is Velayat-e Faqih?	Velayat-e Faqih is the doctrine that a qualified Islamic jurist holds guardianship over the Islamic state and its population, giving clerical authority a constitutional role beyond advisory religious guidance. In Iran it was institutionalized after 1979 through the Supreme Leader, Guardian Council, and related bodies. It fuses religious legitimacy with state sovereignty rather than separating them. Its scope remains contested even within Shiism.	African perspective: parallels postcolonial fusion of liberation legitimacy with state authority, but warns against unaccountable guardianship.

Tag	Card Type	Front	Back	Perspective Note
L42	Mechanism	How does the Guardian Council shape political choice?	The Guardian Council vets candidates, reviews legislation for conformity with Islamic law and the constitution, and supervises elections. This creates dual gatekeeping: popular elections occur within boundaries set by clerical-legal review. It can disqualify reformist or dissident candidates, shaping the menu of political choice. The mechanism converts electoral competition into managed pluralism.	Western perspective treats this as authoritarian filtering; UN perspective sees tension with free and fair election norms.

Tag	Card Type	Front	Back	Perspective Note
L42	Mechanism	Why is the IRGC more than a conventional military?	The IRGC is a parallel military-security institution created to protect the revolution, not merely territory, with land, naval, aerospace, and Quds Force components. It also holds extensive economic assets and political influence, making it a hybrid actor. Its mandate links regime survival to regional deterrence. This blurs the line between defense, ideology, and commerce.	Russian perspective values it as an anti-Western balancer; African perspective notes parallel security apparatuses in post-revolutionary states.

Tag	Card Type	Front	Back	Perspective Note
L42	Comparison	How do the Artesh and IRGC differ?	The Artesh is the conventional national army oriented toward territorial defense, while the IRGC is a revolutionary guard with ideological, political, and economic roles. The Artesh generally lacks the IRGC's parallel command and patronage networks. This dual structure prevents any single military institution from monopolizing coercive power. It also complicates civilian control and accountability.	Chinese perspective emphasizes institutional stability; Western perspective sees fragmented coercion.

Tag	Card Type	Front	Back	Perspective Note
L42	Source	What does Abrahamian (2008) contribute to understanding Iran?	Abrahamian (2008) frames modern Iran through social and political history, emphasizing how revolutionary mobilization, class alliances, and state-building shaped the Islamic Republic. His work cautions against reducing Iran to theology or geopolitics alone. It highlights continuities between pre- and post-revolutionary state structures. This supports a historically grounded, not purely ideological, analysis.	African perspective: useful for comparing revolutionary state formation across postcolonial contexts.

Tag	Card Type	Front	Back	Perspective Note
L42	Debate	Is Iran best explained by defensive realism or revolutionary ideology?	Defensive realism explains Iran's behavior as security-seeking under encirclement, sanctions, and regime-change threats. Revolutionary ideology explains its support for allied movements and anti-status-quo rhetoric. The two are not mutually exclusive: ideology can function as a tool of deterrence and regime legitimacy. Adjudication requires separating capability-building from rhetorical commitments.	Russian perspective stresses anti-Western solidarity; Western perspective often overstates ideology.

Tag	Card Type	Front	Back	Perspective Note
L42	Reconstruction	How does China frame its partnership with Iran?	China's perspective emphasizes strategic partnership, energy security, and non-interference, treating Iran as a sovereign state and market. It generally opposes unilateral sanctions and supports diplomatic engagement. This view contributes economic alternatives but can occlude domestic repression and proxy warfare. It frames Iran as a node in multipolar order-building.	Chinese perspective: partnership and non-interference; African perspective shares sovereignty concerns but questions great-power instrumentalization.

Tag	Card Type	Front	Back	Perspective Note
L42	Occlusion	What does the Western "irrationality" critique occlude?	The "irrationality" critique portrays Iran's leadership as driven by apocalyptic ideology rather than cost-benefit calculation. This occludes evidence of strategic patience, bargaining, and survival-oriented behavior. It can justify coercive policies by denying adversary rationality. A better approach tests claims against observable decisions and constraints.	Western perspective's blind spot; African perspective warns against dehumanizing adversaries.

Tag	Card Type	Front	Back	Perspective Note
L42	Adjudication	Do the 2022 protests prove a legitimacy crisis?	The 2022 Mahsa Amini protests revealed deep grievances over gender, policing, and economic conditions, but did not by themselves demonstrate imminent regime collapse. GAMAAN surveys suggest significant dissatisfaction and declining trust, yet the state retained coercive capacity and elite cohesion. A legitimacy crisis is therefore partial and contested, not a simple binary. Evidence must distinguish protest intensity from institutional breakdown.	UN perspective focuses on rights violations; African perspective asks whether protest translates into alternative state capacity.

Tag	Card Type	Front	Back	Perspective Note
L42	Visual	How should the resistance economy be visualized?	The resistance economy concept refers to policies aimed at reducing vulnerability to sanctions through domestic production, import substitution, and alternative trade routes. Visualizing it requires showing formal state programs alongside informal smuggling and China-linked trade. The gap between official rhetoric and household welfare is analytically important. It is a resilience strategy, not autarky.	African perspective: compares with sanctions-busting and informal economies in sanctioned states.

Tag	Card Type	Front	Back	Perspective Note
L42	Mechanism	What role does the Basij play in social control?	The Basij is a paramilitary volunteer militia mobilized for social control, ideological policing, and crisis response. It extends state reach into neighborhoods, universities, and workplaces. Its role in suppressing protests illustrates how revolutionary institutions penetrate civil society. It is both a coercive and socialization mechanism.	Western perspective sees repression; UN perspective sees rights concerns.

Tag	Card Type	Front	Back	Perspective Note
L42	Definition	What is the resistance economy?	The resistance economy is an Iranian policy framework for sanctions resilience, emphasizing self-reliance, domestic manufacturing, and reduced dependence on Western markets. It does not eliminate external trade but redirects it toward partners such as China and Russia. Its success is uneven across sectors and households. It is best treated as a strategic narrative and policy bundle.	Chinese perspective: opportunity for partnership; African perspective: sovereignty under economic coercion.

Tag	Card Type	Front	Back	Perspective Note
L42	Application	How should GAMAAN surveys be used?	GAMAAN surveys provide evidence on Iranian public attitudes toward the regime, religion, and protests, often showing lower support than official narratives claim. They are valuable but face methodological constraints, including online sampling and self-censorship. They should be triangulated with behavior, repression data, and elite signals. They measure sentiment, not revolutionary capacity.	UN perspective: rights-relevant data; Western perspective: legitimacy indicator.

Tag	Card Type	Front	Back	Perspective Note
L42	Comparison	What does the African perspective add to Iran analysis?	The African perspective compares Iran's revolutionary state to postcolonial states where liberation movements became governing parties and security apparatuses. The parallel highlights how revolutionary legitimacy can coexist with authoritarian consolidation. It also warns against assuming Western categories of "failed" or "rogue" state. Differences in religion, geopolitics, and sanctions exposure remain significant.	African perspective primary: reveals what Western adversarial framing occludes.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence audit table (scored 0-100)

Competency	Self-rated confidence (0-100)	Target (0-100)	Evidence of mastery	Priority gap
Define Velayat-e Faqih and the Guardian Council's role		85	Can distinguish jurist guardianship from conventional theocracy	Conflating religious authority with unchecked personal rule
Map IRGC, Artesh, and Basij functions		85	Can explain parallel coercion and regime protection	Treating all forces as one military hierarchy

Competency	Self-rated confidence (0-100)	Target (0-100)	Evidence of mastery	Priority gap
Explain defensive realism plus revolutionary ideology		90	Can separate security-seeking from rhetorical commitments	Overattributing behavior to ideology alone
Analyze sanctions resilience and resistance economy		85	Can link policy rhetoric to smuggling, oil, and household welfare	Assuming sanctions either fully succeed or fully fail
Interpret GAMAAN and public-opinion data		80	Can state sampling limits and triangulate with behavior	Converting sentiment into regime-collapse prediction
Reconstruct all five perspectives		90	Can steel-man each tradition without caricature	Neglecting African or UN vantage points
Apply the four levels of analysis		85	Can move between individual, state, systemic, and transnational	Fixating on one level
Adjudicate the legitimacy-crisis question		90	Can distinguish description, explanation, prediction, prescription	Treating protests as sufficient evidence of collapse

7.2 Three-question debrief

1. **Which evidence would change your view that Iran behaves as a strategically rational actor?**
   Suggested reflection: Identify one observable decision—such as nuclear bargaining, proxy restraint, or sanctions adaptation—that would falsify the rationality claim, and state what would count as ideology overriding cost-benefit calculation.

2. **Which perspective did you most neglect when reconstructing the 1979 revolution?**
   Suggested reflection: Compare your first reconstruction with the African, Chinese, Russian, Western, and UN accounts; note which tradition's contribution or occlusion you initially missed.

3. **What is the difference between describing protest size and explaining regime durability?**
   Suggested reflection: Separate empirical observation (numbers, repression, economic indicators) from causal explanation (elite cohesion, coercive capacity, alternative institutions) and from prediction (col-

lapse, reform, or stalemate).

7.3 Error-log table

Common Misconception	Correction	Evidence
Velayat-e Faqih means clerics rule without institutions	It is constitutionalized through specific bodies such as the Supreme Leader, Guardian Council, and related offices	Abrahamian (2008); Takeyh (2009)
The IRGC is only a military force	It is a parallel security, political, and economic actor with revolutionary mandate	Takeyh (2009); Maloney (2015)
Iran is purely ideologically driven	Defensive realism and regime survival interact with revolutionary ideology	Ehteshami (2017); Takeyh (2009)
Sanctions have completely crippled Iran	Resistance-economy policies, smuggling, and China-linked trade create uneven resilience	Maloney (2015); GAMAAN surveys
Large protests prove imminent regime collapse	Protest intensity must be weighed against coercive capacity, elite cohesion, and lack of alternative state capacity	GAMAAN surveys; Ehteshami (2017)
The Western view is only adversarial	Western scholarship and policy include engagement, deterrence, and rights-based debates	Takeyh (2009); Maloney (2015)

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Velayat-e Faqih; Guardian Council; clerical authority	Jurist guardianship; candidate vetting; legislation review	Abrahamian (2008); Takeyh (2009)	1979 Islamic Revolution	Clerical authority vs popular sovereignty	Evidence of clerical powerlessness or purely symbolic religious role	L43 sectarian politics; L45 nuclear

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
IRGC; Artesh; Basij; parallel security apparatus	Revolutionary protection; dual military structure; neighborhood social control	Takeyh (2009)	Post-1979 institutional consolidation	Parallel coercion vs civilian control	Evidence of unified command under civilian authority	L44 proxy warfare
Defensive realism plus revolutionary ideology	Security-seeking; deterrence; support for allied movements	Ehteshami (2017); Takeyh (2009)	Iran-Iraq War; regional proxy networks	Rationality vs ideological irrationality	Repeated self-destructive decisions ignoring survival	L41 West Asian state system
Resistance economy; smuggling; Chinese partnerships	Import substitution; sanctions evasion; redirected trade	Maloney (2015)	Iranian oil exports 2010-2024; inflation and GDP data	Sanctions efficacy vs resilience	Sustained collapse of oil revenue and essential imports	L45 nuclear negotiations
Persian nationalism; Shia identity; martyrdom politics	Identity mobilization; regime legitimation; grievance framing	Abrahamian (2008); Ehteshami (2017)	2009 Green Movement; 2022 Mahsa Amini protests	Identity vs class/material explanations	Evidence that identity rhetoric has no mobilizing effect	L43 sectarian; L7 ontological security
Five perspectives on Iran	Steel-manning; occlusion analysis; adjudication	Abrahamian; Takeyh; Ehteshami; Maloney; GAMAAN	GAMAAN public-opinion surveys	Adversarial vs multipolar framing	A perspective that cannot identify its own blind spot	L41-L45 module arc

SECTION 9 — REVIEW SCHEDULE

Review	Timing	Concrete action
R1	Same day, 20-30 minutes	Re-read all flashcards, redraw the resistance-economy visual from memory, and write one sentence stating the core mechanism of Velayat-e Faqih.

Review	Timing	Concrete action
R2	24-48 hours	Reconstruct the African, Chinese, Russian, Western, and UN perspectives from memory, then compare against notes and mark one neglected insight.
R3	1 week	Re-analyze the IRGC, oil-export, inflation/GDP, and GAMAAN data tables; update the error log with one new misconception.
R4	1 month	Apply the lesson to a new case, such as Iran-Saudi normalization or a sanctions episode, using all four levels of analysis and all five perspectives.
R5	3 months	Write a full independent memo from scratch on whether the Islamic Republic faces a legitimacy crisis, then check it against the falsifiers and adjudication criteria.

SECTION 10 — COMPLETION CHECKLIST

- ☐ I can define Velayat-e Faqih without conflating it with generic theocracy.
- ☐ I can explain the Guardian Council's vetting and review functions.
- ☐ I can distinguish the IRGC, Artesh, and Basij by mandate and structure.
- ☐ I can explain why the IRGC is a hybrid military-economic-political actor.
- ☐ I can state Iran's strategic logic as defensive realism plus revolutionary ideology.
- ☐ I can identify the strongest counterargument to the "irrationality" critique.
- ☐ I can explain the resistance economy and its limits.
- ☐ I can interpret Iranian oil-export and inflation/GDP data with appropriate caution.
- ☐ I can summarize what GAMAAN surveys show and their methodological limits.
- ☐ I can reconstruct the African perspective as primary, not an add-on.
- ☐ I can reconstruct the Chinese, Russian, Western, and UN perspectives fairly.
- ☐ I can compare the five perspectives using contribution, occlusion, stance, evidence, and objection.
- ☐ I can apply individual, state, systemic, and transnational levels of analysis to the 1979 revolution.
- ☐ I can adjudicate whether the 2009 and 2022 protests indicate a legitimacy crisis.
- ☐ I can distinguish description, explanation, prediction, and prescription in my memo.
- ☐ I have recorded at least one misconception and correction in the error log.

44. The Sectarian Security Dilemma and the Axis of Resistance

LESSON METADATA

Field	Value
Lesson number and title	Lesson 43 — The Sectarian Security Dilemma and the Axis of Resistance
Module	Module 7: West Asia and Iranian Geopolitics
Prerequisites	L42 (Iran), L23 (asymmetric warfare), L41 (West Asia state system)

Field	Value
Interleaved links	Forward to L44 (proxy warfare), L45 (nuclear), L50 (non-state actors)
Reading load	7-9 hours
Content channels	Text, data tables, worked example, problem pair, flashcards, visuals
Bloom ceiling	Evaluate / Create
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

The central puzzle of this lesson is deceptively simple to state and extraordinarily difficult to resolve: under what conditions does sectarian identity become the organizing logic of interstate and transnational security competition, and when is it merely the vocabulary through which material, strategic, and regime-survival interests are pursued? The West Asian regional order is routinely described in sectarian terms—a "Shia crescent" stretching from Iran through Iraq, Syria, and Lebanon, confronting a Sunni bloc anchored by Saudi Arabia and the Gulf monarchies, with Israel and Turkey occupying ambiguous positions. This description is not false, but it is dangerously incomplete. It risks reifying identities that are politically constructed, treating as primordial what is in fact produced by competition, and mistaking the language of conflict for its cause. The lesson's first task is to hold this tension open rather than resolve it prematurely. The second task is to analyze the Axis of Resistance—Iran's network of allied state and non-state actors—not as a fixed alliance system but as a dynamic security architecture whose coherence, limits, and internal contradictions must be traced through mechanism rather than assumed from ideology.

The lesson sits at a critical junction in the curriculum. It draws on L41's analysis of the West Asian state system as a multipolar, oil-dependent, externally penetrated order lacking a stable hegemon; on L42's treatment of Iran as a revolutionary state whose ideology and national interest are in permanent, productive tension; and on L23's framework for asymmetric warfare, in which weaker actors exploit the vulnerabilities of stronger ones through indirect, deniable, and cost-imposing strategies. It prepares the ground for L44 on proxy warfare, L45 on nuclear proliferation and deterrence, and L50 on non-state actors as autonomous security agents. The student who masters this lesson should be able to move fluidly across levels of analysis—individual, state, systemic, and transnational—without collapsing one into another, and to recognize when an explanation that works at one level fails at another.

The scholarly stakes are high and genuinely contested. Vali Nasr's 2006 argument that the Iraq war unleashed a Shia revival and a Sunni backlash gave academic respectability to the view that sectarian identity had become the master cleavage of regional politics. Nasr's claim was not that sect was primordial but that the collapse of the Iraqi state removed the coercive lid that had suppressed sectarian mobilization, allowing identity to become politically salient in ways that reshaped alliances, threat perceptions, and state strategies. This is a defensible and important argument. But it has been challenged by scholars who warn against "sectarianization"—the process by which political actors construct, amplify, and instrumentalize sectarian categories for strategic gain. Haddad's 2018 work on the politics of sectarianism in the Arab world insists that the relevant question is not "why are Sunnis and Shias fighting?" but "who benefits from framing the conflict in sectarian terms, and through what institutional mechanisms does that framing be-

come self-fulfilling?" Wehrey's 2018 analysis of Saudi-Iranian rivalry similarly cautions against reducing a complex geopolitical competition to religious identity, noting that both states have historically cooperated when interests aligned and that domestic political legitimation, not theology, drives much of the sectarian rhetoric. Juneau's 2020 work on Iran's regional strategy emphasizes the material and strategic logic of the Axis of Resistance—deterrence, forward defense, and regime survival—while acknowledging that ideology provides the connective tissue that makes the network resilient. Crisis Group reports on Iran and the Gulf provide granular, field-based documentation of how these dynamics play out in specific theaters. The lesson adjudicates among these positions not by declaring a winner but by specifying the scope conditions under which each holds.

The African perspective is not a regional add-on to this analysis; it is the lens that reveals what the other four perspectives systematically obscure. African states and societies have extensive experience with the instrumentalization of identity—ethnic, religious, regional, and communal—by elites competing for control of the state and its resources. The African scholarly tradition, from Fanon's analysis of colonial identity construction through Mamdani's work on the politicization of ethnicity, Bayart's "politics of the belly," and Grovogui's critique of international order as a racialized and civilizational project, provides theoretical resources that are directly applicable to the West Asian case. The key insight is this: the sectarian security dilemma is not a clash between two pre-existing communities but a political process in which states and non-state actors produce the very identities they claim to defend. The African vantage point foregrounds the agency of political entrepreneurs, the role of external powers in freezing and weaponizing identity categories, and the possibility that "communities of fear" are manufactured rather than discovered. This does not mean that identity is infinitely malleable or that material interests explain everything; it means that the relationship between identity and interest is itself a political variable, and that the analyst who treats identity as fixed has already taken sides in the conflict.

What the student will be able to do after mastering this lesson is substantial and specific. First, reconstruct five distinct perspectives—African, Chinese, Russian, Western, and UN—on the sectarian security dilemma and the Axis of Resistance, steel-manning each from within its own premises. Second, apply four levels of analysis to any case, identifying which level explains what and where explanations break down. Third, distinguish description from explanation, prediction, and prescription—a discipline that prevents the common error of treating a compelling narrative as a causal account. Fourth, evaluate competing theories against evidence, specifying falsifiers and scope conditions. Fifth, produce an independent analytical memo that demonstrates all of the above. The lesson is demanding because the subject is genuinely difficult: the same evidence can support multiple interpretations, and the stakes of getting it wrong—whether in policy or in scholarship—are high.

A final methodological caution frames everything that follows. The mere co-occurrence of sectarian identity and violent conflict does not establish causation. Correlation is not mechanism. The analyst must trace decision-making processes, resource flows, rhetorical strategies, and institutional pathways to determine how identity becomes salient, for whom, and with what effects. Where such tracing is impossible—because of secrecy, denial, or the absence of documentation—the honest response is to mark the claim as unverified rather than to fill the gap with assumption. This discipline is especially important in a domain where conspiracy theories, propaganda, and genuine uncertainty are densely intertwined. The lesson models this discipline throughout: every claim is tied to a mechanism, every mechanism to scope conditions, every theory to its strongest counterargument.

SECTION 1 — Pre-Class Priming

1.1 Retrieval Warm-Up

Answer the following questions from memory before reading further. Do not look up answers. The purpose is to activate prior knowledge and identify gaps.

1. From L41 (West Asia state system): What structural features of the West Asian state system—multipolarity, external penetration, resource dependence—make it prone to security dilemmas, and how does the absence of a regional hegemon shape threat perception?
2. From L42 (Iran): How does the Islamic Republic reconcile its revolutionary ideology with its national interests, and what instruments does it use to project influence beyond its borders?
3. From L23 (asymmetric warfare): Define asymmetric warfare and explain how a weaker actor can impose costs on a stronger one without matching its conventional capabilities.
4. From L41: What role do oil rents and water scarcity play in shaping state capacity and regional competition in West Asia?
5. From L42: What is the "forward defense" doctrine, and how does it relate to Iran's perception of its strategic environment?
6. From L23: How does the presence of non-state actors complicate traditional deterrence theory, which assumes rational state actors with clear chains of command?

1.2 Orientation Questions

These questions frame the lesson's central puzzles. Hold them in mind as you read; you will return to them in the problem pair and independent memo.

1. Is the Saudi-Iranian rivalry fundamentally sectarian in nature, or is sectarianism the available vocabulary through which a geopolitical, regime-security, and status competition is expressed? What evidence would distinguish these two hypotheses?
2. Does the Axis of Resistance constitute a coherent alliance with shared objectives and command structures, or a loose network of convenience bound by overlapping but distinct interests? What would a "coherent alliance" look like in terms of observable behavior?
3. How does the sectarian security dilemma differ from the classic interstate security dilemma described by Herz and Jervis? Does the addition of identity make the dilemma more or less tractable?
4. What would falsify the claim that sectarian identity is merely instrumental—that is, what evidence would demonstrate that sectarian attachments have causal force independent of elite manipulation?

1.3 Vocabulary Pre-Teach

The following terms will be used throughout the lesson. These are provisional definitions; refine them as you encounter the concepts in context.

- **Sectarianization**: The process by which political actors construct, amplify, and institutionalize sectarian categories as salient bases for political mobilization and conflict. Distinct from "sectarianism" as a pre-existing attitude; emphasizes agency and construction. (Haddad, 2018)
- **Security dilemma**: A situation in which measures taken by one state to increase its security are perceived as threatening by another, prompting countermeasures that leave both less secure. In its sectarian variant, identity-based mobilization by one actor is read as existential threat by another.

- **Axis of Resistance**: Iran's network of allied state and non-state actors—including Hezbollah in Lebanon, the Houthis in Yemen, Iraqi Shia militias, and Hamas in Palestine—united by opposition to US and Israeli regional dominance and by varying degrees of alignment with Iranian strategic objectives.
- **Shia Crescent**: A geopolitical concept describing a contiguous arc of Shia-majority or Shia-influenced states and populations from Iran through Iraq, Syria, and Lebanon. Functions as both an analytical category and a rhetorical device; its "reality" is contested.
- **Proxy warfare**: The use of third parties—states, militias, or other non-state actors—to conduct military operations on behalf of a principal, providing plausible deniability and cost reduction. (See L44 for full treatment.)
- **Instrumentalization**: The strategic use of identity categories by political elites to mobilize support, justify policy, and delegitimize opponents, without necessarily believing in the identity's primordial significance.
- **Deep structure (of identity)**: The argument that sectarian or communal identities have autonomous causal force rooted in history, theology, and social organization, independent of elite manipulation. Contrasts with instrumentalization.
- **Rapprochement**: The re-establishment of diplomatic and strategic relations between previously hostile states. The 2023 Saudi-Iran agreement brokered by China is the central case.
- **Deterrence by punishment**: A strategy of threatening unacceptable costs to an adversary in response to aggression, as opposed to deterrence by denial (preventing the adversary from achieving its objectives). Iran's Axis of Resistance is often analyzed as a punishment mechanism.
- **Communal identity**: A sense of belonging to a religious, ethnic, or sectarian community that may or may not be politically mobilized. The gap between communal identity and political sectarianism is a key analytical distinction.
- **Transnationalism**: Political, social, and military activity that crosses state borders, including the operation of non-state actors like Hezbollah and the Houthis across multiple national contexts.
- **Asymmetric retaliation**: A response to aggression that exploits the adversary's vulnerabilities through indirect, deniable, or unconventional means rather than symmetric conventional force. Central to the Axis of Resistance's operational logic.

SECTION 2 — LESSON CORE

2.1 Learning Objectives

By the end of this lesson, the student will be able to:

1. **Explain** the historical trajectory of Saudi-Iranian rivalry from the 1979 Iranian Revolution through the 2023 Beijing-brokered rapprochement, identifying the structural shifts in regime type, regional order, and threat perception that transformed a manageable bilateral competition into a region-wide sectarianized security dilemma.

2. **Analyze** the causal mechanisms through which defensive measures by one rival are interpreted as offensive threats by the other, applying the security dilemma framework to the Gulf and Levant and specifying the conditions under which sectarian identity becomes a mobilizing resource rather than a latent social fact.

3. **Evaluate** competing claims about the "Shia Crescent" — as empirical geopolitical description, as Iranian strategic doctrine, and as Saudi/Israeli rhetorical construction — and adjudicate which components are verifiable and which are politically performative.
4. **Compare** the five major interpretive traditions (African, Chinese, Russian, Western, UN) on the Axis of Resistance, identifying what each framework renders visible and what it systematically occludes, and defend a reasoned judgment about which framework best explains a given case.
5. **Synthesize** the distinction between instrumentalization and deep structure in sectarian politics, applying it to the 2019 Aramco attack and the 2023 rapprochement, and produce a falsifiable prediction about whether the Beijing agreement will endure under specified conditions.

2.2 KEY IDEA 1 — The Saudi-Iranian Rivalry: From the 1979 Revolution to the 2023 Beijing-Brokered Rapprochement

Bolded Causal Claim: The Saudi-Iranian rivalry is not an ancient sectarian feud but a modern, state-driven competition that was sectarianized after 1979, when the Iranian Revolution replaced a secularizing, Western-aligned monarchy with a revolutionary republic that claimed pan-Islamic and pan-Shia leadership, thereby converting a manageable bilateral contest over Gulf hegemony into an existential, identity-laden security dilemma that structured regional politics for four decades.

Mechanism: The mechanism operates through three linked transformations. First, the 1979 revolution eliminated the Pahlavi state's role as the Gulf's Western-aligned gendarme and replaced it with a regime whose legitimacy rested on exporting revolution and championing the oppressed (mostazafin), including Shia communities in Saudi Arabia's Eastern Province, Bahrain, Iraq, and Lebanon. This was not merely a change in foreign policy orientation; it was a change in the ontological basis of the state, from dynastic-national to ideological-transnational. Second, the Saudi monarchy, whose legitimacy derived from custodianship of the Two Holy Mosques and from a Wahhabi clerical establishment that defined Shia Islam as heterodox, interpreted Iranian revolutionary rhetoric as a direct threat to its domestic order and to its regional standing. The mechanism here is threat perception amplification: the same Iranian statements that Tehran framed as solidarity with the oppressed were read in Riyadh as subversion of the Saudi state and its Gulf allies. Third, the Iran-Iraq War (1980-1988) locked both states into a militarized rivalry in which each side armed proxies, cultivated sectarian constituencies, and securitized identity. The war's outcome — Iran's survival despite international isolation — convinced Tehran that asymmetric, proxy-based deterrence was essential, while convincing Riyadh that containment of Iran required American security guarantees and, later, a network of Sunni-aligned states. Over the subsequent decades, this rivalry became self-reinforcing: each Iranian gain (Hezbollah's consolidation in Lebanon after 2006, the post-2003 Iraqi state's Shia-majority character, the Houthi takeover of Sana'a in 2014) was read in Riyadh as evidence of an encircling "Shia Crescent," while each Saudi move (support for Saddam Hussein during the war, the 2015 Yemen intervention, the 2017 Qatar blockade) was read in Tehran as American-backed encirclement. The 2023 Beijing-brokered rapprochement did not dissolve this structure; it suspended it. The mechanism of suspension was mutual exhaustion and Chinese economic leverage: both states faced fiscal constraints (Saudi Arabia's Vision 2030 financing needs, Iran's sanctions-strangled economy), both had failed to achieve decisive victories in Yemen and Syria, and both calculated that a diplomatic pause would yield economic dividends. China's role was not merely mediatory; it was structural, offering a non-Western framework that allowed both parties to save face and to frame the agreement as multipolar rather than as capitulation to American pressure.

Scope Conditions: The rivalry-as-security-dilemma framework applies most strongly under three conditions: (a) when both states possess asymmetric capabilities and cannot achieve decisive military victory, producing a stalemate that incentivizes proxy competition; (b) when domestic legitimacy in each state is partially tied to sectarian or ideological identity, making concession costly; and (c) when an external great power (the United States) is present but unreliable, creating incentives for both states to hedge through regional balancing. The framework applies less well when the rivalry is driven primarily by resource competition (oil market share) or by pure geopolitical balancing without identity content, as in the pre-1979 period when Iran and Saudi Arabia, despite being rivals, cooperated within the Nixon Doctrine's "twin pillars" framework. It also applies less well when one side achieves clear dominance, which would convert the dilemma into a hierarchy rather than a security competition. The 2023 rapprochement tests these scope conditions: if it endures, it suggests that economic exhaustion and great-power mediation can override identity-based rivalry; if it collapses, it confirms that the underlying security dilemma remains structurally intact.

Observable Implications: If the rivalry is genuinely a sectarianized security dilemma rather than a primordial religious conflict, we should observe several patterns. First, periods of reduced threat perception should produce rapid de-escalation regardless of theological differences — as occurred in the 1990s under Rafsanjani and Khatami, when Iran and Saudi Arabia cooperated on OPEC and regional stability. Second, the rivalry should intensify when third parties (the United States, Israel) are perceived as tilting the balance, and should moderate when those parties are distracted or withdrawn. Third, proxy groups should exhibit agency and interests distinct from their patrons, sometimes escalating beyond patron control (as the Houthis did in 2019) or pursuing local agendas (as Hezbollah does in Lebanon). Fourth, the 2023 rapprochement should produce measurable reductions in proxy attacks, diplomatic normalization (embassy reopenings, prisoner exchanges, economic agreements), and rhetorical de-escalation — but not necessarily the dismantling of proxy networks, which would indicate a tactical pause rather than strategic transformation. Observable indicators of collapse would include renewed attacks on Saudi or Iranian targets, the reactivation of dormant proxy cells, and the resumption of sectarian rhetoric in state media.

Perspective Note (five traditions in brief):

African (primary): The African perspective reconstructs the Saudi-Iranian rivalry through the lens of post-colonial state formation and the instrumentalization of identity by ruling elites. Drawing on Mamdani's analysis of the colonial state's bifurcated structure and Bayart's concept of the "politics of the belly," African scholars would read both Riyadh and Tehran as post-colonial states whose ruling elites deploy sectarian identity as a resource for domestic legitimation and regional influence, much as African post-colonial elites deployed ethnicity. The African vantage point reveals what the Western and UN frameworks occlude: that the rivalry is not primarily about religion but about the political economy of state survival in a region where colonial borders created weak states and where external powers have historically intervened to shape outcomes. The African perspective also highlights the parallel between the Gulf's sectarian security dilemma and the African Great Lakes' ethnic security dilemmas, where defensive mobilization by one group is read as existential threat by another. What this perspective risks occluding is the genuine ideological content of the Iranian revolutionary project, which cannot be reduced to elite instrumentalization; Fanon's and Cabral's insights on liberation movements suggest that revolutionary ideology has autonomous force even when captured by state elites.

Chinese: The Chinese perspective frames the rivalry as a destabilizing competition that threatens energy security and the Belt and Road Initiative, and interprets the 2023 rapprochement as a vindication of Chinese mediation and multipolar diplomacy. Beijing's reading emphasizes that both states are partners in a non-

Western international order and that their reconciliation serves Chinese interests in stable oil flows and in demonstrating that the United States is not the indispensable mediator in the Middle East. This perspective contributes the insight that great-power competition shapes regional rivalries and that mediation can be a tool of strategic positioning. It occludes, however, the depth of the identity-based and proxy dimensions of the rivalry, treating them as manageable through state-to-state diplomacy and economic incentives.

Russian: The Russian perspective frames the rivalry within a multipolar, anti-Western narrative, emphasizing that both Iran and Saudi Arabia are sovereign states resisting American hegemony and that their reconciliation weakens the US-led order. Moscow's reading highlights the failures of American policy in the region and presents Russia as a stabilizing power through its military presence in Syria and its energy diplomacy. This perspective contributes the insight that the rivalry is embedded in great-power competition and that American withdrawal creates space for regional accommodation. It occludes the extent to which Russia benefits from continued tension (which sustains demand for Russian arms and energy) and the limits of Russian leverage over either party.

Western: The Western perspective, dominant in US and European policy circles, frames the rivalry as Iranian expansionism versus Saudi defensive interests, with Iran as the primary destabilizer through its proxy network and nuclear program. This reading emphasizes the Axis of Resistance as an Iranian imperial project and treats Saudi Arabia as a status quo power requiring American protection. It contributes detailed intelligence and military analysis of proxy capabilities and Iranian command structures. It occludes, however, the extent to which Saudi actions (the Yemen war, support for Sunni militias in Syria and Iraq) are equally destabilizing, and it tends to treat sectarian identity as a primordial driver rather than a politically constructed resource.

UN: The UN perspective frames the rivalry through the lens of international law, civilian protection, and mediation, emphasizing cross-border attacks, humanitarian crises (Yemen, Syria), and the need for inclusive political settlements. This reading contributes normative standards and institutional mechanisms for de-escalation. It occludes, however, the power asymmetries that make UN mediation dependent on great-power backing and the extent to which UN frameworks are instrumentalized by member states for partisan ends.

2.3 KEY IDEA 2 — The 'Shia Crescent': Reality and Rhetorical Construction

Bolded Causal Claim: The "Shia Crescent" denotes both a real, Iran-facilitated network of Shia-identified political-military actors stretching from Tehran through Baghdad, Damascus, and Beirut (and, more loosely, Sana'a) and a rhetorical construction that reifies contingent alliances into a civilizational bloc; the concept's analytical value depends entirely on whether it is deployed as an empirical map of influence or as an ideological frame that naturalizes sectarian conflict.

Mechanism: The mechanism operates on two levels. At the material level, Iran's post-1979 revolutionary foreign policy invested in building cross-border networks of Shia political-military actors: the Islamic Revolutionary Guard Corps (IRGC) Quds Force cultivated Hezbollah in Lebanon from 1982, supported the Supreme Council for the Islamic Revolution in Iraq (SCIRI) and its Badr Brigade during the Iran-Iraq War, and later deepened ties with Iraqi militias after 2003; in Syria, Iran backed the Assad regime's survival after 2011; and in Yemen, Iranian support for the Houthis grew from the mid-2010s. These ties are real, sustained, and involve funding, training, weapons transfers, and ideological coordination. At the discursive level, King Abdullah II of Jordan's 2004 coinage of "Shia Crescent" (hilal shi'i) transformed this contin-

gent set of alliances into a seemingly natural sectarian geography. The term's circulation in Arab, Western, and Israeli media and policy discourse created a feedback loop: the label shaped threat perception, which shaped policy (Saudi counter-mobilization, US "surge" rhetoric, Israeli strikes), which in turn deepened the very polarization the label described. Vali Nasr's 2006 analysis of the "Shia Revival" captured the demographic and political awakening of Shia communities after the US invasion of Iraq, but the popularization of the "Crescent" concept went further, converting demographic shifts into a geopolitical threat narrative. The mechanism is thus dialectical: material Iranian influence provides the substrate; discursive reification provides the accelerant.

Scope Conditions: The concept retains empirical purchase where three conditions hold: (a) Iran provides sustained, substantial material support to an actor; (b) that actor's identity and interests are substantially aligned with Tehran's strategic priorities; and (c) the relationship is durable across leadership changes. Hezbollah in Lebanon meets all three; the Houthis meet (a) partially and (b) weakly, given their rootedness in Yemeni grievances and Zaydi (not Twelver) Shia identity; Hamas, a Sunni Islamist movement, meets none of the identity criteria yet is included in the "Axis of Resistance," which exposes the sectarian framing as analytically inadequate. The concept loses purchase—and becomes actively misleading—when it is used to imply a unified command structure, a shared ideology, or a single decision-making center. It also fails when applied to Shia communities as such: the majority of Arab Shia are not aligned with Iran, and their political behavior is shaped by local contexts (Iraqi Shia politics, Bahraini opposition, Lebanese confessionalism) rather than Tehran's directives. The scope condition, in short, is that the "Crescent" is a map of Iranian influence networks, not a map of Shia identity.

Observable Implications: If the "Shia Crescent" is primarily a real bloc, we should observe coordinated military operations, shared command and control, policy alignment on core issues (Israel, US presence, Saudi Arabia), and rapid Iranian ability to redirect allied forces. If it is primarily rhetorical, we should observe divergent interests, local autonomy, public disagreements, and the instrumental use of the label by rivals to justify their own policies. The evidence is mixed in ways that favor the second reading for the bloc-as-a-whole while confirming the first for specific dyads. Hezbollah's subordination to Iranian strategic priorities is well-documented (its intervention in Syria at Iran's behest, its role in regional deterrence). Iraqi Shia militias (Hashd al-Shaabi factions) show more autonomy, with some factions (Kata'ib Hezbollah) closely aligned and others (Sadrists) fiercely independent. The Houthis pursue a Yemeni agenda that frequently diverges from Tehran's preferences. Hamas's inclusion in the "Axis" despite its Sunni identity and its own agency (including the October 7, 2023 attack, which Iran did not direct) further undermines the sectarian framing. Crisis Group reports on Iran and the Gulf consistently note that Iranian influence is real but overstated by rivals, and that the "Shia Crescent" discourse itself fuels the security dilemma it purports to describe. The observable implication for analysts is that the label should be used descriptively for specific influence relationships, not as a civilizational category.

Perspective Note (five traditions in brief):

African (primary): The African vantage treats the "Shia Crescent" as a case study in the political construction and reification of identity categories—a process African scholarship has analyzed extensively in the context of ethnicity and "tribalism." Mahmood Mamdani's argument in *Citizen and Subject* (1996) that colonial powers "defined and ruled" through customary categories, and that postcolonial states inherited these reified identities, provides a direct parallel: the "Shia Crescent" discourse imposes a sectarian grid on complex political realities, much as colonial ethnography imposed tribal grids on African societies. Jean-François Bayart's concept of "extraversion"—the way African elites leverage external recognition and resources—illuminates

how regional actors (Saudi Arabia, Iran) and external powers (US, Israel) instrumentalize sectarian identity for strategic gain. Achille Mbembe's analysis of how colonial and postcolonial power operates through the production of "difference" and the management of populations suggests that the "Crescent" discourse functions as a technology of rule: it renders certain populations legible as threats, justifying intervention, surveillance, and violence. Siba Grovogui's critique of international relations theory's Eurocentrism—its tendency to treat Western categories as universal—applies directly: the "Shia Crescent" is a Western/Arab elite category that obscures the agency of local actors and the material drivers (state weakness, resource competition, foreign intervention) of conflict. The African perspective also draws on the continent's own experience with proxy warfare during the Cold War, when superpowers armed factions along ethnic and religious lines, producing conflicts that were then narrated as "ancient hatreds." The lesson is that sectarian categories are not primordial facts but political achievements, and that the "Crescent" discourse, by treating them as natural, forecloses the possibility of cross-sectarian political coalitions. What this vantage reveals that others miss is the extent to which the discourse itself is an instrument of power: it is not merely a description of reality but a performative act that produces the very sectarianization it claims to observe.

Chinese: The Chinese perspective approaches the "Shia Crescent" through the lens of non-interference and developmental stability, treating sectarian framing as a destabilizing discourse that complicates regional order. Beijing's official position emphasizes state sovereignty and territorial integrity, and Chinese analysts tend to view the "Crescent" concept as an externally imposed category that exacerbates divisions. China's interest in the concept is primarily economic: sectarian conflict threatens energy supplies and Belt and Road Initiative (BRI) investments. Chinese scholarship and policy discourse often frame the issue as one of "extremism" and "terrorism" rather than sectarian geopolitics, aligning with Beijing's domestic narrative. This perspective contributes a focus on economic interdependence as a stabilizing force and a skepticism toward identity-based explanations of conflict. It occludes, however, the extent to which China's own partnerships (with Iran, Saudi Arabia, Israel) are shaped by the very sectarian dynamics it downplays, and it tends to treat state actors as unitary rational actors, understating the role of non-state networks.

Russian: The Russian perspective frames the "Shia Crescent" within a multipolar, anti-Western narrative, treating Iranian influence as a legitimate counterweight to US hegemony and Saudi/Western dominance. Moscow's alliance with Tehran (especially in Syria) and its engagement with Shia militias in Iraq reflect a pragmatic acceptance of Iranian regional power. Russian analysts often critique the "Shia Crescent" concept as a Western/Israeli construct designed to justify intervention and contain Iran. This perspective contributes a counter-hegemonic framing that highlights Western double standards and the legitimacy of Iranian security concerns. It occludes, however, the extent to which Russia's own interventions (Syria) have deepened sectarian polarization, and it tends to minimize the agency and suffering of local populations caught in proxy conflicts.

Western: The Western perspective, particularly in US and Israeli policy discourse, has often treated the "Shia Crescent" as a real and threatening geopolitical formation, framing Iranian influence as expansionist and destabilizing. This reading emphasizes Iran's material support for proxies, its ballistic missile program, and its challenge to the US-led regional order. It contributes detailed intelligence assessments and a focus on state-level deterrence. It occludes, however, the extent to which Western interventions (Iraq 2003) created the conditions for Iranian influence, and it tends to reify sectarian identity as a primordial driver rather than a politically constructed resource, as Haddad (2018) and Wehrey (2018) have argued.

UN: The UN perspective frames the issue through international law, civilian protection, and the need for inclusive political settlements, emphasizing that sectarian framing undermines national cohesion and fuels

humanitarian crises. UN reports on Syria, Yemen, and Iraq highlight how sectarianization of conflict harms civilians and obstructs peace processes. This reading contributes normative standards and institutional mechanisms for de-escalation. It occludes, however, the power asymmetries that make UN frameworks dependent on member-state backing and the extent to which UN categories (e.g., "minorities") can themselves reify sectarian identities.

2.4 KEY IDEA 3 — The Axis of Resistance: Hezbollah, the Houthis, Iraqi Shia militias, and Hamas

Bolded Causal Claim: The "Axis of Resistance" is a real but loose network of Iran-aligned actors whose operational coordination varies dramatically by dyad; it is best understood not as a unified command structure but as a hub-and-spoke system in which Tehran provides resources and strategic direction while local actors retain significant autonomy, with the network's coherence depending on shared opposition to US/Israeli/Saudi regional order rather than on sectarian identity per se.

Mechanism: The mechanism is hub-and-spoke: Iran (primarily via the IRGC Quds Force) sits at the center, providing funding, training, weapons, intelligence, and strategic coordination; spokes include Hezbollah (Lebanon), the Houthis (Yemen), Iraqi Shia militias (Hashd al-Shaabi factions, especially Kata'ib Hezbollah and Asa'ib Ahl al-Haq), and—despite its Sunni identity—Hamas (Gaza). The network's coherence derives from shared opposition to the US-led regional order, Israel, and Saudi Arabia, not from sectarian identity: Hamas's inclusion demonstrates that the "Axis" is politically defined, not sectarian. Coordination occurs through bilateral channels, joint operations (e.g., the 2023-2024 multi-front pressure on Israel), and shared media narratives, but there is no unified command. The mechanism includes "forward defense": Iran projects power through proxies to deter attacks on its own territory, creating strategic depth. Juneau (2020) emphasizes that Iran's proxy strategy is driven by regime insecurity and the need to deter superior conventional forces (US, Israel), not by expansionist ideology alone. The mechanism also includes "resistance economy" elements: smuggling, sanctions evasion, and local resource extraction sustain proxy operations.

Scope Conditions: The Axis model holds where: (a) Iran has sustained access to an actor (geographic proximity, shared borders, or permissive environments); (b) the actor faces a common enemy (US, Israel, Saudi Arabia); (c) material incentives align (funding, weapons, political support); and (d) local grievances provide recruitment base. It weakens where local actors prioritize national agendas over Tehran's (Houthis' Yemen focus, Sadrists' Iraqi nationalism), where sectarian identity diverges (Hamas), or where external pressure disrupts supply lines. The model is also scope-limited by Iran's own resource constraints: sanctions limit the scale of support, and Tehran must prioritize among proxies.

Observable Implications: If the Axis is a unified command, we should observe synchronized attacks, shared targeting, and rapid Iranian ability to halt or redirect operations. If it is hub-and-spoke with autonomy, we should observe divergent timing, local initiative, and occasional public disagreements. Evidence favors the latter: the October 7, 2023 Hamas attack was not directed by Iran (per US intelligence assessments); Hezbollah's escalation in 2023-2024 was calibrated, not automatic; Houthi Red Sea attacks served Yemeni/Houthi interests as much as Iranian strategy; Iraqi militia attacks on US forces in 2023-2024 were partially suspended after Iranian pressure (suggesting Tehran can modulate but not fully control). Crisis Group reports note that Iran's influence is real but that proxies have their own agendas, and that the "Axis" label, like the "Shia Crescent," can overstate coherence.

Perspective Note (five traditions in brief):

African (primary): The African vantage illuminates the Axis of Resistance through the lens of liberation-movement networks and the politics of solidarity across borders. African scholarship on pan-Africanism, anti-colonial solidarity, and the Non-Aligned Movement provides a framework for understanding how states and movements build transnational alliances around shared opposition to dominant powers. Kwame Nkrumah's concept of "neo-colonialism" and his advocacy for continental unity against external domination resonate with the Axis's self-framing as resistance to US/Israeli/Saudi hegemony. Amílcar Cabral's emphasis on the "weapon of theory" and the need for political clarity in liberation struggles applies: the Axis's coherence depends on a shared political narrative (resistance to occupation and hegemony) rather than on sectarian identity. Frantz Fanon's analysis of how colonialism produces reactive violence and how liberation movements navigate the tension between national and international solidarity is directly relevant: the Axis actors are simultaneously national movements (Hezbollah as Lebanese, Houthis as Yemeni) and transnational resistance actors, and their behavior reflects this duality. The African perspective also draws on the continent's experience with proxy warfare during the Cold War, when superpowers armed local factions, producing conflicts that were narrated as ideological but driven by local grievances. What the African vantage reveals that others miss is the extent to which the Axis is a response to perceived imperial domination, not merely an instrument of Iranian expansion: treating it solely as Iranian proxy network (Western view) or as civilizational threat (sectarian view) obscures the genuine grievances (occupation, sanctions, intervention) that motivate participation. It also highlights the risk of "extraversion" (Bayart): Axis actors may leverage Iranian support for local ends, just as African elites leveraged Cold War patronage. The African perspective thus reframes the Axis from a security threat to a symptom of unresolved regional grievances and asymmetric power.

Chinese: The Chinese perspective frames the Axis through the lens of state sovereignty and non-interference, treating non-state armed groups as destabilizing but emphasizing that their roots lie in unresolved conflicts (Palestine, occupation, intervention). Beijing's engagement with Iran and its mediation efforts (e.g., 2023 Saudi-Iran rapprochement) reflect a preference for diplomatic solutions over military containment. Chinese analysts tend to view the Axis as a consequence of regional disorder rather than its cause, and emphasize economic development as the antidote. This perspective contributes a focus on root causes and a skepticism toward military solutions. It occludes, however, the extent to which China's own economic interests (energy, BRI) depend on the very order the Axis challenges, and it understates the agency and ideology of Axis actors.

Russian: The Russian perspective treats the Axis as a legitimate counterweight to US hegemony and a partner in multipolar order-building. Moscow's military cooperation with Iran and Hezbollah in Syria reflects a pragmatic alliance of convenience against Western-backed forces. Russian analysts frame the Axis as "resistance" to unipolar dominance, aligning with Russia's own anti-Western narrative. This perspective contributes a counter-hegemonic framing and highlights Western double standards. It occludes, however, the extent to which Russia's own interventions have deepened sectarian polarization and civilian suffering, and it tends to minimize the agency of local populations.

Western: The Western perspective, particularly US and Israeli, frames the Axis as an Iranian proxy network and a primary security threat, emphasizing Iran's material support, the network's military capabilities, and its role in regional destabilization. This reading contributes detailed intelligence and a focus on deterrence and containment. It occludes, however, the extent to which Western interventions (Iraq 2003, support for Saudi Arabia in Yemen) created conditions for Axis growth, and it tends to treat Axis actors as Iranian puppets rather than as actors with their own grievances and agency, as Juneau (2020) and Crisis Group reports caution.

UN: The UN perspective frames the Axis through international humanitarian law and civilian protection,

emphasizing the harm caused by proxy warfare to civilians in Lebanon, Yemen, Gaza, and Iraq. UN reports highlight cross-border attacks, violations of sovereignty, and the need for political settlements. This reading contributes normative standards and documentation of civilian harm. It occludes, however, the power asymmetries that make UN action dependent on great-power consensus and the extent to which UN frameworks are instrumentalized by member states.

2.5 KEY IDEA 4 — The Sectarian Security Dilemma: How Defensive Measures Appear Offensive to Rivals

Bolded Causal Claim: In West Asia, the sectarian security dilemma operates when defensive measures taken by one sectarian-aligned actor—arming co-religionist militias, fortifying borders, acquiring ballistic missiles, or deepening alliances—are interpreted by rivals as offensive threats, generating reciprocal escalation that neither side initially sought and that is amplified by identity-based threat perception.

Mechanism: The classical security dilemma, formalized by Jervis (1978), rests on two variables: the distinguishability of offensive from defensive capabilities, and the offense-defense balance. When states cannot distinguish defensive from offensive postures, and when offense is perceived to dominate, mutual fear drives arms racing even among status-quo powers. The sectarian variant adds a third variable: identity-based threat inflation. In West Asia, Saudi Arabia and Iran do not merely compete for power; they compete as guardians of rival sectarian communities. When Iran arms Hezbollah or supports Iraqi Shia militias, Tehran frames these as defensive measures against Sunni extremism and US encirclement; Riyadh reads the same measures as encirclement and subversion of Sunni-majority states. Conversely, Saudi support for Sunni rebels in Syria or for the Yemeni government against the Houthis is framed in Riyadh as state sovereignty and stability; Tehran reads it as anti-Shia aggression. The mechanism is a feedback loop: each defensive step confirms the rival's worst fears, deepening mistrust and justifying further buildup. Posen's (1993) analysis of the security dilemma and ethnic conflict extends this logic to communal groups, showing how mobilization for protection becomes indistinguishable from preparation for aggression. In the sectarian case, the indistinguishability is structural: a missile battery defending a Shia shrine can strike a Sunni capital; a militia protecting a community can project power across borders. Communication channels are weak, intelligence is politicized, and identity markers override material calculation, so the spiral model dominates over the deterrence model.

Scope Conditions: The sectarian security dilemma is most acute under four conditions: (1) mutual uncertainty about intentions, where neither side can credibly signal restraint; (2) offensive-defensive indistinguishability, where capabilities serve both purposes; (3) identity-based threat perception that trumps material interest, so that even cooperative gestures are read as deception; and (4) weak or absent institutionalized communication, whether diplomatic hotlines or arms-control regimes. It is attenuated where states share a superordinate identity, where third-party mediation is trusted, or where military capabilities are transparently defensive, such as clearly demarcated border fortifications. It is also weaker when one side achieves clear dominance, converting a dilemma into a hierarchy, though dominance itself may provoke balancing. The dilemma is not automatic: it requires elite choices to frame security in sectarian terms, and it can be dampened by cross-sectarian coalitions or by external guarantees.

Observable Implications: If the sectarian security dilemma is operating, we should observe reciprocal military buildup in the Gulf and Levant; expansion of proxy forces on both sides; preemptive or preventive strikes, including the 2019 Aramco attack, the Saudi-led intervention in Yemen, and Israeli strikes on Iranian

positions in Syria; diplomatic freezes punctuated by crisis; arms racing in missile and drone capabilities; and rhetoric that frames the rival's defensive measures as existential threats. We should also observe variation: the dilemma intensifies during regional crises such as the Syrian civil war and the Yemen war, and attenuates during détente, as in the 2023 Beijing rapprochement. A key test is whether de-escalation measures by one side reduce or increase the other's threat perception; under the dilemma, even concessions may be read as tactical.

Perspective Note (five traditions in brief):

African (primary): The African vantage treats the sectarian security dilemma not as a Middle Eastern anomaly but as a variant of a broader pattern in which identity becomes the currency of security competition. African scholarship on ethnic and communal security dilemmas—Mamdani's (1996) analysis of how colonial indirect rule hardened ethnic categories into political identities, and Mbembe's (2001) work on the militarization of identity—suggests that the dilemma is often manufactured rather than discovered. From this perspective, the Saudi-Iranian rivalry is not simply two states fearing each other; it is two regimes instrumentalizing sectarian identity to consolidate domestic legitimacy and externalize internal contradictions. The African experience with ethnic security dilemmas, from Nigeria's Middle Belt to Sudan's north-south divide, reveals that defensive mobilization by one community routinely appears as aggression to another, and that external patrons, whether colonial or Cold War, often amplified these spirals. What the African vantage adds is a focus on the domestic political economy of the dilemma: regimes use sectarian threat perception to justify repression, military spending, and the suspension of democratic accountability. Grovogui's (2006) critique of international order as a racialized and hierarchical system further suggests that the sectarian security dilemma is embedded in a global structure that privileges certain states' security claims over others. The African perspective thus sees the dilemma as partly endogenous to regime type and partly exogenous to global hierarchy, and it warns against treating sectarian identity as a primordial given rather than a political achievement.

Chinese: China frames the sectarian security dilemma as a manageable security problem amenable to dialogue and economic interdependence. Beijing's mediation of the 2023 Saudi-Iran rapprochement reflects a view that the dilemma is driven by misperception and lack of communication rather than by irreconcilable identity conflict. Chinese analysis emphasizes non-interference and the stabilizing effects of trade and infrastructure investment. This perspective contributes a practical diplomatic toolkit but occludes the depth of identity-based threat perception and the domestic political functions of sectarian mobilization.

Russian: Russia frames the dilemma as a product of Western hegemony and unipolar interventionism, arguing that US policies—from the 2003 Iraq invasion to support for Saudi Arabia—destroyed regional balances and created vacuums filled by sectarian actors. Moscow's anti-Western framing treats the dilemma as externally imposed and sees multipolarity as the remedy. This contributes a structural critique of great-power responsibility but occludes Russian and Iranian agency in fueling sectarian competition.

Western: Western analysis, particularly in US and European policy circles, tends to frame the dilemma through Iranian expansionism: Iran's support for proxies is treated as the primary driver, with Saudi and Gulf responses as reactive and defensive. This perspective contributes detailed intelligence on Iranian networks and a focus on deterrence. It occludes, however, the extent to which Western interventions and arms sales have shaped the regional security environment, and it risks treating Saudi actions as purely defensive.

UN: The UN perspective frames the sectarian security dilemma through international humanitarian law and civilian protection, emphasizing the harm to civilians from proxy warfare and cross-border attacks. UN

reports document violations of sovereignty and call for political settlements and confidence-building measures. This contributes normative standards and empirical documentation of civilian harm. It occludes the power asymmetries that make UN action dependent on great-power consensus and the extent to which UN frameworks are instrumentalized by member states.

2.6 KEY IDEA 5 — The Politics of Sectarian Identity: Instrumentalization versus Deep Structure

Bolded Causal Claim: Sectarian identity in West Asia is neither a primordial given nor a mere elite fabrication; it is a politically constructed and historically deepened structure that elites instrumentalize, and the balance between deep structure and instrumentalization varies by state, regime, and historical moment.

Mechanism: The debate over sectarianism's nature has two poles. Primordialist or essentialist accounts treat Sunni-Shia division as an ancient, theological fault line that inevitably generates conflict. Instrumentalist accounts treat sectarianism as a tool elites deploy to mobilize support, justify repression, and externalize blame. The scholarly consensus, reflected in Haddad (2018), Wehrey (2018), and Nasr (2006), rejects both extremes. Haddad argues that sectarianism is not an age-old hatred but a modern political construction, shaped by state-building, colonialism, and Cold War competition; yet he insists it has acquired real social and institutional depth through decades of political practice. Nasr's (2006) Shia revival thesis holds that Shia identity has become a genuine political and social force, rooted in clerical networks, religious endowments, and communal memory, not merely an elite invention. Wehrey (2018) pushes further, arguing that sectarianism is overemphasized in Western analysis and that cross-cutting identities—class, tribe, nationality, ideology—remain significant, so that sectarian mobilization is contingent rather than automatic. The mechanism is dialectical: elites instrumentalize sectarian identity because there is pre-existing social material to exploit; repeated instrumentalization deepens the structure, making future mobilization easier. State capacity mediates: strong states can suppress or channel sectarian identity, as in Ba'athist Iraq or Pahlavi Iran, while weak or collapsing states allow identity entrepreneurs to fill institutional vacuums, as in post-2003 Iraq or post-2011 Syria. External patrons amplify the process: Iranian and Saudi funding of religious institutions, media, and militias deepens sectarian infrastructure. Juneau (2020) notes that Iran's regional policy relies on pre-existing Shia networks but also actively cultivates them, blurring the line between responding to deep structure and creating it. The result is a feedback loop in which instrumentalization and deep structure co-produce each other.

Scope Conditions: Instrumentalization dominates where regimes face legitimacy crises, where state institutions are weak or collapsing, and where external patrons fund sectarian entrepreneurs. Deep structure dominates where religious institutions are autonomous and well-resourced, where sectarian identity is embedded in law, education, and personal status codes, as in Lebanon's confessional system or Bahrain's discriminatory practices, and where historical grievances are institutionalized in collective memory. The two interact dynamically: deep structure makes instrumentalization effective, while instrumentalization deepens structure over time. The balance also varies by issue: sectarian identity may be highly salient in security and foreign policy while cross-cutting in economic or local politics. The scope condition most often neglected is generational change: younger cohorts may be less attached to sectarian identity where education and media diversify, or more radicalized where conflict socializes them.

Observable Implications: If the instrumentalization-deep structure thesis holds, we should observe sectarian rhetoric spiking during political crises, elections, and external threats; cross-sectarian coalitions forming when material interests align, as in some Iraqi or Lebanese protests; identity salience fluctuating with state capacity and external threat; religious institutions showing varying degrees of autonomy from state con-

trol; and survey evidence showing sectarian identity is important but rarely the sole or primary identity. We should also observe path dependence: once sectarian institutions are built, they persist even when elite incentives change, and de-sectarianization requires sustained institutional reform, not just elite restraint. A key test is whether reducing external intervention reduces sectarian mobilization; if deep structure dominates, mobilization persists; if instrumentalization dominates, it declines.

Perspective Note (five traditions in brief):

African (primary): The African vantage is indispensable for dissolving the false binary between instrumentalization and deep structure. African scholarship on ethnicity and identity—Mamdani (1996) on how colonial indirect rule constructed ethnic subjects; Bayart (1993) on the politics of the belly and the instrumentalization of ethnicity by postcolonial elites; Rodney (1972) on how underdevelopment and class structure shaped communal identities; Fanon (1963) on the colonial construction of identity and its psychological depth; Nkrumah (1965) on neocolonialism's use of ethnic division; Nyerere (1968) on ujamaa and the deliberate construction of national over ethnic identity; Cabral (1973) on culture as both weapon and terrain of struggle; Oyěwùmí (1997) on how gender and identity categories are epistemologically constructed; Tamale (2020) on African feminism and the politics of identity; and Aning and Danso (2012) on African security governance—collectively demonstrates that identity is always both constructed and lived, both elite tool and social reality. From this perspective, asking whether sectarianism is real or instrumentalized misposes the question. African experience shows that colonial and postcolonial states routinely produced ethnic and religious categories through censuses, indirect rule, and patronage, and that these categories then acquired genuine social depth through education, marriage, and political mobilization. The African vantage reveals what Western and Middle Eastern analyses often miss: the question is not whether identity is deep or instrumental but who controls the means of identity production—states, clerics, parties, or external patrons—and how identity categories are institutionalized in law, bureaucracy, and resource distribution. Mbembe's (2001) concept of commandment and Grovogui's (2006) critique of international order as hierarchical and racialized further suggest that sectarian identity in West Asia is embedded in a global system that privileges certain identities and states. The African perspective thus reframes the debate: sectarianism is a political technology whose effectiveness depends on pre-existing social infrastructure, and dismantling it requires not just elite restraint but institutional transformation and the redistribution of the means of identity production.

Chinese: China tends to treat sectarian identity as a manageable social variable whose salience can be reduced through economic development, education, and state-led modernization. Beijing's domestic experience with ethnic management and its emphasis on non-interference shape a view that external powers should not exploit identity divisions. This perspective contributes a developmental optimism and a focus on state capacity but occludes the historical depth of sectarian institutions and the ways in which state-led modernization can itself deepen identity grievances.

Russian: Russia frames sectarian identity as largely a product of Western intervention and unipolar destabilization, arguing that the 2003 Iraq invasion and support for regime change created the conditions for sectarian mobilization. Moscow's anti-Western framing treats sectarianism as externally imposed rather than endogenous. This contributes a structural critique of great-power responsibility but occludes Russian and Iranian agency in cultivating sectarian networks and the genuine social depth of religious identity.

Western: Western analysis often treats sectarianism as an obstacle to modernization and democratization, with a tendency to see it as either primordial in popular discourse or as elite manipulation in academic discourse. Policy prescriptions frequently emphasize secular governance, civil society, and cross-sectarian institution-building. This contributes attention to institutional design and civil society but occludes the ways

in which Western interventions have shaped sectarian dynamics and the genuine social meaning of religious identity for communities.

UN: The UN perspective frames sectarian identity through human rights and minority protection, emphasizing the rights of religious and ethnic communities and the need for inclusive governance. UN frameworks treat sectarian discrimination as a human rights violation and promote intercommunal dialogue. This contributes normative standards and a focus on protection. It occludes, however, the political economy of identity production and the extent to which UN categories of minority and community can reify the very identities they seek to manage.

2.7 FIVE PERSPECTIVES IN DEPTH

2.7.1 African Perspective (PRIMARY)

The African vantage point on the sectarian security dilemma in West Asia begins from a position of structural familiarity rather than geographic distance. African states and societies have lived through the very dynamics that the West Asian sectarian security dilemma names: the instrumentalization of identity by political elites, the hardening of communal boundaries under external intervention, the transformation of defensive mobilization into perceived threat, and the use of proxy actors to project power while avoiding direct confrontation. The African perspective therefore does not treat sectarianism in West Asia as an exotic pathology of religious difference; it reads it as a variant of a more general political syndrome in which identity becomes the currency of security competition.

Drawing on Mahmood Mamdani's analysis of the colonial state in Africa, the African perspective emphasizes that identities which appear primordial are in fact politically produced. Mamdani's distinction between "citizen" and "subject" in the colonial state shows how colonial rule governed through "customary" authority, fixing fluid communities into administratively legible ethnic and religious categories. The parallel to West Asia is direct: the sectarian categories that now structure the Saudi-Iranian rivalry were not simply waiting to be activated; they were produced and hardened through decades of state-building, external intervention, and regional competition. Vali Nasr's account of the Shia revival after 1979, read through this lens, is not merely a story of religious awakening but of political mobilization in which a previously subordinated community acquires institutional voice and regional patrons. The African perspective thus insists that the "Shia Crescent" is not a natural bloc but a political construction whose coherence depends on the very rivalry that names it.

Frantz Fanon's analysis of colonial violence and the Manichean world of the settler colony provides a second theoretical resource. Fanon argued that colonialism produces a world divided into zones, and that the colonized subject is forced into an identity defined by the colonizer's gaze. Applied to West Asia, this suggests that the sectarian framing of regional politics is partly an artifact of external powers—Western, and to some extent Russian and Chinese—whose security architectures require legible categories of friend and enemy. The African perspective notes that the "Axis of Resistance" is itself a label produced by adversaries; it bundles Hezbollah, the Houthis, Iraqi Shia militias, and Hamas into a single category that obscures their distinct local grievances, national contexts, and political projects. Fanon's insistence on the concrete, lived experience of the colonized against abstract categorization thus becomes a methodological caution: the analyst must recover the specific political economy of each actor rather than subsuming them under a sectarian master narrative.

Achille Mbembe's concept of necropolitics—the subjugation of life to the power of death—offers a third lens. Mbembe's work on the postcolony and on the contemporary world of borders, camps, and targeted killing

illuminates the material violence that the sectarian security dilemma produces. The 2019 Aramco attack, the Saudi-led intervention in Yemen, and the Israeli strikes on Hezbollah and Iranian assets in Syria are not merely strategic moves in a rivalry; they are exercises of sovereign power over populations whose lives are rendered expendable. The African perspective, drawing on Mbembe, refuses to treat these as abstract security dilemmas and insists on the bodily reality of the violence. This is particularly important because the sectarian framing can sanitize violence: when an attack is described as "sectarian," it becomes a clash of identities rather than a political act with specific perpetrators and victims.

Jean-François Bayart's concept of the "politics of the belly" and his analysis of "extraversion"—the ways in which African states and elites have historically relied on external resources and recognition to maintain domestic power—provides a fourth resource. Bayart's framework suggests that the Saudi-Iranian rivalry is not simply a bilateral competition but a system in which both states extravert their domestic legitimation needs into regional arenas. Saudi Arabia's projection of Sunni leadership and Iran's projection of revolutionary Shia identity are, on this reading, strategies of domestic regime consolidation as much as regional security policies. The African perspective thus redirects attention from the religious content of the rivalry to its political function: identity is the medium through which states secure resources, legitimacy, and survival. This parallels Bayart's analysis of how African rulers have used ethnic and religious mobilization to manage access to state resources.

Walter Rodney's historical materialism and his analysis of how external powers underdeveloped Africa provide a fifth resource. Rodney's insistence that the international system is structured by unequal power relations, and that apparent local conflicts are often expressions of global structures, leads the African perspective to situate the West Asian sectarian security dilemma within the broader architecture of global power. The United States' security guarantees to Saudi Arabia, its sanctions on Iran, and its military presence in the Gulf are not neutral background conditions; they are constitutive of the rivalry. The African perspective, informed by Rodney, is skeptical of accounts that treat the Saudi-Iranian rivalry as a self-contained regional dynamic. It insists on the role of external great powers in creating the conditions under which sectarian identity becomes salient.

The African perspective also draws on the continent's own diplomatic experience. The African Union's emphasis on non-indifference, its mediation efforts in conflicts from Sudan to the Democratic Republic of Congo, and the historical experience of the Organization of African Unity's non-interference doctrine all inform an African reading of the 2023 China-brokered Saudi-Iran rapprochement. African states have long experience with externally brokered peace agreements that address symptoms rather than structures; the African perspective is therefore cautious about reading the Beijing rapprochement as a genuine strategic shift. It asks whether the agreement addresses the underlying security dilemma or merely manages its symptoms, and it notes that African experience suggests the latter is more common. The African perspective also values the principle of African solutions to African problems, and by extension is attentive to the question of who mediates and whose interests the mediation serves. China's role as broker is read not as neutral but as an expression of Chinese strategic interests, much as African states have historically been wary of external mediation that serves the mediator's interests.

What does the African perspective contribute that the other four cannot? First, it provides a theory of identity production that is not dependent on the specific theology of Sunni-Shia relations. By treating sectarian identity as politically constructed through state-building and external intervention, it avoids the trap of reifying religious categories. Second, it insists on the material and bodily reality of violence, resisting the abstraction of the security dilemma into a game-theoretic exercise. Third, it situates the regional rivalry within

global structures of power, drawing on Rodney and Fanon to show how external intervention constitutes the very identities it claims to manage. Fourth, it brings a skepticism born of experience with externally brokered agreements and proxy conflicts, which tempers both Western alarmism about Iranian expansionism and Chinese triumphalism about mediation.

What does the African perspective occlude? It risks underestimating the genuine theological and communal content of sectarian identity. Not all sectarian mobilization is elite manipulation; communities have real grievances, real memories of persecution, and real attachments to religious institutions. The African perspective's emphasis on instrumentalization can slide into a reductionism that treats religious identity as epiphenomenal. It also risks overextending analogies: the colonial state in Africa and the post-revolutionary state in Iran are not the same, and the specific dynamics of Shia jurisprudence, the marja'iyya, and the Iranian revolutionary ideology have no direct African parallel. Finally, the African perspective's focus on external power can obscure the agency of regional actors, who are not merely puppets of global structures but pursue their own strategies with considerable autonomy.

The African perspective thus offers a powerful corrective to both Western and regional narratives, but it must be held in tension with attention to the specific content of religious identity and the agency of regional actors. Its greatest contribution is methodological: it teaches the analyst to ask who benefits from the sectarian framing, how identities are produced rather than discovered, and whose bodies bear the cost of the security dilemma.

2.7.2 Chinese Perspective

The Chinese perspective on the West Asian sectarian security dilemma is shaped by three strategic imperatives: energy security, the Belt and Road Initiative, and the pursuit of a multipolar international order in which China plays a central mediating role. China is the largest importer of Gulf oil and has deep economic ties with both Saudi Arabia and Iran, which means it has a material interest in regional stability that transcends the sectarian divide. This economic interdependence is the foundation of the Chinese perspective: stability is not a normative preference but a commercial necessity.

The Chinese perspective treats the Saudi-Iranian rivalry as a manageable competition that has been exacerbated by external—primarily American—intervention. From this vantage point, the United States' "maximum pressure" campaign against Iran, its security guarantees to Saudi Arabia, and its military presence in the Gulf have deepened the security dilemma by signaling to each side that the other is backed by an external power. China's own approach, by contrast, is framed as non-interfering and development-oriented: it engages both states economically without taking sides in their ideological or sectarian competition. The 2023 Beijing-brokered rapprochement between Saudi Arabia and Iran is presented as the vindication of this approach, demonstrating that patient diplomacy and economic incentives can achieve what military pressure cannot.

The Chinese perspective also frames the rivalry through the lens of multipolarity. It views the West Asian security order as historically dominated by the United States and sees the emergence of alternative power centers—including China, Russia, and regional actors—as a positive development. The Axis of Resistance is not treated as a unified threat but as a set of actors whose relationships with Iran are diverse and whose local grievances must be understood on their own terms. China's strategic partnership with Iran, signed in 2021, and its deepening economic ties with Saudi Arabia are presented as complementary rather than contradictory, reflecting a pragmatic approach that prioritizes state-to-state relations over ideological alignment.

What does the Chinese perspective contribute? It provides an alternative to the Western framing of the rivalry

as a contest between Iranian expansionism and Saudi self-defense, emphasizing instead the role of external powers in exacerbating tensions. It also highlights the economic dimensions of regional order, drawing attention to the ways in which trade, investment, and infrastructure can create incentives for de-escalation. The mediation success of 2023 is a genuine contribution, demonstrating that a power with economic stakes in both sides can broker agreements that traditional security guarantors cannot.

What does it occlude? The Chinese perspective tends to understate the depth of the security dilemma and the genuine fears that drive both sides. By framing the rivalry primarily as a product of American intervention, it risks ignoring the autonomous agency of Saudi and Iranian leaders and the real security threats they perceive. It also occludes the human rights and civilian protection dimensions of regional conflicts, particularly in Yemen, where Chinese economic interests have led to a studied neutrality that avoids condemning either side. Finally, the Chinese perspective's emphasis on non-interference can serve as a rhetorical cover for prioritizing commercial interests over political accountability, a tension that becomes visible when Chinese investments are threatened by instability.

2.7.3 Russian Perspective

The Russian perspective on the West Asian sectarian security dilemma is organized around three themes: multipolarity, anti-Westernism, and the management of regional order through great-power concert. Russia views the Middle East as a theater in which American unipolarity is being challenged, and it sees the Saudi-Iranian rivalry as both a problem to be managed and an opportunity to expand Russian influence. Russia's military intervention in Syria, its partnership with Iran, and its careful cultivation of Saudi Arabia reflect a strategy of positioning itself as an indispensable actor in regional security.

The Russian perspective treats sectarian identity as a tool of political mobilization rather than a primordial force, but it does so with a cynical instrumentalism that differs from the African perspective's structural analysis. Russian analysts tend to view sectarian rhetoric as a convenient language for states to justify their interests, and they are skeptical of claims that the rivalry is driven by religious ideology. This skepticism is partly self-serving: by denying the religious content of the conflict, Russia can justify its own alliances with both Shia Iran and Sunni states without appearing inconsistent. The Russian perspective thus contributes a realist reading that strips away ideological pretense, but it does so in a way that serves Russian strategic interests.

Russia's approach to the Axis of Resistance is pragmatic. It has cooperated with Iran and Hezbollah in Syria while maintaining relations with Israel and the Gulf states. This balancing act reflects Russia's broader strategy of maximizing its leverage by being indispensable to all sides. The Russian perspective frames this not as opportunism but as a necessary response to a region in which no single power can impose order. It argues that the American attempt to build a regional order around Saudi Arabia and Israel has failed, and that a more inclusive concert involving Iran, Russia, and other powers is required.

The Russian perspective also emphasizes the destabilizing effects of external intervention, particularly American and Israeli military actions. It frames the 2019 Aramco attack and similar incidents as consequences of a security environment in which states and non-state actors lack legitimate channels for addressing grievances. Russia's mediation efforts, including its participation in the Astana process on Syria, are presented as models of inclusive diplomacy that the West has failed to replicate.

What does the Russian perspective contribute? It provides a critique of Western hegemony that is shared by many regional actors, and it highlights the ways in which American security guarantees have distorted the regional balance. It also draws attention to the role of non-state actors as legitimate political forces rather

than mere proxies, a framing that challenges the Western tendency to reduce Hezbollah and the Houthis to Iranian instruments.

What does it occlude? The Russian perspective's anti-Western framing can obscure the genuine security concerns of regional states and the real threats posed by Iranian-backed militias. Its emphasis on multipolarity can serve as a cover for Russian self-interest, particularly in Syria, where Russian intervention has been driven by the desire to preserve a client regime rather than by a principled commitment to inclusive order. The Russian perspective also tends to understate the human costs of its own interventions and those of its partners, and it has little to say about civilian protection or human rights. Finally, its cynical treatment of sectarian identity risks ignoring the real communal grievances that drive mobilization, much as the African perspective risks reductionism but without the African perspective's attention to structural violence.

2.7.4 Western Perspective

The Western perspective on the West Asian sectarian security dilemma is dominated by the framing of Iranian expansionism and the need to contain it. This framing, which became particularly prominent after the 2003 Iraq War and the rise of the "Shia Crescent" discourse, treats Iran as the primary driver of regional instability and the Axis of Resistance as a network of Iranian proxies designed to project power and threaten American allies. The Western perspective is not monolithic—it includes realist, liberal, and neoconservative variants—but it shares a common emphasis on the threat posed by Iran and the need for a regional order anchored in American security guarantees.

Vali Nasr's 2006 analysis of the Shia revival is a key text in this tradition, though Nasr himself is more nuanced than many who cite him. Nasr argued that the rise of Shia power in Iraq, Lebanon, and Iran represented a fundamental shift in the regional balance, and that the United States needed to engage with this new reality rather than simply contain it. However, much Western policy discourse has simplified Nasr's argument into a narrative of Iranian expansionism, treating the Shia Crescent as a coherent geopolitical project rather than a contingent alignment of interests. Haddad's 2018 critique of sectarianism as an analytical category is partly a response to this Western tendency to reify sectarian identity into a geopolitical bloc.

The Western perspective contributes a focus on state behavior and strategic interaction. It treats the Saudi-Iranian rivalry as a classic security dilemma in which each side's defensive measures are perceived as offensive by the other, and it emphasizes the role of arms races, proxy conflicts, and alliance politics in escalating tensions. The 2019 Aramco attack is read through this lens as an Iranian-orchestrated escalation designed to demonstrate the vulnerability of Saudi oil infrastructure and to pressure the United States. Wehrey's 2018 analysis of sectarianism and power in the Middle East, and Juneau's 2020 work on Iran's foreign policy, provide more sophisticated versions of this perspective, emphasizing the interplay between domestic politics, regional competition, and great-power involvement.

The Western perspective also includes a strong normative dimension, particularly in its liberal variant. This variant emphasizes human rights, democratic governance, and the protection of minorities, and it views sectarian discrimination as a violation of these principles. The UN's human rights frameworks are often invoked in Western policy discourse, though the Western perspective tends to be selective in its application, emphasizing Iranian human rights abuses while downplaying those of allied states.

What does the Western perspective contribute? It provides a detailed account of state behavior and strategic interaction, and it has generated extensive empirical research on proxy warfare, arms transfers, and alliance politics. It also maintains a focus on the agency of regional actors, treating Saudi Arabia and Iran as strategic actors with their own interests rather than as puppets of global structures. Crisis Group reports on Iran and

the Gulf provide a more balanced version of this perspective, emphasizing the need for dialogue and de-escalation.

What does it occlude? The Western perspective's framing of Iranian expansionism can become a self-fulfilling prophecy, justifying policies that deepen the security dilemma. By treating the Axis of Resistance as a unified Iranian project, it obscures the local grievances and autonomous agency of Hezbollah, the Houthis, and Iraqi militias. It also tends to understate the role of Western interventions—in Iraq, Libya, and Syria—in creating the conditions for sectarian mobilization. The Western perspective's selective application of human rights norms undermines its credibility and can be read as hypocrisy by regional actors. Finally, its emphasis on containment can preclude engagement with Iran, foreclosing diplomatic options that might reduce tensions.

2.7.5 UN Perspective

The UN perspective on the West Asian sectarian security dilemma is organized around three pillars: international law, human rights, and mediation. The UN treats cross-border attacks, proxy warfare, and sectarian violence as violations of international law and threats to international peace and security. It emphasizes the protection of civilians, the rights of religious and ethnic minorities, and the need for inclusive governance as foundations of sustainable peace. The UN's approach is normative and procedural: it seeks to establish rules, monitor compliance, and facilitate dialogue.

The UN perspective on the Saudi-Iranian rivalry emphasizes the destabilizing effects of proxy conflicts and the need for regional dialogue. UN Security Council resolutions on Yemen, Syria, and Iraq reflect this framing, treating these conflicts as threats to international peace that require collective action. The UN's mediation efforts, including the work of special envoys in Yemen and Syria, are presented as contributions to de-escalation, though their effectiveness has been limited by the lack of great-power consensus and the reluctance of regional actors to compromise.

The UN perspective on sectarian identity is framed through the lens of minority rights and non-discrimination. UN human rights bodies have documented sectarian discrimination in various West Asian states and have called for legal reforms and inclusive governance. This framing treats sectarian identity as a protected characteristic and sectarian violence as a human rights violation. It contributes normative standards and a focus on protection, but it can reify the very identities it seeks to manage by treating "communities" as fixed units.

The UN perspective on the 2023 rapprochement is cautiously optimistic, welcoming any reduction in tensions while emphasizing the need for implementation and the inclusion of affected populations. The UN's humanitarian agencies are acutely aware that diplomatic agreements between states do not automatically improve conditions for civilians, and the UN perspective insists on the need for humanitarian access, civilian protection, and accountability for violations.

What does the UN perspective contribute? It provides a normative framework that transcends the strategic interests of great powers, and it maintains a focus on civilian protection and human rights that other perspectives often neglect. Its mediation efforts, while limited, have created channels for dialogue that might otherwise not exist. The UN's data collection and reporting on conflicts provide an empirical foundation for policy debates.

What does it occlude? The UN perspective's reliance on state consent limits its ability to address the root causes of conflicts, particularly when states are themselves the perpetrators of sectarian violence. Its human rights framing can be depoliticized, treating sectarianism as a matter of discrimination rather than a product of political competition and external intervention. The UN's institutional structure, which gives great powers

veto power in the Security Council, means that its actions are often constrained by the very rivalries it seeks to manage. Finally, the UN perspective's emphasis on dialogue and consensus can be inadequate in the face of actors who view violence as a legitimate tool of politics.

2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Reveals sectarianism as an instrumentalized political technology of state survival and external manipulation; draws parallels to African post-colonial statecraft in which identity is mobilized for regime security; centers the agency of local actors rather than great-power scripts	May underweight the genuine ideational and theological content of sectarian identity for believers; risks overemphasizing instrumentalization at the expense of lived religious experience	Anti-imperial sovereignty and emancipatory statecraft; sectarian framing is a technology of domination to be dismantled	Parallel between African post-colonial manipulation of ethnic and religious identity for regime survival and Gulf state sectarian instrumentalization; Mbembe's necropolitics; Mamdani's citizen/subject distinction	Western: Iranian revolutionary ideology and Saudi Wahhabism carry genuine transnational religious content that cannot be reduced to instrumentalization

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Chinese	Demonstrates that great-power mediation can de-escalate regional rivalries without military intervention; frames stability as precondition for economic development and BRI connectivity	Obscures human rights abuses and sectarian repression by both Saudi Arabia and Iran; treats stability as order rather than justice	Non-interference, development-first, multipolar stability	2023 Beijing-brokered Saudi-Iran rapprochement; China as largest buyer of both countries' oil	Western: mediation without accountability rewards authoritarian regimes and ignores civilian suffering
Russian	Highlights US retrenchment and the decline of unipolarity; positions Russia as indispensable broker (Syria, Iran); frames Western intervention as source of regional disorder	Ignores Russian complicity in Syrian sectarian violence and its own arms sales; presents multipolarity as neutral when it serves Russian interests	Multipolarity, anti-hegemonism, state sovereignty	Russian military intervention in Syria (2015); Astana process; arms sales to Iran	African: Russian "multipolarity" reproduces great-power domination under new management rather than emancipating the Global South

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Western	Documents Iranian proxy network expansion and ballistic missile proliferation; provides intelligence and military support to Gulf allies; frames deterrence as stabilizing	Understates Western complicity in regional instability (2003 Iraq invasion, arms sales); treats Saudi interests as synonymous with regional order	Containment of Iranian expansionism, alliance management, counterterrorism	US intelligence assessments of Iranian weapons transfers; Saudi defense spending data; Houthi missile capabilities	UN: containment framing escalates rather than resolves the security dilemma and undermines civilian protection
UN	Provides empirical documentation of attacks (Panel of Experts on Yemen); mediates ceasefires; frames civilian protection and humanitarian access as priorities	Reliance on state consent limits addressing root causes; Security Council veto constrains action; human rights framing can depoliticize sectarianism	International law, civilian protection, multilateral mediation	UN Panel of Experts reports on Yemen; UN mediation in Yemen; humanitarian appeals	African: UN frameworks reproduce colonial hierarchies of knowledge and power, treating West Asian states as objects of management rather than agents of their own security

2.8 WORKED EXAMPLE (I do)

Case: The 2019 Saudi Aramco Attack and the Regional Security Dilemma

On 14 September 2019, a swarm of drones and cruise missiles struck Saudi Aramco's Abqaiq processing facility and Khurais oil field, temporarily halving Saudi oil production — roughly 5.7 million barrels per day, about five percent of global supply. The Houthi movement in Yemen claimed responsibility, framing the strike as retaliation for the Saudi-led coalition's war in Yemen. The United States and Saudi Arabia attributed the attack to Iran, citing the weapons' origin and trajectory. The incident did not trigger direct US military retaliation; instead, Washington deployed additional troops and air-defense assets to Saudi Arabia, and Riyadh accelerated diplomatic feelers toward Tehran that would culminate in the March 2023 Beijing-brokered rapprochement. The attack thus functioned as a shock that reconfigured the regional security dilemma rather than as a discrete battle.

Levels of analysis. At the individual level, the decision-making of Saudi Crown Prince Mohammed bin Salman and Iranian Supreme Leader Ali Khamenei shaped the response: MBS faced a choice between escalation and restraint, while Khamenei's calculus weighed the deterrent value of proxy capability against the risk of direct confrontation. At the state level, Saudi Arabia's vulnerability as a rentier state dependent on a single commodity and a handful of processing nodes became visible; Iran's state strategy of "forward defense" through allied non-state actors was tested. At the systemic level, the attack occurred within a multipolar transition in which US security guarantees were perceived as eroding, Gulf states were diversifying security partnerships, and China was emerging as an economic mediator. At the transnational level, the strike linked the Yemen war, the Iran-Saudi rivalry, global oil markets, and the Houthi movement's claim to represent Yemeni sovereignty against foreign intervention.

Mechanism. The mechanism is the sectarian security dilemma operating through proxy capability and infrastructure vulnerability. Saudi Arabia's air-defense architecture, optimized against conventional state threats, proved unable to intercept low-flying drones and cruise missiles launched from multiple vectors. The attack demonstrated that Iran's "Axis of Resistance" could impose costs on Saudi Arabia without crossing the threshold of direct state-on-state war, thereby exploiting the ambiguity between state and non-state attribution. This ambiguity is the engine of the dilemma: Saudi defensive measures — air-defense upgrades, coalition warfare in Yemen, alignment with the United States — were read by Tehran as offensive encirclement, while Iranian proxy support was read by Riyadh as existential threat. The Aramco strike intensified both readings simultaneously. It also revealed a feedback loop: the more Saudi Arabia invested in defense, the more Iran invested in asymmetric offset, and vice versa, with each side's security-seeking behavior reducing the other's security. The absence of US retaliation further signaled that the external guarantor's commitment was conditional, accelerating Saudi Arabia's interest in de-escalation with Iran and in diversifying security partners.

Perspective reconstruction. From an African vantage point, the Aramco attack illuminates how peripheral states and non-state actors can leverage the rivalries of regional powers to assert agency, much as African liberation movements once exploited Cold War competition. The Houthi claim of responsibility, whether fully accurate or not, asserts a Yemeni sovereignty narrative against Saudi intervention, paralleling African anti-colonial claims to self-determination against external domination. The attack also reveals the instrumentalization of sectarian identity: the "Shia Crescent" framing that justified Saudi intervention in Yemen is, on this reading, a technology of state survival that masks resource and geopolitical competition, much as ethnic and religious identities were mobilized in post-colonial African statecraft to legitimate authoritarian rule. African scholarship — from Fanon's analysis of colonial violence to Mamdani's critique of the bifurcated state — suggests that the security dilemma is not merely a structural condition but a product of historically constituted hierarchies of power in which some states are treated as sovereign and others as arenas. The African perspective thus asks who benefits from framing the conflict as sectarian: the answer, it argues, is regimes on both sides that consolidate domestic authority through external threat construction. What this perspective may occlude is the genuine material and ideational stakes for Yemeni civilians caught between Houthi governance and Saudi bombardment.

The Chinese perspective reads the attack as evidence of the fragility of a regional order dependent on US security guarantees and as an opportunity for Beijing to position itself as a stabilizing mediator. China's interest in uninterrupted oil flows — it is the largest buyer of both Saudi and Iranian crude — makes de-escalation a commercial imperative, and the 2023 rapprochement is presented as proof that development-first diplomacy can succeed where military containment fails. This perspective occludes the human rights dimensions of both Saudi and Iranian conduct and treats stability as synonymous with order.

The Russian perspective frames the attack within a narrative of US retrenchment and multipolar transition, arguing that Washington's hesitation to retaliate exposed the hollowness of American security commitments and validated Russia's role as an alternative broker. Moscow's arms sales to Iran and its intervention in Syria are presented as stabilizing counterweights to Western hegemony. This perspective occludes Russian complicity in Syrian sectarian violence and its own interest in prolonging regional instability to weaken US influence.

The Western perspective, particularly the US and Saudi framing, attributes the attack to Iranian state direction and treats it as evidence of Tehran's expansionist strategy through the Axis of Resistance. It emphasizes intelligence assessments of weapons origin and trajectory, and frames the response as deterrence and alliance reassurance. This perspective occludes Western complicity in regional instability — including the 2003 Iraq invasion that reshaped the sectarian landscape — and tends to treat Saudi interests as synonymous with regional order.

The UN perspective documents the attack through the Panel of Experts on Yemen, which found that the Houthis lacked the capability to launch such a strike from Yemeni territory and that evidence pointed to Iran. It frames the incident within international humanitarian law and civilian protection, emphasizing the Yemeni civilian toll of the broader conflict. This perspective occludes the political economy of the rivalry and the agency of regional actors, and its reliance on state consent limits its ability to address root causes.

Adjudication. The Western perspective best explains the material mechanics of the attack — weapons origin, state attribution, and the proxy network's operational capacity — because it is grounded in intelligence assessments and the documented structure of the Axis of Resistance. However, it misses the structural and historical dimensions that the African perspective supplies: the attack was not merely an Iranian offensive operation but a moment in a security dilemma constituted by decades of mutual threat construction, external intervention, and the instrumentalization of sectarian identity. The Western framing's tendency to treat Saudi interests as regional order and to understate Western complicity in producing the conditions for rivalry limits its explanatory power. The African perspective, while strongest on historical constitution and agency, risks underweighting the genuine ideational content of sectarian identity and the material reality of Iranian proxy capabilities. A synthesis would hold that the Aramco attack was simultaneously an Iranian proxy operation (Western), a product of a structurally constituted security dilemma (systemic), and an assertion of Yemeni agency within a historically hierarchical regional order (African) — with the Chinese and Russian perspectives best explaining the subsequent diplomatic realignment rather than the attack itself.

2.9 PROBLEM PAIR (We do)

1. Define the 2023 Beijing-brokered Saudi-Iran rapprochement in operational terms: identify what changed (diplomatic relations, embassy reopening, security and economic dialogue) and what did not (proxy networks, unresolved conflicts in Yemen, Lebanon, Syria, and Iraq).

2. Reconstruct the Saudi, Iranian, and Chinese perspectives on why the agreement was signed, using the five-perspective framework and noting what each reading foregrounds and occludes.

3. Apply the sectarian security dilemma: explain how normalization can be interpreted by hardliners in each state as either reducing threat or creating vulnerability.

4. Assess the Axis of Resistance after March 2023: identify which groups' behavior changed and which did not, and distinguish correlation from causation.

5. Specify falsifiers: list three observable developments over twenty-four months that would support a "genuine strategic shift" and three that would support "tactical rebalancing."

6. Adjudicate: write a bounded conclusion that avoids both "peace breakthrough" and "pure deception" extremes.

Model answer (continuous prose): The 2023 Beijing-brokered rapprochement is best understood as a tactical rebalancing that opened a limited strategic possibility, not as a resolution of the Saudi-Iranian rivalry. Operationally, the agreement restored diplomatic relations, reopened embassies, and created channels for security and economic dialogue; it did not dismantle proxy networks or settle the regional conflicts through which the rivalry is fought. From the Saudi perspective, the deal reduced immediate escalation risks, protected economic transformation plans, and allowed Riyadh to manage Yemen and maritime security without a direct Iranian front; from the Iranian perspective, it eased diplomatic isolation, legitimized Tehran's regional role, and created space for economic relief under sanctions pressure. China's perspective emphasized mediation success, energy security, and a strategic partnership narrative that presents Beijing as a stabilizing alternative to US-centric security architectures. Russia framed the deal within multipolarity and anti-Western realignment, while Western analysts often read it as Iranian tactical relief or Saudi hedging; the UN perspective treated it as a welcome but incomplete confidence-building measure requiring follow-through on cross-border attacks and civilian protection. The sectarian security dilemma explains why normalization did not end competition. Saudi defensive measures—missile defense, Gulf coalition building, support for Sunni-aligned actors—have long appeared to Tehran as encirclement; Iranian support for Hezbollah, Iraqi militias, and the Houthis appears to Riyadh as revolutionary expansion. The rapprochement changed the diplomatic register but not the structural condition: each side still interprets the other's security-seeking as threatening. Consequently, the Axis of Resistance remained active after March 2023. Hezbollah retained its arsenal and political role in Lebanon; Iraqi militias continued to pressure US and Gulf interests; the Houthis maintained capabilities that later shaped Red Sea dynamics. The absence of immediate proxy disarmament does not prove bad faith—disarmament was not in the agreement—but it does show that the deal's scope was diplomatic, not transformative. A genuine strategic shift would require observable proxy de-escalation: sustained reduction in cross-border attacks, verifiable constraints on arms transfers, and negotiated settlements in Yemen or Lebanon that both capitals endorse. Tactical rebalancing is supported by continued proxy activity, rhetorical escalation during crises, and economic engagement without security reciprocity. The evidence to date is mixed but leans tactical: diplomatic normalization advanced while regional arenas remained contested. The strongest counterargument is that diplomacy often precedes security change; the 1979–2023 rivalry itself shows long cycles. Yet without mechanism-level change in how each state secures itself through non-state allies, the rapprochement remains a managed pause. The bounded verdict: it is a real diplomatic achievement and a tactical rebalancing, with strategic potential contingent on proxy restraint and reciprocal verification.

2.10 INDEPENDENT MEMO (You do)

(a) Case description: In late 2023 and 2024, Houthi attacks on commercial shipping in the Red Sea followed the Gaza war, prompting US and UK strikes and raising insurance and trade costs. Saudi Arabia, which had normalized diplomatic relations with Iran in March 2023, faced pressure to protect shipping

lanes without direct entanglement, while Iran denied operational control over the Houthis but benefited from pressure on Western and Gulf interests. The episode tested whether the rapprochement could absorb proxy escalation, whether Gulf states would securitize maritime routes independently, and whether African littoral states along the Red Sea and Horn of Africa would be treated as security stakeholders or merely as geographic backdrop. It also raised questions about civilian protection, freedom of navigation, and the legitimacy of cross-border force.

(b) Required memo headings as prompts:

Mechanism: Identify the causal chain linking the Gaza war, Houthi maritime attacks, US/UK strikes, and Saudi-Iranian diplomatic constraints; specify which links are structural and which are contingent.
Perspective reconstruction: Reconstruct African, Chinese, Russian, Western, and UN readings of the crisis, including what each foregrounds and occludes.
Historical analogue: Compare the episode to one earlier case (for example, the 1980s Tanker War or the 2019 Aramco attack) and state the limits of the analogy.
Falsifiers: List observable evidence that would refute your central claim about whether the rapprochement survived proxy escalation.

(c) Self-check: Did you distinguish description (what happened), explanation (why it happened), prediction (what is likely next), and prescription (what should be done), and avoid letting prescription masquerade as explanation?

2.11 HINGE QUESTION

Which statement best captures the sectarian security dilemma in the Saudi-Iranian rivalry?

A. Sectarian identity is primordial, so conflict is inevitable regardless of state policy.
B. Each state's defensive support for co-religionists abroad is interpreted by the rival as offensive encirclement, producing escalation even without aggressive intent.
C. The dilemma is caused primarily by UN mediation failures.
D. China's economic partnerships have resolved the security competition.

Correct answer: B.

Distractor diagnoses:
- A: treats sectarian identity as deep structure rather than examining its instrumentalization; ignores scope conditions and policy variation.
- C: overstates the UN's causal role; UN mediation responds to, rather than generates, the dilemma.
- D: conflates economic interdependence with security resolution; trade ties do not automatically dismantle proxy competition.

SECTION 2A — DATA LAB

Table 1. Selected attributed proxy and cross-border incidents, 2015–2023 (illustrative, not exhaustive)

Date	Actor (attributed/claimed)	Target / Location	Method	Attribution / Claim	Source
2015–present	Houthi forces (Ansar Allah)	Saudi border regions; later UAE	Ballistic missiles, drones, cruise missiles	Claimed by Houthis; Saudi/UAE attribute Iranian enabling	Crisis Group Gulf reports
14 Sep 2019	Houthi claim; US/Saudi attribution to Iran	Abqaiq and Khurais oil facilities, Saudi Arabia	Drone and cruise-missile swarm	Houthi claim; US/Saudi attribution to Iran	Crisis Group; Wehrey (2018) context
3 Jan 2020	United States	Qassem Soleimani convoy, Baghdad	Airstrike	US claim of imminent threat	Crisis Group Iran reports
8 Jan 2020	Iran (IRGC)	Ain al-Asad air base, Iraq	Ballistic missiles	Iranian state claim	Crisis Group Iran reports
17 Jan 2022	Houthi forces	Abu Dhabi, UAE	Missile and drone attack	Houthi claim	Crisis Group Gulf reports
2021–2023	Iraqi Shia militia factions	US and coalition positions in Iraq/Syria	Rockets, drones, IEDs	Claimed by factions; attributed to Iran-aligned networks	Crisis Group Iraq reports

Table 2. Military expenditure, selected states (SIPRI, latest available approximate figures)

State	Military expenditure (USD billions, approx.)	Share of GDP (approx.)	Notes
Saudi Arabia	75.0 (2022)	7.4%	Highest in Middle East; large procurement and personnel costs
United Arab Emirates	22.8 (recent SIPRI estimate)	~5.0%	High per-capita spending; advanced procurement
Qatar	15.4 (recent SIPRI estimate)	~7.0%	Rapid post-2017 buildup
Kuwait	8.2 (recent SIPRI estimate)	~5.1%	Smaller force, high equipment intensity

State	Military expenditure (USD billions, approx.)	Share of GDP (approx.)	Notes
Iran	10.3 (recent SIPRI estimate)	~2.5%	Lower absolute spending; higher reliance on proxies and asymmetric tools
Israel	23.4 (recent SIPRI estimate)	~4.5%	Regional comparator, not Gulf state

Figures are rounded approximations from SIPRI military expenditure data; percentages vary by SIPRI year and national accounting method. Use for ordinal comparison, not exact budgeting.

Table 3. Publicly cited estimates of Iranian support to allied groups (highly uncertain)

Group	Estimated support	Type of support	Evidentiary status
Hezbollah	Up to roughly $700 million annually in some US estimates	Funding, weapons, training, political backing	Public estimate; not independently auditable

Estimates are politically contested, often derived from intelligence claims, and should be treated as ranges rather than verified budgets.

Five numbered analysis questions

1. **Trend.** Using Tables 1 and 2, describe the trend in (a) the frequency, geographic reach, and precision of attributed proxy or cross-border attacks, and (b) Gulf defense spending from 2015 to 2023. Which variable changed more sharply, and what does that asymmetry imply about whether the regional security dilemma is driven more by offensive opportunity or defensive fear?
2. **Level of analysis.** Are the patterns in Table 1 best explained at the individual level (leader ideology and threat perception), the state level (regime survival and territorial security), the systemic level (balance of power and polarity), or the transnational level (sectarian networks and non-state armed groups)? Defend one level as primary, identify the strongest evidence for it, and specify what evidence would falsify your choice.
3. **Perspective reconstruction (all five).** Reconstruct how the African, Chinese, Russian, Western, and UN perspectives would read Tables 1–3. Which perspective best explains the 2023 Saudi-Iran rapprochement as a durable shift rather than a tactical pause, and which perspective is most directly challenged by the spending and support data?
4. **Interpretation.** Do the data support the claim that Iranian support (Table 3) is the primary driver of proxy attacks (Table 1), or do they equally support a security-dilemma interpretation in which Gulf military buildup (Table 2) is partly endogenous to perceived Iranian threat? Specify the causal test you would need to distinguish external sponsorship from reciprocal escalation.

5. **Limitation.** What are the three most serious limitations of these data—attribution uncertainty, hidden or in-kind transfers, and definitional ambiguity in "defense spending"—and how would each limitation bias conclusions about escalation, restraint, or the balance of power?

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — "The Sectarian Security Dilemma Spiral"

Draw a large circle in the center of the page, labeled **"Regional Security Dilemma"** in bold. Inside the circle, draw a tight spiral beginning at a small inner dot labeled **"Regime Survival Fear."** From the inner dot, draw four curved arrows moving outward along the spiral, each arrow representing one escalation move. Label the arrows, in order: **"Defensive Mobilization," "Proxy Support," "Retaliatory Strike,"** and **"Existential Threat Narrative."** The final arrow should curve back toward the inner dot, showing feedback. Use two colors: red for Saudi/Gulf moves and green for Iranian/Axis moves, alternating along the spiral. Place small case labels beside the arrows: **"Yemen," "Lebanon," "Iraq,"** and **"Aramco 2019."** Around the outer edge of the circle, draw five small rectangular boxes, one for each perspective, with short annotations: **African:** "instrumentalization of identity"; **Chinese:** "mediation opportunity"; **Russian:** "multipolar counterweight"; **Western:** "containment and deterrence"; **UN:** "civilian harm and cross-border law."** The visual teaches that the dilemma is not a single action but a recursive interpretation loop: each defensive move is read as offensive by the rival.

Visual 2 — "Axis of Resistance as Network, Not Hierarchy"

Draw Tehran as a central hexagon labeled **"Iran / IRGC-QF."** Around it, draw five circles: **"Hezbollah," "Houthis (Ansar Allah)," "Iraqi PMF Factions," "Hamas,"** and **"Palestinian Islamic Jihad."** Connect Tehran to each circle with two kinds of lines: solid lines labeled **"material support"** (funding, weapons, training) and dashed lines labeled **"local agency"** (domestic grievances, autonomous decision-making, electoral or militia politics). Add a second, lighter cluster on the right labeled **"Saudi/Gulf Counter-Network"** with nodes for **"Saudi Arabia," "UAE," "Bahrain,"** and **"US/UK support."** Draw dashed cross-cluster arrows labeled **"rivalry," "deterrence,"** and **"proxy competition."** Add a legend: solid line = resource flow; dashed line = political autonomy or rivalry. Perspective overlay: place small tags near the Tehran hub: **Western:** "command and control"; **African:** "fragmented sovereignty"; **Chinese:** "non-state complexity"; **Russian:** "anti-hegemonic alignment"; **UN:** "accountability gap."** The visual teaches that the Axis is better understood as a variable-geometry network than as a chain of command.

Visual 3 — "Escalation Ladder of the 2019 Aramco Attack"

Draw a staircase rising from bottom left to top right. Each step is a horizontal bar with a label. Step 1 (bottom): **"Houthi claim of responsibility."** Step 2: **"Drone/cruise-missile strike on Abqaiq and Khurais."** Step 3: **"Disruption of roughly 5% of global oil supply."** Step 4: **"US/Saudi attribution to Iran."** Step 5: **"Saudi and UAE restraint; no direct state-on-state war."** Step 6 (top): **"2023 China-brokered Saudi-Iran rapprochement."** Draw upward arrows between steps labeled **"escalation pressure."** Draw downward or sideways arrows labeled **"restraint," "attribution ambiguity,"** and **"diplomatic off-ramp."** Add a vertical side column labeled **"Competing Readings":** red text for **"offensive Iranian expansion,"** green text for **"defensive deterrence,"** blue text for **"proxy autonomy,"** and black text for **"civilian/economic vulnerability."** Perspective overlay: small boxes at the top: **African:** "state capacity and resource vulnerability"; **Chinese:** "mediation window"; **Russian:** "US retrenchment"; **Western:** "deterrence failure";

UN: "protection of civilian infrastructure."** The visual teaches that the same event can be an escalation, a warning, or a restraint signal depending on the interpretive frame.

SECTION 4 — CORNELL NOTES

Cue (prompt)	Notes (with source log)
What is the sectarian security dilemma?	A regional feedback loop in which defensive mobilization by one side is interpreted as existential threat by the other, producing proxy support, retaliation, and narrative escalation. Mechanism: perception → mobilization → counter-mobilization → hardened identity. Source log: Nasr (2006); Haddad (2018); Wehrey (2018).
What happened in 1979?	Iranian Revolution transformed Iran from US-aligned monarchy to revolutionary republic; Saudi Arabia and Gulf monarchies read it as ideological and security threat. Source log: Nasr (2006); Crisis Group Iran reports.
Is the "Shia Crescent" real?	It is partly a geopolitical description of Iranian-linked networks and partly a rhetorical construction that can overstate coherence, religious unity, and Iranian control. Source log: Haddad (2018); Wehrey (2018).
What is the Axis of Resistance?	A variable network of Iran-aligned actors—Hezbollah, Houthis, Iraqi Shia militias, Hamas/PIJ—linked by material support and shared opposition to US/Israeli/Saudi regional order, but with significant local autonomy. Source log: Juneau (2020); Crisis Group.
How did Aramco 2019 matter?	It exposed vulnerability of critical energy infrastructure, raised attribution ambiguity, and showed that high-impact proxy attacks need not trigger direct interstate war. Source log: Crisis Group Gulf reports; Wehrey (2018).
What do Gulf defense budgets show?	High absolute and relative spending reflects threat perception, procurement cycles, and regime security; spending is a signal as well as a capability. Source log: SIPRI data; Juneau (2020).
What do Iranian support estimates show?	Public estimates suggest sustained but uneven support; they are contested, fragmented, and not auditable. Source log: Crisis Group; US public estimates.

Cue (prompt)	Notes (with source log)
What is instrumentalization?	Political elites use sectarian identity to mobilize constituencies, justify alliances, and frame rivals as existential threats; identity becomes a tool of statecraft. Source log: Haddad (2018); Mamdani (general statecraft parallel).
What is deep structure?	Sectarian identities may also have social, communal, and historical depth that cannot be reduced to elite manipulation. Source log: Haddad (2018); Nasr (2006).
How does the African perspective reframe this?	It treats sectarianism as one form of identity instrumentalization within a state system marked by weak sovereignty, external intervention, and resource politics; parallels include proxy competition and communal mobilization in African conflicts. Source log: Grovogui; Mbembe; Mamdani.
How does China frame the rivalry?	As a regional instability problem manageable through mediation, economic integration, and non-interference; the 2023 rapprochement is presented as diplomatic success. Source log: Chinese foreign ministry statements; Crisis Group.
How does the UN frame it?	Through cross-border attack prohibitions, civilian protection, humanitarian access, and mediation; legal accountability is often weaker than geopolitical bargaining. Source log: UN Security Council resolutions; Crisis Group.

Summary (3–5 sentences). The Saudi-Iranian rivalry is best understood as a recursive security dilemma in which defensive measures, proxy support, and identity narratives are mutually interpreted as threats. The "Shia Crescent" and "Axis of Resistance" are partly real networks and partly rhetorical constructions that exaggerate coherence and obscure local agency. Data on attacks, defense spending, and Iranian support show persistent escalation pressure but cannot settle causation because attribution and hidden transfers remain opaque. The African perspective is especially useful because it foregrounds instrumentalization, state weakness, and external intervention rather than treating sectarian identity as a primordial cause.

SECTION 5 — FEYNMAN COMPRESSION

Step 1 — Explain without jargon.
Imagine two neighbors who each buy a stronger lock because they fear the other. Each lock makes the other more afraid, so each adds cameras, then guards, then pays local gangs to watch the street. Soon both say, "I am only defending myself," but the street is more dangerous than before. In West Asia, Saudi Arabia and Iran are the neighbors, and the "locks and guards" include missiles, militias, and sectarian language. The 2019

attack on Saudi oil facilities was like a gang throwing a brick through a window: it hurt the house, proved the guards were weak, but did not start a full war. The 2023 deal brokered by China was like both neighbors agreeing to talk, not because they suddenly trust each other, but because the street fight had become too costly.

Step 2 — Mark gaps.
My simple version hides four things. First, it treats Saudi Arabia and Iran as two unitary actors, when each contains factions, clerical networks, security services, and economic interests. Second, it makes sectarian identity sound like a costume leaders put on, when for many communities it is a lived social reality. Third, it understates the role of the United States, Israel, and other external powers in shaping threat perceptions. Fourth, it cannot explain why some attacks escalate into crises while others are absorbed; the difference depends on attribution, oil markets, domestic politics, and alliance commitments.

Step 3 — Reread verification.
Returning to the sources, the mechanism is not merely "fear causes arms." Nasr (2006) emphasizes that the 1979 revolution changed Iran's regional role and made sectarian identity politically salient. Haddad (2018) warns against treating sectarianism as either pure primordial hatred or pure elite manipulation; it is constructed, but construction has real social effects. Wehrey (2018) shows how the "Shia Crescent" can become a self-fulfilling security narrative. Juneau (2020) highlights that Iranian support is significant but does not amount to full control over allied groups. Crisis Group reports repeatedly stress attribution ambiguity, civilian vulnerability, and the gap between military pressure and political settlement. The simple neighbor story therefore needs the added clause: fear is filtered through ideology, institutions, and incomplete information.

Step 4 — Analogy with explicit limits.
The neighbor analogy works for the security dilemma: defensive measures can be read as offensive, and reciprocal fear can produce escalation without either side wanting war. It fails in four ways. It cannot capture the transnational character of militias that operate across borders. It cannot represent the religious and historical depth of sectarian identity. It cannot model great-power intervention, especially US military presence and Chinese economic diplomacy. It also cannot represent the 2023 rapprochement accurately, because neighbors can move away, whereas Saudi Arabia and Iran remain locked into the same regional system and must manage rivalry rather than escape it.

Step 5 — Rewrite.
The Saudi-Iranian rivalry is a regional security dilemma amplified by sectarian narratives, proxy networks, and asymmetric capabilities. Iran's support for Hezbollah, the Houthis, Iraqi militias, and Palestinian groups gives it reach beyond its conventional military power, while Saudi Arabia and its partners respond through high defense spending, coalition warfare, and diplomatic alignment with the United States. Each side's defensive measures are read by the other as offensive expansion, especially when attacks such as Aramco 2019 expose critical infrastructure vulnerability. The "Shia Crescent" and "Axis of Resistance" are useful but dangerous labels: they describe real networks, but they can exaggerate Iranian control and turn political competition into civilizational conflict. The 2023 China-brokered rapprochement reduced immediate escalation risk, yet it did not resolve the underlying competition over regional order, state sovereignty, and identity politics. A rigorous analysis must therefore distinguish description of networks, explanation of escalation, prediction of restraint, and prescription for diplomacy, while remaining alert to the limits of available data.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L43	definition	What is the sectarian security dilemma?	A situation in which measures taken by one sect-coded actor to protect its community or regime are read by rivals as offensive threats, prompting countermeasures that deepen mutual insecurity. It is not reducible to ancient hatred; it is produced by political competition under weak trust.	African: parallels to instrumentalized communal security in postcolonial states.
L43	mechanism	How does defensive sectarian mobilization become offensive in perception?	Actors signal resolve through militias, alliances, or sectarian rhetoric; rivals cannot distinguish defense from expansion, especially under information asymmetry and prior enmity. The result is an action-reaction spiral.	Western: often reads Iranian mobilization as inherently expansionist.

Tag	Card Type	Front	Back	Perspective Note
L43	comparison	Is the “Shia Crescent” primarily a description or a political construct?	It can describe real networks of Shia political actors from Iran to Lebanon, but as a singular bloc it is a rhetorical construction that flattens local grievances and state interests. The concept’s power lies in making diverse actors appear coordinated.	Chinese: cautions against bloc language that hardens identities.
L43	application	What did the 2019 Aramco attack reveal about the regional security dilemma?	The strike showed that proxy-attributed force could impose high costs on a major oil producer while allowing plausible deniability, intensifying Saudi threat perception and demands for deterrence. It also exposed gaps in air defense and the difficulty of calibrated response.	Russian: highlights vulnerability of Western-aligned energy infrastructure.

Tag	Card Type	Front	Back	Perspective Note
L43	source	What is Vali Nasr's (2006) core contribution?	Nasr argued that the Shia revival and sectarian political mobilization would reshape Middle Eastern order after Iraq, emphasizing identity as a political force rather than only theology. His thesis is influential but risks overpredicting sectarian determinism.	African: useful but must be tested against local political economy.
L43	debate	Instrumentalization or deep structure: which better explains sectarian politics?	Instrumentalization stresses elite manipulation of identity for power; deep structure stresses durable social, institutional, and memory-based cleavages. Most cases require both: elites activate identities that have real historical and institutional anchors.	UN: supports conflict-sensitive, non-essentialist policy.

Tag	Card Type	Front	Back	Perspective Note
L43	reconstruction	How does the African perspective reframe the Axis of Resistance?	It treats sectarian alignment as one layer of a broader postcolonial problem of externalized security, weak state capacity, and elite legitimation, rather than as a civilizational bloc. This foregrounds domestic political economy and historical intervention.	African primary: reveals occlusions in civilizational framing.
L43	occlusion	What does the Western perspective often occlude in this rivalry?	It often foregrounds Iranian expansionism and regime ideology while underweighting Saudi agency, domestic legitimation needs, and the security effects of Western military interventions. This can make containment appear as the only rational policy.	Western: containment bias.

Tag	Card Type	Front	Back	Perspective Note
L43	adjudication	How should one adjudicate the 2023 Saudi-Iran rapprochement?	Evidence of genuine shift includes restored diplomacy and reduced public escalation; evidence of tactical rebalancing includes continued proxy competition and unresolved regional files. The best reading is conditional: a managed de-escalation, not a strategic reconciliation.	Chinese: mediation success but not alliance.
L43	visual	What should an "Axis of Resistance" map annotate?	It should show nodes and ties to Iran, but also annotate funding, command autonomy, local grievances, and points of friction. Without autonomy and friction, the map overstates coherence.	UN: warns against monolithic actor assumptions.

Tag	Card Type	Front	Back	Perspective Note
L43	definition	What is the Axis of Resistance?	A loose Iran-linked network of state and non-state actors sharing opposition to US, Israeli, and Saudi influence, with varying degrees of coordination, ideology, and autonomy. It is not a unified command structure.	Russian: multipolar counterweight narrative.
L43	mechanism	Why does proxy support create commitment problems?	Patrons gain deniability and leverage, but proxies may pursue local agendas, escalate beyond patron intent, or become costly liabilities. This makes control partial and retaliation risky.	Western: emphasizes deterrence dilemmas.
L43	comparison	Saudi Arabia vs Iran: rivalry drivers	The rivalry combines regime security, sectarian identity, regional hegemony, and external alliance politics; neither state is driven by sectarian identity alone. Reducing it to Sunni-Shia theology misses strategic and domestic drivers.	African: avoids civilizational reductionism.

Tag	Card Type	Front	Back	Perspective Note
L43	source	What do Crisis Group Iran and Gulf reports contribute?	They provide granular, field-informed analysis of escalation risks, sanctions effects, and diplomatic openings, often stressing unintended consequences and the need for de-escalation. They are policy-oriented rather than theory-building.	UN: supports mediation and civilian protection.
L43	application	How do Gulf defense spending trends matter?	Rising defense spending signals threat perception and procurement cycles, but spending alone does not measure effectiveness, alliance dependence, or escalation control. It must be read alongside doctrine and proxy activity.	Chinese: notes arms-race risks.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence audit (score each 0–100)

Competency	Self-score (0–100)	Evidence of mastery	Gap to close
Defining the sectarian security dilemma			
Tracing the mechanism from defense to perceived offense			
Distinguishing Shia Crescent reality from rhetoric			
Mapping Axis actors and their autonomy			
Reconstructing all five perspectives			
Adjudicating the 2023 rapprochement			

Competency	Self-score (0–100)	Evidence of mastery	Gap to close
Analyzing the 2019 Aramco attack			
Interpreting proxy and defense-spending data			
Designing falsifiers			

7.2 Three-question debrief

1. Which perspective did you reconstruct least charitably, and what evidence would force you to revise it?
2. Which of your claims is most vulnerable to the instrumentalization-versus-deep-structure critique?
3. Did you keep description, explanation, prediction, and prescription separate in your memo?

7.3 Error-log

Common Misconception	Correction	Evidence
Sectarian conflict is ancient and theological.	It is politically activated and institutionally mediated; theology alone rarely causes war.	Haddad (2018); Nasr (2006)
The Axis of Resistance is a unified army.	It is a loose network with autonomous local agendas and partial patron control.	Crisis Group Iran and Gulf reports
The 2023 rapprochement ended the rivalry.	Diplomatic normalization coexists with proxy competition and unresolved regional files.	Crisis Group Iran and Gulf reports
The Shia Crescent is an objective bloc.	It is partly descriptive and partly rhetorical; local actors have distinct interests.	Wehrey (2018); Haddad (2018)
Higher defense spending equals greater security.	Spending reflects perception and procurement, not necessarily effectiveness or stability.	Data lab trends
Western containment is a neutral reading of the region.	It is a strategic stance with distributional and escalation consequences.	African perspective; Juneau (2020)

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Sectarian security dilemma	Defensive mobilization read as offensive; action-reaction spiral	Security dilemma; Nasr (2006)	2019 Aramco attack	Ancient hatred vs political activation	Evidence that purely defensive intent reduces rival mobilization	L42, L44
Saudi-Iran rivalry	Regime security, hegemony, identity, alliance politics	Mabon (2016); Gause (2014)	1979 revolution to 2023 Beijing rapprochement	Strategic shift vs tactical rebalancing	Sustained proxy de-escalation after 2023	L41, L45
Shia Crescent	Network description plus rhetorical bloc construction	Haddad (2018); Wehrey (2018)	Iran-Lebanon-Iraq-Yemen linkages	Reality vs construct	Local actors defecting from Iranian preferences	L50
Axis of Resistance	Proxy support, deniability, commitment problems	Juneau (2020); Crisis Group	Hezbollah, Houthis, Iraqi militias, Hamas	Coherent bloc vs loose network	Demonstrated proxy autonomy causing patron costs	L23, L44
Sectarian identity politics	Instrumentalization and deep structure interact	Haddad (2018); Mamdani (2004) (comparative)	Elite mobilization in Gulf and Levant	Instrumentalization vs deep structure	Identity salience declines when institutions deliver	L42
Data interpretation	Defense spending and proxy attacks as indicators	Crisis Group reports	Gulf defense spending; attack datasets	Perception vs capability	Spending rises while attacks fall	L41

SECTION 9 — REVIEW SCHEDULE

- **R1 (Day 0, 30 minutes):** Re-read all flashcards and redraw the Axis of Resistance map from memory, annotating autonomy and friction.
- **R2 (Day 2, 45 minutes):** Reconstruct all five perspectives in writing, then compare against the lesson's perspective matrix.

- **R3 (Day 7, 60 minutes):** Re-analyze the 2019 Aramco attack using individual, state, systemic, and transnational levels of analysis.
- **R4 (Day 14, 60 minutes):** Update the 2023 rapprochement memo with one new piece of evidence and one new falsifier.
- **R5 (Day 30, 90 minutes):** Complete a timed practice set: hinge question, data-lab questions, and a short perspective reconstruction.

SECTION 10 — COMPLETION CHECKLIST

☐ I can define the sectarian security dilemma.
☐ I can trace the mechanism from defensive mobilization to perceived offense.
☐ I can distinguish the Shia Crescent as reality and as rhetoric.
☐ I can map Axis actors and their autonomy.
☐ I can compare all five perspectives.
☐ I can reconstruct the African perspective as primary and most developed.
☐ I can adjudicate the 2023 rapprochement as shift or rebalancing.
☐ I can analyze the 2019 Aramco attack.
☐ I can interpret proxy and defense-spending data.
☐ I can design falsifiers for my claims.
☐ I can avoid conflating description, explanation, prediction, and prescription.
☐ I can identify what each perspective occludes.
☐ I can use canonical sources accurately.
☐ I can answer the hinge question.
☐ I can complete Cornell notes.
☐ I can follow the spaced-review schedule.

45. Proxy Warfare and Chokepoint Geopolitics

LESSON METADATA

Field	Value
Lesson number and title	Lesson 44 — Proxy Warfare and Chokepoint Geopolitics
Module	Module 7: West Asia and Iranian Geopolitics
Prerequisites	L23 (asymmetric warfare), L25 (maritime security), L43 (sectarianism and identity politics)
Interleaved links	Forward to L45 (nuclear), L46 (hydrocarbons), L48 (Indo-Pacific chokepoints)
Reading load	7-9 hours
Content channels	Text, data tables, visual anchors, flashcards, memo practice
Bloom ceiling	Evaluate / Create (adjudicate competing explanations; design falsifiers)
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

The central puzzle of this lesson is deceptively simple: how did a non-state militia operating from one of the world's poorest countries force a restructuring of global shipping lanes, trigger a multinational naval coalition, and impose measurable costs on economies thousands of miles away? The Houthi attacks on commercial vessels in the Red Sea and Bab el-Mandeb strait from late 2023 onward are not merely a regional skirmish. They constitute a case study in how proxy warfare, maritime geography, and the securitization of commerce interact to convert local political violence into global economic leverage. The lesson asks you to hold three analytical problems in tension simultaneously: the principal-agent dynamics through which Iran delegates violence to non-state partners while managing their autonomy; the physical geography of chokepoints that amplifies small disruptions into systemic shocks; and the political process by which a maritime incident becomes a security crisis demanding military response. Each of these problems has its own theoretical lineage, its own scope conditions, and its own strongest counterargument. Mastering the lesson means learning to move between them without collapsing one into another.

This lesson sits at a critical junction in the curriculum. It builds directly on L23, where you studied asymmetric warfare and the principal-agent problems inherent in delegating violence to non-state actors; on L25, where you examined maritime security, freedom of navigation, and the legal architecture of the sea; and on L43, where you analyzed sectarianism and identity politics as mobilizing frameworks in West Asia. It also prepares the ground for L45 on nuclear geopolitics, where Iran's proxy network and chokepoint leverage must be understood as complements to, not substitutes for, nuclear deterrence; for L46 on hydrocarbons, where energy transit volumes through Hormuz and Bab el-Mandeb make maritime security an energy-security question; and for L48 on Indo-Pacific chokepoints, where the analytical framework developed here travels to the Malacca Strait and the South China Sea. The lesson is therefore both integrative and generative: it synthesizes prior modules and supplies tools for subsequent ones.

The theoretical lineage you need spans several traditions. Principal-agent theory, developed in economics and political science to explain delegation under information asymmetry, has been applied to proxy warfare by scholars such as Andrew Mumford, who treats proxy war as a form of indirect intervention in which the

principal seeks to achieve strategic objectives while minimizing costs and risks, but at the price of reduced control over the agent. The chokepoint literature draws on classical strategic thought about maritime geography and on more recent work on supply-chain vulnerability and critical infrastructure. Securitization theory, associated with the Copenhagen School, explains how an issue is moved from normal politics to emergency politics through speech acts and institutional framing. These traditions do not always agree. Principal-agent theory tends to treat proxy autonomy as a problem of control; securitization theory treats the crisis framing as partly constructed; and maritime strategic thought treats geography as a hard constraint. The lesson requires you to adjudicate among them rather than choose one.

The African perspective is not an add-on to this lesson; it is the lens that reveals what the other four perspectives systematically underweight. For African states and societies, Red Sea disruptions are not primarily a question of great-power naval competition or of Western freedom-of-navigation norms. They are a question of import costs, food security, port revenues, and the fragility of trade-dependent development strategies. Egypt's Suez Canal revenues, Sudan's and Ethiopia's access to global markets, Djibouti's port economy, and the cost of grain imports across the Horn of Africa all move with shipping volumes through Bab el-Mandeb. African scholarship on extraversion, on the political economy of external dependence, and on the ways in which global systems extract value from African territories provides a vocabulary for understanding why a chokepoint crisis in West Asia lands hardest on African consumers and workers. The African vantage also exposes a blind spot in Western and UN framings: the assumption that restoring "normal" shipping is a neutral technical objective, when for many African economies "normal" already meant structurally disadvantageous terms of trade. Reconstructing the African perspective from within means taking seriously the argument that chokepoint security is inseparable from questions of economic sovereignty and equitable global commerce.

What you will be able to do after mastering this lesson is substantial and specific. You will be able to specify the mechanism by which a principal delegates violence to a proxy and the conditions under which the proxy gains autonomy; to map the physical and institutional vulnerabilities of Hormuz, Bab el-Mandeb, and comparable chokepoints; to reconstruct how each of the five perspectives frames the Red Sea crisis and identify what each contributes and occludes; to adjudicate between competing explanations of the same event using evidence rather than assertion; and to produce a policy memo that distinguishes description, explanation, prediction, and prescription. You will also be able to identify falsifiers: evidence that would weaken or refute each major claim, so that your analysis is not merely plausible but testable.

A final methodological note. This lesson insists on level-of-analysis discipline. The Houthi attacks can be analyzed at the individual level (leadership decisions, ideological commitments), the state level (Iranian strategy, Saudi and Emirati responses, Yemeni fragmentation), the systemic level (great-power competition, global trade architecture), and the transnational level (shipping networks, insurance markets, diaspora finance, humanitarian supply chains). Each level generates different explanations and different predictions. Conflating them produces incoherent analysis. Throughout the lesson, you should ask which level a given claim operates on and whether the evidence offered actually supports a claim at that level. The worked example and problem pair are designed to make this discipline habitual rather than optional.

SECTION 1 — Pre-Class Priming

1.1 Retrieval Warm-Up

Answer each question from memory before consulting notes. The purpose is to activate prior knowledge and to identify gaps.

1. From L23 (asymmetric warfare): What is the principal-agent problem, and why does it become acute when a state delegates violence to a non-state actor rather than to its own armed forces?
2. From L23: Name two mechanisms by which a principal can attempt to control a proxy's behavior, and one reason each mechanism commonly fails in practice.
3. From L25 (maritime security): What is the legal status of transit passage through international straits under UNCLOS, and how does it differ from innocent passage through territorial waters?
4. From L25: Why are chokepoints such as Hormuz and Bab el-Mandeb considered "systemic" vulnerabilities rather than merely local geographic features?
5. From L43 (sectarianism): How can sectarian identity function as both a mobilizing resource and a constraint on a proxy's strategic autonomy?
6. From L43: What is the difference between a sectarian narrative used for domestic legitimation and one used for transnational alliance-building, and why does the distinction matter for proxy warfare?

1.2 Orientation Questions

These questions frame the lesson's central puzzle. You need not answer them fully now; return to them after completing the lesson.

1. If Iran did not order the Houthi Red Sea attacks, in what sense can they still be understood as an Iranian strategic success? If Iran did order them, what does the subsequent difficulty of stopping them reveal about delegation?
2. Why did a multinational naval response not immediately restore pre-crisis shipping volumes, and what does this imply about the limits of sea control against dispersed, low-cost attackers?
3. How does the Red Sea crisis look different when analyzed from the perspective of an African grain-importing state rather than from the perspective of a Western naval power?
4. What evidence would convince you that the Houthi attacks were primarily driven by Yemeni domestic politics rather than by regional proxy dynamics?

1.3 Vocabulary Pre-Teach

Provisional definitions to be refined during the lesson. Each term will be revisited in context.

- **Proxy warfare**: The use of a third party by a state or non-state principal to conduct violence or coercion while the principal retains plausible deniability and avoids direct costs. The definition is contested; some scholars restrict it to interstate delegation, others include non-state principals.
- **Principal-agent problem**: The difficulty a principal faces in ensuring that an agent acts in the principal's interest when the agent has superior information and independent preferences. In proxy warfare, the agent may pursue its own agenda, escalate beyond the principal's intent, or become difficult to restrain.
- **Delegation**: The transfer of authority or task execution from a principal to an agent. In strategic studies, delegation is rarely complete; it is better understood as a spectrum of control ranging from

tight command to loose sponsorship.

- **Autonomy (proxy)**: The degree to which a proxy actor can set its own objectives, choose its own methods, and act without prior authorization. Autonomy is not the opposite of control; the two coexist in variable combinations.
- **Chokepoint**: A narrow maritime passage through which a large share of global trade or energy transit must pass, such that disruption at that point has disproportionate systemic effects. Chokepoints are defined by geography but activated by politics.
- **Bab el-Mandeb**: The strait connecting the Red Sea to the Gulf of Aden, approximately 26 kilometers wide at its narrowest, through which a substantial share of Europe-Asia container traffic and energy shipments pass.
- **Strait of Hormuz**: The narrow passage between the Persian Gulf and the Gulf of Oman, through which roughly one-fifth of global petroleum liquids consumption transits. It is the world's most important energy chokepoint.
- **Securitization**: The process by which an issue is framed as an existential threat requiring emergency measures beyond normal political procedures. In maritime contexts, securitization transforms commercial shipping disruptions into security crises justifying naval deployment.
- **Freedom of navigation**: The principle, codified in UNCLOS, that ships enjoy the right of transit through international straits and high seas. It is invoked by naval powers as both a legal norm and a strategic interest.
- **War risk premium**: The additional cost charged by marine insurers for vessels transiting high-risk areas. It is a market-based indicator of perceived threat and a mechanism by which maritime insecurity is priced into global trade.
- **Ansar Allah (the Houthis)**: A Zaydi Shia political-military movement originating in northern Yemen, which seized Sana'a in 2014 and has since controlled much of northern Yemen. It is aligned with but not controlled by Iran.
- **Multinational naval task force**: A coalition of warships from multiple states deployed to protect commercial shipping, conduct interdiction, or deter attacks. Such task forces raise questions of command unity, rules of engagement, and burden-sharing.

SECTION 2 — LESSON CORE

2.1 Learning objectives

By the end of this lesson, students will be able to:

1. **Explain** the principal-agent logic of proxy warfare, distinguishing delegation from autonomy and identifying the monitoring, selection, and incentive mechanisms that principals use to control proxies, as well as the conditions under which proxies defect, escalate beyond principal intent, or become self-sustaining political actors. (Bloom: Understand/Explain)

2. **Analyze** the Levantine theater—specifically the Hezbollah-Israel dynamic and the Syrian civil war's multi-sided proxy competition—through principal-agent theory, identifying where Iran's delegation strategies succeeded in creating durable leverage and where proxy autonomy produced outcomes Tehran did not intend. (Bloom: Analyze)

3. **Evaluate** the Houthi Red Sea shipping crisis (2023–present) as a case of maritime asymmetric proxy

warfare, assessing how a non-state actor leveraged chokepoint geography to disrupt global commerce, compel multinational naval intervention, and reshape insurance and routing markets. (Bloom: Evaluate)

4. **Compare** the five perspectives (African, Chinese, Russian, Western, UN) on proxy warfare and chokepoint geopolitics, identifying what each reveals and occludes about the relationship between regional conflict, non-state agency, and global supply-chain vulnerability. (Bloom: Compare/Analyze)
5. **Synthesize** the securitization of maritime chokepoints—Hormuz, Bab el-Mandeb, and the Red Sea—into a coherent framework linking principal-agent proxy dynamics to global economic governance, and produce a falsifiable prediction about escalation thresholds and principal-agent breakdown. (Bloom: Synthesize/Create)

These objectives build on the asymmetric-warfare foundations of Lesson 23, the maritime-security frameworks of Lesson 25, and the sectarian-politics analysis of Lesson 43. They prepare the student for Lesson 45 (nuclear proliferation), Lesson 46 (hydrocarbon geopolitics), and Lesson 48 (Indo-Pacific chokepoints) by establishing the analytical vocabulary—delegation, autonomy, chokepoint vulnerability, securitization—through which later lessons examine state behavior under constraint.

2.2 KEY IDEA 1 — Proxy warfare: principal-agent theory, delegation, and autonomy

Bolded Causal Claim: Proxy warfare is best understood not as a cheap substitute for direct state conflict but as a principal-agent relationship in which a state delegates coercive capacity to a non-state actor, and the resulting autonomy of the proxy—shaped by information asymmetry, divergent preferences, and independent resource bases—determines whether escalation is contained, spirals beyond principal intent, or produces a self-sustaining political actor that the principal can no longer control.

Mechanism: The theoretical lineage runs from economics through political science to strategic studies. Stephen Ross (1973) and Bengt Holmström (1979) formalized the principal-agent problem: a principal delegates a task to an agent whose actions the principal cannot perfectly observe, creating two pathologies. Adverse selection occurs when the principal cannot distinguish high-quality from low-quality agents before contracting; moral hazard occurs when the agent, once contracted, takes risks or shirks in ways the principal cannot fully monitor. Kiewiet and McCubbins (1991) translated this into political science, showing how legislators delegate to bureaucracies and executives. Salehyan (2010) and Mumford (2013) extended the framework to armed conflict, defining proxy warfare as the indirect engagement of a third party in a conflict through a surrogate force. Mumford's definition emphasizes that proxy warfare involves "the indirect engagement of a third party in a conflict through a surrogate force," and that the surrogate retains some degree of operational autonomy.

The mechanism operates through four channels. First, delegation: the principal (typically a state) transfers resources—funding, weapons, training, intelligence, or political cover—to an agent (typically a non-state armed group) because direct intervention is too costly, too risky, or domestically unsustainable. The principal's motivation is not merely cost-saving but also plausible deniability: by operating through a surrogate, the principal can influence outcomes while avoiding the reputational and legal costs of direct action. Second, monitoring: the principal attempts to observe and constrain the agent's behavior through embedded advisors, financial conditionality, intelligence sharing, and threats of support withdrawal. Monitoring is always im-

perfect because the agent operates in a local environment the principal does not fully understand. Third, incentive alignment: the principal designs rewards (continued funding, political recognition, territorial concessions) and punishments (aid cutoff, exposure, abandonment) to shape agent behavior. Fourth, autonomy: the agent's independent resource base—local legitimacy, territorial control, alternative funding streams, ideological commitment—generates a capacity for action that exceeds the principal's intent. Autonomy is not a malfunction of the proxy relationship; it is its constitutive feature. A proxy with zero autonomy is merely a puppet, and puppets are ineffective in complex local environments.

The critical causal claim is that autonomy, not principal intent, drives escalation dynamics. When the agent's survival interests, ideological commitments, or local political calculations diverge from the principal's strategic goals, the agent may initiate actions—attacks on third parties, territorial expansion, rhetorical escalation—that the principal did not authorize and may not desire. The principal then faces a dilemma: abandon the proxy (losing influence and credibility) or support it (risking unwanted escalation). This is the "blowback" mechanism that Mumford identifies as central to proxy warfare's dangers. Juneau (2020), analyzing Iran's proxy network, demonstrates that Tehran's relationships with Hezbollah, Hamas, the Houthis, and Iraqi militias are characterized by varying degrees of autonomy, and that Iran's influence is greatest where it provides unique resources (funding, weapons) and weakest where proxies have independent revenue or popular legitimacy.

The mechanism also includes a temporal dimension. Proxy relationships often begin as tightly controlled delegations and evolve toward greater agent autonomy as the agent develops independent capabilities. This trajectory—delegation → capacity-building → autonomy → potential defection—is observable in multiple cases and is not an aberration but a predictable consequence of successful proxy empowerment.

Scope Conditions: Principal-agent proxy warfare is most likely to emerge and persist under four conditions. First, the principal faces high costs or risks of direct military intervention (domestic political constraints, geographic distance, fear of escalation). Second, the agent possesses local legitimacy, territorial knowledge, and operational capacity that the principal lacks. Third, information asymmetry between principal and agent is high but not total—the principal must know enough to select and monitor the agent, but not so much as to eliminate the agent's comparative advantage. Fourth, the principal can credibly threaten to withdraw support, giving it leverage over the agent's behavior. The framework fails or requires modification when the agent becomes financially self-sufficient (reducing principal leverage), when the agent's ideology is non-negotiable (reducing incentive alignment), or when the principal's reputation costs of association with the agent exceed the benefits of delegation. The framework also struggles to explain cases where the "principal" is not a single state but a diffuse network of funders, or where the "agent" is a state itself (state-to-state proxy relationships, as in the Iran-Syria alliance).

Observable Implications: If the principal-agent framework is correct, several patterns should be observable. (1) Proxy attacks should cluster at times when the principal is diplomatically constrained or domestically distracted, suggesting agent-initiated rather than principal-directed action. (2) The principal should provide resources but not operational command, creating a gap between capability and control. (3) Escalation spirals should follow proxy actions that trigger retaliation against the principal's interests, forcing the principal to choose between abandonment and unwanted confrontation. (4) The proxy's public rhetoric should sometimes diverge from the principal's diplomatic posture, signaling autonomy. (5) Principal leverage should decline as the agent develops independent funding, territorial control, or popular legitimacy. (6) Proxy relationships should exhibit "drift"—gradual divergence of interests over time—as the agent's local priorities reshape its strategic calculus.

Perspective Note (five traditions in brief):

African (primary): The African vantage point reconstructs proxy warfare not as a West Asian anomaly but as a structural feature of the international order whose genealogy runs through colonial indirect rule. African scholarship—from Nkrumah's analysis of neo-colonialism through Mamdani's work on indirect rule and the bifurcated state, Rodney's underdevelopment thesis, and Bayart's "politics of the belly"—reveals that the delegation of violence to local intermediaries is not a modern strategic innovation but a technique of imperial governance with deep roots in African history. European colonial powers delegated coercion to chiefs, militias, and local strongmen; post-colonial states inherited this architecture, and Cold War superpowers replicated it in Angola, Mozambique, the Democratic Republic of Congo, and elsewhere. From this perspective, principal-agent theory, developed in Western economics, obscures the colonial genealogy of delegation and treats as a rational choice what is in fact a historically sedimented structure of extraction. African scholars such as Aning and Danso emphasize that African non-state actors possess political projects that are not reducible to external manipulation; the "autonomy" that Western analysts attribute to proxies is, from the African vantage, often a recognition of agency that was always present but systematically denied. Mbembe's concept of necropolitics further illuminates how proxy warfare in African contexts operates through the instrumentalization of bodies and territories, with the principal's distance from violence enabling a moral disengagement that the agent cannot afford. The African perspective thus reveals what Western principal-agent theory occludes: that delegation is not merely a strategic choice but a mode of governance with colonial origins, and that the "agent" is never merely an instrument but a political actor whose autonomy is constitutive, not incidental. The African view also cautions against overestimating external control: in cases from the Congo wars to the Sahel insurgencies, local actors have repeatedly demonstrated that their agendas diverge from those of their supposed principals, and that the principal's leverage is far more limited than strategic-studies frameworks assume.

Chinese: China's perspective on proxy warfare is shaped by its non-intervention doctrine, its critique of Western regime-change operations, and its emphasis on state sovereignty. Beijing views proxy warfare as a tool of Western hegemony that destabilizes regions, disrupts economic corridors, and threatens Chinese interests—particularly energy imports and Belt and Road Initiative investments. Chinese strategic thinkers such as Yan Xuetong and Wang Jisi frame proxy warfare as a symptom of great-power competition in which the United States and its allies use non-state actors to undermine sovereign governments. China's own approach favors economic statecraft—infrastructure investment, trade agreements, and diplomatic mediation—over military delegation, though it maintains security partnerships with states and has been accused of using economic leverage as indirect influence. On proxy warfare specifically, China positions itself as a neutral mediator, as in its brokering of the Saudi-Iran rapprochement in 2023. The Chinese perspective contributes an emphasis on sovereignty and economic stability but occludes its own tolerance of authoritarian partners when they serve Chinese interests and its reluctance to acknowledge that economic leverage can function as a form of indirect control analogous to proxy warfare.

Russian: Russia's perspective is informed by its extensive experience with proxy and "hybrid" warfare, from the Wagner Group's operations in Africa and the Middle East to its support for separatist militias in eastern Ukraine and its backing of the Assad regime in Syria. Russian strategic culture, drawing on Soviet-era "active measures," treats the use of non-state actors as a legitimate and necessary tool of statecraft in a competitive international system. Russian thinkers such as Karaganov and Trenin frame proxy warfare as an instrument of great-power competition that Russia must master to counter Western dominance. Moscow's support for Iran-aligned groups in the Levant and its own proxy deployments are justified as defensive measures against NATO expansion and Western interventionism. The Russian perspective contributes an understanding of

proxy warfare as embedded in great-power competition rather than as a regional pathology, but it occludes the destabilizing and humanitarian consequences of its own proxy operations and tends to treat all Western-supported non-state actors as illegitimate while legitimizing Russian-supported ones.

Western: The Western perspective, rooted in principal-agent theory and strategic studies, treats proxy warfare as a rational cost-benefit calculation by states seeking to project power without direct military commitment. Western analysts such as Mumford, Juneau, and Byman emphasize control problems, escalation risks, and the potential for "blowback." The Western view prioritizes freedom of navigation, counter-terrorism, alliance management, and the protection of commercial interests. It tends to frame proxies primarily as security threats—Hezbollah, the Houthis, Hamas—and to emphasize military and sanctions-based responses. The Western perspective contributes rigorous analytical frameworks and extensive empirical documentation of proxy networks, but it occludes the political legitimacy that proxies often enjoy in their local contexts and tends to reduce non-state actors to instruments of hostile states, missing their autonomous political projects and the historical conditions that produced them.

UN: The UN perspective frames proxy warfare through international humanitarian law, state sovereignty, and Security Council resolutions. The UN emphasizes the protection of civilians, humanitarian access, and the legal accountability of states for proxy actions under the law of state responsibility. UN panels of experts—such as the Panel of Experts on Yemen—document proxy support, arms transfers, and violations of sanctions regimes. The UN perspective contributes a legal-normative framework that holds states accountable for proxy actions and prioritizes civilian protection, but it occludes power asymmetries in the Security Council that prevent consistent enforcement and struggles to address non-state actors that do not fit state-centric legal categories. The UN framework also tends to treat proxy warfare as a violation of sovereignty rather than as a structural feature of the international system, limiting its analytical reach.

2.3 KEY IDEA 2 — The Levantine Theater: Lebanon, Syria, and the Hezbollah-Israel Dynamic

Bolded Causal Claim: The Levantine theater is best understood not as a collection of separate civil wars and border conflicts but as a single, structurally coupled arena in which Iran's forward-defense doctrine and Israel's red-line doctrine are mediated through non-state proxies, above all Hezbollah, with Syrian territory serving as the connective tissue; the resulting equilibrium is a deterrence relationship that is stable only when both sides can read each other's escalation thresholds, and fragile when ambiguity, domestic politics, or third-party intervention obscure them.

Mechanism: The mechanism begins with principal-agent delegation. Iran's Islamic Revolutionary Guard Corps, particularly the Quds Force, has historically provided Hezbollah with funding, weapons, training, and strategic guidance, while Hezbollah retains substantial operational autonomy in Lebanon and, at times, in Syria. This is not a simple chain of command; it is a delegated partnership in which the principal gains deniability and geographic reach, while the agent gains resources and political protection. Mumford's work on proxy warfare emphasizes that proxy relationships are shaped by the principal's need for plausible deniability and the agent's need for survival, producing bargaining rather than obedience. Juneau's analysis of Iran's proxy strategy similarly stresses that Tehran's regional influence depends on partners whose interests overlap with but are not identical to Iran's, creating both leverage and risk.

Hezbollah's institutionalization is the second mechanism. Since the 1980s, and especially after the 2006 war with Israel, Hezbollah has become a hybrid actor: a Lebanese political party, a social-service provider, and

a military force with capabilities that exceed those of the Lebanese state. This hybridity matters because it blurs the distinction between state and non-state violence. Israel cannot treat Hezbollah as a mere terrorist group without ignoring its domestic legitimacy; Iran cannot treat it as a simple instrument without ignoring its Lebanese constituency and its own strategic calculus. The agent's autonomy is therefore not a deviation from proxy theory but a condition of its effectiveness.

Syria provides the third mechanism: strategic depth and logistical corridor. Before 2011, Syria was Iran's only Arab state ally and a crucial transit route for weapons to Hezbollah. The Syrian civil war transformed this relationship. Iran and Hezbollah intervened to preserve the Assad regime, not only to protect an ally but to prevent the emergence of a hostile Sunni-dominated state that could sever the land bridge to Lebanon. This intervention militarized the Levantine theater and turned Syria into a testing ground for Iranian-backed militias, Russian airpower, and Israeli strikes. Israel's "campaign between wars"—repeated strikes on Iranian and Hezbollah assets in Syria—was designed to prevent the transfer of precision-guided munitions and to degrade capabilities without triggering full-scale war. The mechanism here is cumulative denial: small, frequent uses of force intended to shift the cost-benefit calculus of the adversary without crossing the threshold that would justify massive retaliation.

Deterrence operates through mutual vulnerability and ambiguity. Hezbollah's rocket and missile arsenal, including precision-guided systems, threatens Israeli population centers and infrastructure; Israel's airpower and intelligence dominance threaten Hezbollah's leadership, weapons depots, and Lebanese infrastructure. Each side's deterrent rests on the credibility of retaliation, but credibility is undermined by the very ambiguity that makes proxy warfare attractive. Iran can deny direct responsibility for Hezbollah's actions; Hezbollah can calibrate attacks to avoid appearing as an Iranian puppet; Israel can strike in Syria while claiming self-defense. The result is a deterrence equilibrium that is informationally demanding: it requires each side to infer the other's red lines from signals that are deliberately noisy.

Domestic politics further complicates the mechanism. Hezbollah's legitimacy in Lebanon depends partly on its resistance narrative, but also on its role in Lebanese politics and social services. Israeli decision-making is shaped by coalition politics, military doctrine, and public tolerance for casualties. Syrian state collapse removed a central authority that once regulated escalation. The Levantine theater is therefore not only an interstate deterrence game; it is a multi-level system in which local actors can trigger or constrain escalation.

Scope Conditions: This model applies most clearly when three conditions hold. First, the proxy agent must possess sufficient autonomy to act as a strategic actor in its own right, rather than as a mere extension of the principal. Hezbollah's political and military institutionalization satisfies this condition; smaller, more dependent militias do not. Second, the theater must contain a shared geographic space—here, Lebanon and Syria—where the principal's interests, the agent's survival, and the adversary's security concerns overlap. Third, escalation thresholds must be partially legible: each side must be able to estimate what level of force will provoke retaliation. When thresholds become illegible—because of leadership changes, intelligence failures, or domestic crises—the model predicts not stability but rapid escalation.

The model does not apply well to cases where the proxy is fully controlled by the principal, or where the adversary lacks the capability to impose costs on the principal directly. It also struggles to explain periods of genuine cooperation or détente, because it foregrounds conflict and delegation. Finally, it risks overstating Iranian control over Hezbollah and understating Hezbollah's Lebanese agency.

Observable Implications: If the model is correct, one should observe several patterns. Hezbollah's military buildup should correlate with Iranian strategic priorities but not mirror them exactly; there should be

visible bargaining over timing and targets. Israeli strikes in Syria should increase when precision-guided munition transfers are detected, but should avoid direct attacks on Iranian soil unless escalation thresholds are crossed. Hezbollah's rhetoric should oscillate between resistance and Lebanese state-building, reflecting its dual identity. Syrian territory should remain a contested logistical space rather than a stable Iranian corridor. Deterrence should hold during periods of clear signaling and break down during periods of ambiguity, such as leadership transitions or major regional shocks.

One should also observe that civilian harm is not incidental but structurally embedded: because proxies operate within populated areas and adversaries target infrastructure, the Levantine theater produces recurrent humanitarian costs. This is a testable implication that distinguishes structural explanations from purely strategic ones.

Perspective Note (five traditions in brief): African perspective (primary): African scholarship approaches the Levantine theater less as a unique Middle Eastern configuration than as a variant of a recurring pattern: external powers cultivating local armed actors to project influence while avoiding direct accountability. From this vantage, Hezbollah's hybridity resembles the militarized political economies that African scholars have analyzed in contexts such as the Democratic Republic of Congo, Libya, and the Sahel, where armed groups become embedded in social and political life rather than remaining external to it. Bayart's concept of extraversion helps explain how local actors leverage external patronage to consolidate domestic power; Mamdani's work on indirect rule illuminates how colonial and postcolonial states govern through delegated violence; Fanon's analysis of colonial violence reminds us that armed resistance can be simultaneously emancipatory and destructive. Rodney and Nkrumah frame proxy warfare as a continuation of neo-colonial extraction, in which regional powers and global hegemons compete over strategic corridors while local populations absorb the costs. Nyerere's non-alignment and Cabral's emphasis on social emancipation provide normative counterpoints: they suggest that security cannot be reduced to deterrence between armed actors, but must include popular sovereignty and social development. Grovogui's critique of international law highlights how legal categories such as "state responsibility" and "non-state actor" often reflect Western state-centric assumptions that struggle to capture hybrid authorities like Hezbollah. Mbembe's necropolitics draws attention to the distribution of death and precarity across the Levant, while Tamale and Oyěwùmí remind us that gendered and epistemic hierarchies shape whose suffering is visible in security discourse. Aning and Danso's work on African agency suggests that African states are not merely recipients of Levantine spillover but active interpreters of proxy warfare, often emphasizing sovereignty, non-interference, and the dangers of external militarization. The African perspective thus reveals what the other traditions often miss: proxy warfare is not only a strategic interaction among states and militias, but a social and political process that reconfigures authority, legitimacy, and survival at the local level. It also warns that deterrence models can normalize permanent militarization by treating armed hybrid actors as stable features of the regional order.

Chinese perspective: China views the Levantine theater primarily through the lens of economic security and regional stability. Beijing's interests include energy imports, Belt and Road connectivity, and the safety of Chinese nationals and investments. China generally supports state sovereignty and non-interference, which leads it to emphasize the territorial integrity of Syria and Lebanon and to resist external regime change. Chinese analysts often criticize Western military interventions for destabilizing the region and creating vacuums filled by extremism. At the same time, China has limited appetite for direct military involvement and prefers diplomatic mediation, as seen in its support for Saudi-Iranian rapprochement. The Chinese perspective contributes an economic and developmental framing that highlights the costs of prolonged conflict for trade and infrastructure, but it occludes the internal political dynamics of Hezbollah and the specific security dilemmas facing Israel, treating them as secondary to great-power stability.

Russian perspective: Russia frames the Levantine theater as a theater of multipolar competition and anti-Western resistance. Its military intervention in Syria from 2015 onward was justified as counterterrorism and state sovereignty, but it also served to preserve a strategic foothold in the Eastern Mediterranean, protect arms markets, and challenge US dominance. Moscow has maintained complex relationships with both Iran and Israel, seeking to balance them while supporting the Assad regime. Russian analysts often portray Western support for regime change as the root cause of regional disorder and view Hezbollah as a legitimate resistance force against Israeli occupation. The Russian perspective contributes an emphasis on state sovereignty and great-power balancing, but it occludes the humanitarian costs of the Syrian war and the coercive dimensions of Iranian proxy support, while overstating the coherence of an anti-Western bloc.

Western perspective: Western, especially US and Israeli, analysis treats the Levantine theater as a problem of Iranian expansion, terrorism, and deterrence. The focus is on Hezbollah's military capabilities, Iran's regional network, and the need to prevent escalation while maintaining Israel's qualitative military edge. Western scholars and policymakers debate whether deterrence, containment, or limited strikes best manage the threat. The perspective contributes detailed military and intelligence analysis and a strong emphasis on alliance security, but it often occludes Lebanese domestic politics, Syrian social fragmentation, and the ways in which Western interventions contributed to regional instability. It also tends to frame Hezbollah primarily as an Iranian instrument, underestimating its local legitimacy and autonomy.

UN perspective: The UN approaches the Levantine theater through Security Council resolutions, peacekeeping, and humanitarian law. Resolution 1701, which ended the 2006 Lebanon war, calls for disarmament of armed groups south of the Litani River and an enhanced UNIFIL presence; Resolution 2254 outlines a political process for Syria. The UN emphasizes civilian protection, humanitarian access, and state responsibility for proxy actions. Its panels and commissions document arms flows and violations. The UN perspective contributes legal accountability and humanitarian norms, but it occludes power asymmetries in the Security Council, struggles to enforce resolutions against powerful states, and treats proxy warfare as a violation of sovereignty rather than a structural feature of regional order.

2.4 KEY IDEA 3 — Yemeni Maritime Asymmetry: The Houthis and the Red Sea Shipping Crisis (2023–Present)

Bolded Causal Claim: The Houthi campaign against Red Sea shipping shows that maritime chokepoint coercion can be executed by a non-state actor without a blue-water navy, because cheap, deniable, land-based anti-ship systems can exploit the geographic concentration and commercial predictability of global shipping; the result is a cost asymmetry in which a localized insurgency imposes systemic costs on global commerce and forces multinational naval responses that may not restore deterrence.

Mechanism: The first mechanism is geographic concentration. The Bab el-Mandeb strait and the southern Red Sea form a narrow maritime corridor connecting the Indian Ocean to the Suez Canal and the Mediterranean. Commercial shipping is not randomly distributed; it follows scheduled routes, predictable chokepoints, and just-in-time logistics. This concentration means that a relatively small number of attacks can disrupt a large share of global trade. Lloyd's List shipping data and other maritime tracking sources have documented sharp rerouting and volume declines during the Houthi campaign, as carriers diverted around the Cape of Good Hope. The mechanism is not merely physical destruction but uncertainty: insurers, shippers, and ports respond to risk perception, not just to realized attacks.

The second mechanism is cost asymmetry. The Houthis have used drones, cruise missiles, ballistic missiles, and unmanned surface vessels—systems that are far cheaper than the naval assets required to intercept

them. A state or coalition defending shipping must maintain continuous patrols, air defense, and intelligence, surveillance, and reconnaissance across a vast area. The attacker can choose the time and place of engagement; the defender must be everywhere. This is a classic asymmetric warfare dynamic, but applied to maritime commerce rather than to territory. The cost ratio favors the attacker even when most attacks are intercepted, because the defender bears the cumulative cost of readiness and the attacker bears only the cost of occasional launches.

The third mechanism is deniability and principal-agent ambiguity. Iran has provided the Houthis with weapons, training, and intelligence, but the Houthis retain their own political agenda, rooted in Yemeni grievances and Zaydi identity. This ambiguity complicates deterrence. If the Houthis are treated as Iranian proxies, retaliation against Iran risks escalation; if they are treated as autonomous actors, deterrence must target a dispersed, resilient insurgency. The principal-agent relationship is thus both a source of Houthi capability and a shield against direct retaliation. Juneau's analysis of Iran's proxy strategy is relevant here: Tehran benefits from partners that can act without its direct command, but it also faces the risk that their actions will trigger responses it cannot control.

The fourth mechanism is the insurance and commercial feedback loop. Maritime insurance premiums, war-risk designations, and charter rates respond to perceived threat. When the Red Sea was designated a high-risk area, costs rose for all shippers, including those not directly attacked. Some carriers suspended transits entirely; others accepted higher costs and passed them to consumers. The mechanism converts localized violence into global price signals. This is why a non-state actor in Yemen can affect inflation and supply chains in Europe, Asia, and Africa without controlling territory beyond its coastal launch sites.

The fifth mechanism is naval response and its limits. Multinational operations, including US- and UK-led strikes and European naval missions, aimed to degrade Houthi capabilities and protect shipping. But naval power is optimized for state adversaries and open-ocean control, not for suppressing dispersed land-based launchers in rugged terrain. Strikes can destroy some assets, but the Houthis can regenerate capacity, exploit civilian infrastructure, and frame attacks as solidarity with Palestinians. The mechanism of deterrence by punishment is therefore weakened by the attacker's resilience and political narrative. The result is a stalemate in which shipping is partially protected but not fully restored, and the conflict persists as a chronic cost rather than a decisive battle.

Scope Conditions: This model applies when four conditions hold. First, the chokepoint must be narrow enough that shipping cannot easily disperse, yet large enough that naval patrols cannot cover all approaches. The Bab el-Mandeb and southern Red Sea fit this condition. Second, the attacker must possess low-cost, land-based anti-ship capabilities and the ability to regenerate them. Third, the global commercial system must be sufficiently integrated that rerouting imposes significant costs. Fourth, the principal-agent relationship must be ambiguous enough to complicate retaliation but strong enough to sustain capability.

The model does not apply to chokepoints where the attacker lacks land-based access, where shipping is less concentrated, or where naval dominance can be established at acceptable cost. It also does not imply that all non-state actors can replicate the Houthi campaign; the specific combination of Iranian support, Yemeni geography, and Red Sea commercial density is unusual. Finally, the model risks overstating Houthi autonomy and understating the degree to which their campaign is shaped by Iranian strategic interests.

Observable Implications: If the model is correct, one should observe several patterns. Shipping volumes through the Red Sea and Suez should decline during periods of intensified Houthi attacks and partially recover during lulls, but not return to baseline if risk perception remains high. Insurance premiums and war-risk

surcharges should spike faster than physical damage, reflecting the uncertainty mechanism. Naval deployments should increase but should not fully suppress attacks, because the attacker retains land-based launch capacity. Houthi rhetoric should link Red Sea attacks to broader regional causes, such as the Gaza war, to sustain political legitimacy. Iranian officials should deny direct control while signaling support, preserving ambiguity. African, European, and Asian economies should experience secondary effects through fuel prices, freight rates, and food costs, even if they are not direct participants.

The model also implies that deterrence will be partial and cyclical: periods of reduced attacks will be interpreted as success, followed by renewed attacks when the attacker perceives that costs have shifted back in its favor.

Perspective Note (five traditions in brief): African perspective (primary): African scholarship and policy analysis approach the Red Sea crisis not as a distant maritime episode but as a direct shock to African economies and security. The Red Sea and Bab el-Mandeb are adjacent to the Horn of Africa; disruptions affect ports in Djibouti, Sudan, Eritrea, and Somalia, as well as landlocked states such as Ethiopia that depend on maritime access. African economies face higher freight and insurance costs, fuel price volatility, and potential food insecurity, particularly in import-dependent states. From an African vantage, the crisis reveals the vulnerability of "blue economy" strategies that depend on external shipping lanes and foreign naval protection. Bayart's extraversion helps explain how African ports and trade systems are integrated into global commerce on terms that expose them to shocks they do not control. Rodney's underdevelopment thesis and Nkrumah's neo-colonialism frame the crisis as another instance in which African economies absorb the costs of great-power and regional rivalries. Mamdani's analysis of state and non-state violence is relevant to the Houthi movement itself, which emerged from Yemeni political and social grievances rather than from a purely external script. Fanon's insights on anti-colonial violence complicate simple condemnation of Houthi attacks, while Cabral's emphasis on social emancipation warns against reducing Yemeni politics to proxy dynamics. Grovogui's critique of international law highlights how UNCLOS and freedom-of-navigation norms are often enforced selectively, privileging commercial powers over coastal and littoral states. Mbembe's necropolitics draws attention to the human costs of maritime militarization, including civilian casualties in Yemen and the precarity of African migrant and fishing communities. Tamale and Oyěwùmí remind us that gendered labor and informal economies are often invisible in maritime security metrics. Aning and Danso's work on African agency underscores that African states and the African Union have their own maritime security frameworks, such as the 2050 Africa's Integrated Maritime Strategy, and are not merely passive victims of Red Sea disruption. The African perspective thus reveals what other traditions miss: the Red Sea crisis is not only a problem of global shipping or Iranian proxy warfare, but a test of African economic resilience and maritime sovereignty in a system where African states bear costs without controlling the levers of escalation.

Chinese perspective: China has significant economic stakes in Red Sea shipping, including energy imports, manufactured exports, and Belt and Road investments. Chinese analysts often frame the crisis as a consequence of regional instability and Western military interventions, while emphasizing the need for diplomatic solutions and respect for sovereignty. Beijing has deployed naval assets to the Gulf of Aden for anti-piracy missions and has a base in Djibouti, reflecting a growing but cautious maritime presence. China's Gulf security critique stresses that US-led naval operations may protect shipping in the short term but do not address root causes, and may exacerbate regional tensions. The Chinese perspective contributes an economic and developmental framing and a preference for multilateralism, but it occludes the coercive dimensions of Iranian support for the Houthis and tends to treat freedom of navigation as subordinate to state sovereignty and non-interference.

Russian perspective: Russia frames Red Sea disruption as both a symptom of Western policy failures and an opportunity to weaken US hegemony. Russian analysts often highlight the costs of US naval operations and question their legitimacy, while portraying Houthi actions as resistance to Western-backed regional orders. Moscow has limited direct economic exposure compared to China or Europe, but it benefits from any erosion of US maritime dominance and from higher energy prices that can result from supply disruptions. The Russian perspective contributes an anti-Western framing that questions the universality of freedom-of-navigation norms, but it occludes the humanitarian costs in Yemen, the economic harm to developing states, and the fact that disruption also affects Russian trade and partners.

Western perspective: Western analysis centers on freedom of navigation, the protection of global commerce, and the limits of deterrence. The US and its allies have conducted strikes and naval patrols to degrade Houthi capabilities and reassure shippers. Western scholars debate whether the campaign reflects a failure of deterrence, the inherent difficulty of coercing a resilient non-state actor, or the need for a broader strategy addressing Iranian support. The perspective contributes operational detail and a strong normative commitment to open sea lanes, but it often occludes the Yemeni political context, the economic spillovers to non-Western states, and the possibility that military responses may prolong rather than resolve the crisis.

UN perspective: The UN approaches the Red Sea crisis through UNCLOS, humanitarian access to Yemen, and Security Council resolutions. The UN emphasizes the protection of civilians, the delivery of aid, and the legal framework governing maritime security. Panels of experts document arms transfers and sanctions violations. The UN perspective contributes a legal-normative framework that holds states accountable for proxy support and prioritizes civilian protection, but it occludes power asymmetries in the Security Council, struggles to enforce resolutions against non-state actors, and treats maritime disruption primarily as a violation of international law rather than as a structural feature of asymmetric conflict.

2.5 KEY IDEA 4 — Chokepoints: Hormuz, Bab el-Mandeb, and the Vulnerability of Global Supply Chains

Bolded Causal Claim: Maritime chokepoints concentrate a disproportionate share of global trade into geographically narrow passages, creating structural vulnerabilities whereby localized conflict, accident, or coercion can generate cascading economic disruption far exceeding the immediate theater of operations.

Mechanism: The mechanism operates through three interlocking channels: volume concentration, route inelasticity, and market amplification. First, volume concentration: the Strait of Hormuz carries approximately 20–21 million barrels per day of crude oil and condensate, representing roughly one-fifth of global petroleum consumption, while the Bab el-Mandeb strait handles approximately 10 percent of global seaborne trade and a significant share of container traffic between Asia and Europe (EIA Hormuz transit data; Lloyd's List shipping data). When a single passage carries such a share of global flow, any disruption—whether military, accidental, or coercive—immediately removes that volume from the global supply chain. Second, route inelasticity: alternative routes around chokepoints are either nonexistent (Hormuz has no practical maritime alternative for Gulf oil exports) or enormously costly (rerouting around the Cape of Good Hope adds 10–14 days and substantial fuel costs to Asia–Europe voyages). The Suez Canal–Bab el-Mandeb corridor has no equivalent alternative; the Cape route increases transit distance by roughly 40 percent. Third, market amplification: shipping markets operate on thin margins and just-in-time logistics. Insurance premiums, freight rates, and inventory buffers amplify physical disruptions into price signals. When Houthi attacks on Red Sea shipping escalated in late 2023, war risk insurance premiums for Red Sea transits surged from approxi-

mately 0.05 percent to 0.5–1 percent of hull value, and some insurers withdrew coverage entirely, effectively closing the route to commercial traffic regardless of physical threat levels (Crisis Group Red Sea reports). The mechanism is not merely that ships cannot pass; it is that the financial and contractual infrastructure of global shipping makes passage economically irrational even when physically possible.

The geographic logic of chokepoints is ancient, but their contemporary significance derives from the scale and speed of globalized supply chains. The Strait of Hormuz, at its narrowest point approximately 21 nautical miles wide with shipping lanes of only 2 miles in each direction, separates the Persian Gulf from the Gulf of Oman. The Bab el-Mandeb, between Yemen and Djibouti, is approximately 18 miles wide at its narrowest. These dimensions mean that naval forces, mines, missiles, or even small boats can threaten commercial traffic across the entire passage. The concentration is not accidental but structural: geography funnels maritime traffic, and economic optimization reinforces the funnel by routing the maximum volume through the shortest path. The result is a system in which efficiency and vulnerability are two sides of the same coin. As Juneau (2020) has argued in the context of Iranian strategy, chokepoints are not merely geographic features but strategic assets whose value derives from the dependence of others on their continued openness.

The historical record reinforces this mechanism. The 1980s Tanker War, in which Iran and Iraq attacked each other's oil shipping, demonstrated that even limited disruption to Hormuz traffic could spike global oil prices and trigger international naval intervention. The 2019 tanker seizures showed that Iran could selectively disrupt Hormuz traffic without closing the strait entirely, using a calibrated approach that maximized coercive leverage while minimizing the risk of full-scale military response. In each case, the mechanism operated through the same channels: volume concentration made the disruption significant, route inelasticity prevented easy substitution, and market amplification translated physical events into economic and political consequences.

Scope Conditions: The chokepoint vulnerability mechanism operates under specific conditions that determine whether disruption is localized or systemic. First, the volume share must exceed the absorptive capacity of alternative routes. If global shipping can reroute without significant cost, the chokepoint loses its coercive leverage. The Cape of Good Hope route, while costly, can absorb some Red Sea traffic, but not all of it without severe congestion at alternative ports and increased freight rates. Second, the insurance market must be sensitive to threat perception. If insurers continue to cover transits at manageable premiums, physical threats do not translate into economic disruption. The Red Sea crisis demonstrated that insurance markets can be more disruptive than physical attacks: the mere threat of Houthi strikes caused premium spikes that made transits uneconomical. Third, the naval response must be insufficient to guarantee safe passage. If a credible naval escort can protect commercial traffic, the chokepoint's vulnerability is mitigated. The US-led Operation Prosperity Guardian and the subsequent EU naval mission (Aspides) attempted this but could not fully restore commercial confidence, in part because the threat environment—anti-ship ballistic missiles, drones, and small-boat attacks—exceeded the defensive capacity of escort vessels. Fourth, the commodity in question must be non-substitutable in the short term. Oil and LNG from the Gulf have limited short-term substitutes; containerized manufactured goods from Asia have somewhat more flexibility but still face severe delays.

The mechanism weakens when: (a) alternative energy sources or suppliers reduce dependence on Gulf oil, as the shale revolution partially did for the United States; (b) strategic petroleum reserves buffer short-term disruptions; (c) shipping companies have diversified routes and inventory; (d) diplomatic or military deterrence prevents attacks. The mechanism strengthens when: (a) global supply chains are optimized for efficiency over resilience, as they were in the pre-pandemic era; (b) insurance markets are risk-averse and quick

to withdraw coverage; (c) naval forces are stretched across multiple theaters; (d) non-state actors possess cheap, effective anti-ship capabilities that outpace defensive systems.

Observable Implications: The chokepoint mechanism generates testable predictions. First, shipping volume data should show sharp declines in chokepoint transits during crises, with corresponding increases in alternative routes. Lloyd's List data from the Red Sea crisis showed Suez Canal transits dropping by over 50 percent in early 2024, with Cape of Good Hope transits increasing correspondingly. Second, insurance premiums should spike before or concurrent with physical attacks, reflecting market anticipation. Third, freight rates on affected routes should increase, with pass-through to consumer prices. Fourth, strategic petroleum reserve releases should correlate with Hormuz disruption fears. Fifth, naval deployment counts should increase in response to chokepoint threats, reflecting the securitization dynamic addressed in Key Idea 5.

For Hormuz specifically, EIA data shows that approximately 20 percent of global oil consumption transits the strait, with Saudi Arabia, Iraq, the UAE, Kuwait, and Iran as the primary exporters. Any closure, even temporary, would remove roughly 20 million barrels per day from global supply—far exceeding the spare capacity of alternative producers. The 2019 tanker seizures demonstrated that Iran could selectively disrupt Hormuz traffic without closing the strait entirely, using a calibrated approach that maximized coercive leverage while minimizing the risk of full-scale military response. Mumford (2013), in his analysis of proxy warfare, notes that chokepoint disruption is a form of indirect coercion that allows weaker actors to impose costs on stronger ones without direct military confrontation—a logic that applies equally to state and non-state actors operating in maritime chokepoints.

Perspective Note (five traditions in brief):

African perspective: The African vantage point on chokepoints centers on the Bab el-Mandeb and the Red Sea as arteries connecting African economies to global markets, not merely as passages for Asian–European trade. For Djibouti, Eritrea, Sudan, and Somalia, Red Sea shipping is the primary conduit for imports, exports, and humanitarian aid. The Houthi crisis disrupted African trade, increased food and fuel prices, and complicated humanitarian delivery to conflict zones. African scholars and policymakers emphasize that chokepoint vulnerability is experienced asymmetrically: African economies bear the costs of disruption (higher import prices, supply shortages) without possessing the naval or diplomatic capacity to influence security outcomes. The African perspective reveals that chokepoint geopolitics is not only about great-power competition but about the structural vulnerability of peripheral economies to disruptions they cannot control. It also highlights the irony that African ports—Djibouti, Berbera, Mombasa—have become strategic assets in great-power competition, with foreign military bases proliferating along the Red Sea and Gulf of Aden coasts, often without corresponding African agency in security governance. Bayart's (2009) analysis of extraversion and the politics of the belly illuminates how African states navigate chokepoint geopolitics as both victims of disruption and hosts of foreign military power, extracting rents from bases while ceding sovereignty over maritime security.

Chinese perspective: China's interest in chokepoints is primarily economic and strategic. As the world's largest oil importer and a major trading nation, China depends on Hormuz and Bab el-Mandeb for energy security and commercial access. China has invested heavily in port infrastructure along the Red Sea and Gulf of Aden (Djibouti, Gwadar, Hambantota) as part of the Belt and Road Initiative, creating a network of commercial and potential naval facilities. China's perspective emphasizes freedom of navigation and the protection of commercial shipping, but it critiques Western naval dominance in these waters as serving US hegemony rather than global commerce. China's naval presence in the Gulf of Aden (anti-piracy missions

since 2008) represents a gradual expansion of maritime security capacity, but Beijing remains cautious about direct confrontation with US or allied forces. The Chinese perspective contributes an economic-security framing that treats chokepoints as critical infrastructure requiring protection, but it occludes the coercive potential of its own port investments and the strategic ambiguity of its naval expansion.

Russian perspective: Russia views chokepoint disruption through the lens of anti-Western geopolitics and energy competition. The Red Sea crisis, from Moscow's perspective, weakens Western economies by increasing shipping costs and energy prices, while Russia's own oil exports (primarily via Baltic and Black Sea routes, plus Arctic) are less affected. Russia has supported or at least not opposed Houthi actions, framing them as legitimate resistance to Western-Israeli aggression. Russia's perspective emphasizes the hypocrisy of Western freedom-of-navigation rhetoric, given US and Israeli military actions in the region. Moscow also sees chokepoint vulnerability as an argument for multipolar maritime security arrangements that reduce Western naval dominance. The Russian perspective contributes a counter-hegemonic framing that questions Western monopoly on maritime security governance, but it occludes Russia's own interest in energy price manipulation and its limited capacity to protect commercial shipping.

Western perspective: The Western perspective frames chokepoints as critical infrastructure requiring protection through naval power and international law. Freedom of navigation is treated as a foundational principle of the liberal international order, and chokepoint disruption is seen as a threat to global economic stability. The US, UK, and EU have deployed naval forces to protect shipping (Operation Prosperity Guardian, Operation Aspides), reflecting a commitment to maintaining open sea lanes. The Western perspective emphasizes deterrence, military capability, and alliance coordination. It contributes a robust security framework and operational capacity, but it occludes the economic interests driving naval presence (protecting Western commercial shipping and energy access), the historical role of Western powers in creating regional instability, and the limitations of military solutions to politically rooted conflicts.

UN perspective: The UN approaches chokepoints through UNCLOS, which guarantees transit passage through straits used for international navigation. The UN emphasizes the legal framework governing maritime security, the protection of civilian shipping, and the humanitarian consequences of disruption. UN Security Council resolutions address piracy, arms trafficking, and threats to navigation. The UN perspective contributes a legal-normative framework that holds states accountable for maritime security, but it occludes enforcement gaps (the UN lacks naval forces), the political dynamics of Security Council decision-making, and the structural inequalities in global shipping that make some states more vulnerable to disruption than others.

2.6 KEY IDEA 5 — The Securitization of Maritime Chokepoints: The Link Between Regional Conflict and Global Commerce

Bolded Causal Claim: The framing of maritime chokepoints as existential security threats—through securitization speech acts by state and non-state actors—transforms regional conflicts into global security priorities, justifying extraordinary military measures and reshaping the political economy of affected regions in ways that often outlast the original crisis.

Mechanism: The mechanism draws on securitization theory (Buzan, Waever, and de Wilde, 1998) and operates through four stages: (1) threat construction, (2) audience acceptance, (3) emergency measures, and (4) institutionalization. First, threat construction: political actors frame chokepoint disruption not as a commercial or criminal problem but as an existential threat to national or international security. The Houthi attacks on Red Sea shipping were framed by US and UK officials as threats to "global commerce" and "freedom

of navigation," elevating a regional conflict to a global security priority. Similarly, Iranian threats to close Hormuz have been framed as threats to global energy security. Second, audience acceptance: the securitization succeeds when relevant audiences (domestic publics, international organizations, allied states) accept the threat framing. The Red Sea crisis achieved rapid audience acceptance because of the visible economic impact (shipping rerouting, price increases) and the symbolic resonance of attacks on commercial vessels. Third, emergency measures: once securitized, the issue moves from normal politics to emergency politics, justifying military responses, sanctions, and exceptional legal measures. Operation Prosperity Guardian, the US–UK strikes on Houthi targets in Yemen, and the designation of the Houthis as a terrorist organization all followed from securitization. Fourth, institutionalization: the emergency measures become normalized, creating permanent security architectures (naval bases, patrol regimes, intelligence sharing) that persist beyond the immediate crisis. The Gulf of Aden anti-piracy missions (2008–present) illustrate this institutionalization: what began as an emergency response to Somali piracy became a permanent multinational naval presence.

The mechanism is not automatic. Securitization can fail if audiences reject the threat framing, if the economic impact is insufficient to mobilize political will, or if alternative framings (humanitarian, developmental) compete successfully. The securitization of chokepoints is also contested: some actors frame disruption as a consequence of regional conflict requiring political solutions, while others frame it as a security threat requiring military response. The competition between these framings determines whether the response is diplomatic or military, and whether the affected region is treated as a security theater or a development challenge.

The link between regional conflict and global commerce operates through what might be called "commercial securitization": the process by which threats to commercial shipping are translated into security priorities that justify military intervention. This translation depends on the concentration of global trade in chokepoints (Key Idea 4) and the political economy of maritime commerce. When shipping companies, insurers, and port operators face disruption, they lobby governments for protection, creating a political constituency for securitization. The result is a feedback loop: regional conflict disrupts shipping, shipping disruption generates economic costs, economic costs generate political pressure, political pressure generates military response, and military response may escalate regional conflict. Mumford (2013) identifies this as a characteristic of proxy warfare in the maritime domain: the indirect nature of the conflict allows the securitizing actor to frame its response as defensive rather than offensive, obscuring the political interests driving intervention.

Scope Conditions: Securitization succeeds under specific conditions. First, the economic impact must be visible and significant enough to mobilize political will. The Red Sea crisis achieved this through measurable shipping declines and price increases. Second, there must be a credible military response available. If naval forces cannot effectively protect shipping, securitization may produce frustration rather than action. Third, the framing must resonate with dominant security narratives. "Freedom of navigation" resonates in Western strategic culture; "resistance to oppression" resonates in Houthi and Iranian narratives. Fourth, institutional pathways must exist for converting securitization into action (UN Security Council, alliance structures, national security councils).

Securitization fails or is contested when: (a) the economic impact is diffuse or delayed; (b) military response is infeasible or counterproductive; (c) competing framings (humanitarian, economic, diplomatic) dominate public discourse; (d) the securitizing actor lacks credibility. The securitization of Hormuz, for example, has been partially contested by states that view US military presence as itself a source of regional instability. Juneau (2020) notes that Iranian securitization of the Gulf—framing US naval presence as a threat to regional security—has achieved limited audience acceptance beyond Iran's immediate allies, illustrating the

importance of credibility and institutional pathways in securitization success.

Observable Implications: The securitization mechanism generates testable predictions. First, policy documents and official statements should show a shift from commercial or criminal framing to security framing during crises. Second, military deployments and budgets should increase in response to securitization. Third, legal designations (terrorist organizations, sanctions) should follow securitization. Fourth, the institutionalization of security measures should persist beyond the immediate crisis. Fifth, the political economy of affected regions should shift toward security-sector dependence, with foreign military bases and security assistance becoming dominant economic activities.

The Red Sea crisis provides clear evidence: US and UK officials framed Houthi attacks as threats to global commerce and international security; military strikes followed; the Houthis were redesignated as a terrorist organization; and naval deployments expanded. The institutionalization is visible in the continued presence of multinational naval forces in the Red Sea and Gulf of Aden, even as commercial shipping has partially returned to the route. Crisis Group Red Sea reports document how the securitization of the Red Sea has transformed Yemen from a humanitarian crisis into a security theater, with military responses taking precedence over diplomatic solutions.

Perspective Note (five traditions in brief):

African perspective: The African vantage point reveals that the securitization of maritime chokepoints often occurs without African participation in the security governance that follows. African states bear the economic costs of disruption—higher fuel and food prices, supply chain delays—while external powers make security decisions that affect African waters. The proliferation of foreign military bases along the Red Sea and Gulf of Aden coasts (US, China, France, Japan, Saudi Arabia, UAE, Turkey) reflects the securitization of African maritime space by non-African actors. African scholars such as Aning and Danso have argued that maritime security in African waters should be governed by African institutions, not external naval powers. The African perspective also highlights the humanitarian dimension: securitization of the Red Sea has complicated humanitarian access to Yemen and Sudan, as naval blockades and security restrictions impede aid delivery. The securitization framework, from an African vantage, often prioritizes commercial shipping over human security, revealing a hierarchy of values that reflects global power asymmetries rather than African priorities. Grovogui's (2006) critique of the international as a space of power rather than justice illuminates how securitization of African maritime space serves external interests while marginalizing African agency. Mamdani's (2009) analysis of the politics of naming—how "terrorism" and "security" are deployed to justify intervention—resonates with African critiques of securitization as a discourse that legitimizes external military presence in African waters.

Chinese perspective: China's approach to the securitization of chokepoints is ambivalent. Beijing benefits from the US-led security architecture that protects its commercial shipping, but it resents the political leverage this gives Washington. China has been reluctant to join US-led military operations (such as Operation Prosperity Guardian) that might be seen as supporting US hegemony, while simultaneously conducting its own naval patrols. China's perspective emphasizes economic security over military security: the protection of trade routes is framed as a commercial necessity, not a military mission. Beijing has criticized the US–UK strikes on Yemen as escalation that worsens regional instability. The Chinese perspective contributes a commercial-security framing that prioritizes trade protection over military confrontation, but it occludes China's own strategic interest in maintaining access to Gulf energy and its growing naval capacity to protect that access independently.

Russian perspective: Russia frames the securitization of chokepoints as a Western pretext for military intervention and regional dominance. Moscow has criticized US and UK strikes on Yemen as violations of sovereignty and escalation that worsens the humanitarian crisis. Russia's perspective emphasizes that securitization serves Western interests—protecting Israeli shipping, maintaining US naval dominance—rather than global commerce. Russia has also used the crisis to argue for multipolar maritime security, proposing that regional states rather than Western powers should govern maritime security. The Russian perspective contributes a critique of Western securitization as self-serving, but it occludes Russia's own interest in energy price increases resulting from disruption and its limited capacity to offer alternative security arrangements.

Western perspective: The Western perspective treats the securitization of chokepoints as a necessary response to threats to the global economy and the liberal international order. Freedom of navigation is framed as a public good that requires military protection. The Western perspective emphasizes the legitimacy of military response to attacks on commercial shipping, the importance of alliance coordination, and the need for sustained naval presence. It contributes operational capacity and a legal framework (UNCLOS, self-defense), but it occludes the economic interests driving securitization, the historical role of Western military intervention in creating regional instability, and the possibility that military responses may prolong rather than resolve crises.

UN perspective: The UN approaches the securitization of chokepoints through the lens of international law, humanitarian protection, and Security Council authority. The UN emphasizes that maritime security measures must comply with international law, protect civilian populations, and not exacerbate humanitarian crises. UN Security Council resolutions on Yemen and maritime security provide a legal framework for international action. The UN perspective contributes a normative framework that constrains unilateral military action and prioritizes civilian protection, but it occludes the power asymmetries in Security Council decision-making, the difficulty of enforcing resolutions against non-state actors, and the tension between security measures and humanitarian access.

SECTION 2.7 — FIVE PERSPECTIVES IN DEPTH

2.7.1 African Perspective (PRIMARY)

The African vantage point on proxy warfare and chokepoint geopolitics begins not with the Strait of Hormuz or the Bab el-Mandeb as abstract nodes in a global shipping network, but with the fact that the Red Sea and the Gulf of Aden are African littorals. Djibouti, Eritrea, Somalia, Sudan, and, across the water, Yemen form a single maritime space in which African populations, ports, fisheries, and trade routes are directly exposed to the consequences of West Asian proxy conflict. From this position, the central puzzle of the lesson is not simply how a non-state actor can disrupt global commerce, but how a regional war fought partly through proxies becomes embedded in African political economies, African state fragility, and African struggles over sovereignty. The African perspective therefore treats chokepoints as lived spaces rather than as technical bottlenecks: they are places where global power is exercised, where African states bargain for rents, and where ordinary people absorb the costs of militarization.

This perspective is rooted in a long tradition of African political thought that reads international order from the standpoint of historical extraction and unequal sovereignty. Rodney's (1972) analysis of how Europe underdeveloped Africa provides the foundational claim that external powers structure African economies for export and dependency, so that disruptions in global shipping are not neutral market events but shocks transmitted through already unequal trade relationships. Nkrumah's (1965) theory of neocolonialism adds

the political mechanism: formal independence does not end external control when foreign military bases, port concessions, debt, and security partnerships allow great and regional powers to shape African state behavior. Fanon's (1961) insistence that colonial violence is not an aberration but a constitutive feature of the colonial order helps explain why militarized chokepoints can be normalized as "security," even when they reproduce insecurity for coastal communities. Mamdani's (1996) citizen-and-subject thesis shows how colonial states bifurcated authority, producing durable patterns in which some populations are governed through customary or indirect rule while others are incorporated as citizens; in the maritime domain, this can mean that coastal communities experience port militarization and foreign basing as extensions of an exclusionary state rather than as protection. Bayart's work on extraversion explains how African political elites may convert external dependence into domestic power, turning foreign security partnerships, port rents, and aid into resources for regime survival. Mbembe's (2001, 2003) analyses of the postcolony and necropolitics highlight how violence, commandement, and the management of death become routinized in spaces where sovereignty is fragmented and external actors hold decisive coercive capacity. Grovogui's critique of Eurocentric sovereignty reminds us that African contributions to international law and to alternative conceptions of order are often erased when "freedom of navigation" is treated as a self-evident Western norm rather than as a historically contested legal and political achievement.

Applied to proxy warfare, this theoretical lineage yields a distinctive mechanism. Proxy war in West Asia and the Horn of Africa is not merely a principal-agent relationship between Iran and the Houthis, or between Gulf states and their clients; it is also a process through which African states are drawn into external security architectures. Regional powers such as Saudi Arabia, the United Arab Emirates, Turkey, Qatar, and Iran compete for influence in Somalia, Sudan, Eritrea, Djibouti, and Yemen, using ports, military bases, training missions, and economic leverage. African governments, facing fiscal constraints and security threats, may accept these arrangements as sources of revenue or protection. The result is a form of extraverted security governance in which African sovereignty is performed through flags, coast guards, and port authorities, while decisive strategic choices are shaped by external patrons. The Bab el-Mandeb therefore becomes a site of layered sovereignty: Yemeni, Djiboutian, Eritrean, Somali, and international actors all claim authority, but the capacity to enforce maritime order is unevenly distributed and often outsourced.

The African perspective also reframes the Houthi Red Sea crisis as a problem of spillover and unequal vulnerability. When shipping is rerouted around the Cape of Good Hope, African economies face higher freight costs, longer delivery times, and increased insurance premiums. For import-dependent states, this translates into food and fuel price inflation, fiscal pressure, and potential social unrest. Ports that handle transshipment may experience congestion or revenue shifts, while smaller ports may be bypassed. The crisis also affects African maritime livelihoods: fishing communities, artisanal traders, and coastal workers face heightened militarization, restricted access to fishing grounds, and the risk of being caught in naval operations. Refugee and displacement pressures can intensify when conflict in Yemen intersects with drought, poverty, and state fragility in the Horn. In this view, the disruption of global shipping is not an abstract efficiency loss; it is a redistribution of risk toward populations with the least capacity to absorb it.

At the same time, the African perspective insists on African agency and on the existence of African maritime governance initiatives that are often invisible in Western or great-power accounts. The African Union's 2050 Africa's Integrated Maritime Strategy, the Lomé Charter on Maritime Security and Safety and Development in Africa, the Djibouti Code of Conduct and its Jeddah Amendment, the Yaoundé Code of Conduct, and regional mechanisms associated with IGAD all represent attempts to frame maritime security as a development and sovereignty issue rather than solely a counter-piracy or freedom-of-navigation issue. These initiatives emphasize capacity building, information sharing, and the protection of African maritime resources. They

also reflect a normative claim: African coastal states have rights over their exclusive economic zones and continental shelves, and maritime security should serve African development rather than external power projection. From this standpoint, foreign naval deployments in the Red Sea and Gulf of Aden are not automatically illegitimate, but they are legitimate only insofar as they respect African sovereignty, coordinate with African institutions, and do not displace local capacity.

The African perspective contributes something the other four cannot fully provide: a historically grounded critique of the claim that maritime security is a neutral public good. It shows that "freedom of navigation" has often been intertwined with imperial access, gunboat diplomacy, and the protection of commercial routes that benefit external powers more than African populations. It also reveals the gendered and social dimensions of maritime insecurity that are frequently absent from strategic analyses. Tamale's decolonial feminist legal scholarship and Oyěwùmí's (1997) critique of colonial categories remind us that security discourses often universalize male, militarized, and state-centric experiences while obscuring how women, informal traders, and marginalized communities experience port militarization, displacement, and economic shock. An African feminist lens does not deny the reality of Houthi attacks or piracy; it asks who is counted as a security subject, whose livelihoods are protected, and whose are sacrificed in the name of global commerce.

The perspective also illuminates the limits of proxy-war models that focus only on Iran-Houthi relations. African scholarship on the postcolony suggests that proxy relationships are not simply top-down chains of command; they are negotiated, contested, and embedded in local political economies. The Houthis are not merely Iranian agents, and African host states are not merely passive platforms. Local actors extract rents, resist, accommodate, or redirect external projects. This means that interventions aimed at "cutting off" a proxy may fail if they ignore the local political economy that sustains the actor. Similarly, naval strikes or sanctions may weaken a group's capacity without resolving the grievances, state collapse, or regional rivalries that produced it.

Yet the African perspective has its own occlusions. It can overstate the continuity between colonial and contemporary forms of external power, sometimes understating the agency of African elites who actively invite foreign bases and security partnerships for their own strategic reasons. It may also romanticize pan-African solidarity or regional integration, underplaying intra-African rivalries, border disputes, and competing port projects that shape maritime politics. The perspective sometimes lacks granular data on shipping volumes, insurance markets, and naval operations, relying more on structural critique than on operational detail. It may be less equipped to adjudicate between specific tactical options, such as whether a particular naval escort mission reduces attacks or merely displaces them. There is also a risk of treating all foreign military presence as neocolonial, which can obscure cases where African states genuinely request assistance against piracy, trafficking, or terrorism. Finally, because African scholarship often emphasizes historical injustice and structural inequality, it may understate the extent to which African economies also benefit from global trade and from the security of chokepoints.

Even with these limits, the African perspective is indispensable because it reframes the lesson's central topic from a problem of global supply-chain vulnerability into a problem of unequal sovereignty. It asks not only how to keep ships moving, but who pays for maritime order, who controls the ports and bases that enforce it, and whether the security of global commerce can be reconciled with the security of African coastal communities. In doing so, it reveals that proxy warfare and chokepoint geopolitics are not external to Africa; they are constitutive of the contemporary African political condition.

2.7.2 Chinese Perspective

China's perspective on proxy warfare and chokepoint geopolitics is shaped by its position as a manufacturing and trading power whose economic model depends on the uninterrupted flow of energy, raw materials, and manufactured goods through maritime chokepoints. From Beijing's vantage, the Red Sea, Suez Canal, Bab el-Mandeb, and Strait of Hormuz are not primarily military theaters; they are arteries of development. China's Belt and Road Initiative, its port investments, and its commercial shipping interests make maritime stability a core economic interest. At the same time, China's strategic culture emphasizes sovereignty, non-interference, and the primacy of development over military coercion. This produces a distinctive approach: China supports maritime security insofar as it protects commerce, but it is skeptical of Western-led military coalitions that it perceives as instruments of hegemony.

The Chinese perspective contributes a critique of the securitization of chokepoints. It argues that framing maritime routes primarily through military threat inflates the role of naval power and underestimates the economic and political roots of instability. Beijing often presents Western sanctions, interventions, and regime-change policies as sources of regional disorder, including in Yemen and the Gulf. In this reading, the Houthi attacks are not simply an act of Iranian proxy aggression; they are also a symptom of unresolved conflict, humanitarian catastrophe, and perceived Western complicity in regional wars. China's Gulf security critique therefore stresses that sustainable maritime security requires political settlement, economic development, and respect for state sovereignty rather than open-ended naval patrols. This aligns with China's broader preference for "collective security" and multilateral frameworks over unilateral or alliance-based military action.

China also has practical maritime security experience. Since 2008, the People's Liberation Army Navy has conducted escort missions in the Gulf of Aden and off the coast of Somalia, initially in response to piracy. The establishment of China's first overseas military base in Djibouti in 2017 reflects both a commitment to protecting Chinese interests and a recognition that China cannot rely indefinitely on other powers for maritime security. Yet Beijing has generally avoided joining US-led coalitions such as Operation Prosperity Guardian, preferring to protect its own shipping through national or UN-authorized mechanisms. This reflects a strategic calculation: participation in Western-led operations could entangle China in conflicts that do not serve its interests, while independent escorts preserve autonomy and signal great-power status without assuming responsibility for regional order.

The Chinese perspective is not purely pacifist or disengaged. It accepts that naval power is necessary to protect commercial interests, and it has invested heavily in port infrastructure across the Indian Ocean and Red Sea. However, it tends to frame these investments as development and connectivity rather than as military expansion. This framing can obscure the strategic implications of port access, dual-use infrastructure, and long-term influence. It also tends to understate China's dependence on the US Navy's broader role in securing global sea lanes, even as Beijing criticizes US hegemony. In the Red Sea crisis, China's commercial interests have been directly affected, yet its response has been cautious, emphasizing de-escalation and diplomatic engagement rather than military contribution to multinational strikes.

The strongest contribution of the Chinese perspective is its insistence that maritime security cannot be separated from economic development and political legitimacy. It highlights how Western military responses may protect shipping in the short term while failing to address the grievances, state collapse, and regional rivalries that generate threats. Its occlusion lies in its reluctance to acknowledge China's own strategic ambitions, its tendency to attribute regional instability primarily to Western actions, and its limited willingness to bear the costs of collective security. It also struggles to reconcile its non-interference doctrine with the reality that Chinese economic presence itself shapes local politics and security dynamics.

2.7.3 Russian Perspective

Russia's perspective on proxy warfare and chokepoint geopolitics is filtered through its broader opposition to Western unipolarity and its emphasis on multipolarity, sovereignty, and great-power equality. Moscow does not have the same direct commercial dependence on Red Sea shipping as China, but it has significant interests in energy markets, Mediterranean access, and the strategic weakening of US-led maritime dominance. From the Russian vantage, chokepoint crises are not only regional security problems; they are opportunities to expose the contradictions of the Western-led order and to advance an alternative vision of international relations in which no single power monopolizes maritime security.

The Russian perspective frames Western naval responses to Houthi attacks and other maritime threats as evidence of militarized hegemony rather than neutral public-goods provision. Moscow frequently criticizes US and allied military operations as violations of sovereignty, selective applications of international law, and sources of escalation. In this narrative, "freedom of navigation" functions as a legitimizing discourse for sustained Western military presence in strategically vital waterways. Russia's own experience with sanctions and confrontation with the West reinforces its tendency to interpret maritime security initiatives through the lens of geopolitical competition. It often aligns rhetorically with calls for political settlement, respect for territorial integrity, and non-interference, while attributing regional instability to Western interventions, including in Iraq, Libya, Syria, and Yemen.

Russia's practical engagement with maritime chokepoints is more limited but not negligible. It maintains a naval facility at Tartus in Syria, giving it a Mediterranean foothold, and it has sought to expand its influence in the Red Sea and Horn of Africa through diplomatic and security partnerships. Russian private military companies and arms relationships have been present in parts of Africa, though these activities are often opaque and contested. Moscow also benefits economically from disruptions that raise energy prices, given its role as a major oil and gas exporter, though this benefit must be weighed against the risks of broader instability and sanctions. Russia's strategic partnership with Iran adds another layer: while not a formal alliance, the relationship gives Moscow an interest in resisting Western pressure on Tehran and in framing US maritime coercion as illegitimate.

The Russian perspective contributes a valuable critique of double standards in maritime security. It highlights how Western powers invoke international law to justify naval operations while exempting themselves from constraints when convenient. It also insists that regional conflicts require political solutions rather than purely military management. This can be a useful counterweight to technocratic approaches that treat chokepoints as engineering problems. However, the perspective is heavily shaped by Russia's own geopolitical grievances and by its desire to weaken Western influence. It often occludes Russia's violations of sovereignty, its use of force in Ukraine, and its own opportunistic exploitation of instability. It also tends to understate the genuine security dilemma faced by commercial shipping and the legitimacy of defensive naval operations under international law.

The strongest objection to the Russian perspective is that its anti-Western framing can become a substitute for analysis. By attributing most maritime insecurity to Western hegemony, it risks ignoring the agency of regional actors, the internal dynamics of proxy relationships, and the real threats posed by non-state violence. Its contribution is therefore most useful when treated as a corrective to Western self-certainty, not as a comprehensive theory of maritime order. It reminds analysts that the language of "freedom of navigation" is politically constructed and that maritime security institutions can serve power as well as commerce.

2.7.4 Western Perspective

The Western perspective on proxy warfare and chokepoint geopolitics is anchored in the idea of a rules-based maritime order, freedom of navigation, and the protection of global commerce. From this vantage, chokepoints such as Hormuz, Bab el-Mandeb, and the Suez Canal are critical infrastructure of the global economy, and their disruption by state or non-state actors constitutes a threat not only to Western interests but to international trade as a whole. The United States, the United Kingdom, France, and other European actors have historically provided naval power to secure sea lanes, and they view this role as a public good that underwrites global prosperity. In the Red Sea crisis, this perspective manifested in multinational naval operations, strikes against Houthi targets, and efforts to reassure commercial shipping and insurance markets.

The Western perspective offers a clear mechanism: deterrence and denial. Naval presence, escort missions, intelligence sharing, and precision strikes are intended to raise the cost of attacks, protect commercial vessels, and signal resolve to both state sponsors and non-state actors. The underlying assumption is that maritime insecurity is partly a problem of insufficient credible force and that robust military response can restore deterrence. This perspective also emphasizes legal frameworks, including UNCLOS, customary international law, and Security Council resolutions, as sources of legitimacy for defensive action. It treats Iran's support for proxies and the Houthis' attacks on shipping as violations of international norms that require a firm response.

The Western perspective contributes operational detail and a focus on the practical challenges of protecting global supply chains. It highlights the importance of insurance markets, shipping rerouting, naval logistics, and multinational coordination. It also recognizes, at least in some analyses, the limits of deterrence: non-state actors may be willing to absorb costs, may adapt tactically, and may exploit the asymmetry between their cheap drones and missiles and expensive naval interceptors. The "limits of deterrence" theme is particularly important because it acknowledges that military force alone may not resolve conflicts rooted in political grievances, state collapse, and regional rivalries. Western analysts have increasingly debated whether naval responses can be sustained financially and politically, and whether they risk escalation with Iran or further radicalization in Yemen.

However, the Western perspective has significant occlusions. It can treat maritime security as a technical and military problem, underweighting the political and economic grievances that produce proxy violence. It often presents Western naval power as neutral and benevolent, obscuring its historical association with imperialism and its contemporary role in protecting unequal global trade structures. It may also understate the civilian costs of strikes and the humanitarian consequences of militarizing already fragile regions. The perspective can be selective in its application of international law, condemning adversaries' violations while justifying its own military actions through broad interpretations of self-defense. Finally, it may overestimate the willingness of allies and commercial actors to bear the costs of prolonged naval operations, as seen in debates over burden-sharing in Red Sea missions.

The strongest version of the Western perspective does not deny these limits. It argues that, despite its imperfections, a rules-based maritime order backed by credible naval power is preferable to a vacuum in which non-state actors and regional powers can coerce global commerce. It sees freedom of navigation as a foundational norm that enables trade, development, and humanitarian access. Its weakness is that it often struggles to connect maritime security to the deeper political settlements required to end proxy wars, and it can mistake the management of symptoms for the resolution of causes.

2.7.5 UN Perspective

The United Nations approaches the securitization of chokepoints through the lenses of international law,

humanitarian protection, and Security Council authority. From this vantage, maritime security is not simply a matter of naval power or commercial efficiency; it is a legal and normative problem requiring compliance with the UN Convention on the Law of the Sea, respect for sovereignty, protection of civilians, and adherence to Security Council mandates. The UN emphasizes that measures taken in response to maritime threats must be proportionate, legally grounded, and attentive to humanitarian consequences, particularly in contexts such as Yemen where conflict has produced severe civilian suffering.

The UN perspective contributes a framework for legitimizing and constraining international action. Security Council resolutions on Yemen and maritime security provide a legal basis for arms embargoes, sanctions, and calls for de-escalation. UNCLOS establishes navigational rights and duties, including transit passage through straits used for international navigation, while also recognizing coastal state rights. The UN's humanitarian agencies highlight how naval blockades, port restrictions, and militarization can impede access to food, fuel, and medical supplies. In the Red Sea crisis, this perspective stresses that protecting shipping must not come at the expense of humanitarian access to Yemen or of civilian protection in coastal areas.

The UN perspective also foregrounds mediation and political settlement. Rather than treating chokepoint insecurity as a purely military problem, it emphasizes negotiated ceasefires, inclusive political processes, and the implementation of prior agreements. This reflects the UN's institutional mandate to prevent and resolve conflict, not merely to manage its symptoms. The UN can convene states, provide legal expertise, and coordinate humanitarian response, even when it lacks independent enforcement capacity. In this sense, it offers a necessary counterweight to unilateral or coalition military action by insisting that maritime security be embedded in broader political and humanitarian frameworks.

The UN perspective's occlusions are structural. The Security Council is subject to great-power politics, and resolutions may be shaped by the interests of permanent members rather than by neutral legal principles. Enforcement against non-state actors is difficult, especially when they operate in fragmented states or enjoy external support. The UN also faces a tension between security measures and humanitarian access: naval inspections, blockades, and militarized zones can protect commerce while complicating aid delivery. Furthermore, the UN's reliance on member states for implementation means that its norms are only as effective as the political will of powerful actors. It may produce resolutions that express international consensus but fail to change behavior on the ground.

The strongest contribution of the UN perspective is its insistence that maritime security must be lawful, proportionate, and humanitarian. It provides a vocabulary for evaluating naval responses and for holding powerful actors accountable to international norms. Its weakness is that it can become procedural, focusing on resolutions and legal categories while struggling to address the power asymmetries and proxy relationships that drive conflict. Nevertheless, without the UN perspective, maritime security debates risk collapsing into pure power politics, with little attention to civilian protection, legal legitimacy, or the long-term political settlements required to stabilize chokepoints.

2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Centers littoral and hinterland costs, non-state agency, and the asymmetry by which global shipping risk is socialized onto poorer economies	Can understate naval deterrence, insurance pricing, and legal frameworks for protecting shipping	Maritime security must be judged by distributional justice and African economic vulnerability	Rerouting costs and spillovers to Egypt, Djibouti, Sudan, Ethiopia, and wider food/fuel prices (Lloyd's List data; Crisis Group Red Sea reports)	Western: without naval escorts and collective defense, commercial freedom and humanitarian access collapse
Chinese	Highlights economic damage, Gulf energy security, and the dangers of militarizing a commercial artery	Tends to downplay Houthi agency and Iranian proxy ties; may treat security as an infrastructure problem	Stability through commerce, non-intervention, and negotiated regional order	Trade and energy volumes through Red Sea/Suez routes; Gulf import dependence	African: commercial framing ignores disproportionate African costs; Western: underestimates coercive intent
Russian	Frames disruption as symptom of Western-led order failure and regional interventionism; emphasizes multipolar critique	Risks excusing attacks on civilian shipping; obscures humanitarian and legal stakes	Anti-hegemonic, multipolar, Western culpability	Western naval interventions and selective enforcement of maritime norms	UN: rhetoric undermines lawful maritime norms and civilian protection
Western	Explains operational response, freedom of navigation, deterrence, and alliance coordination	Overstates controllability; underweights African costs and Houthi local agency	Open seas, rules-based order, collective defense	Multinational naval deployments, rerouting data, insurance spikes	African: naval response externalizes costs and risks escalation

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
UN	Provides legal and humanitarian framework: UNCLOS, Security Council resolutions, proportionality, civilian protection	Proceduralism; struggles with power asymmetries and proxy coercion	Lawful, proportionate, humanitarian maritime security	UNCLOS, Security Council resolutions, humanitarian access constraints in Yemen	Western: legalism may be too slow for coercive maritime threats

2.8 WORKED EXAMPLE (I do)

The Houthi Red Sea shipping attacks of 2023–2025 provide a worked example of how a non-state actor can convert a maritime chokepoint into coercive leverage and force a multinational naval response. Beginning in late 2023, Houthi forces in Yemen attacked commercial vessels in the Red Sea and Gulf of Aden, using drones, anti-ship missiles, unmanned surface vessels, and small-boat tactics. The attacks did not require control of the sea; they required only enough uncertainty to make commercial transit uninsurable or unprofitable. The result was large-scale rerouting around the Cape of Good Hope, higher insurance and freight costs, and the deployment of multinational naval forces. The case is best understood not as a conventional naval battle but as an asymmetric contest over risk, geography, and the political economy of global shipping.

Levels of analysis. At the individual level, the case turns on Houthi leadership, local Yemeni grievances, ideological framing, and the agency of commanders such as Abdul-Malik al-Houthi. The Houthis are not merely an Iranian instrument; they possess their own political project, territorial base, and decision-making autonomy, even where Iranian support matters. At the state level, the case involves the collapse of Yemeni state authority, the Houthis' emergence as a de facto governing power, Iran's role as patron, Saudi and Emirati interests, and the responses of the United States, the United Kingdom, and Egypt. At the systemic level, the case reflects US naval hegemony, global supply-chain dependence, insurance-market amplification of risk, and great-power competition over maritime order. At the transnational level, it involves shipping networks, multinational naval coalitions, humanitarian access to Yemen, and the transfer of commercial risk across borders.

Mechanism. The mechanism is principal-agent delegation combined with asymmetric maritime coercion. Iran's relationship with the Houthis illustrates delegation with autonomy: support flows through weapons, training, intelligence, and political alignment, but the Houthis retain operational initiative and local legitimacy. The Houthis then exploit the geography of Bab el-Mandeb and the Red Sea, where a narrow and commercially vital corridor allows a weaker actor to impose costs on stronger ones. The key mechanism is not destruction of shipping but the inflation of risk: even limited attacks can raise insurance premiums, delay cargoes, reroute vessels, and force states to spend heavily on naval protection. This creates a cost-exchange asymmetry in which cheap drones and missiles can compel expensive multinational responses. The com-

mercial system itself amplifies the coercion, because shipping firms, insurers, and charterers respond to perceived risk faster than navies can restore confidence. EIA data on Hormuz transit volumes underscore the broader chokepoint logic, but the Red Sea case shows how a non-state actor can activate that logic without controlling a state or a fleet.

Perspective reconstruction. From an African vantage point, the Red Sea attacks were not primarily a naval contest between the Houthis and Western navies; they were a shock to African and Arab littoral economies that depend on Suez and Red Sea transit. Egypt's Suez Canal revenues, Djibouti's port economy, Sudan's and Ethiopia's logistics corridors, and wider food and fuel prices all absorbed costs generated by a conflict in which African states had little agency. The African perspective therefore treats the Houthis as actors with their own political project, not as instruments of Iranian strategy, while also refusing to let Western naval narratives define the meaning of the crisis. It highlights how global shipping risk is socialized onto poorer economies through insurance, freight, and import prices. Its limitation is that it can understate the coercive intent of the attacks and the legal and operational requirements of protecting civilian shipping. China's perspective stresses the economic damage of disrupted trade and the dangers of militarizing a commercial artery; it tends to frame the crisis as a failure of regional security governance and a threat to energy and supply-chain stability, while emphasizing negotiation and economic incentives, though it may understate Houthi agency and the coercive character of the attacks. Russia frames the crisis within a broader critique of Western hegemony and regional interventionism, treating Houthi actions as blowback from Western policies and emphasizing multipolar alternatives to US-led maritime order; this can illuminate grievances against selective enforcement of norms, yet it risks excusing attacks on civilian shipping and obscuring humanitarian and legal stakes. The Western perspective centers freedom of navigation, collective defense, and the operational necessity of naval escorts and strikes; it explains why states formed multinational responses and why deterrence was attempted, but it can overstate the controllability of the crisis and understate its costs for African and Arab economies. The UN perspective evaluates the crisis through UNCLOS, Security Council resolutions, humanitarian access to Yemen, and proportionality; it insists that responses to maritime threats must remain lawful and protect civilians, and it highlights the link between Red Sea insecurity and Yemen's humanitarian catastrophe, though procedural and legal frameworks may lag behind fast-moving proxy and commercial dynamics.

Explicit adjudication. The African perspective best explains the case as a whole because it captures the least visible but most consequential dimension: the redistribution of global shipping risk onto African and Arab economies and the agency of a non-state actor operating within a collapsed state. It also prevents the crisis from being reduced to a technical naval problem. However, it misses or underweights the operational logic of deterrence, the legal framework for protecting shipping, and the Houthis' deliberate coercion of global commerce. A complete explanation therefore synthesizes African political economy with Western operational analysis and UN legal-humanitarian constraints; no single perspective is sufficient, but the African perspective is the necessary corrective to accounts that treat the Red Sea as merely a corridor for Western naval power.

SECTION 2.9 PROBLEM PAIR (We do)

Tasks

1. Identify the principal-agent structure in Iran's 2019 tanker seizures: name the principal, the agent, the

delegated task, and the autonomy the agent retained.
2. Map the coercive mechanism: explain how seizure of tankers in the Strait of Hormuz translated into leverage over states, firms, and insurers.
3. Distinguish description from explanation: first describe the sequence of seizures (dates, vessels, locations), then explain why Iran chose this instrument rather than direct military confrontation.
4. Apply levels of analysis: individual (IRGC commanders), state (Iranian strategic calculus), systemic (US maximum pressure, regional balance), and transnational (shipping markets, insurance).
5. Reconstruct two perspectives—Western (freedom of navigation, deterrence) and Iranian (asymmetric coercion, resistance economy)—and state what each occludes.
6. Falsify: specify the evidence that would have shown the seizures were routine maritime enforcement rather than coercive leverage.

MODEL ANSWER

In July 2019, Iran's Islamic Revolutionary Guard Corps (IRGC) seized the British-flagged tanker *Stena Impero* in the Strait of Hormuz, following the earlier detention of the *Grace 1* (later *Adrian Darya 1*) by British forces off Gibraltar. The seizures occurred amid the US "maximum pressure" campaign and the effective collapse of the JCPOA. The principal-agent structure is not a clean delegation: the Iranian state (principal) relies on the IRGC Navy (agent), whose operational autonomy is high, consistent with Mumford's observation that proxies and delegated forces often possess independent agendas that complicate principal control. The delegated task was coercive signaling—disrupting commercial shipping to impose costs on states enforcing sanctions—while the agent retained latitude in timing and target selection, which Juneau's work on Iran's proxy architecture suggests is characteristic of Tehran's "forward defense" model.

The coercive mechanism operated through three channels. First, direct physical control of hulls and crews created immediate bargaining leverage over the flag state (the United Kingdom) and the vessel's owner. Second, the seizures injected risk into the Hormuz transit corridor, raising insurance premiums and forcing rerouting deliberations among shippers; Lloyd's List data from the period show elevated war-risk premiums in the Gulf. Third, the incidents demonstrated Iran's capacity to harass the strait without a formal blockade, converting geographic position into political currency. The leverage was thus not merely over the seized vessels but over the global oil supply chain's confidence in Hormuz, through which roughly one-fifth of world petroleum liquids transit (EIA Hormuz transit data).

At the individual level, IRGC commanders acted with operational discretion shaped by factional politics and the IRGC's institutional interest in demonstrating relevance. At the state level, Tehran calibrated seizures to avoid direct US military retaliation while maximizing pressure on European states to preserve JCPOA remnants. Systemically, the seizures were a response to the US withdrawal from the JCPOA and reimposition of sanctions, fitting a pattern of asymmetric coercion when conventional military options are unavailable. Transnationally, shipping markets and insurers transmitted and amplified the coercive effect, as risk pricing converted a localized incident into a global cost.

Western and Iranian perspectives diverge sharply. The Western framing, evident in UK and US statements, treated the seizures as violations of freedom of navigation and UNCLOS, justifying naval escorts and sanctions; it occludes the prior Gibraltar detention that Tehran cited as provocation. The Iranian framing, articulated by officials and aligned analysts, presented the seizures as lawful enforcement and proportionate response to economic warfare; it occludes the coercive intent and the harm to third-party commercial actors. A UN perspective would stress UNCLOS obligations and the need for de-escalation, while noting the absence of a binding Hormuz transit regime.

Adjudicating, the evidence supports the coercive-leverage interpretation over routine enforcement: the timing correlated with sanctions pressure, targets were selected for political salience (a British flag after Gibraltar), and IRGC statements emphasized retaliation. However, the mechanism's effectiveness was bounded—European states did not abandon sanctions, and the US did not lift maximum pressure—suggesting that chokepoint coercion can impose costs without achieving strategic objectives, a limit consistent with Mumford's caution that asymmetric instruments often produce tactical gains without strategic resolution.

SECTION 2.10 INDEPENDENT MEMO (You do)

(a) Case description (150–200 words)

In May and June 2019, four commercial tankers were damaged by explosions near the UAE port of Fujairah in the Gulf of Oman, and two further tankers were attacked in the same waters weeks later. The United States attributed the incidents to Iran, citing limpet-mine damage and intelligence assessments; Iran denied responsibility and suggested a "false flag" operation. The attacks occurred during heightened US-Iran tensions following the US withdrawal from the JCPOA and the reimposition of sanctions. Unlike the later Hormuz seizures, the Fujairah incidents involved no claimed responsibility and no detention of vessels, yet they similarly disrupted commercial confidence, raised insurance premiums, and prompted multinational naval deployments. The case is useful for testing whether chokepoint coercion requires acknowledged authorship to function, and whether attribution ambiguity strengthens or weakens the coercive effect.

(b) Required memo headings (use as prompts)

- **Mechanism:** How did the Fujairah attacks (if attributed to Iran) convert maritime geography into coercive leverage, and through which channels (physical damage, insurance pricing, naval response, diplomatic signaling)?
- **Perspective reconstruction:** Reconstruct at least three perspectives (e.g., US/Western, Iranian, UN/UNCLOS) on the incidents; state what each contributes and what each occludes.
- **Historical analogue:** Identify one prior case of ambiguous maritime coercion (e.g., 1980s Tanker War, 2019 Hormuz seizures) and specify what is similar and what differs in mechanism and outcome.
- **Falsifiers:** State the evidence that would falsify (i) Iranian authorship, (ii) coercive intent, and (iii) strategic effectiveness.

(c) Self-check

Before submitting, verify that you have distinguished description (what happened, when, to whom) from explanation (why it happened and through what mechanism), prediction (what follows if the mechanism holds), and prescription (what policy should follow).

SECTION 2.11 HINGE QUESTION

Question: Which of the following best explains why Iran's 2019 tanker seizures in the Strait of Hormuz functioned as coercive leverage rather than as routine maritime law enforcement?

A. Because the seizures were conducted by the IRGC Navy, which lacks legal authority under Iranian domestic law. B. Because the seizures targeted politically salient vessels at moments of sanctions pressure, raised

war-risk insurance premiums, and were accompanied by retaliatory rhetoric—indicating instrumental use of chokepoint geography. C. Because the United Kingdom immediately lifted sanctions on Iran in response. D. Because UNCLOS explicitly prohibits all vessel seizures in international straits.

Distractor diagnoses

- **A is wrong** because the legal authority of the IRGC Navy under Iranian domestic law is irrelevant to whether the seizures functioned as coercive leverage; the question concerns international coercive effect, not internal legal competence, and Iran's domestic legal framework does not determine how third parties (shippers, insurers, flag states) experienced the incidents.
- **C is wrong** because the United Kingdom did not lift sanctions in response to the seizures; this option inverts the actual outcome and conflates coercive intent with coercive success, which the evidence does not support.
- **D is wrong** because UNCLOS does not contain an explicit blanket prohibition on all vessel seizures in international straits; it establishes transit-passage and innocent-passage regimes, and the legal status of the seizures was contested rather than categorically prohibited, making this a misstatement of treaty law.

SECTION 2A — DATA LAB

Table 1 — Red Sea / Suez Canal shipping indicators, 2023–2025 (indicative ranges from trade press and official statistics)

Indicator	Pre-crisis baseline (Q3 2023)	Crisis trough (Q1 2024)	Partial recovery (2025)	Source
Suez Canal transits (vessels/week)	~350–400	~150–200	~220–280	Suez Canal Authority; Lloyd's List
Share of global container traffic via Red Sea	~30%	~10–15%	~18–22%	UNCTAD; Lloyd's List
Additional voyage time via Cape of Good Hope	0 days	+10 to +14 days	+7 to +10 days	Carrier schedules; UNCTAD
War-risk insurance premium (% of hull value)	~0.05–0.1%	~0.5–1.5%	~0.3–0.7%	Lloyd's market; Joint War Committee

Table 2 — Strait of Hormuz oil and gas transit (EIA estimates)

Metric	Approximate value	Source
Crude oil and condensate transit (million b/d)	~20–21	EIA

Metric	Approximate value	Source
Share of global petroleum liquids consumption	~20%	EIA
LNG transit, primarily Qatari (bcf/d)	~3–4	EIA
Narrowest shipping lane (Traffic Separation Scheme)	~2 nautical miles	IMO / EIA
Alternative pipeline bypass capacity (Saudi East-West, UAE ADCOP)	~6–7 million b/d combined	EIA

Table 3 — Naval deployments, attack tallies, and market response, Red Sea 2023–2025

Element	Detail	Source
Operation Prosperity Guardian (US-led multinational)	Launched December 2023; defensive escort and interception	US CENTCOM
EU Aspides (defensive naval operation)	Launched February 2024	EU Council
Houthi attack incidents	Hundreds of drone, missile, and small-boat attacks, 2023–2025	US CENTCOM tallies
Joint War Committee (Lloyd's) high-risk listing	Red Sea and Gulf of Aden listed; premiums repriced	Lloyd's Market Association
Humanitarian access to Yemen	Port of Hodeidah operations intermittently disrupted; aid flows constrained	UN OCHA; Crisis Group

Five numbered analysis questions

1. **Trend.** Describe the trajectory of Suez Canal transits from the Q3 2023 baseline through the Q1 2024 trough to the 2025 partial recovery. Does the partial recovery indicate (a) a durable resolution of the security problem, (b) market adaptation without resolution, or (c) a new equilibrium of chronic risk? Justify with reference to the insurance-premium column.

2. **Level of analysis.** The Houthi attacks are frequently explained at the state level by Iran's sponsorship. Using principal-agent theory, identify the specific conditions under which the agent's autonomy — not the principal's intent — becomes the analytically decisive variable. Apply this to the question of whether Tehran ordered, permitted, or merely benefited from the Red Sea campaign.

3. **Perspective reconstruction (all five).** Reconstruct how each perspective reads the insurance-premium spike in Table 1: (a) African — spillover to import-dependent economies and port revenues; (b) Chinese — cost to Belt and Road logistics and energy security; (c) Russian — evidence of Western naval overstretch and anti-Western opportunity; (d) Western — market signal justifying naval intervention and freedom of navigation; (e) UN — humanitarian access and UNCLOS compliance. One sentence each, steel-manned.

4. **Interpretation.** Does the combined evidence of Tables 1–3 better support the "securitization of chokepoints" thesis (regional conflict becomes global economic emergency) or the "market adaptation" thesis (shipping reroutes, insurance reprices, trade continues)? Adjudicate on the evidence, specifying which metric would have to move in which direction to falsify your preferred reading.

5. **Limitation.** What do Tables 1–3 systematically fail to capture about the humanitarian situation in Yemen, and why does that omission matter for any policy evaluation that relies on these data? Identify at least two missing variables and their likely effect on conclusions.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — Principal-agent proxy network (hand-drawn diagram)

What to draw: Place a large circle at the top labeled "PRINCIPAL (Iran)" with sub-labels "funding / training / weapons / intelligence." Draw five smaller circles radiating downward and outward, each labeled: "Hezbollah (Lebanon)," "Houthis (Yemen)," "Hamas/PIJ (Gaza)," "Iraqi PMF militias," "Syrian regime allies." Draw solid arrows from the principal to each agent, annotated "delegation." Draw dashed arrows returning from each agent to the principal, annotated "autonomy / escalation risk / blowback." Add a horizontal axis at the bottom labeled "Control ←→ Autonomy" with each agent placed along it (Hezbollah closest to control, Houthis furthest). Add a second small box labeled "Delegation costs: deniability, blowback, mission creep."

Labels to place: "Principal," "Agent," "Delegation," "Autonomy," "Control," "Deniability," "Escalation risk."

Perspective overlay: Annotate in the margin — Western: "state sponsorship chain"; African: "externalization of regional order"; Chinese: "non-interference violated by proxy logic"; Russian: "asymmetric balancing against US hegemony"; UN: "accountability and attribution gaps."

Visual 2 — Chokepoint schematic map (hand-drawn, not to scale)

What to draw: Sketch the Arabian Peninsula in the center. To its east, draw the Persian Gulf with the Strait of Hormuz marked as a narrow gap (~2 nm lane) between Iran and Oman. To its west, draw the Red Sea with Bab el-Mandeb at the southern end and the Suez Canal at the northern end. Draw the Gulf of Aden and the Indian Ocean beyond. Use thick blue arrows for shipping lanes: one through Hormuz (labeled "~20 mb/d oil"), one through Bab el-Mandeb and Suez (labeled "~12% of global trade"). Shade two "disruption zones" in red hatching: the Hormuz approaches and the southern Red Sea. Draw a dashed alternative route around the Cape of Good Hope labeled "+10–14 days."

Labels to place: "Strait of Hormuz," "Bab el-Mandeb," "Suez Canal," "Gulf of Aden," "Cape of Good Hope (reroute)," "Disruption zone."

Perspective overlay: Annotate — Chinese: "energy security and BRI corridor"; Russian: "Western naval concentration"; Western: "freedom of navigation"; UN: "UNCLOS transit passage"; African: "port revenues and food-import costs."

Visual 3 — Red Sea shipping volume trend (hand-drawn line chart)

What to draw: Draw axes: x-axis "Time (Oct 2023 – 2025)," y-axis "Suez Canal transits per week (or % of global container traffic)." Plot a line that starts high (~350–400 transits/week), drops sharply between

November 2023 and January 2024 to a trough (~150–200), then recovers partially to ~220–280 by 2025 without returning to baseline. Mark three vertical dashed lines with labels: "First Houthi attacks (Nov 2023)," "Operation Prosperity Guardian (Dec 2023)," "EU Aspides (Feb 2024)." Add a secondary small bar or annotation showing war-risk insurance premium rising then partially falling.

Labels to place: "Baseline," "Trough," "Partial recovery," "No return to baseline," event labels.

Perspective overlay: Annotate — African: "import cost inflation and port-traffic loss"; Chinese: "logistics cost shock"; Russian: "demonstration of Western inability to secure sea lanes"; Western: "naval response justified by data"; UN: "humanitarian access to Yemen not captured by this metric."

SECTION 4 — CORNELL NOTES

Cue (prompt)	Notes (with source log)
Define proxy warfare	Indirect conflict in which a principal delegates violence to an agent to achieve goals while limiting direct exposure. Mumford (2013) frames it as a strategy of the weak and the strong alike, with delegation costs.
Principal-agent problem	Principal cannot perfectly monitor or control agent; agent has own interests, information asymmetry, and autonomy. Applies to Iran–proxy relationships. Juneau (2020).
Iran's proxy network	Hezbollah, Houthis, Hamas/PIJ, Iraqi PMF, Syrian allies. Functions as "forward defense" and deterrence. Juneau (2020).
Levantine theater	Lebanon/Syria/Israel dynamics; Hezbollah as most capable agent; autonomy highest where state capacity is weakest.
Yemeni maritime asymmetry	Houthis use cheap drones/missiles/USVs against high-value shipping; cost-exchange ratio favors attacker. Crisis Group Red Sea reports.
Strait of Hormuz	~20–21 mb/d oil; ~20% of global petroleum liquids; ~2 nm lane. EIA data.
Bab el-Mandeb	Southern Red Sea chokepoint; gateway to Suez; ~12% of global trade. Lloyd's List; UNCTAD.
Suez Canal	~30% of global container traffic pre-crisis; transits fell ~50%+ at trough.
War-risk insurance	Premiums rose from ~0.05–0.1% to ~0.5–1.5% of hull value at peak; partial normalization by 2025. Lloyd's market.
Naval responses	Operation Prosperity Guardian (Dec 2023); EU Aspides (Feb 2024); defensive posture, limited offensive scope.

Cue (prompt)	Notes (with source log)
Securitization of chokepoints	Regional conflict reframed as global economic emergency; justifies multinational naval action.
African spillover	Higher freight and insurance costs raise import prices; port revenues and food security affected; African economies as price-takers.

Source log: Mumford (2013); Juneau (2020); International Crisis Group, Red Sea reports; Lloyd's List shipping data; US EIA, Strait of Hormuz transit data; UNCTAD; US CENTCOM; EU Council; UN OCHA.

Summary (3–5 sentences): Proxy warfare delegates violence from principal to agent, creating autonomy and escalation risks that the principal cannot fully control. In West Asia, Iran's proxy network extends this logic to maritime chokepoints, where the Houthis' asymmetric attacks on Red Sea shipping disrupted roughly half of Suez transits at the 2024 trough and spiked war-risk insurance premiums. Hormuz and Bab el-Mandeb concentrate global oil and container flows into narrow passages, so regional conflict rapidly becomes a global supply-chain emergency. Naval responses restored partial traffic but did not resolve the underlying conflict, and African economies absorbed spillover costs as import-dependent price-takers. The data show market adaptation alongside, not instead of, securitization.

SECTION 5 — FEYNMAN COMPRESSION

1. **Explain without jargon.** A powerful state can fight indirectly by arming and funding smaller groups to do the fighting for it. This saves the powerful state from direct risk but creates a problem: the smaller groups have their own goals and may not obey. In West Asia, this dynamic meets geography. Two narrow sea passages — Hormuz and Bab el-Mandeb — carry a large share of the world's oil and container ships. When a proxy group like the Houthis attacks ships in one of these passages, the damage is not just local: insurance prices spike, ships reroute around Africa adding weeks, and food and goods become more expensive far away, including in Africa. Navies then arrive to protect shipping, but they cannot easily stop cheap drones with expensive missiles, and they cannot fix the underlying political conflict. So the world adapts — trade continues, but costlier and riskier — while the root cause persists.

2. **Mark gaps.** I am unsure of the exact share of Houthi attacks that Iran directly ordered versus permitted; the principal-agent autonomy problem is precisely that this is unobservable. I am also unsure whether the 2025 partial recovery in Suez transits reflects improved security or simply shipper habituation to higher costs. I have not specified the elasticity of African import prices to freight-cost shocks.

3. **Reread verification.** Rechecking Mumford (2013) confirms that proxy warfare is defined by delegation and its attendant control problems, not merely by covert action. Juneau (2020) confirms Iran's proxy strategy is framed as forward defense and deterrence, with acknowledged autonomy costs. EIA data confirm Hormuz carries roughly one-fifth of global petroleum liquids. Lloyd's List and UNCTAD confirm the Red Sea traffic collapse and partial recovery. Crisis Group reports confirm the humanitarian access constraints in Yemen that shipping data omit.

4. **Analogy with explicit limits.** Think of a principal as a landlord who hires a contractor to renovate a

building. The contractor may cut corners or escalate disputes with neighbors in ways the landlord did not authorize, and the landlord cannot easily fire the contractor mid-job without losing the investment. The analogy captures delegation and autonomy but breaks down on three points: (a) proxies are armed political actors, not commercial contractors; (b) the "building" is a regional order with sovereign states, not property; (c) the landlord (Iran) may actually benefit from some unauthorized escalation, whereas a landlord never benefits from a contractor's unauthorized damage.

5. **Rewrite.** Proxy warfare is a delegation relationship in which a principal transfers the means of violence to an agent, accepting autonomy and escalation risk in exchange for deniability and reduced direct exposure. When such proxy dynamics intersect with maritime chokepoints — narrow passages carrying disproportionate shares of global oil and container traffic — localized conflict is converted into systemic supply-chain risk. The Houthi Red Sea campaign (2023–2025) demonstrated this conversion: Suez transits fell by roughly half at the trough, war-risk premiums multiplied, and shipping rerouted around the Cape of Good Hope. Naval responses partially restored traffic but left the underlying conflict and its humanitarian costs in Yemen unresolved, while African and other import-dependent economies absorbed the price spillover. The evidence supports securitization and market adaptation as simultaneous, not competing, processes.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L44	Definition	What is proxy warfare in principal-agent terms?	Proxy warfare is the delegation of violence or coercion to an intermediary actor, creating a principal-agent relationship in which the sponsor seeks influence while the proxy retains partial autonomy. The mechanism is not simple command-and-control; it is bargaining over risk, resources, and escalation.	African: proxy relationships are often read through local legitimacy and survival, not only sponsor strategy.

Tag	Card Type	Front	Back	Perspective Note
L44	Mechanism	What is the autonomy problem in proxy warfare?	The autonomy problem arises when the proxy's local interests, ideology, or survival imperatives diverge from the sponsor's preferences, producing escalation or restraint that the sponsor did not authorize. This is the central mechanism linking delegation to unintended outcomes.	Western: often framed as control failure; African: often framed as local agency.
L44	Application	How does the Levantine theater illustrate proxy warfare?	The Hezbollah-Israel dynamic shows a non-state actor with its own domestic base, military capacity, and escalation logic operating within a broader Iran-aligned network. The mechanism is overlapping sovereignty: deterrence, retaliation, and political survival interact.	Israeli/Western: deterrence and security; Lebanese: sovereignty and civil vulnerability.

Tag	Card Type	Front	Back	Perspective Note
L44	Application	What is Yemeni maritime asymmetry?	The Houthis use relatively low-cost drones, missiles, and small-boat tactics to threaten high-value commercial shipping, converting geographic proximity to Bab el-Mandeb into coercive leverage. The mechanism is cost-exchange asymmetry, not fleet parity.	African: Red Sea littoral states bear spillover costs; UN: humanitarian access concerns.
L44	Definition	What makes a chokepoint strategically significant?	A chokepoint is a narrow maritime passage whose disruption can impose disproportionate costs on global trade, energy transit, or naval mobility. Significance depends on volume, substitutability, and the credibility of threats.	Chinese: supply-chain vulnerability; Russian: Western dependence.

Tag	Card Type	Front	Back	Perspective Note
L44	Mechanism	How do Hormuz and Bab el-Mandeb differ as chokepoints?	Hormuz is primarily an energy-export chokepoint with high oil and LNG transit volumes, while Bab el-Mandeb is a broader commercial and naval passage linking the Red Sea to the Gulf of Aden. Both create leverage, but through different commodity and routing structures.	African: Bab el-Mandeb directly affects Horn of Africa economies; UN: maritime security and aid routes.
L44	Mechanism	What is the securitization of maritime chokepoints?	Securitization occurs when routine commercial risk is reframed as an existential or systemic threat, justifying naval deployments, insurance spikes, sanctions, or military action. The mechanism moves from local violence to global economic governance.	Western: freedom of navigation; Chinese: over-securitization of trade routes.

Tag	Card Type	Front	Back	Perspective Note
L44	Case	What did the Houthi Red Sea attacks (2023-2025) demonstrate?	A non-state actor disrupted major shipping lanes, raised insurance and rerouting costs, and forced multinational naval responses without possessing a conventional blue-water navy. The case shows how proxy-linked maritime coercion can globalize a regional conflict.	African: port, food, and fuel spillovers; UN: humanitarian and legal constraints.
L44	Case	How did Iran's 2019 tanker seizures create leverage?	Iran used seizures and harassment in and around Hormuz to signal that maritime pressure could be met with counter-pressure, raising costs for adversaries and demonstrating chokepoint responsiveness. The mechanism was coercive signaling, not permanent closure.	Western: deterrence and FON; Russian: anti-Western leverage.

Tag	Card Type	Front	Back	Perspective Note
L44	Data	What do Red Sea shipping volume declines indicate?	Declines in Red Sea transits indicate that threat perception, insurance pricing, and rerouting decisions can rapidly alter global shipping patterns even without a formal blockade. The data measure behavioral response as much as physical danger.	African: trade and inflation effects; Chinese: supply-chain risk.
L44	Data	What do Hormuz transit volumes indicate?	High Hormuz oil and LNG transit volumes indicate structural global dependence on a narrow passage, making even limited disruption threats economically significant. The data show vulnerability, not inevitability of closure.	Western: energy security; UN: regional stability.

Tag	Card Type	Front	Back	Perspective Note
L44	Perspective	What does the African perspective add to chokepoint analysis?	The African perspective foregrounds Red Sea and Horn of Africa spillovers, including port economies, food and fuel prices, inflation, and the security externalities imposed on littoral states. It reveals costs often treated as secondary in great-power debates.	African primary: local costs and agency.
L44	Perspective	What does the Chinese perspective emphasize?	The Chinese perspective emphasizes commercial shipping interests, energy import security, and skepticism toward Western-led securitization that may militarize trade routes. It contributes a trade-first reading of maritime order.	Chinese: economic interests; Western: naval order.

Tag	Card Type	Front	Back	Perspective Note
L44	Perspective	What does the UN perspective emphasize?	The UN perspective emphasizes UNCLOS, freedom of navigation, humanitarian access to Yemen, and Security Council frameworks, while facing constraints from great-power vetoes and enforcement gaps. It contributes legal and humanitarian guardrails.	UN: law and access; Russian: sovereignty critique.
L44	Adjudication	How should competing explanations of chokepoint crises be adjudicated?	Adjudication requires matching mechanisms to evidence: proxy autonomy, cost-exchange ratios, transit data, insurance premiums, naval deployments, and local spillovers. No single perspective should be treated as the natural frame.	All five: evidence over assertion.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence audit table (scored 0-100)

Topic	Confidence (0-100)	Evidence of mastery	Gap to close
Proxy warfare as principal-agent delegation		Can define delegation and autonomy problem	May overstate sponsor control

Topic	Confidence (0-100)	Evidence of mastery	Gap to close
Levantine theater and Hezbollah-Israel dynamic		Can explain overlapping sovereignty	May underweight Lebanese domestic politics
Yemeni maritime asymmetry and Houthi tactics		Can explain cost-exchange leverage	May conflate proxy with fully independent actor
Hormuz and Bab el-Mandeb chokepoint logic		Can distinguish energy vs. commercial passages	May ignore substitutability and rerouting
Securitization of maritime chokepoints		Can explain threat framing to policy	May blur description with prescription
Five-perspective reconstruction		Can steel-man each view	May rank perspectives prematurely
Data interpretation (volumes, premiums, deployments)		Can link data to behavior	May treat correlation as causation
Worked example: Houthi Red Sea attacks		Can trace levels of analysis	May miss African spillover
Problem pair: Iran 2019 tanker seizures		Can identify coercive signaling	May overread intent from outcomes
Adjudication across theories		Can compare explanations	May understate scope conditions

7.2 Three-question debrief

1. Which concept in this lesson did I initially treat as settled truth, and what scope condition or counterargument should have complicated it?

2. Did I distinguish description, explanation, prediction, and prescription when evaluating naval responses and proxy behavior?

3. Which perspective—African, Chinese, Russian, Western, or UN—did I most neglect, and what evidence would force me to take it seriously?

7.3 Error-log table

Common Misconception	Correction	Evidence
Proxy actors are mere instruments of their sponsors.	Proxy actors retain autonomy; delegation creates bargaining, not simple control.	Principal-agent theory; Mumford (2013) on proxy warfare.

Common Misconception	Correction	Evidence
Chokepoint disruption requires closing the strait.	Threats, insurance spikes, and rerouting can disrupt commerce without physical closure.	Lloyd's List shipping data; Red Sea 2023-2025 case.
Naval deployments automatically restore deterrence.	Deployments may raise costs but can also escalate, displace risk, or fail to address proxy autonomy.	Houthi Red Sea attacks; Crisis Group Red Sea reports.
Hormuz and Bab el-Mandeb are interchangeable chokepoints.	They differ in commodity mix, geography, naval access, and spillover patterns.	EIA Hormuz transit data; Red Sea shipping data.
The UN perspective is only legal formalism.	It also addresses humanitarian access, Yemeni civilian protection, and multilateral legitimacy constraints.	UN-focused analysis of UNCLOS and Security Council frameworks.

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Proxy warfare; principal-agent delegation; autonomy; chokepoint; securitization; maritime asymmetry	Delegation with partial control; cost-exchange asymmetry; threat-induced rerouting; coercive signaling; reframing commercial risk as systemic threat	Mumford (2013) proxy warfare; Juneau (2020) Iran-Houthi limited partnership; principal-agent theory	Houthi Red Sea attacks 2023-2025; Iran 2019 tanker seizures; Hormuz oil/LNG transit; Red Sea shipping volume declines; insurance premium spikes; naval deployment counts	Control vs. autonomy; deterrence vs. escalation; freedom of navigation vs. militarization; global commerce vs. local spillover	Evidence that proxies act against sponsor preferences; no shipping response to threats; stable premiums despite attacks; no local African spillover	L23 asymmetric warfare; L25 maritime security; L43 sectarian geopolitics; L45 nuclear; L46 hydrocarbons; L48 Indo-Pacific chokepoints

SECTION 9 — REVIEW SCHEDULE

- **R1 (24 hours):** Re-read the five key ideas and reconstruct the principal-agent mechanism in one paragraph without notes.
- **R2 (3 days):** Redraw the Houthi Red Sea case using the four levels of analysis and label each

perspective's contribution.

- **R3 (1 week):** Reconstruct Iran's 2019 tanker seizures as coercive signaling and list three scope conditions under which the tactic would fail.
- **R4 (2 weeks):** Reinterpret the Red Sea shipping and Hormuz transit data, distinguishing volume, premium, and deployment indicators.
- **R5 (1 month):** Write a short adjudication comparing African, Chinese, Russian, Western, and UN readings of a new chokepoint incident.

SECTION 10 — COMPLETION CHECKLIST

☐ I can define proxy warfare as principal-agent delegation with autonomy problems.

☐ I can explain the mechanism linking sponsor goals to proxy behavior.

☐ I can analyze the Levantine theater without reducing it to Iran-Israel rivalry.

☐ I can explain Yemeni maritime asymmetry and Houthi cost-exchange tactics.

☐ I can distinguish Hormuz from Bab el-Mandeb by commodity, geography, and spillover.

☐ I can explain securitization as a process, not just a label.

☐ I can reconstruct all five perspectives from within.

☐ I can place the African perspective first and explain its distinctive contribution.

☐ I can interpret Red Sea shipping volume declines and insurance spikes.

☐ I can interpret Hormuz transit data as vulnerability rather than inevitability.

☐ I can apply the four levels of analysis to the Houthi case.

☐ I can analyze Iran's 2019 tanker seizures as coercive leverage.

☐ I can distinguish description, explanation, prediction, and prescription.

☐ I can identify at least two falsifiers for each major claim.

☐ I can complete the memo headings without collapsing perspectives.

☐ I can explain why naval deployments do not automatically restore deterrence.

☐ I can link this lesson to L23, L25, L43, L45, L46, and L48.

☐ I can state the strongest counterargument to my preferred interpretation.

46. Nuclear Proliferation and Deterrence in West Asia

LESSON METADATA

Field	Value
Lesson number and title	Lesson 45: Nuclear Proliferation and Deterrence in West Asia
Module	Module 7: West Asia and Iranian Geopolitics
Prerequisites	L21 (nuclear strategy), L42 (Iran), L43 (sectarian)

Field	Value
Interleaved links	Forward to L46 (hydrocarbons), L55 (quantum and NC3), L47 (US-China nuclear dynamics)
Reading load	7-9 hours
Content channels	Text, data tables, worked examples, flashcards
Bloom ceiling	Evaluate / Create
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

The central puzzle of this lesson is deceptively simple: why does a state that has never possessed a nuclear weapon, that is a signatory to the Nuclear Non-Proliferation Treaty (NPT), and that faces no existential conventional military threat that nuclear weapons uniquely neutralize, invest more than half a century in building an enrichment infrastructure that places it weeks from weapons-grade material? The answer cannot be found in any single theory of international relations, and it cannot be found by looking only at Iran. The puzzle is systemic. It concerns the architecture of the NPT itself, the reversibility of great-power commitments, the credibility of extended deterrence, and the way in which a state can occupy the space between legal non-nuclear status and de facto nuclear latency without ever crossing the line that would trigger military action. Iran's nuclear program, from its origins in the 1950s Atoms for Peace initiative through the 2015 Joint Comprehensive Plan of Action (JCPOA) and its subsequent collapse, is the most thoroughly documented case of a state navigating that space. By 2023, the International Atomic Energy Agency (IAEA) reported that Iran had accumulated uranium enriched to 60 percent purity, a level with no credible civilian justification, and had installed advanced centrifuges that shortened the breakout timeline to a matter of weeks. The question is not whether Iran has decided to build a bomb—it has not, by most intelligence assessments—but why the international order has been unable to close the gap between Iran's capabilities and its commitments, and what that failure implies for the future of non-proliferation in West Asia and beyond.

This lesson sits at the intersection of three theoretical traditions, and part of its purpose is to force an adjudication among them. Realism, in its structural variant, treats Iran's program as rational hedging: a state facing a hostile regional environment—Israel's undeclared nuclear arsenal, the US military presence in the Gulf, the memory of the Iran-Iraq War—seeks the ultimate insurance policy without paying the full cost of weaponization. The mechanism is the security dilemma: Iran's enrichment is read by others as threatening, which produces countermeasures (sanctions, sabotage, assassination of scientists) that in turn harden Iran's resolve. Liberal institutionalism treats the JCPOA as a verification-and-incentives bargain of unprecedented intrusiveness, and its collapse as evidence that institutional commitments are only as durable as the domestic politics of the most powerful signatory. The mechanism here is the reversibility of commitments: when the United States withdrew in 2018 and reimposed sanctions, the bargain's incentive structure inverted, and Iran's step-by-step reduction of compliance (2019–2021) was a predictable, if not inevitable, response. Constructivism treats the NPT as a normative order whose legitimacy depends on a reciprocal bargain—non-nuclear states forgo weapons in exchange for peaceful technology and, crucially, the nuclear-armed states' commitment to disarmament. The mechanism is normative erosion: when the nuclear-armed states fail to disarm, the non-nuclear states' compliance becomes a matter of coercion rather than consent, and the regime's legitimacy frays. Each theory captures something real; none is sufficient alone. The lesson's analytical task is to specify the scope conditions under which each operates and to identify the evidence that would discriminate among them.

The African vantage point is not a regional footnote to this story; it is the lens that reveals the structural asymmetry at the heart of the non-proliferation regime. African states have lived with the NPT's double standard since 1968: five states are permitted to retain nuclear weapons indefinitely, while all others are permanently barred from acquiring them. The African Nuclear-Weapon-Free Zone Treaty (Pelindaba, 1996) was not merely a regional arrangement but a principled rejection of this asymmetry, and African diplomats have been among the most consistent advocates for disarmament at NPT Review Conferences. The Treaty on the Prohibition of Nuclear Weapons (TPNW, 2017), championed by African and Latin American states, represents the most direct challenge to the NPT's legitimacy in half a century. From this vantage, the Iranian case is not a story of a rogue state defying a legitimate order; it is a story of a state responding rationally to an order that permits permanent nuclear hierarchy. Scholars such as Siba Grovogui have argued that the international legal order itself is structured by colonial and racial hierarchies that determine whose sovereignty is respected and whose is conditional. Applied to the nuclear domain, this means that the same enrichment activity that is tolerated or even assisted when undertaken by allies is criminalized when undertaken by adversaries. The African perspective thus reframes the question: not "why is Iran proliferating?" but "why is the regime that defines proliferation legitimate, and for whom?" This reframing does not excuse Iranian non-compliance, but it does explain why the regime's enforcement mechanisms are perceived as political rather than legal across much of the Global South.

The threshold state problem is the lesson's second major puzzle, and it is where theory meets measurement. A threshold state is one that possesses the fissile material, the delivery systems, and the technical knowledge to produce a nuclear weapon within weeks or months, but has not assembled one. Iran's enrichment to 60 percent—far above the 3.67 percent cap of the JCPOA and the 20 percent level that had previously been treated as a red line—places it in this category. The IAEA's quarterly reports document not only enrichment levels but also the installation of IR-6 and IR-9 centrifuges, the accumulation of uranium hexafluoride, and the limitations on inspector access that followed Iran's 2021 decision to reduce cooperation. The significance of the threshold condition is not merely technical. It reshapes regional calculations: Saudi Arabia's Crown Prince has stated that the kingdom would acquire nuclear weapons if Iran does; Turkey and Egypt have made similar statements; Israel, which maintains a policy of nuclear ambiguity, has repeatedly signaled that it will not permit Iran to cross the threshold. The mechanism of cascade is not automatic—it requires decisions by multiple actors, each with their own domestic politics and alliance commitments—but the threshold condition lowers the barrier to those decisions by demonstrating that the NPT's enforcement is contingent on great-power will rather than on legal obligation.

The JCPOA is the lesson's central case study in institutional design and its limits. Signed in July 2015 by Iran and the P5+1 (the five permanent members of the UN Security Council plus Germany), the deal capped enrichment at 3.67 percent, reduced Iran's centrifuge inventory by two-thirds, shipped out 98 percent of its enriched uranium stockpile, and subjected Iran to the most intrusive verification regime ever negotiated. In exchange, Iran received sanctions relief. The architecture was elegant: it did not require Iran to abandon enrichment (which Iran insisted was a sovereign right under Article IV of the NPT) but it made weaponization practically impossible within a one-year breakout window. The US withdrawal in May 2018, followed by the reimposition of sanctions and Iran's phased reduction of compliance beginning in May 2019, demonstrated that the deal's durability depended on a political commitment that the US electoral system could not guarantee. The snapback mechanism—designed to automatically reimpose UN sanctions if Iran violated the deal—was itself contested when the US attempted to invoke it in 2020 after having withdrawn from the agreement. The episode reveals a design flaw: mechanisms intended to constrain the weaker party (Iran) were not matched by mechanisms constraining the stronger party (the US), and the Security Council's structure ensured that

no enforcement action could be taken against a permanent member.

What the student will be able to do after mastering this lesson is substantial and specific. They will be able to trace the causal mechanisms linking enrichment capacity to regional security dilemmas, distinguishing between the technical facts of Iran's program and the political interpretations placed upon them. They will be able to reconstruct five perspectives—African, Chinese, Russian, Western, and UN—on the Iranian nuclear question, identifying what each contributes and what each occludes. They will be able to evaluate the JCPOA's architecture against its alternatives, using evidence from IAEA reports, UNSC resolutions, and the statements of the parties. They will be able to specify the scope conditions under which extended deterrence stabilizes (when the guarantor's commitment is credible and the client's security concerns are addressed) and destabilizes (when the guarantor's commitment is doubted and the client seeks autonomous capability). And they will be able to identify the falsifiers that would challenge their conclusions: for example, if Iran were to accept zero enrichment, or if Saudi Arabia were to acquire nuclear weapons without an Iranian test, or if the NPT Review Conference were to produce a consensus document endorsing disarmament timelines. The lesson does not resolve the Iranian nuclear question; it equips the student to analyze it with the theoretical depth and evidentiary discipline that the question demands.

SECTION 1 — Pre-Class Priming

1.1 Retrieval warm-up

1. What is the difference between counterforce and countervalue targeting, and why does it matter for crisis stability? (L21)
2. What is the stability-instability paradox, and how does it apply to nuclear-armed rivals? (L21)
3. What were the principal domestic and international drivers of the 1979 Iranian Revolution? (L42)
4. How does sectarian identity interact with state interest in the Middle East—does it determine policy or merely frame it? (L43)
5. What is extended deterrence, and what is the credibility problem that haunts it? (L21)
6. What distinguishes a nuclear-weapon state, a threshold state, and a non-nuclear-weapon state under the NPT? (L21, L42)

1.2 Orientation questions

1. Why did Iran invest in enrichment capacity for decades despite having no nuclear weapons and facing no existential conventional threat that nuclear weapons uniquely solve?
2. What does the collapse of the JCPOA reveal about the fragility of non-proliferation architecture when great-power commitments are reversible?
3. How does the African critique of the NPT—as a regime that permits permanent nuclear hierarchy—differ from the Western focus on Iranian non-compliance?
4. Under what conditions does extended deterrence stabilize versus destabilize the Middle East nuclear order?

1.3 Vocabulary pre-teach

- **Breakout timeline**: The estimated time required for a state to produce enough weapons-grade fissile material for one nuclear device, given its current enrichment capacity and stockpile. Provisional definition: a technical estimate, not a political decision to build.

- **Threshold state**: A state that possesses the fissile material, the delivery systems, and the technical knowledge to produce a nuclear weapon within weeks or months but has not assembled one. Provisional definition: latency without weaponization.
- **Enrichment**: The process of increasing the concentration of uranium-235 in uranium, typically via gas centrifuges, to produce fuel for reactors or, at higher levels, weapons-grade material. Provisional definition: a dual-use technology central to the NPT's Article IV bargain.
- **Centrifuge**: A rapidly spinning cylinder that separates uranium isotopes by mass, the core technology of modern enrichment. Provisional definition: the hardware whose quantity and type determine enrichment capacity.
- **Safeguards**: The IAEA's system of inspections, monitoring, and verification designed to ensure that nuclear material is not diverted to weapons use. Provisional definition: the technical backbone of NPT compliance.
- **JCPOA**: The Joint Comprehensive Plan of Action, the 2015 agreement between Iran and the P5+1 that capped Iran's enrichment and subjected it to enhanced verification in exchange for sanctions relief. Provisional definition: the most intrusive non-proliferation bargain ever negotiated.
- **Snapback**: The mechanism in UNSC Resolution 2231 that allows any participant to reimpose UN sanctions on Iran if it is found in significant non-performance. Provisional definition: an automatic enforcement tool whose invocation became contested after US withdrawal.
- **Extended deterrence**: The commitment by a nuclear-armed state to use its nuclear weapons to defend an ally. Provisional definition: the security guarantee that underpins US alliances in the Middle East and beyond.
- **Nuclear ambiguity**: A policy of neither confirming nor denying possession of nuclear weapons, most associated with Israel. Provisional definition: a deterrent posture that avoids the legal and diplomatic costs of declared possession.
- **Hedging**: A strategy of maintaining the option to acquire nuclear weapons without crossing the threshold, through investment in enrichment and delivery systems. Provisional definition: the middle ground between compliance and proliferation.
- **NPT**: The Treaty on the Non-Proliferation of Nuclear Weapons (1968), which divides states into nuclear-weapon states and non-nuclear-weapon states and promises peaceful nuclear cooperation. Provisional definition: the cornerstone of the non-proliferation regime, increasingly contested.
- **Pelindaba Treaty**: The African Nuclear-Weapon-Free Zone Treaty (1996), establishing Africa as a zone free of nuclear weapons. Provisional definition: the African rejection of nuclear hierarchy.

SECTION 2 — LESSON CORE

2.1 Learning objectives

By the end of this lesson, the student will be able to:

1. **Explain** the historical trajectory of Iran's nuclear program from the 1957 US-Iran Atoms for Peace agreement through the Shah's ambitious reactor plans, the post-revolutionary suspension, the 1990s covert revival, and the 2002 exposure of the Natanz and Arak facilities, identifying the key institutional actors (the Atomic Energy Organization of Iran, the Supreme National Security Council) and the turning points (IAEA findings, UNSC resolutions 1696 and 1737) that transformed a bilateral technical cooperation project into a multilateral proliferation crisis.

2. **Analyze** the technical determinants of Iran's breakout timeline—centrifuge generations (IR-1 through IR-6), enrichment levels (3.67%, 20%, 60%), stockpile quantities measured in kilograms of uranium hexafluoride, and the critical distinction between fissile-material production and weaponization—evaluating how incremental changes in each variable alter independent estimates of the time required to produce 25 kilograms of weapons-grade highly enriched uranium.

3. **Evaluate** competing interpretations of Iran's nuclear intentions, distinguishing among the "civilian energy" narrative advanced by Iranian officials, the "latent deterrence" thesis favored by some strategic analysts, and the "threshold state" characterization used by non-proliferation specialists, using IAEA safeguards data, US National Intelligence Estimates, and Iranian Supreme Leader fatwas as evidence, and identifying what each interpretation can and cannot explain.

4. **Compare** the five major international perspectives on Iran's nuclear program—African, Chinese, Russian, Western, and UN—identifying each perspective's core causal claims, normative commitments, and characteristic blind spots, and explaining how these perspectives generate divergent policy prescriptions ranging from engagement and verification to sanctions and containment.

5. **Synthesize** the implications of Iran's threshold-state status for the Nuclear Non-Proliferation Treaty regime, assessing whether the treaty's grand bargain—non-proliferation in exchange for peaceful use and disarmament—can accommodate a state that has mastered the full fuel cycle without crossing the weapons threshold, and whether the erosion of that bargain threatens to trigger proliferation cascades across West Asia and beyond.

2.2 KEY IDEA 1 — Iran's nuclear program: history, capabilities, breakout timelines

Bolded Causal Claim: Iran's nuclear program, initiated under the Shah as a civilian energy project and covertly revived in the 1990s as a latent weapons capability, has produced a durable "threshold state" condition in which Iran possesses the indigenous technical infrastructure to produce weapons-grade fissile material on a timeline of weeks to months, and this condition persists regardless of the diplomatic status of any particular agreement because enrichment knowledge, centrifuge manufacturing capacity, and industrial infrastructure cannot be reversed by treaty.

Mechanism: The mechanism operates through four sequential phases, each of which added irreversible layers of technical capability. First, the *foundation phase* (1957–1979): under the US Atoms for Peace program, Iran received a 5-megawatt Tehran Research Reactor (TRR) in 1967, fueled by 93% enriched uranium supplied by the United States, and in 1974 the Shah established the Atomic Energy Organization of Iran (AEOI) with plans for 23 nuclear power reactors. Contracts were signed with Siemens (Germany) for the Bushehr plant and with Framatome (France) for additional reactors. Iran signed the NPT in 1970 and ratified it in 1974. This phase created the institutional and human-capital base—trained nuclear engineers, a regulatory framework, and a research reactor—that would later be repurposed. Second, the *suspension and survival phase* (1979–1989): the 1979 revolution halted most nuclear activities, and the Iran-Iraq War (1980–1988) damaged the Bushehr site. However, the AEOI survived, and Iran maintained its NPT membership and its research reactor, preserving a thin thread of nuclear expertise. Third, the *covert revival phase* (1990s–2002): following the war, Iran quietly rebuilt its nuclear program with foreign assistance. Russia agreed in 1995 to complete the Bushehr reactor (which finally connected to the grid in 2011). More critically, Iran acquired centrifuge technology—initially P-1 designs derived from the Urenco/AQ Khan network, and later more advanced models—through a combination of procurement networks and possibly direct transfers. Iran be-

gan constructing the Natanz enrichment facility and the Arak heavy-water reactor (IR-40) without declaring them to the IAEA, in violation of its safeguards obligations. The existence of these facilities was revealed in August 2002 by the National Council of Resistance of Iran (NCRI), an opposition group, triggering the first IAEA inspections and the beginning of the international crisis. Fourth, the *maturation and diversification phase* (2002–present): Iran admitted to undeclared activities, signed the Additional Protocol voluntarily in 2003 (though it suspended implementation in 2006), and began feeding uranium hexafluoride (UF6) into centrifuge cascades at Natanz in 2006. The IAEA discovered that Iran had conducted plutonium separation experiments and had worked on P-1 and P-2 centrifuge designs. In 2009, the existence of the Fordow enrichment facility—built inside a mountain near Qom—was revealed, providing a hardened, deeply buried site for enrichment. Iran began enriching to 20% in 2010 at Natanz (justified as fuel for the TRR) and at Fordow in 2012. The 20% enrichment level is significant because it represents roughly 90% of the separative work needed to reach weapons-grade (90%) enrichment, dramatically shortening the breakout timeline. The Stuxnet cyberattack in 2010 destroyed approximately 1,000 IR-1 centrifuges at Natanz, demonstrating that the program was vulnerable to sabotage but also that Iran could replace and expand its centrifuge inventory. By 2013, independent analysts estimated that Iran could produce enough weapons-grade uranium for one nuclear device in approximately two to three months, assuming it used its existing stockpile of 20% enriched uranium and its installed centrifuge capacity. The Joint Comprehensive Plan of Action (JCPOA) of 2015 extended this breakout timeline to roughly one year by capping enrichment at 3.67%, limiting the stockpile to 300 kg of UF6, restricting centrifuges to 5,060 IR-1 machines at Natanz, and requiring the redesign of the Arak reactor. However, the technical knowledge, the centrifuge manufacturing infrastructure, and the experienced workforce remained intact. Following the US withdrawal from the JCPOA in 2018, Iran progressively reduced its commitments: it exceeded the 3.67% cap in 2019, accumulated a growing stockpile, installed advanced centrifuges (IR-2m, IR-4, IR-6) at Natanz and Fordow, and began enriching to 60% in 2021. By 2022, IAEA inspectors detected uranium particles enriched to 83.7% at Fordow—just below the 90% weapons-grade threshold—though Iran attributed this to unintended fluctuations. Independent breakout estimates consequently shortened to weeks rather than months. The mechanism's irreversibility lies in the fact that centrifuge design knowledge, cascade configuration expertise, and uranium metallurgy skills are embedded in human capital and institutional memory; they cannot be "unlearned" by diplomatic agreement, only monitored, delayed, or redirected.

Scope Conditions: This causal claim holds under specific conditions and fails under others. It holds when a state has (a) indigenous uranium enrichment capability, (b) a covert or semi-covert history of undeclared nuclear activities, (c) a stockpile of enriched uranium at levels above natural (0.7%) and approaching or exceeding 20%, and (d) a workforce and industrial base capable of manufacturing and maintaining centrifuges. It does not hold for states that rely entirely on imported fuel and lack enrichment infrastructure (e.g., most NPT non-nuclear-weapon states), nor does it apply to states that have voluntarily dismantled their programs (South Africa in the early 1990s, Libya in 2003). The claim also assumes that the state in question has not made a definitive political decision to build a weapon; Iran's Supreme Leader has issued a fatwa against nuclear weapons, and the US intelligence community has assessed since 2007 that Iran halted its structured weaponization program in 2003. The threshold-state condition is therefore a statement about *capability*, not *intent*—a distinction that is analytically crucial but politically contested. The claim further assumes that IAEA safeguards, while imperfect, provide sufficient monitoring to detect a diversion of declared material; it does not assume that safeguards can detect all covert activities, as the 2002 revelations demonstrated.

Observable Implications: If this causal claim is correct, we should observe several patterns. First, IAEA Director General reports should show a steady increase in Iran's installed centrifuge capacity and enrich-

ment levels following the collapse of the JCPOA, with particular attention to the deployment of advanced centrifuges (IR-2m, IR-4, IR-6) and the accumulation of 60% enriched uranium. Second, independent breakout estimates (published by institutions such as the Institute for Science and International Security) should shorten from months to weeks as Iran's stockpile grows and its centrifuge inventory diversifies. Third, Iran should maintain a gap between its technical capability and an actual weaponization decision, preserving ambiguity—what strategists call "nuclear hedging"—rather than conducting an overt test. Fourth, we should observe continued Iranian insistence on its right to peaceful enrichment under NPT Article IV, coupled with resistance to any agreement that permanently caps enrichment below levels it considers its sovereign right. Fifth, the IAEA should report ongoing verification challenges, including disputes over access to sites, the resolution of safeguards questions regarding undeclared nuclear material and activities, and the installation of monitoring equipment. The detection of 83.7% enriched uranium particles at Fordow in 2022, and Iran's subsequent explanation, exemplifies the kind of ambiguous observable that this framework predicts: technically alarming but politically deniable.

Perspective Note (five traditions in brief):

The **African perspective** on Iran's nuclear program is shaped by a deep and historically grounded critique of the NPT as a discriminatory regime that privileges the five nuclear-weapon states while constraining the technological sovereignty of the Global South. African states, through the Pelindaba Treaty (1996), established a nuclear-weapon-free zone across the continent, and South Africa remains the only state to have voluntarily dismantled a nuclear arsenal, giving African diplomacy a unique moral authority on non-proliferation. From this vantage, Iran's program is not primarily a proliferation threat but a symptom of the NPT's unequal structure: Article IV guarantees the right to peaceful nuclear technology, yet the P5 have failed to fulfill their Article VI disarmament obligations, and Israel's undeclared arsenal in West Asia creates a security asymmetry that the NPT does nothing to address. African scholarship—Grovogui's critique of international legal order as Eurocentric, Mbembe's analysis of the necropolitics of global governance, and Mamdani's insistence on the political construction of categories—frames the Iran nuclear crisis as an instance of a broader pattern in which Western powers invoke "proliferation" to police the technological ambitions of non-Western states while exempting their allies. African states at NPT Review Conferences have consistently supported Iran's right to peaceful enrichment and have pushed for a Middle East WMD-free zone that would address Israel's arsenal alongside Iran's program. The African perspective also draws on the Treaty on the Prohibition of Nuclear Weapons (TPNW, 2017), which most African states have signed or ratified, reflecting frustration with the NPT's failure to deliver disarmament. What this perspective reveals that others miss is the structural hypocrisy of a non-proliferation regime that demands abstinence from states that have never possessed nuclear weapons while permitting the P5 to modernize their arsenals indefinitely. What it risks occluding is the genuine security concerns of Iran's neighbors and the possibility that an Iranian bomb would destabilize a region already fractured by sectarian conflict and great-power competition.

The **Chinese perspective** treats Iran's nuclear program through the lens of non-proliferation combined with strategic partnership and commercial interest. China supports Iran's right to peaceful nuclear energy under the NPT, opposes unilateral sanctions, and was a party to the JCPOA negotiations. Beijing's approach emphasizes multilateralism and diplomatic engagement over coercion, reflecting both its general preference for non-interference and its specific interest in maintaining stable energy supplies and Belt and Road Initiative connectivity through Iran. China's perspective occludes its own historical role in nuclear technology transfers to Pakistan and its commercial interests in Iranian oil and infrastructure, which create incentives to downplay proliferation risks. It also tends to frame US pressure on Iran as hegemonic rather than as a legitimate security concern.

The **Russian perspective** frames Iran's nuclear program within a multipolarity narrative in which the United States seeks to maintain unipolar dominance. Russia, as a P5+1 member and a supplier of nuclear technology to Iran (Bushehr), supports Iran's civilian program while opposing US sanctions and the 2018 withdrawal from the JCPOA. Moscow's position combines genuine non-proliferation interest—Russia does not want a nuclear-armed Iran on its southern border—with geopolitical opportunism: Iran serves as a partner in resisting US influence in West Asia and in sustaining Russian energy leverage. Russia's perspective occludes its own early assistance to Iran's nuclear program and its tendency to use the Iran issue as a bargaining chip in broader US-Russia relations.

The **Western perspective** (encompassing the US, UK, France, Germany, and Israel) treats Iran's nuclear program primarily as a proliferation threat to be prevented through a combination of sanctions, diplomacy, and, if necessary, military action. This perspective emphasizes Iran's history of undeclared activities, its support for regional proxies, and the potential for a nuclear Iran to trigger a regional arms race. The JCPOA collapse debate—between those who view the deal as a flawed but necessary constraint and those who view it as an insufficient and temporary fix—divides Western opinion. What this perspective occludes is the double standard of tolerating Israel's undeclared arsenal while demanding Iranian abstinence, and the failure of the P5 to meet their own disarmament obligations, which undermines the moral authority of non-proliferation demands.

The **UN perspective** centers on the institutional framework of IAEA safeguards, NPT Review Conferences, and Security Council resolutions (1696, 1737, 1929, 2231). This perspective treats Iran's program as a compliance problem to be managed through verification, legal obligation, and multilateral enforcement. The IAEA's technical assessments provide the evidentiary basis for international action, while the Security Council provides the enforcement mechanism. What this perspective occludes is the political nature of its own institutions: the P5 veto power means that enforcement is selective, and the IAEA's dependence on member-state intelligence and funding creates vulnerabilities to politicization. The UN framework is strongest on technical verification and weakest on addressing the underlying security dilemmas that drive proliferation.

SECTION 2.3 — KEY IDEA 2: The JCPOA — Architecture, Commitments, and Verification

Bolded Causal Claim: The JCPOA's architecture rested on a trade of verifiable, multi-point enrichment constraints for sanctions relief, creating a time-bound but technically robust non-proliferation bargain whose durability depended on sustained political commitment from all parties and on the economic benefits actually reaching Iran.

Mechanism: The mechanism is simultaneous constraint of the fuel cycle at multiple chokepoints, coupled with a verification regime dense enough to detect diversion. Signed on July 14, 2015, by Iran and the P5+1 (China, France, Germany, Russia, the United Kingdom, and the United States) and endorsed by UNSC Resolution 2231, the Joint Comprehensive Plan of Action (JCPOA) reduced Iran's enrichment ceiling from 20 percent to 3.67 percent U-235; capped its low-enriched uranium (LEU) stockpile at 300 kilograms (down from roughly 10,000 kilograms); limited installed centrifuges to 5,060 first-generation IR-1 machines at Natanz (removing approximately 13,000 others, including advanced models, from service); converted the Fordow underground facility into a research center with no enrichment; redesigned the Arak heavy-water reactor so that its annual plutonium output would fall from roughly 10 kilograms to less than one; and committed Iran to the Additional Protocol and modified Code 3.1 safeguards. The IAEA gained access to monitor the entire fuel cycle, including uranium mines, mills, and centrifuge production workshops. In

exchange, UNSC Resolution 2231 terminated the previous sanctions resolutions (1696, 1737, 1747, 1803, 1835, 1929); the European Union lifted nuclear-related economic and financial sanctions; and the United States waived statutory sanctions on Iran's oil, banking, and shipping sectors. The core strategic logic was the "breakout timeline": by constraining both enrichment capacity and fissile-material stockpile, the deal extended Iran's time to produce enough highly enriched uranium (HEU) for one weapon from an estimated two to three months to roughly twelve months. The mechanism also included a Joint Commission dispute-resolution process and a "snapback" provision (UNSC 2231, paragraphs 11–12) permitting any P5 member to reimpose sanctions if Iran were found in significant non-performance. Sunset clauses phased out restrictions over 8 to 25 years: centrifuge limits after 8 years, enrichment limits after 15, procurement-channel oversight after 10, and IAEA access to uranium mines after 20. The Additional Protocol and modified Code 3.1, however, were intended to continue indefinitely, providing a long-term verification floor.

Scope Conditions: The bargain held only under four conditions: (a) Iran's compliance had to be continuously verifiable by the IAEA; (b) sanctions relief had to be economically meaningful, not merely legal; (c) the United States had to sustain the deal across changes of administration; and (d) Iran's underlying security dilemma — conventional inferiority relative to Israel and the Gulf monarchies, plus the absence of a US security guarantee — had to be bracketed rather than resolved. The JCPOA deliberately excluded Iran's ballistic missile program and its regional activities from the negotiating scope, a choice that maximized the chance of a nuclear deal but created a political vulnerability: critics could argue that the deal legitimized Iran's nuclear infrastructure while leaving its missile and proxy capabilities untouched. The mechanism also assumed that Iran's leadership would calculate that the economic benefits of compliance exceeded the strategic value of an unconstrained program — an assumption that depended on the sanctions relief actually materializing in Iran's economy.

Observable Implications: From January 2016 through May 2018, IAEA quarterly reports confirmed Iranian compliance: the LEU stockpile remained below 300 kilograms, enrichment stayed at or below 3.67 percent, centrifuge numbers matched commitments, and no diversion of declared nuclear material was detected. The IAEA's monitoring and verification activities in Iran expanded significantly, with inspector-days and access points increasing. However, the economic implications were weaker than the technical ones. Foreign banks, fearing US secondary sanctions and Treasury Department enforcement, remained reluctant to process Iran-related transactions; major commercial deals (Total's South Pars investment, Boeing aircraft sales) stalled or collapsed. Iran's oil exports recovered partially but not to pre-sanctions levels. This gap between legal relief and economic reality meant that the JCPOA's political sustainability in Tehran was always thinner than its technical compliance record suggested. The deal's domestic fragility was visible in both countries: in the United States, the Congressional Review Act (2015) and subsequent opposition from congressional Republicans and the Netanyahu government in Israel; in Iran, hardliner criticism of Rouhani's government and the Revolutionary Guards' skepticism about Western commitments.

Perspective Note (five traditions in brief):

African (primary): The JCPOA is read through the lens of NPT inequality and the Treaty of Pelindaba. African states, most of which are NPT members in good standing with no nuclear weapons, view the deal as a pragmatic but structurally imperfect non-proliferation measure. The African perspective notes that the JCPOA's asymmetry — Iran constrained while Israel's undeclared arsenal remains unacknowledged — reproduces the NPT's discriminatory architecture, in which five states possess nuclear weapons legally and others are forbidden them. The Pelindaba Treaty (1996) established Africa as a nuclear-weapon-free zone, and African states have consistently supported universal disarmament and the Treaty on the Prohibition of

Nuclear Weapons (TPNW, 2017). From this vantage, the JCPOA's sunset clauses and the absence of disarmament obligations on nuclear-armed states reveal the deal as a non-proliferation instrument that does not address proliferation's root cause: the security value that possessors attribute to nuclear weapons. African scholarship (Grovogui, Mbembe) would frame the JCPOA as an instance of technical governance substituting for political equality — verification regimes managing symptoms while the underlying hierarchy persists. The African perspective also notes that the deal's collapse reinforced skepticism about Western commitments to negotiated solutions, echoing African experiences with sanctions, conditionalities, and broken promises in other domains. The TPNW's emphasis on the humanitarian consequences of nuclear weapons and the illegitimacy of nuclear threats resonates with African states' experience of being subject to nuclear coercion during the Cold War and beyond.

Chinese: China supported the JCPOA as a model of multilateral diplomacy and a stabilizing factor in the Middle East. Beijing's interest combined non-proliferation with energy security and Belt and Road connectivity. China participated in the Arak reactor redesign (leading the working group) and supported IAEA verification. The Chinese perspective emphasizes non-interference and the legitimacy of Iran's peaceful nuclear rights under the NPT. China opposed US withdrawal and reimposition of sanctions, viewing them as unilateralism undermining multilateralism. China's strategic partnership with Iran (the 25-year cooperation agreement signed in 2021) reflects a hedging strategy: maintaining economic ties and diplomatic support while not directly challenging US sanctions enforcement.

Russian: Russia was a P5+1 member and co-architect of the JCPOA. Moscow's interest combined non-proliferation (preventing a nuclear-armed Iran on its southern flank) with multipolarity (resisting US unilateralism). Russia supplied fuel for the Bushehr reactor and participated in the Arak redesign. After US withdrawal, Russia supported Iran's position that the deal's collapse was Washington's fault, while also urging Iranian restraint. The Russian perspective frames the JCPOA as an example of successful multilateralism that US unilateralism destroyed, reinforcing Moscow's narrative about the need for a multipolar order in which no single state can unilaterally abrogate negotiated agreements.

Western: The Western perspective is deeply divided. The Obama administration viewed the JCPOA as the best achievable non-proliferation outcome, arguing that no better deal was available and that the alternatives were war or an unconstrained Iranian program. Critics — including the Netanyahu government, congressional Republicans, and later the Trump administration — argued the deal was too weak: sunset clauses allowed Iran to resume enrichment after 10–15 years, missile limits were absent, and regional behavior was unaddressed. European powers (the E3: France, Germany, the United Kingdom) sought to preserve the deal through the INSTEX mechanism. The Western debate centers on whether the JCPOA was a sufficient constraint on Iran's nuclear ambitions or a dangerous legitimization of its nuclear infrastructure.

UN: The UN perspective treats the JCPOA as anchored in UNSC Resolution 2231, which endorsed the deal and established the snapback mechanism. The IAEA's verification role is central: the agency's quarterly reports provided the evidentiary basis for assessing compliance. The UN framework provided legal authority for both sanctions relief and reimposition. The perspective's strength is technical verification and multilateral legal authority; its weakness is dependence on P5 consensus, which fractured after US withdrawal, and the IAEA's dependence on member-state intelligence and funding, creating vulnerabilities to politicization.

SECTION 2.4 — KEY IDEA 3: The US Withdrawal (2018), Snapback, and Iran's Steps Back from Compliance

Bolded Causal Claim: The US withdrawal from the JCPOA in May 2018, followed by maximum pressure sanctions and the failure of European INSTEX, destroyed the bargain's reciprocity, leading Iran to progressively breach enrichment limits from 2019 onward and ultimately to accumulate near-weapons-grade uranium by 2023–2024.

Mechanism: The mechanism is reciprocity collapse in a conditional bargain. The JCPOA's logic required both sides to perform simultaneously: Iran constrained its fuel cycle in exchange for sanctions relief. When the United States withdrew on May 8, 2018, and reimposed sanctions in two tranches (August and November 2018), the US side of the bargain vanished while Iran's obligations remained in place. Iran initially maintained compliance for approximately fourteen months — a period Tehran termed "strategic patience" — hoping that European powers would deliver economic benefits through INSTEX, established in January 2019 as a special-purpose vehicle for humanitarian trade. When INSTEX failed to process significant transactions (it completed only a single small transaction in 2020), Iran began calibrated, reversible breaches designed to signal leverage rather than to build a weapon. The sequence: July 2019, exceeding the 300-kilogram LEU cap and raising enrichment to 4.5 percent; November 2019, resuming enrichment at Fordow; January 2020, exceeding 20 percent enrichment; April 2021, producing 60 percent HEU; 2021–2022, installing advanced centrifuges (IR-4, IR-6) at Natanz and Fordow; 2022, removing IAEA surveillance cameras at Karaj and Natanz; 2023, expelling several experienced IAEA inspectors. Each step was calibrated to be reversible and to increase pressure on the remaining parties to restore the deal's economic benefits. The "snapback" dispute compounded the crisis: the Trump administration claimed rights under UNSC 2231 paragraph 11 to trigger snapback reimposition of all UN sanctions despite having withdrawn from the deal; the E3 and other Security Council members rejected this, arguing that the United States was no longer a participant and therefore lacked standing. The mechanism was accelerated by external shocks: the January 2020 US assassination of Qasem Soleimani, the April 2021 sabotage at Natanz (attributed to Israel), and the 2020 Iranian law (the Strategic Action Plan to Lift Sanctions) mandating 20 percent enrichment and restricting IAEA access until sanctions were lifted. By 2024, Iran had accumulated an estimated 140–180 kilograms of 60 percent HEU, with breakout timeline estimates shrinking from roughly twelve months in 2018 to a matter of weeks.

Scope Conditions: The collapse required both US withdrawal and European inability to deliver economic benefits; neither alone would have produced the same outcome. Iran's breaches were calibrated to be reversible, implying that Tehran sought leverage and threshold status rather than immediate weaponization — though the distinction between "threshold" and "weapon" narrows as enrichment advances. The mechanism assumes Iran's leadership calculates that nuclear latency (the ability to produce a weapon quickly if needed) serves its security without incurring the costs of actual weaponization, including NPT withdrawal and potential military strikes. The mechanism also depends on Iran's technical capacity to scale enrichment, which advanced significantly during the JCPOA implementation period because research on advanced centrifuges continued under the deal's permitted R&D provisions. A further scope condition: the mechanism assumes that no external actor (Israel, the United States) would conduct military strikes that would reset Iran's program by force — an assumption that has been tested by sabotage operations but not by full-scale military action.

Observable Implications: IAEA Director General reports from 2019 through 2024 document the progressive enrichment increases and stockpile growth: 4.5 percent (July 2019), 20 percent (January 2020), 60 percent (April 2021), with stockpiles of 60 percent HEU reaching approximately 140–180 kilograms by

early 2024. Breakout timeline estimates, which the IAEA and independent analysts (including the Institute for Science and International Security) tracked, shrank from roughly twelve months in 2018 to weeks by 2024. The IAEA lost monitoring continuity at several facilities: surveillance cameras at Karaj and Natanz were removed or their footage withheld; the agency's access to centrifuge production workshops was restricted. Iran's 2020 Strategic Action Plan law mandated 20 percent enrichment and restricted IAEA access until sanctions were lifted. The IAEA Board of Governors issued censures in 2022 and 2024; Iran responded by further restricting inspector access, including the September 2023 expulsion of several experienced inspectors. The 2024 assessment by the IAEA and independent analysts was that Iran was closer to a nuclear weapon than at any point since 2015, though the agency continued to state that it had not detected diversion of declared nuclear material to a weapons program.

Perspective Note (five traditions in brief):

African (primary): The collapse is read as confirmation of the NPT's structural inequality and the unreliability of Western security commitments. African states, many of which have experienced sanctions and conditionalities in other domains, view the US withdrawal as an instance of great-power caprice that undermines the normative order. The African perspective emphasizes that Iran's breaches, while technically violations of the JCPOA, were responses to a broken bargain — a causal logic that Western non-proliferation discourse often inverts by treating Iranian behavior as the independent variable. African scholarship (Mamdani, Bayart) would frame the episode as "extraversion": the JCPOA's fate was determined by US domestic politics and Israeli security concerns, not by Iranian behavior alone. The TPNW's emphasis on the humanitarian consequences of nuclear weapons and the illegitimacy of nuclear threats resonates with African states' experience of being subject to nuclear coercion. The African perspective also notes that the collapse accelerated proliferation hedging by Saudi Arabia and other regional actors, demonstrating that non-proliferation bargains must be durable to be effective. The Pelindaba NWFZ remains Africa's contribution to a non-proliferation order that the great powers have failed to sustain. From this vantage, the lesson is not that Iran was untrustworthy but that the international order's enforcement mechanisms are politically contingent and asymmetrically applied.

Chinese: China opposed US withdrawal and supported Iran's right to peaceful nuclear energy under the NPT. Beijing's perspective emphasizes multilateralism and the JCPOA as a diplomatic achievement. China continued to import Iranian oil despite sanctions and signed a 25-year strategic partnership agreement with Iran in 2021. China's position on Iran's breaches is nuanced: it urges restraint while blaming US unilateralism for the collapse. The Chinese perspective sees the episode as evidence of US unreliability, reinforcing Beijing's narrative about the need for a multipolar order and its own role as a stabilizing force. China's mediation of the 2023 Saudi-Iran rapprochement reflects this self-image. Beijing's interest in non-proliferation is genuine but subordinate to its strategic partnership with Tehran and its broader competition with Washington.

Russian: Russia blamed the United States for the collapse and supported Iran's position that the deal's failure was Washington's fault. Moscow's perspective frames the episode as US unilateralism destroying multilateralism. Russia also had commercial interests (Bushehr reactor fuel supply, potential arms sales). After 2022, Russia-Iran ties deepened significantly (drone supplies for the Ukraine war), though this deepening is driven more by the Ukraine conflict than by nuclear issues. Russia's position on Iran's enrichment is that it is a sovereign right under the NPT, while urging Tehran not to weaponize. The multipolarity framing is central: the JCPOA collapse demonstrates, in Moscow's view, that the US cannot be trusted to honor agreements, reinforcing the case for a multipolar order.

Western: The Western perspective is deeply divided. The Trump administration viewed maximum pressure

as necessary to address the JCPOA's flaws — sunset clauses, absence of missile limits, and unaddressed regional behavior — and believed that economic coercion could produce a "better deal." The Biden administration sought to revive the deal through indirect talks in Vienna (2021–2022) but failed due to disagreements over the scope of sanctions relief and Iran's demands for guarantees against future US withdrawal. European powers (the E3) sought to preserve the deal but were unable to deliver economic benefits through INSTEX. The Western debate centers on whether maximum pressure was a failed strategy (it did not produce a better deal and accelerated Iran's nuclear advances) or whether the JCPOA was fundamentally flawed and its collapse inevitable. The 2024 consensus assessment: Iran is closer to a weapon than in 2015, and the non-proliferation regime in the Middle East is weaker.

UN: The UN perspective focuses on the legal and verification crisis. UNSC 2231's snapback mechanism became contested; the IAEA lost monitoring access at several facilities; the Board of Governors issued censures in 2022 and 2024. The UN framework's enforcement capacity was paralyzed by P5 divisions (the United States versus Russia and China). The IAEA's technical assessments (Director General reports) documented the breaches but could not compel compliance. The UN perspective's strength is documentation and legal authority; its weakness is enforcement when great powers disagree. The IAEA's dependence on member-state intelligence and funding, and the Security Council's P5 veto structure, mean that the UN framework is strongest on technical verification and weakest on addressing the underlying security dilemmas that drive proliferation.

2.5 KEY IDEA 4 — Extended Deterrence in the Middle East: Israel's Ambiguity, US Guarantees, and the Saudi Nuclear Question

Bolded Causal Claim: Extended deterrence in the Middle East is stabilizing only when three conditions hold simultaneously: the guarantor's commitment is perceived as credible by both the protected state and the adversary; the protected state's threat perception is acute enough to accept dependence; and the adversary's decision calculus is distorted by uncertainty about retaliation. Where any condition fails, extended deterrence does not prevent proliferation; it displaces it into hedging, opacity, and latent capability. In this region, Israel's nuclear ambiguity, the United States' conditional security guarantees, and Saudi Arabia's hedging behavior form an interdependent system in which assurance and insecurity are produced by the same instruments.

Mechanism: Extended deterrence is the promise by a nuclear-armed state to use force, including nuclear force, to defend an ally or partner. In Europe and East Asia, this promise is institutionalized through alliances, forward deployment, and integrated command structures. In the Middle East, by contrast, US extended deterrence has historically been less formalized and more contingent on presidential discretion, congressional politics, and shifting regional priorities. The mechanism therefore operates through signaling rather than automaticity: arms sales, missile-defense deployments, joint exercises, and declaratory statements are interpreted by adversaries as indicators of US willingness to absorb risk. The logic draws on Thomas Schelling's analysis of commitment and on Glenn Snyder's alliance theory, both of which emphasize that deterrence depends less on aggregate capability than on the adversary's belief that the guarantor will accept costs that exceed the immediate value of the contested object. Israel's doctrine of nuclear opacity, or amimut, adds a second mechanism. By neither confirming nor denying possession of nuclear weapons, Israel creates strategic uncertainty that raises the expected cost of existential attack without providing adversaries with a clear threshold for preemption. This ambiguity can deter rational state actors, but it also prevents adversaries from

calibrating their own forces, encouraging worst-case planning and investment in survivable delivery systems. Robert Jervis's security-dilemma framework is useful here: measures taken to increase one's own security can decrease another's, and opacity magnifies that effect because it denies the adversary information needed to distinguish defensive from offensive preparations. The Saudi response illustrates the third mechanism: hedging. Faced with Iranian nuclear advances and doubts about US reliability, Saudi leaders have pursued civilian nuclear cooperation, ballistic-missile development, and rhetorical commitments to matching any Iranian capability. Hedging is not yet weaponization; it is the accumulation of options that reduces the time and political cost of crossing the threshold later. The interaction is recursive: Israeli opacity heightens Iranian insecurity; Iranian latency heightens Saudi hedging; Saudi hedging heightens Iranian and Israeli threat perception. Each actor's defensive measure becomes another's provocation, producing a security dilemma in which extended deterrence and proliferation pressure are two sides of the same coin.

Scope Conditions: Extended deterrence in this region is effective only under narrow conditions. First, the guarantor must have interests that the adversary believes are worth nuclear risk; if Washington's commitment appears conditional on domestic politics or on the value of a particular partner, deterrence erodes. Second, the protected state must not possess an independent nuclear option that it can activate quickly; once hedging becomes advanced, the guarantor's leverage declines because the client can substitute self-help for alliance. Third, the adversary must be a unitary, risk-averse state actor capable of cost-benefit calculation; extended deterrence is less reliable against fragmented regimes, revolutionary ideologies, or actors that value martyrdom over survival. Israel's opacity is stabilizing mainly against state-level existential threats and less so against non-state actors or against adversaries who believe they can exploit ambiguity to test red lines. Saudi hedging is constrained by technical capacity, financial resources, alliance dependence, and nonproliferation agreements; it is not an automatic march to a bomb. The cascade scenario—Saudi Arabia, Turkey, and Egypt following Iran—is a conditional possibility, not a law. It requires that Iran cross a visible threshold, that US guarantees be perceived as hollow, and that regional rivals possess or can acquire the necessary fuel-cycle capabilities. Where these conditions are absent, hedging may remain latent and reversible. Alliance theory also suggests that extended deterrence is more credible when the guarantor has troops or assets in harm's way, creating a tripwire effect; in the Middle East, the absence of such institutionalized tripwires makes credibility more dependent on episodic demonstrations of resolve.

Observable Implications: The theory predicts several observable patterns. If US extended deterrence is perceived as credible, Saudi Arabia should accept limits on enrichment and reprocessing, sign and implement robust safeguards, and rely on US-supplied missile defense and conventional arms; if credibility declines, one should observe Saudi interest in indigenous fuel-cycle capabilities, expanded missile programs, and diplomatic hedging toward Pakistan or other nuclear suppliers. Israel's opacity should be accompanied by investments in second-strike survivability, civil-defense and continuity planning, and deliberate ambiguity in official statements; observable shifts would include explicit nuclear threats or, conversely, arms-control proposals that trade ambiguity for recognition. Iranian behavior provides the trigger variable: accelerated enrichment, reduced IAEA access, or weaponization-relevant research should correlate with Saudi and Israeli hardening. At the institutional level, one should observe IAEA safeguards negotiations with Saudi Arabia, congressional debates over US-Saudi nuclear cooperation, and recurring NPT Review Conference disputes over extended deterrence and disarmament. The absence of a Saudi enrichment program despite Iranian advances would suggest that US guarantees, economic incentives, or technical barriers are operating as scope conditions. Conversely, a Saudi move toward enrichment would indicate that hedging has crossed from latent option to active capability.

Perspective Note (five traditions in brief): The African perspective treats extended deterrence in the Mid-

dle East as an expression of nuclear hierarchy: a small group of states retains weapons and extends protection to clients while demanding that others renounce them. African scholarship and diplomacy, from the Pelindaba Treaty to support for the Treaty on the Prohibition of Nuclear Weapons, frame this as a legitimacy crisis rather than merely a regional security problem. African states see the Middle East's extended deterrence as continuous with a global order in which nuclear possession is tolerated for some and criminalized for others; the African vantage point therefore asks not only whether deterrence prevents war but whether it perpetuates an unequal international society. The Chinese perspective supports nonproliferation and opposes nuclear proliferation in the Middle East, but it interprets US extended deterrence as an instrument of hegemony that can provoke insecurity rather than resolve it. Beijing emphasizes Iran's rights under the NPT, criticizes unilateral sanctions, and presents itself as a stabilizing partner, while also warning that Saudi nuclear hedging would damage regional stability. The Russian perspective, shaped by its role in the P5+1 and its multipolarity framing, criticizes the US withdrawal from the JCPOA and argues that American extended deterrence has failed to prevent the crisis; Moscow supports nonproliferation but insists that security guarantees must be multilateral and that sanctions cannot substitute for diplomacy. The Western perspective, especially in the United States and Israel, treats Iranian nuclear capability as the primary threat and extended deterrence as a necessary response; it emphasizes prevention, intelligence, and military options, while debating whether US guarantees are sufficient to prevent Saudi proliferation. The UN perspective, through the IAEA and the NPT review process, does not endorse extended deterrence as a policy; it focuses on safeguards, compliance, and the legal obligations of non-nuclear-weapon states, while recognizing that the Security Council's enforcement capacity is limited when P5 interests diverge.

2.6 KEY IDEA 5 — The Threshold State Problem: Proliferation Cascades, Hedging, and the Erosion of the NPT Regime

Bolded Causal Claim: The most dangerous proliferation actor is not always the state that builds a bomb; it is the state that acquires the capability to build one quickly while remaining inside the NPT. Such threshold states compress the decision timelines of rivals, blur the treaty's distinction between peaceful use and weapons development, and exploit the gap between what safeguards can verify (material accountancy) and what they cannot (intent). The result is a regime crisis in which the NPT's central bargain—nonproliferation in exchange for peaceful technology and disarmament—loses credibility even without a new nuclear-armed state.

Mechanism: A threshold state possesses the industrial, scientific, and material prerequisites for nuclear weapons—especially enrichment or reprocessing capability—without having assembled a device. The mechanism of danger is latency: the shorter the time between a political decision and a usable weapon, the less opportunity adversaries and institutions have to detect, deter, or reverse the move. Hedging is the strategic logic behind latency. A state hedges when it maintains an option to weaponize while avoiding the costs of open proliferation, including sanctions, isolation, and preventive attack. Hedging can be defensive (insurance against future threats), offensive (coercive leverage), or domestic (regime prestige and technological nationalism). The NPT's Article IV guarantees the right to peaceful nuclear energy, while Article II prohibits acquisition of nuclear weapons; the treaty does not define how much enrichment capacity is "peaceful." This ambiguity is the structural opening through which threshold states pass. IAEA safeguards are designed to verify that declared nuclear material is not diverted to weapons; they are not designed to certify the absence of a weapons program in a state with advanced fuel-cycle capabilities. Consequently, a threshold state can remain technically compliant while becoming strategically dangerous. The cascade mechanism operates through perception and time. If State A is believed to be approaching a threshold, State B faces a choice:

rely on alliances and deterrence, or begin its own hedging. Because hedging takes years, the rational response to uncertainty is to start early. Thus the mere possibility of proliferation can generate proliferation, even if State A never builds a weapon. The erosion of the NPT follows from repeated episodes in which major powers either fail to enforce the treaty against allies or impose it selectively against adversaries. When non-nuclear states conclude that the treaty protects the privileges of the nuclear-armed rather than their security, the normative foundation weakens and hedging becomes more attractive. The theoretical debate between Kenneth Waltz and Scott Sagan frames this problem: Waltz argues that nuclear proliferation can be stabilizing because deterrence is robust, while Sagan argues that organizational pathologies, civil-military relations, and preventive-war incentives make new nuclear states dangerous. The threshold state complicates both arguments because it is neither fully nuclear nor fully non-nuclear; it creates deterrence-like effects without the stabilizing institutions that accompany declared arsenals.

Scope Conditions: The threshold problem is acute only under specific conditions. It requires advanced fuel-cycle technology, which is expensive, regulated, and technically demanding; many states that desire nuclear options cannot sustain them. It requires a security environment in which alliances are perceived as unreliable and threats are existential; where extended deterrence is credible, hedging is less likely. It also requires domestic political coalitions that favor technological autonomy and are willing to bear economic costs. The cascade is not automatic. Historical experience suggests that proliferation is rare and clustered; most states that could build weapons choose not to, constrained by norms, alliances, economic integration, and domestic opposition. The NPT has been remarkably successful in limiting the number of nuclear-armed states, even if it has not eliminated latency. Threshold states can be stabilizing if their capability is transparent, reversible, and embedded in strong safeguards; Japan is often cited as a case of stable latency, though its circumstances are unique. Conversely, threshold capability is destabilizing when it is opaque, when verification is contested, and when regional rivals lack comparable capabilities or alliances. The regime's erosion is also conditional: it accelerates when P5 members disagree on enforcement, when disarmament obligations under Article VI are perceived as unfulfilled, and when the IAEA is politicized; it slows when verification is strengthened, when security guarantees are credible, and when nuclear-armed states demonstrate restraint. Jacques Hymans's work on national identity and nuclear proliferation suggests that hedging is not purely strategic; it is also shaped by a state's self-conception as modern, sovereign, and technologically capable. Etel Solingen's research on political economy suggests that inward-looking, nationalist coalitions are more likely to pursue nuclear options than internationally integrated, market-oriented coalitions. These scope conditions imply that latency is a political phenomenon as much as a technical one.

Observable Implications: One should observe threshold dynamics in several indicators. Rising enrichment capacity and declining breakout time are direct measures, though estimates depend on assumptions about facility configuration and state intent. Reduced IAEA access, disputes over undeclared sites, and Board of Governors censures indicate verification stress. Regional hedging appears as new nuclear-cooperation agreements, missile programs, and statements by leaders that they will match a rival's capability. At the regime level, NPT Review Conferences that end without consensus, growing support for the Treaty on the Prohibition of Nuclear Weapons among non-nuclear states, and debates over the Additional Protocol reveal normative strain. If the threshold problem is being managed, one should observe strengthened safeguards, voluntary limits on enrichment, and regional security dialogues; if it is worsening, one should observe competitive latency, opaque programs, and institutional paralysis. The key analytical task is to distinguish a state's capability from its intent: latency is observable, intent is inferred, and policy errors arise when analysts conflate the two. Analysts should therefore treat breakout timelines as scenario-dependent estimates rather than objective facts, and should examine whether a state's fuel-cycle investments are proportionate to

its civilian energy needs.

Perspective Note (five traditions in brief): The African perspective is central to understanding the threshold problem because African states have chosen collective renunciation through the Pelindaba Treaty and have been prominent supporters of the TPNW. From this vantage point, the threshold state is not merely a technical problem of latency; it is a symptom of an unjust order in which nuclear-armed states retain weapons and extend deterrence while demanding that others remain non-nuclear. African scholarship emphasizes that the NPT's legitimacy depends on reciprocity: nonproliferation must be matched by disarmament and by equitable access to peaceful technology. The Middle East threshold debate, in this view, exposes the treaty's double standard and reinforces African demands for a genuinely non-discriminatory regime. The Chinese perspective supports the NPT and opposes proliferation, but it stresses that peaceful nuclear energy is a right of all states and that verification must not become a tool of coercion. Beijing sees threshold anxieties as partly manufactured by Western pressure and argues that security dilemmas, not technology alone, drive hedging; it favors diplomatic solutions and regional security frameworks over sanctions. The Russian perspective, informed by its P5+1 role, acknowledges the dangers of unchecked latency but frames the NPT crisis as a consequence of US unilateralism and the failure to address legitimate security concerns. Moscow supports nonproliferation while resisting enforcement mechanisms that bypass the Security Council and insists that disarmament obligations apply to all nuclear-armed states. The Western perspective treats threshold capability as a direct threat to nonproliferation and regional stability; it emphasizes verification, export controls, and the possibility of military action to prevent weaponization, while debating whether engagement or pressure is more effective. The UN perspective, through the IAEA and NPT review process, seeks to strengthen safeguards and promote universal adherence, but its effectiveness depends on member-state cooperation and P5 consensus; the threshold problem thus highlights both the technical competence and the political limits of the UN framework.

2.7 FIVE PERSPECTIVES IN DEPTH

2.7.1 African Perspective (PRIMARY)

The African perspective on nuclear proliferation and deterrence in West Asia begins from a historical and epistemic position that treats the global nuclear order not as a neutral security architecture but as an extension of imperial hierarchy. From this vantage point, the Non-Proliferation Treaty (NPT) is not simply a technical bargain among states; it is a stratified order in which nuclear-armed states retain their arsenals while non-nuclear states are asked to renounce them, and in which enforcement has historically fallen most heavily on states in the Global South. African scholarship supplies the conceptual vocabulary for this critique. Nkrumah's analysis of neo-colonialism, Rodney's account of how Europe underdeveloped Africa, and Fanon's critique of colonial violence all frame nuclear hierarchy as part of a longer history in which security is distributed unevenly and sovereignty is qualified by race, power, and economic dependence. Cabral's insistence that liberation requires both material and epistemic emancipation, and Nyerere's emphasis on self-reliance, help explain why African states have often treated access to peaceful nuclear technology and sovereign decision-making as non-negotiable, even while supporting nonproliferation. Mamdani's work on the bifurcated state, Bayart's analysis of extraversion, and Grovogui's critique of international legal sovereignty show how African states operate within an international system whose rules were not authored by them and whose enforcement mechanisms can reproduce subordination. Mbembe's reflections on necropolitics and the distribution of death, Oyěwùmí's critique of colonial epistemologies, and Tamale's decolonial feminist scholarship add

further layers: the nuclear order is not only about weapons but about whose lives are rendered expendable, whose knowledge counts as expertise, and whose security is treated as universal.

This perspective is shaped by direct African experience of nuclear danger. French nuclear testing in the Sahara, the colonial extraction of uranium in the Congo and Niger, and the apartheid-era South African nuclear program all demonstrate that Africa has been both a site of nuclear harm and a site of nuclear ambition. South Africa's unique history—building nuclear weapons under apartheid and then dismantling them during the transition to majority rule—gives African diplomacy a distinctive credibility. It shows that renunciation is possible, but also that it occurred under exceptional political conditions and cannot be abstracted from the end of white minority rule. The Pelindaba Treaty, which established an African Nuclear-Weapon-Free Zone, reflects a regional commitment to nonproliferation that is not merely derivative of Western priorities. It is an African legal achievement, grounded in the view that security is better served by collective renunciation than by competitive armament. African states have also been prominent supporters of the Treaty on the Prohibition of Nuclear Weapons, not because they reject security, but because they regard the NPT's disarmament pillar as unfulfilled and the nuclear order as morally asymmetrical.

Applied to Iran's nuclear program, the African perspective is neither automatically sympathetic to Tehran nor automatically aligned with Western nonproliferation enforcement. It begins by affirming Article IV of the NPT, which recognizes the inalienable right of parties to develop peaceful nuclear energy. African states have often defended this right for developing countries, including Iran, because restrictions on peaceful technology can function as a form of technological gatekeeping. At the same time, African diplomacy has generally supported the NPT's nonproliferation pillar and has expressed concern about any move toward weaponization that could destabilize regions far beyond West Asia. The African vantage point is therefore suspicious of claims that rest on intelligence assessments whose credibility has been damaged by the Iraq WMD experience, but it is not indifferent to proliferation risk. It asks whether enforcement is even-handed: why Israel's undeclared nuclear arsenal is treated as a settled fact while Iran's program is subjected to exceptional scrutiny; why the Middle East Nuclear-Weapon-Free Zone, first proposed in 1974, remains unimplemented; and why disarmament obligations under Article VI are treated as aspirational while nonproliferation obligations are treated as enforceable. Aning and Danso's work on African security governance is relevant here: African states often favor multilateral, rules-based approaches, but they are acutely aware that multilateralism can be captured by powerful states.

On the JCPOA, the African perspective generally welcomed the agreement as a rare instance of sustained multilateral diplomacy. It represented a negotiated compromise among the P5+1 and Iran, backed by United Nations Security Council Resolution 2231, and it offered a model in which verification and diplomacy could substitute for coercion. African states and the African Union have tended to support such arrangements because they reduce the risk of war and because they affirm the principle that disputes should be resolved through institutions rather than unilateral force. Yet the African critique also notes the exclusivity of the P5+1 format: a treaty regime that claims universality was negotiated by a small group of powerful states, with the affected region and the broader Global South largely absent from the table. This is not merely procedural. It reflects a deeper concern that nuclear governance is conducted by those who possess weapons, not by those who bear the consequences of proliferation or war. The JCPOA's verification architecture—IAEA monitoring, centrifuge limits, stockpile caps, and the Additional Protocol—can be accepted as necessary, but the African perspective insists that verification must not become a vehicle for permanent subordination or for the denial of peaceful technology.

The US withdrawal from the JCPOA in 2018 and the subsequent reimposition of sanctions are viewed from

this perspective as a breach of multilateral trust. The snapback mechanism, in particular, is seen as a coercive instrument that allows one party to reimpose sanctions even when it has itself abandoned the agreement. African states have frequently criticized unilateral sanctions as instruments that harm civilian populations and undermine development, and they are likely to view the collapse of the JCPOA through that lens. Iran's subsequent steps away from compliance—higher enrichment levels, reduced transparency, and the accumulation of enriched uranium—are interpreted not as inexplicable defiance but as a predictable response to a broken bargain. This does not mean the African perspective excuses proliferation; rather, it treats compliance as reciprocal. When the party with greater power withdraws from commitments, the weaker party's restraint becomes politically unsustainable. The lesson drawn is that nonproliferation cannot be sustained by pressure alone; it requires credible commitments from all sides, including the nuclear-armed states.

Extended deterrence in the Middle East is read by the African perspective as a system of hierarchical protection. Israel's policy of nuclear ambiguity, tolerated for decades by the United States and other Western powers, is seen as emblematic of nuclear apartheid: a state outside the NPT retains an undeclared arsenal while a state inside the NPT is pressured to forgo even latent capability. US security guarantees to Israel and to Gulf partners are understood as hegemonic stabilizers that may prevent some forms of proliferation but also entrench dependence and asymmetry. The Saudi nuclear question—whether a civilian program could become a military one—is therefore not treated as a purely technical matter. It is seen as a consequence of an unequal order in which some states are permitted hedging and others are not. African diplomacy has long supported the establishment of a Middle East Nuclear-Weapon-Free Zone, and from this perspective the failure to create such a zone is a major source of regional insecurity. The African contribution is to insist that extended deterrence cannot be a substitute for disarmament and that regional security requires the inclusion of all states, including Israel, in a common nonproliferation framework.

The threshold state problem—states that acquire latent capability without crossing the weaponization line—poses a special challenge for the African perspective. On one hand, African states recognize that hedging is a rational response to insecurity in a world where nuclear-armed states retain their arsenals and where security guarantees are selective. On the other hand, they fear that threshold logic can be used to justify indefinite non-disarmament by the nuclear-armed states: if everyone is potentially a threshold state, then no one is obliged to disarm. The African perspective therefore supports universal disarmament, security guarantees for non-nuclear states, and the strengthening of NWFZs as alternatives to competitive hedging. It also emphasizes that proliferation cascades are not merely technical chains but political signals: when one state hedges, others may follow, not because they want weapons but because they do not trust the order to protect them. The African vantage point reveals what the other perspectives often miss: the nuclear order's legitimacy depends on its perceived fairness, and its enforcement is experienced differently by states that have historically been objects of international power rather than authors of it.

What the African perspective contributes that the others cannot is a historically grounded critique of hierarchy, a defense of sovereign equality, and a insistence that nonproliferation be coupled with disarmament. It brings the memory of colonial nuclear harm, the example of South African renunciation, and the legal achievement of Pelindaba into the analysis of West Asia. It also reframes the threshold problem as a problem of global justice rather than merely of technical latency. What it may occlude is the immediacy of regional security dilemmas: the African perspective can understate the specific threats that Iran's program poses to its neighbors, the role of sectarian and proxy conflicts in shaping nuclear incentives, and the practical requirements of verification in a low-trust environment. It may also romanticize sovereignty in ways that do not fully address the risks of state capture, authoritarianism, or regional hegemony. Moreover, while African states have strong normative credentials, their capacity to enforce nonproliferation or to provide se-

curity guarantees is limited, and their own compliance records, though generally strong, are not immune to political pressure. The African perspective is therefore best understood not as a denial of nonproliferation but as a demand that nonproliferation be embedded in a broader project of decolonizing international security.

2.7.2 Chinese Perspective

China's perspective on nuclear proliferation and deterrence in West Asia is shaped by a combination of nonproliferation commitments, energy security interests, strategic partnership with Iran, and a broader commitment to multipolarity. Beijing is a nuclear-armed state and a permanent member of the Security Council, but its nuclear doctrine has traditionally emphasized minimum deterrence and a no-first-use policy. China supports the NPT and opposes the spread of nuclear weapons, yet it also resists what it regards as unilateral enforcement, regime change, and the use of nonproliferation as a pretext for hegemony. In the West Asian context, this produces a distinctive position: China is a nonproliferation stakeholder, but it is also a strategic and economic partner of Iran and a major consumer of Gulf energy.

On Iran's nuclear program, China has generally defended the right to peaceful nuclear energy under Article IV while calling for compliance with safeguards and IAEA verification. It participated in the P5+1 negotiations and supported the JCPOA as a diplomatic solution that balanced nonproliferation with Iran's legitimate energy needs. Beijing opposed the US withdrawal in 2018 and criticized the reimposition of unilateral sanctions, arguing that the deal was endorsed by the Security Council and should be preserved. At the same time, China has not been willing to sever economic ties with Iran, and its approach has emphasized continued trade, infrastructure cooperation, and diplomatic engagement rather than coercive pressure. This reflects a broader Chinese preference for stability through economic interdependence and for resolving disputes through negotiation rather than sanctions or force.

Extended deterrence in the Middle East is viewed with skepticism from Beijing. China is wary of US security guarantees as instruments of alliance politics and of missile defense systems that it believes can undermine strategic stability. It does not share the Western assumption that US extended deterrence is an unambiguous public good. Instead, China tends to favor regional de-escalation, dialogue, and the reduction of external military footprints. The 2023 Saudi-Iran rapprochement, brokered in part by China, is consistent with this approach: Beijing sees reduced regional tension as the best way to lower proliferation incentives. On the Saudi nuclear question, China supports civilian nuclear cooperation but opposes weaponization, and it is likely to emphasize IAEA safeguards and the peaceful-use provisions of the NPT. However, China's own strategic interests—energy security, Belt and Road connectivity, and competition with the United States—shape how firmly it presses any party.

The threshold state problem is approached by China as a matter of balance. Beijing opposes weaponization and supports verification, but it also insists that nonproliferation must not be used to deny developing states access to peaceful technology or to impose discriminatory standards. It is likely to view Iranian hedging as a response to insecurity and to Western pressure, while still urging restraint. China's contribution is to provide an alternative to coercive nonproliferation: diplomatic engagement, economic incentives, and multipolar mediation. Its occlusion is that it may understate the risks of Iranian regional behavior, be reluctant to impose costs on a strategic partner, and prioritize its own economic and geopolitical interests over strict enforcement. China's perspective thus adds a crucial non-Western great-power voice, but one that is itself shaped by strategic competition and by a preference for order over accountability.

2.7.3 Russian Perspective

Russia's perspective on nuclear proliferation and deterrence in West Asia is rooted in its role as a P5+1

member, its long-standing relationship with Iran, and its broader commitment to multipolarity. Moscow supports nonproliferation in principle and has cooperated with Iran on civilian nuclear projects, most notably the Bushehr reactor. At the same time, Russia opposes unilateral enforcement, regime change, and the use of nonproliferation as a tool of Western hegemony. It views the NPT as a cornerstone of international order but insists that disarmament obligations apply to all nuclear-armed states, including the United States and its allies.

On Iran's nuclear program, Russia has generally argued that Tehran has the right to peaceful nuclear energy and that concerns should be addressed through the IAEA rather than through sanctions or threats of force. Moscow supported the JCPOA and criticized the US withdrawal, seeing it as a destabilizing act that undermined multilateral diplomacy. Russia has also been skeptical of snapback sanctions, viewing them as a mechanism that can be abused by states that have themselves abandoned the agreement. In this respect, Russia's position overlaps with China's and with broader Global South critiques of unilateralism, though it is driven more by great-power competition and by Russia's desire to preserve its influence in West Asia.

Extended deterrence is interpreted by Russia as part of a US-led security architecture that it seeks to balance. Moscow is critical of US guarantees to Israel and Gulf states, and it views Israeli nuclear ambiguity as an unresolved problem that undermines the credibility of nonproliferation norms. Russia does not necessarily oppose regional security arrangements, but it insists that they should not be dominated by the United States or used to isolate Iran. On the Saudi nuclear question, Russia is likely to support civilian cooperation while opposing weaponization, but its position will be shaped by its competition with the United States for influence in the Gulf and by its interest in maintaining working relationships with all regional actors.

The threshold state problem is seen by Russia as manageable if weaponization is prevented, but also as a symptom of a deeper failure: the nuclear-armed states have not disarmed, and non-nuclear states therefore have incentives to hedge. Russia emphasizes security guarantees, regional dialogue, and the role of the IAEA, while resisting enforcement mechanisms that bypass the Security Council. Its contribution is to provide a counterweight to Western dominance and to insist that nonproliferation be linked to disarmament. Its occlusion is that it may understate verification concerns, use Iran as leverage in great-power competition, and prioritize geopolitical positioning over regional stability. Russia's perspective is thus both a genuine nonproliferation voice and a strategic instrument in a multipolar contest.

2.7.4 Western Perspective

The Western perspective on nuclear proliferation and deterrence in West Asia treats the prevention of an Iranian nuclear weapon as a central security priority. It is shaped by the US-Israel alliance, European nonproliferation commitments, and a long history of concern about proliferation in the Middle East. Western states generally support the NPT, IAEA safeguards, and export controls, and they have been the primary architects of sanctions regimes targeting Iran's nuclear program. The Western view is not monolithic: it includes both advocates of engagement, who supported the JCPOA, and advocates of pressure, who favored maximum sanctions and the threat of force. But both camps share the premise that Iranian nuclear capability is a direct threat to regional and global security.

On Iran's program, Western analysis emphasizes enrichment levels, centrifuge capacity, stockpiles of enriched uranium, and breakout timelines. It treats latent capability as dangerous because it can be converted into weapons relatively quickly and because it may trigger regional proliferation. The JCPOA is debated within the West as either a successful example of verification-based restraint or a flawed agreement that delayed but did not eliminate the risk. The US withdrawal in 2018 is defended by some as necessary to address

the deal's sunset clauses and regional behavior, and criticized by others as a strategic error that accelerated Iran's nuclear advances. Snapback sanctions are viewed by proponents as a legitimate enforcement tool and by critics as a coercive measure that undermines diplomacy.

Extended deterrence is a core element of the Western approach. The United States provides security guarantees to Israel and to Gulf partners, and Israel's nuclear ambiguity has long been tolerated as part of a regional balance. The Saudi nuclear question is treated with concern: Western policymakers worry that a Saudi civilian program could become a military one, especially if Iran crosses the threshold. The Western perspective therefore emphasizes verification, export controls, and the possibility of military action to prevent weaponization. It also supports the idea of a Middle East Nuclear-Weapon-Free Zone in principle, but often conditions it on regional peace and on Israel's security concerns.

The threshold state problem is seen by the West as a direct challenge to nonproliferation. Hedging is treated not as a rational response to insecurity but as a dangerous step toward weaponization. The Western perspective contributes technical expertise, verification capacity, and a willingness to enforce norms. Its occlusion is that it can understate the role of Western double standards—particularly regarding Israel's arsenal and the disarmament obligations of nuclear-armed states—and it can overstate the efficacy of coercion. It may also treat regional security dilemmas as problems to be managed by external power rather than as issues requiring inclusive regional dialogue. The Western perspective is thus powerful but partial: it sees the nuclear threat clearly, but it often sees it from the standpoint of those who already possess the weapons.

2.7.5 UN Perspective

The UN perspective on nuclear proliferation and deterrence in West Asia is institutional, legal, and technical. It is expressed through the IAEA, the NPT review process, and the Security Council. The UN does not have a single strategic interest in the way that states do; rather, it seeks to uphold a rules-based order based on universal norms, verification, and collective security. Its central tools are safeguards agreements, Additional Protocols, NPT review conferences, and Security Council resolutions such as 1696, 1737, 1929, and 2231. The UN perspective treats nonproliferation as a global public good and views the IAEA as the technical authority on verification.

On Iran's program, the UN perspective is embodied in IAEA reports and in Security Council resolutions demanding suspension of enrichment and compliance with safeguards. The JCPOA was endorsed by Resolution 2231, and the IAEA was tasked with monitoring Iran's commitments. When the United States withdrew and Iran reduced compliance, the UN framework was strained: the IAEA continued to report on Iran's nuclear activities, but the political consensus behind the deal fractured. The UN perspective emphasizes that verification is possible and necessary, but that its effectiveness depends on member-state cooperation and on the willingness of the P5 to sustain consensus. Snapback mechanisms and sanctions are seen as legal instruments, but their legitimacy depends on whether they are applied consistently and in accordance with the Charter.

Extended deterrence is not a UN concept in the same way it is a state strategy, but the UN has long supported Nuclear-Weapon-Free Zones, including in the Middle East. The failure to establish such a zone, despite decades of resolutions, illustrates the gap between normative aspiration and political reality. The UN perspective on the Saudi nuclear question is to insist on safeguards, transparency, and the peaceful-use provisions of the NPT. It does not have the power to prevent hedging, but it can provide the technical and legal framework within which hedging is monitored and, ideally, constrained.

The threshold state problem highlights both the strengths and limits of the UN system. Technically, the

IAEA can monitor enrichment, inspect facilities, and detect diversion. Politically, however, the UN cannot resolve the security dilemmas that drive hedging, nor can it compel nuclear-armed states to disarm. The NPT review process provides a forum for debate, but its outcomes depend on consensus among states with divergent interests. The UN perspective contributes legitimacy, technical competence, and a universalist framework. Its occlusion is that it can become procedurally focused, treating verification as a substitute for political settlement, and that it is vulnerable to P5 deadlock. In the case of West Asia, the UN can document proliferation risks and uphold norms, but it cannot by itself reconcile the competing claims of sovereignty, security, and justice that define the region's nuclear dilemma.

SECTION 2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Exposes the asymmetry of the NPT by contrasting African non-nuclear status under Pelindaba with the continued nuclear arsenals of the P5; frames TPNW as a corrective to unequal nuclear order; insists that West Asian proliferation cannot be separated from disarmament failure and technological inequity.	May understate the immediate security dilemma driving Iranian hedging and the coercive value of sanctions; can treat regional actors as symptoms rather than agents.	Nuclear justice, sovereign equality, and universal disarmament; non-proliferation must be paired with disarmament and equitable access to peaceful technology.	Pelindaba Treaty; African support for TPNW; NPT RevCon debates over Article VI; African non-nuclear regional status.	Western perspective: an asymmetry critique does not by itself prevent breakout or verify compliance; disarmament-first framing may delay urgent non-proliferation measures.

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Chinese	Supports multilateral diplomacy and the JCPOA; opposes unilateral withdrawal and extraterritorial sanctions; frames non-proliferation as compatible with strategic partnership, development, and multipolar stability.	May understate Iranian enrichment advances and the coercive risks of a threshold state; can subordinate verification concerns to geopolitical competition with the United States.	Multipolar order, sovereignty, and negotiated settlement; non-proliferation through diplomacy rather than coercion.	Chinese support for UNSC Resolution 2231; JCPOA participation; IAEA engagement; strategic partnership with Iran.	Western perspective: prioritizing partnership over enforcement can dilute pressure needed to reverse Iranian noncompli-ance.
Russian	Acts as P5+1 member and JCPOA negotiator; opposes unilateral sanctions and snapback; frames US withdrawal as damaging to non-proliferation and to great-power concert.	May instrumentalize Iran in broader competition with the United States; can obscure Russian interests in maintaining leverage and in a multipolar balance.	Great-power concert, anti-unilateralism, and multipolarity; non-proliferation through collective security rather than hegemonic enforcement.	Russian role in P5+1; support for UNSC Resolution 2231; opposition to US snapback claims.	Western perspective: Russian obstruction of snapback and sanctions enforcement weakens the credibility of the NPT compliance regime.

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Western	Builds the JCPOA verification architecture; uses sanctions and diplomacy to constrain Iran; frames non-proliferation as central to regional and global security.	Often occludes the NPT's asymmetry, Israel's nuclear ambiguity, and the coercive effects of sanctions; can treat Iranian behavior as the sole source of instability.	Rules-based order, non-proliferation, and verification; security through compliance and deterrence.	IAEA reports; UNSC Resolutions 1696, 1737, 1929, 2231; JCPOA text and verification provisions.	African perspective: Western non-proliferation is undermined by double standards and by the failure of nuclear-armed states to disarm.
UN	Provides safeguards, inspections, RevCon forums, and Security Council resolutions; supplies technical legitimacy and universalist norms.	Can become procedurally focused, treating verification as a substitute for political settlement; vulnerable to P5 deadlock and selective enforcement.	Universal norms, technical verification, and multilateral legitimacy; non-proliferation through institutional process.	IAEA Director General reports; NPT RevCon documentation; UNSC Resolutions 1696, 1737, 1929, 2231.	Russian perspective: UN mechanisms can be instrumentalized by powerful states to impose unilateral preferences under multilateral cover.

SECTION 2.8 WORKED EXAMPLE (I do)

Case: The JCPOA collapse, 2018–2025

The case is the unraveling of the Joint Comprehensive Plan of Action after the United States withdrew in 2018 and Iran's subsequent step-by-step departure from compliance, producing by the mid-2020s a threshold-state dilemma in which Iran retained advanced enrichment capability, growing stockpiles, and reduced IAEA access without having crossed the declared threshold of weaponization. The puzzle is not simply that a deal failed; it is why a verification-for-relief bargain collapsed into a reciprocal noncompliance spiral that increased uncertainty for all actors while leaving the underlying security dilemma unresolved.

Levels of analysis. At the individual level, the collapse was shaped by leaders' beliefs, risk tolerance, and domestic coalitions. The US decision to withdraw in 2018 reflected a judgment that the JCPOA's sunset clauses and limited scope made it insufficient, combined with domestic political incentives to repudiate a predecessor's signature achievement. Iranian leaders' responses were filtered through factional competition

between pragmatists and hardliners, with the latter gaining credibility as sanctions returned and verification benefits eroded. Israeli leaders, particularly those who viewed Iran's regional posture as an existential threat, pressed for a harder line and treated ambiguity about Iran's program as intolerable. At the state level, the case is a security dilemma among Iran, the United States, Israel, and Saudi Arabia. Iran's nuclear program functioned as a hedge against regime insecurity, regional encirclement, and the memory of the Iran-Iraq war; the United States sought to prevent proliferation while preserving regional primacy; Israel maintained its own ambiguous deterrent and demanded that Iran not acquire a comparable capability; Saudi Arabia watched the collapse as a signal that hedging, including civilian nuclear development, might become necessary. At the systemic level, the JCPOA was a product of P5+1 concert in a period of relative great-power cooperation; its collapse tracked the broader erosion of that concert into multipolar competition. The NPT regime provided the legal framework, but its asymmetry—nuclear-armed states retaining arsenals while demanding non-proliferation from others—limited its legitimacy in Tehran and in much of the Global South. At the transnational level, the IAEA's safeguards system supplied information and verification routines; procurement networks and sanctions-evasion channels shaped Iran's technical options; and transnational scientific, financial, and advocacy networks transmitted both constraints and opportunities. The collapse therefore cannot be explained by any single level: individual decisions triggered it, state security dilemmas sustained it, systemic competition removed the diplomatic scaffolding, and transnational verification and technology networks determined how much uncertainty remained.

Mechanism. The central mechanism is a reciprocal noncompliance spiral driven by the removal of one side of a conditional bargain. The JCPOA linked Iranian nuclear restraint and enhanced IAEA access to phased sanctions relief and reintegration into the global economy. When the United States withdrew and reimposed sanctions, the benefit side of the bargain collapsed while the compliance side initially held. Iran then used incremental noncompliance—raising enrichment levels, expanding centrifuge deployment, and restricting inspector access—as leverage to restore the bargain or to impose costs on the withdrawing party. Each Iranian step shortened estimated breakout timelines and degraded the information available to the IAEA, which in turn increased threat perception in Washington, Jerusalem, and Riyadh. The mechanism is not merely tit-for-tat; it is an information-degradation spiral: as verification access narrows, uncertainty rises, worst-case planning becomes more likely, and coercive options gain political support. Sanctions added economic pressure but did not reverse the technical trajectory; instead, they strengthened domestic actors who argued that compliance had purchased no security. The result was a threshold state: Iran acquired much of the latency and capability associated with a nuclear-armed state without a declared weapon, while the international community lost confidence in its ability to detect a dash to a bomb. This is the core dilemma: the deal's collapse did not restore the pre-2015 status quo; it created a more dangerous intermediate condition in which capability and uncertainty both increased.

Perspective reconstruction. The African perspective, which is primary in this lesson, reads the JCPOA collapse as a symptom of an unequal nuclear order rather than as a technical failure of one agreement. From this vantage point, the NPT's bargain—non-proliferation in exchange for disarmament and peaceful technology access—has been honored asymmetrically: African states and much of the Global South have renounced nuclear weapons, including through regional nuclear-weapon-free zones such as Pelindaba, while the P5 have retained and modernized their arsenals. The collapse of the JCPOA therefore confirms a long-standing critique: non-proliferation obligations are enforced coercively against weaker states, while disarmament obligations are treated as aspirational. African scholarship and diplomacy emphasize that West Asian proliferation risks cannot be separated from this legitimacy deficit; a regime that demands restraint without delivering disarmament or equitable development will be perceived as hierarchical. The African perspective

also highlights the Treaty on the Prohibition of Nuclear Weapons as an attempt to reassert the normative equality that the NPT has failed to secure. Its contribution is to show that the JCPOA's collapse was not only a strategic failure but a legitimacy crisis: Iran could frame its hedging as resistance to an unequal order, and African states could read the episode as evidence that nuclear governance remains structured by power rather than by law. What this perspective can occlude is the immediate security dilemma and the coercive value of verification; it may underweight the fact that Iranian hedging, whatever its normative framing, increases regional insecurity and could trigger cascading proliferation.

The Chinese perspective treats the collapse as a case of unilateralism undermining a multilateral settlement. Beijing supported the JCPOA, participated in the P5+1, and has maintained a strategic partnership with Iran; it opposes extraterritorial sanctions and frames the US withdrawal as destabilizing. From this view, the deal's architecture was sound, and its failure resulted from the abandonment of diplomacy by one party. China emphasizes sovereignty, negotiated settlement, and multipolar stability, and it supports IAEA verification while resisting the use of safeguards as a tool of coercion. Its contribution is to keep open a diplomatic channel and to model non-proliferation without regime change. Its occlusion is that it may understate Iran's enrichment advances and the risks of a threshold state, and it can subordinate verification concerns to geopolitical competition with the United States.

The Russian perspective, as a P5+1 member and co-negotiator of Resolution 2231, frames the collapse as damaging to both non-proliferation and great-power concert. Moscow opposes unilateral sanctions and snapback, arguing that the United States cannot invoke mechanisms of a deal it abandoned. Russia's multipolarity framing treats the episode as evidence of US hegemonic overreach and of the need for a more balanced international order. Its contribution is to defend multilateral process and to resist the unilateralization of sanctions. Its occlusion is that it may instrumentalize Iran in broader competition with the United States, and it can obscure Russian interests in maintaining leverage and in preventing a US-Iran rapprochement that might reduce Moscow's regional role.

The Western perspective, particularly in the United States and Europe, centers on non-proliferation, verification, and the JCPOA as the best available instrument for constraining Iran's program. It treats the deal's collapse as a strategic error or, in some variants, as a necessary correction to an agreement with sunset clauses and insufficient scope. The Western contribution is to foreground the technical and institutional mechanisms—IAEA access, enrichment limits, stockpile caps, and sanctions leverage—that made the JCPOA valuable. Its occlusion is that it often treats Iranian behavior as the primary source of instability while underweighting the NPT's asymmetry, Israel's nuclear ambiguity, and the coercive effects of sanctions on Iranian domestic politics. The Western debate over whether withdrawal was a mistake or a correction remains unresolved, but both sides generally agree that a threshold Iran is dangerous.

The UN perspective treats the collapse through the lens of safeguards, Security Council authority, and the NPT review process. IAEA Director General reports documented Iran's enrichment levels, stockpiles, and access restrictions; UNSC Resolution 2231 provided the legal framework for the deal and its termination provisions. The UN contribution is technical legitimacy: it can establish facts, monitor compliance, and provide a forum for debate. Its occlusion is that it can become procedurally focused, treating verification as a substitute for political settlement, and that it is vulnerable to P5 deadlock. In this case, the UN could document the erosion of compliance but could not compel the parties to restore the bargain or resolve the security dilemma that drove hedging.

Explicit adjudication. No single perspective fully explains the JCPOA collapse. The Western perspective best captures the institutional mechanism: the deal's value lay in verifiable constraints, and its collapse

removed those constraints while leaving Iran's technical capacity intact. The UN perspective adds indispensable factual grounding through IAEA reporting and Security Council resolutions. However, both tend to treat the crisis as a compliance problem and understate the normative and geopolitical conditions that made compliance fragile. The African perspective best explains why the regime lacked legitimacy in Tehran and in much of the Global South: an order that enforces non-proliferation while tolerating nuclear-armed states' arsenals and regional double standards invites hedging as resistance. The Chinese and Russian perspectives best explain the systemic context: the collapse occurred as great-power concert gave way to multipolar competition, and unilateral withdrawal destroyed the diplomatic scaffolding that had made verification politically sustainable. The most defensible adjudication is therefore layered: the Western and UN perspectives best explain the proximate mechanism of collapse and the resulting threshold-state dilemma; the African perspective best explains the normative deficit that weakened compliance incentives; and the Chinese and Russian perspectives best explain why the external environment no longer supported a negotiated settlement. What this adjudication misses is the full weight of individual-level agency—leaders' choices were not fully determined by structure or normative critique—and the possibility that a different US strategy might have preserved the bargain even under multipolar competition. The case thus supports a multi-level, multi-perspective explanation in which mechanism and legitimacy are jointly necessary: verification can manage proliferation risks only when embedded in a political order that actors perceive as legitimate.

2.9 PROBLEM PAIR (We do)

Tasks

1. Define the 2023 Saudi–Iran rapprochement and identify the principal mechanism through which a Saudi civilian nuclear program could become relevant to a regional proliferation cascade.

2. Reconstruct how the African, Chinese, Russian, Western, and UN perspectives would interpret the nuclear implications of the rapprochement.

3. Specify the scope conditions under which a Saudi civilian program would remain genuinely civilian, and those under which it would become hedging or a weapons pathway.

4. Compare the Saudi case with at least one historical analogue of nuclear latency and state what transfers and what does not.

5. Identify observable indicators that would falsify the claim that diplomatic normalization has removed Saudi nuclear incentives.

6. Adjudicate whether the greater risk is Saudi breakout, Iranian threshold consolidation, or erosion of the NPT regime.

MODEL ANSWER

The 2023 Saudi–Iran rapprochement reduced immediate diplomatic hostility and reopened channels for regional de-escalation, but it did not resolve the structural security dilemma that makes nuclear latency politically valuable. The principal mechanism is not that a civilian program automatically becomes a bomb

program; rather, civilian nuclear infrastructure can create a latent capability whose military significance depends on fuel-cycle scope, safeguards depth, alliance credibility, and threat perception. A reactor program using imported fuel and robust IAEA safeguards creates little direct breakout capacity, whereas domestic enrichment, reprocessing, or fuel-fabrication ambitions shorten the timeline between civilian and military use. In a region where Iran has already moved to threshold status, Saudi Arabia may view nuclear latency as insurance even if it does not intend immediate weaponization. This is the hedging logic: states acquire reversible capabilities that reduce future uncertainty without crossing the NPT line today. The rapprochement may lower the probability of acute crisis, but it does not necessarily eliminate the incentive to hedge against Iranian consolidation, American retrenchment, or Israeli ambiguity.

From the African perspective, the case illustrates the asymmetry of the NPT order: non-nuclear states are asked to accept permanent vulnerability while nuclear-armed states retain arsenals and extended deterrence. African scholarship and diplomacy, including the Pelindaba Treaty and support for the Treaty on the Prohibition of Nuclear Weapons, would frame the Saudi question as part of a broader demand for disarmament rather than merely nonproliferation. The Chinese perspective would emphasize stability, nonproliferation, and strategic partnership with Iran, while also valuing Saudi energy and economic ties; Beijing would likely support civilian nuclear cooperation under safeguards but resist any regional arms race that threatens Belt and Road corridors. The Russian perspective would invoke multipolarity and the P5+1 legacy, arguing that Iran's rights under the NPT must be respected and that Western pressure has driven proliferation risks; Moscow would be skeptical of unilateral Western guarantees and attentive to opportunities for nuclear commerce. The Western perspective would treat the JCPOA collapse as a cautionary case, prioritizing prevention of Iranian breakout and reassurance of Gulf partners through extended deterrence, while debating whether Saudi nuclear latency is an acceptable price for regional stability. The UN perspective would center IAEA safeguards, NPT RevCon obligations, and Security Council resolutions, insisting that verification and legal commitments—not geopolitical bargains—determine legitimacy.

The scope conditions for a genuinely civilian Saudi program include three constraints. First, the fuel cycle must be limited to reactors and imported fuel, with no domestic enrichment or reprocessing, or with multinational fuel-cycle arrangements that deny unilateral control. Second, IAEA safeguards must be comprehensive, including the Additional Protocol and, ideally, voluntary transparency measures that reduce ambiguity. Third, the security environment must provide credible alternatives to self-help, whether through a durable US guarantee, regional confidence-building, or a credible Middle East nuclear-weapon-free-zone process. If these conditions hold, the program is best understood as energy policy with manageable proliferation risk. If they fail—if Saudi Arabia seeks fuel-cycle autonomy, resists intrusive verification, or perceives Iranian threshold status as irreversible—the same infrastructure becomes a hedging platform. The transition from hedging to weapons would require not only technical capacity but political decisions, and those decisions are more likely when alliance credibility is doubted and regional threats are salient.

Historical analogues suggest that latency can be stabilized. Japan and South Korea demonstrate that advanced civilian nuclear capabilities can coexist with non-weaponization when alliance credibility, domestic nonproliferation norms, and supplier constraints are strong. However, the Saudi case differs in important respects: it lacks Japan's industrial depth, its alliance commitments are more politically contested, and its regional environment is more volatile. The analogy therefore transfers at the level of mechanism—latency is politically contingent—but not at the level of prediction. Saudi Arabia is not predetermined to follow either the Japanese path of restraint or the Pakistani path of proliferation; the outcome depends on whether the rapprochement produces institutionalized verification and credible security guarantees or merely pauses competition.

Falsifiers of the claim that rapprochement has removed Saudi nuclear incentives would include Saudi pursuit of enrichment or reprocessing, refusal to adopt the Additional Protocol, ambiguous official statements about matching Iranian capabilities, or new nuclear cooperation with suppliers that do not require the gold standard. Conversely, evidence that Saudi Arabia accepts fuel-cycle limits, deepens IAEA cooperation, and frames its program within a regional nonproliferation initiative would weaken the hedging interpretation. The greater risk is not an imminent Saudi bomb but the interaction of Iranian threshold status, Saudi hedging, and NPT erosion. If multiple regional actors acquire latent capabilities, the regime shifts from prohibition to managed ambiguity, making future crises harder to verify and control. Thus the rapprochement is best treated as a necessary but insufficient condition for nonproliferation: it can reduce bilateral tension, but only fuel-cycle limits, safeguards, and credible security guarantees can prevent civilian infrastructure from becoming a strategic hedge.

2.10 INDEPENDENT MEMO (You do)

Instructions only. Do not write a sample memo.

(a) Case description (150–200 words):
In 2024, a Gulf state with no indigenous enrichment infrastructure proposes a civilian nuclear program built around imported fuel, research reactors, and IAEA safeguards, while simultaneously seeking a long-term security partnership with a nuclear-armed patron. Its regional rival maintains a threshold capability, including enrichment to 60 percent and reduced inspector access, and has not foreclosed a weapons option. Proponents argue that civilian cooperation will lock in nonproliferation through verification, energy diversification, and integration into global supply chains. Critics argue that any future fuel-cycle ambition, combined with alliance uncertainty and persistent regional threat perception, could shorten breakout timelines and trigger reciprocal hedging. You are asked to assess whether the proposed program is best understood as energy policy, strategic hedging, or a latent weapons pathway, and to specify what evidence would change your assessment.

(b) Required memo headings as prompts:
- **Mechanism:** What causal process links civilian nuclear infrastructure to proliferation risk or restraint in this case?
- **Perspective reconstruction:** How would African, Chinese, Russian, Western, and UN perspectives interpret the program and its safeguards?
- **Historical analogue:** Which past case of nuclear latency is most comparable, and what does and does not transfer?
- **Falsifiers:** What observable evidence would support or undermine your central claim?

(c) Self-check:
Before finalizing, verify that you have distinguished description (what is happening), explanation (why it is happening), prediction (what is likely to happen next), and prescription (what should be done).

2.11 HINGE QUESTION

Question: Which statement best captures the relationship between a Saudi civilian nuclear program and the risk of a regional proliferation cascade in the context of the 2023 Saudi–Iran rapprochement?

A. A civilian program with full fuel-cycle rights under IAEA safeguards necessarily prevents militarization because verification eliminates breakout.

B. The rapprochement removes security incentives for Saudi nuclear hedging, so civilian infrastructure has no military relevance.
C. Latency from civilian fuel-cycle capabilities can become a military pathway if safeguards, alliance credibility, and regional threat perceptions deteriorate; rapprochement may reduce but not eliminate hedging.
D. Saudi Arabia's lack of technical capacity means no civilian program can ever contribute to a weapons option.

Correct answer: C.

Distractor diagnoses:
- **A** conflates verification with elimination: IAEA safeguards reduce uncertainty and raise costs, but they do not remove the latent capability created by fuel-cycle infrastructure; breakout risk depends on access, scope, and political intent, not merely on the presence of inspectors.
- **B** overstates diplomatic normalization: rapprochement can reduce bilateral tension, but hedging may persist because of Iranian threshold status, alliance uncertainty, and domestic strategic calculations; civilian infrastructure retains military relevance if fuel-cycle autonomy is later pursued.
- **D** confuses present capacity with future capacity: technical limitations are not permanent, and proliferation risk is assessed through trajectory, supplier relationships, and institutional commitments rather than through a static snapshot of current capability.

SECTION 2A — DATA LAB

Table 1 — Iran's Enrichment Profile: Selected Milestones (approximate, drawn from IAEA Director General reports)

Period	Maximum enrichment level (%)	Enriched uranium stockpile (kg, approx.)	Key development
2013 (pre-JCPOA baseline)	20% (limited)	~10,000 kg at ≤3.5%; ~200 kg at 20%	Iran had accumulated a large low-enriched stockpile; 20% production for Tehran Research Reactor fuel
2015–2018 (JCPOA in force)	3.67% (capped)	≤300 kg at 3.67%	Stockpile reduced; centrifuges limited; IAEA verification expanded
2019–2020 (post-withdrawal, stepwise breaches)	4.5% → 20%	Growing; 20% production resumed	Iran exceeded JCPOA limits in response to US withdrawal and sanctions
2021 (escalation)	60%	~2.5 kg at 60% initially, then rising	60% enrichment began; advanced centrifuges (IR-2m, IR-4, IR-6) deployed

Period	Maximum enrichment level (%)	Enriched uranium stockpile (kg, approx.)	Key development
2023 (IAEA finding)	83.7% (particles detected)	~120+ kg at 60%	IAEA reported particles enriched to 83.7% at Fordow; Iran attributed to "unintended fluctuations"
2024–2025 (threshold posture)	60% (sustained)	~6,000+ kg total enriched; ~140+ kg at 60%	Stockpile of 60% material grew; breakout estimates shortened to weeks or less for fissile material

Note: Figures are rounded public approximations from IAEA reporting; they measure fissile-material capability, not weaponization or delivery.

Table 2 — Breakout Timeline Estimates (time to produce fissile material for one weapon)

Period	Estimated breakout time	Basis
2013 (pre-deal)	~2–3 months	IAEA/US estimates of centrifuge capacity and stockpile
2016–2018 (JCPOA)	~12 months	Deal constraints on enrichment level, stockpile, and centrifuge numbers
2019–2021 (breaches begin)	~3–6 months	Reduced constraints; rising stockpile
2022–2024	Weeks to ~1–2 months	Advanced centrifuges at scale; accumulated 60% stockpile
2025 (threshold posture)	Days to weeks (material only)	Analyst and IAEA-derived estimates; assumes no further technical barriers to 90%

Breakout here means production of enough weapons-grade fissile material; it does not include weapon design, testing, or delivery-system integration.

Table 3 — IAEA Safeguards Cooperation Indicators (qualitative, by period)

Indicator	2015–2018 (JCPOA)	2019–2021	2022–2025
Routine inspections	Extensive; daily access at key sites	Reduced; Iran limited access	Further reduced; gaps in continuity of knowledge
Additional Protocol	Implemented	Suspended (Feb. 2021)	Not applied; monitoring curtailed

Indicator	2015–2018 (JCPOA)	2019–2021	2022–2025
Surveillance cameras	Installed and operational	Removed or disabled at some sites	Limited; IAEA lost data continuity at several locations
Declared inventory verification	Full reconciliation	Partial; discrepancies unresolved	Unresolved questions on undeclared sites and particles

Analysis Questions

1. **Trend.** The data show enrichment levels and stockpile rising monotonically after 2018, with a step-change to 60% in 2021 and detection of 83.7% particles in 2023. What does this trend establish about Iran's technical trajectory, and what does it *not* establish about political intent? Distinguish "can produce" from "has decided to produce."

2. **Level of analysis.** Breakout timelines are calculated at the state level (centrifuge capacity, stockpile mass). Yet the decision to break out is made by individuals (the Supreme Leader, senior IRGC commanders) within a state, and is shaped by systemic pressures (sanctions, regional rivals, US posture). Explain how the same data point—say, a 60% stockpile of ~140 kg—carries different meaning at the individual, state, systemic, and transnational levels, and why conflating these levels produces analytical error.

3. **Perspective reconstruction (all five).** Reconstruct how each of the five perspectives reads the *identical* IAEA enrichment data:

    - **African:** The data confirm that the NPT creates a two-tier order in which enrichment is policed for some states and permitted for others; the African vantage stresses Pelindaba-style regional nuclear-weapon-free zones and the TPNW as the only durable remedy, treating IAEA data as evidence of regime hypocrisy rather than Iranian exceptionalism.
    - **Chinese:** The data are read through a non-proliferation-plus-partnership lens: enrichment growth is regrettable but attributed to US withdrawal from the JCPOA; Beijing stresses diplomatic restoration and opposes unilateral sanctions while maintaining strategic ties with Tehran.
    - **Russian:** The data are framed within multipolarity: Iran's nuclear advances are a predictable consequence of Western coercion; Moscow positions itself as a P5+1 mediator whose interests lie in preventing both proliferation and US hegemony, with skepticism toward IAEA politicization.
    - **Western:** The data are read as evidence of a shrinking breakout window and a failing verification regime; the dominant frame is non-proliferation urgency, with debate over whether pressure or diplomacy can still reverse the trend.
    - **UN:** The data are technical inputs to safeguards and Security Council processes; the UN frame treats IAEA findings as the authoritative baseline for compliance judgments, while acknowledging that the Council's enforcement capacity depends on great-power consensus that has fractured.

4. **Interpretation.** Does the detection of 83.7% enriched particles prove Iran is building a nuclear weapon? Distinguish capability, intent, and the "threshold state" concept. What additional evidence (weaponization indicators, delivery-system integration, command-and-control preparations) would be

required to move from "Iran *can* produce weapons-grade material" to "Iran *is* producing a weapon"?

5. **Limitation.** What do IAEA enrichment and stockpile data *not* capture about a nuclear weapons program? Identify at least three gaps (e.g., weaponization research, delivery systems, intent/decision-making, covert sites) and explain how each gap constrains the policy conclusions that can responsibly be drawn from the data alone.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — "The Enrichment Escalation Ladder"

What to draw: A vertical ladder (or staircase) with four labeled rungs rising from bottom to top. Rung 1 (bottom): "3.67% — JCPOA cap (2015–2018)." Rung 2: "20% — Tehran Research Reactor fuel / post-2019 breach." Rung 3: "60% — 2021 escalation." Rung 4 (top): "90% — weapons-grade (threshold)." Draw a figure or arrow climbing from rung 1 to rung 3, with a dashed arrow toward rung 4 labeled "not yet crossed (material only)." Place a small box at rung 3 noting "83.7% particles detected, 2023."

Labels to place: "JCPOA ceiling," "20% (TRR fuel)," "60% (2021)," "90% (weapons-grade)," "83.7% particles (2023)," "Breakout = material, not weapon."

Perspective overlay to annotate: - **African (primary):** annotate the ladder's base with "NPT permits 'peaceful' enrichment for some; polices it for others — Pelindaba NWFZ as regional alternative." - **Chinese:** annotate rung 3 with "consequence of US withdrawal; restore diplomacy." - **Russian:** annotate with "coercion produces proliferation; multipolar mediation needed." - **Western:** annotate top rungs with "shrinking breakout window; verification gap." - **UN:** annotate with "IAEA data = authoritative baseline; Council enforcement fractured."

Visual 2 — "The Threshold State Spectrum"

What to draw: A horizontal spectrum line from left to right. Left end: "Latent capability (Japan, Brazil, Germany)." Middle-left: "Threshold state (Iran, 2025)." Center: "Ambiguous posture (Israel — opacity)." Middle-right: "Hedging (Saudi Arabia, Turkey, Egypt, UAE)." Right end: "Declared weapon state (Pakistan, India, North Korea)." Place each actor as a labeled dot on the spectrum. Draw a dashed vertical line between "threshold" and "ambiguous" labeled "NPT Article IX / safeguards boundary."

Labels to place: "Latent," "Threshold (Iran)," "Ambiguous (Israel)," "Hedging (Saudi/Turkey/Egypt/UAE)," "Declared (Pak/India/DPRK)," "NPT boundary."

Perspective overlay to annotate: - **African (primary):** annotate the spectrum's left-to-right gradient with "African NWFZ (Pelindaba) rejects the entire spectrum; TPNW delegitimizes all positions including 'ambiguous.'" - **Chinese:** annotate hedging states with "partnership and non-proliferation; oppose cascade." - **Russian:** annotate with "multipolarity: no single enforcer; regional security architectures." - **Western:** annotate with "extended deterrence and alliance guarantees as stabilizers." - **UN:** annotate with "NPT RevCon and safeguards as the normative frame; compliance as the metric."

Visual 3 — "Proliferation Cascade Network (West Asia and beyond)"

What to draw: A network diagram. Central node: "Iran (threshold)." Radiating nodes: "Israel (ambiguous arsenal)," "Saudi Arabia (hedging/civilian program)," "Turkey (hedging)," "Egypt (hedging)," "UAE (civilian nuclear, Barakah)." Draw solid arrows from Iran to Saudi/Turkey/Egypt labeled "hedging response." Draw a dashed arrow from Israel to Iran labeled "existential deterrence / opacity." Enclose all nodes in a large dashed oval labeled "NPT regime (fractured)." Add a small node outside the oval: "TPNW (African-led normative challenge)."

Labels to place: "Iran (threshold)," "Israel (ambiguous)," "Saudi (hedging)," "Turkey (hedging)," "Egypt (hedging)," "UAE (civilian)," "NPT regime (fractured)," "TPNW."

Perspective overlay to annotate: - **African (primary):** annotate the TPNW node with "African states as TPNW champions; Pelindaba as proof that regional NWFZ works without great-power guarantees." - **Chinese:** annotate edges with "strategic partnership with Iran; oppose cascade via diplomacy." - **Russian:** annotate with "P5+1 legacy; multipolar balance; resist US-led enforcement." - **Western:** annotate with "extended deterrence; JCPOA collapse as cautionary case." - **UN:** annotate with "IAEA safeguards; UNSC resolutions 1696/1737/1929/2231 as enforcement architecture."

SECTION 4 — CORNELL NOTES

Cue (Question / Prompt)	Notes (with source log)
What is a "threshold state"?	A state that possesses the technical capability to produce weapons-grade fissile material and the industrial base to weaponize, but has not assembled or tested a device; Iran post-2025 exemplifies. *Source: Fitzpatrick (2019); IAEA DG reports.*
What did the JCPOA cap?	Enrichment at 3.67%, stockpile at 300 kg, centrifuge types/numbers limited, Fordow converted, Arak redesigned; IAEA verification expanded. *Source: UNSC Res. 2231; IAEA DG reports.*
What triggered Iran's stepwise breaches?	US withdrawal (May 2018) and reimposed sanctions; Iran responded with calibrated, reversible breaches from 2019. *Source: Sanger (2012) for strategic context; IAEA reports for chronology.*
What is "breakout time"?	Time to produce enough weapons-grade fissile material for one weapon; not weaponization or delivery. Pre-JCPOA ~2–3 months; under JCPOA ~12 months; 2025 threshold posture: days–weeks. *Source: IAEA DG reports; public analyst estimates.*
What is Israel's nuclear posture?	Deliberate ambiguity ("opacity"): no official confirmation, no NPT signature as a nuclear-weapon state, Dimona reactor, estimated arsenal ~80–90 warheads. *Source: Fitzpatrick (2019).*

Cue (Question / Prompt)	Notes (with source log)
What is the Saudi nuclear question?	Saudi Arabia has pursued civilian nuclear cooperation (with US, China, South Korea) and has stated it would match Iran's nuclear status; hedging posture, not yet a weapons program. *Source: Fitzpatrick (2019); IAEA reports.*
What is extended deterrence in the Middle East?	US security guarantees to Israel and Gulf partners; debate over whether guarantees suffice or incentivize indigenous hedging. *Source: Sanger (2012); Fitzpatrick (2019).*
What is the African critique of the NPT?	The NPT legitimates five nuclear-weapon states while policing others; African states champion Pelindaba NWFZ and the TPNW as corrective. *Source: Grovogui; Mamdani; NPT RevCon documentation.*
What are UNSC Resolutions 1696/1737/1929/2231?	Escalating sanctions and restrictions on Iran's nuclear/missile programs (2006–2015); 2231 endorsed the JCPOA and set snapback provisions. *Source: UNSC resolutions.*
What is the "snapback" mechanism?	Reimposition of UN sanctions if Iran non-compliant; US invoked it in 2020; contested by other P5+1 members. *Source: UNSC Res. 2231.*
What do IAEA data not show?	Weaponization research, delivery systems, intent/decision-making, covert sites; data measure material, not programs. *Source: IAEA DG reports; Fitzpatrick (2019).*
What is the proliferation cascade risk?	Iran's threshold status may incentivize Saudi, Turkish, Egyptian hedging, eroding the NPT. *Source: Fitzpatrick (2019); IAEA reports.*

Summary (3–5 sentences): Iran's nuclear program has moved from a capped, verified posture under the JCPOA to a threshold state capable of producing weapons-grade fissile material in days to weeks, following US withdrawal in 2018 and Iran's stepwise breaches. IAEA data document enrichment escalation and stockpile growth but cannot establish weaponization intent or delivery capability. The regional response—Israeli opacity, Saudi hedging, and Turkish/Egyptian interest—raises cascade risks that the NPT regime, fractured by great-power disagreement, is poorly positioned to contain. African states read this as confirmation of NPT hierarchy and champion Pelindaba-style zones and the TPNW; Chinese, Russian, Western, and UN frames diverge on whether diplomacy, multipolarity, pressure, or safeguards can still stabilize the regime. The central analytical task is to keep capability, intent, and regime legitimacy analytically separate.

SECTION 5 — FEYNMAN COMPRESSION

1. **Explain without jargon.** Iran learned how to make the key ingredient for a nuclear bomb and now has enough of a head start that it could produce bomb-grade material very quickly. A 2015 deal slowed this down and let inspectors watch closely, but the United States left the deal in 2018, Iran started breaking the rules step by step, and now inspectors see less. Iran says its program is peaceful; neighbors like Saudi Arabia are watching and may want their own programs. Israel already has bombs but does not admit it. The big question is whether Iran will actually build a weapon or just keep the ability as leverage—and whether the world's rules can stop a chain reaction of new nuclear programs.

2. **Mark gaps.** I am not sure I can explain *why* Iran stopped at 60% rather than going to 90% (is it technical caution, political signaling, or a decision not yet made?). I also cannot yet distinguish cleanly between "breakout time" and "weaponization time," and I tend to conflate Iran's *capability* with its *intent*. I need to revisit the difference between fissile-material production and full weapon assembly, and the role of the Supreme Leader's fatwa.

3. **Reread verification.** Re-reading the IAEA Director General reports and Fitzpatrick (2019) confirms that breakout estimates measure fissile material only; weaponization and delivery remain unverified gaps. UNSC Resolution 2231's snapback provisions and the 2021 suspension of the Additional Protocol are the key institutional turning points. The African critique (Pelindaba, TPNW) is a normative frame, not a technical claim about Iran's program.

4. **Analogy with explicit limits.** Think of Iran's program like a factory that has learned to refine uranium to near-bomb-grade and has stockpiled the intermediate product: it could finish the job quickly, but finishing requires additional steps (weapon design, testing, delivery) that are not visible in the "factory output" data. *Limit of the analogy:* a factory's output is a complete product; Iran's fissile-material stockpile is an input to a weapon, and the analogy obscures the political decision, the covert research, and the regime-legitimacy questions that the African and UN perspectives foreground.

5. **Rewrite.** Iran is a nuclear threshold state: it can produce weapons-grade fissile material in days to weeks but has not assembled a device. The JCPOA temporarily extended this timeline and expanded verification; US withdrawal in 2018 and Iran's subsequent breaches collapsed both. IAEA data track enrichment and stockpile but cannot resolve intent or weaponization. Regionally, Israeli opacity and Saudi hedging create cascade risk. African states read the episode as NPT hierarchy and champion Pelindaba/TPNW; Chinese, Russian, Western, and UN frames differ on remedy. The analytical core is separating capability from intent and material from weapon.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L45	Definition	What is nuclear breakout time?	Breakout time is the estimated period required to produce enough fissile material for one nuclear weapon using existing stocks and centrifuges. It measures material production, not weaponization, delivery, or political decision. It is sensitive to enrichment level, stockpile size, and cascade performance.	African NPT critique: breakout metrics can obscure prior inequality of arsenals and unfulfilled disarmament obligations.
L45	Mechanism	How did the JCPOA constrain Iran's fuel cycle?	It capped enrichment at 3.67 percent, reduced installed centrifuges, converted Fordow, redesigned Arak, and expanded IAEA monitoring. In exchange, Iran received phased sanctions relief. The mechanism linked verifiable limits to economic incentives.	Western emphasis on verification; Iranian emphasis on sovereign fuel-cycle rights.

Tag	Card Type	Front	Back	Perspective Note
L45	Application	What did IAEA reporting show after the JCPOA collapsed?	IAEA reports documented Iranian enrichment to 60 percent and growing stocks of enriched uranium, far above JCPOA limits. These changes shortened estimated breakout timelines. They were framed by Iran as reversible responses to sanctions and by critics as proliferation risk.	Chinese and Russian views stress reversibility and negotiation; Western views stress noncompliance.
L45	Source	What did UNSC Resolution 2231 do?	It endorsed the JCPOA, established a snapback mechanism for prior UN sanctions, and modified some restrictions. It became contested after the 2018 U.S. withdrawal. The resolution tied multilateral legitimacy to a deal the U.S. later abandoned.	Russian and Chinese objections centered on unilateral snapback claims.

Tag	Card Type	Front	Back	Perspective Note
L45	Debate	What is a threshold state?	A threshold state possesses latent capability to produce weapons quickly without necessarily violating the NPT's text. The concept captures hedging between civilian and military fuel cycles. It creates ambiguity for deterrence and verification.	African scholarship critiques threshold discourse as normalizing unequal nuclear orders.
L45	Comparison	How does Israeli ambiguity differ from the Saudi nuclear question?	Israel maintains a policy of nuclear opacity and is widely treated as a de facto nuclear-armed state. Saudi Arabia has pursued civilian nuclear cooperation and hedging rhetoric while relying on U.S. extended deterrence. The two cases raise different verification and alliance problems.	Western nonproliferation focuses on Iran; regional actors point to Israeli opacity.

Tag	Card Type	Front	Back	Perspective Note
L45	Reconstruction	What is the African perspective on the NPT in this lesson?	African states and scholars criticize the NPT as discriminatory because nuclear-armed states retain arsenals while non-nuclear states accept permanent restraint. The Pelindaba Treaty and support for the TPNW express an alternative normative order. Disarmament obligations are treated as unfulfilled.	Primary perspective: African agency, not regional illustration.
L45	Occlusion	What does the Western perspective often occlude?	A Western nonproliferation frame may foreground Iranian compliance while understating Israeli nuclear opacity, NPT asymmetry, and the security dilemma created by sanctions. It can treat technical verification as politically neutral. This occlusion matters for legitimacy in West Asia.	Occlusion identified from African and Global South critiques.

Tag	Card Type	Front	Back	Perspective Note
L45	Adjudication	Did the JCPOA solve the Iranian nuclear problem?	While in force, it lengthened breakout timelines and improved verification. After U.S. withdrawal and Iranian countermeasures, those gains eroded. The deal managed but did not resolve the underlying security dilemma.	Adjudication: partial success, not durable settlement.
L45	Visual	What does an enrichment cascade do?	Cascades of centrifuges increase the concentration of uranium-235 through successive stages. Low-enriched fuel, 20 percent, 60 percent, and weapons-grade material represent different thresholds. The same technology supports civilian and military pathways.	Technical visual should distinguish assay levels without implying intent.

Tag	Card Type	Front	Back	Perspective Note
L45	Mechanism	How does snapback work under Resolution 2231?	A participant can trigger reimposition of prior UN sanctions if it judges significant non-performance. The mechanism was designed to preserve leverage after sanctions relief. Its legitimacy became disputed when the U.S. withdrew yet claimed snapback rights.	Russian and Chinese view: snapback requires participant status and good faith.
L45	Application	What does the Pelindaba Treaty signify?	The African Nuclear-Weapon-Free Zone Treaty prohibits nuclear weapons on African territory and reflects a collective nonproliferation commitment. It is often cited as evidence that Global South states can build regional disarmament institutions. It contrasts with threshold hedging in West Asia.	African primary case: regional order built on disarmament, not deterrence.

Tag	Card Type	Front	Back	Perspective Note
L45	Debate	What is extended deterrence in the Middle East?	Extended deterrence refers to security guarantees by a nuclear-armed patron, especially the United States, to non-nuclear allies. It may reduce proliferation incentives but can create dependency and entanglement. Credibility depends on perceived willingness to risk escalation.	Western and UN frames emphasize stability; regional critics emphasize dependency.
L45	Source	What does Fitzpatrick (2019) contribute?	Fitzpatrick's 2019 work analyzes Iran's nuclear program and the JCPOA with attention to technical capabilities and political constraints. It helps distinguish material capacity from weaponization decisions. It is useful for mechanism-level analysis rather than prediction.	Western academic source; should be read alongside Iranian and African critiques.

Tag	Card Type	Front	Back	Perspective Note
L45	Reconstruction	What is the Chinese perspective in this lesson?	China supports nonproliferation and the JCPOA while maintaining a strategic partnership with Iran. It opposes unilateral sanctions and snapback claims. Its stance combines regime stability, energy interests, and multipolar diplomacy.	Chinese perspective: order through negotiated multilateralism.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence audit (score 0–100)

Competency	Your score (0–100)	Calibration note
Define breakout time and distinguish material capacity from weaponization	___	A high score requires stating both the technical and political limits of the metric.
Explain JCPOA architecture, verification, and sanctions linkage	___	Include caps, centrifuges, Fordow, Arak, monitoring, and relief.
Trace U.S. withdrawal, snapback claims, and Iranian countermeasures	___	Sequence matters: 2018 withdrawal precedes Iranian step-backs.
Analyze extended deterrence and the Saudi nuclear question	___	Distinguish guarantees, hedging, and civilian infrastructure.
Explain threshold states and NPT erosion	___	Define latent capability and the ambiguity problem.
Reconstruct the African perspective on its own terms	___	Must include NPT critique, Pelindaba, and TPNW.
Reconstruct Chinese, Russian, Western, and UN perspectives	___	Each must be steel-manned, not caricatured.
Adjudicate competing explanations using evidence and falsifiers	___	Separate description, explanation, prediction, and prescription.

7.2 Three-question debrief

1. Which of the five perspectives did you reconstruct least charitably, and what evidence would force you to revise that reconstruction?
2. Which mechanism did you confuse with an outcome, and how would you restate it as a causal chain?
3. Which falsifier would most change your conclusion about whether the JCPOA collapse made an Iranian bomb more likely?

7.3 Error-log

Common Misconception	Correction	Evidence
Iran already has a nuclear weapon.	No verified Iranian nuclear weapon exists; the program is best analyzed as latent or threshold capability.	IAEA Director General reports; NPT safeguards framework.
The JCPOA permanently prevented an Iranian bomb.	It lengthened breakout timelines and improved verification while in force, but those gains eroded after U.S. withdrawal and Iranian countermeasures.	IAEA reports after 2018; UNSC Resolution 2231 context.
The 2018 U.S. withdrawal had no strategic effect.	Withdrawal preceded Iranian enrichment increases and reduced verification leverage.	IAEA reporting; Iranian step-back announcements.
A Saudi civilian nuclear program is automatically a weapons program.	Civilian infrastructure is necessary but not sufficient; intent, fuel-cycle choices, and safeguards matter.	NPT safeguards; Saudi statements; IAEA framework.
The NPT is a neutral technical regime.	African and Global South critiques treat it as politically asymmetrical because disarmament obligations remain unfulfilled.	NPT RevCon documentation; Pelindaba Treaty.
Snapback is automatic and uncontested.	Snapback under Resolution 2231 became legally and politically disputed after U.S. withdrawal.	UNSC Resolution 2231; Russian and Chinese objections.

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Breakout time; enrichment levels; fissile material	Centrifuge cascades raise U-235 concentration; stockpiles and cascade performance shape timelines	Sanger (2012); IAEA Director General reports	Iranian enrichment to 60 percent; IAEA inspections data	Material capacity vs. weaponization decision	Verified diversion to weapons; sustained 90 percent stockpile	L21; L42
JCPOA architecture; verification; sanctions relief	Caps, centrifuge limits, Fordow conversion, Arak redesign, monitoring linked to relief	Fitzpatrick (2019); UNSC Resolution 2231	Deal text; IAEA verification reports	Verification vs. sovereignty	Full compliance data; restored breakout timelines	L42; L43
U.S. withdrawal; snapback; Iranian countermeasures	Unilateral exit; reimposition claims; step-backs from compliance	UNSC Resolutions 1696, 1737, 1929, 2231	2018 withdrawal; enrichment increases	Leverage vs. escalation	Reversible Iranian steps; renewed deal	L47
Extended deterrence; Saudi nuclear question	Patron guarantees; alliance dependency; credibility signaling	Western deterrence theory; UN security framework	U.S.-Saudi and U.S.-Israel security ties	Stability vs. entanglement	Ally proliferation despite guarantees	L21
Threshold state; NPT erosion	Hedging; latent capability; ambiguity between civilian and military fuel cycles	African IR critique; NPT RevCon documentation	Iran case; Saudi hedging rhetoric	Proliferation cascade vs. managed deterrence	Clear weaponization decision; disarmament progress	L43; L45

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
African perspective; Pelindaba; TPNW	Regional nuclear-weapon-free zone; disarmament-first normative order	Grovogui; Mbembe; Mamdani	Pelindaba Treaty; African support for TPNW	Disarmament vs. deterrence	African state acquisition of nuclear weapons	L1; L42

SECTION 9 — REVIEW SCHEDULE

- **R1 (24 hours):** Re-read the flashcards and define breakout time, threshold state, and snapback from memory; sketch the enrichment ladder.
- **R2 (3 days):** Reconstruct all five perspectives without notes; compare the JCPOA's mechanisms with the threshold-state problem.
- **R3 (1 week):** Complete the worked example on the JCPOA collapse; identify one mechanism, one occlusion, and one falsifier for each perspective.
- **R4 (2 weeks):** Complete the problem pair on Saudi-Iran rapprochement; draft a memo using the four required headings.
- **R5 (1 month):** Write a timed adjudication essay on whether threshold states erode the NPT; update the error log with any corrected misconceptions.

SECTION 10 — COMPLETION CHECKLIST

☐ I can define breakout time and distinguish it from weaponization.
☐ I can explain the JCPOA's caps, centrifuge limits, facility conversions, and verification.
☐ I can trace the sequence from U.S. withdrawal to Iranian countermeasures.
☐ I can explain snapback and why it became contested.
☐ I can define a threshold state and explain its ambiguity problem.
☐ I can analyze extended deterrence and its credibility problem.
☐ I can distinguish Saudi civilian nuclear ambition from a weapons program.
☐ I can reconstruct the African perspective using NPT critique, Pelindaba, and TPNW.
☐ I can steel-man the Chinese perspective on nonproliferation and Iran.
☐ I can steel-man the Russian perspective on P5+1 and multipolarity.
☐ I can steel-man the Western perspective on nonproliferation and JCPOA collapse.
☐ I can explain the UN perspective through IAEA safeguards and Security Council resolutions.
☐ I can use the four levels of analysis in the worked example.
☐ I can distinguish description, explanation, prediction, and prescription.
☐ I can state at least one falsifier for my main conclusion.
☐ I have completed the confidence audit and error log.
☐ I have scheduled R1–R5 review actions.

FURTHER READING (Optional)

- **Program history and capabilities:** Sanger (2012).
- **JCPOA architecture and verification:** Fitzpatrick (2019).
- **IAEA monitoring:** IAEA Director General reports on Iran.
- **Security Council framework:** UNSC Resolution 1696 (2006).
- **Security Council framework:** UNSC Resolution 1737 (2006).
- **Security Council framework:** UNSC Resolution 1929 (2010).
- **Security Council framework:** UNSC Resolution 2231 (2015).
- **NPT regime:** NPT Review Conference documentation.

End of Lesson 45. Say **Next** when you are ready.

---

47. Hydrocarbon Geopolitics and Gulf Strategy

LESSON METADATA

Field	Value
Lesson number and title	Lesson 46: Hydrocarbon Geopolitics and Gulf Strategy
Module	Module 7: West Asia and Iranian Geopolitics
Prerequisites	L19 (energy), L41 (West Asia state system), L43 (sectarian)
Interleaved links	Forward to L51 (climate geopolitics), L52 (semiconductors), L49 (Global South)
Reading load	7-9 hours
Content channels	Core text, data lab, visual anchor, worked example, problem pair, flashcards, review schedule
Bloom ceiling	Evaluate / Adjudicate
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

Hydrocarbons have made the Gulf monarchies simultaneously wealthy, strategically central, and politically brittle. The lesson's central puzzle is not whether oil matters—it obviously does—but how a finite, price-volatile, geopolitically contested resource structures state-society bargains, foreign alignments, and regional order in West Asia, and how those structures are being renegotiated as the global energy system changes. Rentier political economy suggests that states financed by external rents can substitute taxation with distribution, weakening representative institutions and strengthening coercive capacity; yet this is not a static equilibrium. Fiscal breakeven prices, sovereign wealth fund returns, demographic pressures, and the prospect of long-term demand erosion create a time-horizon problem: governments must convert underground wealth into durable legitimacy and diversified economies before the rent base thins. The Gulf is therefore not merely an oil exporter but a laboratory of late rentier transformation, where Vision 2030-style agendas, sovereign

wealth fund activism, and diplomatic diversification are attempts to solve a political-economy problem that classical rentier theory described but did not resolve. The student must learn to see oil not as a commodity price series but as a mechanism that shapes who governs, how they are legitimated, and what kinds of alliances they can afford.

The puzzle is sharpened by structural shifts in global oil markets. The US shale revolution altered the supply curve, reduced American import dependence, and changed Washington's strategic incentives in the Gulf; it also introduced a more elastic, short-cycle source of supply that complicates OPEC+ price management. At the same time, Asian demand growth, especially Chinese demand, has reoriented trade flows and made Gulf producers attentive to energy-security partnerships beyond the Atlantic. Russia's role in OPEC+ after 2016 created a new coordination mechanism between the world's two largest exporters, one that was tested by the 2020 price war and subsequent cuts. These developments mean that Gulf strategy cannot be read solely through a US-centric security lens; it must be analyzed as multi-alignment, in which security guarantees, market access, investment, and diplomatic legitimacy are sourced from different partners. The lesson therefore trains the student to distinguish market structure from alliance structure, and to avoid collapsing one into the other.

Domestically, hydrocarbon rents interact with the West Asian state system and sectarian politics in ways that make diversification politically dangerous as well as economically necessary. The Gulf monarchies' legitimacy formulas combine dynastic authority, religious sanction, welfare distribution, and nationalist narratives; rentier wealth funds these formulas but also creates vulnerabilities, including Dutch disease, labor-market dualism, and dependence on expatriate labor. Diversification is therefore not just an economic plan but a political project that threatens established distributional coalitions. The Abraham Accords illustrate how economic statecraft and security normalization can be linked to diversification agendas, while the 2023 Iran-Saudi rapprochement shows how regional détente can be pursued to reduce risk to investment and infrastructure. Both cases require distinguishing description (what happened), explanation (why), prediction (what follows), and prescription (what should be done), a distinction this lesson repeatedly trains. The student is not asked to celebrate or condemn any of these developments, but to reconstruct the mechanisms that make them intelligible.

The African perspective is primary because the Gulf's hydrocarbon transition is not contained within West Asia. Gulf sovereign wealth funds and state-backed firms are increasingly significant investors in African energy, ports, logistics, agriculture, and digital infrastructure; Gulf states also compete and cooperate with African producers in oil and gas markets. From an African vantage, the relevant questions include who captures value from hydrocarbon and transition minerals, how Gulf capital shapes African industrialization, and whether energy-transition finance reproduces dependency or enables autonomous development. This perspective reveals occlusions in Western energy-security framing, which often treats African producers as marginal supply nodes, and in Chinese framing, which can reduce African agency to infrastructure corridors. It also connects to the Global South problematic: hydrocarbon geopolitics is not only about barrels and prices but about the terms on which late-developing economies enter, or are excluded from, the energy transition. The lesson therefore treats African scholarship and African strategic concerns as constitutive of the subject, not as a regional application of Western theory.

Methodologically, the lesson builds on earlier modules. From energy studies, it takes supply-demand analysis, market power, and transition pathways; from the West Asian state system, it takes regime type, alliance patterns, and regional order; from sectarian politics, it takes identity as both a resource and a constraint. It then adds a level-of-analysis discipline: individual leaders and elites, state institutions, systemic market and

alliance structures, and transnational capital flows must be separated before being recombined. The worked example on the 2020-2022 oil price war and OPEC+ coordination demonstrates how a single episode can be explained by elite bargaining, fiscal stress, market structure, and alliance politics simultaneously. The problem pair on the 2023 Iran-Saudi rapprochement trains the same discipline in a diplomatic case. By the end, the student should be able to adjudicate between competing explanations using evidence, specify scope conditions, and identify what would falsify each claim rather than merely narrating events.

Finally, the lesson is deliberately forward-linked. Hydrocarbon geopolitics intersects with climate geopolitics because Gulf diversification is partly a hedge against demand decline; with semiconductor geopolitics because energy-intensive manufacturing and digital infrastructure reshape electricity demand; and with Global South politics because African and Asian development strategies are entangled with Gulf capital and energy markets. The student is not asked to memorize a narrative of Gulf exceptionalism but to master a portable analytical toolkit: rentier mechanisms, market structure, alliance bargaining, and perspective reconstruction. That toolkit is what makes the lesson reusable across cases that have not yet occurred, including future price shocks, new normalization agreements, and contested energy-transition finance. The aim is not prediction as prophecy but disciplined explanation under uncertainty, with explicit attention to what each perspective reveals and what it hides.

SECTION 1 — Pre-Class Priming

1.1 Retrieval warm-up

1. From L19: What is the difference between a supply shock and a demand shock in energy markets, and which Gulf-relevant episode can illustrate each?
2. From L19: How does OPEC's market power depend on spare capacity, quota discipline, and the elasticity of non-OPEC supply?
3. From L41: What are the main components of the West Asian state system, and how do regime type and external patronage shape alliance behavior?
4. From L41: Why is the Gulf security architecture often described as a US-led umbrella with local partners rather than a fully autonomous regional order?
5. From L43: How can sectarian identity function simultaneously as a domestic legitimation tool and a transnational alliance resource?
6. From L43: What is the difference between sectarianism as an ideology and sectarianism as a political strategy?

1.2 Orientation questions

1. How does rentier wealth convert into political legitimacy, and what happens to that bargain when prices fall or reserves deplete?
2. How did the US shale revolution change the strategic environment of Gulf producers and the bargaining power of OPEC+?
3. What is multi-alignment in Gulf foreign policy, and what are its domestic, regional, and systemic limits?
4. How does an African perspective change the evaluation of Gulf diversification, sovereign wealth fund investment, and energy-transition finance?

1.3 Vocabulary pre-teach

- **Rentier state**: A state whose revenues derive primarily from external rents, especially hydrocarbons, rather than from domestic taxation, with consequences for accountability and representation.
- **Hydrocarbon rents**: Income generated from the extraction and sale of oil and gas, often treated as state property and distributed through public spending, subsidies, and patronage.
- **Fiscal breakeven price**: The oil price at which a government's budget balances, given its spending commitments, production levels, and non-oil revenues.
- **Dutch disease**: The tendency for a resource boom to appreciate the real exchange rate and crowd out non-resource tradable sectors such as manufacturing and agriculture.
- **Sovereign wealth fund (SWF)**: A state-owned investment vehicle that converts hydrocarbon revenues into diversified financial assets, often used for intergenerational saving and strategic influence.
- **OPEC+**: The expanded oil producers' coalition that includes OPEC members plus non-OPEC exporters, notably Russia, coordinating production to influence global prices.
- **Shale revolution**: The expansion of US oil and gas production through hydraulic fracturing and horizontal drilling, increasing supply elasticity and reducing US import dependence.
- **Abraham Accords**: The 2020 normalization agreements between Israel and several Arab states, including the UAE and Bahrain, linking diplomatic recognition to security and economic cooperation.
- **Vision 2030**: Saudi Arabia's state-led diversification agenda aimed at reducing oil dependence, expanding non-oil sectors, and restructuring the social contract.
- **Multi-alignment**: A strategy in which a state maintains security, economic, and diplomatic ties with multiple great powers rather than relying on a single patron.
- **Energy transition**: The long-term shift from fossil-fuel-based energy systems toward lower-carbon sources, with uneven effects on producers, consumers, and investors.
- **Late rentierism**: The phase in which rentier states attempt to diversify, reform, and re-legitimate themselves while still depending on hydrocarbon revenues.

SECTION 2 — LESSON CORE

2.1 Learning objectives

By the end of this lesson, the student will be able to: (1) **Analyze** the rentier political-economy mechanism through which hydrocarbon rents are converted into welfare provision, public employment, and political legitimacy in Gulf states, specifying the causal chain from external revenue to state-society bargaining; (2) **Explain** how rentier scope conditions—rent per capita, state ownership of subsoil resources, weak domestic taxation, small populations, and limited private-sector depth—shape fiscal vulnerability, diversification constraints, and the durability of authoritarian bargains; (3) **Evaluate** competing interpretations of Gulf legitimacy, including distributional, institutional, ideological, and security-based accounts, using budget structure, non-oil GDP growth, sovereign-wealth-fund behavior, and fiscal breakeven prices as evidence; (4) **Compare** the African, Chinese, Russian, Western, and UN perspectives on rentierism and Gulf strategy, identifying each tradition's distinctive contribution, its characteristic occlusion, and the evidence that would adjudicate between them; and (5) **Apply** the rentier framework to a novel case—such as a Gulf fiscal adjustment, an African petro-state, or a post-rentier transition scenario—while stating boundary conditions, falsifiers, and the level of analysis at which the explanation operates. These objectives are assessable through mechanism-based short answers, perspective-reconstruction essays, and case-based memos that require the student to distinguish description, explanation, prediction, and prescription.

2.2 KEY IDEA 1 — Rentier political economy: the oil state, welfare, and legitimacy

Bolded Causal Claim: In hydrocarbon-dependent states where rents are large relative to population and are centrally controlled, the state can substitute external rent for domestic taxation, thereby weakening the fiscal contract with citizens and converting welfare distribution into a primary source of political legitimacy.

Mechanism: The rentier mechanism begins with a structural feature of the political economy: a substantial share of state revenue derives not from taxing domestic economic activity but from rents paid by external buyers for exhaustible natural resources. In the Gulf cases, hydrocarbon rents flow to the state through national oil companies, production-sharing arrangements, or state ownership of subsoil rights, creating what the rentier-state literature describes as an allocation state rather than a production state. Because the state is the principal allocator of externally generated wealth, it can fund public employment, subsidies, services, and transfers without extracting comparable revenue from citizens through income, property, or broad-based consumption taxes. The resulting fiscal asymmetry alters state-society bargaining: citizens are less likely to demand representation as a condition of taxation, while the state can purchase compliance, co-opt elites, and manage dissent through distribution. Legitimacy is therefore not primarily procedural or ideological in the liberal sense; it is performative and distributive, anchored in the state's capacity to deliver welfare, status, and security. The mechanism is reinforced by the enclave character of hydrocarbon extraction, which requires limited labor absorption, permits capital-intensive production, and allows the state to remain financially autonomous from the domestic private sector. Hertog's analysis of Gulf political economy emphasizes that rentierism is not merely a budgetary pattern but an organizational logic: the state becomes the central node through which wealth, employment, and opportunity are distributed, shaping everything from bureaucratic recruitment to business-state relations. Yergin's histories of oil power underscore that this arrangement is historically contingent on the global oil order, imperial concessions, and the postwar security architecture, not a natural feature of resource endowment. The mechanism also contains a feedback loop: because the state does not need to tax, it has weaker incentives to build extractive institutions, broaden the tax base, or cultivate a productive private sector; conversely, citizens have fewer institutional channels through which to convert economic contribution into political voice. Gray's work on Gulf monarchies adds that legitimacy is further stabilized by kinship, religion, and tribal idioms, meaning rentier distribution interacts with preexisting social solidarities rather than replacing them. The strongest counterargument is that rentierism is not destiny: states with similar endowments have produced divergent outcomes depending on institutional choices, leadership, and historical timing. Norway's transparent management of petroleum wealth, and partial Gulf experiments in fiscal reform, suggest that rents can be governed through rules, savings, and public accountability. The mechanism therefore predicts tendencies, not inevitabilities, and must be tested against institutional variation rather than assumed from resource dependence alone.

Scope Conditions: The rentier mechanism operates most strongly when several conditions coincide: hydrocarbon rents are large relative to population; the state controls the resource and its revenue stream; domestic taxation is low and non-oil revenue is marginal; the private sector is small, dependent on state contracts, or concentrated in non-tradable services; and the population is small enough that per-capita distribution is politically meaningful. In the Gulf, these conditions have historically been met in varying degrees: Kuwait, Qatar, and the United Arab Emirates have had very high rent per capita and small citizen populations, while Saudi Arabia's larger population has required more extensive welfare commitments and has produced greater fiscal strain. The mechanism weakens where populations are large, as in Iran, where rents must be spread across tens of millions of citizens and the state has greater need for taxation, coercion, or ideological mobilization. It also weakens where resource ownership is fragmented, where private firms control significant production, or where the state lacks the administrative capacity to distribute rents effectively. Price volatility

is a critical scope condition: the mechanism assumes a revenue stream sufficient to sustain the distributive bargain; when prices fall below fiscal breakeven levels, the state must borrow, cut spending, raise taxes, or draw down sovereign wealth, each of which can strain the legitimacy formula. Another scope condition is external security: rentier states often rely on external guarantees to protect the resource and the regime, and the cost of that protection—whether paid in bases, arms purchases, or diplomatic alignment—can reduce the net rent available for domestic distribution. The mechanism is also bounded by time: exhaustible resources imply that rentier legitimacy is intertemporally fragile unless rents are converted into productive assets, human capital, or diversified revenue. Finally, the mechanism should not be conflated with corruption or authoritarianism in general; rentierism is a specific fiscal structure that can coexist with different regime types, and its effects are mediated by institutions, elite bargains, and social norms.

Observable Implications: If the rentier mechanism is operating, one should observe a budget structure dominated by hydrocarbon revenue; low non-oil tax revenue as a share of GDP; high public-sector employment among citizens; extensive subsidies for energy, water, food, and services; large sovereign-wealth-fund assets accumulated during price booms; and diversification rhetoric that outpaces non-oil productive capacity. One should also observe fiscal breakeven prices that exceed market prices during downturns, forcing deficit financing or austerity; public-investment cycles that track oil prices; and business sectors oriented toward state procurement rather than export competitiveness. Politically, one should observe limited taxation-based accountability, managed elections or consultative institutions with restricted authority, and legitimacy claims centered on development, stability, and welfare rather than representation. The mechanism implies that fiscal shocks—such as the 2014–2016 oil price collapse or the 2020 pandemic shock—should produce austerity measures, subsidy reforms, value-added taxes, or diversification plans, as seen in Saudi Arabia's Vision 2030 and the UAE's earlier fiscal adjustments. It also implies that sovereign wealth funds will be used as buffers, but that their drawdowns may be politically sensitive because they represent the intergenerational conversion of rent. A further implication is that non-oil GDP growth may rise in service sectors—construction, finance, logistics, tourism—without necessarily reducing hydrocarbon dependence if the state remains the dominant investor and if private firms remain rent-seeking. The mechanism does not imply that citizens are passive; rather, it predicts that political demands will often be framed as claims on the distributive state—jobs, housing, subsidies, and public services—rather than as demands for systemic regime change, though this pattern can break down under sustained fiscal stress or generational change.

Perspective Note (five traditions in brief):

African (primary): The African perspective reconstructs rentier theory from the vantage point of postcolonial political economy and treats hydrocarbon dependence not as a neutral fiscal condition but as a historically produced structure of external extraction. African scholarship—from Rodney's analysis of underdevelopment and Nkrumah's critique of neo-colonialism to Fanon's account of the postcolonial state, Cabral's emphasis on material conditions, and later work by Mamdani, Bayart, and Mbembe—suggests that the state in many African petro-states is not simply an allocator of rent but a site of violent accumulation, elite capture, and militarized sovereignty. This vantage point reveals what rentier theory often occludes: the colonial origins of resource enclaves, the racialized global division of labor, the role of multinational oil companies, and the transnational circuits through which rents are laundered, invested, or securitized. It also highlights that African petro-states such as Nigeria, Angola, Gabon, and Equatorial Guinea have experienced rentier dynamics with far weaker developmental outcomes than the Gulf, suggesting that population size, institutional capacity, and colonial legacies are not secondary variables but constitutive ones. From this perspective, Gulf investment in Africa—whether in ports, agriculture, logistics, or renewable energy—must be analyzed not only as south-south cooperation but as a possible extension of extractive political economy into new sectors,

including green energy and carbon markets. The African vantage further asks whether the energy transition will reproduce rentierism under new guises: critical minerals, land, solar corridors, and carbon credits may become the new rents, with similar risks of elite capture and weak accountability. Scholars such as Grovogui and Oyěwùmí remind us that the categories of "state," "citizen," and "development" are themselves historically and epistemically situated; applying rentier theory to Africa without decolonizing its assumptions risks treating African states as deficient versions of an idealized Gulf model. Thus the African perspective contributes a deeper historical and transnational account of rent, while warning that rentierism is not merely a Gulf pathology but a global structure of accumulation in which Africa has often been the site of extraction rather than the beneficiary of rent.

Chinese: The Chinese perspective treats Gulf hydrocarbon rents primarily through the lens of energy security and state-capitalist partnership. It emphasizes long-term supply contracts, infrastructure investment, and non-conditional engagement, arguing that rentier vulnerability can be mitigated by state capacity, industrial planning, and mutual benefit. This view contributes an alternative to Western conditionality and highlights the Gulf's role in China's energy diversification, but it may occlude labor standards, debt sustainability, and the political risks of concentrated state-to-state bargaining.

Russian: The Russian perspective frames hydrocarbon coordination, especially through OPEC+, as an instrument of multipolarity and sovereign equality against Western market and institutional dominance. It stresses state control over strategic resources, diplomatic leverage, and the legitimacy of producer coordination, contributing a critique of unipolar energy governance. Its occlusion lies in understating domestic authoritarianism, fiscal fragility, and the dependence of Russian strategy on sustained high prices and Chinese demand.

Western: The Western perspective generally interprets rentierism as a governance pathology to be addressed through market reform, transparency, diversification, and gradual political liberalization. It contributes institutional metrics, fiscal surveillance, and security-architecture analysis, and it foregrounds the Gulf's role in global energy stability. Its characteristic occlusion is the tendency to treat Western security guarantees, arms sales, and financial interests as external to the rentier bargain rather than as constitutive elements of it.

UN: The UN perspective approaches rentier political economy through sustainable development, energy transition, and social protection. It emphasizes SDG 7, climate finance, just-transition planning, and the vulnerability of rent-dependent populations to price shocks and decarbonization. This view contributes normative frameworks for diversification and equity, but it may occlude geopolitical power, the unequal distribution of transition costs, and the fact that international climate governance can itself create new rent-seeking opportunities.

SECTION 2.3 KEY IDEA 2 — The US Shale Revolution and Its Structural Impact on Global Oil Markets

Bolded Causal Claim: The US shale revolution structurally eroded OPEC's swing-producer power by introducing a price-elastic, short-cycle supply source that caps sustained price spikes and compresses the fiscal rent available to hydrocarbon-dependent states.

Mechanism: The mechanism operates through a chain of technological, financial, and market-structure changes that together reconstituted the global oil supply curve. Hydraulic fracturing combined with horizontal drilling unlocked vast volumes of tight oil and shale gas in formations such as the Permian Basin, the

Eagle Ford, and the Bakken. Unlike conventional megaprojects with decade-long lead times, shale wells can be drilled and brought online within weeks, and production declines steeply after the first year, which means operators can throttle output in response to price signals. This short-cycle elasticity transformed the supply side of the global oil market. Before shale, OPEC—and Saudi Arabia in particular—functioned as the marginal swing producer: when demand outstripped supply, Riyadh could add barrels; when prices collapsed, it could cut. After shale, the marginal barrel was increasingly American. The result was a flattening of the supply curve at the margin and a new ceiling on price rallies. Capital markets played a critical enabling role: the junk-bond and private-equity financing that funded the shale boom allowed rapid entry and exit, though it also introduced financial fragility, as the 2015-2016 and 2020 price collapses demonstrated when leveraged producers went bankrupt. The structural impact on global markets was therefore not merely additional volume but a change in the price-formation process itself. OPEC's traditional strategy of withholding supply to raise prices now risked ceding market share to shale producers who would respond to higher prices with new drilling. This is the logic that drove Saudi Arabia's 2014 decision to maintain production and let prices fall, an attempt to discipline shale that partially succeeded in bankrupting marginal operators but also inflicted fiscal pain on Riyadh and its OPEC partners. The shale revolution thus did not eliminate OPEC, but it fundamentally altered the strategic environment in which OPEC operated, forcing the creation of OPEC+ in 2016 to bring Russia into a broader coordination framework. For rentier states, the mechanism transmitted through fiscal breakeven prices: when the market price fell below the price required to balance the budget, governments faced deficits, reserve drawdowns, and pressure to cut spending or raise non-oil revenue. The shale revolution therefore accelerated the diversification imperative that Gulf states had long rhetorically embraced but rarely implemented.

Scope Conditions: The shale mechanism operates only under specific conditions. Technologically, it requires the combination of hydraulic fracturing, horizontal drilling, and seismic imaging, plus a regulatory environment permissive of land access and water use. Geologically, it requires source-rock formations with sufficient organic content and brittleness. Financially, it requires deep capital markets willing to fund high-risk, high-decline assets; when credit tightens, as in 2020, shale production can fall rapidly, temporarily restoring OPEC's leverage. Infrastructure matters: without pipeline and export capacity, production growth stalls, as occurred in the Permian in 2018-2019. The mechanism is also price-dependent: shale is profitable above roughly fifty to sixty dollars per barrel for most basins, though breakevens have fallen over time. Below that threshold, drilling collapses and the supply elasticity disappears. Politically, the mechanism depends on US federal and state regulatory frameworks that permit private mineral rights and rapid permitting; this institutional configuration is not easily replicated in countries where the state owns subsurface resources. Finally, the mechanism assumes continued innovation in drilling efficiency; if productivity gains plateau, the cost curve shifts upward and OPEC regains room to maneuver.

Observable Implications: The observable implications are substantial and well-documented. US crude oil production rose from roughly five million barrels per day in 2008 to over thirteen million by late 2019, making the United States the world's largest producer and a net petroleum exporter by 2019 for the first time in decades. OPEC's share of global production fell, and the organization's ability to manage prices unilaterally declined. The 2014-2016 price collapse, driven partly by Saudi strategy to test shale resilience, saw prices fall from over one hundred dollars to below thirty, triggering fiscal crises across the Gulf and forcing austerity measures in Saudi Arabia, including subsidy cuts and the introduction of VAT. The creation of OPEC+ in late 2016, bringing Russia into a formal coordination arrangement with OPEC, was a direct strategic response to shale's challenge. The 2020 price war between Saudi Arabia and Russia, followed by the historic negative prices in April 2020, demonstrated both the volatility of the new market and the limits

of coordination. Fiscal breakeven prices for Gulf states, which had risen during the high-price years of the 2000s, became unsustainable, providing political impetus for diversification agendas such as Saudi Vision 2030. Energy Information Administration data document these production trajectories, while IMF Article IV reports for Gulf states record the fiscal adjustment pressures. The shale revolution also altered trade flows: US exports to Asia and Europe displaced some Gulf and Russian crude, reshaping tanker routes and refining economics.

Perspective Note (five traditions in brief):

African: From an African vantage point, the US shale revolution is not merely a North American supply story but a restructuring of global energy rents that reshapes African fiscal and developmental possibilities. African oil producers such as Nigeria and Angola, which depend on crude exports for the majority of government revenue and foreign exchange, faced compressed prices and reduced market share as US shale displaced their barrels in Atlantic Basin markets. The mechanism transmitted through price: lower and more volatile oil prices narrowed fiscal space for infrastructure, health, and education spending, exacerbating the rentier vulnerabilities that African political economists have long identified. At the same time, the shale revolution's demonstration that technological innovation can rapidly alter energy supply curves carries a dual lesson for African states. It suggests that hydrocarbon dependence is increasingly risky as a development strategy, reinforcing arguments for diversification and value-addition rather than raw export. It also raises the prospect that African gas and oil resources may face stranded-asset risk as global demand peaks and supply sources multiply. African scholarship on resource governance, from Rodney's analysis of extractive economies to contemporary work on the resource curse, frames the shale shock as an external reminder that rents are politically constructed and historically contingent. The African perspective also highlights what Western market analysis often occludes: the distributional consequences within African producer states, where price collapses fall hardest on public-sector workers and the poor while elites with offshore assets are insulated. Gulf investment in Africa, which expanded in the 2010s, must be understood partly as a search for alternative assets and markets in a post-shale world, though African analysts caution that such investment can reproduce extractive patterns if governance frameworks are weak. The African view thus reads the shale revolution as both a market event and a structural warning about the fragility of rent-based development.

Chinese: China's perspective centers on energy security and the strategic value of diversified supply. The shale revolution reduced US import dependence, which Beijing interpreted as a potential shift in American strategic priorities away from Gulf protection, but it also increased global supply flexibility that benefited Chinese importers. China's response has been to deepen partnerships with Gulf producers while building strategic petroleum reserves and expanding renewable capacity. The occlusion in this view is the underestimation of how shale volatility affects Chinese state-owned enterprises' overseas investments.

Russian: Russia's perspective frames the shale revolution as a competitive threat to its hydrocarbon rents and a catalyst for OPEC+ cooperation. Moscow initially dismissed shale as a bubble but later recognized its structural impact, leading to the 2016 OPEC+ agreement. The Russian view emphasizes multipolarity: by coordinating with OPEC, Russia sought to preserve price levels and geopolitical influence. Its occlusion is the tendency to treat OPEC+ as a durable alliance rather than a tactical arrangement vulnerable to cheating and divergent interests.

Western: The Western perspective, particularly in the United States, celebrates shale as a triumph of market innovation and private enterprise that enhanced energy security, reduced import dependence, and provided geopolitical leverage. It emphasizes consumer benefits from lower prices and the strategic optionality of becoming a swing producer. Its characteristic occlusion is the neglect of environmental externalities, the

financial fragility of the sector, and the way shale volatility destabilizes rentier states whose stability Western security architectures depend upon.

UN: The UN perspective approaches the shale revolution through sustainable development and climate governance. It notes that abundant, cheap shale gas displaced coal in some markets, reducing emissions in the short term, but also that cheap fossil fuels can delay renewable investment and lock in carbon-intensive infrastructure. The UN view emphasizes SDG 7 and the need for a just transition, highlighting that shale's boom-and-bust cycles create economic insecurity for workers and communities. Its occlusion is the limited capacity to address the geopolitical power shifts that shale triggered, which fall outside normative climate frameworks.

SECTION 2.4 KEY IDEA 3 — The Abraham Accords and Gulf Diversification Strategies

Bolded Causal Claim: The Abraham Accords accelerated Gulf economic diversification by opening Israeli technology, capital, and security partnerships that reduce hydrocarbon dependence, while simultaneously reconfiguring regional alignments around a shared Iran threat perception.

Mechanism: The mechanism runs through several channels. First, normalization agreements between Israel and the United Arab Emirates, Bahrain, Morocco, and Sudan in 2020 created legal frameworks for trade, investment, and technology transfer that had previously been blocked by the Arab boycott. Israeli strengths in cybersecurity, water technology, agritech, and defense systems complement Gulf capital and market access, creating potential for non-oil sector growth. Second, the Accords facilitated security cooperation, including intelligence sharing and joint defense planning, which reduced the perceived need for exclusive reliance on US security guarantees and allowed Gulf states to hedge their strategic bets. Third, normalization opened tourism and aviation corridors, generating service-sector revenue. Fourth, and critically, the Accords were embedded in a broader US strategy of regional realignment that linked Gulf diversification to the containment of Iran, creating a security-economy nexus. The mechanism is not automatic, however. It depends on sustained political commitment, the resolution of Palestinian grievances that remain a source of regional legitimacy, and the willingness of Israeli and Gulf business communities to overcome cultural and regulatory barriers. The Accords also created a feedback loop: diversification requires stability, and normalization was partly motivated by the desire to secure Gulf states against Iranian influence, which in turn required maintaining the US security umbrella even as economic ties with China deepened. The result is a complex multi-alignment in which diversification and security are intertwined.

Scope Conditions: The mechanism operates under specific conditions. Politically, it requires leaderships willing to absorb domestic and regional criticism for normalizing with Israel, which remains deeply unpopular in Arab public opinion. The UAE and Bahrain, with smaller populations and more centralized authority, faced lower domestic costs than Saudi Arabia, which has not normalized and faces stronger legitimacy constraints. Economically, it requires complementary assets: Israeli technology and Gulf capital, plus regulatory harmonization. The mechanism is vulnerable to escalation in the Israeli-Palestinian conflict, which can freeze cooperation, as occurred after October 2023. It also depends on US facilitation and credibility; if Washington's commitment wavers, the security rationale weakens. Regionally, the mechanism requires a shared threat perception, primarily regarding Iran; if Gulf-Iran relations improve, as in the 2023 rapprochement, the security driver diminishes. Finally, the mechanism assumes that diversification gains are not offset by new dependencies, such as reliance on Israeli technology in critical infrastructure.

Observable Implications: The observable implications include rapid growth in UAE-Israel trade, which reached billions of dollars within two years of normalization, and the establishment of direct flights, em-

bassies, and joint ventures. Bahrain and Morocco followed with their own agreements. The Negev Forum brought together Israel, the UAE, Bahrain, Morocco, Egypt, and the United States in a multilateral framework. Israeli companies established offices in Dubai and Abu Dhabi, and Gulf sovereign wealth funds explored investments in Israeli technology. However, the October 2023 Gaza war strained these relationships, with the UAE and Bahrain condemning Israeli military operations while maintaining diplomatic ties, illustrating the fragility of the mechanism. Saudi Arabia, the largest Gulf economy, has not normalized, conditioning any agreement on progress toward a Palestinian state, which demonstrates the scope conditions. The Accords also accelerated Gulf interest in non-oil sectors such as tourism, finance, and technology, contributing to non-oil GDP growth in the UAE. IMF Article IV reports for the UAE and Bahrain note the diversification momentum, though they caution about implementation risks. The Accords did not, however, resolve the underlying Palestinian issue or eliminate regional tensions, and their long-term economic impact remains contingent on political developments.

Perspective Note (five traditions in brief):

African: From an African perspective, the Abraham Accords are significant less for their bilateral Gulf-Israel dynamics than for what they reveal about the geopolitics of diversification and the marginalization of African and Palestinian voices in regional ordering. African states have long experienced the consequences of externally brokered normalization deals that prioritize great-power and regional-elite interests over popular sovereignty. The Accords' framing of diversification as a technocratic, security-driven process echoes patterns African scholars have identified in structural adjustment and resource governance: external actors define the terms of economic transformation while local populations bear the costs. African analysts note that Gulf diversification strategies, including those enabled by the Accords, have increased Gulf investment in African agriculture, ports, and logistics, which can support African development but also risk reproducing extractive relationships if not governed by transparent frameworks. The African perspective also insists on the Palestinian dimension: many African states, shaped by their own anti-colonial histories, view the normalization process as sidelining Palestinian self-determination, and the Accords' security logic as reinforcing a regional order that privileges state elites over popular aspirations. From within African scholarship, the Accords illustrate how economic diversification and security realignment can be coupled in ways that obscure questions of justice and equity. The African vantage point thus contributes a critique of the technocratic framing of diversification and a reminder that regional orders built on elite bargains without popular legitimacy are inherently fragile. It also highlights the opportunity for African states to leverage Gulf diversification by demanding technology transfer, local content requirements, and equitable investment terms, rather than accepting passive roles in Gulf-led economic networks.

Chinese: China's perspective on the Abraham Accords is ambivalent. Beijing has historically supported Palestinian statehood and the two-state solution, and the Accords bypassed that framework, which China criticized as undermining international law. At the same time, China's economic interests in the Gulf and Israel are substantial, and Beijing has sought to maintain relationships with all parties. The Accords also complicated China's Belt and Road Initiative by strengthening US-aligned regional networks. China's occlusion is its tendency to frame the issue primarily through great-power competition rather than regional agency.

Russian: Russia's perspective views the Abraham Accords with suspicion, seeing them as an American attempt to build a regional coalition against Iran and Russia. Moscow has maintained relationships with both Israel and Gulf states, and the Accords threatened to reduce Russian diplomatic maneuverability. Russia's occlusion is its framing of all regional developments through the lens of US containment, which underesti-

mates the autonomous economic motivations of Gulf states.

Western: The Western perspective, particularly in the United States, presents the Abraham Accords as a diplomatic breakthrough that advances peace, prosperity, and regional integration. It emphasizes trade growth, security cooperation, and the potential for a new regional architecture. Its occlusion is the tendency to understate the Palestinian issue, the domestic legitimacy costs for Arab signatories, and the fragility of the agreements under regional escalation.

UN: The UN perspective approaches the Abraham Accords through international law, human rights, and sustainable development. It emphasizes the need for a just resolution of the Israeli-Palestinian conflict and warns that normalization without progress on Palestinian rights may undermine long-term stability. The UN view also highlights the potential for regional cooperation on water, climate, and technology to advance SDGs. Its occlusion is the limited leverage of UN frameworks over great-power-brokered deals and the risk that normative statements substitute for effective action.

2.5 KEY IDEA 4 — Saudi Vision 2030 and the Politics of Economic Transformation

Bolded Causal Claim: Saudi Vision 2030 is a state-led project to convert hydrocarbon rent into diversified productive capacity and a new basis of regime legitimacy, but its trajectory is governed by the internal contradiction of the rentier state: the transformation requires fiscal extraction, labor-market restructuring, and elite centralization that directly threaten the distributive social contract on which Saudi political order has rested since the 1970s oil boom.

Mechanism: Vision 2030, launched in 2016 under Crown Prince Mohammed bin Salman (MBS), operates through five interconnected instruments. First, the Public Investment Fund (PIF) has been repositioned from a passive holding company into an active sovereign wealth vehicle with assets exceeding $700 billion, tasked with generating returns and seeding new industries. Second, the 2019 initial public offering of Saudi Aramco—selling roughly 1.5 percent of shares—transferred capital to the PIF while preserving state control, converting subsoil wealth into investable financial assets. Third, "giga-projects" (NEOM, Qiddiya, the Red Sea Project, Diriyah Gate) are designed to create entirely new economic clusters in tourism, entertainment, and technology, bypassing the existing bureaucratic and social structures of the oil economy. Fourth, social liberalization—women driving from 2018, an entertainment authority, tourism visas, and relaxed gender-mixing rules—expands the labor supply and consumer base while signaling modernity to foreign investors. Fifth, fiscal reforms including the introduction of value-added tax in 2018, subsidy reductions, expatriate levies, and the "citizen's account" compensation scheme attempt to reduce the budget's oil dependence.

The mechanism of political risk lies in what Hertog (2010) describes as the Saudi "allocation state": a system in which the regime distributes oil rent to citizens, tribal elites, and bureaucratic clients in exchange for political quiescence, without extracting taxes that would create representation demands. Rentier state theory, developed in the work of Beblawi and Luciani and applied to the Gulf by Hertog, predicts that states deriving revenue from external rent rather than domestic taxation face weak societal accountability and can sustain authoritarian bargains. Vision 2030 inverts this logic: it requires citizens to work in a productive private sector, to accept taxation (VAT), and to compete in labor markets rather than receive guaranteed public employment. The mechanism of backlash is therefore structural: the very reforms that reduce oil dependence also erode the distributive basis of legitimacy. The state must simultaneously spend on transformation, maintain social transfers to avoid unrest, and fund military commitments (notably the Yemen war), against oil revenue that

fluctuates with global prices and OPEC+ decisions.

The political mechanism is equally important. Transformation at speed requires dismantling the consensual, distributed authority of the Al Saud family and the religious establishment. MBS's centralization—sidelining senior princes, the 2017 Ritz-Carlton detention of elites, the restructuring of the religious police, and the 2018 killing of journalist Jamal Khashoggi—reflects the political logic of economic transformation: a fragmented elite cannot execute rapid restructuring. This is the "politics" of Vision 2030: not merely economics but a reconfiguration of elite bargains, coercive capacity, and the ideological basis of rule, shifting from Wahhabi religious legitimacy toward nationalist, performance-based legitimacy centered on the crown prince personally.

Scope Conditions: The transformation succeeds under identifiable conditions and fails under others. Success conditions include: (a) sustained oil prices above the fiscal breakeven level, which IMF Article IV consultations have placed in the range of roughly $80–90 per barrel in recent years, providing fiscal space for investment without austerity; (b) PIF investment returns and foreign direct investment inflows approaching the ambitious targets (FDI has remained well below the stated goals of roughly $100 billion annually); (c) absorption of Saudi nationals into private-sector employment through Saudization (Nitaqat) programs; (d) social acceptance of cultural opening without destabilizing conservative constituencies or provoking Islamist backlash; and (e) geopolitical stability that does not drain resources into regional conflicts. Failure modes include prolonged low prices forcing austerity and popular backlash; implementation bottlenecks and cost overruns in giga-projects; elite resistance from displaced princes and clerics; and regional escalation (Iran, Yemen, or Gaza) that redirects fiscal and political attention. The scope condition most often underestimated is state capacity: the Saudi bureaucracy, as Hertog (2010) documents, was built for distribution and patronage, not for project execution at the scale Vision 2030 demands.

Observable Implications: The observable record is mixed, which is itself informative. Non-oil GDP growth has accelerated, reaching roughly 4–5 percent in 2022–2023, and female labor force participation has risen from approximately 20 percent to roughly 35 percent. The entertainment and tourism sectors have expanded rapidly, and the PIF has become one of the world's most active sovereign investors, acquiring stakes in global sports, technology, and infrastructure. Aramco remains the world's most profitable company, providing the fiscal base. Yet FDI inflows remain below targets; youth unemployment persists; several giga-projects have been scaled back or delayed; and the NEOM "The Line" project has been dramatically reduced in scope. Politically, centralization has deepened, with continued detention of dissidents, activists, and clerics, and the Khashoggi killing remains a defining reputational cost. The Saudi Green Initiative and associated climate commitments represent an overlay that attempts to align transformation with global energy-transition discourse, but hydrocarbon production remains central to fiscal planning.

Perspective Note (five traditions in brief): The African perspective (primary) treats Vision 2030 as both a source of capital and a contested model of state-led diversification. Gulf sovereign wealth funds—PIF, Mubadala, ADIA, QIA—have become major investors in African infrastructure, agriculture, ports, and technology, including Saudi and Emirati investments in mining and logistics across the continent. African scholarship, drawing on Rodney's analysis of "development of underdevelopment" and Nkrumah's critique of neo-colonialism, asks whether Gulf capital reproduces extractive patterns—extracting resources and repatriating profits—or builds productive capacity through technology transfer and local content requirements. The African vantage point also highlights that Gulf investment is not monolithic: competition among Saudi, Emirati, and Qatari capital creates openings for African states to negotiate better terms, but only if African governments possess the industrial policy capacity to do so. Vision 2030's energy-transition rhetoric intersects

with African energy needs in contradictory ways: Gulf states invest in African renewables and green hydrogen while simultaneously expanding fossil-fuel extraction, creating tension for climate-vulnerable African populations. The African perspective's occlusion is the internal Saudi political dynamics—centralization, repression, elite bargaining—that shape investment decisions; African analysis often treats Gulf states as unitary actors, missing the domestic politics that drive external economic behavior. The Chinese perspective views Vision 2030 as an opportunity for economic partnership, with Chinese firms involved in construction, technology, and energy-transition projects; it emphasizes mutual benefit and non-interference while occluding governance and labor-rights concerns. The Russian perspective sees Saudi transformation as both a potential competitor in oil markets and a partner in OPEC+ coordination; it emphasizes multipolarity and the weakening of US influence while occluding Saudi domestic politics and the limits of Russian economic capacity. The Western perspective focuses on investment opportunities, market opening, and social liberalization as modernization indicators, while also expressing security concerns about MBS's authoritarian consolidation; it tends to occlude the rentier-structural constraints and the possibility that transformation reinforces rather than dissolves authoritarianism. The UN perspective emphasizes SDG alignment, diversification, women's empowerment, and climate commitments, while occluding political repression and the persistent gap between stated targets and implementation outcomes.

2.6 KEY IDEA 5 — The Gulf's Multi-Alignment Strategy: US Security Guarantees, Chinese Economic Partnership, and Russian Diplomatic Relations

Bolded Causal Claim: Gulf states, led by Saudi Arabia and the United Arab Emirates, have adopted a multi-alignment strategy that decouples security dependence on the United States from economic partnership with China and diplomatic coordination with Russia, a strategy made possible by the US shale revolution's reduction of American import dependence and by the eastward shift of global oil demand toward Asia.

Mechanism: Multi-alignment operates through three distinct pillars that are deliberately kept separate. The security pillar remains anchored in the United States: the US Fifth Fleet is headquartered in Bahrain, Al Udeid Air Base in Qatar hosts US Central Command forward elements, and Washington provides arms sales, intelligence sharing, and missile defense cooperation. No Gulf state has sought to replace this security architecture, because no alternative power can project comparable military force into the Gulf. The economic pillar has shifted decisively toward China: China is the largest trading partner for most Gulf states, Chinese firms dominate construction and infrastructure, Huawei has built 5G networks across the Gulf, and Gulf sovereign wealth funds have increased allocations to Chinese markets. The diplomatic and energy pillar involves coordination with Russia through OPEC+ since 2016, participation in BRICS (UAE joined in January 2024; Saudi Arabia was invited), dialogue-partner status in the Shanghai Cooperation Organisation, and experiments with non-dollar trade settlement.

The enabling mechanism is structural rather than ideological. The US shale revolution, documented by Yergin (2011) and subsequent EIA data, transformed the United States from the world's largest oil importer into a major producer and net exporter, reducing American dependence on Gulf hydrocarbons. This reduced the US willingness to guarantee Gulf security unconditionally—evident in the muted US response to the 2019 Abqaiq-Khurais attacks on Saudi oil facilities—and created incentives for Gulf states to diversify their partnerships. Simultaneously, global oil demand growth shifted eastward: China, India, Japan, and South Korea became the primary destinations for Gulf crude, making Asian markets economically indispensable. The mechanism is "strategic autonomy" through issue-specific alignment rather than bloc commitment: security

with Washington, economy with Beijing, energy diplomacy with Moscow. This is sustained by the fact that neither the United States nor China has yet demanded exclusive alignment, and by Gulf states' financial capacity to purchase influence across multiple capitals. The 2023 Iran-Saudi rapprochement, brokered by China, demonstrated that multi-alignment could yield diplomatic dividends unavailable through US mediation alone.

Scope Conditions: Multi-alignment works when great powers tolerate hedging, when oil revenues fund diversification, and when regional threats are manageable through diplomacy or deterrence. It is facilitated by the absence of a formal US security treaty that would prohibit independent diplomacy, and by Gulf states' small populations and large financial resources, which allow them to absorb the costs of playing multiple sides. It fails or strains under three conditions: first, if US-China competition forces a binary choice, particularly in technology (Huawei 5G, semiconductor access) or financial sanctions; second, if regional escalation—such as the Gaza war or a direct Iran-Israel confrontation—forces Gulf states to choose sides publicly; third, if domestic political change in a Gulf state alters its risk tolerance. The scope condition most often overlooked is the asymmetry of dependence: Gulf states need the US for security more than the US needs Gulf oil, while China needs Gulf oil more than Gulf states need Chinese security, creating a complex triangular bargaining structure that favors different parties on different issues.

Observable Implications: The observable record includes the December 2022 state visit of Chinese President Xi Jinping to Riyadh, which produced a comprehensive strategic partnership and dozens of agreements; the UAE's accession to BRICS in January 2024; Saudi Arabia's invitation to BRICS; the March 2023 Iran-Saudi rapprochement brokered by China; OPEC+ production cuts coordinated with Russia despite Western sanctions; Gulf states' refusal to join sanctions against Russia after 2022; diversification of arms procurement (French Rafale jets for the UAE, Chinese Wing Loong drones); and pilot programs for yuan-denominated oil trade. These are not signs of anti-Americanism but of calibrated hedging: Gulf states continue to host US forces, purchase US weapons, and coordinate on regional security even as they deepen ties with Beijing and Moscow.

Perspective Note (five traditions in brief): The African perspective (primary) examines Gulf multi-alignment through its implications for African security and development. Gulf states' expanded multi-aligned footprint in Africa—UAE and Saudi investments in ports, logistics, agriculture, and mining; Qatari mediation in Sudan and Darfur; Emirati involvement in the Horn of Africa—creates both opportunities and risks for African states. The African perspective asks whether multi-alignment among Gulf powers allows African states to play competing Gulf actors against each other for better terms, or whether it fragments African agency by multiplying external patrons. African scholars such as Aning and Danso emphasize that African states must develop their own multi-alignment strategies rather than become arenas for Gulf and great-power competition. The African vantage point also highlights that Gulf multi-alignment includes competition over green hydrogen and critical minerals in Africa, with Gulf states positioning themselves as intermediaries between African resources and Asian and European markets. The occlusion in African analysis is the tendency to treat Gulf states as monolithic "Middle Eastern" actors, missing their internal differentiation and the fact that Gulf multi-alignment is itself a response to declining US hegemony—a structural shift that also reshapes Africa's room for maneuver. The Chinese perspective views Gulf multi-alignment as validation of its economic diplomacy and "community of shared future," positioning China as an indispensable partner; it occludes security risks and the limits of Chinese hard power in the Gulf. The Russian perspective frames multi-alignment as evidence of multipolarity and declining US unipolarity, with OPEC+ as proof of Russia's continued relevance; it occludes Russian economic weakness and dependence on the Chinese market. The Western perspective expresses anxiety about loss of influence, technology

leakage through Huawei, and Gulf states' refusal to align on Russia sanctions, while also seeing opportunity in the Abraham Accords; it occludes the US role in driving Gulf diversification through shale production and strategic retrenchment. The UN perspective emphasizes multilateralism, SDG financing, and climate cooperation, seeing multi-alignment as potentially supportive of UN frameworks if channeled toward development; it occludes power politics and the risk that multipolarity weakens normative enforcement.

SECTION 2.7 — FIVE PERSPECTIVES IN DEPTH

2.7.1 African Perspective (PRIMARY)

The African vantage point on hydrocarbon geopolitics and Gulf strategy is not a regional application of theories developed elsewhere; it is a generative standpoint from which the entire field looks different. To understand why, one must begin with the structural position that African states occupy in the global hydrocarbon order. Africa is simultaneously a major hydrocarbon producer—Nigeria, Angola, Algeria, Libya, Egypt, and Equatorial Guinea among them—and a continent whose energy access deficits remain acute, with roughly six hundred million people lacking electricity access according to the International Energy Agency's 2023 Africa Energy Outlook. This dual position means that African states experience Gulf hydrocarbon geopolitics not as distant great-power maneuvering but as a set of forces that directly shape their fiscal capacity, their development trajectories, and their vulnerability to price shocks. When OPEC+ coordinated production cuts in 2020 and again in 2022, the price effects rippled through African petrostate budgets with immediate consequences for public spending, debt servicing, and social stability. The African perspective thus begins from material embeddedness rather than from abstract strategic theory.

The theoretical lineage of this perspective runs through several distinct African intellectual traditions. Walter Rodney's *How Europe Underdeveloped Africa* (1972) established the foundational insight that extractive economies in the periphery are not merely underdeveloped but actively underdeveloped by the structure of global capitalism, a framework that applies with equal force to African hydrocarbon economies and to the Gulf rentier states that compete with them in global markets. Rodney's analysis of the "development of underdevelopment" provides the conceptual architecture for understanding how Gulf oil wealth, rather than simply enriching Gulf populations, has historically been integrated into a global system that constrains African industrialization by locking in primary commodity dependence. Kwame Nkrumah's *Neo-Colonialism: The Last Stage of Imperialism* (1965) extended this analysis to the post-independence period, arguing that formal sovereignty masked continued economic subordination through control of commodity markets, investment flows, and technology transfer. Nkrumah's framework is directly relevant to contemporary Gulf-Africa relations: when Gulf sovereign wealth funds acquire African agricultural land, port infrastructure, or telecommunications assets, the question of whether this constitutes development partnership or neo-colonial extraction cannot be answered by the investor's stated intentions alone but must be assessed through the structural effects on African productive capacity.

Jean-François Bayart's concept of "extraversion"—the strategic orientation of African elites toward external patrons as a source of domestic power—provides a second theoretical pillar. In *The State in Africa: The Politics of the Belly* (1993), Bayart argued that African states are not simply weak or failed but are organized around a distinctive political logic in which rulers derive legitimacy and resources from their position in international networks rather than from domestic taxation or production. This framework illuminates the Gulf-Africa nexus in two directions. First, it helps explain why African elites have historically welcomed

Gulf investment without demanding the governance conditionalities that Western donors attach: Gulf capital comes without the institutional reform agendas that African rulers experience as sovereignty violations. Second, and more critically, it suggests that the Gulf's own rentier state model—where legitimacy derives from hydrocarbon distribution rather than taxation—represents an extreme form of the extraversion logic that Bayart identified in African politics. The Gulf states are not a different species of state; they are the logical terminus of a political economy in which external resource rents substitute for domestic productive legitimacy. This insight is unavailable from Western or Chinese perspectives, which tend to treat Gulf rentierism as sui generis rather than as a variant of a broader postcolonial political economy.

Mahmood Mamdani's *Citizen and Subject: Contemporary Africa and the Legacy of Late Colonialism* (1996) adds a crucial dimension through his analysis of the bifurcated state—the institutional separation between urban civil society and rural customary authority that colonialism bequeathed to postcolonial Africa. Mamdani's framework helps explain why African states have struggled to convert hydrocarbon revenues into broad-based development: the institutional architecture of the postcolonial state was designed for extraction and control, not for productive investment. When Gulf states invest in African infrastructure, they are operating within institutional environments shaped by this bifurcated legacy, and the development outcomes depend less on the volume of investment than on whether it reinforces or transcends the extractive institutional logic. Mamdani's insistence on the historical specificity of African state forms also serves as a corrective to the universalizing tendencies of rentier state theory, which often assumes that oil wealth produces similar political outcomes regardless of institutional context.

Amílcar Cabral's writings on national liberation and economic transformation provide a third theoretical resource. Cabral's insistence that political independence without economic transformation is meaningless—his famous formulation that "the people are not fighting for ideas, for the things in anyone's head. They are fighting to win material benefits, to live better and in peace, to see their lives go forward"—frames the African evaluation of Gulf investment in terms of concrete material outcomes rather than diplomatic symbolism. From a Cabralian perspective, the question is not whether Gulf states are "good partners" in the abstract but whether their investment increases African productive capacity, transfers technology, and builds domestic institutional capability. The evidence here is mixed: Gulf investment in African ports (DP World in Djibouti, Senegal, and elsewhere) has improved logistics infrastructure but has also generated sovereignty disputes, as in the Djibouti case where the government terminated DP World's concession and seized the Doraleh Container Terminal in 2018, triggering international arbitration. Gulf investment in African agriculture—often characterized as "land grabs" by critics—has frequently prioritized export-oriented production over domestic food security, reproducing the colonial pattern of extracting primary commodities for external markets.

Frantz Fanon's *The Wretched of the Earth* (1961) contributes the critical insight that the national bourgeoisie in postcolonial states often becomes a comprador class, mediating between foreign capital and domestic populations without generating genuine development. Fanon's analysis is directly applicable to the Gulf-Africa nexus: the African intermediaries who facilitate Gulf investment—politicians, business elites, military officers—may capture rents from the relationship without ensuring that benefits reach broader populations. Fanon's warning about the "pitfalls of national consciousness" also cautions against celebrating Gulf-Africa partnerships as evidence of South-South solidarity when the structural dynamics may reproduce dependency. The African perspective thus demands a distinction between the diplomatic rhetoric of partnership and the material reality of extraction, a distinction that Western and Chinese perspectives often blur in their enthusiasm for or anxiety about Gulf strategic realignment.

Julius Nyerere's philosophy of ujamaa and self-reliance provides a normative counterpoint. Nyerere's insistence that African development must be rooted in African realities and controlled by African peoples frames the evaluation of Gulf investment in terms of sovereignty and self-determination rather than efficiency or growth. From this standpoint, the critical question is not whether Gulf capital flows into Africa but whether African states retain policy space to direct those flows toward nationally determined priorities. The African Continental Free Trade Area (AfCFTA), which entered into force in 2021, represents an attempt to build the kind of collective bargaining power that Nyerere envisioned, and its interaction with Gulf investment strategies—whether Gulf states engage with AfCFTA as a continental framework or continue bilateral deal-making with individual states—will be a key indicator of whether the relationship is genuinely developmental or merely extractive.

Achille Mbembe's *On the Postcolony* (2001) and his subsequent work on necropolitics provide a more contemporary theoretical lens. Mbembe's analysis of the "commandment" as a mode of power—where authority operates through the spectacle of violence and the management of bodies rather than through institutional legitimacy—helps explain the political dynamics of African petrostates where hydrocarbon revenues fund security apparatuses that maintain order without consent. Mbembe's concept of "brutalism" and his analysis of the "becoming-black of the world" also frame the African experience of global hydrocarbon politics in terms of racialized extraction: the environmental and social costs of hydrocarbon production are disproportionately borne by populations of color, whether in the Niger Delta, the Gulf of Guinea, or the Gulf states' own migrant labor camps. This racial dimension is largely invisible in Western, Chinese, and Russian perspectives, which treat hydrocarbon geopolitics as a matter of state interest rather than of embodied inequality.

Siba Grovogui's work on international relations theory and African agency provides the most direct theoretical challenge to the Western-centric frameworks that dominate Gulf geopolitics analysis. In *Sovereigns, Quasi Sovereigns, and Africans* (1996) and subsequent writings, Grovogui argued that the international system was constructed through the exclusion of African and other non-Western peoples, and that the resulting order systematically privileges Western states' interests while presenting itself as universal. Applied to Gulf hydrocarbon geopolitics, Grovogui's framework suggests that the "rules-based international order" that Western states invoke when discussing Gulf security is itself a historically contingent construction that serves Western energy security interests. The African perspective thus asks: whose order is being defended when the US maintains military bases in the Gulf? Whose development is being prioritized when OPEC+ coordinates production cuts? The answers, from an African standpoint, are not neutral but reflect the power asymmetries embedded in the international system.

Oyèrónkẹ́ Oyěwùmí's *The Invention of Women* (1997) and her broader work on gender and social organization in African societies contributes a dimension that is entirely absent from mainstream Gulf geopolitics analysis. Oyěwùmí's argument that gender categories are culturally constructed rather than biologically determined, and her critique of the imposition of Western gender binaries on African societies, has implications for understanding the social transformations that Gulf diversification strategies entail. Vision 2030's social reforms in Saudi Arabia—women's driving rights, entertainment liberalization, labor market participation—are often analyzed in Western frameworks as "modernization" or "liberalization." An Oyěwùmí-informed perspective would ask how these reforms interact with existing gendered social structures in Gulf societies and what their implications are for African migrant workers, particularly women, who constitute a significant share of the Gulf's domestic labor force. The kafala system, which ties migrant workers to individual sponsors, has been extensively documented as a site of exploitation, and African women migrants—particularly from Ethiopia, Kenya, and Nigeria—have been disproportionately affected. The African perspective thus insists that Gulf hydrocarbon geopolitics cannot be analyzed without attention to the gendered and racialized

labor regimes that sustain Gulf economies.

Kwesi Aning's work on African security governance and Rita Tamale's contributions to African feminist jurisprudence provide additional analytical resources. Aning's research on the securitization of African politics and the role of external actors in African security arrangements is relevant to understanding how Gulf states' security partnerships with African states—particularly in the Horn of Africa, where the UAE has established military bases in Eritrea and Somaliland—reshape African security governance. Tamale's work on the intersection of law, gender, and power in African contexts provides tools for analyzing how Gulf investment in African infrastructure affects local communities, particularly women who bear disproportionate costs of land displacement and environmental degradation.

What does the African perspective contribute that the other four cannot? First, it centers the material experience of populations in the global South who are affected by Gulf hydrocarbon geopolitics but who have no voice in its formulation. The Western, Chinese, and Russian perspectives are all state-centric; the UN perspective is institution-centric. The African perspective, rooted in traditions of anti-colonial thought and postcolonial critique, insists on the standpoint of those who experience the consequences of great-power and middle-power strategies without participating in their design. Second, it provides a theoretical framework—drawing on Rodney, Nkrumah, Bayart, Mamdani, and others—that treats extraction and dependency as structural features of the global economy rather than as policy failures or development gaps. This framework is essential for understanding why Gulf diversification strategies, however well-intentioned, may reproduce rather than transcend the extractive dynamics of the hydrocarbon era. Third, it reveals the racialized and gendered dimensions of Gulf hydrocarbon geopolitics that are invisible in other perspectives: the migrant labor regimes, the environmental injustices, and the unequal distribution of climate vulnerability.

What does the African perspective occlude? It may underweight the genuine security concerns that drive Gulf states' strategic calculations—the Iranian threat, the instability of the regional order, the vulnerability of maritime chokepoints. By focusing on extraction and dependency, it risks treating Gulf states as mere extensions of global capitalism rather than as actors with their own agency, interests, and constraints. It may also underweight the agency of African states themselves, which are not simply victims of Gulf investment but active negotiators with their own strategic interests. The African perspective's emphasis on structural inequality can sometimes obscure the heterogeneity of African experiences—oil-producing states like Nigeria and Angola face different challenges than oil-importing states like Kenya and Ethiopia, and the Gulf's role in each differs accordingly. Finally, the African perspective may be overly skeptical of Gulf diversification, underweighting the genuine economic transformation that Vision 2030 and similar initiatives represent and the opportunities they create for African trade and investment.

2.7.2 Chinese Perspective

The Chinese perspective on hydrocarbon geopolitics and Gulf strategy is organized around a single overriding imperative: energy security for the world's largest oil importer. China imported approximately 11.3 million barrels per day of crude oil in 2023, of which roughly half originated from the Gulf region, with Saudi Arabia, Iraq, the UAE, and Kuwait as the principal suppliers. This dependency ratio means that Gulf stability is not a distant strategic concern for Beijing but a direct determinant of Chinese economic performance and social stability. The Chinese perspective thus begins from vulnerability rather than from power, a framing that distinguishes it sharply from Western analyses that treat China as a rising hegemon seeking to displace US influence in the Gulf.

The theoretical and policy lineage of this perspective runs through China's "going out" strategy (zou chuqu),

launched in the early 2000s and accelerated under the Belt and Road Initiative (BRI) announced in 2013. The BRI's energy corridor through the Gulf—encompassing port investments in the UAE, pipeline projects in Saudi Arabia, and refinery partnerships in Oman and Kuwait—represents not merely commercial expansion but a strategic effort to secure supply routes and diversify import sources. Chinese state-owned enterprises, particularly Sinopec, CNPC, and CNOOC, have become major players in Gulf upstream and downstream operations, with Sinopec's 2022 acquisition of a stake in Saudi Aramco's refining capacity representing a landmark in bilateral energy integration. The Chinese perspective treats these investments as win-win partnerships that benefit both parties: China gains supply security, Gulf states gain access to the world's largest growth market.

The concept of "multi-alignment" in Gulf strategy is viewed from Beijing as a strategic opportunity rather than a threat. Chinese analysts have long argued that the US unipolar order in the Gulf was inherently unstable and that a multipolar arrangement—in which Gulf states maintain security ties with Washington while deepening economic ties with Beijing—better serves Chinese interests. The 2023 Iran-Saudi rapprochement, brokered by China, is celebrated in Chinese strategic discourse as evidence of Beijing's growing diplomatic capacity and of the declining efficacy of US-centric security architectures. From this standpoint, China is not seeking to replace the US as the Gulf's security guarantor—a role it explicitly disavows—but to create a diplomatic and economic environment in which Gulf states have alternatives to US conditionalities.

The Chinese perspective also emphasizes the complementarity between Gulf diversification strategies and Chinese economic interests. Saudi Vision 2030's emphasis on non-oil GDP growth, technology transfer, and infrastructure development aligns with Chinese capabilities in construction, renewable energy, and digital technology. The NEOM project, Saudi Arabia's planned megacity, has attracted significant Chinese investment and contracting, and Chinese firms are major participants in the Gulf's renewable energy buildout, including solar projects in the UAE and Saudi Arabia. From Beijing's standpoint, Gulf diversification is not a threat to Chinese energy interests but an expansion of the economic relationship beyond hydrocarbons into higher-value sectors.

What does the Chinese perspective contribute that others cannot? It provides the most detailed understanding of the economic complementarities between Gulf states and Asian markets, and it frames Gulf multi-alignment as a natural evolution rather than a crisis. It also brings a long-term developmental perspective—rooted in China's own experience of state-led economic transformation—that treats Gulf diversification as a genuine project rather than as rhetoric.

What does it occlude? The Chinese perspective systematically underweights the political and security dimensions of Gulf strategy. By treating Gulf states primarily as economic partners, it risks underestimating the depth of US security commitments and the institutional inertia of the Gulf security architecture. It also underweights the human rights and labor governance issues that affect Chinese workers and African migrant laborers in the Gulf. The Chinese perspective's emphasis on "win-win" cooperation can obscure the power asymmetries in Gulf-China economic relations, where Gulf sovereign wealth funds are increasingly acquiring strategic assets in China while Chinese firms remain dependent on Gulf state contracts. Finally, by celebrating the Iran-Saudi rapprochement as a Chinese diplomatic triumph, Beijing risks overestimating its own influence and underestimating the fragility of the agreement, which remains vulnerable to regional escalation and domestic political shifts in both Tehran and Riyadh.

2.7.3 Russian Perspective

The Russian perspective on hydrocarbon geopolitics and Gulf strategy is shaped by a dual identity: Russia is simultaneously a major hydrocarbon producer competing with Gulf states in global markets and a diplomatic actor seeking to leverage energy coordination into broader geopolitical influence. This dual identity produces a perspective that is more internally contradictory than the Chinese or Western alternatives, and it requires careful parsing.

The theoretical lineage runs through Russia's post-Soviet strategic doctrine, which treats energy as a geopolitical instrument rather than merely a commercial commodity. This doctrine was articulated most clearly in the 2003 Energy Strategy of Russia and subsequent iterations, which framed Russia's hydrocarbon resources as a source of "soft power" and a tool for restoring Russia's great-power status. The concept of "energy superpower" (energeticheskaya sverkhderzhava), popularized in Russian strategic discourse in the mid-2000s, captured the ambition to convert hydrocarbon wealth into diplomatic leverage. While this concept has been partially discredited by the shale revolution's erosion of Russian market power in Europe, it remains influential in Russian thinking about Gulf relations.

The OPEC+ framework is the central institutional expression of the Russian perspective. Russia's participation in OPEC+ coordination—beginning with the 2016 Vienna agreement and continuing through the 2020 price war and subsequent production cuts—represents a strategic choice to cooperate with Gulf producers rather than compete with them. From Moscow's standpoint, OPEC+ serves multiple functions: it stabilizes global oil prices in ways that benefit Russian fiscal revenues; it provides a forum for Russia to engage with Saudi Arabia and other Gulf states as an equal rather than a supplicant; and it demonstrates Russia's continued relevance in global energy governance despite Western sanctions and the loss of European markets. The 2020-2022 oil price war, in which Saudi Arabia and Russia initially clashed over production levels before reaching a historic agreement, is interpreted in Russian discourse as evidence of Moscow's indispensability: Saudi Arabia could not stabilize markets without Russian cooperation, and the eventual OPEC+ agreement validated Russia's strategic importance.

The multipolarity framing is the second pillar of the Russian perspective. Russian strategic discourse consistently interprets Gulf multi-alignment as evidence of a declining US unipolar order and the emergence of a multipolar world in which Russia plays a central role. The Abraham Accords are viewed with suspicion as a US-Israeli initiative designed to consolidate Western influence, but the broader trend of Gulf states diversifying their partnerships—including with Russia—is celebrated as validation of Moscow's multipolarity thesis. Russia's diplomatic relations with Gulf states, including arms sales to Saudi Arabia and the UAE, nuclear cooperation agreements, and participation in regional security dialogues, are presented as evidence that Russia remains a relevant actor in the Gulf despite its economic limitations.

What does the Russian perspective contribute that others cannot? It provides the most explicit articulation of energy as a geopolitical instrument and the most developed theory of how hydrocarbon coordination can serve multipolar ambitions. It also brings a practitioner's understanding of OPEC+ dynamics, having been a central participant in the framework's evolution.

What does it occlude? The Russian perspective systematically overstates Russia's economic leverage in the Gulf and understates its dependence on Chinese markets for hydrocarbon exports following the loss of European demand. It treats OPEC+ coordination as evidence of Russian power when it may more accurately reflect Russian weakness—the need to cooperate with Saudi Arabia to prevent price collapse. It also occludes the impact of Western sanctions on Russia's ability to invest in or technology-transfer to Gulf states,

and it underweights the Gulf states' own agency in managing relations with Moscow as part of a broader diversification strategy rather than as alignment with Russian interests. The Russian perspective's multipolarity framing can become self-serving, interpreting any Gulf state's refusal to follow US preferences as evidence of Russian influence when it may reflect independent Gulf calculations. Finally, the perspective tends to treat the Iran-Saudi rapprochement as a setback for US influence without adequately acknowledging that China, not Russia, brokered the agreement—a fact that underscores Russia's secondary role in Gulf diplomacy.

2.7.4 Western Perspective

The Western perspective on hydrocarbon geopolitics and Gulf strategy is organized around two imperatives that are increasingly in tension: energy security and the maintenance of a US-led security architecture in the Gulf. This tension has intensified since the US shale revolution reduced American dependence on Gulf oil imports, creating a strategic paradox in which the US remains the Gulf's security guarantor while becoming less economically dependent on Gulf hydrocarbons. The Western perspective is thus characterized by anxiety about the sustainability of the security-for-energy bargain that has structured US-Gulf relations since the 1945 Quincy meeting between Franklin Roosevelt and Ibn Saud.

The theoretical lineage runs through the realist tradition in international relations, particularly the "hegemonic stability" framework associated with Robert Gilpin and Charles Kindleberger, which treats US military presence in the Gulf as a public good that stabilizes global energy markets. This framework was operationalized through the Carter Doctrine of 1980, which declared that any attempt by an external force to gain control of the Gulf region would be regarded as an assault on the vital interests of the United States. The Carter Doctrine and its successors established the institutional architecture—CENTCOM, the Fifth Fleet, bilateral defense agreements—that remains the foundation of Gulf security. The Western perspective treats this architecture as essential not merely for US interests but for global economic stability, since Gulf oil flows underpin the entire international trading system.

The shale revolution has profoundly disrupted this framework. As US oil production surged from approximately 5 million barrels per day in 2008 to over 13 million by 2023, the US became the world's largest oil producer and a net exporter of petroleum products. This transformation reduced US dependence on Gulf imports but did not eliminate US interest in Gulf stability, since global oil prices remain interconnected and Gulf supply disruptions would still affect US consumers and the global economy. However, the shale revolution did alter the political economy of US-Gulf relations: Gulf states could no longer assume that their oil exports purchased automatic US security guarantees, and the US could no longer justify its Gulf military presence primarily in terms of energy security. The Western perspective has struggled to articulate a coherent rationale for continued US engagement, oscillating between "great power competition" framing (countering China and Russia), counterterrorism, and regional stability.

The Abraham Accords of 2020 represent the most significant Western diplomatic initiative in the Gulf in recent decades. From the US perspective, the normalization agreements between Israel and the UAE, Bahrain, Morocco, and Sudan were designed to create a regional coalition against Iran, to reduce US military burdens by fostering regional self-defense, and to create economic opportunities that would bind Gulf states more closely to the US-led order. The Western perspective treats the Accords as a strategic success that demonstrates the continued relevance of US diplomacy in the Gulf, even as it acknowledges that the Accords have not produced the anticipated broader normalization (particularly with Saudi Arabia) and have been complicated by the 2023-2024 Gaza conflict.

The Western perspective also encompasses significant European dimensions. European states, particularly the UK and France, maintain military presences in the Gulf and have deep historical ties to the region. The European energy crisis triggered by Russia's 2022 invasion of Ukraine renewed European interest in Gulf LNG supplies, with Germany and other states signing long-term contracts with Qatar. This has created a transatlantic divergence in which European states are more dependent on Gulf energy than the US, producing different strategic calculations within the Western camp.

What does the Western perspective contribute that others cannot? It provides the most detailed understanding of the institutional and military architecture of Gulf security, and it brings a practitioner's knowledge of alliance management, defense cooperation, and intelligence sharing. It also offers the most developed analysis of the shale revolution's structural impact on global oil markets, drawing on extensive data from the Energy Information Administration and other sources.

What does it occlude? The Western perspective systematically underweights the agency of Gulf states in driving diversification and multi-alignment, treating these trends primarily as reactions to US policy rather than as independent strategic choices. It also underweights the economic complementarities between Gulf states and Asian markets, which are the primary drivers of Gulf reorientation. The Western perspective's anxiety about "losing" the Gulf to China and Russia can become self-fulfilling, producing policy responses—such as technology restrictions and alliance pressure—that accelerate rather than retard Gulf diversification. It also tends to treat the Abraham Accords as a Western achievement rather than as a Gulf state strategy, occluding the UAE's independent motivations for normalization. Finally, the Western perspective's focus on security architecture can obscure the domestic political economy of Gulf states—the rentier dynamics, the social contracts, the transformation pressures—that ultimately determine their strategic choices.

2.7.5 UN Perspective

The UN perspective on hydrocarbon geopolitics and Gulf strategy is organized around the tension between the Sustainable Development Goals—particularly SDG 7 (affordable and clean energy) and SDG 13 (climate action)—and the continued centrality of hydrocarbons to global energy systems and to the economies of Gulf states. This tension is not merely analytical but institutional: the UN system contains both agencies that promote fossil fuel development (such as the UN Development Programme's work on energy access) and agencies that advocate for rapid decarbonization (such as the UN Environment Programme and the IPCC). The UN perspective thus reflects the organization's own internal contradictions as much as any coherent analytical framework.

The theoretical lineage runs through the UN's sustainable development paradigm, which emerged from the 1987 Brundtland Commission report and was codified in the 2015 Sustainable Development Goals. The SDG framework treats energy as a cross-cutting issue that affects poverty reduction, health, education, gender equality, and climate action. From this standpoint, Gulf hydrocarbon geopolitics is evaluated not in terms of state power or market efficiency but in terms of its contribution to or detraction from sustainable development. The UN perspective asks: does Gulf oil production support or undermine global energy access? Does Gulf diversification create opportunities for technology transfer and capacity building in developing countries? Does the Gulf's multi-alignment strategy strengthen or weaken multilateral cooperation on climate change?

The UN's engagement with Gulf states has intensified in recent years through several channels. The UN Framework Convention on Climate Change (UNFCCC) process has seen Gulf states—particularly the UAE, which hosted COP28 in 2023—take on leadership roles in climate diplomacy. The UAE's appointment of Sultan Al Jaber, CEO of ADNOC, as COP28 president was controversial but reflected the UN's pragmatic

recognition that fossil fuel producers must be part of the climate solution. The UN's climate finance architecture, including the Green Climate Fund and the Loss and Damage Fund established at COP27, depends significantly on contributions from Gulf sovereign wealth funds and development finance institutions. The UN perspective thus treats Gulf states as potential partners in climate finance and technology transfer, while also pressing them to accelerate decarbonization and reduce fossil fuel production.

The UN perspective also encompasses the humanitarian and development dimensions of Gulf-Africa relations. UN agencies operating in Africa—including UNDP, UNICEF, and WFP—interact with Gulf development finance institutions such as the Saudi Fund for Development and the Abu Dhabi Fund for Development. The UN perspective evaluates these interactions in terms of their contribution to African development outcomes, with particular attention to the SDG targets on poverty, hunger, health, and education. From this standpoint, Gulf investment in African infrastructure is welcome insofar as it supports SDG achievement but problematic insofar as it creates debt burdens, displaces communities, or prioritizes extractive over developmental outcomes.

The UN perspective's treatment of multi-alignment is cautiously optimistic. The organization's founding principles—sovereign equality, non-intervention, peaceful settlement of disputes—align with Gulf states' desire for strategic autonomy. The UN sees multi-alignment as potentially supportive of multilateralism if it channels Gulf resources toward development and climate goals rather than toward competitive great-power rivalry. However, the UN also recognizes the risk that multipolarity weakens normative enforcement: if Gulf states can play competing powers against each other, they may be less responsive to UN human rights and governance standards.

What does the UN perspective contribute that others cannot? It provides the only framework that systematically evaluates Gulf hydrocarbon geopolitics in terms of global public goods—climate stability, energy access, poverty reduction—rather than state interests. It also brings institutional legitimacy and convening power that no single state possesses, enabling it to broker agreements (such as the COP28 UAE Consensus) that would be impossible through bilateral diplomacy alone.

What does it occlude? The UN perspective systematically underweights power politics and the security dimensions of Gulf strategy. By treating Gulf states as development partners and climate actors, it risks underestimating the competitive dynamics that drive their strategic choices. It also occludes the organization's own dependence on Gulf funding for its development and humanitarian operations, which can constrain its ability to criticize Gulf states' human rights records or environmental practices. The UN perspective's emphasis on multilateralism can become normative rather than analytical, treating the organization's own frameworks as universal when they are in fact contested and historically contingent. Finally, by focusing on climate and development, the UN perspective may underweight the immediate security concerns—regional stability, maritime security, non-proliferation—that dominate Gulf states' strategic calculations and that shape their willingness to cooperate with UN initiatives.

2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African	Centers the distributional consequences of Gulf-centered oil politics for African producers and importers; shows how OPEC+ price management externalizes adjustment onto the Global South; highlights Gulf sovereign-wealth and national-oil-company investment in African energy and infrastructure	May understate intra-Gulf agency, market mechanisms, and the strategic autonomy of Gulf states; can risk treating African economies as passive price-takers	Energy justice, equitable transition, developmental sovereignty, and protection of fiscal space in import-dependent states	African fiscal stress during the 2020 price collapse; Gulf investment in African gas, renewables, ports, and infrastructure	Western perspective: market adjustment and domestic policy choices, not cartel politics alone, determine African outcomes; African states retain agency in diversification
Chinese	Treats China as the decisive demand-side weight in global oil markets; explains Gulf strategy through energy security, supply diversification, and long-term economic partnership	May understate political risk, price volatility, and the possibility that Gulf states use Chinese demand as leverage rather than simply serving it	Stable supply, mutual benefit, non-interference, and managed interdepen-dence	China's large Gulf crude imports; BRI energy and infrastructure projects; strategic petroleum reserve expansion	Russian perspective: Chinese demand alone does not explain OPEC+ bargaining; Saudi-Russian coordination is driven by producer-state interests, not consumer demand

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Russian	Frames OPEC+ as a platform for multipolarity, sovereign equality, and resistance to US-dominated energy governance; explains Saudi-Russian cooperation as strategic alignment beyond oil	Underplays the economic costs of price wars, the asymmetry of Saudi-Russian quota bargaining, and the dependence of Russian fiscal planning on coordinated cuts	Multipolarity, anti-unilateralism, producer sovereignty, and diplomatic parity with the United States	Russia-Saudi coordination during 2020–2022; Russian insistence on OPEC+ as a political as well as market forum	Western perspective: OPEC+ is cartel collusion that harms consumers and distorts markets; cooperation with Russia after 2022 is strategically indefensible
Western	Explains market structure, shale responsiveness, fiscal breakevens, and the Gulf security architecture; captures the United States' shift from dependent importer to net exporter and security guarantor	Often treats Gulf states as clients or derivative actors; underplays their strategic autonomy, multi-alignment, and domestic transformation agendas	Open markets, alliance management, energy security, and rules-based international order	US shale boom and bust; EIA production data; IMF Article IV fiscal assessments; Gulf basing and security cooperation	African perspective: market framing ignores distributional harm to import-dependent states and the externalization of adjustment costs

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
UN	Brings energy transition, SDG 7, climate finance, and vulnerability of importers into the analysis; highlights how price volatility affects investment in renewables and fossil-fuel subsidy regimes	Underweights immediate security concerns, fiscal breakevens, maritime security, and non-proliferation; can treat UN frameworks as universal rather than contested	Sustainable development, multilateralism, climate justice, and protection of vulnerable populations	UN energy-transition agendas; SDG 7 indicators; climate-finance discussions; price-shock impacts on import-dependent economies	Russian perspective: transition timelines and climate conditionality can ignore development needs and producer-state sovereignty

2.8 WORKED EXAMPLE (I do)

Case: The 2020–2022 oil price war and OPEC+ coordination

Levels of analysis

At the **individual** level, the episode was shaped by the decisions of a small number of leaders: Mohammed bin Salman's willingness to flood the market in March 2020 after Russia refused deeper cuts; Vladimir Putin's calculation that lower prices would damage US shale producers more than Russian fiscal capacity; and Donald Trump's pressure on both Riyadh and Moscow to reach an agreement as prices collapsed. At the **state** level, Saudi Arabia's high fiscal breakeven price, Russia's budget dependence on hydrocarbon revenues, the financial fragility of US shale firms, and the sanctions environment after 2022 structured what each government could accept. At the **systemic** level, the case combined a pandemic demand shock, the rise of US shale as a flexible non-OPEC supply source, the institutionalization of OPEC+ as a Saudi-Russian co-management forum, and the geopolitical rupture caused by Russia's 2022 invasion of Ukraine. At the **transnational** level, oil traders, national oil companies, international agencies, sanctions-evasion networks, capital markets, and consumer-state diplomacy all transmitted and amplified the effects of producer-state bargains.

Mechanism

The core mechanism was coercive bargaining followed by institutionalized collusion. In March 2020, Saudi Arabia used its spare capacity to slash prices and increase output after Russia rejected proposed cuts, imposing costs on both Moscow and US shale producers. The resulting price collapse—Brent fell below $20 per barrel in April 2020—forced a reversal: the April 2020 OPEC+ agreement cut 9.7 million barrels per day, the largest coordinated reduction in the group's history. The crisis converted a temporary price war into a durable framework in which Saudi Arabia and Russia jointly managed supply through OPEC+. When demand recov-

ered in 2021, the group gradually unwound cuts; when Russia invaded Ukraine in 2022, sanctions disrupted Russian exports, but OPEC+ maintained a cautious, incremental approach rather than fully replacing lost Russian barrels. The result was not simply higher or lower prices, but a new market structure in which Saudi Arabia retained swing-producer leverage, Russia retained a diplomatic platform despite sanctions, and US shale became a financially sensitive marginal adjuster rather than the dominant price-setter.

Perspective reconstruction

The African perspective, which should be read as primary rather than peripheral, treats the 2020–2022 episode as an external shock that restructured fiscal and developmental possibilities across the continent. The March 2020 collapse transmitted immediately into African oil exporters' revenue streams and into the debt and import-cost calculations of African oil importers, while the subsequent OPEC+ cuts raised energy costs during a fragile recovery. African scholarship on dependency and extraversion helps explain why African producers and consumers remain price-takers in a market governed by Saudi-Russian bargaining, even when African states possess significant hydrocarbon reserves. At the same time, Gulf sovereign wealth funds and national oil companies expanded investments in African gas, renewables, ports, and infrastructure, creating new dependencies that are not captured by either Western market narratives or UN transition frameworks. The African vantage point therefore reveals that the price war was not merely a technical supply episode but a redistribution of energy rents and investment power with uneven developmental consequences. It also shows that Gulf-Africa energy relations are now shaped as much by capital flows and infrastructure finance as by crude prices.

The Chinese perspective emphasizes energy security and demand-side weight. As the world's largest crude importer, China benefited temporarily from the 2020 price collapse but also faced the fragility of a market on which its industrial economy depends. The subsequent OPEC+ cuts raised import costs and complicated planning, reinforcing Beijing's interest in diversified suppliers, strategic petroleum reserves, and long-term contracts with Gulf producers. China deepened partnerships with both Saudi Arabia and Russia, treating OPEC+ as a stabilizing forum while accelerating domestic renewables and electrification. This perspective reads the episode as evidence that energy interdependence requires diplomatic hedging rather than reliance on any single supplier or price regime.

The Russian perspective frames OPEC+ as a vehicle for multipolarity and sovereign equality. Moscow initially resisted Saudi-proposed cuts in March 2020, calculating that lower prices would weaken US shale more than Russian fiscal capacity; the subsequent collapse and April agreement exposed the limits of that strategy. After 2022, OPEC+ became a platform through which Russia retained market influence and diplomatic legitimacy despite Western sanctions, with Saudi Arabia's refusal to isolate Moscow underscoring a multipolar alignment. Russian analysts present this cooperation as resistance to US-dominated energy governance. Yet the same arrangement required Russia to accept Saudi leadership in setting quotas, revealing an asymmetry that the multipolarity narrative tends to obscure.

The Western perspective centers market structure, shale responsiveness, and alliance politics. Western analysts argue that Saudi flooding and subsequent OPEC+ cuts demonstrated the cartel's residual power to manage prices, while US shale's rapid decline and partial recovery showed the elasticity of non-OPEC supply. The episode reinforced the importance of the Gulf security architecture to Washington, even as the United States became a net exporter and less directly dependent on Gulf oil. After 2022, Western governments criticized OPEC+ for insufficient production increases amid the Ukraine war, framing Saudi-Russian coordination as strategically problematic. This lens captures market and alliance dynamics well but often treats Gulf agency as derivative of US security guarantees.

The UN perspective highlights how extreme price volatility complicates energy-transition planning. Very low prices in 2020 discouraged investment across both hydrocarbons and renewables, while high prices in 2022 accelerated fossil-fuel subsidies, cost-of-living crises, and political pressure to maximize short-term output. OPEC+ management is assessed against SDG 7 and climate goals: prolonged high prices can fund transition investments but may also entrench carbon-intensive systems. The UN frame also stresses impacts on vulnerable importers and the need for climate finance. It is strongest on normative goals and transition planning but weaker on the security and fiscal imperatives that drove Saudi and Russian choices.

Explicit adjudication

The most persuasive explanation of the 2020–2022 episode is a state-centric political-economy account: Saudi Arabia and Russia used OPEC+ to reconcile fiscal imperatives with strategic bargaining, while US shale acted as a flexible but financially fragile competitor. This account best explains both the 2020 collapse and the 2021–2022 stabilization because it links producer-state budget needs, spare-capacity leverage, and institutionalized supply management. However, it underweights the transnational distributional consequences emphasized by the African perspective and the normative transition concerns raised by the UN perspective. The African perspective is indispensable for seeing who bore the adjustment costs and how Gulf capital is reshaping African energy systems; the UN perspective is indispensable for seeing how price volatility distorted transition investment. Neither alone explains Saudi-Russian agency, but together they correct the tendency of Western and Russian accounts to treat the global oil market as a closed game among producers.

SECTION 2.9 PROBLEM PAIR (We do)

Case: The 2023 Iran–Saudi rapprochement — how did it reshape Gulf strategic calculations?

Tasks:

1. **Mechanism identification.** Identify the proximate trigger and the deeper structural cause of the March 2023 Beijing-brokered agreement restoring diplomatic relations between Iran and Saudi Arabia. Distinguish the Chinese mediation role from the underlying convergence of interests.
2. **Levels of analysis.** Analyze the rapprochement at four levels: individual (leadership decisions by Mohammed bin Salman, Ebrahim Raisi, and Xi Jinping), state (Saudi strategic pivot toward Vision 2030 and Iranian economic distress under sanctions), systemic (US retrenchment from the Gulf and the rise of multipolarity), and transnational (sectarian proxy networks in Yemen, Lebanon, Syria, and Iraq).
3. **Perspective reconstruction.** Reconstruct how each of the five perspectives — African, Chinese, Russian, Western, and UN — interprets the rapprochement's significance for Gulf order.
4. **Historical analogue.** Compare the 2023 rapprochement with an earlier episode of Saudi–Iranian détente (e.g., the mid-1990s rapprochement under Rafsanjani and Crown Prince Abdullah, or the 2015 JCPOA period). What is similar and what differs in the causal structure?
5. **Falsifiers.** Specify two pieces of evidence that would falsify your preferred explanation — for example, a resumption of proxy escalation in Yemen or a Saudi return to exclusive US security dependence.
6. **Adjudication.** On the basis of the evidence, which perspective provides the most complete explanation, and what does it occlude?

MODEL ANSWER

The 2023 Iran–Saudi rapprochement is best explained as a structural adjustment to US retrenchment and the rise of Chinese economic leverage, not as a sudden diplomatic breakthrough. The proximate trigger was Chinese mediation in Beijing in March 2023, but the deeper cause was a convergence of Saudi and Iranian interests produced by shifts in the systemic environment. Saudi Arabia, under Mohammed bin Salman, had concluded that the US security guarantee was no longer sufficient to manage regional threats, particularly after the 2019 Abqaiq attack and the perceived US withdrawal from Afghanistan. Iran, meanwhile, faced severe economic distress under sanctions and sought relief through regional de-escalation. China, as the largest buyer of both Saudi and Iranian oil, possessed the economic leverage to broker a deal that Washington could not.

At the individual level, the rapprochement reflected leadership calculations: MBS needed stability to execute Vision 2030, Raisi needed economic breathing room, and Xi needed to demonstrate China's capacity as a global mediator. At the state level, Saudi Arabia was pivoting from a security-first posture to an economic-transformation agenda, while Iran was attempting to break out of diplomatic isolation. At the systemic level, US shale production had reduced American dependence on Gulf oil, weakening the strategic rationale for US military primacy in the region and creating space for multipolar diplomacy. At the transnational level, the rapprochement did not immediately dissolve sectarian proxy networks in Yemen, Lebanon, Syria, and Iraq; rather, it created a framework for managing them, with the Yemen ceasefire as the most visible early dividend.

The African perspective highlights that the rapprochement reduced the risk of a wider Gulf war that would have disrupted energy markets and African import costs, while also noting that Gulf investment flows into Africa — particularly Saudi and Emirati capital — depend on regional stability. The Chinese perspective frames the deal as evidence of Beijing's growing diplomatic capacity and its interest in securing energy supply lines through the Belt and Road Initiative. The Russian perspective interprets it as a blow to US unipolarity and a vindication of multipolarity, consistent with Moscow's OPEC+ coordination with Riyadh. The Western perspective, particularly in Washington, initially viewed the deal with alarm as a loss of influence, though some analysts argued it aligned with US interests in reducing regional tensions. The UN perspective welcomed the agreement as a contribution to regional stability and SDG 16, while noting that durable peace requires addressing underlying grievances and proxy conflicts.

Historically, the rapprochement resembles the mid-1990s détente between Saudi Arabia and Iran under Rafsanjani and Crown Prince Abdullah, which also followed a period of tension and was driven by mutual economic interests. However, the 2023 agreement differs in three respects: it was brokered by China rather than by bilateral diplomacy; it occurred in a context of US retrenchment rather than US primacy; and it was explicitly linked to Saudi economic diversification rather than to oil-market management alone. The 2015 JCPOA period offers a partial analogue, but that episode was centered on Iran's nuclear program and US diplomacy, whereas the 2023 deal was a regional arrangement independent of Washington.

Falsifiers of this explanation would include a collapse of the agreement due to renewed proxy escalation in Yemen or Lebanon, or a Saudi decision to re-anchor its security posture exclusively in the US. If either occurred, it would suggest that the structural drivers identified here were weaker than the proximate diplomatic factors. Conversely, sustained economic cooperation between Riyadh and Tehran, including joint investment or energy projects, would strengthen the structural explanation.

On balance, the Chinese and systemic perspectives together provide the most complete explanation, because they capture both the mediator's leverage and the underlying shift in great-power competition. However, this combination occludes the domestic political drivers — MBS's need for stability to execute Vision 2030

and Iran's internal economic crisis — which the state-level perspective captures. The Western perspective, by contrast, overstates the loss of US influence and understates the degree to which Washington tacitly welcomed de-escalation. The African perspective correctly identifies the energy-market and investment implications but does not fully explain the diplomatic mechanism. The UN perspective is normatively valuable but analytically thin on causation. The most robust conclusion is that the rapprochement was overdetermined: multiple structural and agential factors converged, and no single perspective captures all of them.

SECTION 2.10 INDEPENDENT MEMO (You do)

(a) Case description. In 2023, Saudi Arabia announced additional voluntary oil production cuts of one million barrels per day, extending them into 2024, while simultaneously accelerating non-oil GDP growth targets under Vision 2030 and expanding sovereign wealth fund investments in African infrastructure. The cuts occurred amid US pressure to increase production to lower global prices and amid recovering Chinese demand. Analyze this decision: why did Riyadh reduce supply when Washington wanted more, and how does the cut interact with Saudi diversification strategy and multi-alignment diplomacy?

(b) Required memo headings (use as prompts):

- **Mechanism:** What causal chain links the production cut to Saudi fiscal needs, OPEC+ coordination with Russia, and the signaling of strategic autonomy from Washington?
- **Perspective reconstruction:** How do the African, Chinese, Russian, Western, and UN perspectives each interpret the cut's significance?
- **Historical analogue:** Which earlier episode of Saudi supply management (e.g., the 1973 embargo, the 1980s price war, or the 2020 price war) offers the best comparison, and where does the analogy break down?
- **Falsifiers:** What evidence would disprove your explanation — for example, a Saudi reversal of cuts following US diplomatic pressure, or a sustained rise in non-oil revenue that decouples the budget from oil prices?

(c) Self-check: Did you distinguish description (what happened) from explanation (why it happened), prediction (what will happen next), and prescription (what should be done)?

SECTION 2.11 HINGE QUESTION

Question: Which of the following best explains why Saudi Arabia cut oil production in 2023 despite US pressure to increase supply?

A) Saudi Arabia cut production primarily to punish the United States for its shale revolution, which had reduced American dependence on Gulf oil.

B) Saudi Arabia cut production because its fiscal breakeven price exceeded the market price, and it needed to support prices to fund Vision 2030.

C) Saudi Arabia cut production as part of a coordinated OPEC+ strategy with Russia to manage global supply, while using the resulting price stability to fund diversification under Vision 2030 and signal strategic autonomy from Washington.

D) Saudi Arabia cut production because Chinese demand had collapsed, making additional supply unnecessary.

Distractor diagnoses:

- **A is wrong** because it conflates a long-term structural shift (the shale revolution reducing US import dependence) with an immediate causal motive. The shale revolution shaped the systemic environment but did not directly trigger the 2023 cuts; Riyadh's decision was about price support and strategic signaling, not retaliation against US energy independence.
- **B is partially correct but incomplete** because it captures the fiscal motive — Saudi breakeven prices do exceed some market levels — but it misses the OPEC+ coordination with Russia, the multi-alignment signaling, and the political dimension of asserting autonomy from Washington. A purely fiscal explanation cannot account for why Riyadh accepted diplomatic friction with the US.
- **D is wrong** because Chinese demand was recovering, not collapsing, in 2023 following the end of zero-COVID policies. The cuts were a supply-management decision, not a response to demand destruction; had demand truly collapsed, price support would have been futile.

SECTION 2A — DATA LAB

Table 1. Approximate crude oil production by country (recent annual averages, million barrels per day).
Sources: EIA international petroleum data; approximate ranges only; verify latest release before use.

Rank	Country	Approx. production (mb/d)	Approx. share of global output	Reading note
1	United States	13.0–13.5	~13–14%	Shale-driven, price-responsive, decentralized
2	Saudi Arabia	9.0–10.0	~9–10%	OPEC+ swing producer; spare capacity central
3	Russia	9.0–9.5	~9%	Sanctions, discounts, OPEC+ coordination
4	Canada	4.8–5.2	~5%	Oil sands; pipeline/export constraints
5	Iraq	4.2–4.6	~4–5%	State-led, infrastructure and security limits

Rank	Country	Approx. production (mb/d)	Approx. share of global output	Reading note
6	China	4.0–4.3	~4%	Import-dependent despite domestic output
7	Brazil	3.3–3.6	~3–4%	Pre-salt offshore; state-company role
8	United Arab Emirates	3.0–3.3	~3%	Capacity expansion; ADNOC-led
9	Iran	2.8–3.2	~3%	Sanctions-constrained; gray-market exports
10	Kuwait	2.5–2.8	~2.5–3%	Low-cost, OPEC quota-bound

Table 2. Gulf fiscal breakeven prices and non-oil growth (approximate).
Sources: IMF Article IV reports; EIA; national statistics; ranges are indicative.

State | Approx. fiscal breakeven oil price ($/bbl) | Approx. recent non-oil GDP growth (%) | Diversification signal | Fiscal vulnerability note | |—|—:|—:|—|—| | Saudi Arabia | 75–90 | 4–6 | Vision 2030, PIF, non-oil revenue reforms | High spending commitments; breakeven sensitive to OPEC+ cuts | | United Arab Emirates | 45–60 | 4–6 | Trade, logistics, finance, tourism | Lower breakeven; more diversified base | | Qatar | 40–55 | 3–5 | LNG, finance, aviation, World Cup legacy | Gas-heavy; LNG contract structures matter | | Kuwait | 60–75 | 2–4 | Slow reform; parliamentary constraints | High assets but slower diversification | | Oman | 65–80 | 2–4 | Duqm, tourism, logistics | Moderate breakeven; debt-management focus | | Bahrain | 90–110 | 2–4 | Financial services, aluminum, tourism | Highest vulnerability among Gulf six | | Iran | 100+ (sanctions-distorted) | 1–3 | State-led, constrained by sanctions | Breakeven not market-clearing; gray exports |

Table 3. Approximate sovereign wealth fund assets (selected, $ billions). *Sources: SWF Institute-style estimates; IMF; national disclosures; figures are approximate and valuation-dependent.*

Fund / State | Approx. assets ($bn) | Primary function | Perspective note | |—|—:|—|—| | Norway GPFG | 1,500–1,700 | Intergenerational saving, ethical investment | Western model of transparent, rules-based saving | | Abu Dhabi ADIA / related entities | 900–1,100 | Long-horizon investment, diversification | Gulf capital as global portfolio power | | Saudi PIF | 800–950 | Domestic transformation + global bets | State-led development finance, not only saving | | Kuwait KIA | 700–850 | Future generations, budget stabilization | Rentier saving with political constraints | | Qatar QIA | 450–550 | Strategic global investment | Small-state leverage through capital | | China CIC | 1,200–1,400 | Foreign-exchange diversification | State-capitalist global investor | | Russia NWF | 120–180 | Budget support, sanctions-era liquidity | Fiscal buffer under geopolitical pressure |

Five numbered analysis questions

1. **Trend.** Using Table 1, identify the two most important structural shifts in global oil supply since the early 2000s. How does the rise of U.S. shale production change the meaning of Saudi spare capacity, and what does the table suggest about the difference between "production volume" and "market power"?

2. **Level of analysis.** Table 2 presents fiscal breakeven prices. Are breakeven prices best treated as a state-level fiscal variable, a systemic market variable, or an interaction between the two? Explain how a state's breakeven price can be altered by domestic policy, while its realized revenue still depends on OPEC+ decisions, sanctions, and global demand.

3. **Perspective reconstruction (all five).** Reconstruct how each perspective would read Tables 2 and 3 together:

    - **African:** Gulf SWFs as capital sources for African infrastructure, energy transition, and industrialization, but also as instruments that may bypass African public accountability.

    - **Chinese:** Gulf diversification as compatible with Belt and Road energy security, port access, and long-term supply contracts.

    - **Russian:** Gulf fiscal stress and OPEC+ coordination as evidence that multipolarity requires producer-state solidarity against Western financial and sanctions power.

    - **Western:** SWF growth and non-oil growth as indicators of market reform, but with concerns about governance, transparency, and strategic asset acquisition.

    - **UN:** Non-oil growth as a development gain, but breakeven dependence as a climate-transition risk if hydrocarbon revenues fund delayed diversification.

4. **Interpretation.** Does a rising non-oil GDP growth rate demonstrate that a rentier state has escaped rentierism? Distinguish "diversification of output" from "diversification of state revenue," "diversification of employment," and "diversification of political legitimacy." Which of these four is hardest to observe in the tables?

5. **Limitation.** What do these tables systematically fail to capture? Consider off-budget spending, sovereign-wealth valuation swings, sanctions evasion, informal oil trade, military expenditure, climate-transition scenarios, and the difference between announced projects and completed productive capacity.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — "Rentier Fiscal Circuit and Diversification Threshold" (hand-drawn flow diagram).
Draw a large circle at the top labeled **Oil Rent**. Draw a thick downward arrow into a central rectangle labeled **State Budget**. From the rectangle, draw four branching arrows to smaller boxes: **Welfare and Subsidies**, **Public Employment**, **Security Apparatus**, and **Sovereign Wealth Fund**. Draw a curved feedback arrow

from all four boxes back to a smaller circle labeled **Political Legitimacy / Social Contract**. Draw a horizontal dashed line across the middle labeled **Fiscal Breakeven Price**; place a small oil-barrel icon above the line labeled **High Price: Surplus** and one below labeled **Low Price: Deficit**. Add a dashed arrow from **State Budget** to a box on the right labeled **Non-Oil GDP / Vision 2030 Projects**, with a question mark over the arrow to signal uncertain transformation. Label the whole diagram **Rentier Loop**.
Perspective overlay: Annotate in four corners: top-left **African: who captures rent and who bears extraction risk?**; top-right **Chinese: supply security and long-term contracts**; bottom-left **Russian: producer solidarity and OPEC+ discipline**; bottom-right **Western: market reform and fiscal sustainability**; along the bottom edge **UN: transition finance and SDG 7**.

Visual 2 — "Gulf Multi-Alignment Triangle" (hand-drawn strategic map).
Draw a triangle. At the top vertex place a circle labeled **Gulf State (security + capital)**. At the bottom-left vertex draw a shield labeled **United States: security guarantees, bases, arms, naval protection**. At the bottom-right vertex draw a factory/trade icon labeled **China: energy demand, infrastructure, technology, ports**. At the bottom-center, slightly below the base, draw a smaller oil-barrel icon labeled **Russia: OPEC+ coordination, diplomatic multipolarity, sanctions-era market management**. Draw solid arrows from the Gulf state to each vertex, labeled respectively **Security**, **Trade/Energy**, and **Producer Coordination**. Draw a dashed double-headed arrow between the U.S. and China vertices labeled **Strategic Competition**. Draw a smaller dashed arrow from Russia to OPEC+ labeled **Price Discipline**. Shade the center of the triangle lightly and label it **Multi-Alignment Space**.
Perspective overlay: Write around the triangle: **African: Gulf capital and energy-transition partnerships**; **Chinese: non-Western economic order**; **Russian: multipolar producer politics**; **Western: alliance management and deterrence**; **UN: cooperative security and energy access**.

Visual 3 — "Energy Transition Interface: Gulf Capital and African Development" (hand-drawn scatter/map hybrid).
Draw a simple map outline of Africa and the Gulf region. Place three large circles in the Gulf labeled **SWF Capital**, **LNG/Oil Revenue**, and **Technology/Logistics**. Draw arrows from these circles to African locations: one arrow to a solar-panel icon labeled **Renewables and Grids**, one to a port icon labeled **Ports and Logistics**, one to a mine icon labeled **Critical Minerals**, and one to a factory icon labeled **Industrial Zones**. Add a small box labeled **African Agency: contract terms, local content, debt transparency**. On the side, draw a small scatterplot with x-axis **Non-Oil GDP Growth** and y-axis **Fiscal Breakeven Price**; plot three unlabeled bubbles of different sizes representing **SWF Assets**. Label the plot **Diversification Is Not Yet Decoupling**.
Perspective overlay: Annotate the African side as primary: **African: development finance, energy access, sovereignty over terms**; annotate the Gulf side: **Chinese: supply-chain and infrastructure integration**; **Russian: producer-state solidarity**; **Western: investment governance and risk**; **UN: SDG 7, climate finance, just transition**.

SECTION 4 — CORNELL NOTES

Cue (prompt)	Notes (with source log)
Rentier state: definition and mechanism	State derives large share of revenue from external rent (oil/gas), not domestic taxation; welfare substitutes for representation; legitimacy tied to distribution. Source log: Hertog (2010); Gray (2011).
Rentierism: scope conditions	Works best where rent is large, state capacity is centralized, and society is dependent on public spending; weaker where taxation, private capital, or federalism create alternative accountability. Source log: Hertog (2010).
U.S. shale revolution: mechanism	Horizontal drilling + hydraulic fracturing lowered cost and shortened investment cycles; U.S. became swing supplier; global price formation less OPEC-centric. Source log: Yergin (2011); EIA data.
Shale: systemic impact	Increased price volatility; reduced OPEC pricing power; made Saudi spare capacity more strategic but less price-determining; linked oil to financialized drilling cycles. Source log: Yergin (2011).
Abraham Accords: Gulf diversification	Normalization with Israel created new trade, technology, and security channels; diversification not only economic but diplomatic and security-oriented. Source log: general IR literature; no invented citation.
Saudi Vision 2030: transformation politics	PIF-led projects, non-oil revenue, social liberalization, and centralization of authority; transformation is political as much as economic. Source log: IMF Article IV reports; Hertog (2010) for rentier context.
Gulf multi-alignment	Simultaneous U.S. security dependence, Chinese economic partnership, Russian OPEC+ coordination; hedging under multipolarity. Source log: Yergin (1991, 2011) for oil geopolitics; EIA/IMF for data.
2020–2022 oil price war / OPEC+	Saudi-Russia breakdown and restoration showed producer coordination as strategic weapon; pandemic demand collapse plus supply surge; later OPEC+ cuts supported prices. Source log: Yergin (2011); EIA data.

Cue (prompt)	Notes (with source log)
2023 Iran-Saudi rapprochement	Chinese-brokered détente reduced immediate Gulf escalation; did not resolve structural rivalry; affected Yemen, Lebanon, maritime security, and OPEC+ politics. Source log: general IR literature; no invented citation.
African perspective (primary)	Energy transition, Gulf investment, extraction governance, local content, debt transparency; African agency in setting terms. Source log: Grovogui, Mbembe, Bayart, Mamdani, Rodney, Nkrumah, Nyerere, Cabral, Fanon, Aning, Danso, Tamale, Oyěwùmí as theoretical lineage.
Chinese / Russian / Western / UN perspectives	Chinese: energy security + economic partnership; Russian: OPEC+ + multipolarity; Western: energy security + Gulf security architecture; UN: transition + SDG 7 + climate finance. Source log: Yergin; EIA; IMF.
Data limitations	Breakeven prices are estimates; SWF assets are valuation-dependent; non-oil growth can be project-driven and not fiscally transformative. Source log: IMF Article IV reports.

Summary (3–5 sentences). Hydrocarbon geopolitics in the Gulf is not only about oil prices; it is about how rent structures state-society relations, how shale altered OPEC's market power, and how Gulf states now hedge across security, economic, and diplomatic partners. Vision 2030 and the Abraham Accords illustrate diversification as a political project, not merely a growth strategy. The African perspective foregrounds who captures rent, who finances transition, and whose development priorities are served by Gulf capital. Data on production, breakeven prices, SWF assets, and non-oil growth help describe this transformation, but they cannot by themselves prove political decoupling from hydrocarbons.

SECTION 5 — FEYNMAN COMPRESSION

1. **Explain without jargon.** Oil money lets some states provide benefits without taxing citizens heavily, which shapes politics. The U.S. shale boom made oil supply more flexible and weakened OPEC's old control. Gulf states now try to build non-oil economies while still depending on oil money, and they keep ties with the U.S. for security, China for trade, and Russia for oil coordination. The African question is whether Gulf money and energy projects help African development on African terms.

2. **Mark gaps.** I am less certain about exact fiscal breakeven prices, because they depend on hidden spending, subsidies, and accounting choices. I also need to separate "non-oil growth" from "non-oil state revenue," and I should not treat SWF size as proof of successful diversification. I have not yet explained how sanctions alter Iran's breakeven in a non-market way.

3. **Reread verification.** Rechecking the core claims: rentier theory predicts welfare-for-legitimacy ex-

change but does not predict identical outcomes across Gulf states; shale increased supply responsiveness but did not eliminate OPEC+ influence; Vision 2030 is a transformation agenda with political centralization; multi-alignment is hedging, not abandonment of the U.S. security umbrella. These claims are consistent with Hertog, Gray, Yergin, EIA, and IMF sources.

4. **Analogy with explicit limits.** A Gulf state can be compared to a household whose main income comes from one high-paying but volatile job: it saves in investments, tries to start side businesses, and keeps relationships with different protectors and partners. The analogy helps explain diversification anxiety, but it fails because states are not households: they control coercion, set laws, manage currencies, and their "income" is geopolitical rent rather than wages.

5. **Rewrite.** Hydrocarbon geopolitics is a system in which oil rent structures state power, shale has fragmented supply control, and Gulf states are attempting economic transformation without surrendering strategic hedging. The key analytical task is to distinguish output diversification from fiscal, political, and legitimacy diversification, while reading Gulf capital and energy policy through African, Chinese, Russian, Western, and UN vantage points. Data on production, breakeven prices, SWF assets, and non-oil growth are necessary but insufficient evidence for claims about transformation.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L46	Definition	What is a rentier state?	A rentier state derives a large share of government revenue from external rent, especially hydrocarbons, rather than broad domestic taxation. This can fund welfare and patronage while weakening fiscal bargaining between citizens and the state. Rentierism is a variable condition, not an automatic regime type.	African political economy often stresses extraction and external dependence, but Gulf rentierism is state-led, fiscally centralized, and historically tied to monarchical bargains.

Tag	Card Type	Front	Back	Perspective Note
L46	Mechanism	How does hydrocarbon rent shape political legitimacy?	Rent allows governments to provide subsidies, public employment, and services without relying heavily on taxation, producing a distribution-based social contract. Legitimacy then depends on performance and patronage as much as on consent. The mechanism is contingent on institutions and elite choices.	Western modernization theory can overstate automatic authoritarianism; African and Gulf scholarship emphasizes bargains, contingencies, and social contracts.
L46	Application	What is a fiscal breakeven oil price?	It is the oil price at which a government's budget is expected to balance under stated spending and production assumptions. Prices above it create surpluses; prices below it imply deficits, reserve drawdowns, or adjustment. It is a planning metric, not a market forecast.	IMF Article IV reports use breakevens to assess Gulf sustainability, but the metric can obscure distributional choices and political priorities.

Tag	Card Type	Front	Back	Perspective Note
L46	Mechanism	How did the US shale revolution structurally affect global oil markets?	Shale added short-cycle, price-responsive supply that increased global supply elasticity and shortened price cycles. It reduced OPEC's ability to manage prices through cuts alone and changed the United States from a major importer to an exporter. It did not eliminate OPEC+ influence.	Western energy-security narratives often celebrate shale; Russian and Gulf perspectives treat it as a competitive shock requiring coordination.
L46	Comparison	What distinguishes OPEC from OPEC+?	OPEC is the original producer cartel, while OPEC+ includes Russia and other non-OPEC producers. OPEC+ expands coordination capacity but also introduces bargaining among members with different fiscal needs and geopolitical goals. It is a coordination mechanism, not a unified state.	Russian perspectives frame OPEC+ as multipolar energy governance; Western perspectives often emphasize cartel power and consumer costs.

Tag	Card Type	Front	Back	Perspective Note
L46	Source	What is Yergin's main contribution to hydrocarbon geopolitics?	Yergin traces how oil shapes geopolitics, technology, markets, and security across the twentieth and twenty-first centuries. His work is a historical narrative of energy transitions and strategic competition rather than a single causal model. It supports mechanism tracing but not deterministic prediction.	The narrative is largely Western-centric; African and Global South readings ask whose energy security is centered and who bears transition costs.
L46	Debate	Is Saudi Vision 2030 mainly economic diversification or political legitimation?	It is both: diversification aims to reduce oil dependence and create employment, while also repositioning the state and its leadership domestically and internationally. These goals can conflict if restructuring or austerity strains the social contract. Evidence includes non-oil GDP targets, project scale, and labor-market reforms.	African development scholars would ask whether diversification reproduces dependency through mega-projects and uneven regional development.

Tag	Card Type	Front	Back	Perspective Note
L46	Mechanism	How do the Abraham Accords connect to Gulf diversification?	Normalization with Israel opened channels for technology, investment, security cooperation, and market access that Gulf states can use to accelerate non-oil sectors. It also carries domestic and regional legitimacy costs. It is a strategic option, not an inevitable alignment.	Western framing emphasizes peace and markets; Arab and African perspectives emphasize Palestinian sovereignty and the political costs of normalization.
L46	Application	What is Gulf multi-alignment?	Gulf states combine US security guarantees, Chinese economic partnerships, and Russian diplomatic and energy coordination to maximize autonomy and reduce dependence on any single power. The strategy requires managing contradictions among partners. It is enabled by rentier wealth but constrained by security dependence.	African non-alignment traditions offer analogies, but Gulf multi-alignment is backed by hydrocarbon wealth and US security guarantees.

Tag	Card Type	Front	Back	Perspective Note
L46	Comparison	How do US security guarantees and Chinese economic partnerships differ in Gulf strategy?	The United States provides military protection, arms, and regional security architecture; China provides markets, investment, infrastructure, and energy demand. Gulf states use both to avoid exclusive dependence. Neither alone explains Gulf agency.	Chinese perspectives emphasize mutual development and sovereignty; Western perspectives emphasize alliance management and deterrence.
L46	Source	What do IMF Article IV reports contribute to Gulf analysis?	They provide country-specific macroeconomic assessments, including fiscal breakevens, growth projections, and reform progress. They are useful for testing diversification claims against fiscal data. They are technocratic and may underweight politics and distribution.	African scholars caution that IMF metrics can normalize austerity and understate the social-contract dimensions of reform.

Tag	Card Type	Front	Back	Perspective Note
L46	Debate	Did the 2020-2022 oil price war strengthen or weaken OPEC+?	It initially collapsed prices and exposed Saudi-Russian rivalry, but later coordination restored prices and institutionalized OPEC+. The episode shows both fragility and resilience. Adjudication depends on time horizon and whether the metric is price stability, market share, or institutional cohesion.	Russian perspectives see restored multipolar coordination; Western perspectives emphasize volatility and consumer costs.
L46	Reconstruction	How did the 2023 Iran-Saudi rapprochement reshape Gulf calculations?	It reduced immediate escalation risk and created space for economic prioritization, while complicating US-centric security framing. It did not resolve proxy conflicts or ideological rivalry. It is best treated as tactical de-escalation with strategic ambiguity.	African conflict-resolution perspectives value regional dialogue; Western perspectives worry about erosion of US influence.

Tag	Card Type	Front	Back	Perspective Note
L46	Occlusion	What does the Western perspective often occlude in Gulf hydrocarbon geopolitics?	It often centers consumer energy security and alliance stability while underweighting Gulf domestic political bargains, African energy-transition impacts, and the distributional costs of diversification. This can make Gulf agency appear as either compliance or defiance rather than strategic calculation.	The African perspective foregrounds transition justice, investment asymmetries, and the externalities of Gulf capital flows.
L46	Adjudication	How should one adjudicate claims that oil dependence is declining?	Use multiple metrics: non-oil GDP growth, fiscal breakeven, export concentration, sovereign wealth assets, employment quality, and political reform. No single indicator is sufficient. Theories predict different timelines and mechanisms.	African political economy adds regional inequality, labor precarity, and the quality of diversification, not just its quantity.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence Audit (score each item 0-100)

Competency	Confidence (0-100)	Evidence of Mastery
Define rentier state and state its scope conditions		
Explain the mechanism linking rent to legitimacy		
Interpret fiscal breakeven prices		
Explain the structural impact of US shale		
Distinguish OPEC from OPEC+		
Reconstruct all five perspectives on Gulf hydrocarbon geopolitics		
Apply levels of analysis to the 2020-2022 oil price war		
Adjudicate competing claims about Gulf diversification		

7.2 Three-Question Debrief

1. Which of the five perspectives did you reconstruct least accurately, and what evidence would improve it?
2. Which mechanism did you initially confuse with an outcome, and how did the causal chain differ?
3. What single piece of evidence would most strongly challenge your current adjudication of Gulf multi-alignment?

7.3 Error-Log

Common Misconception	Correction	Evidence
Oil wealth automatically produces authoritarianism.	Rentierism is contingent; institutions, elite bargains, and social contracts vary across oil states.	Hertog (2010); Gray (2011).
The US shale revolution ended OPEC's relevance.	Shale increased supply elasticity but OPEC+ coordination still shapes prices and market expectations.	EIA data; OPEC+ agreements.
Saudi Vision 2030 guarantees successful diversification.	Targets and projects are not outcomes; fiscal, labor, and political constraints remain.	IMF Article IV reports.

Common Misconception	Correction	Evidence
The Abraham Accords resolved regional conflict.	Normalization created new channels but did not resolve Palestinian or Iranian questions.	Regional diplomatic record.
Multi-alignment means Gulf states are neutral.	They remain security-dependent on the United States while deepening economic ties with China and Russia.	Defense and trade patterns.
The 2023 Iran-Saudi rapprochement ended rivalry.	It reduced escalation risk but left proxy conflicts and ideological competition unresolved.	Diplomatic statements and continued regional tensions.

SECTION 8 — CHEATSHEET

Core Concepts	Key Mechanisms	Theories and Authors	Cases and Evidence	Debates	Falsifiers	Cross-links
Rentier state; fiscal breakeven; OPEC/OPEC+; shale revolution; Vision 2030; Abraham Accords; multi-alignment	Rent funds welfare without taxation; shale shortens price cycles; OPEC+ coordinates supply; diversification repositions state; multi-alignment hedges dependence	Rentier theory; Hertog (2010); Gray (2011); Yergin (1991, 2011); IMF macro-fiscal analysis	2020-2022 oil price war; 2023 Iran-Saudi rapprochement; EIA production data; IMF Article IV reports	Rentierism vs. institutional variation; shale vs. OPEC power; diversification as economics vs. legitimation; multi-alignment vs. neutrality	Sustained low breakeven with high non-oil employment; OPEC+ collapse without price recovery; Vision 2030 targets missed with fiscal crisis; rapprochement followed by direct conflict	L19 energy; L41 West Asia state system; L43 sectarianism; L49 Global South; L51 climate geopolitics; L52 semiconductors

SECTION 9 — REVIEW SCHEDULE

- **R1 (Day 1, 20 minutes):** Review flashcards and define rentier state, fiscal breakeven, OPEC+, and multi-alignment without notes.
- **R2 (Day 3, 30 minutes):** Reconstruct the 2020-2022 oil price war across individual, state, systemic, and transnational levels of analysis.

- **R3 (Week 1, 45 minutes):** Complete the problem pair on the 2023 Iran-Saudi rapprochement and compare your answer with the model answer.
- **R4 (Week 2, 60 minutes):** Draft the independent memo, ensuring separate sections for mechanism, perspective reconstruction, historical analogue, and falsifiers.
- **R5 (Month 1, 90 minutes):** Reconstruct all five perspectives from memory, then adjudicate one contested claim using evidence and explicit scope conditions.

SECTION 10 — COMPLETION CHECKLIST

☐ I can define a rentier state and state its scope conditions.
☐ I can explain the mechanism linking hydrocarbon rent to legitimacy.
☐ I can interpret a fiscal breakeven price.
☐ I can explain the structural impact of the US shale revolution.
☐ I can distinguish OPEC from OPEC+.
☐ I can explain Saudi Vision 2030 as both economic and political strategy.
☐ I can explain the Abraham Accords' connection to Gulf diversification.
☐ I can define Gulf multi-alignment.
☐ I can reconstruct the African perspective as primary.
☐ I can reconstruct the Chinese perspective.
☐ I can reconstruct the Russian perspective.
☐ I can reconstruct the Western perspective.
☐ I can reconstruct the UN perspective.
☐ I can apply levels of analysis to the 2020-2022 oil price war.
☐ I can adjudicate competing claims about Gulf diversification.
☐ I have completed the confidence audit.
☐ I have logged at least one misconception and correction.
☐ I have scheduled R1-R5 reviews.

End of Lesson 46. Say **Next** when you are ready.

48. US-China Rivalry and Power Transition

LESSON METADATA

Field	Value
Lesson number and title	Lesson 47: US-China Rivalry and Power Transition
Module	Module 8: Indo-Pacific, Systemic Rivalry, and Transnational Forces
Prerequisites	L5 (realism), L13 (liberal order), L14 (contemporary transition), L18 (interdependence)
Interleaved links	Forward to L48 (Indo-Pacific), L49 (institutional revisionism), L52-56 (techno-geopolitics)
Reading load	7-9 hours
Estimated study time	7-9 hours
Content channels	Text, data lab, visual anchor, worked example, problem pair, flashcards
Bloom ceiling	Evaluate / Create

SECTION 0 — Why This Lesson Exists

The central puzzle of contemporary international order is whether the relative decline of the United States and the rise of China must culminate in great-power war, or whether the transition can be managed without catastrophic violence. This is not merely an empirical question about two states; it is a theoretical question about the relationship between material power shifts and systemic stability. The lesson takes as its object the US-China rivalry as the paradigmatic case of power transition in the twenty-first century, and asks students to evaluate competing theoretical accounts—power transition theory, offensive realism, Chinese relational and moral realism, interdependence theory, and the engagement-containment debate—against evidence from trade, technology, military spending, and the Taiwan flashpoint. The puzzle is deliberately framed from an African vantage point: African states are not bystanders to this rivalry but are increasingly the terrain on which it is contested, through debt, infrastructure, digital networks, and security partnerships. What the African perspective reveals that the others miss is that bipolar competition is experienced not as an abstract systemic shift but as a set of concrete constraints and opportunities that reshape domestic politics, fiscal space, and strategic autonomy across the continent.

The theoretical stakes are high because each framework carries different implications for policy and for the probability of war. Organski's power transition theory (1958) posits that the international system is hierarchical and that war becomes likely when a challenger approaches the dominant power's capabilities and is dissatisfied with the status quo distribution of benefits. Allison's "Thucydides Trap" (2017) popularized this logic, cataloguing sixteen cases of rising-power challenge and finding war in twelve. Mearsheimer's offensive realism (2001, 2014) goes further: great powers are structurally compelled to maximize relative power, and a rising China will inevitably seek regional hegemony, provoking US resistance. Both frameworks treat conflict as structurally overdetermined. Against them, Chinese scholars offer alternative ontologies. Qin Yaqing's relational theory (2018) locates order in relationships rather than in material power; Yan Xuetong's

moral realism (2011) argues that legitimacy and moral leadership, not merely capability, determine which state leads; Zhao Tingyang's Tianxia (2021) proposes a world order built on inclusive relationality rather than zero-sum competition. These are not mere propaganda; they are serious theoretical traditions with distinct scope conditions and empirical referents.

The economic dimension complicates every theoretical prediction. L18 established that interdependence creates both vulnerability and restraint. The US-China economic relationship—deeply integrated supply chains, mutual investment, and dollar-denominated trade—has been described as too big to fail, yet also as a source of strategic risk. Friedberg (2018) argues that engagement failed to liberalize China and that the United States must now adopt a strategy of competitive containment, including decoupling in sensitive sectors. The "new cold war" framing implies a bipolar division of the global economy into competing blocs. But the evidence is mixed: trade volumes remained high even during tariff escalation, and third countries—especially in Africa and Southeast Asia—have become critical nodes in rerouted supply chains. The question is whether interdependence stabilizes or destabilizes, and under what conditions.

Taiwan is the most concrete and dangerous flashpoint. The island sits at the intersection of power transition, security dilemma, and domestic politics in both Beijing and Washington. A power-transition reading sees Taiwan as the test of whether the challenger can revise the status quo; an offensive-realist reading sees it as the geographic anchor of US containment; a relational reading sees it as a relationship that must be managed through mutual recognition rather than coercion. The risk of war is not abstract: military exercises, gray-zone coercion, and alliance commitments (AUKUS, Quad) have raised the temperature. The lesson's problem pair asks students to apply both power transition and security dilemma frameworks to the Taiwan Strait.

The African perspective is primary because it reveals what the other four occlude. African states experience the rivalry as a set of structural pressures: debt distress linked to Chinese lending and Western conditionality; competition for critical minerals; digital infrastructure choices between Huawei and Western vendors; and security partnerships that import great-power competition into fragile states. Yet African agency is real: multi-alignment, the African Continental Free Trade Area, and collective bargaining through the African Union offer strategies for preserving autonomy. Grovogui, Mbembe, Bayart, Mamdani, and others have theorized this condition as extraversion, rhizomatic power, and the politics of the belly—frameworks that do not reduce African states to pawns. The African vantage point shows that the "US-China rivalry" is not only a bilateral or systemic phenomenon but a transnational one that reconfigures sovereignty, development, and security across the Global South.

By the end of this lesson, the student will be able to: (1) state and compare the causal mechanisms of power transition theory, offensive realism, and Chinese relational and moral realism; (2) specify the scope conditions under which each predicts war or peace; (3) reconstruct how each of the five perspectives frames the rivalry; (4) apply these frameworks to the 2018-2024 trade and technology war and to the Taiwan flashpoint; and (5) identify falsifiers that would discriminate among the theories. The lesson is designed for graduate-level evaluation, not mere description: every claim must be tied to a mechanism, and every theory must be presented with its strongest counterargument.

SECTION 1 — Pre-Class Priming

1.1 Retrieval warm-up

1. According to structural realism (L5), what is the primary determinant of state behavior, and how does

this differ from classical realism's emphasis on human nature?
2. What are the three pillars of the post-1945 liberal international order (L13), and what does the "contemporary transition" (L14) suggest about their durability?
3. How does the "contemporary transition" framework (L14) distinguish between a change in the distribution of power and a change in the rules of the international order?
4. Under what conditions does economic interdependence reduce the probability of war, and under what conditions does it increase it (L18)?
5. What is the security dilemma, and why does it make cooperation difficult even between states with no aggressive intentions (L5)?
6. What is hegemonic stability theory, and what does its decline imply for global governance (L13, L14)?

1.2 Orientation questions

1. Does China's rise necessarily produce war with the United States, or can the transition be managed?
2. How do Chinese theoretical traditions challenge the Western assumption that power transitions are zero-sum?
3. Is economic interdependence between the US and China a stabilizer or a source of vulnerability?
4. What would have to be true for the "engagement" strategy to be judged a success or a failure?

1.3 Vocabulary pre-teach

- **Power transition theory**: A theory (Organski 1958) holding that the international system is hierarchical and that war becomes most likely when a rising challenger approaches parity with the dominant power and is dissatisfied with the status quo distribution of benefits.
- **Thucydides Trap**: Allison's (2017) term for the structural tendency toward war when a rising power threatens to displace a ruling power; derived from Thucydides' account of the Peloponnesian War.
- **Offensive realism**: Mearsheimer's (2001) theory that great powers are structurally compelled to maximize relative power and seek regional hegemony, making intense security competition inevitable.
- **Relational theory (guanxi)**: Qin Yaqing's (2018) framework locating international order in social relationships and processes rather than in material power distributions.
- **Moral realism**: Yan Xuetong's (2011) argument that legitimacy, moral leadership, and political authority—not merely capability—determine which state can lead the international order.
- **Tianxia**: Zhao Tingyang's (2021) concept of a world order built on inclusive relationality and universal benefit rather than zero-sum competition among sovereign states.
- **Security dilemma**: The condition in which one state's efforts to increase its security decrease the security of others, potentially producing arms races and conflict even without aggressive intent.
- **Engagement vs. containment**: The debate over whether to integrate China into the liberal order (engagement) or to limit its power (containment); Friedberg (2018) argues engagement failed.
- **Decoupling**: The partial or full separation of US and Chinese economies in sensitive sectors such as semiconductors, telecommunications, and critical minerals.
- **Gray-zone coercion**: Actions below the threshold of armed conflict—cyber operations, economic pressure, maritime militia—that advance strategic objectives without triggering war.
- **Multi-alignment**: The strategy of maintaining productive relationships with multiple great powers simultaneously rather than choosing a single patron.
- **Extraversion**: Bayart's concept describing how African states have historically engaged external pow-

ers to secure resources and legitimacy, a framework that illuminates contemporary multi-alignment.

SECTION 2 — LESSON CORE

2.1 Learning objectives

By the end of this lesson, the student will be able to:

1. **Explain** the causal mechanism of power transition theory as formulated by A.F.K. Organski and refined by Jacek Kugler, including the role of differential growth rates, the "danger zone" of approaching parity, and the critical distinction between power transition and power dissatisfaction, and identify the scope conditions under which the theory predicts major war rather than peaceful adjustment. (Bloom: comprehension/analysis)
2. **Analyze** how Graham Allison's "Thucydides Trap" framing has shaped policy discourse in both Washington and Beijing, distinguishing Allison's stronger, more deterministic claim from Organski's original conditional argument, and evaluating whether the framing functions as an analytical tool or as a self-fulfilling prophecy that narrows the space for diplomatic creativity. (Bloom: analysis/evaluation)
3. **Evaluate** the empirical foundations of the power-transition research program against the principal critiques—Jack Levy's finding that hegemonic wars are historically rare, Steve Chan's challenge to the theory's case selection and its application to China, and the security-dilemma literature's argument that structural pressures do not mechanically produce war—rendering a reasoned judgment about the theory's predictive validity. (Bloom: evaluation)
4. **Apply** power transition theory and the security dilemma to the Taiwan flashpoint, distinguishing the structural pressures generated by a narrowing power gap from the agency exercised by leaders, domestic coalitions, and third-party actors, and specifying what evidence would confirm or disconfirm the hypothesis that Taiwan is the likely trigger of a US-China war. (Bloom: application)
5. **Synthesize** the African, Chinese, Russian, Western, and UN perspectives on US-China rivalry into a comparative analytical judgment, identifying what each perspective reveals about the distribution of costs and benefits of great-power competition and what each occludes, with particular attention to the African vantage point on bipolar competition as a structural condition shaping the continent's development trajectory. (Bloom: synthesis)

2.2 KEY IDEA 1 — Power transition theory (Organski, Kugler) and the Thucydides Trap (Allison)

Bolded Causal Claim: Major war becomes most probable when a dissatisfied rising power approaches parity with the dominant power in the international system, because the narrowing power gap simultaneously tempts the challenger to demand revision of the order and tempts the hegemon to strike preventively while it still holds a margin of superiority, and because neither side can credibly commit to restraint once the balance shifts.

Mechanism: The mechanism operates through four linked stages. First, differential growth rates: in Organski's original formulation in *World Politics* (1958), the international system is hierarchical, with a dominant power at the apex, great powers below, and small powers at the base. Growth is not uniform; a challenger state may grow faster than the hegemon because it is modernizing from a lower base, because it has not yet

assumed the burdens of global order maintenance, or because its political system permits more concentrated resource mobilization. Second, the "danger zone": Organski and Kugler, in *The War Ledger* (1980), specified that the risk of war peaks when the challenger reaches roughly 80 percent of the dominant power's capabilities—not at full parity, and not when the challenger is still weak. The logic is that at 80 percent the challenger is strong enough to fight and to win a revisionist war, yet not so strong that the hegemon has already accommodated; the hegemon, meanwhile, still has a margin of superiority that makes preventive war thinkable. Third, dissatisfaction as the activating variable: power transition alone does not cause war. Organski was explicit that a satisfied rising power—one that accepts the rules, norms, and distribution of benefits of the existing order—will be accommodated peacefully, as the United States was accommodated by Britain in the late nineteenth century. War requires that the challenger be dissatisfied with the status quo, whether because the order was built by and for the hegemon, because the challenger's growing power is not matched by growing influence, or because the challenger holds a different vision of legitimate international order. Fourth, the trap dynamics that Allison emphasizes: even rational leaders who wish to avoid war may be unable to do so because of commitment problems (the rising power cannot credibly promise not to use its future power to extract concessions), preventive-war incentives (the declining power has reason to fight now rather than later), audience costs (leaders who appear weak face domestic punishment), and the catalytic role of third-party crises that force choices before the underlying power shift has been negotiated. Allison's *Destined for War* (2017) draws on Thucydides' observation that "it was the rise of Athens and the fear that this instilled in Sparta that made war inevitable" to argue that structural forces can overwhelm individual agency. Allison studied sixteen cases of a rising power challenging a ruling power over five centuries and found that twelve ended in war—a 75 percent rate that he presents as a warning rather than a destiny. The mechanism, in Allison's rendering, is not that leaders want war but that the structural position of the two powers generates incentives and fears that make war the default outcome unless both sides make "huge, painful, and reciprocal" adjustments to accommodate the shift.

Scope Conditions: Power transition theory applies only under a specific set of conditions, and recognizing these conditions is essential to avoiding the theory's overextension. First, the theory assumes a hierarchical system with a single dominant power and a single challenger; it does not travel well to multipolar systems or to systems with multiple rising powers. Second, it requires that power be measurable and that the challenger's growth trajectory be sustained and visible; if growth stalls or if power is diffuse across military, economic, and technological dimensions that do not move in tandem, the "danger zone" becomes difficult to locate. Third, the theory's predictive power depends on the challenger's dissatisfaction, which is a subjective and politically constructed variable; a challenger that is integrated into the order through institutions, trade, and elite socialization may remain satisfied even as its power grows. Fourth, the theory was developed to explain hegemonic war—war between great powers for control of the international system—and does not necessarily explain regional conflicts, civil wars, or wars of intervention. Fifth, and critically, Organski's original theory was conditional and probabilistic; Allison's "trap" framing is stronger and more deterministic. Conflating the two produces the error of treating a structural tendency as an iron law. The theory also struggles to account for nuclear deterrence, which may suppress the preventive-war mechanism that drives the model, and for the role of domestic politics, which can either accelerate or retard the transition. Finally, the theory assumes that states are unitary actors with coherent preferences; it has difficulty incorporating the role of transnational actors, multinational corporations, and global supply chains that may create cross-cutting interests between the hegemon and the challenger.

Observable Implications: If power transition theory is operating in the US-China case, several observable implications should follow. Militarily, one would expect a sustained increase in Chinese defense spending

as a share of GDP, the expansion of the People's Liberation Army's power-projection capabilities, and the development of anti-access/area-denial systems designed to raise the cost of US intervention in the Western Pacific. One would expect the United States to respond with forward deployment, alliance reinforcement, and investments in technologies designed to offset Chinese advantages. Economically, one would expect a gradual decoupling of supply chains, the weaponization of trade and technology, and the formation of competing economic blocs. Diplomatically, one would expect the challenger to demand greater voice in international institutions, the creation of parallel institutions, and the contestation of norms. In the Taiwan case specifically, one would expect the issue to become more salient as the power gap narrows, with both sides hardening their positions and reducing the space for ambiguity. The theory also implies that crises over peripheral territories—Taiwan, the South China Sea, the East China Sea—will become more frequent and more dangerous as the transition proceeds, because these crises serve as tests of resolve and as opportunities to establish new facts on the ground. Conversely, if the theory is wrong or inapplicable, one would expect to see continued deep economic interdependence, institutional cooperation on shared challenges such as climate change and pandemic response, and the absence of a clear "danger zone" moment because power is multidimensional and does not converge on a single metric.

Perspective Note (five traditions in brief):

African (primary): The African perspective on power transition theory begins from a position that the theory itself does not occupy: the view from the periphery of a system whose center is defined by great-power competition. African scholarship—drawing on Nkrumah's analysis of neo-colonialism, Rodney's account of how Europe underdeveloped Africa, and Mamdani's work on the bifurcated colonial state—treats the international system not as an anarchic arena of sovereign equals but as a structured hierarchy in which the rules of the game were written by and for the dominant powers. From this vantage point, the US-China power transition is not an abstract structural process but a concrete reconfiguration of the conditions under which African states must pursue development. The theory's focus on the hegemon-challenger dyad occludes the fact that the "transition" is experienced in Africa as a new scramble: competition for minerals critical to the green transition and digital economy, competition for port access and military basing rights, and competition for diplomatic alignment in multilateral forums. African scholars such as Grovogui have argued that the language of "power transition" itself reproduces a Eurocentric ontology in which Africa appears only as a terrain of competition rather than as a site of agency. Yet the African perspective also identifies opportunities: the rivalry creates bargaining leverage for African states that can play the two powers against each other, diversify their partnerships, and extract better terms for infrastructure and technology transfer. The African Union's Agenda 2063 and the African Continental Free Trade Area represent attempts to aggregate African bargaining power and reduce the continent's vulnerability to external shocks. The African vantage point thus reveals what the theory's systemic framing misses: that power transitions are not just about who rules the system but about how the transition reshapes the life chances of those who did not design it. It also raises the question—rarely asked in Western or Chinese discourse—of whether the "trap" is not just a risk of war between two great powers but a trap of perpetual subordination for the rest of the world, in which the costs of great-power competition are externalized onto the Global South.

Chinese: The Chinese perspective on power transition theory is shaped by a dual movement: the embrace of the theory's descriptive insight that China is rising, combined with a sharp rejection of its prescriptive implication that war is likely or inevitable. Chinese scholars and officials have argued that the "Thucydides Trap" is a Western construct that misreads Chinese intentions and that China's rise is peaceful, defensive, and oriented toward the restoration of a rightful position rather than the overthrow of the existing order. The official Chinese position, articulated in Xi Jinping's 2015 statement that "there is no such thing as the

Thucydides Trap," holds that the theory reflects a Western zero-sum mentality that China does not share. Chinese international-relations scholars such as Qin Yaqing have argued that the theory's state-centric, materialist framework misses the relational and normative dimensions of Chinese foreign policy. At the same time, Chinese strategic discourse has internalized the theory's warning: the recognition that the United States may act preventively has informed Chinese investments in military modernization, economic resilience, and technological self-sufficiency. The Chinese perspective thus both rejects and instrumentalizes the theory—rejecting its determinism while using its structural logic to justify defensive preparations.

Russian: The Russian perspective treats power transition theory as a partial description of a broader process: the decline of unipolarity and the emergence of a multipolar world order. Russian scholars and officials have argued that the theory's focus on a single hegemon-challenger dyad is too narrow and that the relevant transition is not from US to Chinese hegemony but from unipolarity to multipolarity, in which Russia, China, and other powers collectively constrain American dominance. The Russian framing emphasizes the anti-hegemonic dimension: the problem is not China's rise per se but the United States' refusal to accept the loss of its unipolar moment. From this vantage point, the "Thucydides Trap" is a Western anxiety that reflects the hegemon's fear of losing control, and the appropriate response is not to manage a bilateral transition but to accelerate the construction of a multipolar order in which no single power can dominate. Russian discourse has also stressed the role of the United States in provoking the rivalry through NATO expansion, color revolutions, and the weaponization of the dollar, suggesting that the "trap" is not structural but manufactured by hegemonic overreach.

Western: The Western perspective, particularly in the United States, has been deeply shaped by Allison's framing, which has entered the policy mainstream as a warning that requires active management. The dominant Western view treats the US-China rivalry as a strategic competition in which China is a revisionist power seeking to displace the United States, and the policy debate centers on whether to engage, contain, or compete. Scholars such as Aaron Friedberg have argued that engagement has failed and that the United States must adopt a strategy of competitive containment. The Western perspective emphasizes the liberal international order as a public good that China threatens, and it frames the power transition as a test of whether the order can accommodate a rising authoritarian power. The perspective's strength is its attention to the material and institutional dimensions of the rivalry; its weakness, acknowledged by critics within the Western tradition, is its tendency to mirror-image Chinese intentions and to treat the rivalry as a new Cold War, which may foreclose cooperative solutions to shared problems.

UN: The UN perspective approaches the power transition through the lens of Charter principles: sovereign equality, the prohibition on the use of force, and the peaceful settlement of disputes. The UN framework does not deny that power shifts occur, but it insists that they must be managed within the rules-based order rather than through unilateral action or preventive war. The UN perspective highlights the risk that great-power rivalry poses to the multilateral system, including the Security Council's ability to function, the integrity of international law, and the protection of smaller states caught between competing powers. On Taiwan specifically, the UN perspective is constrained by the fact that the organization does not recognize Taiwan as a member state and that the issue is governed by the "One China" principle as understood by the majority of member states, yet the UN Charter's prohibition on the use of force applies to all parties. The UN vantage point thus emphasizes de-escalation, crisis management, and the maintenance of channels of communication, while acknowledging that the organization's effectiveness depends on the willingness of the great powers to subordinate their rivalry to collective security.

SECTION 2.3 KEY IDEA 2 — Offensive realism (Mearsheimer) and the tragedy of great-power politics applied to US-China

Bolded Causal Claim: Under offensive realism, the anarchic structure of international politics compels great powers to maximize relative power and seek regional hegemony, so the rise of China makes sustained US-China strategic competition and a high risk of conflict structurally likely even in the absence of hostile intentions.

Mechanism: Offensive realism, most systematically developed by John Mearsheimer in *The Tragedy of Great Power Politics* (2001) and applied to China in later work (2014), rests on five core assumptions: the international system is anarchic; no state can be certain of another state's intentions; states prioritize survival; states can never be certain that other states will not use force; and power is the means by which states ensure survival. From these assumptions, Mearsheimer derives a demanding conclusion: great powers are not merely security-seekers but power-maximizers, and the ultimate aim of each is to become the hegemon in its own region while preventing any other state from achieving hegemony in another region. Global hegemony is treated as impossible because of the difficulty of projecting power across oceans, so the realistic ambition is regional hegemony. The "tragedy" is that even rational, defensive efforts to increase security are interpreted by others as threatening, producing a security dilemma in which all states end up less secure. Applied to US-China relations, the mechanism works as follows. The United States has been the regional hegemon in the Western Hemisphere and the dominant external power in East Asia since 1945; China's rapid economic and military growth threatens that position. Because intentions cannot be verified, Washington must assume that a stronger China will eventually seek to dominate Asia and push the United States out. Beijing, conversely, must assume that Washington will try to contain it and preserve US primacy. Each side's defensive measures—US alliances, forward bases, and freedom-of-navigation operations; Chinese anti-access/area-denial capabilities, naval expansion, and missile forces—are read by the other as preparations for coercion. Taiwan sits at the center of this mechanism because it is both a strategic and symbolic node in the first island chain; control of Taiwan would significantly expand China's ability to project power into the western Pacific and complicate US defense of Japan and the Philippines. Mearsheimer's 2014 argument that China cannot rise peacefully follows directly: the United States and China's neighbors will balance against it, and China will respond by seeking greater military capability, making intense security competition likely. Nuclear weapons may reduce the probability of all-out war by making conquest prohibitively costly, but they do not eliminate conventional conflict, crises, or the possibility of escalation. The theory therefore predicts not an inevitable war but a structurally driven rivalry in which both sides have strong incentives to compete for relative power.

Scope Conditions: Offensive realism applies most strongly when five conditions hold: the system is anarchic and lacks a reliable enforcer; states are rational unitary actors focused on survival; power can be converted into security; geography permits regional hegemony; and intentions are opaque. It is less predictive when nuclear deterrence makes war unthinkable, when economic interdependence creates powerful domestic constituencies against conflict, when a state's ambitions are genuinely limited, when regional states bandwagon rather than balance, or when domestic politics and ideology override structural incentives. It also assumes that power is measurable and that military capability is the decisive currency of international politics; it therefore struggles to account for forms of influence that are not easily militarized, such as institutional leadership, technological standards, or normative attraction. The theory is a theory of great powers, not of small states, and it says little about the agency of secondary actors except as balancers or bandwagoners. Finally, because it treats intentions as unknowable, it cannot distinguish between a genuinely revisionist China and a China seeking only security; this is both its analytical strength and its policy danger, since it can justify

worst-case planning that becomes self-fulfilling.

Observable Implications: If offensive realism is a useful lens, one should observe sustained increases in military spending on both sides; the expansion of Chinese naval, missile, and space capabilities; the strengthening of US alliances and partnerships in the Indo-Pacific, including AUKUS and the Quad; more frequent US freedom-of-navigation operations; larger and more complex Taiwan arms packages; Japanese and Australian defense buildups; South China Sea militarization; and efforts by both powers to reduce dependence in security-sensitive technologies. One should also observe hedging by regional states that fear both Chinese dominance and US abandonment. The theory implies that economic cooperation will be subordinated to security competition in strategic sectors, even if broad trade continues. Falsifiers would include a durable peaceful power transition, Chinese acceptance of US regional primacy, US retrenchment without conflict, deep integration preventing war, China refraining from military dominance, or regional states refusing to balance. The theory is not falsified merely by the absence of war, because it predicts competition rather than conflict; but it is weakened if competition remains limited and institutionalized over long periods.

Perspective Note (five traditions in brief):

African (primary): Offensive realism's structural determinism can be read from Africa as a theory that treats great-power competition as inevitable and thereby normalizes the subordination of smaller states to the security requirements of hegemons. African scholarship and diplomacy have long emphasized that bipolar and unipolar systems generate externalities—commodity price shocks, debt distress, militarized aid, and proxy conflicts—that are borne disproportionately by the global South. Yet the same structural rivalry also creates multi-alignment opportunities: African states can leverage competition among powers to diversify partnerships, negotiate better terms, and resist exclusive alignment. The African vantage point therefore does not deny the reality of power competition but insists that its costs and opportunities are unevenly distributed and that African agency lies in strategic autonomy, regional integration, and the refusal to be conscripted into a binary. Scholars such as Grovogui and Mbembe highlight how international orders are experienced as racialized and extractive; from this perspective, offensive realism explains the behavior of great powers but not the legitimacy of their claims. The theory's occlusion is its tendency to treat African states as objects of balancing rather than as actors with their own security projects.

Chinese: Offensive realism is frequently rejected in Chinese discourse as a self-fulfilling prophecy. Chinese officials and scholars argue that the "Thucydides Trap" is not a law of history and that China's rise can be peaceful if the United States abandons containment and zero-sum thinking. The theory is seen as rationalizing US military primacy and alliance expansion in the Indo-Pacific. At the same time, some Chinese realists accept structural competition and advocate military modernization; the debate is internal as well as external. The Chinese perspective emphasizes that intentions matter and can be shaped through dialogue, economic integration, and institutional cooperation.

Russian: Russian commentary generally treats offensive realism as a description of US behavior rather than a universal law. Moscow frames the United States as a declining hegemon resisting multipolarity, while China's rise is interpreted as part of a broader correction of the post-Cold War order. Russia's own strategic culture combines great-power realism with anti-hegemonic rhetoric, producing an alignment with China that is pragmatic rather than ideological. The risk, from a Russian vantage point, is that an unbalanced China could itself become a hegemon; hence Moscow values multipolarity and strategic autonomy even within the Sino-Russian partnership.

Western: In Western IR, offensive realism is one of the most influential and contested theories of great-power politics. Mearsheimer's work shapes US strategic debates, especially arguments for offshore balancing and preventing Chinese regional hegemony. Critics from liberal institutionalism, constructivism, and economic

interdependence theory argue that the theory overstates the inevitability of conflict, understates the constraining effects of institutions and commerce, and risks becoming a self-fulfilling prophecy. The Western perspective is therefore internally divided between those who see structural competition as unavoidable and those who believe policy can shape outcomes.

UN: The UN perspective treats offensive realism as a warning about the dangers of unchecked great-power competition rather than as a policy guide. The Charter's prohibition on the use of force and its emphasis on collective security stand in tension with a theory that normalizes power maximization. From the UN vantage point, the relevant question is whether crisis-management mechanisms, communication channels, and legal constraints can prevent structural pressures from producing war. Taiwan is a particular concern because any conflict would implicate the Charter's core norms and the organization's credibility.

SECTION 2.4 KEY IDEA 3 — Chinese relational and moral realist accounts (Qin Yaqing, Yan Xuetong, Zhao Tingyang)

Bolded Causal Claim: Chinese relational and moral-realist theories argue that international order is constituted by relationships, moral authority, and inclusive world-systems rather than by anarchic power competition; therefore US-China rivalry need not follow a Thucydides Trap if both sides cultivate relational harmony, moral leadership, and Tianxia-style inclusive governance.

Mechanism: The mechanism has three distinct but complementary strands. First, Qin Yaqing's relational theory, developed in *A Relational Theory of World Politics* (2018), begins with an ontological claim: the world is composed of relations rather than substances. Actors are not pre-given, self-contained units that enter into relations; they are constituted by their relations. This challenges the substantialist ontology that underlies much Western IR theory, in which states are treated as billiard balls or unitary actors. Qin introduces "relational rationality," in which actors pursue harmony, mutual constitution, and the maintenance of relationships rather than only utility maximization. Power is understood as relational capacity—the ability to shape and sustain networks of relations—rather than as a stock of material resources. "Harmony without uniformity" becomes a governing principle: order does not require sameness but the management of difference through relationship. In the US-China context, this implies that rivalry is not mechanically determined by material power shifts; it is shaped by the quality of diplomatic, economic, and social relations. If both sides invest in relational management—summits, institutional dialogue, people-to-people ties, and shared problem-solving—anarchy can be socially transformed into a more ordered relational community. Second, Yan Xuetong's moral realism, articulated in *Ancient Chinese Thought, Modern Chinese Power* (2011), argues that international leadership depends on moral standing as well as material power. Drawing on pre-Qin Chinese thought, Yan distinguishes "humane authority" (wangdao), which attracts voluntary followers through moral credibility and benevolent governance, from "hegemony" (badao), which relies on coercion and is less durable. Moral realism does not deny power politics; it insists that power must be accompanied by moral resources if it is to produce stable leadership. In a power transition, the rising power must cultivate strategic credibility and moral authority; the declining power's resistance may be mitigated if the rising power is perceived as legitimate. This reframes the US-China rivalry not only as a contest over capabilities but as a competition over which state can offer a more credible and attractive model of order. Third, Zhao Tingyang's Tianxia theory, developed in works such as *All Under Heaven* (2021), critiques the Westphalian system as exclusionary, anarchic, and incapable of producing genuine world order. Tianxia, or "all-under-heaven," proposes an inclusive world system in which the world is treated as a single political community rather than a collection of sovereign states. "Coexistence" and "universal care" are central; the goal is not hegemony but the construction of a shared world. Zhao's argument is philosophical and normative rather than a blueprint

for policy, but it offers a powerful critique of both US liberal hegemony and crude realism. Together, these three strands shift the analytical focus from material structure to social and moral constitution, from zero-sum power to relational harmony, and from state-centric anarchy to world-system inclusiveness. They suggest that US-China rivalry can be moderated by relational management, moral legitimacy, and inclusive institutions, even though they do not deny the reality of power.

Scope Conditions: These theories are most plausible when several conditions hold: elites and publics are receptive to relational or moral frameworks; institutions can be reformed to reflect inclusiveness; power asymmetries are manageable; security dilemmas are not acute; and cultural resources are credible to both domestic and international audiences. They are less applicable when material threats dominate decision-making, when trust is absent, when core security issues such as Taiwan are at stake, when domestic politics reward hawkishness, or when the theories are deployed as normative cover for power projection. There is also an epistemological boundary: relational and moral theories are partly philosophical and normative, and their empirical validation is difficult. They may describe how order ought to be constituted more than how it is constituted. A further risk is conflation between scholarly theory and state discourse. Qin's relational theory, Yan's moral realism, and Zhao's Tianxia are academic arguments; they are not identical to official Chinese policy, even though they resonate with concepts such as a "community of shared future for mankind." Treating them as mere propaganda would be unfair, but treating them as settled descriptions of Chinese state behavior would be equally mistaken. Finally, these theories may understate the coercive dimensions of power: relational harmony can be imposed, and moral claims can be instrumentalized.

Observable Implications: If these theories influence Chinese diplomacy and international order-building, one should observe sustained emphasis on relational language—"community of shared future," "win-win cooperation," "mutual respect," "harmony without uniformity"—in official discourse; the use of the Belt and Road Initiative as a relational network rather than a purely extractive project; investments in people-to-people ties, educational exchange, and cultural diplomacy; moral claims in global governance debates; and academic prominence for Tianxia and relational theory. One might also expect efforts to create or reform institutions that emphasize inclusiveness and consensus. However, observable implications also include continued military modernization, coercive diplomacy, and assertive behavior in the South China Sea and around Taiwan, which suggest that material competition persists alongside relational rhetoric. The theories are therefore not falsified by the existence of rivalry, but they are weakened if relational language is consistently contradicted by coercive practice. Conversely, they are strengthened if periods of tension are followed by renewed cooperation, institutional innovation, or durable crisis management. A key test is whether relational and moral frameworks can constrain behavior when core interests are at stake, or whether they function mainly as diplomatic vocabulary during periods of lower tension.

Perspective Note (five traditions in brief):
African (primary): Relational and moral-realist theories resonate with African intellectual traditions that emphasize communal ethics, Ubuntu, and the critique of atomistic individualism. African scholars have long argued that international order should be evaluated by its capacity to sustain human dignity and collective flourishing, not merely by power balances. From this vantage point, Qin's relational ontology and Zhao's inclusive world-system offer a vocabulary for multi-alignment and for resisting binary Cold War logics. Yet African critics, including Grovogui and Mbembe, caution that relational harmony can obscure structural asymmetry: a "community of shared future" may still be organized around the interests of the powerful. The African perspective therefore welcomes the decentering of Western individualism but insists that relational ethics must be coupled with material redistribution, debt justice, and genuine equality. Theories of moral leadership are attractive, but African history warns that moral claims by great powers can legitimate interven-

tion and extraction. Thus the African contribution is to demand that relational and moral orders be measured by their effects on the most vulnerable, not by the rhetoric of the powerful.

Chinese: This is the indigenous theoretical core. Qin, Yan, and Zhao represent efforts to build Chinese IR theory from Chinese philosophical resources rather than importing Western frameworks. They are not identical to official policy: Qin's relational theory is academic; Yan's moral realism is prescriptive; Zhao's Tianxia is philosophical. Yet they resonate with official discourse about a "community of shared future for mankind" and multipolarity. The Chinese perspective sees these theories as correcting Western biases—substantialism, individualism, and anarchy—and as offering a more humane and inclusive vision of order. Critics within China debate their empirical validity and political implications.

Russian: Russian IR and strategic culture are more statist and civilizational than relational in the Chinese sense, but Moscow finds Chinese moral/relational rhetoric useful as a counter to Western liberal universalism. The idea of multipolarity and civilizational pluralism aligns with Russian critiques of US hegemony. Russia's own tradition emphasizes sovereignty, great-power status, and anti-hegemonism rather than relational harmony. Thus the Russian perspective treats Chinese theories as complementary to, but not substitutable for, a multipolar balance of power. There is also caution about Chinese moral claims becoming a new form of universalism.

Western: Western scholars are divided. Liberals and constructivists may find relational ethics and moral leadership promising, especially as correctives to crude realism. Realists tend to view these theories as normative narratives that do not alter material constraints; some see them as strategic discourse designed to legitimize China's rise. The Western perspective also worries that Tianxia can be read as a hierarchical order centered on China. The debate is whether these theories are genuine alternatives to anarchy or sophisticated justifications for power.

UN: The UN Charter's universalism, sovereign equality, and collective security resonate with the inclusive aspirations of Tianxia and relational ethics. However, the UN system is legal and institutional rather than moral-philosophical; it depends on state consent and great-power cooperation. From the UN vantage point, relational and moral theories can support diplomacy and confidence-building, but they cannot replace legal obligations or enforcement. The risk is that moral claims by powerful states override the rights of smaller states. The UN perspective therefore welcomes dialogue while insisting on Charter principles.

SECTION 2.5 — KEY IDEA 4: ECONOMIC INTERDEPENDENCE AND THE 'NEW COLD WAR' FRAMING

Bolded Causal Claim: Deep US–China economic interdependence does not reliably pacify rivalry once security externalities and asymmetric vulnerabilities are securitized; instead, interdependence becomes a domain of coercion, producing selective decoupling and a "new cold war" in strategic sectors without full economic separation.

Mechanism: The liberal interdependence tradition, most clearly associated with Keohane and Nye, predicts that dense trade, investment, and production networks raise the cost of conflict and create stakeholders for cooperation. That mechanism operates when economic exchange is politically insulated and when gains are broadly distributed. In the US–China case, however, the same networks created chokepoints: semiconductor equipment, advanced chips, critical minerals, cloud infrastructure, financial messaging, and data flows became instruments of leverage. The mechanism of escalation is not simply tariff retaliation but the conversion of commercial dependence into strategic vulnerability. When Washington perceives that Chinese firms

can access dual-use technologies, it expands export controls, investment screening, and sanctions; when Beijing perceives that supply chains and capital markets can be weaponized, it accelerates self-reliance, stockpiling, and alternative payment systems. The "new cold war" framing, advanced by scholars such as Friedberg, captures a competition that is ideological and systemic rather than merely territorial, yet it differs from the US–Soviet case because the two economies remain deeply intertwined in consumer goods, agriculture, manufacturing, and services. The result is not autarky but bifurcation by sector: continued trade in low-politics goods alongside restriction in high-politics technologies. A second mechanism is domestic political securitization. Bipartisan consensus in Washington increasingly treats economic engagement with China as a source of national-security risk, while Beijing treats US restrictions as evidence of containment and technological suppression. Once economic policy is framed as security policy, the normal bargaining logic of trade—compromise, mutual gain, and institutional dispute settlement—gives way to zero-sum framing, industrial policy, and alliance-based supply-chain restructuring. The "new cold war" is therefore less a description of total separation than a strategic narrative that justifies selective decoupling, friend-shoring, and the politicization of markets.

Scope Conditions: The pacifying version of interdependence is most plausible when exchange is concentrated in non-strategic sectors, when no single node creates asymmetric vulnerability, and when domestic coalitions benefit from continued access. The weaponized version becomes more likely when trade involves dual-use technologies, when one side controls a chokepoint, when security communities dominate economic policymaking, and when both states possess the administrative capacity to enforce controls. The "new cold war" framing is most accurate where competition spans ideology, institutions, and technology; it is less accurate where third countries refuse bloc alignment, where firms reroute trade through intermediaries, or where consumer and producer interests sustain integration despite political tension. It also overstates separation if bilateral trade volumes remain high even as their composition shifts. The framing is weakest as a predictive claim if it assumes inevitable global bifurcation; it is strongest as an analytical claim about the securitization of economic policy.

Observable Implications: The 2018 tariff rounds and the Phase One agreement showed that trade conflict could escalate without ending interdependence. Subsequent US export controls on advanced semiconductors and semiconductor manufacturing equipment, the expansion of the Entity List, investment-screening reforms, and allied coordination on technology controls illustrate the shift from market access to technology denial. China's responses include industrial-policy campaigns, efforts to reduce dependence on foreign chokepoints, and diversification of trade and financial partnerships. Observable indicators include changes in the sectoral composition of US–China trade, relocation of assembly to Vietnam, Mexico, and other intermediaries, increased screening of inbound and outbound investment, and the growth of "friend-shoring" rhetoric in G7 and allied policy. A further implication is that third countries become arenas of competition: they may gain manufacturing investment while facing pressure to align on export controls, data governance, and critical-minerals supply. If the "new cold war" framing is accurate, one should observe persistent restrictions in strategic sectors alongside continued integration in agriculture, energy, and consumer goods; if it is overstated, one should observe rapid corporate adaptation that restores trade through alternative routes without durable political blocs.

Perspective Note (five traditions in brief):

African (primary): From an African vantage point, the "new cold war" framing is not an abstract superpower metaphor but a material risk to development. African economies are exposed to commodity-price volatility, debt distress, inflation, and supply-chain disruption when US–China competition intensifies, yet they also

gain leverage from critical minerals, demographic growth, and the African Continental Free Trade Area. The African perspective, informed by long traditions of analyzing unequal exchange and external dependence, treats bipolar competition as both a danger and an opportunity for multi-alignment: African states can bargain for infrastructure, technology transfer, and market access while resisting pressure to choose a single patron. The occlusion in superpower discourse is that African agency is often reduced to a prize in a contest rather than a set of independent development projects. The strongest African objection to the "new cold war" framing is that it can normalize the subordination of African priorities to great-power rivalry; the strongest contribution is that it highlights how global economic fragmentation raises costs for import-dependent and debt-burdened states.

Chinese: The Chinese perspective generally rejects the "new cold war" framing as a US attempt to contain China's development and to deny the legitimacy of its rise. It emphasizes mutual benefit, development rights, and a "community of shared future," arguing that interdependence should be managed through cooperation rather than securitized decoupling. From this vantage point, US export controls are not neutral security measures but hegemonic efforts to preserve technological dominance. The perspective contributes a critique of Western double standards and a defense of state-led development; it occludes the security concerns of other states about coercion, opacity, and asymmetric dependence.

Russian: The Russian perspective frames US–China economic rivalry as part of a broader transition away from unipolarity and welcomes the erosion of US economic hegemony. It emphasizes multipolarity, anti-hegemonism, and the legitimacy of states resisting Western sanctions and financial dominance. Moscow tends to interpret US technology controls as instruments of imperial power and supports de-dollarization, BRICS expansion, and alternative trade routes. This perspective contributes a systemic critique of Western economic governance; it occludes Russia's own use of economic coercion and the dependence of many states on stable, rules-based trade.

Western: The Western perspective treats economic interdependence with China as a strategic vulnerability requiring "de-risking," not necessarily full decoupling. It emphasizes economic security, resilience, alliance coordination, and the protection of critical technologies. The engagement-to-containment shift reflects a judgment that economic integration did not produce political liberalization and that China's state-capitalist model exploits openness. This perspective contributes serious attention to coercion, intellectual-property theft, and supply-chain risk; it occludes the costs of fragmentation for consumers, firms, and the Global South, and it sometimes conflates commercial competition with existential threat.

UN: The UN perspective approaches economic interdependence through Charter principles, sovereign equality, development rights, and the need for a rules-based multilateral trading system. It warns that weaponized trade, sanctions, and fragmented supply chains disproportionately harm developing countries and undermine the Sustainable Development Goals. From this vantage point, the "new cold war" framing risks legitimizing economic coercion and eroding non-discrimination. The UN contribution is to insist that economic security must be reconciled with global development and legal equality; its occlusion is that it lacks enforcement power when great powers treat trade as security policy.

SECTION 2.6 — KEY IDEA 5: THE DEBATE OVER ENGAGEMENT VERSUS CONTAINMENT, AND THE RISK OF WAR OVER TAIWAN

Bolded Causal Claim: The Taiwan Strait is the most dangerous escalation pathway in US–China rivalry because unresolved sovereignty, military modernization, and alliance commitments convert a political dispute into a deterrence problem; whether Washington's strategy is engagement or containment shapes whether

Beijing perceives restraint or encirclement, but neither strategy eliminates the risk of inadvertent war.

Mechanism: Engagement and containment are not merely policy labels; they imply different causal theories about how rising powers behave. Engagement assumes that economic integration, institutional inclusion, and diplomatic normalization socialize a rising state into the existing order, reducing incentives for revisionism. In the US–China case, this logic underpinned post-Cold War trade expansion, WTO accession, and the expectation that prosperity would produce political liberalization. Containment assumes that power must be balanced, that revisionist states exploit openness, and that deterrence requires alliances, military superiority, and denial of strategic technologies. The mechanism of rivalry is that each strategy can become self-fulfilling: engagement can be read as appeasement if the rising power uses openness to build power; containment can be read as encirclement if the rising power interprets balancing as an attempt to block legitimate development. Taiwan concentrates this dilemma because it sits at the intersection of sovereignty, nationalism, alliance credibility, and military geography. The PRC's anti-secession framework treats Taiwan as an internal matter and warns against formal independence; the United States maintains a "one China" policy, the Taiwan Relations Act, arms sales, and strategic ambiguity about whether it would defend Taiwan. The mechanism of war risk is not simply a decision for invasion but a chain of misperception: gray-zone coercion, military exercises, domestic political signaling, alliance commitments, and the possibility that either side believes it can achieve objectives at acceptable cost. Deterrence by denial requires the defender to convince the attacker that success is impossible; deterrence by punishment requires credible threats of escalation. Both are undermined by uncertainty about US willingness to fight, PLA confidence in rapid fait accompli, and domestic pressures in Taipei, Washington, and Beijing. Escalation can also occur through accidents, cyber operations, space assets, or maritime incidents that outpace crisis management.

Scope Conditions: Engagement is most plausible when the rising power accepts the status quo, when domestic politics permit compromise, and when economic ties create constituencies for restraint. It is least plausible when the rising power seeks to revise territorial or institutional arrangements and when domestic nationalism rewards assertiveness. Containment is most effective when alliances are credible, military balances are favorable, and economic denial is enforceable; it is least effective when it provokes accelerated military buildup, drives the target toward self-reliance, or lacks allied consensus. The risk of war over Taiwan is highest when three conditions coincide: the PLA believes it can achieve a quick fait accompli before US intervention; US domestic politics make ambiguity less credible; and Taiwanese politics move in ways that Beijing interprets as crossing a red line. The risk is lower when crisis-management channels function, when economic interdependence raises the cost of conflict, and when all sides believe that time favors their position without requiring immediate action. Neither engagement nor containment eliminates these conditions; each changes the incentives and perceptions that shape them.

Observable Implications: Indicators of the engagement-versus-containment debate include shifts in US strategy documents, export-control intensity, alliance expansion, and diplomatic language about China as competitor, rival, or threat. Indicators of Taiwan risk include PLA exercises around the island, blockade or quarantine simulations, arms packages, diplomatic visits, cross-strait economic coercion, and changes in Taiwanese defense spending and conscription. Alliance developments such as AUKUS, the Quad, and Japan's defense buildup signal containment; continued trade, climate cooperation, and crisis hotlines signal residual engagement. A useful test is whether military signaling remains bounded and reversible or whether it becomes normalized as a new status quo. If engagement logic dominates, one expects sustained dialogue and managed competition; if containment logic dominates, one expects harder decoupling, expanded deterrence, and more explicit security commitments. The most dangerous observable pattern is not a single crisis but the normalization of high-intensity military activity combined with eroding crisis-management trust.

Perspective Note (five traditions in brief):

African (primary): The African perspective on Taiwan and great-power war begins with the cost of escalation: a conflict in the Taiwan Strait would disrupt global shipping, energy markets, food prices, finance, and development finance, with disproportionate effects on import-dependent and debt-burdened African states. African diplomacy therefore emphasizes non-alignment, peaceful settlement, and the protection of development gains, while also navigating the tension between territorial integrity and self-determination that resonates with African experiences of colonial borders and secessionist conflicts. Multi-alignment allows African states to maintain relations with Beijing, Washington, and Taipei-linked economic networks without endorsing either side's maximal claims. The African contribution is to insist that great-power rivalry must be evaluated by its human and developmental consequences; its occlusion in superpower debate is that African states are treated as peripheral to a crisis that would reshape their economies. The strongest African objection to containment logic is that it can militarize global politics; the strongest objection to engagement logic is that it can excuse coercion against smaller actors.

Chinese: The Chinese perspective treats Taiwan as an internal affair and reunification as a core national interest. It opposes foreign interference, supports the one-China principle, and frames US arms sales and high-level visits as violations of sovereignty and provocations. From this vantage point, deterrence is legitimate defense of territorial integrity, while US strategic ambiguity is destabilizing. The perspective contributes a strong claim about sovereignty and historical grievance; it occludes the preferences of Taiwan's population and the risks that coercion poses to regional stability.

Russian: The Russian perspective generally aligns with China's anti-hegemonic framing and treats US involvement in Taiwan as part of a broader strategy to contain rising powers. It emphasizes multipolarity, sovereignty, and opposition to Western military alliances. Moscow's contribution is to highlight how US alliance expansion can be perceived as encirclement; its occlusion is that it applies sovereignty selectively and underestimates the dangers of normalizing force as a tool of territorial revision.

Western: The Western perspective centers on deterrence, strategic ambiguity, and the defense of a rules-based order. It treats Taiwan as a critical node in semiconductor supply chains and democratic resilience, and it debates whether engagement failed or was never fully tried. Containment advocates emphasize alliances, military readiness, and technology denial; engagement advocates emphasize crisis management, economic costs, and avoiding self-fulfilling prophecy. The perspective contributes serious analysis of credibility and escalation; it occludes the extent to which US policy itself shapes Chinese threat perception and the domestic costs of sustained rivalry.

UN: The UN perspective approaches Taiwan through Charter principles: sovereignty, territorial integrity, non-use of force, and peaceful settlement of disputes. General Assembly Resolution 2758 recognized the People's Republic of China as the sole legitimate representative of China, and the UN system does not treat Taiwan as a member state. At the same time, the UN emphasizes that disputes must be resolved peacefully and that great-power conflict would violate the Charter's collective-security aspirations. The UN contribution is to elevate legal process and human protection over unilateral force; its occlusion is that it cannot enforce restraint when permanent members are directly involved.

SECTION 2.7 — FIVE PERSPECTIVES IN DEPTH

2.7.1 African Perspective (PRIMARY)

The African vantage point on US-China rivalry begins from a position that the other four perspectives systematically under-theorize: the experience of being the terrain on which great-power competition is fought, extracted, and narrated, rather than a party to it. This is not merely an empirical observation about African states' marginalization in great-power diplomacy; it is a theoretical claim about the structure of international order. From the vantage of African political thought, the US-China rivalry is not a dyadic transition between two hegemons but a reconfiguration of a global system whose rules were written during colonialism and whose material flows still run through African bodies, minerals, and debt. The African perspective therefore asks a different question than the other four: not "who will win the transition?" but "what does the transition cost those who did not choose it, and what leverage do they retain?"

The theoretical lineage runs through several distinct traditions. Walter Rodney's *How Europe Underdeveloped Africa* established the foundational claim that African underdevelopment is not a natural condition but a product of structured extraction by external powers; applied to the present, this means that both US and Chinese engagement with Africa must be read against a history in which external powers have consistently converted African resources into their own industrial and military capacity. Kwame Nkrumah's *Neo-Colonialism: The Last Stage of Imperialism* warned that formal independence would be hollowed out by economic control; the contemporary debate about Chinese debt and US conditionality replays this argument with new actors. Julius Nyerere's ujamaa and his insistence on non-alignment provided a practical doctrine: African states should refuse to be conscripted into blocs whose conflicts are not theirs. Amílcar Cabral's emphasis on "return to the source" and on the material basis of culture grounds a skepticism toward both Western liberal universalism and Chinese "community of shared future" rhetoric when either is offered as a substitute for African self-determination. Frantz Fanon's *The Wretched of the Earth* supplies the psychological and political grammar: the colonized are not merely victims but agents whose negotiation reshapes the metropole; applied to US-China rivalry, this suggests African states are not passive arenas but actors whose choices alter the costs of great-power competition.

Contemporary African scholarship sharpens these classical positions. Siba Grovogui's work on international law and sovereignty argues that the international legal order was constructed to manage European empire and that African states encounter it as a structure of subordination; from this angle, both US and Chinese invocations of "rules-based order" or "sovereignty" are strategic vocabularies whose application to Africa is selective. Achille Mbembe's analysis of the postcolony suggests that African populations live under regimes of extraction that precede and exceed any particular great-power rivalry; the US-China competition is thus layered onto existing structures of violence rather than creating them. Jean-François Bayart's "politics of the belly" and his analysis of extraversion describe how African elites have historically profited from mediating external power; this implies that the costs and benefits of US-China rivalry are distributed unevenly within African societies, not borne uniformly by "Africa." Mahmood Mamdani's *Citizen and Subject* and his later work on colonialism highlight how the colonial state's bifurcated structure persists, shaping which African actors can engage great powers and on what terms. Oyèrónkẹ́ Oyěwùmí's decolonial feminism challenges the universalization of Western categories such as "state," "power," and "security," and asks whose knowledge counts in defining the rivalry; Sylvia Tamale's work on African feminism and decoloniality extends this to questions of gendered extraction in mining and infrastructure. In security studies, Kwesi Aning and Kwaku Danso have analyzed how African security architectures navigate great-power competition, emphasizing institutional agency and the limits of external security assistance.

The mechanism through which US-China rivalry affects Africa operates on several channels. First, the economic channel: both powers compete for access to critical minerals—cobalt, lithium, coltan, rare earths—essential to the energy transition and defense industries; this reproduces a classic extractive dynamic in which

African states export raw materials and import finished goods, with value addition occurring elsewhere. Second, the debt and finance channel: Chinese lending through the Belt and Road Initiative and Western-led IMF and World Bank conditionality create competing creditor structures; African states navigate between them, sometimes gaining bargaining space, sometimes facing debt distress and austerity. Third, the security channel: US Africa Command and Chinese security engagement introduce great-power military presence into African conflicts, potentially internationalizing local disputes and constraining African security autonomy. Fourth, the diplomatic channel: competition for votes in the UN General Assembly, recognition of Taiwan, and alignment on human-rights resolutions forces African states into choices that may not serve their interests. Fifth, the narrative channel: both powers frame their engagement in developmental and civilizational terms, which can crowd out African-defined priorities.

The African perspective's distinctive contribution is to reframe the rivalry's stakes. Where Western analysis asks whether China is a revisionist power, African analysis asks how the binary itself—revisionist versus status quo—presupposes a legitimacy for the existing order that African states never consented to. The "rules-based international order" that the US defends was, from this vantage, built on colonial extraction and racial hierarchy; Chinese challenges to it are not automatically liberatory, but the defense of it is not automatically just. This produces a position of "active non-alignment" or "multi-alignment": African states seek to maximize agency by engaging both powers without subordination to either, using the rivalry as leverage for better terms. The African Union's Agenda 2063, the African Continental Free Trade Area, and the push for permanent African seats on the UN Security Council are institutional expressions of this strategy. The perspective also highlights the costs of bipolarity: the Cold War's proxy wars in Angola, Mozambique, Ethiopia, and the Horn of Africa devastated the continent; a "new cold war" risks repeating this pattern, with African states again serving as battlegrounds for others' conflicts.

The African perspective's occlusions are equally important. It can romanticize non-alignment, understating the asymmetry of power that makes genuine equidistance difficult: African states need markets, finance, and security assistance that neither power provides unconditionally. It can treat "Africa" as a unitary actor, obscuring the heterogeneity of fifty-four states with divergent interests, regime types, and relationships to both powers. It can understate African elite agency in choosing alignment for domestic political gain, as Bayart's extraversion suggests. It can also overstate the novelty of great-power competition, since European powers have competed for African resources since the scramble; the US-China rivalry is a new configuration of an old structure. Finally, the perspective risks being so focused on external power that it under-theorizes internal governance failures and the ways African states themselves produce insecurity and extraction. Scope conditions: the African perspective is most illuminating when analyzing resource and debt politics, diplomatic leverage, and the distributional consequences of great-power competition; it is less directly applicable to the military balance in the Taiwan Strait or to nuclear deterrence dynamics, where African states have limited direct stakes. Its strongest counterargument comes from within: Nyerere's non-alignment worked partly because the Cold War's ideological stakes were clearer; today's rivalry is more economic and technological, and African states' dependence on both US and Chinese markets makes pure non-alignment harder to sustain.

2.7.2 Chinese Perspective

The Chinese perspective on US-China rivalry is structured by a rejection of the premise that the rivalry is a power transition in the Western sense. Chinese official discourse and much Chinese IR scholarship insist that China's rise is peaceful, that the "Thucydides Trap" is not inevitable, and that the proper frame is not competition between two hegemons but the emergence of a multipolar "community of shared future

for mankind." This is not merely propaganda; it reflects distinct theoretical traditions in Chinese IR that challenge Western realism's assumptions.

Qin Yaqing's relational theory of world politics argues that the Western IR canon is built on an ontology of atomistic, self-interested actors, whereas Chinese thought emphasizes relationality: actors are constituted by their relationships, and order emerges from the cultivation of harmonious relations rather than from the balance of power. Applied to US-China rivalry, this means the relationship is not a zero-sum transition but a dynamic that can be managed through mutual accommodation and relational governance. Yan Xuetong's "moral realism" offers a different Chinese account: international order is shaped by the moral quality of leadership, and China's rise can be stabilizing if it provides moral leadership rather than pursuing hegemony. Yan is more realist than Qin—he accepts that power transitions occur and that states pursue interests—but he argues that the moral basis of leadership determines whether transitions are peaceful or violent. Zhao Tingyang's "tianxia" (all-under-heaven) system proposes a cosmopolitan world order in which no single state is hegemon and all are included in a shared political community; this is explicitly offered as an alternative to the Westphalian state system and to US unipolarity.

The mechanism of Chinese engagement is framed as "win-win cooperation": infrastructure investment, trade integration, and diplomatic multilateralism through BRICS, the Shanghai Cooperation Organisation, and the Asian Infrastructure Investment Bank create mutual benefit rather than zero-sum extraction. The Chinese perspective emphasizes that China does not seek to replace the US as global hegemon but to democratize international governance, giving developing countries greater voice. The "no Thucydides Trap" argument, articulated by Xi Jinping and echoed in Chinese scholarship, holds that the trap is a Western projection: conflict is not structurally determined by power shifts but results from misperception and hostile policy, particularly US containment.

The Chinese perspective's contribution is to challenge the inevitability thesis and to offer alternative vocabularies for order. Its occlusions are significant. It tends to understate the coercive dimensions of Chinese power: the militarization of the South China Sea, economic coercion against Australia and Lithuania, and the opacity of Belt and Road debt. It treats "win-win" as descriptive rather than aspirational. It underplays the security dilemma that Chinese military modernization creates for neighbors, including those who do not seek US alignment. And it can conflate the Chinese state's interests with those of "the Chinese people" or "the developing world," obscuring internal diversity and dissent. The perspective also struggles to account for why so many states, including in Africa and Southeast Asia, seek US security guarantees despite Chinese economic engagement: if the relationship were truly win-win, balancing would be unnecessary.

2.7.3 Russian Perspective

The Russian perspective on US-China rivalry is shaped by Russia's own confrontation with the West and its strategic partnership with China. Russian IR and official discourse frame the rivalry as the terminal crisis of US unipolarity and the emergence of a multipolar order in which Russia and China are co-architects. The core claim is anti-hegemonic: the US-led order is illegitimate not because of its values but because of its unilateralism, and its decline creates space for sovereign equality and civilizational diversity.

The theoretical lineage includes Russian Eurasianism, which posits Russia as a distinct civilization bridging Europe and Asia, and the realist tradition of Primakov's "multipolar world" concept from the 1990s, which argued that Russia should pursue strategic partnerships with China and India to counterbalance US dominance. Contemporary Russian scholarship frames the US-China rivalry as evidence of the "end of the American century" and the rise of a "post-Western" world. The Russian perspective shares with the Chinese

a rejection of the Thucydides Trap framing as Western-centric, but adds a distinctive emphasis on NATO expansion and US military interventionism as the primary sources of global instability.

The mechanism of Russian strategy is "strategic partnership without alliance": deepening economic, military, and diplomatic coordination with China while preserving formal autonomy. This includes energy deals, joint military exercises, coordination in the UN Security Council, and shared opposition to US sanctions. Russia's own confrontation with the West over Ukraine has accelerated this alignment, making Russia increasingly dependent on China economically and diplomatically.

The Russian perspective's contribution is to highlight the role of US policy in generating rivalry: NATO expansion, regime change operations, and the weaponization of the dollar and financial system are presented as provocations that made US-China confrontation inevitable. It also draws attention to the hypocrisy of Western "rules-based order" rhetoric given US violations of sovereignty in Iraq and Libya. Its occlusions are severe. It systematically understates Russian agency in generating insecurity, including the invasion of Ukraine and interference in neighboring states. It overstates the coherence and durability of the China-Russia partnership, which is asymmetric—China is the senior partner economically—and rests on convergent opposition to the US rather than a shared positive vision. It ignores the agency of smaller states, including in Central Asia and the Caucasus, who may not welcome a Sino-Russian condominium. And it treats multipolarity as inherently desirable without examining whether a multipolar world with weak institutions might be more conflict-prone than the unipolar moment it replaces. The perspective also cannot easily explain why states that share Russia's anti-hegemonic rhetoric nonetheless seek Western security guarantees and investment.

2.7.4 Western Perspective

The Western perspective on US-China rivalry is the most institutionally powerful and the most theoretically diverse. It spans a spectrum from engagement to containment, but converges on several premises: that the post-1945 liberal order is worth defending, that China's rise poses a systemic challenge to that order, and that US leadership remains indispensable to managing the transition. The perspective is not monolithic; it contains internal debates that are themselves part of the policy landscape.

The theoretical lineage includes offensive realism (Mearsheimer 2001, 2014), which predicts that China's growth will produce hegemonic ambition in Asia and inevitable conflict with the US; liberal internationalism, which emphasizes institutions, interdependence, and democratic peace; and constructivism, which examines how identities and norms shape the rivalry. Power transition theory (Organski 1958) provides the structural frame: a rising power approaches parity with the dominant power, and war becomes likely if the rising power is dissatisfied with the status quo. Allison's "Thucydides Trap" (2017) popularized this for policy audiences. Friedberg (2018) argued that the US must prepare for long-term competition and that engagement had failed to produce a liberal China.

The mechanism of Western strategy has shifted over time. The engagement era assumed that economic integration would liberalize China; the post-2017 consensus treats China as a "strategic competitor" requiring "managed competition." Instruments include tariffs and export controls on semiconductors and AI chips, alliance reinforcement through AUKUS and the Quad, and technology decoupling. The Western perspective's contribution is to identify the specific mechanisms of Chinese revisionism—military modernization, economic coercion, technology theft, human-rights abuses—and to mobilize collective action through alliances.

The Western perspective's occlusions mirror those of its rivals. It can overstate Chinese revisionism, treating

defensive Chinese behavior as inherently aggressive. It can understate US agency in generating the security dilemma: US forward deployment, Taiwan arms sales, and technology controls are themselves perceived as threats in Beijing. It universalizes Western interests as "international" interests, conflating the defense of US primacy with the defense of global order. It can treat the liberal order as more consensual and beneficial than many Global South states experience it. And the engagement-versus-containment debate reveals an internal tension: if engagement failed, was the failure inherent to the strategy or to its implementation? Mearsheimer would say engagement was always naive; liberals argue it was undermined by Chinese political closure and US inattention. The perspective also struggles with the Taiwan question: deterrence requires ambiguity, but ambiguity increases risk of miscalculation.

2.7.5 UN Perspective

The UN perspective approaches US-China rivalry through the lens of Charter principles: sovereign equality, non-use of force, peaceful settlement of disputes, and collective security. The UN system does not recognize Taiwan as a member state (General Assembly Resolution 2758, 1971), and the PRC holds the China seat on the Security Council. The UN's contribution is to elevate legal process and human protection above unilateral force, and to provide forums—General Assembly, Security Council, specialized agencies—where rivalry can be managed multilaterally.

The mechanism of UN engagement is institutional: the Security Council can authorize collective action, though P5 veto power limits this when permanent members are involved; the General Assembly provides a platform for norm-setting and coalition-building; and specialized agencies manage functional cooperation that can survive political rivalry. The UN also provides humanitarian and development frameworks that address the consequences of great-power competition for vulnerable populations.

The UN perspective's contribution is to insist that US-China rivalry is not merely a bilateral or systemic issue but a threat to the collective security architecture established in 1945. It highlights the risk that great-power conflict would violate the Charter's core purposes and cause catastrophic harm, particularly to non-combatant populations. It also provides a legal framework for Taiwan: the UN position is that Taiwan is not a sovereign state and that any change in status must be peaceful and consensual, not imposed by force.

The UN perspective's occlusions are structural. The organization cannot enforce restraint when permanent members are directly involved; the veto ensures that the Security Council is paralyzed on issues touching US or Chinese core interests. The UN's legal formalism can obscure power asymmetries: General Assembly resolutions are non-binding, and the "international community" often means Western-led coalitions. The UN also struggles to adapt to a world where two permanent members are strategic rivals; the Charter assumed great-power concert, not sustained rivalry. Finally, the UN perspective can be overly state-centric, underweighting non-state actors, civil society, and the transnational dimensions of the rivalry—technology, climate, pandemics—that fall outside traditional security frameworks. The UN's strength, its universal membership and legal authority, is also its weakness: it can articulate norms but cannot compel compliance from the powerful.

SECTION 2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Reveals the costs of bipolar competition for non-aligned states and the agency of multi-alignment; frames the rivalry as a structural constraint on African industrialization and sovereignty	Can underweight the agency of African elites who actively leverage rivalry for bargaining power; risks homogenizing a diverse continent	Multipolarity as justice: no single power should monopolize rule-making; African states have the right to choose partners without coercion	AU Agenda 2063; African Continental Free Trade Area (AfCFTA); votes at UNGA on Ukraine and Taiwan that split along interest lines rather than bloc lines	Western: multi-alignment can free-ride on security guarantees; Chinese: African agency is overstated by a continent still dependent on external finance
Chinese	Offers a relational, process-based alternative to Western atomistic IR; "community of shared future" reframes order as cooperative rather than competitive	Obscures the coercive dimensions of Chinese economic statecraft and the asymmetry of the Belt and Road; treats US containment as exogenous rather than partly reactive	Harmony through hierarchy: a moral order led by a virtuous center, with multipolarity as the path to shared prosperity	BRI scale; RCEP; Global Development Initiative; diplomatic framing that "there is no Thucydides Trap"	Western: relationalism masks power asymmetry; African: "community of shared future" can reproduce dependency

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Russian	Names unipolarity as the core grievance and frames multipolarity as democratization of international order; exposes double standards in Western liberal order	Romanticizes multipolarity; underweights Russian coercion in its near abroad; treats US decline as inevitable rather than contingent	Anti-hegemonism: any concentration of power is illegitimate; sovereignty is absolute and non-intervention is paramount	BRICS expansion; SCO; UN voting coalitions; rhetoric at Valdai and BRICS summits	Western: anti-hegemonism is instrumental, masking Russian imperial ambition; UN: sovereignty absolutism paralyzes collective security
Western	Provides the most developed theoretical toolkit (power transition, security dilemma, offensive realism); generates testable predictions about conflict risk	Can reify US primacy as natural; tends to treat Chinese rise as exogenous threat rather than partly endogenous to US policy; underweights non-Western agency	Liberal international order: rules-based, open, democratic; US leadership as stabilizing public good	NATO expansion of partnerships; AUKUS; CHIPS Act; alliance network in Indo-Pacific	African: order is not neutral but hegemonic; Chinese: "rules-based order" means US rules

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
UN	Supplies universal legal vocabulary (Charter, sovereignty, non-use of force) and a forum for articulating shared norms; keeps Taiwan and great-power conflict on the agenda	Legal formalism obscures power asymmetry; state-centrism underweights transnational dimensions (tech, climate, pandemics); paralyzed when P5 interests collide	Charter universalism: sovereignty, non-intervention, peaceful settlement of disputes; no legitimate use of force except self-defense or Security Council authorization	UNGA resolutions; ICJ advisory opinions; Secretary-General statements on Taiwan Strait tensions	Western: UN cannot compel compliance from great powers; African: UN structures (Security Council) reproduce colonial-era power

---

SECTION 2.8 WORKED EXAMPLE (I do)

Case: The 2018–2024 US–China Trade and Technology War — From Tariffs to Export Controls

Levels of analysis

Individual. The trade and technology war cannot be reduced to structural forces alone; individual leaders and their cognitive frames mattered. Donald Trump's mercantilist worldview and his conviction that trade deficits signal national weakness reframed China from a partner to be engaged into a competitor to be confronted. Joe Biden retained and deepened the confrontation, suggesting the shift was not merely personal but had acquired bureaucratic and political momentum. On the Chinese side, Xi Jinping's consolidation of authority and his "Made in China 2025" industrial policy signaled an ambition to climb the value chain that US policymakers read as a direct challenge to American technological primacy. Individual agency here operated within structural constraints: neither leader invented the rivalry, but each accelerated it through specific decisions—tariff schedules, entity-list designations, executive orders on investment screening.

State. At the state level, the conflict is a contest between two political economies with incompatible development models. The United States, responding to domestic deindustrialization and the political backlash against globalization, deployed Section 301 tariffs, export controls, and industrial policy (the CHIPS and Science Act of 2022) to rebuild domestic capacity and deny China access to advanced semiconductors. China responded with retaliatory tariffs, rare-earth export restrictions, and accelerated indigenous innovation programs. Each state's policy was shaped by its internal coalition politics: US measures drew support from both labor and national-security constituencies, while Chinese measures were framed as defending sovereignty and development rights. The state level reveals that the "war" was not a single event but a sequence of

policy instruments—tariffs, then entity lists, then comprehensive export controls, then outbound investment screening—each expanding the scope of decoupling.

Systemic. Systemically, the trade and technology war is an instance of power-transition dynamics: a rising power (China) approaching parity with a hegemon (the United States) in economic and technological capacity, triggering defensive measures by the incumbent. Offensive realism predicts that the hegemon will seek to prevent the challenger from translating economic power into military capability, which is precisely what the October 2022 semiconductor export controls attempted—denying China the advanced chips needed for artificial intelligence and military modernization. Power transition theory (Organski, Kugler) adds that the danger is greatest when the challenger is dissatisfied with the existing order; here, US policymakers increasingly read China's industrial policy as evidence of such dissatisfaction. The systemic frame also captures the alliance dimension: the United States sought to multilateralize controls through the Wassenaar Arrangement and coordination with Japan and the Netherlands, while China deepened ties with Russia and the Global South.

Transnational. The transnational level is where the war's most consequential effects appear. Global supply chains—Taiwan Semiconductor Manufacturing Company (TSMC), ASML in the Netherlands, Samsung in South Korea—meant that US export controls rippled through third countries, forcing firms and governments to choose between US market access and Chinese market access. Technology standards (5G, AI governance, quantum encryption) became arenas of competition with global spillovers. Diaspora scientists, academic collaborations, and cross-border investment flows were disrupted. The transnational level also includes the ideological and narrative competition: the "new cold war" framing itself became a transnational discourse shaping how states, firms, and publics understood the rivalry, with consequences for investment, migration, and scientific cooperation.

Mechanism

The core mechanism is a *security dilemma operating through economic interdependence*. Under conditions of deep integration, measures taken by one state to reduce vulnerability (export controls, reshoring, friend-shoring) are read by the other as hostile intent, triggering countermeasures that deepen the spiral. The mechanism has three stages. First, *threat perception*: US policymakers came to view Chinese technological advancement not as benign development but as a security threat, especially after the Made in China 2025 plan and the fusion of military and civilian technology under Xi. Second, *instrumental escalation*: the United States moved from tariffs (2018) to targeted technology denial (2019–2020) to comprehensive semiconductor controls (2022) to outbound investment screening (2023), each step expanding the domain of confrontation. Third, *structural decoupling*: even where full decoupling did not occur, the expectation of future restrictions drove firms to diversify supply chains, creating a self-fulfilling fragmentation of the global economy. The mechanism is reinforced by domestic politics: in both countries, hawkish constituencies gained influence, making de-escalation politically costly. The result is not a clean break but a "small yard, high fence" regime—targeted denial in critical technologies alongside continued trade in non-strategic goods.

Perspective reconstruction

African (primary). From an African vantage point, the trade and technology war is not primarily a US–China story; it is a shock to the global trading system on which African development depends. The African perspective, drawing on Rodney's analysis of how external powers structure peripheral economies, sees the rivalry as accelerating the fragmentation of global value chains in ways that can either harm or benefit African indus-

trialization. On one hand, decoupling raises costs for African importers of technology and reduces demand for African commodities tied to Chinese manufacturing. On the other hand, "China Plus One" strategies and the search for alternative supply-chain nodes create openings for African economies—Morocco's automotive sector, Ethiopia's industrial parks, South Africa's mineral processing—to capture relocated investment. African states have responded with multi-alignment: maintaining ties with both Washington and Beijing while asserting sovereignty over critical minerals (cobalt, lithium, rare earths) through resource nationalism. The African perspective also highlights what Western and Chinese accounts occlude: the war's costs are borne disproportionately by the Global South, which has no voice in setting the rules of decoupling. Bayart's "politics of the belly" reminds us that African elites may extract rents from the rivalry, but the structural position of African economies remains subordinate. The African contribution is to reframe the war not as a bilateral power transition but as a reordering of global capitalism whose distributional consequences fall hardest on those least responsible for it.

Chinese. The Chinese perspective frames the trade and technology war as a US attempt to contain China's legitimate development, violating the principles of free trade and technological openness that the United States itself championed. From this view, tariffs and export controls are not defensive measures but offensive acts of hegemonic preservation, driven by anxiety about China's rise rather than by genuine security threats. Qin Yaqing's relational theory suggests that the US approach—atomistic, zero-sum, treating China as an adversary to be contained—reflects a Western ontology ill-suited to an interdependent world. Yan Xuetong's moral realism would judge US policy as lacking the moral authority of a legitimate hegemon, since it prioritizes narrow self-interest over the common good. Zhao Tingyang's "community of shared future" offers the normative alternative: a world order in which technological development is shared rather than weaponized. The Chinese perspective emphasizes that the war has accelerated indigenous innovation—Huawei's 7nm chip, the push for semiconductor self-sufficiency—and has strengthened China's resolve to reduce dependence on US technology.

Russian. The Russian perspective reads the trade and technology war as confirmation that unipolarity is over and that the United States is lashing out to preserve a fading hegemony. From Moscow's vantage point, US sanctions and export controls against China mirror those applied to Russia, revealing a pattern of economic coercion against any state that challenges Western dominance. The war is evidence that multipolarity is not a choice but a fact, and that the US-led order is fragmenting under the weight of its own contradictions. Russia's interest lies in deepening its partnership with China—energy, technology, military—while positioning itself as a pole in an emerging multipolar order. The Russian perspective underweights the costs of this alignment for China and overstates the coherence of an anti-Western bloc.

Western. The Western perspective, drawing on Friedberg and Mearsheimer, treats the trade and technology war as a necessary and overdue correction to a failed engagement strategy. From this view, decades of economic integration did not liberalize China; instead, they funded its military modernization and technological catch-up. The war is thus a defensive adjustment: tariffs address unfair trade practices, and export controls prevent the transfer of militarily relevant technology to a strategic competitor. The Western perspective emphasizes that the measures are targeted ("small yard, high fence") rather than blanket decoupling, and that they are coordinated with allies to preserve the liberal order's technological edge. It occludes the extent to which US policy is driven by domestic political economy—protectionist constituencies, techno-nationalism—and the possibility that containment may accelerate the very Chinese self-sufficiency it seeks to prevent.

UN. The UN perspective frames the trade and technology war as a challenge to the multilateral trading system

and to the principles of non-discrimination and peaceful economic cooperation enshrined in the Charter and the WTO. From this view, unilateral tariffs and export controls undermine the rules-based order and risk fragmenting the global economy into competing blocs. The UN emphasizes the need for dialogue, dispute settlement through the WTO, and the avoidance of measures that could escalate into broader conflict. The UN perspective occludes the power asymmetries that make multilateral rules ineffective when great powers choose to bypass them, and it struggles to address the security dimensions of technology competition that fall outside traditional trade frameworks.

Explicit adjudication

The Western perspective best explains the *initiation* of the trade and technology war: the shift from engagement to containment was driven by a reassessment of China's trajectory, grounded in power-transition logic and the recognition that economic interdependence had not produced political convergence. The mechanism of instrumental escalation—tariffs to entity lists to comprehensive controls—fits the Western narrative of a defensive adjustment to a rising challenger. However, the Western perspective misses the *transnational and distributional* dimensions that the African perspective captures: the war's costs fall on third parties, and the "small yard, high fence" framing understates the breadth of decoupling's spillovers. The Chinese perspective correctly identifies the coercive character of US measures but underweights the security concerns that motivated them and the degree to which Chinese industrial policy was itself a driver of US threat perception. The systemic frame (power transition) explains why the rivalry intensified when it did, but it cannot explain the specific instrument choices—why semiconductors rather than, say, pharmaceuticals—without reference to the transnational supply-chain structure and domestic political coalitions. The most complete explanation combines the systemic (power transition creating the conditions), the state (policy instruments shaped by domestic politics), and the transnational (supply-chain interdependence determining which technologies became flashpoints). The African perspective does not explain the war's origins but provides the essential corrective: any account that treats the US–China dyad as the whole story misses the global distributional consequences and the agency of states caught between the two powers. No single perspective is sufficient; the Western frame explains the trigger, the systemic frame explains the timing, and the transnational frame explains the mechanism's reach.

SECTION 2.9 PROBLEM PAIR (We do)

Task 1 — Level of analysis. At which level or levels (individual, state, systemic, transnational) does the Taiwan flashpoint most plausibly operate, and why does the dominant level change depending on whether one is explaining the 1995–96 crisis, the 2022 Pelosi visit, or a hypothetical 2027 blockade?

Task 2 — Power-transition reading. Using Organski and Kugler's power-transition logic and Allison's Thucydides Trap, reconstruct the argument that Taiwan is the most likely trigger for a US–China war. What exactly is the "trap" mechanism, and where does credibility enter?

Task 3 — Security-dilemma reading. Using Mearsheimer's offensive realism, explain how Taiwan functions as the intervening variable that converts abstract systemic rivalry into concrete military planning, and how US commitments and Chinese countermeasures feed each other.

Task 4 — Chinese relational and moral-realist reading. How would Yan Xuetong's moral realism, Qin Yaqing's relational theory, and Zhao Tingyang's *tianxia* frame Taiwan differently from the Western power-transition account? What do they assume about anarchy, intentions, and recognition?

Task 5 — Occlusion and adjudication. What does each of the three readings occlude? On the available evidence (military exercises, diplomatic statements, economic integration, Taiwan's own agency), which reading has the strongest support and which the weakest?

Task 6 — Falsifiers. Specify two pieces of evidence that, if observed by 2030, would weaken the power-transition reading and two that would weaken the security-dilemma reading.

MODEL ANSWER (continuous prose). The Taiwan flashpoint is best analyzed as a multi-level phenomenon whose dominant causal register shifts with the time horizon. At the systemic level, the flashpoint is a power-transition problem: Taiwan sits at the intersection of a rising China's claim to territorial integrity and a declining hegemon's commitment to a status-quo order. Organski's original formulation held that war is most likely when a challenger approaches parity with the dominant power and is dissatisfied with the existing order; Allison's popularization of the "Thucydides Trap" adds the psychological mechanism that the established power's fear of decline and the rising power's demand for recognition compress decision time and magnify misperception. On this reading, Taiwan is dangerous not because of its intrinsic value but because it is the one issue on which both sides have staked credibility: Beijing's "core interest" framing and Washington's strategic ambiguity each make retreat domestically costly, so the bargaining space narrows as the power gap narrows.

At the state level, Mearsheimer's offensive realism supplies a different mechanism: the security dilemma. Because states cannot know others' intentions and must maximize relative power to survive, China's military modernization — including anti-access and area-denial capabilities around Taiwan — is read in Washington as preparation for coercion, while US arms sales, freedom-of-navigation operations, and alliance tightening are read in Beijing as containment. The result is a self-fulfilling spiral in which defensive measures are indistinguishable from offensive ones. Taiwan functions here as the intervening variable that converts abstract systemic rivalry into concrete military planning: exercises, blockades, and gray-zone pressure become the currency of competition.

The Chinese relational and moral-realist accounts reframe the same facts. Yan Xuetong argues that moral leadership, not material power alone, determines whether a rising state can replace the hegemon; on this view, China's Taiwan policy is judged by whether it demonstrates humane authority rather than mere dominance. Qin Yaqing's relational theory treats the Taiwan issue as embedded in a web of relationships — cross-strait, Sino-US, and regional — whose stability depends on mutual recognition and face-saving rather than on balance-of-power calculations. Zhao Tingyang's *tianxia* reframes the entire problem: the goal is not victory in a bilateral rivalry but the construction of an all-under-heaven order in which Taiwan's status is resolved within a shared civilizational framework rather than through zero-sum competition. These accounts occlude the security-dilemma logic by assuming that intentions can be signaled and read, and they occlude power-transition logic by denying that the system is necessarily anarchic.

Each reading occludes something. The power-transition reading occludes the degree of economic integration that raises the cost of war for both sides and the agency of Taiwan itself, which is not a passive object of great-power bargaining. The security-dilemma reading occludes the possibility that at least some Chinese behavior is driven by status and identity rather than by security maximization, and it risks treating all US policy as reactive. The Chinese readings occlude the coercive dimension of Beijing's military signaling and the genuine security fears of smaller states. Adjudicating on the evidence: the 2022 Pelosi visit and subsequent PLA exercises showed that signaling and misperception operate powerfully, supporting the security-dilemma reading; the long-term growth of China's naval and missile capabilities supports the power-transition reading's material premise; but the absence of a war despite repeated crises supports the relational reading's claim

that dense interaction and mutual interest in stability can manage, if not resolve, the rivalry. The weakest reading on current evidence is strong Thucydides-Trap determinism, which treats war as structurally likely; the historical base rate of power transitions ending in war is lower than Allison's framing suggests, and both sides have strong incentives to avoid direct conflict.

Falsifiers: the power-transition reading would be weakened by a sustained Chinese economic slowdown that removes parity pressure, or by a durable US–China agreement on Taiwan's status. The security-dilemma reading would be weakened by transparent, verifiable military confidence-building measures that both sides implement and sustain, or by a Chinese decision to unilaterally reduce military exercises without reciprocal US concessions. Conversely, a Chinese blockade rehearsal combined with US non-response would strengthen the power-transition reading, while a spiral of reciprocal sanctions and military deployments would strengthen the security-dilemma reading.

SECTION 2.10 INDEPENDENT MEMO (You do)

(a) Case description. In May 2024, the United States raised tariffs to 100 percent on Chinese electric vehicles, 25 percent on lithium-ion EV batteries, and 50 percent on solar cells, while extending export controls on advanced semiconductors and AI model weights. China responded with anti-dumping investigations into European pork and brandy, tightened export licensing for gallium, germanium, and graphite, and accelerated subsidies for domestic chip fabrication. Several African and Southeast Asian governments announced they would not enforce either bloc's trade measures, positioning themselves as transshipment and assembly hubs; the African Continental Free Trade Area secretariat warned that "bipolar trade fragmentation" threatened industrialization plans. Meanwhile, Taiwan's TSMC continued to dominate leading-edge foundry capacity, and both Washington and Beijing intensified diplomatic competition over Pacific Island states' recognition of Taiwan versus the PRC. The episode raised the question of whether economic interdependence is still a brake on conflict or has become a weapon.

(b) Required memo headings (respond to each as a prompt).

- **Mechanism:** Identify the causal mechanism linking the 2024 tariff and export-control escalation to (i) the power-transition dynamic, (ii) the security dilemma, and (iii) the interdependence-as-weapon thesis. Specify which level of analysis each mechanism operates at and what would have to be true for the mechanism to fail.
- **Perspective reconstruction:** Reconstruct how an African, Chinese, Russian, Western, and UN analyst would each explain the same 2024 episode, steel-manning each from within. Identify the one thing each perspective sees that the others miss and the one thing each occludes.
- **Historical analogue:** Select one historical case (e.g., Anglo-German trade rivalry pre-1914, US-Japan semiconductor friction 1980s, or Cold War COCOM controls) and specify the respects in which it is and is not analogous. State the limits of the analogy explicitly.
- **Falsifiers:** List three observable developments by 2027 that would falsify your central claim, and state which of your mechanisms each would most directly test.

(c) Self-check. Before submitting, verify that you have distinguished description (what happened), explanation (why it happened), prediction (what will happen next), and prescription (what should be done), and that no single sentence conflates two of these.

SECTION 2.11 HINGE QUESTION

Question. In the US–China case, which statement best distinguishes the causal mechanism of Organski's power-transition theory from that of Mearsheimer's offensive realism?

A. Power-transition theory locates the danger in the challenger's dissatisfaction with the existing order as it approaches parity; offensive realism locates it in the structural impossibility of knowing intentions, which drives all great powers to seek hegemony.

B. Power-transition theory predicts war only when the challenger is weaker than the dominant power; offensive realism predicts war only when the two powers are roughly equal.

C. Power-transition theory is a liberal theory of interdependence; offensive realism is a constructivist theory of identity.

D. Both theories predict that economic interdependence prevents war, but they disagree on whether international institutions matter.

Correct answer: A.

Distractor diagnosis.

- **B** misstates both theories' scope conditions. Organski's danger zone is the approach to parity, not weakness; Mearsheimer's security dilemma operates across power distributions, not only at equality. A student choosing B has confused "parity" with "equality of outcome" and treated offensive realism as a balance-of-power threshold theory.
- **C** misclassifies both traditions. Power-transition theory is a realist theory of hierarchy and dissatisfaction, not liberal interdependence; offensive realism is structural realism, not constructivism. A student choosing C is importing paradigm labels without matching them to the theories' actual premises.
- **D** attributes to both theories a liberal claim neither makes. Neither Organski nor Mearsheimer treats interdependence as a reliable brake on war; both are skeptical of institutional and economic pacification. A student choosing D has projected liberal institutionalism onto realist frameworks.

SECTION 2A — DATA LAB

Data sources and caveats. The tables below assemble publicly available indicators from the World Bank (GDP), SIPRI (military expenditure), the US Census Bureau and UN Comtrade (bilateral trade), and the US Bureau of Industry and Security (BIS) entity-list and export-control actions. All figures are approximate and rounded; Chinese military spending is reported at official budget levels, while independent estimates (SIPRI) run higher and are used here. GDP in purchasing-power-parity (PPP) terms and in nominal (market-exchange-rate) terms measure different things: PPP captures domestic productive capacity and living standards, while nominal GDP captures international purchasing power, debt-servicing capacity, and the scale of cross-border transactions. Both matter for power-transition analysis, and they tell different stories about the US–China gap. Technology-control coverage is measured by cumulative entity-list designations and by the scope of controlled items, not by a single scalar; the table therefore reports directional thresholds rather than precise counts.

Table 1 — Aggregate power indicators, United States and China, 2000–2024 (approximate)

Year	US nominal GDP (USD trn)	China nominal GDP (USD trn)	US GDP PPP (USD trn)	China GDP PPP (USD trn)	US military spending (USD bn)	China military spending (USD bn, SIPRI est.)
2000	10.3	1.2	10.3	3.7	295	22
2005	13.1	2.3	13.1	5.9	495	63
2010	14.9	6.1	14.9	13.9	698	114
2015	18.2	11.1	18.2	20.0	596	215
2018	20.6	13.9	20.6	25.4	649	250
2022	25.5	17.9	25.5	30.3	877	292
2024 (est.)	28.8	18.5	28.8	33.0	916	314

Sources: World Bank World Development Indicators (GDP); SIPRI Military Expenditure Database. Figures rounded to one decimal for GDP and nearest billion for military spending.

Table 2 — Bilateral economic interdependence and technology controls, 2017–2024 (approximate)

Indicator	2017	2020	2022	2024 (est.)
US goods imports from China (USD bn)	505	435	536	427
US goods exports to China (USD bn)	130	124	154	148
Bilateral goods trade total (USD bn)	635	559	690	575
US goods trade deficit with China (USD bn)	375	311	382	279
Cumulative China-linked BIS Entity List designations	~100	~300	~600	~900+
Semiconductor export-control regime	minimal	partial (Huawei 2020)	Oct. 2022 rules	expanded 2023–24

Sources: US Census Bureau, Foreign Trade Division; BIS Entity List and October 7, 2022 interim final rule; subsequent BIS updates through 2024.

Table 3 — Structural chokepoints in US–China technology interdependence (approximate shares)

Chokepoint	Dominant actor	Approx. share	Source
Advanced logic fabrication (<7 nm)	Taiwan (TSMC)	~90%	Industry estimates
Electronic design automation (EDA) tools	US firms	~75–80%	SIA / industry
Rare-earth processing and refining	China	~90%	USGS / IEA
Lithium-ion battery cell production	China	~75%	BloombergNEF
US–China science co-publications (annual)	bilateral	~50,000+ (declining post-2019)	NSF / Scopus
Global fabless semiconductor design	US firms	~50%	SIA

Five numbered analysis questions

1. **Trend.** Describe the trajectory of the US–China power gap between 2000 and 2024 using both nominal and PPP GDP, and then compare it with the trajectory of military spending. Does the gap close faster in economic or in military terms, and what does that imply for Organski's claim that power transitions occur when the challenger's power approaches the dominant state's? Note specifically the 2015–2022 period, when Chinese nominal growth slowed while PPP estimates continued to rise.

2. **Level of analysis.** The October 2022 semiconductor export controls and the cumulative entity-list designations are state actions, but they operate through firm-level supply chains, individual researchers, and transnational production networks. At which level of analysis — individual, state, systemic, or transnational — is the technology war best explained, and why does the choice of level change the predicted outcome? Consider whether a systemic-level reading (bipolar competition) predicts decoupling, while a transnational-level reading (interdependence) predicts managed friction.

3. **Perspective reconstruction (all five).** Reconstruct how each of the five perspectives reads Tables 1–3. The African perspective should foreground the costs of bipolar competition for development finance and the opportunities of multi-alignment; the Chinese perspective should read the data as evidence of legitimate catch-up and of US containment; the Russian perspective should read it as confirmation of multipolarity and of anti-hegemonic opportunity; the Western perspective should read it as evidence of strategic rivalry requiring managed competition; the UN perspective should read it as a test of Charter principles and of the risk of great-power conflict. Which perspective best explains the 2022–2024 decline in bilateral trade alongside rising entity-list designations?

4. **Interpretation.** Does the data support the "new cold war" framing, or does it support the "deep interdependence" framing? Use the trade totals, the deficit trajectory, and the chokepoint table to adjudicate. Specify what evidence would falsify each framing: for example, a sustained fall in bilateral trade below USD 300 bn with no substitution would support decoupling, while stable or rising trade alongside expanding controls would support managed interdependence.

5. **Limitation.** Identify three data limitations that could reverse or qualify your conclusions. At minimum, address (a) the gap between official and estimated Chinese military spending, (b) the difference

between nominal and PPP GDP for assessing international power, and (c) the absence of reliable data on technology-control evasion, smuggling, and third-country transshipment. Explain how each limitation biases the analysis toward either alarmism or complacency.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — The power-transition curve (Organski) with a Thucydides overlay.

What to draw. On a large sheet, draw two horizontal axes: the vertical axis labelled "Relative power (index, 1990 = 100)" and the horizontal axis labelled "Year, 1990–2040." Plot two smooth curves: a solid line for the United States that rises gently to a plateau around 2010 and then flattens or slightly declines; a dashed line for China that starts far below in 1990, crosses the US line somewhere between 2025 and 2035 (draw the crossing as a shaded band, not a single point, to signal uncertainty), and continues rising. Shade the band where the two curves are within 10–15 percent of each other in dark grey and label it "Danger zone / power-transition band." Add a vertical dashed line at the crossing labelled "Transition point (contested)."

Labels to place. Label the US curve "Dominant power (status quo)," the China curve "Challenger (rising power)," and annotate three historical markers along the x-axis: 2001 (WTO accession), 2018 (trade war begins), 2022 (semiconductor controls). Add a small box in the corner titled "Organski mechanism: challenger grows faster → power gap narrows → war risk peaks during transition, not after."

Perspective overlay to annotate. In the upper-left margin, write "Western reading (Allison): Thucydides Trap — 12 of 16 historical cases ended in war." In the lower-right margin, write "Chinese reading (Qin/Yan/Zhao): 'no Thucydides Trap' — relational order and moral legitimacy can manage transition." Draw a double-headed arrow between the two margin notes labelled "Same data, divergent causal attribution."

Visual 2 — The Taiwan security dilemma spiral.

What to draw. Draw two concentric circles. The inner circle is labelled "Taiwan Strait (contested space)." The outer circle is labelled "Regional security environment." Place two nodes on opposite sides of the inner circle: "PRC" on the left and "US/ROC" on the right. Draw curved arrows between them in a spiral pattern: PRC arrow → "military exercises / ADIZ incursions" → US/ROC arrow → "arms sales / freedom-of-navigation" → PRC arrow → "grey-zone coercion" → US/ROC arrow → "deterrence posture" → back to PRC. Each arrow should be thicker than the last to show escalation. In the centre of the inner circle, draw a small Taiwan silhouette labelled "Status quo ambiguity."

Labels to place. Along the spiral, label four rungs: (1) "Perception of threat," (2) "Defensive response," (3) "Counter-perception," (4) "Escalation." Add a box at the bottom: "Security dilemma (Herz/Jervis): defensive measures read as offensive → spiral." Add a second box: "Power-transition overlay: Taiwan as the 'most dangerous' flashpoint because it combines status inconsistency with alliance commitments."

Perspective overlay to annotate. Annotate the PRC-side arrows with "Chinese reading: anti-secession, sovereignty, US interference." Annotate the US/ROC-side arrows with "Western reading: deterrence, Taiwan Relations Act, 'strategic ambiguity.' " Annotate the spiral itself with "Russian reading: US hegemony provoking crisis; African reading: proxy cost of bipolar competition; UN reading: Charter Art. 2(4) and peaceful settlement."

Visual 3 — The technology interdependence web and chokepoints.

What to draw. Draw a network diagram with five nodes arranged in a pentagon: "US design (EDA, IP)," "Taiwan fab (TSMC)," "China assembly/test," "China rare-earth processing," and "Global markets." Connect them with thick lines labelled with flows: "design files," "wafers," "components," "raw materials," "finished goods." Place a red "X" or scissors icon on three edges to mark chokepoints: US EDA → China, China rare earths → US/Japan, Taiwan fab → global. Shade the nodes by actor: US nodes in blue, China nodes in red, Taiwan node in yellow, global node in grey.

Labels to place. Title the diagram "Managed interdependence, 2022–2024." Label each chokepoint with its control instrument: "BIS entity list / Oct. 2022 rules," "Export licensing / quota," "Strategic ambiguity + deterrence." Add a legend: solid line = flow, dashed line = restricted flow, X = active control.

Perspective overlay to annotate. Around the diagram, place five short margin notes: "African: chokepoints raise input costs for African manufacturing and green-transition minerals." "Chinese: US 'small yard, high fence' is containment in disguise." "Russian: sanctions architecture is a tool of hegemony." "Western: 'de-risking' not decoupling; controls are defensive." "UN: export controls must comply with WTO and Charter obligations; technology access is a development right." Draw a bracket grouping the last two notes labelled "Contested legal framing."

SECTION 4 — CORNELL NOTES

Cue (prompt)	Notes (with source log)
What is power transition theory?	Organski (1958): power transitions occur when a rapidly growing challenger approaches the dominant state's power; war risk is highest during the transition, not after. Kugler extended with quantitative power indices. Scope: assumes a hierarchical international system with a single dominant power.
What is the Thucydides Trap?	Allison (2017): of 16 historical cases of a rising power challenging a ruling power, 12 ended in war. Mechanism: fear, honour, interest (Thucydides). Not deterministic — 4 cases avoided war.
What does offensive realism predict for US–China?	Mearsheimer (2001, 2014): great powers seek regional hegemony; the US will not tolerate a Chinese hegemon in Asia; bipolarity is unstable; conflict is structurally likely. Scope: assumes anarchy, offensive military advantage, uncertainty.
What is the Chinese relational/moral realist account?	Qin Yaqing (2018): relational theory — order built on relationships, not contracts. Yan Xuetong (2011): moral realism — legitimacy and humane authority (wangdao) shape power. Zhao Tingyang (2021): Tianxia — all-under-heaven as a universal political imagination. Together: transition can be managed through relational order; "no Thucydides Trap."

Cue (prompt)	Notes (with source log)
What is the ‘new cold war’ framing?	Friedberg (2018) and others: US–China competition is structural, ideological, and long-term; engagement failed to liberalise China. Counter: interdependence (Keohane/Nye) makes full decoupling costly and unlikely.
What is the engagement vs containment debate?	Engagement (1990s–2010s): trade and institutions would socialise China. Containment (post-2017): strategic competition, decoupling in sensitive sectors. Middle position: “de-risking” / managed competition.
Why is Taiwan the flashpoint?	Combines status inconsistency (PRC claim vs de facto autonomy), alliance commitments (US Taiwan Relations Act), geographic proximity, and semiconductor chokepoint. Security dilemma + power transition overlap.
What do the data show on GDP?	China larger than US in PPP since ~2014–2016; US still larger in nominal terms. Gap narrowing but not closed in nominal; PPP gap widened in China’s favour.
What do the data show on military spending?	US spends ~3x China (SIPRI est.); China’s spending grew faster from a low base; official Chinese figures understate. Quality/technology gap persists.
What do the data show on trade?	Bilateral trade peaked ~2022 at ~USD 690 bn; declined to ~575 bn by 2024; deficit narrowed; controls expanded. Interdependence persists but is being managed/restricted.
What is the African perspective?	Costs of bipolar competition: aid conditionality, debt distress, proxy conflicts; opportunities: multi-alignment, non-aligned bargaining, mineral leverage, African Continental Free Trade Area. Grovogui, Mbembe, Aning.
What is the UN perspective?	Charter principles (sovereignty, non-use of force, peaceful settlement); Taiwan’s status as unresolved; risk of great-power conflict; need for dialogue mechanisms; development as a right.

Source log. Allison (2017); Mearsheimer (2001, 2014); Organski (1958); Kugler (power-transition extensions); Qin (2018); Yan (2011); Zhao (2021); Friedberg (2018); World Bank; SIPRI; US Census Bureau; BIS. Secondary: Herz (1950) and Jervis (1978) on the security dilemma; Keohane and Nye (1977, 2012) on interdependence; Grovogui (2006), Mbembe (2019), Aning (2020) on African vantage points.

Summary. US–China rivalry is best understood as a power transition in progress, but whether it produces war depends on mechanisms — security dilemma, alliance commitments, and technology chokepoints — that

are not captured by aggregate power indices alone. The data show a narrowing but unclosed gap, persistent and managed interdependence, and an expanding but incomplete control regime. The five perspectives disagree on whether the transition is manageable: Chinese relational theory and African multi-alignment see opportunity in multipolarity, while Western offensive realism and the Thucydides framing see structural danger, and the UN stresses Charter-based restraint.

SECTION 5 — FEYNMAN COMPRESSION

Step 1 — Explain without jargon. Imagine two runners on a track. One has been ahead for decades and owns most of the equipment. The other is catching up fast, has more people, and is building its own equipment. The race is not just about speed; it is about who gets to set the rules of the track. The danger is highest not when the second runner is far behind, nor when it has clearly won, but in the middle, when the first runner fears losing and the second runner feels it deserves a say. That middle period is the power transition. Now add a narrow bridge on the track — Taiwan — that both runners claim. Even if neither wants to crash, the bridge makes a crash more likely because each runner's defensive move looks like an attack to the other. That is the security dilemma. The data show the second runner is still behind in money that counts internationally, but ahead in money that buys things at home, and the two runners still trade heavily even as they restrict each other's technology. So the race is real, the bridge is dangerous, but the runners are still tied together by the track itself.

Step 2 — Mark gaps. Three gaps remain in this explanation. First, it treats "power" as a single number, but military quality, alliance networks, and technological leadership are not captured by GDP. Second, it does not explain why the African perspective matters: the two runners' race reshapes finance, debt, and mineral markets for everyone else, and those effects are not visible in bilateral US–China data. Third, it assumes the security dilemma is symmetric, but the two sides have different political systems and different time horizons, which may make one side more risk-acceptant than the other.

Step 3 — Reread verification. Re-reading Organski (1958) confirms that the transition period, not the endpoint, carries the highest war risk, and that the challenger's satisfaction with the status quo matters as much as its power. Re-reading Allison (2017) confirms that the Thucydides Trap is a probability, not a destiny: four of sixteen cases avoided war, usually through accommodation or alliance restructuring. Re-reading Mearsheimer (2014) confirms that offensive realism predicts US resistance to Chinese regional hegemony but does not predict inevitable war; it predicts sustained competition. Re-reading Qin (2018) and Yan (2011) confirms that Chinese scholars argue relational legitimacy can lower transition risk, a claim that is theoretically coherent but empirically untested at this scale. Re-reading Friedberg (2018) confirms that the engagement-to-competition shift is dated to roughly 2017–2018 in US strategy documents. The Feynman analogy survives but must carry these qualifications.

Step 4 — Analogy with explicit limits. The runners-on-a-track analogy captures the transition dynamic and the bridge/flashpoint logic, but it fails in four ways. It implies two actors, whereas the system includes Taiwan, Japan, ASEAN, the EU, and African states as consequential agents. It implies a finish line, whereas power transitions are open-ended and reversible. It implies physical collision, whereas modern great-power conflict may be economic, cyber, or proxy rather than kinetic. And it cannot represent the interdependence that makes both runners' shoes in the other's factory. Use the analogy for the transition mechanism only; do not extend it to policy prescription.

Step 5 — Rewrite. US–China rivalry is a power transition in which a rising challenger approaches a dominant power's capabilities, raising war risk during the transition window; the risk is amplified by a security dilemma over Taiwan and by technology chokepoints, but is moderated by deep economic interdependence and by competing visions of international order. Whether the transition ends in conflict or managed competition depends on mechanisms — alliance credibility, domestic politics, and relational legitimacy — that aggregate power data alone cannot settle, and on perspectives that the bilateral frame systematically underweights, especially those of African, UN, and smaller-state actors.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L47	Definition	What is power transition theory?	Organski's theory holds that war is most likely when a rising challenger approaches parity with the dominant power, especially if it is dissatisfied with the status quo; Kugler later refined measurement and conditions. It is probabilistic and conditional, not a law of inevitability.	Western structural-realist framing; African analysts often stress that aggregate parity metrics can obscure developmental asymmetries.

Tag	Card Type	Front	Back	Perspective Note
L47	Mechanism	What is the Thucydides Trap?	Allison argues that structural stress arises when a rising power threatens to displace a ruling power; among sixteen historical cases, twelve ended in war. The mechanism is fear-driven escalation and preventive logic, not automatic destiny.	Chinese officials often reject inevitability; African scholars warn that great-power fear can be externalized as proxy costs.
L47	Mechanism	What does offensive realism predict for US-China relations?	Mearsheimer argues that anarchy and uncertainty push great powers to maximize relative power and seek regional hegemony; therefore the United States will resist Chinese hegemony in Asia. It predicts sustained balancing and competition, not necessarily immediate war.	Western lens; African critics often argue it overweights military power and underweights economic agency.

Tag	Card Type	Front	Back	Perspective Note
L47	Comparison	How does power transition theory differ from the security dilemma?	Power transition theory focuses on aggregate power shifts and the challenger's satisfaction with the order; the security dilemma focuses on how defensive measures by one state are perceived as threats by another. Both can operate simultaneously, and Taiwan illustrates both.	UN and African perspectives emphasize de-escalation and restraint rather than structural fatalism.
L47	Source	What is Qin Yaqing's relational theory?	Qin treats world politics as constituted by relations, processes, and identities rather than by atomistic units; it offers a non-Western ontology of international order. It does not deny power but reframes how order is produced and legitimated.	Chinese perspective; African scholars may find resonances with relational and community-based political thought.

Tag	Card Type	Front	Back	Perspective Note
L47	Source	What is Yan Xuetong's moral realism?	Yan argues that international leadership depends on moral capacity and humane authority, not only material power; legitimacy and political virtue shape durable order. It is a normative realist account rather than pure power politics.	Chinese perspective; Western skeptics often question how moral capacity can be measured or verified.
L47	Source	What is Zhao Tingyang's tianxia framework?	Zhao presents tianxia as a world-as-one-community framework that emphasizes inclusive order over a strictly Westphalian sovereignty model. It is philosophical and aspirational, not a description of current institutions.	Chinese perspective; African readers may compare it with pan-African unity ideals while noting risks of hierarchy.

Tag	Card Type	Front	Back	Perspective Note
L47	Application	Why is Taiwan a flashpoint in US-China rivalry?	Taiwan concentrates sovereignty ambiguity, military geography, semiconductor supply chains, and alliance commitments; it is a high-risk node where deterrence and reassurance must be balanced. Escalation remains contingent on signaling, domestic politics, and crisis management.	UN stresses Charter principles and peaceful settlement; African states often stress non-interference and stability.
L47	Mechanism	Does economic interdependence pacify US-China rivalry?	Trade and supply chains raise the costs of conflict but also create leverage, vulnerability, and weaponization; decoupling is partial, costly, and sector-specific. Interdependence is therefore not automatically pacifying.	African economies can face price shocks, supply disruptions, and technology-access constraints.

Tag	Card Type	Front	Back	Perspective Note
L47	Debate	What is the engagement-versus-containment debate?	One view holds that engagement failed to liberalize China and facilitated its rise; another holds that engagement reduced conflict and that containment risks a self-fulfilling rivalry. The evidence is mixed and time-dependent.	Western debate; many African states prefer non-exclusive partnerships that preserve strategic agency.
L47	Occlusion	Why is Thucydides Trap determinism misleading?	Treating the trap as destiny occludes agency, diplomacy, domestic politics, and institutional restraint; Allison himself frames it as a warning rather than fate. The better analytical question is which mechanisms escalate or de-escalate.	Chinese and African perspectives both stress agency and the costs of great-power fatalism.

Tag	Card Type	Front	Back	Perspective Note
L47	Adjudication	How should the 2018-2024 trade and technology war be explained?	Tariffs and export controls reflect strategic competition and security framing, but they also fragment supply chains and accelerate indigenous innovation. Neither pure containment nor pure engagement explains all measures.	African importers and technology users face access constraints and price effects.
L47	Visual	What does a power-transition curve show?	A graph of challenger versus dominant power capabilities over time highlights the parity zone as a period of elevated risk; satisfaction, alliances, and institutional ties modify that risk. It is an analytical heuristic, not a prediction.	Western quantitative framing; African scholars caution against metric bias and developmental blind spots.

Tag	Card Type	Front	Back	Perspective Note
L47	Reconstruction	What is African multi-alignment in this rivalry?	Many African states seek diversified partnerships to avoid forced alignment, leveraging rivalry for infrastructure, finance, and technology while managing debt and sovereignty risks. This is strategic agency rather than passivity.	African primary perspective; it reframes the rivalry as an arena of choice, not only bipolar pressure.
L47	Debate	Is “new cold war” an accurate frame?	The frame highlights ideological and systemic rivalry but can obscure differences from US-Soviet bipolarity, especially economic entanglement and Global South agency. It is a contested analogy rather than a settled description.	Russian and Chinese actors often reject it; African analysts warn of proxy pressures and alignment demands.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence Audit

Competency	Score (0-100)	Evidence of Mastery	Gap to Close
Define power transition theory and its conditions	0-100	Can state Organski’s parity-and-dissatisfaction logic without determinism	Distinguish Kugler’s refinements from Organski’s original claim

Competency	Score (0-100)	Evidence of Mastery	Gap to Close
Explain offensive realism's causal mechanism	0-100	Can link anarchy, uncertainty, survival, and hegemonic ambition	Avoid conflating Mearsheimer's prediction with policy prescription
Reconstruct Qin, Yan, and Zhao on their own terms	0-100	Can separate relational, moral-realist, and tianxia arguments	Prevent reducing Chinese theories to Western realism
Analyze economic interdependence as mechanism	0-100	Can explain both pacifying and weaponizing effects	Specify sectoral differences such as semiconductors versus commodities
Evaluate engagement versus containment	0-100	Can identify strongest arguments on both sides	Add time-horizon and metric-specific evidence
Apply all five perspectives to US-China rivalry	0-100	Can reconstruct African, Chinese, Russian, Western, and UN views	Ensure African perspective is primary, not an afterthought
Use levels of analysis correctly	0-100	Can separate individual, state, systemic, and transnational factors	Avoid collapsing domestic politics into systemic structure
Identify falsifiers for major claims	0-100	Can state what evidence would weaken a theory	Distinguish absence of war from falsification of risk mechanisms

7.2 Three-Question Debrief

1. Which theory in this lesson did I initially treat as more deterministic than its author intended, and what textual or logical cue should have corrected that?
2. When I reconstructed the African perspective, did I explain it from within African scholarly and political traditions, or did I merely append African examples to a Western theory?
3. Which of my claims about US-China rivalry would change if I shifted from nominal GDP to PPP GDP, or from aggregate military spending to specific capability domains?

7.3 Error-Log

Common Misconception	Correction	Evidence
"The Thucydides Trap means war between the US and China is inevitable."	Allison presents the trap as a structural warning and emphasizes agency, diplomacy, and choice; historical cases include non-war outcomes.	Allison (2017); the sixteen-case framework includes cases that did not end in war.
"Power transition theory says any rising power causes war."	The theory emphasizes parity plus dissatisfaction; a satisfied challenger or strong institutional binding can reduce risk.	Organski (1958); Kugler's refinements on conditions and measurement.
"Offensive realism is identical to Chinese strategic thinking."	Mearsheimer's theory is a Western structural theory; Chinese scholars such as Qin, Yan, and Zhao offer distinct ontological and normative frameworks.	Mearsheimer (2001, 2014); Qin (2018); Yan (2011); Zhao (2021).
"Economic interdependence automatically prevents conflict."	Interdependence can deter, but it can also create leverage, vulnerability, and escalation through sanctions and supply-chain weaponization.	Friedberg (2018); trade and technology-war evidence.
"Engagement clearly failed, so containment is the only rational policy."	Engagement had mixed effects across sectors and time horizons; containment carries risks of self-fulfilling rivalry and alliance strain.	Friedberg (2018); debate over engagement versus containment.
"African states are merely passive objects of US-China rivalry."	African actors exercise multi-alignment, bargaining, and institutional agency, while facing real costs from bipolar competition.	African perspective on multi-alignment and costs of bipolar competition.

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Power transition; Thucydides Trap; parity; dissatisfaction	Rising challenger approaches dominant power; fear and preventive logic escalate	Organski (1958); Allison (2017)	Historical rising-ruling power cases; US-China capability trends	Inevitability versus agency	Sustained peaceful power shift; institutionalized burden-sharing	L5 realism; L14 transition
Offensive realism; hegemony; balancing	Anarchy and uncertainty drive relative-power maximization and resistance to regional hegemony	Mearsheimer (2001, 2014)	US balancing in Asia; China's regional military growth	Structural determinism versus diplomacy	Durable cooperation under anarchy; successful restraint	L5; L48 Indo-Pacific
Relational theory; moral realism; tianxia	Order produced through relations, legitimacy, and inclusive community rather than only coercion	Qin (2018); Yan (2011); Zhao (2021)	Chinese diplomatic discourse; "community of shared future"	Western universalism versus plural ontologies	Failure of relational or moral claims to shape behavior	L13 liberal order; L49 revisionism
Interdependence; decoupling; weaponization	Trade raises conflict costs but creates leverage and vulnerability; partial decoupling reshapes supply chains	Friedberg (2018)	Tariffs, export controls, semiconductor restrictions	Pacification versus weaponization	Full stable decoupling without escalation; restored trust	L18 interdependence; L52-56 techno-geopolitics

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Engagement; containment; deterrence; Taiwan risk	Policy oscillation between integration and restriction; ambiguity and signaling around sovereignty	Friedberg (2018); Allison (2017)	Taiwan Strait tensions; alliance commitments; tech controls	Engagement failure versus containment blowback	Verified liberalization; credible stable deterrence	L48; L49
African multi-alignment; bipolar costs; agency	Diversified partnerships reduce forced alignment; rivalry creates opportunities and shocks	African scholarly tradition	Infrastructure finance; debt; technology access; commodity shocks	Non-alignment versus strategic hedging	Sustained equitable partnerships; reduced proxy pressure	L14; L48; L52-56
UN Charter; peaceful settlement; great-power risk	Legal norms and crisis management constrain escalation but depend on power politics	UN perspective	Taiwan debates; Security Council paralysis risks	Law versus power	Effective collective security; de-escalation mechanisms	L13; L49

SECTION 9 — REVIEW SCHEDULE

Interval	Timing	Concrete Action
R1	Immediately after first study	Recite the five key ideas from memory, then check against the lesson; mark any idea you cannot state in two sentences.

Interval	Timing	Concrete Action
R2	24 hours	Redraw the power-transition curve and label the parity zone, satisfaction variable, and alliance modifier; explain one African and one Chinese perspective in your own words.
R3	72 hours	Write a 200-word adjudication of whether the 2018-2024 trade and technology war is better explained by containment or by structural rivalry; include one falsifier.
R4	1 week	Complete the Taiwan problem pair again without notes, then compare with the model answer; correct any level-of-analysis error.
R5	2 weeks	Teach the lesson's central puzzle aloud for five minutes, covering all five perspectives and ending with one adjudicated claim; log remaining gaps in the error-log.

SECTION 10 — COMPLETION CHECKLIST

- ☐ I can state power transition theory and its scope conditions without calling it inevitable.
- ☐ I can distinguish Organski's original claim from Allison's Thucydides Trap framing.
- ☐ I can explain Mearsheimer's offensive realism and its strongest counterargument.
- ☐ I can reconstruct Qin, Yan, and Zhao as distinct Chinese theoretical traditions.
- ☐ I can explain why interdependence can both deter and escalate conflict.
- ☐ I can present the engagement-versus-containment debate with evidence on both sides.
- ☐ I can analyze Taiwan through power transition and security-dilemma frameworks.
- ☐ I can reconstruct the African perspective as primary, not as an add-on.
- ☐ I can steel-man Chinese, Russian, Western, and UN perspectives.
- ☐ I can use individual, state, systemic, and transnational levels of analysis correctly.
- ☐ I can identify at least one falsifier for each major claim in the lesson.
- ☐ I can distinguish description, explanation, prediction, and prescription in a memo.
- ☐ I can interpret GDP, military spending, trade, and export-control data without overclaiming.
- ☐ I can explain what each of the five perspectives occludes.
- ☐ I can produce an adjudicated claim rather than a mere summary.
- ☐ I have logged at least two misconceptions in the error-log.
- ☐ I can connect this lesson to L48, L49, and L52-56.
- ☐ I can explain why "new cold war" is a contested analogy.

FURTHER READING (Optional)

Power transition and structural realism - Organski (1958) - Allison (2017) - Mearsheimer (2001) - Mearsheimer (2014)

Chinese international relations theory - Qin (2018) - Yan (2011) - Zhao (2021)

Interdependence, authoritarian challenge, and engagement - Friedberg (2018)

SECTION 0 — Why This Lesson Exists

The central puzzle of this lesson is whether the maritime order of the Indo-Pacific is being reconstituted through a contest over geography itself, or whether the apparent contest is better understood as a redistribution of power within an order whose basic rules remain intact. The term "Indo-Pacific" has displaced "Asia-Pacific" in strategic discourse over the past decade, and that displacement is not merely lexical. It reorients the spatial frame of great-power competition from a Pacific-centered theater to a wider maritime system linking the Indian and Pacific Oceans, with consequences for which states count as central, which alliances matter, and which legal regimes are treated as authoritative. The lesson asks you to hold that construct open as an object of analysis rather than adopting it as a neutral descriptor, and to trace how its adoption interacts with China's anti-access/area-denial (A2/AD) architecture, the reconfiguration of US alliance structures, the flashpoints of the Taiwan Strait and the South China Sea, and the hedging strategies of middle powers.

This lesson sits at the intersection of two prior lessons and three future ones. It builds directly on L25, which established the classical and modern vocabulary of maritime strategy—sea control versus sea denial, the role

of chokepoints, the strategic significance of fleet composition—and on L47, which framed US-China rivalry as a structural condition rather than a bilateral quarrel. What L47 treated at the level of systemic polarity and economic interdependence, this lesson treats at the level of maritime materiality: hulls in the water, missile ranges, island chains, and the legal geography of exclusive economic zones. It also prepares the ground for L49 on institutional revisionism, because the maritime order is one of the principal sites where China's challenge to existing institutions is most concrete; for L52 on semiconductors, because the sea lanes of the Indo-Pacific carry the inputs and outputs of the digital economy; and for L57 on space, because maritime awareness increasingly depends on satellite constellations and because the same strategic logic of denial is migrating upward. You should read this lesson as a bridge between abstract systemic rivalry and the physical infrastructure of global order.

The lesson is organized around five key ideas that move from the abstract to the concrete and back again. The first idea treats the "Indo-Pacific" as a strategic construct, asking what work the term does and whose interests it serves. The second examines A2/AD and sea denial, focusing on China's layered defensive architecture and the first island chain as a geographic fact that both enables and constrains. The third analyzes alliance architecture—the hub-and-spokes system, the Quad, and AUKUS—as a set of institutional responses to the perceived erosion of US primacy. The fourth turns to the two flashpoints where abstraction meets crisis: the Taiwan Strait and the South China Sea. The fifth examines middle powers and hedging, with ASEAN centrality, India's strategic autonomy, and Japan's military normalization as three distinct modalities of navigating between Washington and Beijing. Each idea is developed through a causal claim, a mechanism, scope conditions, observable implications, and a brief perspective note across five traditions.

The African perspective is treated as primary throughout, not as a regional illustration of Western theory. The Indian Ocean is a lived strategic space for African littoral states, and the Indo-Pacific construct, by centering US-China rivalry, risks rendering African agency invisible. African scholarship—from Nkrumah's and Nyerere's non-alignment traditions to contemporary work on maritime security, port geopolitics, and strategic autonomy—offers a vantage that the other four perspectives systematically underweight. African states confront piracy, illegal, unreported, and unregulated fishing, trafficking, and the militarization of chokepoints such as Bab el-Mandeb and the Mozambique Channel, while also navigating the port investments and naval presences of external powers. The African view reveals that the Indo-Pacific is not only a theater of great-power competition but also a space of extractive economies, fragile governance, and strategic choice, and that the language of "centrality" and "architecture" can obscure whose security is actually being secured. This vantage also illuminates why middle-power hedging resonates with longer African traditions of non-alignment and strategic autonomy, and why the importation of Indo-Pacific frameworks into African maritime policy is contested.

Methodologically, the lesson trains you to operate across levels of analysis—individual, state, systemic, and transnational—and to reconstruct five perspectives on any maritime claim before adjudicating among them. You will work through a worked example on the 2016 South China Sea arbitration ruling, a problem pair on AUKUS and the submarine question, and an independent memo task. The hinge question tests whether you can distinguish a description of naval balances from an explanation of alliance formation, a prediction of crisis, and a prescription for policy. The data lab supplies naval vessel counts, shipbuilding rates, freedom-of-navigation operation tallies, and trade flows through the South China Sea, and asks you to interpret them with explicit attention to what they can and cannot establish.

By the end of this lesson you should be able to do four things. First, you should be able to evaluate competing claims about the origins and consequences of the Indo-Pacific construct, specifying the mechanism through

which a geographic label becomes a strategic project. Second, you should be able to explain how A2/AD architectures alter the calculus of intervention and deterrence, with attention to scope conditions and to the difference between capability and intent. Third, you should be able to reconstruct the five perspectives—African, Chinese, Russian, Western, and UN—on any maritime development in the region, identifying what each contributes and what it occludes. Fourth, you should be able to produce a falsifiable assessment of a maritime flashpoint that distinguishes description, explanation, prediction, and prescription, and that names the evidence that would change your conclusion. These capacities are the core of the lesson's assessment architecture and are tested in the worked example, the problem pair, the independent memo, and the hinge question.

SECTION 1 — Pre-Class Priming

1.1 Retrieval warm-up

1. From L25 (maritime strategy): What is the analytical distinction between sea control and sea denial, and which historical case is most commonly invoked to illustrate the transition from one to the other?
2. From L25: How did Alfred Thayer Mahan's theory of sea power link fleet concentration, coaling stations, and national greatness, and what is the principal critique of Mahan's determinism?
3. From L25: What strategic function do maritime chokepoints perform, and why does their significance increase as naval reach extends?
4. From L47 (US-China rivalry): What are the three mechanisms through which US-China rivalry is characterized as structural rather than merely bilateral?
5. From L47: How does the security dilemma operate in the Taiwan Strait, and what makes it particularly acute in that theater?
6. From L47: Distinguish the engagement and containment strands in US China policy since the end of the Cold War, and identify one piece of evidence for each.

1.2 Orientation questions

1. Is the "Indo-Pacific" a neutral geographic descriptor that merely reflects economic integration, or is it a strategic construct that redistributes attention, resources, and legitimacy among states?
2. Does China's A2/AD architecture make armed conflict in the region more likely by lowering the cost of coercion, or less likely by raising the cost of intervention?
3. Are the deepening US alliances in the Indo-Pacific—AUKUS, the Quad, the hub-and-spokes system—stabilizing deterrents that preserve the status quo, or escalatory commitments that accelerate the security dilemma?
4. How should a middle power such as India or Indonesia balance between Washington and Beijing without surrendering strategic autonomy, and what does "ASEAN centrality" actually deliver?

1.3 Vocabulary pre-teach

- **Indo-Pacific**: A strategic-geographic construct linking the Indian and Pacific Oceans into a single theater of competition; contested as a neutral descriptor because it reorients attention away from "Asia-Pacific" and elevates certain states and alliances.
- **A2/AD (anti-access/area denial)**: A layered defensive strategy using missiles, submarines, mines, and sensors to prevent an adversary from entering or operating within a maritime theater; distinct from sea control in that it aims to deny rather than to command.

- **First island chain**: The arc of islands from Japan through Taiwan and the Philippines to Borneo that forms the geographic boundary of China's near-seas A2/AD envelope and the forward line of US and allied defense planning.
- **Hub-and-spokes**: The US alliance system in Asia in which Washington (the hub) maintains bilateral treaties with individual allies (the spokes), contrasting with the multilateral NATO model.
- **Quad**: The Quadrilateral Security Dialogue among the United States, Japan, India, and Australia, revived in 2017, focused on maritime security, infrastructure, and technology coordination.
- **AUKUS**: The 2021 trilateral security pact among Australia, the United Kingdom, and the United States, centered on nuclear-powered submarine cooperation and advanced defense technology sharing.
- **UNCLOS**: The United Nations Convention on the Law of the Sea, the foundational treaty governing maritime zones, navigation rights, and dispute settlement.
- **Freedom of navigation (FONOP)**: Operational assertions by naval vessels challenging excessive maritime claims; in the Indo-Pacific most associated with US challenges to Chinese claims in the South China Sea.
- **Hedging**: A strategy in which a state maintains security ties with one great power while preserving economic and diplomatic flexibility with another, avoiding exclusive alignment.
- **Strategic autonomy**: A state's capacity to make independent foreign and security policy choices without subordination to a great power; central to Indian and French strategic discourse.
- **ASEAN centrality**: The principle that the Association of Southeast Asian Nations should remain the primary institutional convener and agenda-setter in regional security architecture.
- **Nine-dash line**: China's cartographic claim to most of the South China Sea, rejected in the 2016 arbitration ruling but maintained in practice.

SECTION 2 — LESSON CORE

2.1 Learning objectives By the end of this lesson, students will be able to: (1) **Define** the "Indo-Pacific" as a contested strategic construct rather than a self-evident geographic region, distinguishing it from "Asia-Pacific" and from the legal maritime zones established by UNCLOS; (2) **Explain** the mechanism by which a naming and spatial-framing shift reorganizes alliance politics, naval planning, and economic statecraft across the Indian and Pacific Oceans; (3) **Analyze** how the construct's meaning changes across African, Chinese, Russian, Western, and UN vantage points, including what each perspective reveals and what it occludes; (4) **Evaluate** the scope conditions under which the Indo-Pacific framing stabilizes into durable institutions rather than remaining rhetorical; and (5) **Apply** the construct to a concrete case—such as the 2016 South China Sea arbitration or AUKUS—by tracing its effects across individual, state, systemic, and transnational levels of analysis. These objectives are assessable through short-answer definitions, mechanism-tracing essays, perspective-reconstruction exercises, and scenario-based policy memos.

2.2 KEY IDEA 1 — The 'Indo-Pacific' as a strategic construct: geography, geopolitics, and contestation Bolded Causal Claim: The "Indo-Pacific" is not a neutral geographic label; it is a strategic construct that fuses the Indian and Pacific Oceans into one competitive arena, thereby privileging maritime connectivity, alliance coordination, and China-centered balancing over the older, more economically and ASEAN-centered "Asia-Pacific" imaginary.

Mechanism: The mechanism is discursive-spatial before it is material. By naming two oceans as one theater,

policymakers create a cognitive map in which chokepoints such as the Malacca Strait, the Bab el-Mandeb, the Mozambique Channel, and the first island chain become parts of a single strategic system. That map then licenses institutional integration: the renaming of U.S. Pacific Command as Indo-Pacific Command in 2018, the elevation of the Quad, the articulation of "free and open Indo-Pacific" strategies, and the alignment of naval, infrastructure, and technology policies across states that previously treated the Indian Ocean and Pacific Ocean as separate planning spaces. The construct also performs boundary work. It moves attention away from continental Eurasia and from ASEAN's institutional centrality toward maritime corridors, island chains, and sea-lane security. In this sense, the term does not merely describe geography; it reorganizes who counts as a regional actor, which threats appear urgent, and which alliances appear natural. Friedberg (2018) frames the underlying dynamic as the return of great-power competition in Asia, while Kaplan (2010) supplies an older geographic intuition: the Indian Ocean is not a peripheral sea but a connective space linking the Middle East, Africa, South Asia, and Southeast Asia. The Indo-Pacific construct operationalizes that intuition for contemporary rivalry.

Scope Conditions: The construct gains traction only where three conditions coincide: first, China's naval and commercial expansion makes maritime space politically salient; second, at least one major power—especially the United States, Japan, Australia, or India—has an interest in linking Indian Ocean and Pacific Ocean planning; and third, regional states accept enough of the framing to participate in its institutions without fully surrendering their own geographic or diplomatic priorities. Where these conditions are absent, the term remains rhetorical. It is weaker in continental Central Asia, in landlocked African states, and in regions where ASEAN or the African Union insists on older spatial vocabularies. It is also contested when states fear that "Indo-Pacific" is a euphemism for containment, alliance encirclement, or the dilution of non-aligned and developing-country agendas.

Observable Implications: If the construct is politically consequential, one should observe renaming and reorganization of military commands; new or upgraded maritime exercises linking the Indian Ocean and Pacific; policy documents that replace or subordinate "Asia-Pacific" language; infrastructure initiatives framed as alternatives to China's Belt and Road Initiative; and diplomatic forums that include both Indian Ocean and Pacific actors. One should also observe resistance: Chinese officials rejecting the term as a "Cold War mentality" construct; ASEAN leaders insisting on "ASEAN centrality"; African and Indian Ocean states seeking to avoid subordination to either U.S. or Chinese maritime agendas; and UN or legal actors treating "Indo-Pacific" as a political, not juridical, category. Data on naval vessel counts, shipbuilding rates, freedom-of-navigation operations, and trade through the South China Sea—such as those tracked by the CSIS China Power Project—provide material indicators of the military and economic stakes attached to the construct, even though no dataset can by itself prove that the label caused the competition.

Perspective Note (five traditions in brief):

African (primary): From an African vantage point, the Indo-Pacific construct is neither simply a useful geographic correction nor merely a Western containment slogan; it is a reminder that the Indian Ocean has long been an African maritime space whose security, trade, and development are too often narrated from the outside. African scholarship and political thought—from Nkrumah's pan-Africanism and Nyerere's non-alignment to contemporary work on maritime security, extraversion, and strategic autonomy—treat the ocean not as an empty corridor between great powers but as a lived space of ports, fisheries, energy routes, and coastal communities. The African Union's maritime strategy and the blue-economy agenda reflect an attempt to move from being an object of external naval competition to a subject of regional ocean governance. The construct can help African states by drawing attention to Indian Ocean security, piracy, illegal fishing, and

chokepoint vulnerability, but it can also occlude African agency by subsuming African littorals into U.S.-China-India-Japan rivalry. States such as South Africa, Kenya, Tanzania, Mozambique, and Mauritius face a double bind: they need external partners for maritime domain awareness and capacity, yet they risk becoming platforms for powers whose priorities are not identical to African development. The African perspective therefore asks whether "Indo-Pacific" can be appropriated for African strategic autonomy—through regional institutions, AU coordination, and Indian Ocean rim cooperation—or whether it will reproduce the older pattern in which Africa's coastline is treated as a theater for others' fleets.

Chinese: The Chinese perspective treats the Indo-Pacific as a politically loaded construct that rebrands containment in geographic language. From Beijing's standpoint, the older "Asia-Pacific" framework better captured a region whose economic center of gravity included China, and the newer term signals an attempt to build a U.S.-led coalition around China's periphery. Chinese officials and scholars emphasize sovereignty, territorial integrity, and the legitimacy of China's maritime claims and development; they also defend anti-access and area-denial capabilities as defensive responses to perceived encirclement. The construct is thus read not as neutral description but as strategic mobilization.

Russian: The Russian perspective interprets the Indo-Pacific as part of a broader U.S. effort to extend alliance and military infrastructure into new regions, analogous to NATO expansion in Europe. Moscow's critique stresses multipolarity, great-power equality, and resistance to U.S. primacy; it tends to view U.S.-led Indo-Pacific initiatives as destabilizing and as attempts to constrain both China and Russia. Russia's own Pacific and Indian Ocean interests, including its partnership with China, are framed as balancing against unilateral U.S. dominance.

Western: The Western perspective presents the Indo-Pacific as a necessary strategic correction to China's rise and as a framework for defending freedom of navigation, open sea lanes, and a rules-based maritime order. It emphasizes alliance architecture—hub-and-spokes relationships, the Quad, AUKUS—and treats maritime connectivity as a shared public good. Its strength is institutional and operational clarity; its risk is that it can conflate U.S. strategic preferences with universal rules, understating how regional states experience those preferences as pressure.

UN: The UN perspective is legal and institutional rather than geopolitical. UNCLOS provides the operative vocabulary—territorial sea, exclusive economic zone, continental shelf, high seas, and dispute settlement—but it does not recognize "Indo-Pacific" as a legal region. From this vantage point, the construct is a political overlay on a legal maritime order whose authority depends on consent, treaty obligations, and adjudication. The 2016 South China Sea arbitration illustrates both the possibilities and limits of that framework: legal rulings can clarify rights, but enforcement depends on state power and political will.

SECTION 2.3 — KEY IDEA 2: A2/AD and Sea Denial — China's Anti-Access Strategy and the First Island Chain

Bolded Causal Claim: China's anti-access/area-denial (A2/AD) architecture converts the first island chain from a passive geographic feature into an active, layered military frontier, raising the cost and risk of US power projection across the Western Pacific to the point where regional deterrence rests on escalation rather than on assured conventional superiority.

Mechanism: The mechanism is cumulative cost imposition through overlapping kill chains. At its foundation sits a dense sensor and reconnaissance network—over-the-horizon radar, space-based ISR, maritime

patrol aircraft, and unmanned systems—that compresses the time between detection and engagement. Upon that foundation, China has layered long-range precision-strike systems, most prominently the DF-21D and DF-26 anti-ship ballistic missiles, whose maneuverable reentry vehicles are designed to target large surface combatants, including aircraft carriers, at ranges that extend well beyond the first island chain. These are complemented by land-attack cruise missiles, integrated air-defense systems such as the HQ-9 and imported S-400 batteries, a growing submarine force of both conventional (Song, Yuan, Type 039) and nuclear (Jin-class SSBN, Shang-class SSN) boats, extensive mine-warfare capabilities, and a maritime militia and coast guard that operate in the gray zone below the threshold of armed conflict. The first island chain—running from the Japanese archipelago through the Ryukyu Islands, Taiwan, the northern Philippines, and down toward Borneo—functions as both the outer defensive perimeter of China's coastal heartland and the inner boundary of its denial zone. The strategic logic, articulated in Chinese military writings and analyzed by Western scholars such as Holmes and Yoshihara (2017), is not to defeat the US Navy in a symmetric engagement but to make intervention so costly, so uncertain, and so escalatory that Washington's political leadership concludes that the risks of forward deployment exceed the benefits. This is the classic A2/AD logic: deny access to the theater (anti-access) and, if access is achieved, degrade operations within it (area denial). The mechanism operates through risk calculus rather than through attrition: each additional layer—missiles, submarines, mines, cyber disruption of C4ISR—adds variance to US operational planning, forcing dispersal, hardening, and longer-range basing that themselves reduce US combat power. Friedberg (2018) emphasizes that this is not merely a military-technical problem but a strategic one: A2/AD erodes the credibility of US extended deterrence by making the defense of allies appear contingent on escalation to nuclear or long-range strike options that Washington may be unwilling to employ.

Scope Conditions: A2/AD is not universally effective; its power depends on several conditions. First, geographic proximity: the density and responsiveness of China's kill chains are highest within and immediately beyond the first island chain and degrade with distance across the Pacific. Second, intelligence and targeting: the system assumes persistent, accurate, and survivable ISR; if US counter-space, cyber, or electronic-warfare operations degrade China's sensor network, the missile threat becomes less precise. Third, escalation dynamics: A2/AD works best when the defender can credibly threaten escalation—conventional or nuclear—without triggering a full-scale war; if the US demonstrates a willingness to absorb initial losses and strike mainland targets, the cost-imposition logic weakens. Fourth, US force posture: distributed, hardened, and submarine-based US forces are less vulnerable than concentrated carrier strike groups; the US shift toward "distributed maritime operations" and "expeditionary advanced base operations" is a direct response. Fifth, alliance cohesion: if Japan, the Philippines, and Australia permit US access to their territory and waters, China's denial zone is perforated; if they hedge or deny access, A2/AD is strengthened. Sixth, industrial and technological competition: the balance depends on relative rates of shipbuilding, missile defense, and hypersonic development, which are themselves endogenous to the rivalry.

Observable Implications: The observable implications are substantial and multidirectional. On the Chinese side: sustained double-digit growth in defense spending for much of the 2000s and 2010s; the rapid expansion of the People's Liberation Army Navy (PLAN), which by the early 2020s had surpassed the US Navy in hull count; the construction of artificial islands in the Spratly and Paracel chains equipped with runways, radar, and missile batteries; the deployment of the DF-21D and DF-26; and the expansion of the maritime militia and coast guard as gray-zone instruments. On the US side: the 2018 National Defense Strategy's emphasis on great-power competition; the creation of the Marine Littoral Regiment; investments in longer-range anti-ship missiles (LRASM, SM-6); the "distributed lethality" concept; increased freedom of navigation operations (FONOPs) in the South China Sea; and the AUKUS agreement's provision of nuclear-

powered submarines to Australia. Regionally: Japan's 2022 National Security Strategy and its commitment to raise defense spending to 2 percent of GDP; the Philippines' Enhanced Defense Cooperation Agreement (EDCA) expansion; and the proliferation of anti-ship missile acquisitions across the region. The CSIS China Power Project has documented the PLAN's shipbuilding trajectory and the growth of China's missile arsenal, providing empirical grounding for the claim that A2/AD is not merely doctrinal but material.

Perspective Note (five traditions in brief):

African (primary): From an African vantage point, A2/AD is not an abstract military-technical problem but a restructuring of the Indian Ocean maritime order that directly affects African littoral states' security and economic interests. The African perspective, drawing on scholarship that treats sovereignty and security as historically contested and externally shaped—Grovogui's analysis of sovereignty as a Eurocentric construct, Mbembe's work on the postcolony, and the tradition of African maritime strategy articulated in the African Union's 2050 Africa's Integrated Maritime Strategy (AIMS)—reads A2/AD as a reminder that great-power competition reorganizes oceanic space in ways that marginalize African agency. The Indian Ocean is not merely a transit corridor for Asian commerce; it is the maritime frontier of East and Southern Africa, and the intensification of US-China naval competition there—evident in Djibouti's hosting of multiple foreign military bases, in the expansion of Chinese naval presence, and in the militarization of the western Indian Ocean—raises the prospect that African states will again be positioned as objects rather than subjects of maritime security. African scholars such as Aning and Danso have emphasized that maritime security in Africa is inseparable from the blue economy, from illegal fishing, and from the governance of exclusive economic zones; great-power A2/AD competition does not address these concerns and may divert attention and resources from them. The African perspective thus insists on strategic autonomy: African states must develop their own maritime domain awareness, their own naval capacity, and their own regional security architectures—such as the Yaoundé Code of Conduct and the Djibouti Code of Conduct—rather than becoming appendages of either US or Chinese maritime strategy. What this perspective reveals that others miss is that A2/AD is not only about deterring the United States; it is about who controls the Indian Ocean's chokepoints and sea lanes, and African states have a stake in ensuring that control is not monopolized by any external power.

Chinese: The Chinese perspective treats A2/AD not as an offensive strategy but as a defensive necessity rooted in historical vulnerability. The "century of humiliation" narrative, the memory of Western and Japanese naval coercion, and the geographic reality of a coastline exposed to maritime powers all inform a doctrine that seeks to prevent the recurrence of foreign intervention. From this vantage point, the first island chain is not a Chinese creation but a Western-imposed strategic geography; A2/AD is the means by which China reclaims strategic depth and protects its sovereignty, its territorial claims, and its economic lifelines. The critique of "Indo-Pacific" as a construct extends here: the framing of Chinese A2/AD as aggressive is, from Beijing's perspective, a projection of US anxiety about the erosion of unchallenged maritime dominance. Chinese strategists associated with the PLA's Academy of Military Science emphasize that China's maritime strategy is defensive in nature, aimed at protecting legitimate interests rather than at excluding others from international waters.

Russian: The Russian perspective views A2/AD through the lens of great-power competition and the critique of US unipolarity. Moscow sees Chinese A2/AD as a legitimate response to US military encirclement and as a contribution to the emergence of a multipolar order in which no single power can project force with impunity. Russian analysts have drawn parallels between Chinese A2/AD in the Western Pacific and Russian A2/AD capabilities in the Baltic, Black Sea, and Eastern Mediterranean—Kaliningrad-based missile systems, S-400

deployments, and submarine activity—treating both as defensive measures against NATO expansion. The Russian perspective occludes the concerns of regional states, particularly in Southeast Asia, that experience Chinese A2/AD as coercive, and it tends to conflate anti-hegemonic rhetoric with support for any state that challenges US power, regardless of its own regional behavior.

Western: The Western perspective, articulated by scholars such as Friedberg (2018) and Holmes and Yoshihara (2017), treats A2/AD as the central military challenge to US primacy in the Indo-Pacific. It emphasizes the erosion of US conventional deterrence, the vulnerability of carrier strike groups, and the need for technological and doctrinal adaptation. The Western perspective is strongest on mechanism and on the operational implications for US force planning; it is weakest in acknowledging that A2/AD is, from the Chinese perspective, a response to decades of US maritime dominance and that the "problem" of A2/AD is partly a problem of US expectations rather than of Chinese aggression alone. It also tends to understate the degree to which US allies in the region have their own agency and their own calculations about risk.

UN: The UN perspective approaches A2/AD through the lens of international law, particularly UNCLOS and the law of armed conflict. UNCLOS does not prohibit the development of defensive military capabilities, but it does establish rules regarding the use of force, the rights of navigation, and the peaceful resolution of disputes. From this vantage point, the concern is not A2/AD per se but the potential for miscalculation and escalation in contested waters, and the erosion of the legal framework that governs maritime conduct. The UN perspective emphasizes that military competition must be constrained by international law and that the development of A2/AD capabilities increases the risk of incidents at sea that could escalate beyond the control of the parties involved. It does not, however, provide a mechanism for enforcing restraint or for resolving the underlying territorial disputes that drive the competition.

SECTION 2.4 — KEY IDEA 3: Alliance Architecture — The Hub-and-Spokes System, the Quad, AUKUS

Bolded Causal Claim: The Indo-Pacific alliance architecture is transitioning from a Cold War hub-and-spokes bilateral system toward networked minilateralism (Quad, AUKUS), a shift that enhances deterrence through capability pooling and burden sharing but also fragments regional order, generates exclusionary dynamics, and risks converting defensive alliances into self-fulfilling security dilemmas.

Mechanism: The mechanism operates through institutional layering and capability aggregation. The hub-and-spokes system, established in the early Cold War, positioned the United States as the central hub connected to bilateral alliances with Japan, South Korea, Australia, the Philippines, and Thailand. This structure provided extended deterrence, forward basing, and interoperability, but it also created dependency, limited allied autonomy, and left gaps in regional coverage—particularly in the Indian Ocean and Southeast Asia. The post-Cold War period saw a gradual thickening of this architecture through trilateral dialogues, defense cooperation agreements, and joint exercises, but the system remained fundamentally bilateral and US-centered. The Quad—comprising the United States, Japan, India, and Australia—represents a qualitative shift: a minilateral grouping that aggregates the capabilities of four major Indo-Pacific democracies without the formal treaty obligations of an alliance. Its mechanism is functional rather than institutional: working groups on vaccines, critical technologies, climate, and maritime domain awareness create habits of cooperation that lower the barriers to security coordination. The Quad's revival in 2017 and its elevation to leader-level summits from 2021 reflect a shared perception of Chinese assertiveness, but its members retain divergent interests—India's commitment to strategic autonomy, Japan's constitutional constraints, Aus-

tralia's economic dependence on China—that limit its coherence as a military alliance. AUKUS, announced in September 2021, goes further: it is a technology and capability-sharing pact that provides Australia with nuclear-powered submarines, and it encompasses cooperation on hypersonics, cyber, artificial intelligence, quantum technologies, and undersea capabilities. Its mechanism is industrial and technological integration: by pooling resources and sharing sensitive capabilities, the three members aim to accelerate the development of advanced military technologies and to create a more capable and interoperable force. The combined effect of these layers is a shift from bilateral dependency to networked deterrence, in which the US is no longer the sole provider of security but one node in a web of overlapping partnerships. However, this networked architecture also generates new dynamics: exclusion of non-members (France, ASEAN states, South Korea), the risk of entanglement in conflicts not of a member's choosing, and the potential for arms racing as other states respond to the perceived threat of a more capable US-led coalition.

Scope Conditions: The effectiveness of this evolving architecture depends on several conditions. First, threat perception convergence: the Quad and AUKUS function only when members share a sufficiently similar assessment of the Chinese challenge; if threat perceptions diverge—as they did when India hesitated to condemn Russia's invasion of Ukraine, or when Australia's economic interests in China create friction—the network weakens. Second, capability complementarity: AUKUS works because the US and UK possess nuclear submarine technology that Australia lacks; if technology sharing is restricted or if industrial capacity is insufficient, the pact's military value diminishes. Third, domestic politics: alliance commitments require sustained political support; changes in government in member states can alter priorities, as seen in the initial Australian enthusiasm for AUKUS under the Morrison government and the subsequent Labor government's continued but more cautious support. Fourth, regional acceptance: if ASEAN states perceive the new architecture as undermining their centrality or as provocative, they may resist or hedge, reducing the architecture's legitimacy and effectiveness. Fifth, US credibility: the entire system rests on the assumption that the United States will remain committed to the region; any signal of retrenchment—such as the Afghanistan withdrawal or debates over Taiwan—can weaken allied confidence. Sixth, the nuclear dimension: AUKUS involves the transfer of nuclear propulsion technology, which raises nonproliferation concerns and sets precedents that other states may seek to emulate.

Observable Implications: The observable implications are visible across the region. The hub-and-spokes system persists: the US-Japan alliance remains the cornerstone, with Japan's 2022 National Security Strategy committing to acquire counterstrike capabilities and raise defense spending; the US-Philippines alliance has been revitalized through EDCA expansion; and the US-Australia alliance has deepened through AUKUS. The Quad has institutionalized: four leader-level summits since 2021, working groups on critical and emerging technologies, maritime domain awareness, and supply chain resilience; the Malabar naval exercises have expanded to include all four members. AUKUS has generated concrete programs: the optimal pathway for Australia's nuclear-powered submarine acquisition, announced in March 2023, involving Virginia-class purchases and AUKUS-class construction; and the Pillar II advanced capabilities agenda. The diplomatic fallout is also observable: France's recall of its ambassadors to the US and Australia in September 2021; Indonesia and Malaysia's expressions of concern about nuclear proliferation and regional stability; and the broader debate about whether AUKUS undermines the Nuclear Non-Proliferation Treaty. Regionally, South Korea has debated acquiring nuclear submarines; Japan has discussed hosting US nuclear weapons; and ASEAN has reiterated its centrality while struggling to maintain relevance in a region increasingly defined by great-power minilateralism. Think tanks such as CSIS have tracked these developments, documenting the shift from bilateral to networked security architecture.

Perspective Note (five traditions in brief):

African (primary): The African perspective on Indo-Pacific alliance architecture is shaped by the recognition that alliance systems in one region reshape security dynamics in others, and that African states have both interests and agency in how those systems evolve. Drawing on the tradition of non-alignment and strategic autonomy articulated by Nkrumah, Nyerere, and the Bandung Conference, and on contemporary African scholarship on security governance—Aning's work on African security architectures, Danso's analysis of African agency in international relations, and Grovogui's critique of the international order's Eurocentric foundations—the African perspective reads the Indo-Pacific alliance network as a potential source of both opportunity and risk. Opportunity: a multipolar alliance structure may create space for African states to diversify their security partnerships, to attract investment in maritime infrastructure, and to leverage their strategic position along Indian Ocean sea lanes. Risk: the intensification of great-power competition may lead to the militarization of the western Indian Ocean, the instrumentalization of African states as bases or partners in a conflict not of their making, and the diversion of resources from African-led security initiatives such as the African Standby Force and the African Union's maritime strategy. The African perspective is particularly attentive to the question of nuclear proliferation: AUKUS's transfer of nuclear propulsion technology to Australia sets a precedent that could be invoked by other states, including those in Africa, and that could complicate the nonproliferation regime on which African security depends. African states have historically been strong supporters of the NPT and of nuclear-weapon-free zones; the African Nuclear-Weapon-Free Zone (Pelindaba Treaty) is a concrete expression of this commitment. From this vantage point, the erosion of nonproliferation norms through AUKUS is not a distant concern but a direct threat to African security interests. What the African perspective reveals that others miss is that alliance architecture is not merely a regional arrangement but a global ordering mechanism whose effects ripple across the Indian Ocean and into Africa, and that African states must engage with it proactively rather than reactively.

Chinese: The Chinese perspective treats the Indo-Pacific alliance architecture as a US-led containment strategy designed to encircle China and to preserve American hegemony. From Beijing's vantage point, the Quad is an "Asian NATO" in embryo, AUKUS is a provocative transfer of nuclear technology that undermines the nonproliferation regime, and the hub-and-spokes system is a Cold War relic being repurposed for great-power competition. Chinese officials and scholars have argued that these arrangements are exclusionary, destabilizing, and contrary to the interests of regional states that seek cooperative rather than confrontational security. The critique of "Indo-Pacific" as a construct extends to the alliance architecture: the very term is seen as an attempt to stitch together disparate states into an anti-China coalition. This perspective occludes the genuine security concerns of China's neighbors and the degree to which Chinese assertiveness has driven the demand for stronger alliances; it also understates the agency of regional states in choosing to align with the United States.

Russian: The Russian perspective frames Indo-Pacific alliance expansion as part of a broader US strategy of global military encirclement that includes NATO expansion in Europe. Moscow views the Quad and AUKUS as instruments of US hegemony that threaten not only China but the principle of multipolarity itself. Russian analysts have drawn explicit parallels between NATO's eastward expansion and US alliance-building in the Indo-Pacific, arguing that both are destabilizing and that both provoke counterbalancing by the targeted state. Russia's own strategic partnerships with China—described as a "no-limits" partnership—position Moscow as a supporter of Beijing's resistance to US alliance architecture. The Russian perspective is strongest in its critique of the double standards of US alliance rhetoric—promoting a "rules-based order" while exempting allies from those rules—and in its attention to the global dimensions of regional alliance politics. It is weakest in its failure to acknowledge Russian actions in Ukraine and elsewhere that have themselves driven alliance consolidation, and in its tendency to treat all US alliances as equivalent regardless of their regional context.

Western: The Western perspective, articulated by scholars such as Friedberg (2018) and reflected in US strategic documents, treats the Indo-Pacific alliance architecture as a necessary and legitimate response to China's rise and assertiveness. It emphasizes the value of alliances in deterring aggression, sharing burdens, and maintaining a favorable balance of power. The Western perspective is strongest on the institutional and operational details of alliance management and on the strategic logic of deterrence; it is weakest in acknowledging the costs of alliance expansion—regional polarization, arms racing, and the potential for entanglement—and in recognizing that not all regional states share the US assessment of the Chinese threat. It also tends to understate the degree to which alliance architecture can become an end in itself, generating bureaucratic momentum that outpaces strategic coherence.

UN: The UN perspective approaches alliance architecture through the lens of international law and collective security. The UN Charter recognizes the right of states to individual and collective self-defense, and regional arrangements are permitted under Chapter VIII, but they must be consistent with the purposes and principles of the UN. From this vantage point, the concern is whether Indo-Pacific alliances contribute to or detract from international peace and security. The UN perspective emphasizes the importance of transparency, confidence-building, and the peaceful resolution of disputes; it is skeptical of arrangements that may be perceived as provocative or that may accelerate arms racing. The UN framework does not, however, provide a mechanism for regulating alliance formation or for ensuring that alliances serve collective rather than particular interests. The 2016 South China Sea arbitration and the broader UNCLOS framework remain the primary legal reference points, but their enforcement depends on state consent and political will.

SECTION 2.5 — KEY IDEA 4: The Taiwan Strait and South China Sea flashpoints

Bolded Causal Claim: The Taiwan Strait and the South China Sea are the two most probable loci of great-power military conflict in the Indo-Pacific because each combines an unresolved sovereignty dispute with dense commercial and military traffic and with alliance commitments that convert localized incidents into systemic crises.

Mechanism: The escalation mechanism operates through three nested channels. First, at the local level, both flashpoints feature contested sovereignty over features and waters that are simultaneously claimed by multiple states, creating a standing incentive for coercive signaling—ramming, water-cannoning, boarding, and the construction of artificial islands—short of war. Second, at the operational level, the presence of high-value military assets (carrier strike groups, submarines, missile batteries) in proximity to contested features compresses decision time and raises the probability of accidental or escalatory contact; Holmes and Yoshihara (2017) emphasize that China's A2/AD architecture is designed precisely to exploit this compression by making US intervention costly within the first island chain. Third, at the systemic level, alliance commitments—US obligations to Japan under the 1960 treaty, the Taiwan Relations Act's ambiguous security commitments, and the Philippines' Mutual Defense Treaty—create a commitment trap in which a local incident involving a US ally or partner can trigger alliance consultation and, potentially, intervention, thereby transforming a bilateral dispute into a US-China confrontation. The Taiwan Strait adds a distinctive economic mechanism: Taiwan's dominance in advanced semiconductor manufacturing means that any disruption to the strait carries immediate global supply-chain consequences, giving both sides incentives to act preemptively to secure or deny that capacity. The South China Sea adds a legal mechanism: the 2016 arbitration ruling under UNCLOS rejected China's nine-dash line claims, yet China's continued assertion of jurisdiction over the features and waters it controls means that the legal and the operational orders diverge,

producing a persistent gap between de jure and de facto authority that invites testing by all parties.

Scope Conditions: The flashpoint mechanism is most dangerous when three conditions coincide: (1) a change in the status quo that one side interprets as crossing a red line (a Taiwanese declaration of independence, a US naval transit paired with diplomatic upgrading, or a Philippine attempt to resupply a grounded vessel); (2) compressed decision time due to proximity and asset density; and (3) alliance commitments that are perceived as credible enough to deter but not so credible as to be automatically invoked, creating ambiguity that invites probing. The mechanism is less dangerous when diplomatic channels are open, when economic interdependence is high enough to raise the cost of escalation, and when both sides share an interest in avoiding uncontrolled escalation—conditions that have historically held but that erode as military capabilities mature and political trust declines. The mechanism does not imply that war is inevitable; it implies that the probability of inadvertent escalation is structurally elevated relative to other regions.

Observable Implications: If this causal claim holds, one should observe: (a) an increasing frequency of close encounters between military and coast-guard vessels in both flashpoints, documented by the CSIS China Power Project and by US Indo-Pacific Command incident reports; (b) a pattern of gray-zone coercion—actions below the threshold of armed conflict that nonetheless shift the factual baseline—such as the construction and militarization of artificial islands in the South China Sea and the normalization of PLA air and naval activity around Taiwan; (c) alliance signaling in response to incidents, including US freedom of navigation operations (FONOPs), Japanese and Australian statements, and Philippine resupply missions to Second Thomas Shoal; and (d) economic hedging by third parties, including the diversification of semiconductor supply chains away from Taiwan and the rerouting of shipping insurance and logistics. The 2016 arbitration ruling provides a natural experiment: despite the ruling's rejection of China's claims, China continued to control the features it occupied, and the ruling did not prevent subsequent militarization, suggesting that legal outcomes alone do not reshape operational realities without enforcement.

Perspective Note (five traditions in brief): The African perspective, which is primary, approaches the Taiwan Strait and South China Sea flashpoints through the lens of maritime security in the Indian Ocean and the strategic autonomy implications of great-power competition. African scholars and policymakers, drawing on the intellectual tradition of Nkrumah's non-alignment and Nyerere's ujamaa-informed diplomacy, view these flashpoints not as distant crises but as determinants of the maritime security environment in which African states operate. The Indian Ocean is the connective tissue between the Indo-Pacific flashpoints and African littoral states; disruptions in the South China Sea or Taiwan Strait propagate through shipping lanes, insurance markets, and energy prices to affect African economies. African states have a direct interest in the freedom of navigation and in the peaceful resolution of disputes, but they also resist the framing of these flashpoints as justifications for military blocs that could draw African states into great-power competition. The African vantage point reveals that the flashpoints are not merely regional disputes but nodes in a global maritime system whose stability affects all littoral states, and that the legal frameworks governing them—particularly UNCLOS—matter to African states because they provide the only multilateral basis for protecting maritime rights. The African perspective also cautions against the militarization of maritime disputes, noting that African states have historically suffered from the externalization of great-power competition into their waters.

The Chinese perspective treats both flashpoints as core sovereignty issues: Taiwan as an inalienable part of Chinese territory and the South China Sea features as historical Chinese possessions. From this vantage point, the flashpoints are not sources of instability but sites of legitimate Chinese assertion against foreign interference; the 2016 arbitration ruling is rejected as illegitimate because China did not consent to the

tribunal's jurisdiction. The Chinese perspective emphasizes that US military presence and alliance activities are the destabilizing factors, not Chinese actions.

The Russian perspective frames the flashpoints as evidence of US hegemonic overreach and alliance expansion; Moscow views US FONOPs and alliance commitments as provocative and as part of a broader strategy to contain both China and Russia. Russia's own experience with NATO expansion informs its reading of Indo-Pacific alliance architecture as similarly destabilizing.

The Western perspective, particularly the US view, treats the flashpoints as tests of the rules-based order: freedom of navigation, peaceful dispute resolution, and the security of allies. The Western framework emphasizes deterrence and alliance credibility as the mechanisms for preventing escalation, while acknowledging the risk of inadvertent conflict.

The UN perspective centers on UNCLOS and the 2016 arbitration ruling as the legal framework for resolving disputes; it emphasizes that the Convention provides mechanisms for peaceful settlement and that all parties should respect international law. The UN framework does not, however, provide enforcement mechanisms, leaving a gap between legal norms and operational realities that the flashpoints continually expose.

SECTION 2.6 — KEY IDEA 5: Middle powers and hedging — ASEAN centrality, India's strategic autonomy, and Japan's military normalization

Bolded Causal Claim: Middle powers in the Indo-Pacific manage great-power rivalry through hedging strategies that preserve strategic autonomy by maintaining simultaneous economic engagement with China and security alignment with the United States, with ASEAN centrality, India's strategic autonomy, and Japan's military normalization representing three distinct variants of this logic.

Mechanism: Hedging, as theorized in the international relations literature on small and middle powers, is a risk-management strategy that combines engagement and containment elements without fully committing to either. The mechanism operates through three channels. First, economic channel: middle powers maintain deep trade and investment ties with China because the economic cost of decoupling exceeds the security benefit, while simultaneously seeking US security guarantees to hedge against Chinese coercion. Second, institutional channel: middle powers invest in regional institutions—ASEAN, the East Asia Summit, the ASEAN Regional Forum—that provide platforms for dialogue and for asserting collective agency, thereby reducing the binary choice between great powers. Third, military channel: middle powers modernize their armed forces and, in Japan's case, reinterpret constitutional constraints to enable collective self-defense and power projection, thereby increasing their own deterrent capability without fully aligning with US war plans. ASEAN centrality is the institutional expression of hedging: by insisting that regional initiatives be ASEAN-led and ASEAN-hosted, Southeast Asian states preserve a degree of agenda-setting power and prevent the region from being divided into exclusive blocs. India's strategic autonomy, rooted in the Non-Aligned Movement and refined through decades of balancing, manifests as multi-alignment: participation in the Quad alongside deep economic ties with China and Russia, and a refusal to join US-led sanctions or military coalitions that are not directly in India's interest. Japan's military normalization, accelerated under the Abe and Kishida governments, represents a shift from passive reliance on the US alliance toward active contribution to regional deterrence, including the acquisition of counterstrike capabilities and the relaxation of arms export restrictions. Each variant reflects a different assessment of the threat environment, domestic political constraints, and the value of US security guarantees.

Scope Conditions: Hedging is sustainable when three conditions hold: (1) the great powers are not yet in

open conflict, so that economic engagement with China does not trigger US sanctions or alliance rupture; (2) the middle power has sufficient economic and military capacity to make its alignment valuable to both sides, creating leverage; and (3) domestic politics permit a flexible foreign policy without excessive partisan polarization. Hedging becomes unsustainable when great-power competition hardens into blocs, when economic interdependence is weaponized (as in the case of Chinese economic coercion against Australia and South Korea), or when domestic politics demands clearer alignment. The mechanism also assumes that middle powers can accurately assess the intentions and capabilities of both great powers; misperception can lead to over- or under-hedging, with corresponding risks.

Observable Implications: If this causal claim holds, one should observe: (a) ASEAN's continued insistence on centrality in regional forums and its resistance to exclusive security arrangements, evidenced by the ASEAN Outlook on the Indo-Pacific (2019) and the rejection of AUKUS as an ASEAN-led initiative; (b) India's participation in the Quad alongside its refusal to join US sanctions against Russia and its continued purchase of Russian energy and weapons; (c) Japan's defense budget increases, the acquisition of Tomahawk missiles, and the reinterpretation of Article 9 to permit collective self-defense; (d) the proliferation of minilateral arrangements (Quad, AUKUS, the Supply Chain Resilience Initiative) that coexist with, rather than replace, broader multilateral frameworks; and (e) economic data showing continued high trade volumes between middle powers and China despite security tensions. The 2016 South China Sea arbitration ruling and its aftermath provide a test: ASEAN's muted response and the Philippines' subsequent pivot under Duterte illustrate how hedging can override legal victories when economic and security calculations shift.

Perspective Note (five traditions in brief): The African perspective, which is primary, views middle-power hedging in the Indo-Pacific as both a model and a caution for African states navigating great-power competition. African scholarship, drawing on Nkrumah's analysis of neo-colonialism and on Mamdani's work on the politics of naming, recognizes that hedging is a strategy available primarily to states with sufficient economic and military weight; most African states lack the capacity to hedge effectively and are instead subject to the pressures of great-power competition without the leverage to shape its terms. The African vantage point reveals that ASEAN centrality is not merely a Southeast Asian phenomenon but a template for how regional organizations can assert collective agency, and that African regional organizations—the African Union, the Regional Economic Communities—could learn from ASEAN's institutional strategies while adapting them to African contexts. India's strategic autonomy is of particular interest to African states because India's non-aligned tradition resonates with African diplomatic history, and because India's growing engagement with Africa through the India-Africa Forum Summit creates opportunities for partnership that do not require exclusive alignment. Japan's military normalization is viewed with more ambivalence: while Japan's economic engagement with Africa is welcomed, its military expansion raises questions about the militarization of the Indo-Pacific and its potential to draw African states into security commitments. The African perspective thus sees hedging as a rational strategy for capable middle powers but emphasizes that the international system's structure constrains the choices available to weaker states, and that the rhetoric of strategic autonomy can obscure the reality of asymmetric dependence.

The Chinese perspective views middle-power hedging as evidence that US alliance architecture is not universally accepted and that many states prefer engagement with China; it interprets ASEAN centrality as a rejection of US-led blocs and India's strategic autonomy as a refusal to join an anti-China coalition. China's own diplomacy emphasizes economic interdependence as the foundation of regional order and criticizes US efforts to militarize the region.

The Russian perspective sees hedging as a rational response to US hegemony and views middle-power auton-

omy as a check on unipolar dominance; Moscow's own partnerships with India and its outreach to ASEAN reflect an effort to cultivate relationships outside the US alliance system. Russia's critique of US alliance expansion extends to the Indo-Pacific, where it sees AUKUS and the Quad as destabilizing.

The Western perspective, particularly the US view, interprets hedging with ambivalence: it welcomes middle-power contributions to regional security (Japan's normalization, India's Quad participation) while worrying that hedging may dilute deterrence and provide China with economic leverage. The Western framework tends to frame the choice as binary—alignment or accommodation—and struggles to accommodate the strategic logic of non-alignment.

The UN perspective emphasizes that middle-power hedging should be conducted within the framework of international law and that regional institutions should contribute to peace and security; it views ASEAN centrality as consistent with the UN Charter's emphasis on regional arrangements under Chapter VIII, provided they do not undermine collective security. The UN framework does not, however, provide guidance on how states should balance competing great-power pressures, leaving a normative gap that hedging fills pragmatically.

2.7.1 African Perspective (PRIMARY)

The African vantage point on Indo-Pacific maritime strategy and alliance architecture does not begin with the South China Sea or the Taiwan Strait. It begins with the Indian Ocean as an African space — a body of water whose western littoral is African, whose northern reaches wash the shores of the Horn and the Red Sea, and whose southern rim is shaped by the Cape of Good Hope and the Mozambique Channel. From this vantage, the "Indo-Pacific" is not a discovered geography but a constructed strategic imaginary, one that renders African littoral states visible only as peripheral objects of great-power competition while centering the maritime concerns of the United States, China, Japan, and India. The African perspective therefore insists on a prior question: whose ocean is the Indo-Pacific, and whose security does its architecture serve?

This question is not merely rhetorical. It is grounded in a long tradition of African political thought that treats sovereignty, development, and non-alignment as inseparable. Kwame Nkrumah's critique of neocolonialism — the argument that formal independence without economic sovereignty reproduces subordination — applies with particular force to maritime domains, where African states often lack the naval capacity to patrol their own exclusive economic zones, monitor illegal, unreported, and unregulated (IUU) fishing, or interdict trafficking in arms, narcotics, and persons. Julius Nyerere's articulation of ujamaa and non-alignment was not isolationism but a principled refusal to be conscripted into bloc politics; it informs contemporary African strategic autonomy, which seeks to engage all powers without becoming a theater of their competition. Amílcar Cabral's insistence on "return to the source" — the recovery of indigenous analytical categories — underwrites the demand that African maritime security be theorized from African conditions rather than imported from Western sea-power doctrine.

The theoretical lineage here is distinct. Walter Rodney's *How Europe Underdeveloped Africa* established that African underdevelopment was not a natural condition but a historical product of extraction; applied to the maritime domain, this means that the contemporary weakness of African naval capacity is not an accident of geography but a legacy of colonial economies oriented toward extraction rather than coastal defense. Mahmood Mamdani's analysis of the bifurcated state — the colonial creation of separate legal and political regimes for "citizens" and "subjects" — illuminates why postcolonial maritime governance in Africa

often remains fragmented, with coastal communities governed by customary tenure systems that are poorly integrated with statutory maritime law. Jean-François Bayart's concept of "extraversion" — the strategic use of external resources and relationships by African elites — explains how African states navigate great-power competition not as passive victims but as agents seeking rents, security guarantees, and development finance, even as this navigation risks reproducing dependency.

The African perspective thus reconstructs maritime security as a development and livelihood issue before it is a great-power competition issue. The African Union's 2050 Africa's Integrated Maritime Strategy (AIMS 2050), adopted in 2014, and the Lomé Charter on Maritime Security and Safety and Development in Africa (2016) frame the maritime domain in terms of the "blue economy" — sustainable exploitation of marine resources, coastal livelihoods, and regional integration. Piracy in the Gulf of Guinea and off the Horn of Africa is understood not merely as a threat to international shipping but as a symptom of coastal underdevelopment, weak governance, and the collapse of artisanal fishing economies. Kwesi Aning's work on maritime security in West Africa emphasizes that effective responses require addressing root causes — poverty, unemployment, and state fragility — rather than purely naval interdiction. This is a contribution the other four perspectives largely occlude: they treat maritime security as a function of naval balance and alliance architecture, whereas the African perspective treats it as a function of coastal development and state capacity.

The African vantage point also reveals what the "Indo-Pacific" construct occludes about geography itself. The construct, popularized in strategic discourse by Shinzo Abe's 2007 address to the Indian Parliament and subsequently adopted by the United States, Australia, Japan, and India, draws a maritime arc from the western Pacific through the Indian Ocean to the eastern coast of Africa. Yet in practice, the strategic attention and alliance architecture it generates — the Quad, AUKUS, the hub-and-spokes system — concentrate on the western Pacific and the South China Sea. African littoral states of the Indian Ocean (Kenya, Tanzania, Mozambique, South Africa, Madagascar, Mauritius, Seychelles, Djibouti, Somalia) appear in this framing primarily as sites of great-power basing competition — the Chinese naval facility in Djibouti, the US base at Camp Lemonnier, the French presence in Réunion and Mayotte — rather than as sovereign actors with their own maritime strategies. The African perspective insists that the Indian Ocean is not merely a transit corridor for Indo-Pacific strategy but a space of African sovereignty, development, and security.

Strategic autonomy, in the African rendering, is not hedging in the sense that Western analysts often use the term — a tactical balancing between great powers. It is a principled commitment to non-alignment rooted in the Bandung Conference of 1955 and the Non-Aligned Movement, updated for a multipolar era. African states participate in the Indian Ocean Rim Association (IORA), engage with China's Belt and Road Initiative and its Maritime Silk Road, maintain security partnerships with the United States and France, and seek to avoid being drawn into US-China competition. This is not incoherence but a rational response to structural position: African states are too weak to balance great powers militarily, too dependent on trade and investment to afford alienation of any major partner, and too committed to sovereignty to accept subordination to any bloc. The African perspective thus contributes the insight that what Western analysts call "hedging" may be better understood as "strategic autonomy" — a normative commitment, not merely a tactical calculation.

The African perspective also draws on epistemic decolonization. Siba N'Zatioula Grovogui's work on sovereignty and international relations argues that the international order is not a neutral framework but a historically constructed hierarchy that privileges Western states; applied to maritime law, this means that the United Nations Convention on the Law of the Sea (UNCLOS), while providing a legal framework, embeds assumptions about state capacity, technological capability, and maritime enforcement that favor developed states. Oyèrónkẹ́ Oyěwùmí's critique of colonial epistemology — the argument that Western categories of

knowledge are not universal but culturally specific — extends to strategic studies, where concepts like "sea power," "deterrence," and "freedom of navigation" are treated as natural rather than as products of particular historical experiences. Sylvia Tamale's decolonial feminism adds that maritime security discourse is gendered: the securitization of maritime spaces affects women in coastal communities disproportionately, through the disruption of fishing livelihoods, the militarization of coastal zones, and the gendered dimensions of trafficking.

Achille Mbembe's concept of necropolitics — the power to determine who may live and who must die — illuminates the darker dimensions of Indo-Pacific maritime strategy from an African vantage. The militarization of the Indian Ocean, the proliferation of naval bases, and the securitization of maritime routes create zones of exception where African migrants, fishers, and coastal communities bear the costs of great-power competition. The Mediterranean and the Red Sea have become sites of mass death for African migrants; the Indian Ocean's militarization risks extending this logic. The African perspective thus asks not only who controls the sea but whose lives are expendable in the process.

What does the African perspective contribute that the other four cannot? First, it reveals the Indo-Pacific as a strategic construct with geographic exclusions, not a neutral description of a region. Second, it reframes maritime security as a development and livelihood issue, not merely a naval balance issue. Third, it offers strategic autonomy as a principled normative commitment with deep historical roots, not merely tactical hedging. Fourth, it exposes the colonial continuities in maritime governance and the epistemic assumptions embedded in strategic concepts. Fifth, it centers the human costs of maritime militarization on coastal communities and migrants.

What does it occlude? The African perspective may understate the genuine security dilemma dynamics that drive US-China competition; its emphasis on development and sovereignty may not fully address the coercive dimensions of Chinese maritime expansion in the South China Sea or the Taiwan Strait. It may romanticize non-alignment, understating the ways in which African states are already entangled in great-power competition through debt, basing agreements, and arms purchases. Its prescriptions — enhanced African naval capacity, regional maritime governance, blue economy development — are often aspirational given resource constraints. And its critique of the Indo-Pacific construct, while valid, may not offer a constructive alternative framework for addressing the very real security challenges in the western Pacific. The African perspective is strongest as a corrective and a complement, not as a standalone grand strategy.

2.7.2 Chinese Perspective

The Chinese perspective on Indo-Pacific maritime strategy is organized around three core commitments: sovereignty and territorial integrity, the legitimacy of China's maritime claims, and the critique of the "Indo-Pacific" as a US-led containment construct. Steel-manned from within, this perspective is not merely reactive; it is grounded in a coherent strategic worldview that draws on China's historical experience, its reading of international law, and its assessment of the regional balance of power.

On sovereignty, China's position is that the South China Sea islands and their adjacent waters have been Chinese territory "since ancient times" — a claim articulated in official documents and maps, including the nine-dash line. The 2016 arbitration ruling by the Permanent Court of Arbitration (PCA) in *Philippines v. China* rejected this claim, ruling that China's historic rights claims were incompatible with UNCLOS and that the nine-dash line had no legal basis. China rejected the ruling as "null and void," arguing that the tribunal

lacked jurisdiction and that the ruling was a product of US manipulation. From the Chinese perspective, the ruling is not a neutral legal determination but a political act by a tribunal that China did not consent to and that reflects Western legal hegemony. This is not simply defiance; it is a principled (if contested) position on the limits of compulsory dispute settlement and the sovereignty of states over their territorial claims.

On A2/AD (anti-access/area denial), China's strategy is framed as defensive. The first island chain — running from Japan through Taiwan and the Philippines to Borneo — is seen as a geographic barrier that the United States and its allies use to contain China. China's development of anti-ship ballistic missiles (the DF-21D and DF-26), submarines, and integrated air defense systems is understood as a response to US naval dominance and the threat of intervention in a Taiwan contingency. Holmes and Yoshihara (2017) analyze this as China's pursuit of "sea denial" — the ability to prevent US forces from operating freely in the western Pacific — rather than "sea control." From the Chinese perspective, this is not expansionism but deterrence: the United States maintains a network of bases and alliances on China's periphery, and China is merely developing the capabilities to defend its coastline and prevent coercion.

The critique of the "Indo-Pacific" as a construct is central. Chinese analysts and officials argue that the term is a geopolitical project designed to contain China by linking the Pacific and Indian Oceans into a single strategic theater dominated by US alliances. The "free and open Indo-Pacific" (FOIP) concept, advanced by the United States and Japan, is seen as code for US hegemony and alliance expansion. China prefers the term "Asia-Pacific," which it argues is more inclusive and less confrontational. The Belt and Road Initiative (BRI) and the Maritime Silk Road are presented as alternatives to the Indo-Pacific framework — economic connectivity rather than military containment. The Chinese perspective thus contributes the insight that geographic concepts are not neutral but politically constructed, and that the Indo-Pacific framing serves particular strategic interests.

On alliance architecture, China views the hub-and-spokes system, the Quad, and AUKUS as instruments of containment. The Quad — comprising the United States, Japan, India, and Australia — is seen as an "Asian NATO" in embryo, despite its members' denials. AUKUS, with its provision of nuclear-powered submarines to Australia, is viewed as a destabilizing escalation that undermines the nuclear non-proliferation regime and intensifies the arms race. China's perspective is that these alliances are not defensive but offensive, designed to maintain US primacy and constrain China's rise.

What does the Chinese perspective occlude? It tends to treat China's maritime claims as historically self-evident, understating the contested nature of sovereignty over the South China Sea and the legitimate security concerns of neighboring states. It frames A2/AD as purely defensive, obscuring its coercive implications for Taiwan and other claimants. It dismisses the Indo-Pacific as a US construct while advancing its own strategic concepts (BRI, community of shared future) that are equally politically motivated. And it underestimates the extent to which China's own actions — island-building, coast guard harassment, maritime militia operations — have driven regional states toward closer alignment with the United States.

2.7.3 Russian Perspective

The Russian perspective on Indo-Pacific maritime strategy is shaped by Russia's broader critique of US-led unipolarity and its strategic partnership with China. Steel-manned from within, this perspective treats the Indo-Pacific as an extension of US containment strategy, analogous to NATO expansion in Europe, and views the alliance architecture as a threat to multipolarity and regional stability.

Russia's core argument is that the United States is constructing a global network of alliances and partnerships designed to maintain hegemony, and that the Indo-Pacific is the latest theater of this effort. The Quad, AUKUS, and the strengthening of the hub-and-spokes system are seen as instruments of containment not only of China but of Russia's own strategic interests. Russia's 2023 Foreign Policy Concept explicitly identifies the "Indo-Pacific" as a US construct and emphasizes Russia's commitment to a "Greater Eurasian Partnership" as an alternative. From the Russian perspective, the US is attempting to create an "Asian NATO" that would extend the logic of military blocs into a region that has historically resisted them.

On A2/AD and sea denial, Russia is ambivalent. It does not share China's specific maritime claims, but it supports China's right to develop defensive capabilities in response to US pressure. Russia's own military modernization — including its Pacific Fleet, based at Vladivostok, and its development of hypersonic weapons — is framed as a response to US and NATO encirclement. The Russian perspective thus aligns with China's critique of US maritime dominance while maintaining its own strategic interests in the Pacific, including its dispute with Japan over the Kuril Islands and its naval presence in the Sea of Japan and the Sea of Okhotsk.

On middle powers and hedging, Russia views ASEAN centrality with some sympathy, seeing it as a counterweight to US-led alliance structures. However, Russia is skeptical of ASEAN's ability to resist US pressure, particularly given the growing US-Philippines and US-Vietnam security relationships. Russia's own engagement with ASEAN — through the ASEAN-Russia Dialogue Partnership and the East Asia Summit — is framed as supporting multipolarity and a "polycentric" world order. India's strategic autonomy is viewed favorably, as India's refusal to fully align with the United States creates space for Russia-India cooperation, including in defense and energy.

On the Taiwan Strait and South China Sea, Russia officially supports China's position on Taiwan (the "one China" principle) and is critical of US arms sales to Taiwan and freedom of navigation operations (FONOPs). Russia views US FONOPs in the South China Sea as provocative and as violations of coastal state sovereignty. However, Russia's own interests in the region are limited; it is primarily concerned with the precedent that US alliance expansion sets for its own security environment.

What does the Russian perspective occlude? It tends to reduce all US strategic initiatives to containment, understating the genuine security concerns that drive US and allied policy — including China's island-building, coercion of neighbors, and military modernization. It aligns with China's position on maritime disputes without fully engaging with the legal arguments or the interests of smaller states. It overstates the coherence of a "multipolar" alternative, given Russia's own limited economic and military capacity in the Indo-Pacific. And it underestimates the extent to which its own actions — the invasion of Ukraine, nuclear saber-rattling — have accelerated the very alliance consolidation it criticizes.

2.7.4 Western Perspective

The Western perspective — encompassing the United States and its allies (Japan, Australia, the United Kingdom, France, and others) — is organized around the defense of a rules-based maritime order, freedom of navigation, and alliance architecture as instruments of deterrence and stability. Steel-manned from within, this perspective treats the Indo-Pacific as a region of vital strategic interest whose maritime order is threatened by China's coercive behavior and revisionist claims.

On the "Indo-Pacific" as a construct, the Western perspective treats it as a recognition of strategic reality, not

a geopolitical project. The term reflects the growing economic and strategic integration of the Indian and Pacific Oceans, the rise of China as a maritime power, and the need for a coordinated response. The US "free and open Indo-Pacific" (FOIP) strategy, articulated in the 2017 National Security Strategy and elaborated in subsequent documents, emphasizes freedom of navigation, open markets, and respect for sovereignty. From this perspective, the Indo-Pacific is not containment but a positive vision for regional order.

On A2/AD and sea denial, the Western perspective — particularly as articulated by Friedberg (2018) and Holmes and Yoshihara (2017) — treats China's anti-access strategy as a direct challenge to US military access and regional stability. The first island chain is not a containment barrier but a geographic reality that China seeks to penetrate and dominate. China's island-building in the South China Sea, its development of anti-ship missiles, and its harassment of neighboring states' vessels are seen as coercive actions that undermine the rules-based order. The Western response includes FONOPs, enhanced forward presence, and the development of new capabilities (long-range precision strike, undersea warfare, distributed maritime operations) to maintain access and deterrence.

On alliance architecture, the Western perspective treats the hub-and-spokes system, the Quad, and AUKUS as essential instruments of deterrence and burden-sharing. The hub-and-spokes system — bilateral alliances between the United States and Japan, South Korea, Australia, the Philippines, and Thailand — is seen as a proven framework for regional security. The Quad is viewed as a flexible, non-binding mechanism for coordinating on maritime security, infrastructure, and technology. AUKUS is understood as a deepening of the US-UK-Australia partnership, providing Australia with nuclear-powered submarines that enhance its ability to contribute to regional deterrence. The Western perspective acknowledges the costs — alliance management challenges, the risk of escalation, the strain on non-proliferation norms — but argues that these are outweighed by the need to maintain a favorable balance of power.

On the Taiwan Strait and South China Sea flashpoints, the Western perspective treats Taiwan as a critical node in the first island chain and a democratic partner whose security is tied to regional stability. The South China Sea is seen as a test case for the rules-based order: China's rejection of the 2016 arbitration ruling and its continued coercion of claimant states are viewed as undermining UNCLOS and international law. FONOPs are defended as necessary to uphold the principle that the seas are global commons, not subject to unilateral claims.

On middle powers and hedging, the Western perspective is ambivalent. It welcomes Japan's military normalization and India's growing strategic engagement, but is concerned about hedging by ASEAN states and others. The Western framework tends to frame the choice as binary — alignment or accommodation — and struggles to accommodate the strategic logic of non-alignment. It views ASEAN centrality as useful for regional diplomacy but insufficient for security, and it worries that hedging may dilute deterrence and provide China with economic leverage.

What does the Western perspective occlude? It tends to universalize its own strategic concepts — "freedom of navigation," "rules-based order," "deterrence" — treating them as neutral rather than as products of particular historical experiences and interests. It may understate the extent to which US actions — FONOPs, alliance expansion, arms sales — contribute to security dilemmas and regional tensions. It often frames middle-power hedging as a problem to be solved rather than a rational response to structural position. And it may not fully reckon with the human and environmental costs of maritime militarization in the region.

2.7.5 UN Perspective

The UN perspective on Indo-Pacific maritime strategy is anchored in the United Nations Convention on the Law of the Sea (UNCLOS), the UN Charter's provisions on the peaceful settlement of disputes, and the broader framework of international law. Steel-manned from within, this perspective treats the maritime order as a legal construct, not a strategic one, and insists that disputes be resolved through legal mechanisms rather than coercion or alliance politics.

UNCLOS is the foundational document. Adopted in 1982 and in force since 1994, it establishes the legal framework for maritime zones — territorial seas, exclusive economic zones, continental shelves, and the high seas — and provides mechanisms for dispute settlement, including compulsory arbitration under Part XV. The 2016 arbitration ruling in *Philippines v. China* is the most significant application of this framework in the Indo-Pacific. The Permanent Court of Arbitration ruled that China's nine-dash line had no legal basis, that China's island-building violated the Philippines' sovereign rights, and that China's harassment of Philippine vessels was unlawful. From the UN perspective, this ruling is a landmark in the development of international maritime law and a validation of the UNCLOS dispute settlement system.

However, the UN perspective also acknowledges the limits of this framework. UNCLOS does not resolve sovereignty disputes over land territory; it provides a framework for maritime entitlements but cannot determine who owns the islands. China's rejection of the ruling highlights the enforcement gap: international law depends on state consent and compliance, and there is no supranational enforcement mechanism. The UN perspective thus recognizes that law alone cannot resolve geopolitical conflicts, but insists that it provides a normative baseline and a framework for peaceful settlement.

On A2/AD and sea denial, the UN perspective is cautious. It does not take a position on the legitimacy of military capabilities per se, but it emphasizes that the use of force or the threat of force in maritime disputes is prohibited by the UN Charter (Article 2(4)) and by UNCLOS. FONOPs are viewed as lawful exercises of navigational rights, but the UN perspective also notes that they can be provocative and that the line between lawful navigation and coercive demonstration is not always clear.

On alliance architecture, the UN perspective is ambivalent. The UN Charter recognizes the right of collective self-defense (Article 51) and the role of regional arrangements (Chapter VIII), but it also emphasizes that regional arrangements should not undermine collective security or the authority of the Security Council. The Quad, AUKUS, and the hub-and-spokes system are viewed as legitimate security arrangements, but the UN perspective warns that they can exacerbate security dilemmas and that they should be conducted transparently and in accordance with international law. The UN framework does not provide guidance on how states should balance competing great-power pressures, leaving a normative gap that hedging fills pragmatically.

On middle powers and hedging, the UN perspective emphasizes that middle-power hedging should be conducted within the framework of international law and that regional institutions should contribute to peace and security. It views ASEAN centrality as consistent with the UN Charter's emphasis on regional arrangements under Chapter VIII, provided they do not undermine collective security. The UN perspective supports the peaceful resolution of disputes through dialogue and legal mechanisms, and it views the 2016 arbitration ruling as a model for how maritime disputes can be addressed, even if compliance cannot be compelled.

On the Taiwan Strait, the UN perspective is constrained by the fact that Taiwan is not a UN member state and that the UN does not take a position on Taiwan's status. The UN framework emphasizes the peaceful resolution of cross-strait differences and the avoidance of the use of force. On the South China Sea, the UN perspective supports the application of UNCLOS and the peaceful settlement of disputes, and it has

welcomed the 2016 ruling as a contribution to the rule of law.

What does the UN perspective occlude? It tends to treat international law as a neutral framework, understating the ways in which law is shaped by power and the interests of dominant states. It may be overly optimistic about the capacity of legal mechanisms to resolve deeply political conflicts. It does not address the security dilemma dynamics that drive alliance formation and military modernization. And it may not fully reckon with the enforcement gap — the fact that international law depends on state compliance and that there is no supranational authority to compel adherence. The UN perspective is strongest as a normative baseline and a framework for dialogue, not as a standalone strategy for managing great-power competition.

2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Frames maritime order through Indian Ocean and Gulf of Guinea security, blue-economy development, and strategic autonomy; exposes how Indo-Pacific legal-military competition can marginalize African maritime governance	Underweights the intensity of great-power naval competition and the material drivers of alliance formation in the Western Pacific	Sovereignty, non-alignment, and capacity-building; international law as a tool for weaker states, not a substitute for power	AU 2050 Africa's Integrated Maritime Strategy; Lomé Charter; ITLOS/ICJ maritime cases involving African states; Indian Ocean Rim Association	Western: African states lack the naval capacity to enforce maritime order alone, so legalism without power is insufficient

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Chinese	Articulates A2/AD and sea denial as defensive strategies; critiques "Indo-Pacific" as a containment construct; asserts historical rights and sovereignty over claimed features	Downplays UNCLOS obligations and the freedom-of-navigation principle; treats historical claims as self-evident; obscures the coercive dimension of island-building	Sovereignty, non-interference, and multipolar equality; rejection of externally imposed legal adjudication	Nine-dash line; artificial island construction and militarization; PLAN modernization; rejection of the 2016 arbitration award	UN/Western: the 2016 tribunal authoritatively rejected the nine-dash line under UNCLOS
Russian	Critiques US alliance expansion and unipolar legalism; champions multipolarity and bilateral dispute resolution; aligns with China against US hegemony	Ignores China's assertiveness and the security concerns of smaller states; treats all US-led initiatives as aggressive by definition	Anti-hegemony, multipolarity, and great-power concert; skepticism of third-party adjudication	Statements opposing the Quad and AUKUS; support for China's bilateral approach; arms and naval cooperation with China	Western: Russia's own revisionism (e.g., Crimea) undermines its critique of others' rule-breaking

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Western	Advances freedom of navigation, alliance architecture (hub-and-spokes, Quad, AUKUS), and the rules-based order; provides material balancing against coercion	May overstate the China threat and understate legitimate Chinese security concerns; can conflate US interests with universal rules	Liberal international order, FON, collective defense, and legalism backed by power	FONOPs; Quad summits; AUKUS; 2016 ruling welcomed as rule-of-law contribution	Chinese: containment disguised as rules; US FONOPs as provocations, not neutral enforcement
UN	Provides UNCLOS, the arbitration framework, and a normative baseline for peaceful dispute settlement; affirms that even great powers are subject to legal process	Treats international law as neutral, understating power's role in shaping law; overestimates legal mechanisms' capacity to resolve political conflicts; ignores enforcement gap and security dilemma	Rule of law, peaceful settlement, and institutionalized dispute resolution	2016 PCA award; UNCLOS Part XV; ITLOS and ICJ maritime jurisprudence	Chinese: tribunal lacked jurisdiction; ruling unenforceable and politically motivated

2.8 WORKED EXAMPLE (I do)

Case: The 2016 South China Sea Arbitration Ruling — How Did It Reshape the Regional Maritime Order?

On 12 July 2016, the arbitral tribunal constituted under Annex VII of the United Nations Convention on the Law of the Sea (UNCLOS) in *Philippines v. China* issued its award. The tribunal rejected China's claim

to historic rights within the nine-dash line, found that none of the features in the Spratly Islands generate an exclusive economic zone or continental shelf, and held that China's island-building, fishing, and law-enforcement activities violated UNCLOS obligations toward the Philippines. China rejected the award as "null and void" and refused to participate. The case asks how this ruling reshaped the regional maritime order.

Levels of analysis. At the *individual* level, the ruling was shaped by the agency of specific leaders: President Benigno Aquino III's decision to file the case in January 2013 despite bilateral pressure; Xi Jinping's choice to reject adjudication and accelerate island construction; President Rodrigo Duterte's subsequent pivot toward Beijing after 2016; and the calibrated US response under the Obama administration, which welcomed the ruling without enforcing it. Individual risk tolerance and domestic political incentives determined whether legal victory translated into strategic gain. At the *state* level, the Philippines acted as a small state deploying "lawfare" against a great power; China asserted sovereignty and refused external adjudication; the United States conducted freedom-of-navigation operations (FONOPs) to signal non-recognition of excessive claims; and Vietnam, Malaysia, and Indonesia recalibrated their own positions. At the *systemic* level, the ruling unfolded within intensifying US-China strategic competition, the erosion of unipolarity, and a deepening security dilemma in the Western Pacific in which each side's defensive measures appeared offensive to the other. At the *transnational* level, UNCLOS functioned as a transnational legal regime; roughly one-third of global maritime trade transits the South China Sea; multinational energy firms and fishing fleets operated across contested waters; and international legal scholars and civil-society actors shaped the ruling's reception and legitimation.

Mechanism. The ruling reshaped the order through three mechanisms. First, *legal clarification*: by authoritatively interpreting UNCLOS, the tribunal removed ambiguity about maritime entitlements, raising the reputational and diplomatic costs of China's claims even absent enforcement. Second, *strategic catalysis*: the clarified legal baseline provided political cover for US FONOPs and for smaller states to resist coercion, but it also hardened China's position, accelerating island militarization and People's Liberation Army Navy (PLAN) modernization. Third, *alliance realignment*: the non-enforcement of the award exposed the gap between legal victory and material power, prompting the Philippines under Duterte to seek accommodation with Beijing (2016–2022) and, under Ferdinand Marcos Jr., to re-tighten with Washington through expanded Enhanced Defense Cooperation Agreement (EDCA) sites in 2023 and trilateral US-Japan-Philippines coordination. The net effect is that the ruling did not change facts on the water — China's artificial islands and military installations remain — but it shifted the diplomatic and legal baseline, intensified the security dilemma, and accelerated both alliance consolidation and China's anti-access/area-denial (A2/AD) buildup.

Perspective reconstruction. From an African vantage point, the 2016 ruling illustrates both the promise and the limits of international legalism for weaker states. African states have historically relied on UNCLOS and on tribunals such as the International Tribunal for the Law of the Sea (ITLOS) and the International Court of Justice (ICJ) to protect maritime zones — as in the Ghana–Côte d'Ivoire ITLOS case (2017) and the Kenya–Somalia ICJ case (2021) — and thus have a stake in the integrity of the law of the sea. The ruling's rejection by a great power resonates with African experiences of selective compliance by powerful states and reinforces skepticism about the enforceability of international law against the strong. At the same time, African maritime security agendas — the African Union's 2050 Africa's Integrated Maritime Strategy, the Lomé Charter, and Indian Ocean Rim Association concerns — emphasize that legal clarity must be paired with capacity-building and cooperative security. The African perspective thus reads the ruling as a normative gain whose practical value depends on power and coalition-building, and it warns that the Indo-Pacific's legal-military competition should not divert attention from African maritime governance, piracy, and blue-

economy development in the Indian Ocean and Gulf of Guinea. The Chinese perspective holds that the tribunal lacked jurisdiction because China had opted out of compulsory dispute settlement under UNCLOS Article 298, that the ruling was a product of US-backed lawfare, and that it violated China's sovereignty and historical rights; it treats the nine-dash line as a legitimate expression of historical title, views the ruling as an illegitimate attempt to constrain China's rise, and reads it as having accelerated China's defensive militarization of the islands and strengthened domestic resolve to resist external pressure. The Russian perspective treats the ruling as an example of Western-led legal instrumentalization against a rising power, consistent with its broader critique of US alliance expansion and unipolar legalism; Moscow has supported China's position that the dispute should be resolved bilaterally rather than through third-party adjudication, has criticized US FONOPs as provocative, and reads the ruling as part of a pattern of using international institutions to constrain non-Western powers. The Western perspective treats the ruling as a landmark affirmation of the rule of law at sea, validating UNCLOS as the governing framework and rejecting expansive historical claims; it provided legal grounding for FONOPs and allied coordination, framed China as a rule-breaker, and is seen as having reshaped the diplomatic baseline even though it did not change physical control. The UN perspective emphasizes the ruling as an exercise of the UNCLOS dispute-settlement system, affirming that even great powers are subject to legal process and that the law of the sea provides a framework for peaceful resolution; it highlights the ruling's contribution to clarifying maritime entitlements and its role in upholding the convention, while acknowledging the enforcement gap and the need for state compliance.

Explicit adjudication. The Western perspective best explains how the ruling reshaped the *strategic* order: it catalyzed alliance realignment, legitimized FONOPs, and framed the diplomatic competition. But it underweights the ruling's legal-normative content and the agency of smaller states. The UN perspective best explains the *legal* content and its contribution to norm clarification, but it cannot explain non-compliance or the security dilemma. The Chinese perspective explains non-compliance and domestic legitimation but occludes the ruling's legal validity. The African perspective correctly identifies the enforcement gap and the risk of legalism without power, but it is less directly explanatory of the specific Indo-Pacific dynamics. On balance, the case is best explained by a synthesis in which the Western perspective accounts for the strategic reshaping and the UN perspective accounts for the legal baseline; neither alone suffices, and the Chinese perspective is necessary to explain why the ruling did not change facts on the water. The ruling reshaped the order not by enforcing compliance but by reconfiguring the diplomatic and legal terrain on which subsequent competition unfolded.

SECTION 2.9 PROBLEM PAIR (We do)

1. **Trigger versus shift:** Identify what changed in Australia's submarine program on 15 September 2021 and explain why cancelling the Attack-class program was not merely a procurement decision but a redefinition of Australia's alliance obligations and capability trajectory.

2. **Levels of analysis:** Reconstruct the France–Australia–United States triangle at the state, systemic, and transnational levels. State what each level explains well and what it tends to obscure.

3. **Mechanism adjudication:** Compare two explanations for France's diplomatic rupture—(a) material loss of a major defense contract and (b) status injury plus erosion of alliance trust. Which is better supported, and what evidence would distinguish them?

4. **Perspective reconstruction:** Reconstruct the African/Indian Ocean, Chinese, Russian, Western, and UN perspectives on AUKUS, giving one genuine contribution and one occlusion for each.

5. **Regional calculus:** Explain how AUKUS altered ASEAN hedging, Australian dependence on the United States and United Kingdom, and China's threat perception.

6. **Falsifiers:** List three observations that would weaken the claim that AUKUS produced durable Indo-Pacific polarization.

MODEL ANSWER

The AUKUS announcement of 15 September 2021 was not simply a change in Australia's submarine supplier; it was a strategic reorientation. Australia terminated its Attack-class program with France's Naval Group and committed, with the United States and United Kingdom, to acquiring nuclear-powered submarines. The immediate effect was diplomatic: France recalled its ambassadors from Australia and the United States, and French leaders publicly accused Australian counterparts of deception. The deeper effect was structural. Australia moved from a conventional submarine designed for regional sea denial toward a longer-range, higher-endurance platform intended to operate with US and UK forces across the Indo-Pacific. That shift implied greater interoperability, shared maintenance and training pipelines, and a tighter operational dependence on Washington and London. It also meant that Australia accepted a multi-decade capability gap, because nuclear-powered submarines would not be available in the near term and would require new industrial, regulatory, and safeguards arrangements.

France's rupture is best explained by the interaction of material loss and status injury, not by either alone. The contract loss was enormous in commercial and industrial terms, and it damaged France's credibility as a defense partner in the Indo-Pacific. Yet the recall of ambassadors and the intensity of French rhetoric suggest that the injury was also relational: Paris believed it had been treated as a transactional supplier rather than a strategic partner, despite France's own Indo-Pacific territories, bases, and resident-power claims. A purely commercial explanation would predict a legal and financial dispute; the actual response was diplomatic and symbolic. A purely status-based explanation, however, would struggle to account for the scale of the industrial setback and the subsequent settlement negotiations. The stronger account is that France experienced both a capability-market loss and a trust rupture, with the latter amplifying the former.

At the state level, the episode shows Australia prioritizing long-term deterrence and alliance integration over short-term diplomatic costs. At the systemic level, it reflects intensified US-China rivalry and the consolidation of an Anglo-American maritime core within the wider Indo-Pacific. At the transnational level, it involves industrial supply chains, nonproliferation norms, and the politics of technology transfer. The state level explains Canberra's decision but understates the alliance shock; the systemic level explains US and Chinese reactions but can flatten Australian agency; the transnational level captures safeguards and industrial constraints but risks treating submarines as mere technology rather than political commitments.

The five perspectives reveal different contributions and blind spots. The African and Indian Ocean perspective highlights how great-power submarine competition can militarize maritime space far from the original flashpoint, raising concerns for littoral states whose trade depends on secure sea lanes and who lack anti-submarine capacity. Its occlusion is that it may underweight the deterrence logic driving Australia's choice. The Chinese perspective treats AUKUS as evidence of encirclement and an arms-race catalyst, contributing a necessary critique of alliance expansion; its occlusion is that it often ignores Australia's agency and the de-

fensive framing of SSN acquisition. The Russian perspective frames AUKUS as another instance of US-led bloc politics, contributing a systemic critique of Western alliance architecture; its occlusion is that it offers little insight into Indo-Pacific maritime geography or ASEAN hedging. The Western perspective emphasizes deterrence, interoperability, and freedom of navigation; its occlusion is that it can normalize alliance dependence as natural and understate the diplomatic costs to partners such as France. The UN perspective focuses on UNCLOS, IAEA safeguards, and nonproliferation; its contribution is to keep the debate anchored in legal frameworks, while its occlusion is that law alone cannot resolve strategic competition or alliance politics.

Regionally, AUKUS complicated ASEAN centrality by introducing a high-end military technology arrangement outside ASEAN-led forums. Some Southeast Asian states expressed concern about nuclearization and escalation, while others quietly welcomed stronger balancing against China. Australia gained long-term capability but accepted deeper dependence on US and UK industrial and operational systems. China's threat perception likely intensified, though AUKUS also gave Beijing a propaganda and diplomatic opening to portray Western powers as destabilizing. The claim that AUKUS produced durable polarization would be weakened if three developments occurred: Australia significantly delays or scales back SSN acquisition; France and Australia rebuild sustained defense-industrial cooperation; or regional states normalize AUKUS through participation, exercises, or institutional dialogue without heightened militarization. Conversely, polarization would be strengthened if SSN deployments became routine, if China expanded its own undersea capabilities in response, and if ASEAN states were forced into explicit alignment choices.

SECTION 2.10 INDEPENDENT MEMO (You do)

(a) Case description (150–200 words):
An East African Indian Ocean littoral state with limited antisubmarine warfare capacity, heavy dependence on secure sea lanes for trade, and a stated commitment to strategic autonomy must assess the implications of AUKUS for its maritime security. Australia's planned nuclear-powered submarine capability, US–UK technology transfer, and China's likely countermeasures may increase great-power submarine activity in the western Indian Ocean. The state must distinguish direct operational effects, such as more transits, exercises, and surveillance, from alliance-political effects, such as pressure to align with the United States, China, or France, and from normative effects, such as precedents for naval nuclear propulsion under IAEA safeguards. It must also consider France's continued Indian Ocean presence, ASEAN hedging patterns as a possible model, and African Union maritime-security frameworks. The memo should not assume that AUKUS is either stabilizing or destabilizing. It should identify mechanisms, compare perspectives, and state what evidence would change the conclusion. The final recommendation should be conditional across three scenarios: intensified great-power submarine competition, managed coexistence, or partial reversal of AUKUS.

(b) Required memo headings as prompts:
- **Mechanism:** Identify the causal chain linking AUKUS to this state's maritime security, separating operational, alliance-political, and normative effects.
- **Perspective reconstruction:** Reconstruct the African, Chinese, Russian, Western, and UN perspectives on the case, giving one contribution and one occlusion for each.
- **Historical analogue:** Compare AUKUS to one prior episode of alliance-driven naval technology transfer or regional militarization, and state the limits of the analogy.
- **Falsifiers:** Specify observations that would weaken your main claim and observations that would strengthen it.

(c) Self-check: Did you distinguish description, explanation, prediction, and prescription, and did you mark

where evidence ends and judgment begins?

SECTION 2.11 HINGE QUESTION

Question: Which mechanism best explains why AUKUS strained the France–Australia–United States relationship?
A. France's loss of submarine contract revenue alone.
B. Breach of alliance trust and status injury, compounded by capability dependence.
C. US coercion of Australia to contain China.
D. Violation of UNCLOS by nuclear-powered submarines.

Distractor diagnosis:
- **A** is wrong because it reduces a diplomatic rupture to a commercial grievance; it cannot explain the recall of ambassadors, the public accusations of deception, or the symbolic intensity of France's response.
- **C** is wrong because it overstates US coercion and understates Australian agency; the evidence points to Canberra's own strategic reassessment, not to Washington forcing the cancellation.
- **D** is wrong because it misapplies UNCLOS; naval nuclear propulsion is not prohibited by the convention, and the relevant issue is IAEA safeguards and nonproliferation politics, not a treaty violation.
- **B** is correct because it captures both the relational injury and the structural dependence created by the shift to US–UK nuclear-powered submarine cooperation.

SECTION 2A — DATA LAB

Table 1 — Major Naval Forces in the Indo-Pacific (approximate, 2024)

Force	Battle-force / major surface combatants	Submarines (SSN/SSBN/SSK)	Notes
US Navy (USN)	~296 battle-force ships	~67 (SSN/SSBN)	Largest by displacement; globally deployed; ~60% of fleet in Pacific
PLAN	~370 ships incl. auxiliaries; ~140 major surface combatants	~60+ (SSBN/SSN/SSK)	Largest by hull count; concentrated in Western Pacific
Japan MSDF	~50 major surface combatants	~22 SSK	Growing; Izumo-class carriers; F-35B integration
India Navy	~150 ships	~17 (SSBN/SSN/SSK)	Indian Ocean primacy; carrier aviation
Australia RAN	~50	6 SSK (Collins)	Transitioning to AUKUS SSN (2030s-2040s)
ROK Navy	~150	~20 SSK	Regional; North Korea focus

Force	Battle-force / major surface combatants	Submarines (SSN/SSBN/SSK)	Notes
ASEAN aggregate (Indonesia, Vietnam, Philippines, Malaysia, Singapore, Thailand)	~200+ small-to-medium combatants	~15-20 SSK	Fragmented; coastal-defense orientation

Sources: IISS Military Balance (2024); CSIS China Power Project; US Navy Force Structure Assessment. Figures are approximate and include auxiliaries for PLAN.

Table 2 — Shipbuilding Rates, FONOPs, and SCS Trade

Indicator	China	United States	Period / Source
Major surface combatants commissioned per year	~10–15	~2–4	IISS / CSIS, 2018–2023
Share of global commercial shipbuilding	~50%+	~0.1%	UNCTAD 2023
SCS FONOPs conducted by USN	—	~8–12 per year (2019–2023)	DoD Annual FON Report
Annual trade transiting SCS	—	~$3.4 trillion (range $3.4–5.3T)	CSIS; UNCTAD
Share of global maritime trade via SCS	—	~one-third	CSIS China Power Project
China oil imports transiting SCS/Malacca	~80% of China's seaborne oil	—	EIA

Table 3 — Alliance Architecture and Force Posture (selected)

Arrangement	Members	Key capability	Status
US-Japan alliance	US, Japan	Forward-deployed 7th Fleet; base access (Yokosuka, Okinawa)	Active; expanding (2024 joint command upgrade)
US-ROK alliance	US, ROK	USFK; extended deterrence	Active
US-Philippines (EDCA)	US, Philippines	Rotational access to 9 sites	Expanded 2023
AUKUS	Australia, UK, US	SSN transfer; Pillar II advanced tech	Announced 2021; Pillar I delivery 2030s-2040s
Quad	US, Japan, India, Australia	Maritime domain awareness; exercises	Revived 2017; leaders' summits 2021+

Arrangement	Members	Key capability	Status
Five Eyes (intelligence)	US, UK, Canada, Australia, NZ	SIGINT sharing	Long-standing

Analysis Questions

1. Trend. The data show a sustained divergence in hull-count growth and shipbuilding throughput: the PLAN adds roughly 10–15 major surface combatants annually while the USN adds 2–4, and China holds over half of global commercial shipbuilding capacity against under 0.1% for the United States. At the same time, US FONOPs in the South China Sea rose from 2 in 2015 to roughly 8–12 per year by 2019–2023. What trend does this combination describe, and what does the FONOP series suggest about how Washington has chosen to respond to the quantitative shift — through presence operations rather than matching hull-for-hull?

2. Level of analysis. The A2/AD (anti-access/area denial) complex — DF-21D/DF-26 anti-ship ballistic missiles, YJ-18 cruise missiles, submarine forces, and island-based sensors — operates primarily at which level of analysis (individual, state, systemic, transnational)? Where do FONOPs sit, and where does the ~$3.4 trillion in annual SCS trade sit? Justify each placement using the Lesson 1 framework.

3. Perspective reconstruction (all five). Read Tables 1–3 through each lens: - *African:* What do these data imply for Indian Ocean littoral states' strategic autonomy and for the security of sea lanes (e.g., Bab el-Mandeb, Malacca) on which African trade depends? - *Chinese:* How does Beijing read the FONOP series and the alliance expansion (AUKUS, EDCA) as evidence of containment, and how does it justify A2/AD as defensive? - *Russian:* How does Moscow read US alliance expansion in the Indo-Pacific as analogous to NATO expansion, and what does it imply for Russian Pacific Fleet posture? - *Western:* How does Washington read the PLAN's hull-count growth as a threat to freedom of navigation and to the rules-based order, and what is the alliance-architecture remedy? - *UN:* How does the UN system read the same data through UNCLOS, the 2016 arbitration ruling, and the dispute-settlement framework — and what is the gap between legal entitlement and enforcement?

4. Interpretation. Do the data support the claim that China has achieved "sea denial" inside the first island chain? Argue for and against: the quantitative naval balance favors China in the Western Pacific, but tonnage, readiness, alliance aggregation (US + Japan + Australia + others), and the "tyranny of distance" for US forces cut in competing directions. What is the most defensible bounded conclusion?

5. Limitation. What do these data systematically fail to capture? Consider: ship quality and readiness (maintenance backlogs, crew training), the difference between hull count and combat power, the role of non-naval instruments (cyber, space, economic coercion), the opacity of Chinese data, and the fact that alliance aggregation is political, not automatic. Which limitation most undermines single-indicator analysis of the Indo-Pacific balance?

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — The First Island Chain and A2/AD Envelope

What to draw: A hand-drawn map of East Asia and the Western Pacific. Draw the coastline of China, the Korean peninsula, Japan, Taiwan, the Philippines, and Indonesia. Draw a dashed curved line from Japan through Taiwan and the Philippines to Borneo — label it "First Island Chain." Draw a second dashed line further east (Marianas, Guam) — label "Second Island Chain." Shade a translucent band (light cross-hatching) extending ~1,000–1,500 km eastward from China's coast, labeled "A2/AD envelope (DF-21D/DF-26, YJ-18, submarine pickets)." Place small icons: missile silos on the coast, a submarine icon inside the shaded band, and a US carrier icon east of the first island chain with an arrow showing "FONOP transit." Add a compass rose and a scale bar.

Labels to place: "China," "Taiwan," "Philippines," "Japan," "First Island Chain," "Second Island Chain," "A2/AD envelope," "Malacca Strait," "South China Sea," "East China Sea."

Perspective overlay: Annotate in the margin with five colored tags: (A) African — "sea-lane security for Indian Ocean trade"; (C) Chinese — "defensive perimeter, sovereignty"; (R) Russian — "US containment arc"; (W) Western — "freedom of navigation, rules-based order"; (U) UN — "UNCLOS EEZ/continental shelf disputes."

Visual 2 — Hub-and-Spokes Alliance Architecture

What to draw: A hub-and-spokes diagram. Draw a large central circle labeled "United States (hub)." Draw spokes (lines) to smaller circles: Japan, South Korea, Philippines, Australia, Thailand. Draw a dashed outer ring connecting Japan–Australia–India labeled "Quad (2017 revived)." Draw a separate triangle of Australia–UK–US labeled "AUKUS (2021)." Draw a dashed line from US to Taiwan labeled "Strategic ambiguity / Taiwan Relations Act." Add arrows indicating "extended deterrence," "base access," and "intelligence sharing (Five Eyes)."

Labels to place: "Hub-and-spokes," "Quad," "AUKUS," "EDCA (Philippines)," "Five Eyes," "Taiwan (ambiguous)."

Perspective overlay: Annotate: (A) "strategic autonomy concerns; non-alignment tradition"; (C) "encirclement / containment"; (R) "NATO-style expansion critique"; (W) "collective deterrence, burden-sharing"; (U) "regional security architecture; ASEAN centrality."

Visual 3 — FONOPs and Naval Balance Trend (Dual-Axis Chart)

What to draw: A hand-drawn dual-axis line chart. X-axis: years 2015–2024. Left Y-axis: "US SCS FONOPs per year" (0–15). Right Y-axis: "PLAN major surface combatants added per year" (0–20). Plot two lines: FONOPs rising from 2 (2015) to ~10 (2023); PLAN additions rising from ~6 (2015) to ~14 (2023). Add a third bar series at the bottom: "SCS trade ($T)" flat at ~3.4. Add a legend and a note: "Correlation ≠ causation; FONOPs are presence, not warfighting."

Labels to place: "FONOPs," "PLAN additions," "SCS trade (~$3.4T)," "2016 arbitration ruling" (vertical marker).

Perspective overlay: Annotate with a small key: (A) "trade dependence"; (C) "sovereignty assertion"; (R) "US escalation"; (W) "rules enforcement"; (U) "legal vs. enforcement gap."

SECTION 4 — CORNELL NOTES

Cue (Question / Prompt)	Notes (Answer / Content)
What is the "Indo-Pacific" as a strategic construct?	Term popularized by Abe (2007 "confluence of two seas"), adopted by US (2017 NSS), India, Japan, Australia. Replaces "Asia-Pacific"; signals Indian Ocean inclusion and China containment framing. Contested: China rejects it as exclusionary; ASEAN prefers "Asia-Pacific."
What is A2/AD and the first island chain?	China's layered defense: DF-21D/DF-26 ASBM, YJ cruise missiles, submarines, island sensors. First island chain (Japan-Taiwan-Philippines) as defensive perimeter and US containment line. Holmes & Yoshihara (2017) on sea denial.
What is the hub-and-spokes system?	US bilateral alliances (Japan, ROK, Philippines, Australia, Thailand) since Cold War. Extended deterrence, base access, interoperability. Supplemented (not replaced) by Quad and AUKUS.
What is the Quad?	US-Japan-India-Australia. Revived 2017. Maritime domain awareness, exercises, supply-chain initiatives. Not a formal alliance; "minilateral."
What is AUKUS?	2021 trilateral. Pillar I: SSN transfer to Australia (2030s-40s). Pillar II: advanced tech (AI, cyber, hypersonics). Strained France-Australia (cancelled Attack-class subs).
What are the Taiwan Strait and SCS flashpoints?	Taiwan: ~100 nm strait; PLA exercises post-Pelosi (2022); blockade scenarios. SCS: nine-dash line; artificial islands; 2016 arbitration (Philippines v. China) rejected historic rights; China non-compliant.
What is ASEAN centrality?	ASEAN's claim to convene regional security (ARF, EAS, ADMM+). Hedging strategy: engage all powers, avoid choosing. Limited enforcement; consensus constraint.
What is India's strategic autonomy?	Non-alignment legacy; Quad member but not alliance; S-400 purchase; border tensions with China (Doklam 2017, Galwan 2020). Indian Ocean as priority theater.
What is Japan's military normalization?	Constitutional reinterpretation (2014 collective self-defense); defense spending rising to 2% GDP; counterstrike capability (2022 NSS); F-35B, Tomahawk.
