Geopolitics and International Relations

nyimbi.com

1. Geopolitics and International Relations

The course is built around a single insistence: an opinion about world politics is not an argument. Every lesson starts with the puzzle — the thing that needs explaining — then locates the level of analysis, the definition of power in use, and the perspective doing the framing, before any of the five traditions (African, Chinese, Russian, Western, UN) is allowed to adjudicate.

It covers the canonical IR machinery — realism in its variants, IPE, institutionalism, constructivism, the English School — alongside structural formulations: world-systems, weaponised interdependence, poly-hegemony, the military-industrial complexes that survive deglobalisation. These are then tested against the empirical matters: conventional and irregular warfare, nuclear latency, cyber and information operations, energy and critical minerals, African demographic and resource trajectories, Ukraine's protracted dynamics, and Iran's strategic positioning.

The later modules are regional and applied: African geopolitics and the resource curse, Ukraine's institutional drift, Iran's nuclear decision-making, the Middle East's sectarian security dilemmas, and a strategic-foresight module on emerging domains and future-oriented analysis. Each lesson ends in exercises, data tasks and a self-test keyed to its learning outcomes. —

2. How to Study International Relations from Zero: Puzzles, Levels, Power, and Perspectives

---

LESSON METADATA

Field	Entry
Lesson number and title	L1 — How to Study International Relations from Zero
Module	Module 0: Orientation and Method
Prerequisites	None. This is the entry point.
Interleaved links	Forward links to L2 (law), L4–8 (theory), L9–14 (history), L27–34 (Africa), L35–40 (Ukraine), L41–46 (Iran)
Reading load	This lesson only. Optional further reading at the end.
Content channels	Canon (summarized here), primary concepts (defined here), data (ACLED/SIPRI exercise), expert voice (quoted and paraphrased here), dissenting sources (five-perspective section)

Field	Entry
Bloom ceiling	Analyze (build and evaluate IR explanations)
Estimated study time	4–6 hours including exercises

Note on self-containment: Everything needed to master this lesson is *inside this document*. Where I cite an author, I summarize the argument fully enough that you do not need to read the original to complete the lesson. The "Further Reading" section at the end is optional deepening, not a requirement.

SECTION 0 — Why This Lesson Exists

Most people who "follow geopolitics" never learn to do it. They consume claims — *NATO provoked Russia; China is debt-trapping Africa; Iran is irrational; the UN is useless* — without the apparatus to test them. The result is a person who has opinions but no analytical capability, who can recite events but cannot explain them, and who mistakes fluency for understanding.

International Relations (IR) as a discipline exists to convert the chaos of world events into **explainable, testable, and falsifiable claims**. This lesson teaches you the four instruments that make that possible:

1. **The puzzle** — the discipline's basic unit of inquiry. Before you can explain anything, you must know precisely what needs explaining.
2. **Levels of analysis** — the discipline's answer to "where do causes live?"
3. **Power** — the discipline's central concept, which is far more complex than "who has the bigger army."
4. **Perspective** — the recognition that different traditions define puzzles, levels, and power differently, and that mature analysis reconstructs each before adjudicating among them.

By the end of this lesson, you will be able to take any geopolitical claim and do four things with it: identify the puzzle, locate the level of analysis, specify which concept of power is being used, and reconstruct how each of the five perspectives (African, Chinese, Russian, Western, UN) would frame it.

SECTION 1 — PRE-CLASS PRIMING

1.1 Diagnostic retrieval (answer before reading further)

This is the first lesson, so there is no prior course material to retrieve. Instead, answer these three questions from your current knowledge. Write your answers down — you will return to them at the end to see how your thinking has changed.

1. When you hear "international relations," what do you think the subject *is*? One sentence.
2. Take the claim: *"The 2023 Niger coup happened because of French neocolonialism."* What would you need to know to decide whether this is a good explanation or a bad one?
3. Take the claim: *"Russia invaded Ukraine because NATO expanded eastward."* Is this an explanation, a justification, a prediction, or something else? Why?

Do not check anything. Write your honest answers. These are your baseline. At the end of the lesson,

you will re-answer them and compare.

1.2 Orientation questions

Before you begin the lesson core, hold these questions in mind:

- Why is it that intelligent people disagree so profoundly about the same events?
- What makes one explanation of a war better than another?
- Can international politics be studied scientifically, or is it inherently interpretive?
- Whose knowledge counts as knowledge in IR?

SECTION 2 — LESSON CORE

2.1 Learning objectives

By the end of this lesson, you can:

1. **Identify** the puzzle in any geopolitical claim, distinguishing description, explanation, prediction, and prescription.
2. **Locate** any explanation at the individual, state, systemic, or transnational level of analysis, and explain what each level reveals and conceals.
3. **Distinguish** the three faces of power (decision-making, agenda-setting, preference-shaping) and the material, relational, and legitimate dimensions of power.
4. **Reconstruct** how the African, Chinese, Russian, Western, and UN traditions each define power and the international, and **adjudicate** among them on a specific case.
5. **Build** a complete IR explanation: puzzle → theory → mechanism → evidence → falsifiers → alternative explanations.

2.2 KEY IDEA 1 — IR is the study of *puzzles*, not events

The claim: An event is not a puzzle. A puzzle is a *variation that needs explaining* — a difference between what happened and what we would have expected, or a difference between two cases that look similar but turned out differently.

Mechanism: Why does this matter? Because without a puzzle, explanation has no target. If you ask "why did the war happen?", the answer can be anything — human nature, capitalism, a mad leader, God's will. If you ask "why did the war happen *in 2022* and not in 2014, when the same structural conditions were present?", you have a puzzle that disciplines your explanation.

How to construct a puzzle. Every good IR puzzle has one of three forms:

1. **Variation over time:** The same conditions produced different outcomes at different times. *Example:* Why did the Cold War end peacefully in 1989–91, but the transition from the Concert of Europe ended in the First World War in 1914?
2. **Variation across cases:** Similar cases produced different outcomes. *Example:* Why did decolonization in Ghana (1957) proceed peacefully, while in Algeria (1954–62) it produced a brutal war?

3. **Puzzle against expectation:** The outcome contradicts what a leading theory predicts. *Example:* Realism predicts that states balance against a rising hegemon. Why, then, have many African states deepened ties with China rather than balancing against it?

Scope condition: Puzzles are only as good as the theory that generates the expectation. A puzzle against realism is only a puzzle if realism is actually the right baseline. If realism never applied to the case, the "puzzle" is spurious.

Observable implication: A well-formed puzzle can be stated in one sentence beginning with "Why did X happen *rather than* Y?" or "Why did X happen *when* Y?" If your puzzle cannot be written in that form, it is probably a topic, not a puzzle.

The four things people confuse with explanation:

Type	Example	What it does
Description	"Russia invaded Ukraine in February 2022."	States what happened.
Explanation	"Russia invaded because NATO enlargement created an existential security threat to its western border."	States *why* it happened.
Prediction	"Russia will escalate further if NATO admits Ukraine."	States what will happen.
Prescription	"NATO should offer Ukraine membership to deter Russia."	States what should be done.

Critical skill: Most public discourse *slides* between these four without noticing. A person may state a prescription ("NATO should…") while thinking they have given an explanation. Your first analytical discipline is to name which of the four you are doing at any moment.

2.3 KEY IDEA 2 — Causes live at different levels, and the level you choose determines what you can see

The claim: Every explanation of international politics locates its cause at one of four levels. The choice of level is not neutral — it determines what you will find, what you will miss, and what you will blame.

The four levels. The classic formulation is Kenneth Waltz's *Man, the State, and War* (1959), which distinguished three "images" — the individual, the state, and the international system. J. David Singer (1961) formalized the "level-of-analysis problem." Modern IR adds a fourth, the transnational. Here is the full apparatus:

Level 1 — The individual. Causes are located in the psychology, beliefs, personality, or pathology of leaders.

- *Example:* The invasion of Ukraine is explained by Putin's personal historical grievances and fear of democratic contagion.

- *What it reveals:* The role of perception, misperception, ego, ideology, and decision-making pathology (e.g., the psychology of humiliation, the "operational code" of leaders, the groupthink of small decision units).
- *What it conceals:* Structural pressures that would have produced similar behavior from any leader in that position; the institutional constraints on leaders; the possibility that "mad" leaders are responding rationally to structural incentives.
- *Diagnostic question:* Would a different leader, facing the same structural conditions, have done the same thing?

Level 2 — The state. Causes are located in domestic institutions, regime type, bureaucratic politics, economic structure, or national identity.

- *Example:* The invasion is explained by Russia's regime type — an authoritarian, personalist system in which no institution can restrain the leader, and in which nationalism is the legitimating ideology.
- *What it reveals:* The role of regime type (democracies vs. autocracies), bureaucratic competition (the military-industrial complex, the security services), domestic coalitions (oligarchs, nationalists), and identity construction.
- *What it conceals:* The system-level pressures that make certain state-level outcomes likely; the fact that states with very different domestic structures sometimes behave similarly.
- *Diagnostic question:* If you changed the domestic regime but kept the international position constant, would the outcome change?

Level 3 — The international system. Causes are located in the distribution of power, the structure of the international system (anarchy, polarity), or the state of the security dilemma.

- *Example:* The invasion is explained by the structure of the post-Cold War system — NATO's expansion into Russia's perceived sphere of influence, the security dilemma that this triggered, and the absence of any institution capable of mediating the conflict.
- *What it reveals:* The role of polarity (unipolarity, bipolarity, multipolarity), anarchy, relative gains, the security dilemma, and the balance of power.
- *What it conceals:* Why states in similar structural positions behave differently; the role of domestic politics; the role of norms and identities.
- *Diagnostic question:* If a different state occupied Russia's structural position, would it behave the same way?

Level 4 — The transnational. Causes are located in forces that cross borders and are not reducible to any single state: capitalism, ideology, religion, ethnic networks, technology, climate, or epistemic communities.

- *Example:* The invasion is explained by the global crisis of the liberal order — the rise of authoritarian capitalism, the fragmentation of the post-1945 normative consensus, and the global competition between democratic and authoritarian models of modernity.
- *What it reveals:* The role of global capitalism, transnational ideology, technological change, climate stress, and non-state actors.
- *What it conceals:* The specific decisions and structures of particular states; the agency of leaders; the difference between global trends and particular outcomes.
- *Diagnostic question:* If you changed the global context but kept the state and system constant, would the outcome change?

The methodological rule: A complete explanation will usually involve *all four levels*, but it will specify which level does the *analytical work* — which level is doing the causal heavy lifting — and which levels are background conditions. The mistake is not using one level; the mistake is using one level *unconsciously* and mistaking it for the whole.

The practical technique: When you encounter an explanation, ask: *at what level is the cause located?* Then ask: *what does this level hide?* Then ask: *what would the explanation look like if the cause were at a different level?* This is called **level-shifting**, and it is the single most useful analytical habit in IR.

Worked illustration — the same event, four explanations:

Level	Explanation of the 2022 invasion	What it emphasizes	What it hides
Individual	Putin's personal historical obsession and fear of humiliation	Leader psychology	Structural pressures any Russian leader would face
State	Russia's authoritarian regime and its inability to tolerate a democratic neighbor	Regime type	The role of NATO and the security dilemma
System	NATO enlargement and the security dilemma in a unipolar system	Structural pressures	Russia's agency and domestic politics
Transnational	The global contest between liberal and authoritarian models of order	Ideological contestation	The specific decisions and borders

None of these is simply "wrong." Each is *incomplete*. The skill is to see which one an analyst is using, what it illuminates, and what it obscures — and then to build an explanation that combines them without collapsing into "everything matters."

2.4 KEY IDEA 3 — Power has three faces, and IR's central concept is contested

The claim: Power is not one thing. It has at least three faces — the ability to win decisions, the ability to keep issues off the agenda, and the ability to shape what others want — and it has three dimensions — material, relational, and legitimate. Different theoretical traditions define power differently, and the definition you adopt determines your entire analysis.

The three faces of power. This is the classic formulation from Steven Lukes, *Power: A Radical View* (1974), building on Robert Dahl and Bachrach and Baratz:

First face — decision-making power (Dahl). A has power over B to the extent that A can get B to do something B would not otherwise do. *Example:* The US persuades or coerces a state to vote a certain way in the UN Security Council. This is observable, measurable, and behavioral.

Second face — non-decision-making power (Bachrach and Baratz). A has power over B to the extent that A can keep certain issues off the agenda, so that B never even considers them. *Example:* The IMF's structural adjustment conditions keep "nationalization of resources" off the policy agenda of borrowing states — not because it was voted down, but because it was never proposed. This is less observable, because the absence of a decision is harder to see than a decision.

Third face — preference-shaping power (Lukes). A has power over B to the extent that A can shape B's *wants* — so that B comes to desire what A wants it to desire. *Example:* Decades of Western development discourse have shaped how African elites define "development" — as integration into global markets rather than as structural transformation or regional autonomy. B does not experience this as coercion; B experiences it as common sense.

The three dimensions of power. Alongside the three faces, IR distinguishes three dimensions of what power *is*:

1. **Material power (capabilities):** military forces, economic output, resources, technology, geography. This is the realist's default — the "elements of national power."
2. **Relational power (network position):** power that comes from occupying a strategic node in a network — financial centrality (the dollar system), supply-chain chokepoints (semiconductors), control of chokepoints (Hormuz, Bab el-Mandeb). Farrell and Newman's "weaponized interdependence" is a theory of relational power. A state with fewer material capabilities can exercise enormous power if it sits at a network chokepoint.
3. **Legitimate power (authority):** power that comes from being recognized as entitled to rule, define, or adjudicate. The UN Security Council's authority rests not only on the P5's military power but on the recognition of the Charter as legitimate. Legitimacy is a form of power that cannot be measured in divisions or GDP.

Why this matters for IR analysis: The claim "China is powerful" is meaningless without specifying: material power (yes, large), relational power (increasingly central in supply chains), or legitimate power (contested — its model of order is accepted by some states and rejected by others). The claim "Iran is weak" is similarly ambiguous: materially weak relative to the US, but relationally powerful in the Strait of Hormuz, and legitimate in the eyes of its regional allies. The concept of power is only useful when *disaggregated*.

Scope condition: The three faces and three dimensions are not always simultaneously operative. In a crisis, first-face material power dominates. In a long-term structural relationship, third-face and relational power dominate. The analyst must specify which face and dimension are doing the work in the case at hand.

Observable implications: - If first-face power is operative, you should see explicit contests, votes, coercive threats, and observable compliance. - If second-face power is operative, you should see systematic absence of certain issues from agendas, and you should be able to identify who benefits from that absence. - If third-face power is operative, you should see convergence of preferences, "common sense" that serves one party's interests, and the absence of coercion.

2.5 KEY IDEA 4 — The five perspectives define power and the international differently, and each is internally coherent

The claim: IR is not a neutral science with "perspectives" added on. The dominant Western tradition is itself a perspective. African, Chinese, Russian, and UN traditions each define the basic concepts — power, order, sovereignty, security — in ways that produce different puzzles, different levels of analysis, and different conclusions. The mature analyst can reconstruct each from within before adjudicating among them.

This section gives you each perspective's core commitments in enough depth to *use* them.

2.5.1 The African perspective (primary) **Core commitments.** African IR is not a single school, but its major strands share a foundational claim: the international system was constituted through colonial conquest and racial hierarchy, and that constitution persists. Key commitments:

- **Sovereignty is hard-won and fragile.** Non-interference is not a procedural nicety — it is a defense against re-colonization. The AU Constitutive Act enshrines sovereignty, territorial integrity, and non-interference as foundational principles precisely because African states experienced the opposite.
- **The state is not the only site of security governance.** African political orders are characterized by hybridity — traditional authorities, religious networks, militias, and informal economies coexist with and sometimes displace the formal state. Theorizing security from this hybridity, rather than treating it as "state failure," expands IR as a whole.
- **Coloniality structures knowledge.** Mainstream IR treats the Western experience of sovereignty and anarchy as universal. African scholarship (Grovogui, Mbembe, Danso and Aning) shows that this erases the hierarchical, racialized, and extractive foundations of the international system.
- **Alternativity.** African experiences are not "cases" to be fitted into Western theory. They are sources of alternative theoretical frameworks.

How this perspective defines power: Power is relational and structural — it includes the capacity to extract, to define, and to set the terms of engagement. A mining concession that transfers cobalt to a foreign firm at prices set elsewhere is an exercise of power, even if no gun is pointed. Power also includes the "weapons of the weak" — the ability to use external competition to extract concessions, to play suitors against each other, to convert weakness into leverage.

How it defines the international: A hierarchically structured system in which formal sovereignty coexists with substantive inequality. The relevant history is not Westphalia (1648) but Berlin (1884–85) and the long struggle for self-determination.

What it occludes: It can underplay the agency of African states themselves (treating them only as victims), and it can underplay the genuine differences among African states' interests and strategies.

2.5.2 The Chinese perspective **Core commitments.** The "Chinese School" is not a monolith, but its major branches share a rejection of the Western state-centric, anarchic ontology in favor of relationality, moral authority, and order as hierarchy:

- **Relational theory (Qin Yaqing):** International politics is constituted through relations and processes, not discrete rational actors. A state's identity and interests emerge from its relationships, not prior to them.
- **Tianxia (Zhao Tingyang):** "All under heaven" frames world order as a hierarchical, harmonious

whole, in which the legitimate ruler orders the world for the benefit of all — not a system of formally equal sovereigns.
- **Moral realism (Yan Xuetong):** Leadership and morality, not only material power, determine the rise and fall of states. A distinct normative strand within realism.
- **Civilizational state:** China is understood as a continuous civilization, not a nation-state. Sovereignty is civilizational, not merely territorial.

How this perspective defines power: Power is relational and moral. It includes the capacity to sustain relationships, to embody legitimacy, and to order hierarchies. Material power matters, but it is insufficient — leadership (in the Confucian sense of moral exemplarity) is the decisive variable in long-run competition.

How it defines the international: A relational order of differentiated statuses, not a flat system of equal sovereigns. The relevant history is civilizational continuity, not the Westphalian settlement.

What it occludes: It can underplay the coercive dimension of hierarchy; it can underestimate the agency of smaller states; it can naturalize China's own position within the hierarchy it describes.

2.5.3 The Russian perspective Core commitments. Russian official and intellectual discourse centers on multipolarity, sovereignty as great-power prerogative, and civilizational plurality:

- **Multipolarity:** The unipolar moment is over. A polycentric order is emerging in which several great powers, each with its own civilizational sphere, coexist.
- **Stratified sovereignty:** Sovereignty is not equal. Great powers are truly sovereign; smaller states fall into the spheres of influence of great powers. This is not a normative claim but a description of how the world actually works.
- **State-civilization:** Russia understands itself as a distinct civilization with a historical legacy and a mission to defend traditional values against universalist liberalism.
- **Anti-hegemonic revisionism:** The post-Cold War settlement is rejected as Western hegemony. The UN Security Council is accepted only insofar as the veto protects Russian interests.

How this perspective defines power: Power is the capacity to defend one's civilizational sphere and to resist the imposition of external models. It is geopolitical, territorial, and cultural — not primarily economic or institutional.

How it defines the international: A permanent competition among civilizational blocs, in which spheres of influence are the natural form of order. The relevant history is the repeated invasion of Russia from the West, and the post-Cold War humiliation.

What it occludes: It can naturalize aggression against smaller neighbors; it can treat the preferences of those neighbors as irrelevant; it can underplay the genuine agency and identity of states within its claimed sphere.

2.5.4 The Western perspective Core commitments. "Western" is not a single tradition either — it includes realism, liberalism, constructivism, Marxism, and critical theory. But the dominant strands share:

- **Anarchy as the organizing condition:** There is no overarching authority above states, and order must be explained, not assumed.
- **The state as the primary actor:** Even when non-state actors matter, the state is the container of political authority.
- **Rationality as the baseline:** States are assumed to calculate costs and benefits, even if imperfectly.

- **The possibility of progress:** Liberal institutionalism in particular holds that cooperation, institutions, and norms can mitigate anarchy.

How this perspective defines power: Primarily material (capabilities) and relational (network position), with legitimacy as a secondary dimension. This is the tradition that produced the three faces and three dimensions you learned above.

How it defines the international: An anarchic system of sovereign states, structured by the distribution of power, in which institutions and norms can partially order cooperation. The relevant history is Westphalia (1648), the World Wars, and the post-1945 institutional settlement.

What it occludes: Its own historical particularity — the colonial foundations of the system it describes, the racial hierarchy that structured sovereignty, and the experience of the majority world. Western critical traditions (post-colonial, feminist, decolonial) are *internal* self-critiques of this perspective, not external ones.

2.5.5 The UN perspective Core commitments. The UN is not a scholarly school but a normative-institutional discourse with distinctive features:

- **The Charter as the frame:** Sovereignty, non-interference, the prohibition on the use of force, and the peaceful settlement of disputes are the foundational norms.
- **Multilateralism as method:** Problems are to be addressed through the collective deliberation of member states, not unilateral action.
- **Peace operations as practice:** The UN's operational identity is bound up with peacekeeping, which requires adaptable, inclusive, politically grounded missions.
- **The gap between principle and practice:** The UN's normative commitments coexist with P5 veto politics and selective enforcement.

How this perspective defines power: Legitimate authority, grounded in the Charter and in the recognition of member states. The UN's power is the power to define what is legal, what is legitimate, and what counts as a threat to international peace and security.

How it defines the international: A society of states governed by law, in which sovereignty and non-interference are the foundational rules, and in which multilateral institutions are the legitimate mechanism for collective action.

What it occludes: The P5's veto politics, the selective enforcement of Charter norms, and the ways in which the UN's own structure reproduces the power hierarchy it claims to transcend.

2.5.6 The comparison matrix Here is the matrix you will use throughout the course. Fill it from memory first, then check against the text above:

Dimension	African (primary)	Chinese	Russian	Western	UN
Core actor/unit	Hybrid orders; AU; post-colonial state	Relational network; civilization-state	Great-power civilization	Sovereign state; market	Member state; Charter system

Dimension	African (primary)	Chinese	Russian	Western	UN
Root cause of insecurity	Coloniality; external interference; weak hybrid institutions	Western narrative hegemony; underdevelop-ment	Western unipolarity; civilizational encroachment	Anarchy; weak institutions; security dilemma	Erosion of international law; multilateral breakdown
Sovereignty	Hard-won; non-interference as defense	Relational; non-interference as principle	Stratified; great powers truly sovereign	Formal; bargained	Legal; Charter-based
Definition of power	Relational and structural; extraction and agenda-setting	Relational and moral; leadership and hierarchy	Civilizational and geopolitical	Material, relational, legitimate	Legitimate authority; Charter-based
What is occluded	African states' own agency	Smaller states' agency; coercion	Neighbors' preferences; aggression	Coloniality; racial hierarchy	P5 veto politics; selective enforcement

2.6 WORKED EXAMPLE (I do)

The puzzle: In 2023, a military junta overthrew Niger's elected president, Mohamed Bazoum. France — Niger's former colonial power and a key security partner — was forced to withdraw its troops. The junta then deepened security ties with Russia (via the Africa Corps) and economic ties with China. Western analysts described this as "Russia and China exploiting instability." Yet Niger's junta enjoyed significant popular support at home, and neighboring Mali and Burkina Faso — which had undergone similar coups — formed an alliance with Niger.

The puzzle stated precisely: *Why did Niger's coup lead to the expulsion of a Western power and the deepening of ties with Russia and China, rather than to a restoration of the previous alignment?*

Level of analysis: The analyst must specify which level does the analytical work. Let us walk through all four.

- **Individual level:** The junta leader, General Abdourahamane Tchiani, had personal grievances against Bazoum and a history of rivalry within the presidential guard. This explains *who* staged the coup, but not why the *outcome* — the realignment — followed. Individual-level explanation is necessary but insufficient.
- **State level:** Niger's state was structurally weak, dependent on external security assistance (French and US troops, plus a large aid budget), and characterized by a rentier political economy (uranium extraction, foreign military bases). The coup revealed the fragility of the state's monopoly on violence and the unpopularity of the elite's dependence on France. This level does substantial work: it explains why the coup was popular and why the junta could mobilize anti-French sentiment.

- **Systemic level:** The post-Cold War security architecture in the Sahel had collapsed. French-led counterterrorism (Operation Barkhane) had failed to contain the insurgency; the US had a light footprint; the AU and ECOWAS had limited enforcement capacity. The systemic vacuum — the absence of a hegemon willing and able to restore order — created the space for realignment. This level explains *why the realignment was possible*, but not why it took the specific form it did.
- **Transnational level:** The global contest between Western liberal order and its rivals provided an ideological vocabulary and material resources. Russia's Africa Corps offered security services without the conditionality that Western partners demanded. China offered infrastructure and mineral extraction without governance conditions. The transnational contest explains *why the junta had alternatives* — it did not have to accept French terms.

The explanation, synthesized: The coup was *made possible* by the collapse of the Sahel security architecture (systemic), *made popular* by the structural dependence and rentier character of the Nigerien state (state), *made possible in its specific form* by the availability of Russian and Chinese alternatives (transnational), and *executed* by a junta with its own internal dynamics (individual). The analytical work is done by the interaction of the state and systemic levels; the individual and transnational levels provide the form and the vocabulary.

Which perspective does this explanation privilege? It is a Western-style multi-level analysis — it uses the standard Western apparatus. Now let us reconstruct the same event from each perspective:

- **African perspective:** The coup is not primarily about Russia or China. It is about the legitimacy crisis of a post-colonial state whose elites were seen as serving foreign interests. The junta's popularity reflects a long history of anti-colonial sentiment and the failure of the post-independence social contract. The "realignment" is a rational strategy of *sovereignty assertion* — using external competition to escape dependence on a single patron. The African perspective foregrounds *agency* and *legitimacy*, not external manipulation.
- **Chinese perspective:** The event illustrates the decline of Western hegemony and the emergence of a multipolar order in which African states exercise genuine choice. China's engagement is developmental and non-interventionist; the "debt-trap" and "exploitation" narratives are Western projections. Relationally, China gains by being a reliable partner that does not impose political conditions.
- **Russian perspective:** The event confirms that the unipolar order is collapsing and that states are free to choose their civilizational partners. Russian security cooperation is a sovereign choice by Niger, not "exploitation." The West's expulsion is a consequence of its own arrogance and its refusal to treat African states as equals.
- **Western perspective:** The event is a symptom of the erosion of the liberal order in the Sahel. Russia and China are exploiting governance vacuums. The West's withdrawal represents a strategic setback. The explanation focuses on the failure of Western policy and the need to compete more effectively — through better conditionality, more effective security assistance, and countering Russian disinformation.
- **UN perspective:** The event raises serious concerns about the unconstitutional change of government and the erosion of democratic norms. The UN condemns coups and calls for a return to constitutional order, while acknowledging the need to address the root causes of instability, including governance deficits and external interference. The Charter's principles of sovereignty and non-interference are relevant to the question of external military presence.

The adjudication. Which perspective best explains the outcome? The African perspective captures some-

thing the Western perspective misses: the *popular legitimacy* of the junta's anti-French posture and the structural roots of that sentiment. The Western perspective captures something the African perspective underplays: the *material and security vacuum* that made the realignment possible. The Chinese and Russian perspectives are partly *justifications* (theirs and the junta's) rather than explanations, but they correctly identify the structural opening provided by multipolarity. The UN perspective captures the normative stakes but not the causal dynamics. A complete explanation *combines* the African and Western insights, uses the Chinese and Russian perspectives as evidence of how the actors themselves understand the event, and treats the UN perspective as a normative benchmark rather than a causal theory.

2.7 PROBLEM PAIR (We do)

Your task: Analyze the following case using the apparatus above. Write your analysis before reading the model answer.

The case: In 2022, Russia invaded Ukraine. Western analysts explained the invasion as a product of Russian imperialism and Putin's personal ambitions. Russian officials explained it as a response to NATO enlargement and the threat of Ukrainian membership in the alliance. African and Global South states largely refused to condemn Russia, citing sovereignty and non-interference, and some cited NATO's own history of intervention.

Your tasks:

1. State the puzzle precisely in one sentence.
2. Identify the level of analysis used by each explanation.
3. Identify which face and dimension of power each explanation emphasizes.
4. Reconstruct the African perspective on the event. What does it foreground? What does it occlude?
5. Write a 300-word adjudication: which perspective best explains the *global reaction* to the invasion, as distinct from the invasion itself?

Model answer (compare after writing your own):

Puzzle: Why did Russia invade Ukraine in 2022, when the same structural conditions (NATO enlargement, Ukrainian sovereignty, Russian decline) had existed since at least 2008, without producing a full-scale invasion?

Levels: - Western explanation: state level (Russian imperialism, Putin's psychology) and systemic level (the security dilemma). - Russian explanation: systemic level (NATO enlargement, security dilemma) with a normative claim about spheres of influence. - African/Global South reaction: systemic and normative (sovereignty, non-interference) with an emphasis on the selectivity of Western norms.

Power: - Western explanation emphasizes material power (Russian military) and the first face of power (coercion). - Russian explanation emphasizes relational power (NATO's network expansion) and the third face (the shaping of what counts as a "threat"). - African reaction emphasizes legitimate power (the authority of sovereignty norms) and the second face (the agenda-setting power of the West in defining which violations matter).

African perspective reconstruction: The African reaction foregrounds the sovereignty norm — a state's territorial integrity should not be violated, and this applies to Ukraine as it applied to African states. But it also

foregrounds the *selective* application of this norm by the West — interventions in Iraq, Libya, and elsewhere were justified by the same powers that now condemn Russia. The African perspective does not endorse the invasion; it refuses the Western framing of the conflict as a simple morality tale. What it occludes: the specific character of Russian aggression and the genuine Ukrainian agency that the "great-power competition" framing can obscure.

Adjudication: The Western and Russian explanations both explain the *invasion* at the systemic level — they disagree on which side bears responsibility for the security dilemma. But neither explains the *global reaction*. The African perspective explains the global reaction better than either: most of the world did not see the invasion as a clash between good and evil, but as a clash between great powers in which the sovereignty norm was being selectively invoked. This does not mean the African perspective explains the invasion — it doesn't. It explains why the invasion did not produce a unified global response. The lesson: different perspectives explain different things, and the analyst must specify what is being explained.

2.8 INDEPENDENT MEMO (You do)

Produce a one-page analytical memo (500–600 words) on the following case, using the four headings below. This is your independent application — do not consult the model answers.

Case: The 2024 collapse of the JCPOA (Iran nuclear deal) and Iran's subsequent withdrawal from the treaty, after the European parties failed to lift sanctions and the UN snapback mechanism was triggered.

Memo headings:

1. **Mechanism:** What causal process explains the collapse? Specify the level of analysis and the concept of power.
2. **Perspective reconstruction:** How would each of the five perspectives explain the collapse? (African, Chinese, Russian, Western, UN — one paragraph each, or a table.)
3. **Historical analogue:** What earlier case illuminates this dynamic? (e.g., the collapse of the League of Nations, the failure of the Concert of Europe, the US withdrawal from the INF Treaty.)
4. **Falsifiers:** What evidence would prove your explanation wrong? What would you need to observe to abandon it?

Self-check before proceeding: Does your memo distinguish description, explanation, prediction, and prescription? Does it specify a level of analysis? Does it specify which face and dimension of power are doing the work? Does it reconstruct each perspective from within, rather than caricaturing it?

2.9 HINGE QUESTION

Answer before proceeding. If you get it wrong, reread the relevant section.

A scholar argues: "The United States maintains global dominance not mainly through its military, but through the dollar's centrality in global finance, which allows it to exclude adversaries from the global financial system." Which concept of power is this scholar using?

- A) First-face material power

- B) Second-face agenda-setting power
- C) Third-face preference-shaping power
- D) Relational power (network centrality)

Answer: D. The dollar's centrality is a *network position* — it is relational power in Farrell and Newman's sense. It is not first-face (it is not a direct decision), not second-face (it is not primarily agenda-setting, though it has that effect), and not third-face (it does not primarily shape preferences). The confusion arises because relational power *enables* all three faces — but the concept being used is relational.

If you answered A: You are conflating material capabilities with network position. Reread Section 2.4. **If you answered B:** You are close — exclusion from SWIFT does shape agendas — but the primary mechanism is network centrality, not agenda-setting. **If you answered C:** You are describing a different mechanism (preference-shaping), which is not what the scholar is describing.

SECTION 2A — DATA LAB (30–45 minutes)

Purpose: Ground the lesson's concepts in empirical work.

Task: Go to the ACLED database (or use the summary data provided below) and examine conflict events in the Sahel (Mali, Burkina Faso, Niger) from 2018 to 2024.

Provided summary data (simplified for this exercise):

Year	Jihadist attacks	State force attacks on civilians	Russian paramilitary attacks on civilians	Civilian fatalities
2018	420	180	0	1,200
2020	680	250	0	1,800
2022	910	310	140	2,400
2024	1,150	420	380	3,100

Analysis questions:

1. **Trend:** What is the trend in each category? What does the data show about the relationship between Russian paramilitary presence and civilian harm?
2. **Level of analysis:** Does this data support a state-level explanation, a systemic explanation, or a transnational explanation of the Sahel crisis? Why?
3. **Perspective:** How would each of the five perspectives interpret this data? (African: external intervention and state fragility; Chinese: Western failure and the need for alternative security models; Russian: sovereign choice and effective counterterrorism; Western: Russian predation and governance failure; UN: civilian protection and accountability.)
4. **Limitation:** What does this data *not* tell you? What would you need to know to make a causal claim?

Rule: Complete this lab before writing your independent memo. Evidence precedes argument.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Task: Draw the following by hand. Do not generate it with a tool.

Visual 1: The levels of analysis. Draw four concentric circles or a four-layer pyramid. Label them: Individual (center), State, System, Transnational (outer). For each layer, write one example of a cause located at that level for the 2022 Ukraine invasion. Draw arrows between layers to show how causes at one level interact with causes at another.

Visual 2: The three faces of power. Draw three columns. For each face, write: the name (decision-making, non-decision-making, preference-shaping), the key theorist (Dahl, Bachrach and Baratz, Lukes), one example, and one observable implication.

Visual 3: The perspective matrix. Draw a five-column table (African, Chinese, Russian, Western, UN) and three rows (definition of power, definition of the international, primary occlusion). Fill it from memory. Then check against Section 2.5.

SECTION 4 — CORNELL NOTES

Set up your notes in the following structure:

Cue column (left third)	Notes (right two-thirds)
What is a puzzle?	A variation that needs explaining; three forms: time, case, expectation
What are the four levels?	Individual, state, system, transnational — each reveals and conceals
What are the three faces of power?	Decision-making, non-decision-making, preference-shaping
What are the three dimensions?	Material, relational, legitimate
What are the five perspectives?	African, Chinese, Russian, Western, UN
Source log:	Lesson text, Section 2.2–2.5; ACLED data (Section 2A)
Summary (bottom):	3–5 sentences in your own words synthesizing the lesson

Rule: Cover the notes and answer the cue-column questions from memory. This is the retrieval engine.

SECTION 5 — FEYNMAN COMPRESSION

Step 1: Explain the lesson's central claim to a smart non-specialist in 150–200 words, without using IR jargon. If you must use a term (e.g., "level of analysis," "security dilemma"), define it in plain language.

Step 2: Mark every point where you hesitated, used a term you could not define, or skipped a causal step. These are your gaps.

Step 3: Reread only the sections corresponding to your gaps. Then rewrite the explanation.

Step 4: Produce one analogy. Then state where the analogy breaks down. (Example: "Levels of analysis are like zoom levels on a map — but unlike a map, the levels are not just different resolutions of the same reality; they are different *causal stories* about the same event.")

SECTION 6 — SPACED-REPETITION FLASHCARDS

Produce 12–15 cards. Use the following types:

Type	Example
Definition	What distinguishes a puzzle from an event?
Mechanism	Why does the level of analysis determine what an explanation can see?
Application	Which level of analysis does the claim "Putin's paranoia caused the war" use?
Comparison	How do the first and third faces of power differ in their observable implications?
Source	Which theorist is associated with the second face of power?
Debate	What is the strongest objection to the claim that African states are "weak"?
Reconstruction	How would a Russian state-civilization theorist explain the 2022 invasion?
Occlusion	What does the Chinese relational framework fail to see about African agency?
Adjudication	Which perspective best explains the global reaction to the Ukraine invasion, and what does it miss?
Visual	Label the three faces of power on the diagram (image occlusion).

Tag each card: `L1`, `method`, `theory`, `perspective`, `difficulty`.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence audit

Before checking any answers, rate your confidence (0–100%) on each learning objective:

Objective	Confidence
Identify the puzzle in a claim	
Locate an explanation at a level of analysis	

Objective	Confidence
Distinguish the three faces of power	
Reconstruct the five perspectives	
Build a complete IR explanation	

After completing the exercises, rate your **accuracy** on each. Calculate the gap.

7.2 Three-question debrief

1. What did I misunderstand? (Not "what did I miss," but "what did I believe that was wrong?")
2. What strategy produced the most learning in this lesson? (Retrieval? The worked example? The perspective reconstruction?)
3. What will I do differently in Lesson 2?

7.3 Error log

Date	Lesson	Error type	Correct understanding	Card created?
	L1			

SECTION 8 — CHEATSHEET (Module 0)

Build the first entry of your Module 0 cheatsheet now.

Column	Content
Core concepts	Puzzle; levels of analysis; three faces of power; three dimensions of power; the five perspectives
Key mechanisms	Puzzle → theory → mechanism → evidence → falsifiers; level-shifting; power disaggregation
Theories and authors	Waltz (levels); Singer (level-of-analysis problem); Dahl/Bachrach & Baratz/Lukes (faces of power); Farrell & Newman (relational power)
Cases and evidence	Niger coup (2023); Ukraine invasion (2022); JCPOA collapse (2024); Sahel ACLED data
Debates	Is IR a science? Whose knowledge counts? Is power material or relational?
Falsifiers	What evidence would prove a level-of-analysis explanation wrong?
Cross-links	Forward to L2 (law), L4–8 (theory), L27–34 (Africa)

SECTION 9 — REVIEW SCHEDULE

Review	Timing	Format
R1	Today	Retrieval warm-up + card creation
R2	2–3 days	Cue-column recall + hinge question variant
R3	1 week	Mixed quiz with Lesson 2 cards
R4	3–4 weeks	Interleaved problem combining L1 with L4–8
R5	End of Module 0	Cheatsheet reconstruction from memory

SECTION 10 — COMPLETION CHECKLIST

- ☐ Diagnostic retrieval answered (Section 1.1)
- ☐ Five learning objectives read and understood
- ☐ Four key ideas studied with mechanisms and scope conditions
- ☐ Perspective comparison matrix filled from memory, then checked
- ☐ Worked example studied and self-explained
- ☐ Problem pair attempted and compared to model answer
- ☐ Independent memo produced (500–600 words)
- ☐ Hinge question answered correctly (or reteaching completed)
- ☐ Data lab completed before independent memo
- ☐ Three dual-coded visuals drawn
- ☐ Cornell notes with cue column, source log, and summary
- ☐ Feynman explanation written, gaps identified, rewritten
- ☐ 12–15 flashcards created with tags
- ☐ Confidence audit and error-log entry
- ☐ Cheatsheet entry added
- ☐ R2 review scheduled

FURTHER READING (Optional — for deepening, not required)

If you wish to go deeper into the material of this lesson, the following are the original sources and extensions. You do not need them to complete the lesson.

- **On levels of analysis:** Kenneth Waltz, *Man, the State, and War* (1959), ch. 1–2; J. David Singer, "The Level-of-Analysis Problem in International Relations," *World Politics* (1961).
- **On the three faces of power:** Steven Lukes, *Power: A Radical View* (1974); Robert Dahl, "The Concept of Power" (1957); Peter Bachrach and Morton Baratz, "Two Faces of Power" (1962).
- **On relational power:** Henry Farrell and Abraham Newman, "Weaponized Interdependence," *International Security* (2019).
- **On the African perspective:** Siba Grovogui, *Sovereigns, Quasi-Sovereigns, and Africans* (1996); Kwaku Danso and Kwesi Aning, "African Experiences and Alternativity in International Relations Theory" (2019); Jean-François Bayart, *The State in Africa* (1989).

- **On the Chinese perspective:** Qin Yaqing, *A Relational Theory of World Politics* (2018); Zhao Tingyang, *Tianxia* (2021); Yan Xuetong, *Ancient Chinese Thought, Modern Chinese Power* (2011).
- **On the Russian perspective:** Fyodor Lukyanov, "Russia's Vision of a Multipolar World" (2023); Mikhail Komin and Jussi Laine, "Russia's Vision of a Multipolar World and the Sovereign 'State-Civilisation' " (2024); Vladimir Putin, Valdai Club speeches (2018–2023).
- **On the UN perspective:** UN Charter; *Pact for the Future* (2024); UN Secretary-General speeches on peace and security (2023–2025).
- **On the Sahel case:** ACLED data and analysis (2023–2025); International Crisis Group reports on the Sahel; UN Security Council debates on the Sahel.

End of Lesson 1. When you are ready, say **"Next"** and I will write Lesson 2 (International Law and Institutions Primer) in the same format.

3. International Law and Institutions Primer: The Charter System, Sovereignty, and the Politics of Legal Order

---

LESSON METADATA

Field	Entry
Lesson number and title	L2 — International Law and Institutions Primer
Module	Module 0: Orientation and Method
Prerequisites	L1 (puzzles, levels of analysis, power, perspectives)
Interleaved links	Forward to L9 (Westphalian myth), L12 (decolonization and the OAU), L28 (AU sovereignty regime), L37 (lawfare of territorial integrity), L45 (JCPOA and snapback), L49 (institutional revisionism)
Reading load	This lesson only. Optional further reading at the end.
Content channels	Primary documents (Charter, AU Act, ICJ judgment, Pact for the Future, all quoted and analyzed here); canon (summarized); data (UN voting and ICJ compliance exercise); five perspectives
Bloom ceiling	Evaluate (adjudicate between legal interpretations and institutional logics)
Estimated study time	5–7 hours including exercises

Note on self-containment: Every primary text you need is quoted in this document with enough surrounding analysis to use it. You do not need to retrieve the UN Charter, the AU Constitutive Act, or the ICJ judgment to complete the lesson. The "Further Reading" section is optional.

SECTION 0 — Why This Lesson Exists

In Lesson 1 you learned that IR explanations live at different levels and that power has multiple faces. This lesson adds the dimension without which none of those explanations can be judged: **law**.

International law is not a decorative overlay on power politics. It is the **grammar through which states justify, contest, and legitimize their actions**. When Russia calls its invasion a "special military operation," when the US invokes "collective self-defense," when African states insist on "non-interference," when the UN Secretary-General calls a veto "a failure of the Council" — each is making a legal claim. The analyst who cannot parse those claims is reduced to saying "it's all power," which explains nothing about *why states bother to make legal arguments at all*.

This lesson does four things:

1. It gives you the **architecture of the Charter system** — the rules on sovereignty, non-interference, and the use of force, and the institutional machinery (UNSC, ICJ, Chapter VII) that enforces or fails to enforce them.
2. It shows how **African states modified the inherited legal order** through the AU Constitutive Act, creating a distinctive sovereignty regime.
3. It teaches you to read **legal documents as strategic instruments** — what they authorize, what they omit, and what they signal.
4. It reconstructs **five perspectives on international law**: African (TWAIL and the AU), Chinese, Russian, Western, and UN.

By the end, you can take any legal claim in world politics and answer: *What rule is being invoked? What exception is being claimed? Who has the authority to interpret it? And whose interests does that interpretation serve?*

SECTION 1 — PRE-CLASS PRIMING

1.1 Retrieval warm-up (from memory, before reading further)

1. From Lesson 1: State the four levels of analysis in one sentence each.
2. From Lesson 1: Name the three faces of power and give one observable implication of the third face.
3. From Lesson 1: In two sentences, reconstruct the African perspective's core claim about the international system.

Check your answers against Lesson 1 before proceeding. If you cannot retrieve them, review the relevant sections.

1.2 Orientation questions

Hold these in mind throughout:

- Is international law "law" in the same sense as domestic law? If not, what makes it binding?
- Why do powerful states sometimes comply with international law and sometimes ignore it?

- Can sovereignty be both a shield (protecting weak states) and a sword (justifying repression)? How?
- Whose interests does the "rules-based international order" serve?

1.3 Vocabulary pre-teach

You will encounter these terms. Write a provisional definition for each; you will revise them by the end of the lesson.

Sovereignty; non-interference; jus cogens; erga omnes; Chapter VII; veto; self-defence; armed attack; non-intervention; uti possidetis juris; R2P; TWAIL; opinio juris; customary international law.

SECTION 2 — LESSON CORE

2.1 Learning objectives

By the end of this lesson, you can:

1. **Reconstruct** the Charter system's rules on the use of force and non-interference, and distinguish them from the principle of non-intervention in customary law.
2. **Analyze** the AU Constitutive Act as a *modification* of the inherited sovereignty regime, explaining what changed and why.
3. **Read** a primary legal document (Charter article, AU Act provision, ICJ judgment, Pact for the Future section) for what it authorizes, prohibits, omits, and signals.
4. **Reconstruct** how the African, Chinese, Russian, Western, and UN perspectives interpret the same legal rules differently, and **adjudicate** among those interpretations on a specific case.
5. **Evaluate** the claim that international law is merely "power politics in legal dress," using evidence from at least two cases.

2.2 KEY IDEA 1 — The Charter system is built on a prohibition, an exception, and a loophole

The claim: The post-1945 legal order rests on three interlocking provisions: Article 2(4) prohibits the use of force; Article 51 preserves a narrow right of self-defence; and Chapter VII authorizes the Security Council to use force to maintain or restore international peace and security. The tension among these three is the engine of most legal disputes in IR.

The text. Here are the provisions you must know, quoted in full:

Article 2(3): "All Members shall settle their international disputes by peaceful means in such a manner that international peace and security, and justice, are not endangered."

Article 2(4): "All Members shall refrain in their international relations from the threat or use of force against the territorial integrity or political independence of any state, or in any other manner inconsistent with the Purposes of the United Nations."

Article 2(7): "Nothing contained in the present Charter shall authorize the United Nations to intervene in matters which are essentially within the domestic jurisdiction of any state or shall require the Members

to submit such matters to settlement under the present Charter; but this principle shall not prejudice the application of enforcement measures under Chapter VII."

Article 51: "Nothing in the present Charter shall impair the inherent right of individual or collective self-defence if an armed attack occurs against a Member of the United Nations, until the Security Council has taken measures necessary to maintain international peace and security."

Chapter VII, Article 39: "The Security Council shall determine the existence of any threat to the peace, breach of the peace, or act of aggression and shall make recommendations, or decide what measures shall be taken in accordance with Articles 41 and 42, to maintain or restore international peace and security."

Article 42: "Should the Security Council consider that measures provided for in Article 41 would be inadequate or have proved to be inadequate, it may take such action by air, sea, or land forces as may be necessary to maintain or restore international peace and security."

The structure. Article 2(4) is a near-absolute prohibition, subject only to the exceptions the Charter itself creates. The two textual exceptions are self-defence under Article 51 and Security Council authorization under Chapter VII. Everything else — humanitarian intervention without Council authorization, anticipatory self-defence against a non-imminent threat, intervention to protect nationals abroad, regime change — must be justified by stretching one of these exceptions or by arguing that a new customary exception has emerged.

The ICJ's authoritative interpretation. In *Nicaragua v. United States* (1986), the International Court of Justice held that the prohibition on the use of force in Article 2(4) is also a principle of **customary international law**, binding on all states regardless of treaty membership. The Court distinguished the **most grave forms** of the use of force — which constitute an "armed attack" triggering the right of self-defence — from lesser forms, such as the mere provision of weapons or logistical support to rebels, which do not. It also held that **collective self-defence requires a request from the victim state** and that the victim must have declared itself to have been attacked.

The Court further defined the **principle of non-intervention** as "the right of every sovereign State to conduct its affairs without outside interference," a principle reflected in "numerous declarations and resolutions adopted by international organizations." A prohibited intervention is one that bears on matters each state is permitted to decide freely — "the choice of a political, economic, social and cultural system, and the formulation of foreign policy" — and that uses "methods of coercion, particularly force, either in the direct form of military action or in the indirect form of support for subversive activities in another State."

Mechanism: Why does this structure produce persistent legal contestation? Because the prohibition is broad, the exceptions are narrow and textually under-specified, and the authoritative interpreter — the Security Council — is a political body subject to the veto. The result is a system in which **legal argument is strategic**: states have incentives to characterize their actions as falling within an exception, and to characterize their adversaries' actions as violating the prohibition.

Scope condition: The Charter framework applies to *inter-state* force. It says much less about civil wars, proxy warfare, cyber operations, or economic coercion — which is precisely where much contemporary contestation occurs.

Observable implication: If the Charter framework is operative, you should see states **justifying** their uses of force in Charter language (self-defence, collective self-defence, Council authorization), even when the justification is strained. A state that makes no legal argument at all is signaling that it does not expect to be judged by the framework.

2.3 KEY IDEA 2 — The AU Constitutive Act modifies the inherited sovereignty regime from within

The claim: African states did not simply inherit the Westphalian/Charter regime. Through the AU Constitutive Act (2000), they **modified** it — retaining non-interference as a foundational principle while adding a right of intervention in grave circumstances. This is one of the most important legal innovations in post-Cold War international law, and it was produced by African agency, not imposed from outside.

The text. Article 4 of the AU Constitutive Act lists the Union's principles. The key provisions:

- **Article 4(a):** "Sovereign equality and interdependence among member states of the Union."
- **Article 4(g):** "Non-interference by any member state in the internal affairs of another."
- **Article 4(h):** "The right of the Union to intervene in a member state pursuant to a decision of the Assembly in respect of grave circumstances, namely: war crimes, genocide and crimes against humanity."
- **Article 4(j):** "The right of member states to request intervention from the Union in order to restore peace and security."
- **Article 4(p):** "Condemnation and rejection of unconstitutional changes of governments."

What changed. The OAU Charter (1963) had enshrined non-interference as an absolute principle, a direct response to the experience of colonialism and the fear of great-power meddling. The AU Act retained non-interference (Article 4(g)) but added Article 4(h) — a right of the Union to intervene in a member state in cases of genocide, war crimes, and crimes against humanity. This was a **significant inroad into the principle of non-interference**, and it was made by African states themselves, not imposed by the UN or Western powers.

The AU also added **Article 4(p)**, rejecting unconstitutional changes of government — a norm that the OAU had lacked, and which has been invoked repeatedly in response to coups in Mali, Guinea, Burkina Faso, Niger, and Gabon.

Mechanism: Why did African states modify the regime? The standard explanation is a learning process from the failures of the OAU — particularly the 1994 Rwandan genocide, which the OAU could not respond to because non-interference was absolute. The AU was designed to retain sovereignty's protective function while creating a narrow exception for the most grave crimes. The norm is often summarized as moving from "non-interference" to "non-indifference."

Scope condition: Article 4(h) is a right of the *Union*, exercised by the Assembly of Heads of State — not a right of individual member states, and not a right of external powers. It is also narrowly defined: genocide, war crimes, and crimes against humanity, not "human rights violations" generally. The AU has been extremely reluctant to invoke it in practice, and its invocation in Libya (2011) was contested.

Observable implication: If the AU regime is operative, you should see (a) African states invoking Article 4(h) as a *normative resource* in debates about intervention, even when they do not invoke it as a legal authorization; (b) AU suspensions of member states after coups, consistent with Article 4(p); and (c) resistance to *external* intervention framed as a violation of Article 4(g), even as the AU claims a *collective* right of intervention under Article 4(h).

2.4 KEY IDEA 3 — Legal documents are strategic instruments: read them for what they authorize, omit, and signal

The claim: A legal document is never just a set of rules. It is a **political act** that distributes authority, creates constituencies, and forecloses alternatives. The analyst must read three layers: the text (what it says), the omission (what it does not say), and the signal (what it communicates to audiences).

The three-layer reading protocol. Apply this to any legal document:

Layer	Question	Example
Authorization	What does this text *permit* an actor to do that it could not otherwise do?	Article 4(h) authorizes the AU Assembly to intervene in a member state — a power the OAU did not have.
Omission	What does the text *not* say, and who benefits from that silence?	Article 2(4) prohibits "force" but does not define it; cyber operations and economic coercion fall outside its text. Article 4(h) covers genocide, war crimes, and crimes against humanity but not "human rights violations" generally — a deliberate narrowing.
Signal	What does the text communicate to audiences — domestic, regional, global?	The AU's Article 4(p) signals to domestic audiences that coups will not be tolerated, and to external audiences that Africa is capable of self-governance. Russia's invocation of Article 51 signals that it expects to be judged by the Charter framework, even as it violates Article 2(4).

Worked illustration — the Pact for the Future (2024). The UN's *Pact for the Future*, adopted at the 2024 Summit of the Future, is a useful case. Read it through the three layers:

- **Authorization:** The Pact is not a treaty and does not create binding legal obligations. It is a political declaration. Its "authorization" layer is weak. But it commits member states to "the most progressive and concrete commitment to Security Council reform since the 1960s," including steps to redress "the historical under-representation of Africa as a priority." It also commits to "the first multilateral recommitment to nuclear disarmament in more than a decade" and to "steps to avoid the weaponization and misuse of new technologies, including lethal autonomous weapons."
- **Omission:** The Pact does not create enforcement mechanisms, does not specify timelines for Security Council reform, and does not name the states that block it. It also does not resolve the fundamental tension between sovereignty and R2P.

- **Signal:** The Pact signals a **recommitment to multilateralism and international law** at a moment of erosion. It signals to African states that their demand for representation is acknowledged. It signals to the P5 that reform pressure is increasing, without creating a mechanism that could force it.

Mechanism: Why do states produce documents whose authorizations are weak but whose signals are strong? Because legal documents do double duty: they **coordinate expectations** (even non-binding commitments shape what states expect of each other) and they **create political resources** (a state can later say "you committed to this"). The Pact's weak authorization layer is not a failure; it is a reflection of the distribution of power in the General Assembly, where the P5 cannot be bound without consent.

Scope condition: The three-layer reading is most revealing for **ambiguous or aspirational documents** — declarations, action plans, framework agreements. For binding treaties and court judgments, the authorization layer is denser and the omission layer more contested.

2.5 KEY IDEA 4 — The five perspectives read the same legal rules differently, and each reading serves a distinct political project

The claim: International law is not a neutral framework that all states interpret identically. It is a **contested terrain**. African, Chinese, Russian, Western, and UN perspectives agree on the text of the Charter but disagree profoundly on its meaning, its application, and its authority. Each reading is internally coherent and serves a political project.

2.5.1 The African perspective (primary) **Core commitments.** African approaches to international law — often grouped under Third World Approaches to International Law (TWAIL) and its African variants — start from a structural claim: international law was **constituted through colonialism**, and it continues to reproduce global hierarchy. TWAIL scholarship highlights "how international law perpetuates global inequality and systemic marginalisation," and argues that international law was "used to justify and legitimise the suppression of Third World peoples" and "was therefore instrumental" to the colonial order. A central TWAIL claim is that international law maintains domination "not through the use of force but through having their worldview accepted as natural by those over whom domination is exercised."

But African legal thought is not only critique. **Contributionism** emphasizes that Africa "in the past participated and continues to participate in the formation of international legal norms," and that Africa is "an innovator and generator" of international law. The AU Constitutive Act's Article 4(h) is a prime example: a distinctly African legal innovation that modified the inherited regime.

How this perspective reads the Charter. Sovereignty and non-interference are not abstract principles — they are **hard-won protections** against a history of external intervention and colonial rule. The AU retained Article 4(g) precisely because African states have experienced the alternative. But the AU also recognized that absolute non-interference had failed to protect civilians in Rwanda and elsewhere, and so it added Article 4(h) — a **collective** right of intervention, exercised by African states themselves, not by external powers.

How it reads the use-of-force regime. African states are often skeptical of humanitarian intervention framed by Western powers, because they have seen it used selectively (Libya 2011, Iraq 2003) and because they suspect it of serving regime-change objectives. They are more receptive to intervention authorized by the AU or the UN, and they insist that any intervention be collective and lawful. The African perspective thus **accepts the Charter framework but reads it through the lens of colonial history and selective enforcement**.

What it occludes: It can underplay the genuine normative commitment of some African states to R2P, and it can underplay the ways in which African governments invoke sovereignty to shield domestic repression.

2.5.2 The Chinese perspective **Core commitments.** Chinese official discourse on international law centers on **sovereign equality, non-interference, and peaceful settlement of disputes**. Chinese statements consistently emphasize that "all states should treat each other as equals, respect each other's sovereignty and territorial integrity, oppose the use or threat of force in international relations, and abide by the golden rule of non-interference in the internal affairs of other countries." China frames its approach as grounded in the UN Charter and in a **multilateral order with the UN at its core**, based on "international law based on the UN Charter."

How this perspective reads the Charter. China reads the Charter as a **sovereignty-protective** document. The prohibition on interference in internal affairs is central, and China opposes "bypassing the Security Council to impose sanctions or use force arbitrarily," and opposes "double standards" in the interpretation and application of international law. China's relational ontology (from Lesson 1) reinforces this: order is sustained through relationships of mutual respect, not through hierarchical enforcement.

How it reads the use-of-force regime. China is skeptical of humanitarian intervention and R2P, preferring peaceful settlement and dialogue. It accepts the Security Council's authority but resists expansive interpretations of Chapter VII. It emphasizes "legitimate security concerns" of all states — a formulation that can be used to justify opposition to NATO enlargement or to sanctions regimes.

What it occludes: It can underplay the coercive dimension of China's own economic and territorial claims, and it can treat sovereignty as a shield for domestic practices that other states regard as rights violations.

2.5.3 The Russian perspective **Core commitments.** Russia's approach to international law is **exceptionalist and civilizational**. Russia does not reject international law wholesale; it sees it as embodied in "the principles of state sovereignty, territorial integrity, non-intervention," and it supports a system "based on sovereignty in which great powers have a strong and recognised status, particularly in questions related to security." But Russia interprets international law from its own perspective, rejecting interpretations of human rights that emphasize individual liberties as "a cultural concept specific only to the West."

How this perspective reads the Charter. Russia reads the Charter as a **great-power concert**. The Security Council's composition and veto are not obstacles to be reformed but the core of the order: "great powers come together to deliberate issues of war and peace and are able to veto any undesirable resolutions." Russia is "strictly opposed to reforms of the UN — and particularly the Security Council — as it is afraid of losing its current strong status."

How it reads the use-of-force regime. Russia claims a right to pre-emptive action in its "sphere of influence" — a concept that has "no basis in the UN Charter or other legal codes" but has been deployed by Russian legal scholars as the "civilisational space of Russia." It justifies its 2022 invasion through a combination of Article 51 self-defence claims, protection of compatriots, and anti-fascism narratives.

What it occludes: It naturalizes aggression against smaller neighbors and treats their sovereignty as conditional on Russian security interests.

2.5.4 The Western perspective **Core commitments.** Western international-law scholarship and state practice are not monolithic, but dominant strands share several features: a commitment to **binding legal rules**,

including human rights and humanitarian law; support for **institutions with enforcement capacity** (the ICJ, the ICC, the Security Council); and a belief that **legal order can be progressively developed** through treaties, courts, and customary law. Western states were the primary architects of the post-1945 legal order and remain its most vocal defenders — though they also selectively violate it (Iraq 2003, drone strikes outside armed conflict, targeted killings).

How this perspective reads the Charter. Western readings tend to emphasize the **purposes** of the Charter (Article 1: peace, security, human rights) as much as its prohibitions. This allows for expansive interpretations of Chapter VII (e.g., "threat to the peace" includes human rights abuses), humanitarian intervention, and R2P. The ICJ's *Nicaragua* judgment is a canonical Western legal text — but it was also a defeat for the US, and the US subsequently withdrew from the case.

How it reads the use-of-force regime. Western states generally accept the Article 2(4) prohibition but argue for **exceptions**: humanitarian intervention, R2P, anticipatory self-defence against imminent threats, and enforcement of Security Council resolutions. These exceptions are contested by Russia, China, and many African states, which see them as vehicles for Western power.

What it occludes: Its own selectivity — the double standards that African, Chinese, and Russian critics identify — and the colonial genealogy of the legal order it defends.

2.5.5 The UN perspective **Core commitments.** The UN's legal discourse is **Charter-centric and institutional**. It treats the Charter as the foundational legal document, the Security Council as the primary authority for peace and security, and the Secretary-General as the guardian of the Charter's purposes. The UN's own normative voice emphasizes **multilateralism, international law, and the peaceful settlement of disputes**. The *Pact for the Future* is a strong statement of "countries' commitment to the United Nations, the international system and international law," and it recommits to "multilateralism, solidarity and international law."

How this perspective reads the Charter. The UN reads the Charter as a **living instrument** that must adapt to new threats (climate, cyber, AI) while remaining anchored in its original principles. It emphasizes the **gap between principle and practice** — the veto, selective enforcement, and the failure to implement Charter norms — and it frames reform (Security Council reform, peacekeeping adaptation, international financial architecture reform) as necessary to close that gap.

How it reads the use-of-force regime. The UN treats Chapter VII as the primary lawful pathway for collective action, while acknowledging that the veto makes it unreliable. It supports peace operations that are "adaptable, inclusive, politically grounded," and it emphasizes prevention and mediation. It is critical of unilateral uses of force but constrained by the P5's interests.

What it occludes: The P5's veto politics and the ways in which the UN's own structure reproduces the power hierarchy it claims to transcend.

2.5.6 The comparison matrix Fill this from memory, then check:

Dimension	African (primary)	Chinese	Russian	Western	UN
Status of sovereignty	Hard-won; non-interference plus collective exception (Art. 4(h))	Absolute; non-interference as golden rule	Stratified; great powers have prerogatives	Formal; subject to human-rights exceptions	Legal; Charter-based
Use of force	Collective, AU/UN-authorized intervention acceptable; unilateral Western intervention suspect	Strong presumption against force; peaceful settlement	Self-defence plus sphere-of-influence claims	Broad exceptions (R2P, humanitarian, anticipatory)	Chapter VII as primary pathway
Attitude to institutions	AU as norm innovator; UN reform for representation	UN-centered multilateral-ism; opposition to bypassing UNSC	UNSC veto as core; opposition to reform	Strong courts and enforcement; selective compliance	Charter as living instrument; reform to close gap
Key occlusion	Sovereignty as shield for repression	Coercive dimension of Chinese power	Neighbors' sovereignty as conditional	Selectivity and double standards	P5 veto politics

---

2.6 WORKED EXAMPLE (I do)

The puzzle: In 2011, the UN Security Council adopted Resolution 1973 authorizing "all necessary measures" to protect civilians in Libya. NATO intervened, and the intervention quickly became a regime-change operation, culminating in the killing of Muammar Gaddafi. In the aftermath, South Africa, which had voted for the resolution, criticized NATO for exceeding its mandate. Russia and China cited the Libya precedent as a reason to veto subsequent resolutions on Syria. The AU, which had its own roadmap for Libya, was sidelined.

The puzzle stated precisely: *Why did the Libya intervention produce a lasting fracture in the legal consensus on humanitarian intervention, even though the intervention was authorized by the Security Council under Chapter VII?*

Level of analysis: The fracture is best explained at the **systemic and normative levels**. The systemic level explains the *opportunity*: the Security Council was able to authorize force because Russia and China abstained rather than vetoed. The normative level explains the *consequence*: the intervention revealed that a Chapter VII authorization could be stretched into regime change, which made Russia and China reluctant to authorize future interventions, and which confirmed African suspicions that humanitarian language could mask power politics.

The three-layer reading of Resolution 1973:

- **Authorization:** The resolution authorized member states to take "all necessary measures" to protect civilians, short of a foreign occupation force.
- **Omission:** It did not authorize regime change, did not specify limits on the use of force, and did not define "civilian protection" precisely enough to constrain the intervening powers.
- **Signal:** It signaled that the Security Council was willing to authorize force for humanitarian purposes — but the *implementation* of the resolution signaled to Russia, China, and African states that such authorizations could be exploited.

Perspective reconstruction:

- **African perspective:** The AU had its own mediation roadmap for Libya, which was bypassed by NATO. South Africa's vote for Resolution 1973 was followed by criticism that NATO had exceeded the mandate. The African reading emphasizes the **selective use of humanitarian law** and the sidelining of African institutions. It reinforces the AU's preference for collective, AU-authorized intervention over ad hoc Western-led operations.
- **Chinese perspective:** The Libya intervention confirmed China's skepticism of expansive interpretations of Chapter VII. China had abstained (not vetoed) on Resolution 1973; it subsequently cited Libya as a cautionary tale and vetoed resolutions on Syria. The Chinese reading emphasizes **non-interference and opposition to regime change**.
- **Russian perspective:** Russia similarly cites Libya as proof that humanitarian language is a pretext for regime change. The Russian reading emphasizes **great-power prerogatives and the dangers of authorizing force without controlling its implementation**.
- **Western perspective:** Western states defend the intervention as a necessary response to an imminent massacre, while acknowledging that the mandate was stretched. The Western reading emphasizes **the responsibility to protect** and the difficulty of limiting intervention once authorized.
- **UN perspective:** The UN was caught between its authorization and its inability to control implementation. The UN's own discourse emphasizes **civilian protection** and the need for **political solutions**, and it treats Libya as a lesson in the importance of aligning mandates with implementation.

Adjudication. Which perspective best explains the *fracture*? The African, Chinese, and Russian perspectives converge on the same diagnosis: the intervention demonstrated that Chapter VII authorizations could be used for purposes beyond their text. The Western perspective explains the *motivation* for the intervention but not its *consequences*. The UN perspective captures the institutional dilemma but not the power dynamics. A complete explanation combines the **systemic level** (the post-2008 distribution of power and the willingness of Russia and China to abstain) with the **normative level** (the contestation over the meaning of "civilian protection"). The African perspective adds a crucial dimension: the **sidelining of regional institutions** as a source of legitimacy.

2.7 PROBLEM PAIR (We do)

Your task: Analyze the following case using the apparatus above. Write your analysis before reading the model answer.

The case: In 2023, the Economic Community of West African States (ECOWAS) threatened military inter-

vention to reverse the coup in Niger. The AU did not endorse the intervention. The junta in Niger invoked sovereignty and non-interference, and neighboring Mali and Burkina Faso — also under military rule — pledged to defend Niger. The UN Secretary-General called for a peaceful resolution and emphasized constitutional order, but did not authorize force.

Your tasks:

1. State the puzzle precisely in one sentence.
2. Apply the three-layer reading to the ECOWAS threat of intervention. What did it authorize? What did it omit? What did it signal?
3. Apply the three-layer reading to the AU's non-endorsement. What did it authorize, omit, and signal?
4. Reconstruct the African perspective on this episode. How does the AU's Article 4(g) and 4(h) framework shape the reading?
5. Write a 300-word adjudication: which perspective best explains why the intervention did not occur?

Model answer (compare after writing your own):

Puzzle: Why did ECOWAS threaten intervention in Niger but ultimately not intervene, despite the coup's violation of ECOWAS and AU norms against unconstitutional changes of government?

ECOWAS threat — three layers: - **Authorization:** ECOWAS claimed authority under its own protocols to reverse an unconstitutional change of government. - **Omission:** It did not specify a legal basis in the UN Charter, did not seek Chapter VII authorization, and did not clarify whether it would act without AU endorsement. - **Signal:** It signaled to the junta that it was serious, to domestic audiences that it would defend constitutional order, and to external powers that West Africa could act collectively.

AU non-endorsement — three layers: - **Authorization:** The AU's silence withheld the legitimacy that ECOWAS needed to frame intervention as a regional, lawful act. - **Omission:** The AU did not invoke Article 4(h) (which covers genocide, war crimes, and crimes against humanity, not coups) and did not invoke Article 4(p) (which condemns unconstitutional changes but does not authorize force). - **Signal:** The AU signaled that it would not authorize military intervention to reverse a coup, and that it preferred diplomatic engagement — a signal consistent with the AU's reluctance to invoke Article 4(h) in practice.

African perspective: The AU framework distinguishes between **condemning** unconstitutional changes (Article 4(p)) and **authorizing intervention** (Article 4(h)). A coup does not meet the Article 4(h) threshold of genocide, war crimes, or crimes against humanity. The AU's non-endorsement is therefore consistent with its own legal framework — even as it frustrated ECOWAS. The African perspective also emphasizes **solidarity among states facing similar legitimacy crises** (Mali, Burkina Faso, Niger) and **suspicion of external intervention**.

Adjudication: The African perspective best explains the non-intervention — not because the AU was weak, but because its legal framework **does not authorize force to reverse coups**, only to stop grave crimes. The Western perspective, which tends to frame the non-intervention as a failure of African institutions, misses this legal distinction. The UN perspective captures the normative preference for peaceful resolution but does not explain the specific legal constraint. The ECOWAS threat was a signaling exercise, not a legal commitment to intervene; the AU's silence removed the legitimacy that would have been necessary.

2.8 INDEPENDENT MEMO (You do)

Produce a one-page analytical memo (500–600 words) on the following case, using the four headings below.

Case: The 2024 *Pact for the Future* and the demand for UN Security Council reform, including the call to redress "the historical under-representation of Africa."

Memo headings:

1. **Mechanism:** What does the Pact's reform commitment actually authorize, and what does it omit? Why did member states produce a commitment that is politically significant but legally non-binding?
2. **Perspective reconstruction:** How would each of the five perspectives interpret the Pact's reform commitment? (One paragraph or table entry each.)
3. **Historical analogue:** What earlier reform effort illuminates this dynamic? (e.g., the 1965 expansion of the Security Council, the 2005 World Summit, the G4/African Union competing reform proposals.)
4. **Falsifiers:** What evidence would show that the Pact's reform commitment has become legally or politically operative? What would show it has failed?

Self-check: Does your memo distinguish what the Pact *authorizes* from what it *signals*? Does it reconstruct each perspective from within? Does it specify what evidence would change your judgment?

2.9 HINGE QUESTION

A state argues that its military intervention in a neighboring country is lawful because it was invited by the neighboring government to help suppress a rebellion. Which legal issue does this raise?

- A) Whether the intervention violates Article 2(4)
- B) Whether the intervention is a prohibited intervention in domestic affairs under the *Nicaragua* standard
- C) Whether the intervention requires Security Council authorization under Chapter VII
- D) Whether the intervention is an act of aggression under the Rome Statute

Answer: A. The core legal question is whether an intervention *at the invitation of a government* falls within the Article 2(4) prohibition. The ICJ in *Nicaragua* addressed this implicitly: the prohibition is on force "against the territorial integrity or political independence of any state." If the government consents, the intervention is not "against" the state — but the validity of consent is contested when the government's authority is itself contested (e.g., a civil war). B is a related but distinct principle (non-intervention in domestic affairs, which concerns coercion rather than force). C is incorrect because if consent is valid, Chapter VII authorization is not required. D concerns individual criminal responsibility, not the legality of the use of force.

If you answered B: You are conflating the use-of-force regime (Article 2(4), Chapter VII) with the non-intervention principle (*Nicaragua*). Both are relevant, but the *primary* legal issue raised by consent is whether the force is "against" the state under Article 2(4). **If you answered C:** You are assuming that all force requires Chapter VII authorization; the Charter does not say this — it creates exceptions (self-defence, consent) that do not require Council authorization. **If you answered D:** You are analyzing a different legal regime (international criminal law) rather than the *jus ad bellum*.

SECTION 2A — DATA LAB (30–45 minutes)

Purpose: Ground the lesson's legal concepts in empirical patterns.

Task: Using the summary data below (simplified from UN voting records and ICJ compliance data), analyze patterns of legal contestation.

Table 1: UN General Assembly votes on resolutions condemning specific uses of force (illustrative)

Resolution	Year	In favor	Against	Abstain	African "yes" share
Condemning Russia's annexation of Crimea	2014	100	11	58	30%
Condemning Russia's invasion of Ukraine	2022	141	5	35	55%
Condemning Israel's Gaza operations	2023	120	14	45	85%
Condemning Myanmar coup	2021	119	1	36	70%

Table 2: ICJ contentious cases involving use of force

Case	Year	Applicant	Respondent	Outcome
Nicaragua v. US	1986	Nicaragua	US	US found in breach; US withdrew from case
Bosnia v. Serbia	2007	Bosnia	Serbia	Genocide not proven; failure to prevent
Ukraine v. Russia (terrorism financing)	2024	Ukraine	Russia	Russia found in breach on some claims

Analysis questions:

1. **Pattern:** What does the variation in African "yes" shares across resolutions tell you about the relationship between African states and the use-of-force regime? Is there a single "African position"?

2. **Level of analysis:** Does the ICJ compliance record support a systemic explanation (power determines compliance) or a normative explanation (law shapes behavior)? What evidence would distinguish them?
3. **Perspective:** How would each of the five perspectives interpret the ICJ record? (African: selective enforcement; Chinese: courts as Western instruments; Russian: courts as political; Western: courts as progressive; UN: courts as part of the Charter system.)
4. **Limitation:** What does the voting data *not* tell you? (Hint: votes may reflect strategic alignment, not legal belief; abstentions may signal ambiguity; the resolutions' text may vary in legal precision.)

Rule: Complete the data lab before the independent memo. Evidence precedes argument.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Task: Draw the following by hand.

Visual 1: The use-of-force architecture. Draw three columns: **Prohibition** (Article 2(4)), **Exceptions** (Article 51 self-defence; Chapter VII authorization; consent), and **Contested grey zones** (humanitarian intervention without authorization; anticipatory self-defence; cyber operations; economic coercion). Draw arrows from the prohibition to each exception, labeling what the exception requires.

Visual 2: The AU modification. Draw two circles, one labeled "OAU 1963" and one labeled "AU 2000." Inside each, list the principles: OAU (sovereign equality, non-interference, territorial integrity, peaceful settlement); AU (sovereign equality, non-interference, Article 4(h) intervention right, Article 4(p) anti-coup norm). Draw an arrow from OAU to AU labeled "Rwanda learning / non-indifference."

Visual 3: The five perspectives on the Charter. Draw a five-column table with rows for: "Use of force," "Sovereignty," "Institutions," "Key occlusion." Fill from memory.

SECTION 4 — CORNELL NOTES

Set up your notes with the following cue column:

Cue column	Notes
What does Article 2(4) prohibit?	Threat or use of force against territorial integrity or political independence
What are the Charter's exceptions to 2(4)?	Self-defence (Art. 51); Chapter VII authorization (Art. 39/42); consent
What did *Nicaragua* establish?	2(4) is customary law; "armed attack" threshold; collective self-defence requires request
What did the AU change?	Article 4(h): collective right of intervention in genocide, war crimes, crimes against humanity; Article 4(p): anti-coup norm
What are the three layers of a legal document?	Authorization, omission, signal

Cue column	Notes
How do the five perspectives read the Charter?	African: colonial history + AU innovation; Chinese: sovereignty + non-interference; Russian: great-power concert; Western: binding rules + exceptions; UN: living instrument + reform
Source log	Lesson text, Sections 2.2–2.5; UN Charter excerpts (quoted); AU Act Art. 4 (quoted); *Nicaragua* judgment (quoted); Pact for the Future (quoted)
Summary	3–5 sentences synthesizing the lesson

SECTION 5 — FEYNMAN COMPRESSION

Step 1: Explain the Charter's use-of-force regime to a smart non-specialist in 150–200 words, without using jargon. If you must use "sovereignty" or "Chapter VII," define them in plain language.

Step 2: Mark every point where you hesitated or used a term you could not define.

Step 3: Reread only the gaps. Rewrite.

Step 4: Produce one analogy for the relationship between Article 2(4) and its exceptions. Then state where the analogy breaks down. (Example: "The Charter is like a building with a strict no-smoking rule and two designated smoking areas — but the building manager decides who gets to use the areas, and the manager is a committee that often disagrees." Where it breaks down: the "manager" (Security Council) is also a smoker.)

SECTION 6 — SPACED-REPETITION FLASHCARDS

Produce 12–15 cards. Use the following types:

Type	Example
Definition	What is the difference between *non-interference* (Article 2(7)) and *non-intervention* (customary law, *Nicaragua*)?
Mechanism	Why does the Charter's prohibition on force require states to justify their actions in legal language, even when they violate it?
Application	A state invokes Article 51 to justify a strike on a non-state group in a neighboring country. What legal issues does this raise?
Comparison	How does AU Article 4(h) differ from the UN's R2P?
Source	What did the ICJ hold in *Nicaragua* about collective self-defence?

Type	Example
Debate	What is the strongest objection to the claim that international law is "just power politics"?
Reconstruction	How would a TWAIL scholar explain the AU's Article 4(h)?
Occlusion	What does the Russian reading of the Charter systematically fail to see?
Adjudication	Which perspective best explains the Libya intervention's aftermath, and what does it miss?
Visual	Label the three layers of legal-document reading on a diagram.

Tag each card: `L2`, `law`, `perspective`, `institutions`, `difficulty`.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence audit

Rate confidence (0–100%) before checking:

Objective	Confidence
Reconstruct the Charter's use-of-force rules	
Analyze the AU's modification	
Apply the three-layer reading	
Reconstruct the five legal perspectives	
Evaluate the "law is power politics" claim	

After exercises, rate accuracy. Calculate the gap.

7.2 Three-question debrief

1. What did I misunderstand about the relationship between Article 2(4) and customary law?
2. Which perspective was easiest to reconstruct? Which was hardest? What does that suggest about my default framing?
3. What will I do differently in Lesson 3?

7.3 Error log

Date	Lesson	Error type	Correct understanding	Card created?
	L2			

SECTION 8 — CHEATSHEET (Module 0)

Add this row to your Module 0 cheatsheet:

Column	Content
Core concepts	Article 2(4); Article 2(7); Article 51; Chapter VII; customary international law; non-intervention; AU Art. 4(h); AU Art. 4(p); three-layer reading
Key mechanisms	Prohibition → exception → contested grey zone; authorization → omission → signal; OAU non-interference → AU non-indifference
Theories and authors	ICJ *Nicaragua* (1986); TWAIL (Mutua, Grovogui); AU Constitutive Act; Pact for the Future
Cases and evidence	Libya 2011; Niger 2023; Crimea 2014; Ukraine 2022; ICJ cases
Debates	Is international law binding? Whose interests does it serve? Is R2P a norm or a tool?
Falsifiers	What evidence would show that legal rules constrain state behavior independent of power?
Cross-links	L9 (Westphalia); L12 (OAU); L28 (AU regime); L37 (lawfare); L45 (JCPOA snapback)

SECTION 9 — REVIEW SCHEDULE

Review	Timing	Format
R1	Today	Retrieval warm-up + card creation
R2	2–3 days	Cue-column recall + hinge variant
R3	1 week	Mixed quiz with L1 and L2 cards
R4	3–4 weeks	Interleaved problem combining L2 with L4–8 (theory) and L27–34 (Africa)
R5	End of Module 0	Cheatsheet reconstruction from memory

SECTION 10 — COMPLETION CHECKLIST

- ☐ Retrieval warm-up completed from memory
- ☐ Five learning objectives read and understood

- ☐ Four key ideas studied with mechanisms and scope conditions
- ☐ Perspective comparison matrix filled from memory, then checked
- ☐ Worked example (Libya 2011) studied and self-explained
- ☐ Problem pair (Niger 2023) attempted and compared
- ☐ Independent memo produced (500–600 words)
- ☐ Hinge question answered correctly (or reteaching completed)
- ☐ Data lab completed before independent memo
- ☐ Three dual-coded visuals drawn
- ☐ Cornell notes with cue column, source log, and summary
- ☐ Feynman explanation written, gaps identified, rewritten
- ☐ 12–15 flashcards created with tags
- ☐ Confidence audit and error-log entry
- ☐ Cheatsheet entry added
- ☐ R2 review scheduled

FURTHER READING (Optional — for deepening, not required)

- **Primary documents:** UN Charter (full text); AU Constitutive Act (full text); ICJ, *Military and Paramilitary Activities in and against Nicaragua* (1986), Merits judgment; UN, *Pact for the Future* (2024).
- **On the Charter and use of force:** Thomas Franck, *Recourse to Force* (2002); Christine Gray, *International Law and the Use of Force* (4th ed., 2018).
- **On TWAIL and African international law:** Makau Mutua, "What Is TWAIL?" (2000); Siba Grovogui, *Sovereigns, Quasi-Sovereigns, and Africans* (1996); Obiora Okafor, *Re-Defining Legitimate Statehood* (2000).
- **On the AU regime:** Ben Kioko, "The right of intervention under the African Union's Constitutive Act" (2003); AU Peace and Security Council communiqués.
- **On Russian and Chinese legal approaches:** Lauri Mälksoo, *Russian Approaches to International Law* (2015); Congyan Cai, *The Rise of China and International Law* (2019).
- **On the UN and reform:** UN *Our Common Agenda* (2021); Security Council reform proposals (G4, African Union Ezulwini Consensus).

End of Lesson 2. Say **"Next"** when you are ready for Lesson 3 (Historical Method and Causal Inference).

4. Historical Method and Causal Inference: How We Know What We Think We Know About International Politics

---

LESSON METADATA

Field	Entry
Lesson number and title	L3 — Historical Method and Causal Inference
Module	Module 0: Orientation and Method
Prerequisites	L1 (puzzles, levels of analysis, power, perspectives); L2 (international law and institutions)
Interleaved links	Forward to L4–8 (theory), L9–14 (history), L27 (colonial state formation), L35 (post-Soviet ontology), L60–61 (capstones)
Reading load	This lesson only. Optional further reading at the end.
Content channels	Canon (summarized); primary documents (quoted); data lab (Correlates of War and ACLED exercises); five perspectives on historical method
Bloom ceiling	Evaluate (judge between competing causal claims and methodological approaches)
Estimated study time	5–7 hours including exercises

Note on self-containment: Every methodological concept, example, and debate you need is explained in this document. You do not need to consult outside readings. The "Further Reading" section is optional.

SECTION 0 — Why This Lesson Exists

Lessons 1 and 2 gave you the conceptual instruments — puzzles, levels, power, perspectives, law. But those instruments are only as good as the **evidence** you feed them. The single most common failure in IR analysis is not bad theory; it is **bad method** — selecting cases that confirm your argument, confusing correlation with causation, reading history backwards from the present, or treating a single case as proof of a general law.

This lesson teaches you how to **know** what you think you know. It covers four interlocking skills:

1. **Historical method:** How to read sources critically, how to avoid presentism and teleology, and how to use archives and historiography without being captured by them.
2. **Causal inference:** How to distinguish causation from correlation, how to use process tracing and comparative method, and how to construct and evaluate counterfactuals.
3. **Selection bias:** Why the cases you choose to study determine what you can conclude, and how the most common error in IR — selecting on the dependent variable — produces false confidence.
4. **Perspective on method:** How African, Chinese, Russian, Western, and UN traditions approach historical evidence differently, and why those differences matter for adjudication.

By the end, you will be able to take any causal claim in IR — "NATO caused the war," "colonialism caused state fragility," "sanctions caused the JCPOA collapse" — and subject it to disciplined evaluation: what is the evidence, what is the mechanism, what would falsify it, and what would we expect to see if it were false?

SECTION 1 — PRE-CLASS PRIMING

1.1 Retrieval warm-up (from memory)

1. From L1: Name the four levels of analysis and give one cause located at each level for a single event.
2. From L1: Distinguish the first, second, and third faces of power with one observable implication of each.
3. From L2: What did the ICJ hold in *Nicaragua* about the relationship between Article 2(4) and customary international law?
4. From L2: What is the three-layer reading of a legal document, and apply it in one sentence to Article 4(h) of the AU Constitutive Act.

Check against the previous lessons before proceeding.

1.2 Orientation questions

Hold these in mind:

- What makes a historical explanation *causal* rather than merely *descriptive*?
- Can we ever know what would have happened if history had gone differently?
- Why do historians and social scientists often disagree about the same events?
- Whose archives survive, and whose do not? What does that mean for what we can know?

1.3 Vocabulary pre-teach

Provisional definitions; revise by the end:

Process tracing; counterfactual; selection on the dependent variable; endogeneity; presentism; teleology; historiography; primary source; secondary source; source criticism; comparative method; most-similar systems design; most-different systems design; congruence method; archival grain.

SECTION 2 — LESSON CORE

2.1 Learning objectives

By the end of this lesson, you can:

1. **Distinguish** causal from correlational claims, and identify the mechanism that links cause to effect.
2. **Apply** process tracing, comparative method, and counterfactual analysis to a single case and explain what each method contributes.
3. **Identify** selection bias, endogeneity, and presentism in existing IR explanations, and explain how each distorts inference.
4. **Read** a primary source and a secondary source critically, using external and internal source criticism, and identify what the archive silences.
5. **Reconstruct** how the African, Chinese, Russian, Western, and UN traditions approach historical method differently, and **adjudicate** among them on a specific case.

2.2 KEY IDEA 1 — Chronology is not explanation: causal claims require mechanisms and counterfactuals

The claim: A causal claim is not a story about what happened. It is a claim that **if the cause had been absent or different, the effect would have been absent or different** — and that we can specify the **mechanism** that links cause to effect.

The problem. Consider this claim: "The Treaty of Versailles caused the Second World War." It is a chronological sequence — Versailles (1919), then the Second World War (1939). But a sequence is not a cause. To make it a causal claim, you must specify:

- **The mechanism:** How did Versailles produce the war? Through German resentment and revisionism? Through the punitive reparations that crippled the Weimar economy? Through the territorial settlements that left German minorities outside the Reich? Through the disarmament clauses that made German rearmament a symbol of sovereignty?
- **The counterfactual:** Would the war have happened without Versailles? If the answer is "probably yes, because the structural conditions of multipolarity and the rise of Nazi ideology would have produced a war anyway," then Versailles is a contributing condition, not a sufficient cause.
- **The scope condition:** Under what conditions does a punitive peace produce a revanchist war? The answer must specify what distinguishes Versailles from other punitive settlements that did not produce wars (e.g., the settlement of 1815 after Napoleon, which produced a century of relative peace).

The mechanism requirement. A causal claim without a mechanism is a black box. "Sanctions caused the collapse of the JCPOA" tells you that two things happened; it does not tell you **how** one produced the other. The mechanism might be:

- **Economic pressure:** Sanctions crippled the Iranian economy, making the regime unwilling to comply with nuclear restrictions.
- **Political signaling:** Sanctions signaled that the West would not deliver the economic benefits promised under the deal, undermining the domestic coalition that supported it.
- **Reciprocal escalation:** Sanctions triggered Iranian counter-escalation (nuclear enrichment, support for proxies), which triggered further sanctions, in a spiral that neither side could control.

Each mechanism implies a different counterfactual and a different observable implication. The economic-pressure mechanism implies that *removing sanctions* would have stabilized the deal. The signaling mechanism implies that *credible commitments* would have stabilized it. The reciprocal-escalation mechanism implies that *de-escalation on both sides* would have been necessary.

The counterfactual requirement. A causal claim is a claim about a **comparison** — between the world we observe and a world in which the cause is absent. This comparison is always counterfactual (we cannot observe it) and always theory-laden (we need a theory to tell us what the counterfactual world would look like). The discipline of constructing counterfactuals is what distinguishes causal analysis from storytelling.

Scope condition: Counterfactuals are only as good as the theory that generates them. A counterfactual that violates everything we know about the world is not a useful comparison; it is a fantasy. The standard is **"minimal rewrite"** — change only the cause in question, hold everything else constant, and ask what would plausibly follow.

Observable implication: If a causal claim is well-specified, you should be able to identify (a) the mecha-

nism, (b) the counterfactual, and (c) the observable implications that would differ in the counterfactual world. If you cannot do all three, the claim is not yet a causal claim.

2.3 KEY IDEA 2 — Process tracing, comparative method, and counterfactuals are complementary tools, not rivals

The claim: IR has three main methods for establishing causal claims: **process tracing** (within-case), **comparative method** (across-case), and **counterfactual analysis** (against-case). They are not competitors; they answer different questions, and the strongest analyses use more than one.

Process tracing. Process tracing is the systematic examination of the **sequence of events within a single case** to identify the causal mechanism that links an independent variable to an outcome. It asks: *Did the mechanism that the theory predicts actually operate in this case?*

The method was formalized by Alexander George and Andrew Bennett, and is now the dominant qualitative method in IR. It involves:

1. **Specifying the mechanism** that the theory predicts (e.g., "NATO enlargement → Russian perception of existential threat → decision to invade").
2. **Identifying observable implications** at each step (e.g., Russian military planning documents, Putin's speeches, diplomatic exchanges).
3. **Testing the evidence** against the mechanism (e.g., did Russian planners actually cite NATO enlargement as a threat? Did Putin's speeches escalate in response to NATO decisions?).
4. **Ruling out alternative mechanisms** (e.g., was the invasion driven by domestic politics, economic interests, or Putin's personal ideology rather than NATO enlargement?).

Process tracing is especially powerful for **testing mechanisms** — it can show whether the causal process that a theory predicts actually occurred. It is less powerful for **estimating causal effects** — it cannot tell you how much of the outcome was due to the mechanism in question versus other factors.

The comparative method. The comparative method examines **variation across cases** to identify causal relationships. It uses John Stuart Mill's methods of agreement and difference, formalized by Arend Lijphart and others:

- **Most-similar systems design:** Compare cases that are similar on most variables but differ on the outcome. If they also differ on one independent variable, that variable may be the cause. *Example:* Compare two African states with similar colonial legacies, similar ethnic compositions, and similar resource endowments, where one experienced a coup and the other did not. If the difference is explained by a single variable (e.g., the presence of a foreign military base), that variable may be causal.
- **Most-different systems design:** Compare cases that are different on most variables but share the same outcome. If they also share one independent variable, that variable may be the cause. *Example:* Compare the collapse of the Soviet Union and the collapse of the Ottoman Empire — very different contexts, but both were multi-ethnic empires that collapsed under the pressure of nationalism and great-power competition.

The comparative method is powerful for **identifying associations** and for **ruling out rival explanations** (by showing that a variable that is present in one case and absent in another does or does not co-vary with the

outcome). It is less powerful for **establishing mechanisms** — it can show that two variables are associated without showing how the association works.

Counterfactual analysis. Counterfactual analysis constructs an explicit alternative world in which the cause is absent or different, and asks what would plausibly follow. It is the method that makes causation **observable by implication** rather than by direct observation.

The classic statement is James Fearon's "Counterfactuals and Hypothesis Testing in Political Science" (1991), which distinguishes **causal effects** (the difference between the observed outcome and the counterfactual outcome) from **causal mechanisms** (the process that produces the outcome). Fearon argues that counterfactuals are unavoidable in causal inference, but they must be disciplined by theory and evidence.

The discipline of counterfactual construction involves:

1. **Specifying the counterfactual** precisely: what is the cause being removed or changed, and what is held constant?
2. **Deriving implications** from theory: what would we expect to see in the counterfactual world?
3. **Testing those implications** against evidence: are there historical cases that approximate the counterfactual? Are there observable traces of the counterfactual world in the actual world?

The complementarity. The strongest causal analyses combine all three:

- **Process tracing** establishes that the mechanism operated in the case.
- **Comparative method** establishes that the cause and effect co-vary across cases.
- **Counterfactual analysis** establishes that the effect would not have occurred without the cause.

Worked illustration — the end of the Cold War. The peaceful end of the Cold War (1989–1991) is one of the most studied cases in IR. How would each method approach it?

- **Process tracing:** Examine the sequence of decisions by Gorbachev, the East European revolutions, and the Soviet withdrawal. Did Gorbachev's ideas (new thinking, common European home) cause the peaceful transition? Did the material pressures of Soviet decline cause it? Did the transnational diffusion of norms cause it? The method would trace the mechanism through archival evidence, memoirs, and interviews.
- **Comparative method:** Compare the end of the Cold War with other hegemonic transitions — the British decline, the collapse of the Ottoman Empire, the end of the Napoleonic wars. What distinguishes the peaceful Cold War transition from transitions that produced war? The method would identify the variable that explains the difference.
- **Counterfactual analysis:** What if Gorbachev had responded to the East European revolutions with force, as Brezhnev had in 1968? Would the Soviet Union have survived? Would the transition have been violent? The method would construct the counterfactual and test it against evidence (e.g., the Soviet leadership's debates, the military's reluctance to intervene).

None of these methods alone gives a complete answer. Together, they provide a more robust causal claim.

2.4 KEY IDEA 3 — Selection bias is the most common error in IR, and it is usually invisible to the analyst

The claim: The cases you choose to study determine what you can conclude. If you select cases on the basis of the outcome you are trying to explain, you will systematically overestimate the importance of whatever variable is present in those cases — because you have excluded the cases where the outcome did not occur.

The problem. This is called **selection on the dependent variable**, and it is the most common methodological error in IR. The classic statement is by Barbara Geddes, who showed that studies of economic development that selected only successful developers would conclude that "the policies of successful developers cause development" — without examining whether unsuccessful developers also adopted those policies.

In IR, the problem takes many forms:

- **Studying only wars:** If you study only wars, you will find that arms races, alliances, and territorial disputes are present in all of them. But you will not know whether those factors are also present in **peaceful** cases — and if they are, they do not explain war.
- **Studying only successful coups:** If you study only coups that succeeded, you will conclude that certain conditions (economic crisis, military factionalism) cause coups. But you will not know whether those conditions are also present in cases where coups were attempted and failed.
- **Studying only cases where a theory applies:** If you study only cases where realism seems to explain behavior, you will conclude that realism is a powerful theory. But you will not know whether it also explains the cases where it seems not to apply — and if it does not, its scope is narrower than claimed.

The mechanism. Selection bias operates through **truncation** — the cases you exclude are not random. They are systematically different from the cases you include, in ways that are correlated with both the cause and the effect. The result is **biased inference**: the relationship you observe in your sample is not the relationship in the population.

How to correct for it. There are three main strategies:

1. **Select on the independent variable:** Choose cases that vary on the cause you are interested in, and examine whether the outcome varies accordingly. This is what most-similar and most-different systems designs do.
2. **Select on the outcome and then examine the counterfactual:** If you must select on the outcome (e.g., you are studying wars because wars are what you care about), explicitly examine the cases where the outcome did not occur, and ask whether the cause was present or absent.
3. **Use large-N data:** If you can measure the cause and the outcome across many cases, you can estimate the relationship without selecting on either. This is what quantitative IR does, and it is one reason why quantitative methods are valuable even for qualitative researchers.

Scope condition: Selection bias is a problem for **causal inference**, not for **description** or **interpretation**. If you are trying to describe how a particular war unfolded, selection bias is irrelevant. If you are trying to explain why wars occur, it is fatal.

Observable implication: If a study is vulnerable to selection bias, you should be able to identify the cases it excludes and show that those cases would change the conclusion. If the excluded cases are similar to the included cases on the cause but different on the outcome, the study's conclusion is suspect.

2.5 KEY IDEA 4 — The five perspectives approach historical evidence differently, and those differences are themselves evidence

The claim: Historical method is not a neutral set of techniques. Different traditions approach the archive, the source, and the narrative with different assumptions about what counts as evidence, whose voice is authoritative, and what the purpose of historical reconstruction is. These differences are not obstacles to analysis; they are **data** about how different traditions understand the international.

2.5.1 The African perspective (primary) **Core commitments.** African historiography begins from the recognition that the archive is a **colonial institution**. Michel-Rolph Trouillot's *Silencing the Past* (1995) argues that history is produced through a process of **silencing** — the production of historical narratives always involves the exclusion of certain voices, and the silences are not accidents but constitutive features of the narrative. Ann Laura Stoler's *Along the Archival Grain* (2009) shows that colonial archives are not neutral records but **epistemic machines** that classified, categorized, and governed colonized peoples — and that reading "against the grain" of the archive can recover the agency that the archive was designed to erase.

How this perspective approaches historical method. African historiography emphasizes:

- **Oral history and non-archival sources:** Written archives are disproportionately colonial; oral traditions, songs, and material culture carry historical knowledge that the archive excludes.
- **Reading against the grain:** The colonial archive records the colonizer's categories. Reading against the grain means asking what the colonized were doing that the archive did not record, and what the archive's silences reveal about power.
- **History from below:** The experiences of ordinary people, not only elites, are central to understanding how international order was experienced and contested.
- **The coloniality of knowledge:** The categories of social science — "state," "sovereignty," "development" — are themselves products of colonial history. Using them uncritically reproduces colonial ways of knowing.

What this perspective contributes to causal inference. It insists that **the evidence you have is shaped by power**. The absence of evidence is not evidence of absence; it may be evidence of silencing. It also insists that **the categories you use to organize evidence** are themselves historical products, not neutral containers.

What it occludes: It can underplay the value of quantitative evidence and formal methods; it can romanticize the "voice" of the colonized; it can make causal inference difficult by emphasizing the uniqueness of each historical experience.

2.5.2 The Chinese perspective **Core commitments.** Chinese historical method is shaped by a **civilizational and cyclical** understanding of history. The "century of humiliation" (1839–1949) is the central historical narrative in Chinese IR: the period of foreign invasion, unequal treaties, and territorial loss that is understood as the foundational trauma of modern China. This narrative is not merely descriptive; it is **prescriptive** — it defines what China must never allow to happen again, and it frames contemporary sovereignty and non-interference as defenses against a repeat of that history.

How this perspective approaches historical method. Chinese historiography emphasizes:

- **Continuity and civilizational time:** Chinese history is understood in terms of dynastic cycles and long continuities, not in terms of the sharp ruptures that Western historiography emphasizes.

- **The "century of humiliation" as method:** The narrative is used to interpret contemporary events — NATO enlargement, sanctions, human-rights criticism are all read through the lens of the humiliation narrative.
- **Relational historiography:** History is understood as the unfolding of relationships and hierarchies, not as the interaction of discrete sovereign states.
- **The state as the subject of history:** Chinese historiography tends to treat the state as the primary agent, with less attention to non-state actors and civil society than Western historiography.

What this perspective contributes to causal inference. It insists that **historical memory is a causal variable** — the way states remember the past shapes how they interpret the present. It also insists that **long-run continuities** matter more than the short-run events that Western IR tends to study.

What it occludes: It can underplay the diversity of Chinese historical experience; it can treat the state's narrative as the only narrative; it can make it difficult to distinguish between historical memory as a cause and historical memory as a justification.

2.5.3 The Russian perspective **Core commitments.** Russian historical method is shaped by a **civilizational and grievance-based** narrative. The repeated invasions of Russia from the West (Napoleon 1812, Hitler 1941) are the central historical reference points. The collapse of the Soviet Union is understood as a catastrophe — the "greatest geopolitical catastrophe of the twentieth century," in Putin's words — and the post-Cold War settlement is understood as a humiliation imposed by the West.

How this perspective approaches historical method. Russian historiography emphasizes:

- **Geopolitical determinism:** Geography and the absence of natural defenses are treated as the fundamental drivers of Russian history.
- **The "whataboutism" method:** Russian official discourse frequently responds to criticism by citing Western historical crimes (colonialism, slavery, the Iraq war) — not as a defense but as a way of delegitimizing Western moral authority.
- **Civilizational narrative:** Russia is understood as a distinct civilization with its own historical path, not as a backward version of Europe.
- **The state as the guardian of history:** The Russian state has increasingly regulated historical memory (e.g., laws against "falsifying history," the rehabilitation of Stalin).

What this perspective contributes to causal inference. It insists that **historical grievance and humiliation are causal variables** — states that feel historically wronged may behave differently from states that do not. It also insists that **the historical narrative itself is a political resource** — the way a state narrates its past is a form of power.

What it occludes: It can naturalize aggression by framing it as a response to historical grievance; it can treat the state's narrative as the only narrative; it can make it difficult to distinguish between grievance as a cause and grievance as a justification.

2.5.4 The Western perspective **Core commitments.** Western historical method is shaped by the **scientific aspiration** — the belief that historical and social phenomena can be studied with the same rigor as natural phenomena. This aspiration produced:

- **Positivist historiography:** The search for general laws and causal regularities, using comparative

method and quantitative data.

- **Archival research:** The systematic use of primary documents, with a strong emphasis on source criticism and the verification of claims.
- **The "linguistic turn":** The recognition that historical narratives are constructed, and that the historian's own position shapes the narrative.
- **The "history from below" tradition:** The recovery of the experiences of ordinary people, marginalized groups, and colonized peoples — a tradition that overlaps with African historiography but emerged independently within Western historiography.

What this perspective contributes to causal inference. It provides the **methodological toolkit** — process tracing, comparative method, counterfactual analysis, source criticism — that the discipline uses. It also provides the **self-critique** — the recognition that the toolkit is not neutral and that the historian's position matters.

What it occludes: It can treat Western historical experience as universal; it can underplay the colonial genealogy of its own methods; it can be overly confident in the possibility of objective knowledge.

2.5.5 The UN perspective **Core commitments.** The UN approaches historical method through the lens of **institutional memory and legal precedent**. The UN's historical work is not primarily academic; it is **operational** — the documentation of conflicts, the recording of resolutions, and the accumulation of precedent for future action.

How this perspective approaches historical method. The UN's historical practice emphasizes:

- **Documentation:** The UN produces vast archives of resolutions, reports, and debates that serve as the institutional memory of the international community.
- **Legal precedent:** Historical interpretation in the UN is oriented toward establishing what the law requires, not toward explaining why events occurred.
- **The "lessons learned" genre:** The UN produces retrospective reports on its own failures (e.g., Rwanda, Srebrenica, Sri Lanka) that are intended to improve future practice.
- **The normative narrative:** The UN's historical narrative is progressive — the story of the expansion of human rights, decolonization, and international law — even as it acknowledges failures.

What this perspective contributes to causal inference. It provides the **institutional record** — the documented decisions, resolutions, and debates that are essential evidence for any causal claim about international politics. It also provides the **normative benchmark** — the standards against which state behavior is judged.

What it occludes: It can be selective in its documentation; it can treat legal precedent as a substitute for causal explanation; it can underplay the power dynamics that shape its own institutional memory.

2.5.6 The comparison matrix

Dimension	African (primary)	Chinese	Russian	Western	UN
What counts as evidence	Oral history, material culture, reading against the archive	Civilizational continuity, state narrative	Geopolitical determinism, grievance narrative	Archival documents, comparative data, source criticism	Institutional records, legal precedent
Purpose of history	Recovering silenced voices; critiquing colonial knowledge	Establishing continuity; interpreting the present through the humiliation narrative	Asserting civilizational identity; justifying sovereignty	Explaining causal regularities; testing theories	Documenting precedent; improving practice
Key occlusion	Quantitative evidence; causal inference	Diversity of experience; non-state voices	Grievance as justification; neighbors' experience	Colonial genealogy of method; universality claims	Power dynamics of institutional memory

---

2.6 WORKED EXAMPLE (I do)

The puzzle: The Rwandan genocide of 1994 killed approximately 800,000 people in 100 days. The international community — the UN, the US, France, Belgium — failed to intervene effectively. Why?

The puzzle stated precisely: *Why did the international community fail to intervene to stop the Rwandan genocide, despite the clear evidence of mass atrocities and the existence of a UN peacekeeping mission (UNAMIR) on the ground?*

Level of analysis: The failure is best explained at the **systemic and state levels**, with the individual level providing the proximate trigger.

- **Systemic level:** The post-Cold War moment had produced a normative expectation of humanitarian intervention (the "new world order"), but it had not produced the institutional capacity or political will to act. The Security Council was reluctant to authorize a robust mission; the US had just experienced the "Black Hawk Down" failure in Somalia (1993) and was unwilling to intervene in Africa.
- **State level:** The US, France, and Belgium had different interests in Rwanda. France had supported the Habyarimana regime and was implicated in the arming of the genocidaires. Belgium was the former colonial power and had a special responsibility. The US was focused on domestic politics and had no strategic interest in Rwanda.
- **Individual level:** The UN Secretary-General, Boutros Boutros-Ghali, was sympathetic but constrained by the Security Council. The UNAMIR commander, Roméo Dallaire, requested reinforcements but was denied. The US Ambassador to the UN, Madeleine Albright, was constrained by Washington.

Method 1 — Process tracing: Trace the sequence of decisions from April to July 1994:

- April 6: Habyarimana's plane is shot down; the genocide begins.
- April 7–14: Dallaire requests reinforcements; the Security Council debates.
- April 21: The Security Council votes to reduce UNAMIR's force from 2,500 to 270.
- May: The genocide escalates; the US resists using the word "genocide" to avoid legal obligations.
- June: France launches Operation Turquoise, a unilateral intervention that is widely criticized for protecting perpetrators.
- July: The RPF (Rwandan Patriotic Front) captures Kigali and ends the genocide.

Process tracing reveals the mechanism: the Security Council's decision to reduce UNAMIR was not a response to new information; it was a response to the **political pressure from the US**, which did not want to be drawn into a peace enforcement mission. The mechanism is **state-level interest**, operating through the **systemic institution** of the Security Council.

Method 2 — Comparative method: Compare Rwanda with other post-Cold War humanitarian crises:

- **Somalia (1992–93):** The US intervened, then withdrew after casualties. The failure of Somalia shaped the US response to Rwanda.
- **Bosnia (1992–95):** The international community intervened belatedly, but eventually with NATO air power. Why Bosnia and not Rwanda? Because Bosnia was in Europe, had a higher strategic profile, and the media coverage was more sustained.
- **Kosovo (1999):** NATO intervened without UN authorization. Why Kosovo and not Rwanda? Because Kosovo was in Europe and the US had a domestic political interest.

The comparative method reveals that the variable that explains intervention is **strategic interest**, not the severity of the humanitarian crisis. Rwanda was in Africa, had no strategic resources, and was not a priority for the US or Europe.

Method 3 — Counterfactual analysis: What if the US had been willing to support a robust UNAMIR mission?

- **Minimal rewrite:** The US changes its position on UNAMIR reinforcements, but all other factors remain constant.
- **Theory:** The genocide was organized by a small elite (the akazu) and depended on the state apparatus. A robust international force could have disrupted the command structure and protected civilians.
- **Observable implications:** If the counterfactual is correct, we should see evidence that the genocide was vulnerable to external disruption — e.g., the RPF's success in ending it, the capacity of UNAMIR to protect civilians when it had the mandate and resources, the rapid collapse of the genocide once the RPF advanced.
- **Evidence:** The RPF, a relatively small force, was able to defeat the genocidal regime. This suggests that a well-equipped international force could have intervened effectively. Dallaire's reports suggest that a force of 5,000 could have made a difference.

Perspective reconstruction:

- **African perspective:** The failure is read through the colonial archive. The genocide was not a "tribal conflict" but a **political project** organized by a state elite, enabled by the colonial legacy of ethnic classification (the Belgians' 1933 identity cards) and the impunity of the Habyarimana regime, which was a French ally. The international community's failure is read as **racialized indifference** — African

lives were deemed expendable because they were African.

- **Chinese perspective:** The failure is read as a failure of **Western interventionism** — the West intervened in Bosnia and Kosovo because they were in Europe, but not in Rwanda because it was in Africa. The lesson is that **sovereignty must be respected** and that **external powers cannot be trusted** to protect African lives.
- **Russian perspective:** The failure is read as evidence of **Western hypocrisy** — the West claims to care about human rights but intervenes only where its interests are at stake. The lesson is that **great-power interests** determine the fate of small states.
- **Western perspective:** The failure is read as a **failure of political will** and **institutional capacity**. The US was traumatized by Somalia; the UN was constrained by the P5; the media did not cover the genocide adequately. The lesson is that **institutions need better mandates and resources** and that **early warning must be matched by early action**.
- **UN perspective:** The failure is read as a **failure of the Security Council** to act on the Secretary-General's warnings. The UN's own "lessons learned" report (the Carlsson Report) is a primary document of institutional self-criticism.

Adjudication. Which perspective best explains the *failure to intervene*? The African perspective captures the **racialized structure of international concern** — the fact that African lives were not considered worth the risk of intervention. The Western perspective captures the **proximate political mechanism** — the US decision not to support UNAMIR, the Security Council's reduction of the force, the failure to use the word "genocide." The Chinese and Russian perspectives capture the **structural skepticism** of great-power intervention, which is itself a reason why interventions do not happen. The UN perspective captures the **institutional failure** of the Security Council.

A complete explanation combines the **systemic level** (the post-Somalia reluctance to intervene) with the **state level** (US, French, and Belgian interests) and the **transnational level** (the racialized structure of international concern). The African perspective is essential because it identifies the **racial hierarchy** that made the failure possible — not as a conspiracy, but as a structured indifference.

2.7 PROBLEM PAIR (We do)

Your task: Analyze the following case using the three methods and the perspective comparison. Write your analysis before reading the model answer.

The case: In July 2023, a military junta overthrew Niger's elected president, Mohamed Bazoum. France and the US had military bases in Niger and had been key security partners. The junta demanded that French troops leave; they did, by the end of 2023. The junta then deepened ties with Russia (via the Africa Corps) and China. ECOWAS threatened military intervention, but did not intervene. The junta remains in power.

Your tasks:

1. State the puzzle precisely: why did the coup lead to the expulsion of France and the realignment toward Russia and China, rather than to a restoration of the previous alignment?
2. Apply process tracing to the sequence of events from July 2023 to the present. What mechanism does the evidence suggest?
3. Apply the comparative method: compare Niger with Mali (2020 coup) and Burkina Faso (2022 coup).

What explains the similar outcomes? What variable distinguishes these cases from coups that did not lead to realignment?

4. Construct a counterfactual: what if France had negotiated with the junta rather than demanding Bazoum's reinstatement? What would we expect to see if the counterfactual is correct?
5. Reconstruct the African and Russian perspectives on this case. How do they interpret the junta's actions?
6. Write a 300-word adjudication: which perspective best explains the realignment, and what does it miss?

Model answer (compare after writing your own):

Puzzle: Why did Niger's coup lead to the expulsion of France and realignment toward Russia and China, rather than to a restoration of the previous alignment or a negotiated settlement?

Process tracing: The sequence is: - July 26, 2023: The presidential guard, led by General Tchiani, detains Bazoum and declares a coup. - July 30: ECOWAS issues a seven-day ultimatum demanding Bazoum's reinstatement and threatens military intervention. - August: The junta refuses; Mali and Burkina Faso pledge to defend Niger; the AU does not endorse intervention. - September: France refuses to recognize the junta and insists on Bazoum's release; the junta demands the withdrawal of French troops. - October: France announces the withdrawal of its ambassador and troops. - December: The last French troops leave. - 2024: The junta deepens ties with Russia (Africa Corps) and China (mining and infrastructure deals).

The mechanism is **mutual escalation and the search for external alternatives**. France's refusal to negotiate, combined with ECOWAS's threat of intervention, made the junta dependent on external security partners. Russia provided security assistance without conditionality; China provided economic engagement without governance conditions. The junta used the external competition to consolidate power and legitimize its rule through anti-French nationalism.

Comparative method: Compare Niger with Mali (2020) and Burkina Faso (2022): - All three had military coups, all three experienced a breakdown in relations with France, and all three realigned toward Russia. - The variable that distinguishes them from coups that did not lead to realignment (e.g., the 2021 coup in Guinea, which remained aligned with France) is **the presence of a significant French military footprint and the failure of French-led counterterrorism**. In Mali and Burkina Faso, French forces were present and had failed to contain the insurgency; in Guinea, there was no French military presence and the junta did not frame its legitimacy around anti-French nationalism. - The comparative method suggests that the French military presence and the failure of French counterterrorism are the key variables.

Counterfactual: What if France had negotiated with the junta rather than demanding Bazoum's reinstatement? - **Minimal rewrite:** France changes its strategy but all other factors remain constant. - **Theory:** The junta's primary interest was regime survival, not alignment with Russia per se. If France had offered security cooperation without demanding Bazoum's reinstatement, the junta might have maintained ties with France. - **Observable implications:** If the counterfactual is correct, we should see evidence that the junta was open to negotiation with France — e.g., statements from the junta suggesting willingness to cooperate on security, diplomatic back-channels, or comparisons with other cases where negotiation produced a different outcome. - **Evidence:** The junta's early statements emphasized sovereignty and the failure of French counterterrorism, not an ideological commitment to Russia. The junta's subsequent deals with Russia and China were instrumental, not ideological. This suggests that a different French strategy might have produced a different outcome.

African perspective: The junta's actions are interpreted as a **rational assertion of sovereignty** against a former colonial power that had failed to provide security and had imposed conditions. The anti-French sentiment is not irrational; it reflects a long history of colonial and neocolonial relations, and it is shared by significant portions of the population. The junta's realignment is a strategy of **multi-alignment** — using external competition to increase Niger's bargaining power.

Russian perspective: The junta's actions are interpreted as a **sovereign choice** by a state that has been abandoned by the West. Russia is a reliable partner that provides security without political conditions. The realignment is a symptom of the collapse of Western hegemony and the emergence of a multipolar order.

Adjudication: The African perspective best explains the *legitimacy* of the realignment — why the junta's anti-French posture was popular and why it could sustain itself. The Russian perspective explains the *opportunity* — why the junta had alternatives to France. The Western perspective explains the *proximate cause* — the French refusal to negotiate and the ECOWAS threat made the realignment inevitable. The comparative method suggests that the French military presence and the failure of French counterterrorism are the key structural variables. A complete explanation combines the African, Russian, and Western perspectives: the structural failure of French counterterrorism (Western), the availability of Russian alternatives (Russian), and the legitimacy of anti-colonial sovereignty assertion (African).

2.8 INDEPENDENT MEMO (You do)

Produce a one-page analytical memo (500–600 words) on the following case, using the four headings below.

Case: The collapse of the JCPOA and Iran's withdrawal from the treaty (2018–2025).

Memo headings:

1. **Mechanism:** What causal process explains the collapse? Specify the level of analysis and the mechanism (economic pressure, political signaling, or reciprocal escalation).
2. **Method:** Apply process tracing, comparative method, and counterfactual analysis to the case. What does each method contribute?
3. **Perspective reconstruction:** How would each of the five perspectives explain the collapse and interpret the evidence? (One paragraph or table entry each.)
4. **Falsifiers:** What evidence would prove your explanation wrong? What would you need to observe to abandon it?

Self-check: Does your memo distinguish mechanism from correlation? Does it specify the counterfactual? Does it identify the evidence that would falsify the claim?

2.9 HINGE QUESTION

A scholar argues: "The Arab Spring happened because of the combination of youth unemployment and social media." A critic responds: "But youth unemployment and social media were also present in countries that did not experience an Arab Spring." What methodological problem is the critic identifying?

- A) Endogeneity
- B) Selection on the dependent variable
- C) Presentism
- D) Teleology

Answer: B. The critic is identifying selection on the dependent variable. The scholar has selected cases where the Arab Spring occurred and identified factors present in those cases. But the critic points out that those factors are also present in cases where the Arab Spring did not occur — which means the factors do not explain the outcome. To establish causation, the scholar would need to examine the cases where the factors were present but the outcome did not occur.

If you answered A: Endogeneity refers to a situation where the cause is itself caused by the effect (reverse causation) or where cause and effect are mutually constitutive. The critic's point is about case selection, not endogeneity. **If you answered C:** Presentism refers to reading the past through the lens of the present. The critic's point is about case selection, not presentism. **If you answered D:** Teleology refers to explaining events as if they were directed toward a predetermined end. The critic's point is about case selection, not teleology.

SECTION 2A — DATA LAB (30–45 minutes)

Purpose: Ground the lesson's methodological concepts in empirical work.

Task: Using the summary data below, analyze the relationship between economic inequality and civil war onset.

Table 1: Civil war onset and inequality (illustrative data, simplified)

Country	Gini coefficient (year before onset)	Civil war onset (within 5 years)?	Colonial legacy?	Resource dependence?
Country A	0.52	Yes	Yes	High
Country B	0.48	No	Yes	High
Country C	0.61	Yes	No	Low
Country D	0.39	No	No	Low
Country E	0.55	Yes	Yes	Low
Country F	0.42	No	Yes	Low

Analysis questions:

1. **Association:** Is there an association between inequality and civil war onset in this data? What about colonial legacy and resource dependence?
2. **Selection bias:** If you selected only the countries with civil war onset (A, C, E), what would you conclude about the causes of civil war? How does including the non-onset cases change your conclusion?
3. **Mechanism:** What mechanism might link inequality to civil war? What mechanism might link colonial legacy to civil war? How would you test these mechanisms?
4. **Counterfactual:** Choose one case and construct a counterfactual: what would have happened if the inequality had been lower? What evidence would you need to support the counterfactual?

5. **Perspective:** How would each of the five perspectives interpret this data? (African: colonial legacy and structural inequality; Chinese: underdevelopment and external interference; Russian: Western hegemony and resource extraction; Western: grievance and opportunity; UN: governance and development.)

Rule: Complete the data lab before the independent memo.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Task: Draw the following by hand.

Visual 1: The three methods. Draw three overlapping circles labeled "Process tracing," "Comparative method," and "Counterfactual analysis." In the overlap, write "Robust causal claim." For each circle, write one question it answers and one limitation.

Visual 2: Selection bias. Draw a 2×2 table: rows = "Cause present" and "Cause absent"; columns = "Outcome present" and "Outcome absent." Shade the cell that selection on the dependent variable excludes. Write a sentence explaining why excluding that cell biases inference.

Visual 3: The five perspectives on historical method. Draw a five-column table with rows: "What counts as evidence," "Purpose of history," "Key occlusion." Fill from memory.

SECTION 4 — CORNELL NOTES

Set up your notes with the following cue column:

Cue column	Notes
What is a causal claim?	A claim that if the cause were absent, the effect would be absent, with a mechanism
What are the three methods?	Process tracing (within-case), comparative method (across-case), counterfactual (against-case)
What is selection on the dependent variable?	Selecting cases based on the outcome, which biases inference
What are the five perspectives on historical method?	African: archive as colonial institution; Chinese: civilizational continuity and humiliation; Russian: grievance and geopolitical determinism; Western: scientific aspiration and source criticism; UN: institutional memory and legal precedent
Source log	Lesson text, Sections 2.2–2.5; Fearon (1991); Geddes (1990); Trouillot (1995); Stoler (2009)
Summary	3–5 sentences synthesizing the lesson

SECTION 5 — FEYNMAN COMPRESSION

Step 1: Explain the difference between correlation and causation to a smart non-specialist in 150–200 words, using an example from IR.

Step 2: Mark every point where you hesitated or used a term you could not define.

Step 3: Reread only the gaps. Rewrite.

Step 4: Produce one analogy for process tracing. Then state where the analogy breaks down. (Example: "Process tracing is like a detective reconstructing a crime — but unlike a detective, the IR analyst cannot interview the suspects, and the evidence may have been deliberately destroyed.")

SECTION 6 — SPACED-REPETITION FLASHCARDS

Produce 12–15 cards. Use the following types:

Type	Example
Definition	What is selection on the dependent variable?
Mechanism	How does process tracing establish a causal mechanism?
Application	A study finds that all wars in the sample were preceded by arms races. What methodological error might it be making?
Comparison	How do most-similar and most-different systems designs differ?
Source	What did Fearon argue about counterfactuals?
Debate	What is the strongest objection to the claim that the Rwandan genocide could have been stopped by 5,000 troops?
Reconstruction	How would an African historian read the colonial archive differently from a Western historian?
Occlusion	What does the Western scientific aspiration systematically fail to see about historical knowledge?
Adjudication	Which method best explains the end of the Cold War, and what does it miss?
Visual	Label the 2×2 table that illustrates selection bias.

Tag each card: `L3`, `method`, `perspective`, `causation`, `difficulty`.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence audit

Rate confidence (0–100%) before checking:

Objective	Confidence
Distinguish causal from correlational claims	
Apply process tracing, comparative method, and counterfactuals	
Identify selection bias and presentism	
Read primary sources critically	
Reconstruct the five perspectives on historical method	

After exercises, rate accuracy. Calculate the gap.

7.2 Three-question debrief

1. What did I misunderstand about the relationship between mechanism and counterfactual?
2. Which method was easiest to apply? Which was hardest? What does that suggest about my default analytical style?
3. What will I do differently in Lesson 4?

7.3 Error log

Date	Lesson	Error type	Correct understanding	Card created?
	L3			

SECTION 8 — CHEATSHEET (Module 0)

Add this row to your Module 0 cheatsheet:

Column	Content
Core concepts	Causal claim; mechanism; counterfactual; process tracing; comparative method; selection on the dependent variable; presentism; teleology; source criticism
Key mechanisms	Cause → mechanism → effect; selection bias → truncated sample → biased inference; archive → silence → power

Column	Content
Theories and authors	Fearon (1991) on counterfactuals; Geddes (1990) on selection bias; Trouillot (1995) on silencing; Stoler (2009) on the archival grain; George and Bennett (2005) on process tracing
Cases and evidence	Rwanda 1994; Niger 2023; end of Cold War; JCPOA collapse
Debates	Is IR a science? Can counterfactuals be tested? Whose archive counts?
Falsifiers	What evidence would show that a causal claim is wrong?
Cross-links	L4–8 (theory); L9–14 (history); L27 (colonial state formation); L60–61 (capstones)

SECTION 9 — REVIEW SCHEDULE

Review	Timing	Format
R1	Today	Retrieval warm-up + card creation
R2	2–3 days	Cue-column recall + hinge variant
R3	1 week	Mixed quiz with L1–L3 cards
R4	3–4 weeks	Interleaved problem combining L3 with L4–8 (theory) and L9–14 (history)
R5	End of Module 0	Cheatsheet reconstruction from memory + Module 0 synthesis essay

SECTION 10 — COMPLETION CHECKLIST

- ☐ Retrieval warm-up completed from memory
- ☐ Five learning objectives read and understood
- ☐ Four key ideas studied with mechanisms and scope conditions
- ☐ Perspective comparison matrix filled from memory, then checked
- ☐ Worked example (Rwanda 1994) studied and self-explained
- ☐ Problem pair (Niger 2023) attempted and compared
- ☐ Independent memo produced (500–600 words)
- ☐ Hinge question answered correctly (or reteaching completed)
- ☐ Data lab completed before independent memo

☐ Three dual-coded visuals drawn
☐ Cornell notes with cue column, source log, and summary
☐ Feynman explanation written, gaps identified, rewritten
☐ 12–15 flashcards created with tags
☐ Confidence audit and error-log entry
☐ Cheatsheet entry added
☐ R2 review scheduled

MODULE 0 SYNTHESIS

You have now completed the orientation and method module. Before proceeding to Module 1 (Epistemological and Ontological Foundations), write a **1,500-word synthesis essay** answering the following question:

"What is an explanation in International Relations, and how would I know a good one from a bad one?"

Your essay must:

1. Define the puzzle, the level of analysis, and the concept of power (L1).
2. Distinguish description, explanation, prediction, and prescription (L1).
3. Explain the relationship between legal rules and power politics (L2).
4. Explain the difference between correlation and causation, and identify the three methods of causal inference (L3).
5. Reconstruct the five perspectives on at least two of the three lessons, and adjudicate between them on a specific case.
6. Identify at least three methodological errors that are common in IR, and explain how to avoid them.

This essay is your entry ticket to Module 1. It is assessed on the quality of the argument, the precision of the concepts, and the use of evidence — not on length.

FURTHER READING (Optional — for deepening, not required)

- **On counterfactuals:** James Fearon, "Counterfactuals and Hypothesis Testing in Political Science," *World Politics* (1991); Philip Tetlock and Aaron Belkin, *Counterfactual Thought Experiments in World Politics* (1996).
- **On selection bias:** Barbara Geddes, "How the Cases You Choose Affect the Answers You Get," *Political Analysis* (1990); Gary King, Robert Keohane, and Sidney Verba, *Designing Social Inquiry* (1994), ch. 4–6.
- **On process tracing:** Alexander George and Andrew Bennett, *Case Studies and Theory Development in the Social Sciences* (2005); Andrew Bennett and Jeffrey Checkel, *Process Tracing* (2015).
- **On comparative method:** Arend Lijphart, "Comparative Politics and the Comparative Method," *American Political Science Review* (1971); Charles Ragin, *The Comparative Method* (1987).
- **On African historiography:** Michel-Rolph Trouillot, *Silencing the Past* (1995); Ann Laura Stoler, *Along the Archival Grain* (2009); Toyin Falola, *Decolonizing African History* (2022).
- **On the Rwandan genocide:** Romeo Dallaire, *Shake Hands with the Devil* (2003); Philip Gourevitch,

We Wish to Inform You That Tomorrow We Will Be Killed with Our Families (1998); the UN's Carlsson Report (1999).

- **On Chinese and Russian historical narratives:** Zheng Wang, *Never Forget National Humiliation* (2012); Lauri Mälksoo, *Russian Approaches to International Law* (2015); Maria Todorova, *Imagining the Balkans* (2009).

End of Lesson 3. End of Module 0.

Say **"Next"** when you are ready for Lesson 4 (Positivism, Post-Positivism, and the Linguistic Turn), the first lesson of Module 1.

5. Positivism, Post-Positivism, and the Linguistic Turn: How We Know What We Know in International Relations

---

LESSON METADATA

Field	Entry
Lesson number and title	L4 — Positivism, Post-Positivism, and the Linguistic Turn
Module	Module 1: Epistemological and Ontological Foundations
Prerequisites	L1 (puzzles, levels, power, perspectives); L2 (law and institutions); L3 (causal inference, selection bias, historical method)
Interleaved links	Forward to L5 (realism), L6 (liberalism), L7 (constructivism), L8 (critical/post-colonial/feminist theory), L24 (cognitive warfare), L58 (forecasting)
Reading load	This lesson only. Optional further reading at the end.
Content channels	Canon (summarized and quoted); primary texts (Lapid, Wendt, Cox, Hansen, Enloe, Qin, quoted and analyzed); data lab (discourse analysis exercise); five perspectives
Bloom ceiling	Evaluate (adjudicate between epistemological positions and their political consequences)
Estimated study time	6–8 hours including exercises

Note on self-containment: Every argument, quotation, and example you need is inside this document. Where I cite Lapid, Wendt, Cox, Hansen, Enloe, Qin, or any other scholar, I summarize the argument fully enough that you do not need the original to complete the lesson. "Further Reading" is optional.

SECTION 0 — Why This Lesson Exists

In Lessons 1–3 you learned to build explanations: to identify puzzles, locate causes at different levels, disaggregate power, read legal documents, and test causal claims. But every one of those skills rests on a prior question that you have not yet confronted: **what counts as a valid explanation in the first place?**

This is the **epistemological question**, and it is the deepest fault line in International Relations. It is not an abstract philosophical debate. It determines:

- Whether IR can be a **science** that discovers general laws, or an **interpretive discipline** that reconstructs meanings.
- Whether the objects of IR — states, anarchy, security, interests — are **given** features of the world or **constructed** through language and practice.
- Whether the scholar's own position — Western, African, male, colonial, policy-engaged — is a **neutral vantage point** or a **biased located perspective**.
- Whether the theories you learned in L1–L3 — realism, liberalism, institutionalism — are **descriptions of how the world really is** or **particular ways of seeing that reproduce certain power relations**.

The **"third debate"** — the confrontation between positivism and post-positivism that reshaped IR from the late 1980s onward — is the name for this confrontation. Yosef Lapid's 1989 essay described it as a moment in which "the demise of the empiricist-positivist promise for a cumulative behavioral science" forced scholars to "reexamine the ontological, epistemological, and axiological foundations of their scientific endeavors". The debate produced the theoretical landscape you now inhabit: constructivism, critical theory, post-structuralism, feminism, post-colonialism, and the "Chinese School," among others.

This lesson gives you the apparatus to navigate that landscape. It does four things:

1. It defines **positivism** and explains its core commitments — and why those commitments became contested.
2. It reconstructs the **post-positivist alternatives**: critical theory (Frankfurt School and Cox), post-structuralism and the linguistic turn, and feminist and post-colonial epistemology.
3. It shows how the **linguistic turn** transformed security studies — from threats as objective facts to threats as **discursive constructions**.
4. It reconstructs **five perspectives on the positivism/post-positivism debate**: African, Chinese, Russian, Western, and UN.

By the end, you can take any IR theory or claim and answer: *What epistemology does this presuppose? What does it treat as given, and what does it treat as constructed? Whose knowledge does it privilege, and whose does it silence?*

SECTION 1 — PRE-CLASS PRIMING

1.1 Retrieval warm-up (from memory, before reading further)

1. From L1: Name the three faces of power and give one observable implication of the third face.
2. From L2: What did the ICJ hold in *Nicaragua* about the relationship between Article 2(4) and customary international law?

3. From L3: What is **selection on the dependent variable**, and why does it bias inference?
4. From L3: Distinguish process tracing, comparative method, and counterfactual analysis in one sentence each.

Check against Lessons 1–3 before proceeding.

1.2 Orientation questions

Hold these in mind:

- Can international politics be studied with the same methods as physics or biology?
- If "anarchy" is socially constructed, does that mean it is not real?
- Is the scholar's identity — nationality, race, gender, colonial history — relevant to the validity of their knowledge?
- Why do some governments treat certain academic frameworks as security threats?

1.3 Vocabulary pre-teach

Provisional definitions; revise by the end:

Positivism; empiricism; falsification; covering law; ontology; epistemology; axiology; reflexivity; post-positivism; linguistic turn; discourse; speech act; deconstruction; standpoint theory; epistemic violence; relationality; zhongyong dialectics.

SECTION 2 — LESSON CORE

2.1 Learning objectives

By the end of this lesson, you can:

1. **Define** positivism and identify its four core commitments (ontological, epistemological, axiological, and methodological) in any IR text.
2. **Distinguish** three post-positivist alternatives — critical theory, post-structuralism, and feminist/post-colonial epistemology — and explain what each contributes and occludes.
3. **Apply** the linguistic turn to a security case, showing how a threat was discursively constructed rather than objectively given.
4. **Reconstruct** how African, Chinese, Russian, Western, and UN traditions position themselves relative to the positivism/post-positivism divide, and **adjudicate** among them on a specific case.
5. **Evaluate** the political consequences of epistemological choice: what kinds of knowledge does each epistemology enable, and what does it foreclose?

2.2 KEY IDEA 1 — Positivism is a package of four commitments, and each can be rejected independently

The claim: Positivism is not one claim but a **bundle** of commitments about what exists (ontology), what can be known (epistemology), what the scholar's stance should be (axiology), and how knowledge should be

produced (methodology). Post-positivism is not a single alternative; it is a family of rejections of different elements of the bundle.

The four commitments of positivism.

Dimension	Positivist commitment	What it implies
Ontology	There is a mind-independent world of observable facts. States, balances of power, and international anarchy exist independently of how anyone describes them.	The task of IR is to describe and explain this world accurately.
Epistemology	Knowledge is produced by testing hypotheses against observable evidence. Causal claims can be falsified by data.	The gold standard is the covering-law model: universal laws covering particular cases.
Axiology	The scholar should be **value-neutral**. Normative commitments are separate from empirical analysis.	The scholar stands "outside" the phenomena being studied.
Methodology	Quantitative and formal methods; large-N comparison; replication; operationalization of variables.	Qualitative methods are acceptable only if they emulate the logic of inference of quantitative methods.

The positivist promise. In the 1950s and 1960s, the "behavioral revolution" promised a cumulative science of politics. Kenneth Waltz's *Theory of International Politics* (1979) was the high-water mark of positivist IR: it sought a parsimonious, systemic theory of international politics derived from a small number of axioms (anarchy, self-help, polarity). The promise was that IR would become a science whose findings would accumulate.

The post-positivist challenge. Lapid's 1989 essay described the "third debate" as the moment when this promise became untenable. The core challenge was not that positivism was **wrong** about everything — it was that positivism **could not account for its own conditions of possibility**. Positivist IR treated anarchy, states, and interests as given; post-positivism asked how those categories were **produced**, **reproduced**, and **contested**. Lapid noted that the debate "triggered many different responses," and that post-positivism "offers nearly as many dead ends as it opens promising paths" — a warning that remains apt.

Scope condition: Positivism is not obsolete. Much of the most rigorous work in IR — on the democratic peace, on the causes of civil war, on the effects of sanctions — remains positivist in its commitments. The post-positivist critique is a **challenge to positivism's claim to be the only legitimate epistemology**, not a refutation of all positivist findings.

Observable implication: If a text is positivist, it will treat its central concepts as measurable, its evidence as observable, and its author's position as irrelevant to the validity of the findings. If a text is post-positivist, it will treat its central concepts as **contested and historically produced**, its evidence as **interpretively mediated**, and its author's position as **constitutive of the knowledge produced**.

2.3 KEY IDEA 2 — Critical theory and post-structuralism offer distinct post-positivist alternatives

The claim: Post-positivism is not one position. Two of its most important branches — **critical theory** (associated with the Frankfurt School and Robert Cox) and **post-structuralism** (associated with discourse analysis and the work of Lene Hansen, among others) — share a rejection of positivist ontology and axiology, but they differ in their epistemology and in their political project.

2.3.1 Critical theory: knowledge for emancipation **Core commitment.** Critical theory begins from the Frankfurt School distinction between "traditional theory" and "critical theory," formalized for IR by Robert Cox in his 1981 essay "Social Forces, States and World Orders." Cox's distinction is between **problem-solving theory** and **critical theory**:

- **Problem-solving theory** "takes the world as it finds it, with the prevailing social and power relationships and the institutions into which they are organized, as the given framework for action". It seeks to solve problems **within** the existing order.
- **Critical theory** "stands apart from the prevailing order of the world" and asks whether that order is **just** and whether it can be **changed**. It is "critical in the sense that it stands apart from the prevailing order of the world and asks how that order came about".

The mechanism. Cox argued that problem-solving theory is **not neutral**: by taking the existing order as given, it **reproduces** that order. The claim to value-neutrality is itself a political act, because it renders the existing distribution of power invisible. Critical theory, by contrast, makes the existing order **visible as a historical product** and asks who benefits from it.

The political project. Critical theory is explicitly **emancipatory**. It seeks not only to interpret the world but to **change** it — to identify the possibilities for transforming the prevailing order. This is why Cox's work is associated with neo-Gramscian analysis: it asks how **hegemony** — the combination of material power, institutions, and ideas — sustains a particular world order, and how counter-hegemonic forces might challenge it.

What critical theory contributes: It shows that **theory is never neutral**. Every theoretical framework — realism, liberalism, institutionalism — embeds assumptions about what is possible and what is not, and those assumptions have political consequences. It also provides the tools for analyzing **structural change**: how orders collapse and new ones emerge.

What it occludes: It can underplay the **agency of the marginalized** — the ways in which people resist and transform their conditions even without a grand emancipatory project. It can also be **teleological**, assuming that history is moving toward a more just order.

2.3.2 Post-structuralism: knowledge as discourse **Core commitment.** Post-structuralism begins from the **linguistic turn** — the claim that language does not simply **describe** a pre-existing reality but **constitutes** it. Meaning is produced through **discourse**: systems of signification that define what can be said, thought, and done in a given context. There is no access to reality outside discourse; what counts as "real" is itself a discursive achievement.

The mechanism. Lene Hansen's *Security as Practice* (2006) provides the most systematic post-structuralist

methodology in IR. Hansen argues that **foreign policy is a discursive practice**: it "articulates and intertwines material factors and ideas to such an extent that the two cannot be separated from one another". Security is not an objective condition that exists independently of how it is represented; it is **produced through representations** that constitute certain actors, spaces, and threats as security problems.

Hansen's methodology — **discourse analysis** — involves: 1. **Identifying the key representations** of identity, threat, and policy in official and media discourse. 2. **Mapping the intertextual links** between representations (how one text draws on another). 3. **Analyzing the constitutive effects** of discourse: what policies become possible or impossible when a particular representation is dominant. 4. **Attending to silences**: what cannot be said within a given discourse, and whose experiences are excluded.

The political project. Post-structuralism is **deconstructive** rather than emancipatory in the classical sense. It does not claim to offer a better representation of reality; it seeks to **denaturalize** dominant representations, showing that they are contingent, historically produced, and could be otherwise. Its political effect is to **open space** for alternative representations and practices.

What post-structuralism contributes: It shows that **the way a problem is represented determines what counts as a solution**. If "terrorism" is represented as a security threat requiring military response, then military response becomes the only thinkable policy. If it is represented as a political grievance requiring negotiation, different policies become possible. It also provides the tools for analyzing **how power operates through language** — not only through coercion.

What it occludes: It can make it difficult to **adjudicate between competing discourses** — if all representations are contingent, on what grounds does one criticize a dominant discourse? It can also underplay **material factors** — the ways in which violence, deprivation, and physical coercion operate independently of discourse.

Scope condition: Critical theory and post-structuralism are not mutually exclusive. Many scholars combine them: a post-structuralist analysis of how "security" is discursively constructed can be combined with a critical-theoretical analysis of who benefits from that construction. The distinction is analytical, not a rigid boundary.

2.4 KEY IDEA 3 — The linguistic turn transformed security studies from objective threats to discursive constructions

The claim: Before the linguistic turn, security studies treated threats as **objective facts** — a state has a large army, therefore it is a threat. After the linguistic turn, threats are treated as **discursive constructions** — a state's army becomes a threat only when it is represented as such within a particular discourse. This shift is not merely academic; it changes what counts as evidence, what counts as an explanation, and what counts as a solution.

The Copenhagen School and securitization. The most influential application of the linguistic turn to security is the **Copenhagen School's** theory of **securitization**, developed by Barry Buzan, Ole Wæver, and Jaap de Wilde. Securitization is the **speech act** through which an issue is moved from the realm of "normal politics" to the realm of "security" — thereby justifying extraordinary measures.

The mechanism: 1. A **securitizing actor** (often a state leader) makes a **speech act** that presents an issue as an **existential threat** to a **referent object** (the nation, the state, a community). 2. If the audience **accepts** the

speech act, the issue becomes **securitized**. 3. Securitization **authorizes** extraordinary measures that would not be acceptable under normal politics — military action, surveillance, suspension of civil liberties.

Why this is a linguistic turn. Securitization theory does not ask whether the threat is **objectively real**. It asks **how the threat was constructed**, **by whom**, **for what purpose**, and **with what effects**. A migration flow is not inherently a security threat; it becomes one when a political actor successfully represents it as such. A cyberattack is not inherently an act of war; it becomes one when it is securitized.

The post-structuralist extension. Hansen's work extends securitization theory by showing that **discourse is not only speech but also image, gesture, and silence**. She analyzes how the Bosnian War was represented in Western discourse — which atrocities were visible, which were not, and how those representations shaped the international response. The post-structuralist contribution is to show that **the conditions of representation are themselves political**: who gets to speak, what counts as evidence, and which lives are grievable.

The feminist and post-colonial extension. Feminist IR scholars — Cynthia Enloe, J. Ann Tickner, and others — have shown that **IR's traditional claims to objectivity mask masculinist assumptions** about who counts as a knower and what counts as knowledge. Enloe's method of **"feminist curiosity"** is a discipline of asking **who is doing the work, who is being harmed, and whose experience is invisible** in any account of international politics. Post-colonial scholars extend this to race and coloniality: the linguistic turn, they argue, must also be a **decolonial turn**, because the dominant discourses of IR were forged in the context of empire.

Scope condition: The linguistic turn does not claim that **material reality does not exist**. It claims that **access to material reality is always mediated by discourse**. A bomb is real; but whether it is a "terrorist attack" or a "counter-insurgency operation" depends on how it is represented. The analyst's task is to hold both dimensions together: material violence and discursive construction.

Observable implication: If the linguistic turn is operative, you should see (a) **contestation over the naming of events** (is it a "war" or a "special operation"? a "coup" or a "popular uprising"?); (b) **policy changes following representational shifts** (a shift from "criminal justice" to "security" framing produces a shift from policing to military response); and (c) **silences** — issues that cannot be named within the dominant discourse.

2.5 KEY IDEA 4 — The five perspectives position themselves differently relative to positivism and post-positivism, and those positions are political

The claim: The positivism/post-positivism debate is not a purely philosophical dispute. It is a **political** dispute about who gets to produce knowledge, what kinds of knowledge are legitimate, and whose interests that knowledge serves. The five perspectives — African, Chinese, Russian, Western, and UN — take different positions, and each position has consequences.

2.5.1 The African perspective (primary) **Core commitments.** African epistemology challenges both positivism and much post-positivism for being **Eurocentric**. The critique is not that positivism is too scientific or too interpretive, but that **both** traditions treat Western experience as universal and African experience as a "case" to be explained.

The post-colonial and decolonial critique of IR argues that the discipline's dominant approaches and debates

are "rooted in a partial, Western-centric, and colonial epistemology". African countries are "predominantly used as exceptional case studies, often on corruption, failed economic policy, political instability, or ethnic violence" — a framing that treats Africa as a **problem to be explained** rather than a **source of theory**.

The concept of epistemic violence. Drawing on Spivak and others, African and post-colonial scholars argue that the **erasure of African knowledge systems** from IR is not an oversight but a form of **violence**. Zubairu Wai's *Epistemologies of African Conflicts* "unmasks the epistemic violence inherent in the positivist power/knowledge regimes". The argument is that positivist frameworks **pre-structure** what can be seen: by defining "state failure" in terms of Western institutional models, they render invisible the **alternative forms of order and governance** that African societies have developed.

The alternative. African epistemology does not simply reject positivism; it **provincializes** it. It insists that African systems of thought — oral traditions, relational ontologies, communal forms of authority — are **sources of knowledge**, not just objects of study. The **"epistemic justice"** project in African IR seeks to "recover marginalized intellectual traditions" and to build a **pluralistic** discipline that reflects African experiences.

What this perspective contributes: It shows that the positivism/post-positivism debate **presupposes a Western subject**. The question "can IR be a science?" is asked from within a tradition that has already **excluded** other ways of knowing. African epistemology asks a different question: **whose science, and for whom?**

What it occludes: It can underplay the **strategic value** of positivist methods for African states (e.g., using quantitative data to document the effects of climate change or sanctions). It can also risk **essentializing** "African knowledge" as a single tradition.

2.5.2 The Chinese perspective **Core commitments.** The Chinese School of IR is not a single position, but its most influential figures explicitly reject the **epistemological premises of Western positivism**. Qin Yaqing, the founder of **relational theory**, argues that IR theory "differs from natural science" because it "entails cultural meaning, context, and understanding". His relational theory is grounded in **Chinese philosophical traditions** — the **yin-yang** meta-relationship and the **zhongyong** (doctrine of the mean) dialectics — and offers an alternative to the "individualism, instrumental rationality, and material reductionism embedded in Western IR theories".

The mechanism. Qin's relational epistemology holds that **actors are constituted through their relationships**, not prior to them. This is a direct challenge to the positivist ontology of discrete, pre-formed states with given interests. If actors are relational, then the **process of interaction** — not the structure of the system — is the primary site of causal explanation. This is why Qin's theory is often described as closer to **constructivism** than to positivism.

The political project. The Chinese School is not merely academic; it is part of a broader project of **epistemic sovereignty** — the claim that China should not be confined to theoretical frameworks developed in the West. This project is supported by the Chinese state, which has invested heavily in building "Chinese IR theory" as a counter to Western dominance of the discipline.

What this perspective contributes: It provides a **non-Western epistemology** that is not simply a critique of positivism but a **constructive alternative**, grounded in a distinct philosophical tradition. It also shows that the positivism/post-positivism debate is not universal — it is a **provincial** debate within Western IR.

What it occludes: It can underplay the **internal diversity** of Chinese scholarship (not all Chinese IR scholars reject positivism; many use quantitative methods). It can also risk **essentializing** "Chinese thought" as a unified tradition.

2.5.3 The Russian perspective **Core commitments.** Russian IR scholarship is **internally divided** on epistemological questions. Some Russian scholars use positivist methods and engage with Western debates; others — particularly those associated with the **civilizational approach** — reject positivism as a Western imposition and emphasize the **exclusive aspects of Russian identity, security, and tradition**.

The civilizational alternative. The civilizational approach holds that Russia is a **distinct civilization** with its own historical path, and that Western social science — including positivist IR — is **inadequate** to understanding it. This approach draws on **19th-century Slavophile thought** and on contemporary debates about **"Russian civilization"** as a category of analysis. It is explicitly **anti-positivist**: it rejects the idea of universal laws that apply across civilizations, and it insists on the **particularity** of Russian experience.

The political project. The civilizational approach is closely linked to the Russian state's project of **ideological sovereignty**. It provides an intellectual justification for rejecting Western criticism of Russian domestic and foreign policy: if Russia is a distinct civilization, then Western standards — human rights, democracy, the rule of law — do not apply.

What this perspective contributes: It shows that the post-positivist critique of positivism can be **mobilized for illiberal purposes**. The rejection of universal laws can become a rejection of universal norms. It also highlights the **geopolitics of epistemology**: the question of what counts as knowledge is bound up with the question of who has the power to define it.

What it occludes: It can underplay the **genuine insights** of positivist social science, and it can treat "Russian civilization" as a monolith, erasing internal diversity and dissent.

2.5.4 The Western perspective **Core commitments.** The Western tradition is **internally contested** between positivism and post-positivism. The **behavioral revolution** of the 1950s and 1960s established positivism as the dominant epistemology in the US academy, and it remains powerful today. But the **"third debate"** of the 1980s opened space for post-positivist alternatives — critical theory, post-structuralism, feminism, post-colonialism — that now occupy a substantial place in the discipline.

The reflexive turn. The distinctive Western contribution to the debate is **reflexivity** — the recognition that the scholar's own position shapes the knowledge they produce. Lapid identified "enhanced reflexivity in the scholarly community" as the "notable contribution to date" of the post-positivist restructuring of IR. Reflexivity means asking: **what are the conditions under which this knowledge was produced? Whose interests does it serve? What does it exclude?**

The political project. Western post-positivism is often **normative** — it seeks to expose the power relations embedded in dominant knowledge and to open space for marginalized voices. But it is also **institutional**: the post-positivist turn has created new journals, new professional networks, and new hierarchies within the discipline. The critique of power has itself become a **position of power**.

What this perspective contributes: It provides the **most developed toolkit** for reflexive analysis — the methodological apparatus of discourse analysis, critical theory, and feminist epistemology. It also provides the **self-critique** of Western IR's own parochialism.

What it occludes: It can be **self-referential** — a debate among Western scholars about Western scholars, conducted in Western journals, with little engagement with non-Western traditions. It can also be **depoliticizing**: the emphasis on reflexivity can become an end in itself, rather than a means to political change.

2.5.5 The UN perspective **Core commitments.** The UN is not a scholarly tradition, but it has a distinctive **epistemological practice**: **legal positivism** combined with **institutional pragmatism**. The UN Charter, international law, and Security Council resolutions are treated as **authoritative sources of knowledge** about what is legal and legitimate. The UN's approach is positivist in its **legal** form (law is what the sources of law say it is) but **pragmatic** in its **operational** form (what matters is what can be agreed and implemented).

The "four approaches" to Charter interpretation. Scholarship on UN law identifies four approaches to interpreting the Charter: **classical positivism** (the text and state consent), **international constitutionalism** (the Charter as a constitution), **political realism** (the Charter as a reflection of power), and **legal formalism** (the Charter as a system of rules). The UN's own practice draws on all four, depending on the political context.

The political project. The UN's epistemological practice is oriented toward **consensus and legitimacy**. It seeks to produce knowledge that can be **accepted by member states**, even when they disagree about fundamentals. This is why UN documents are often **deliberately ambiguous** — ambiguity allows agreement without resolving disagreement.

What this perspective contributes: It provides the **institutional record** — the documented decisions, resolutions, and debates that are essential evidence for any analysis of international politics. It also provides a **normative benchmark** — the standards against which state behavior is judged.

What it occludes: It can treat **legal positivism** as the only legitimate epistemology, excluding other forms of knowledge (oral testimony, civil society reports, academic research). It can also **depoliticize** — by framing issues as legal-technical problems, it can obscure the power relations that shape what is legally possible.

2.5.6 The comparison matrix

Dimension	African (primary)	Chinese	Russian	Western	UN
Epistemological stance	Post-colonial/decolonial; provincializes positivism	Relational; rejects Western positivist premises	Divided; civilizational approach rejects positivism	Contested between positivism and post-positivism	Legal positivism + institutional pragmatism
What counts as knowledge	African systems of thought; oral traditions; lived experience	Relationality; zhongyong dialectics; cultural context	Civilizational particularity; anti-universalism	Reflexive, methodologically plural	Legal sources; institutional consensus

Dimension	African (primary)	Chinese	Russian	Western	UN
Key contribution	Epistemic justice; critique of Eurocentrism	Constructive non-Western alternative	Illiberal mobilization of anti-positivism	Reflexivity; methodological toolkit	Institutional record; normative benchmark
Key occlusion	Strategic value of positivist methods	Internal diversity of Chinese scholarship	Genuine insights of positivist science	Self-referential; parochial	Exclusion of non-legal knowledge

---

2.6 WORKED EXAMPLE (I do)

The puzzle: In the aftermath of the 9/11 attacks, the United States launched a "Global War on Terror." The framing of the attacks as an act of "war" rather than a "crime" had profound consequences: it authorized military detention without trial (Guantánamo), drone strikes outside recognized battlefields, and the invasion of Afghanistan. Why did the "war" frame prevail over the "crime" frame, and what did that choice make possible?

The puzzle stated precisely: *Why was the 9/11 attack represented as an act of war rather than a criminal act, and how did that representation constitute the range of possible responses?*

Epistemological framing. A positivist analysis would ask: **was the attack objectively an act of war?** It would look for measurable criteria — the scale of violence, the identity of the perpetrator, the existence of an armed conflict. A post-positivist analysis would ask: **how was the attack represented, by whom, and with what effects?** It would not deny the reality of the violence; it would ask how that violence was **given meaning** through discourse.

Post-structuralist analysis. The "war" frame was constructed through a series of speech acts:

- President Bush's address to Congress on September 20, 2001, declared a "war on terror" that would "not end until every terrorist group of global reach has been found, stopped and defeated."
- The frame drew on **intertextual links** to earlier discourses: the "war on drugs," the "war on poverty," and the Cold War framing of a global ideological struggle.
- The frame **constituted** the actors: Al-Qaeda was not a criminal organization but an **enemy army**; the United States was not a **law enforcement agency** but a **belligerent**.
- The frame **authorized** extraordinary measures: military force, detention without trial, surveillance, and the suspension of civil liberties.

Critical-theoretical analysis. Who benefited from the "war" frame?

- The **executive branch** gained unprecedented powers: the Authorization for Use of Military Force (AUMF) became the legal basis for military action across the globe, with little congressional oversight.
- The **defense industry** benefited from a massive increase in military spending.
- The **surveillance apparatus** expanded dramatically, with the Patriot Act and subsequent legislation.

- The **"war" frame** also served to **legitimize** the invasion of Iraq (2003), which was justified through the same discursive structure (Saddam Hussein as a threat, weapons of mass destruction as an existential danger).

Feminist and post-colonial analysis. Who was made invisible by the "war" frame?

- The **civilian casualties** in Afghanistan and Iraq were represented as "collateral damage" — a category that makes certain deaths unremarkable.
- The **experiences of women** in Afghanistan were mobilized to justify intervention ("saving Afghan women"), while the gendered violence of the occupation itself was obscured.
- The **racialized dimension** of the "war on terror" — the targeting of Muslim communities, the construction of "radical Islam" as a civilizational threat — drew on colonial discourses of the "barbaric Other."

Adjudication. Which epistemology best explains the "war on terror" frame? The **post-structuralist** analysis explains **how** the frame was constructed. The **critical-theoretical** analysis explains **who benefited** from the frame. The **feminist and post-colonial** analyses explain **who was made invisible**. The **positivist** analysis — asking whether the attack was "objectively" a war — misses the point: the attack was **whatever it was represented to be**, and the representation had material consequences.

But the positivist analysis is not irrelevant. It would ask: **what were the material conditions that made the "war" frame possible?** The scale of the violence, the transnational character of Al-Qaeda, the weakness of the Afghan state — these are material factors that constrained the range of plausible representations. A complete explanation holds both dimensions together: **material conditions constrain representation, but representation constitutes the response.**

2.7 PROBLEM PAIR (We do)

Your task: Analyze the following case using the apparatus above. Write your analysis before reading the model answer.

The case: In 2015, the European Union faced a "migration crisis" as hundreds of thousands of refugees and migrants arrived from Syria, Afghanistan, and other conflict zones. Some EU member states framed the arrivals as a **security threat** requiring border closures and military response; others framed them as a **humanitarian crisis** requiring rescue operations and resettlement. The framing varied not only across states but within states, and it changed over time.

Your tasks:

1. State the puzzle precisely: why did the same material phenomenon — people arriving at EU borders — produce different security and humanitarian responses?
2. Apply the **securitization** framework: identify the securitizing actors, the speech acts, the referent objects, and the audience acceptance.
3. Apply the **critical-theoretical** framework: who benefited from the securitization of migration? Who was disadvantaged?
4. Apply the **post-colonial** framework: how did the EU's response reflect colonial legacies and racialized hierarchies of deservingness?

5. Write a 300-word adjudication: which epistemology best explains the variation in responses, and what does it miss?

Model answer (compare after writing your own):

Puzzle: Why did EU member states respond differently to the 2015 migration surge, with some securitizing migration and others framing it as a humanitarian obligation?

Securitization analysis: The securitizing actors were primarily **right-wing political leaders** in Hungary, Poland, and Austria, who represented migration as an **existential threat** to national identity, security, and the European way of life. The speech acts were explicit: Viktor Orbán's claim that migration would "dismantle European civilization"; the Hungarian government's construction of a border fence; the framing of migrants as "illegal" and "criminal." The **referent object** was the nation and its identity. The **audience** — domestic publics — largely accepted the frame in some states, leading to policy changes (border closures, detention camps). In other states — Germany, Sweden — the **humanitarian frame** prevailed, with Chancellor Merkel's "Wir schaffen das" (we can do it) as the key speech act.

Critical-theoretical analysis: Who benefited from securitization? **Right-wing parties** gained electoral support. **Security industries** gained contracts for border enforcement. **National governments** gained the ability to suspend asylum obligations and civil liberties. Who was disadvantaged? **Migrants and refugees** themselves, whose suffering was rendered invisible by the security frame. **Civil society organizations** that provided humanitarian assistance were criminalized in some states (e.g., Hungary's "Stop Soros" laws).

Post-colonial analysis: The EU's response reflected **colonial legacies**: the construction of migrants as a threat drew on racialized discourses of the "Other"; the distinction between "deserving" refugees (Syrians) and "undeserving" economic migrants (Africans) reproduced a **hierarchy of humanity**; the externalization of border control to Libya and Turkey reflected a **neocolonial** logic of outsourcing violence to the global periphery.

Adjudication: The **post-structuralist** analysis best explains the **variation** in responses: the same material phenomenon was represented differently in different national discourses, and those representations constituted different policy possibilities. The **critical-theoretical** analysis best explains **who benefited** from the securitization of migration. The **post-colonial** analysis best explains **why the securitization took a racialized form**. A complete explanation combines all three: the material conditions of the migration surge (wars in Syria and Afghanistan, the collapse of the Libyan state) **constrained** the range of possible representations, but the **discursive struggle** over how to represent the arrivals determined which responses became possible.

2.8 INDEPENDENT MEMO (You do)

Produce a one-page analytical memo (500–600 words) on the following case, using the four headings below.

Case: The representation of China's Belt and Road Initiative (BRI) in Western, African, and Chinese discourses. Western discourse often frames the BRI as "debt-trap diplomacy" and a threat to sovereignty; Chinese discourse frames it as "win-win cooperation" and "common development"; African discourse is divided, with some states embracing the BRI and others expressing concerns about debt and dependency.

Memo headings:

1. **Mechanism:** How does each discourse construct the BRI? Identify the key speech acts, the actors they constitute, and the policies they authorize.
2. **Perspective reconstruction:** How would each of the five perspectives explain the divergence in representations? (One paragraph or table entry each.)
3. **Epistemological adjudication:** Which epistemology — positivist, critical-theoretical, post-structuralist, feminist/post-colonial — best explains the **political effects** of these competing representations?
4. **Falsifiers:** What evidence would show that the "debt-trap" discourse is a **misrepresentation**, or that it is an **accurate description**? What would you need to observe?

Self-check: Does your memo distinguish between **what the BRI is** (positivist question) and **how it is represented** (post-positivist question)? Does it identify who benefits from each representation?

2.9 HINGE QUESTION

A scholar argues: "The concept of 'failed states' is not a neutral description. It reflects a particular Western model of what a state should look like, and it renders invisible the alternative forms of order that exist in many African societies." Which epistemological position does this scholar most clearly adopt?

- A) Positivism
- B) Critical theory
- C) Post-colonial/decolonial epistemology
- D) Legal positivism

Answer: C. The scholar is making a **post-colonial** argument: the concept of "failed states" is Eurocentric, it imposes a Western model, and it silences African forms of order. This is the core of the African/post-colonial critique of IR: the categories of the discipline are not neutral but **colonially constituted**.

If you answered A: Positivism would treat "failed states" as a measurable category, not as a contested concept. **If you answered B:** Critical theory would also critique the concept, but it would focus on **who benefits** from the "failed state" discourse (e.g., interventionist powers) rather than on the **colonial genealogy** of the category. **If you answered D:** Legal positivism concerns the sources of law, not the epistemology of social-scientific concepts.

SECTION 2A — DATA LAB (30–45 minutes)

Purpose: Practice discourse analysis — the core method of post-structuralist IR.

Task: Analyze the following three excerpts about the same event — the 2023 Niger coup. Identify the **speech acts**, the **actors constituted**, the **policies authorized**, and the **silences**.

Excerpt A (ECOWAS statement, July 2023): "ECOWAS condemns in the strongest terms the coup d'état in Niger. The attempted overthrow of the democratically elected government is a violation of the ECOWAS Protocol on Democracy and Good Governance. ECOWAS demands the immediate restoration of constitutional order and warns that it will take all necessary measures to ensure this."

Excerpt B (Niger junta statement, August 2023): "The National Council for the Safeguard of the Homeland has taken power to save Niger from corruption, mismanagement, and foreign domination. The former government was a puppet of France. We call on the Nigerien people to support the patriotic forces in their struggle for true sovereignty."

Excerpt C (Russian Foreign Ministry statement, August 2023): "The events in Niger are an internal affair of the Nigerien people. Russia respects the sovereignty of Niger and opposes any external interference. We call on all parties to resolve their differences through peaceful dialogue."

Analysis questions:

1. **Speech acts:** What does each excerpt **do** through language? (Condemn? Legitimize? Express concern?)
2. **Actors:** How is each actor represented? (ECOWAS as enforcer? Junta as liberators? Russia as neutral mediator?)
3. **Policies authorized:** What policies does each representation make possible or impossible? (ECOWAS: military intervention? Junta: resistance to external pressure? Russia: diplomatic engagement?)
4. **Silences:** What is **not said** in each excerpt? (ECOWAS: the colonial history of French intervention? Junta: the internal repression? Russia: its own security interests in the Sahel?)
5. **Epistemology:** Which excerpt is most **positivist**, and which is most **post-structuralist**? How does the epistemological stance shape the representation?

Rule: Complete this lab before the independent memo. Evidence precedes argument.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Task: Draw the following by hand.

Visual 1: The positivist bundle. Draw a four-part diagram: Ontology (what exists), Epistemology (what can be known), Axiology (the scholar's stance), Methodology (how knowledge is produced). For each part, write the positivist commitment and one post-positivist rejection.

Visual 2: Critical theory vs. post-structuralism. Draw a two-column table. Rows: "Goal of theory," "Mechanism of power," "Political project," "Key occlusion." Fill from memory.

Visual 3: The five perspectives on epistemology. Draw a five-column table (African, Chinese, Russian, Western, UN) with rows: "Epistemological stance," "What counts as knowledge," "Key contribution," "Key occlusion."

SECTION 4 — CORNELL NOTES

Set up your notes with the following cue column:

Cue column	Notes
What are the four commitments of positivism?	Ontological realism; epistemological empiricism; axiological neutrality; methodological quantitative/formal
What is the "third debate"?	Lapid's term for the post-positivist challenge to empiricist-positivist IR
What is the distinction between problem-solving and critical theory?	Cox: problem-solving takes the world as given; critical theory asks how it came about and whether it can be changed
What is the linguistic turn?	Language constitutes reality rather than merely describing it; discourse analysis
What is securitization?	The speech act through which an issue is moved from normal politics to security, authorizing extraordinary measures
What is epistemic violence?	The erasure of non-Western knowledge systems through the imposition of Eurocentric categories
How do the five perspectives position themselves?	African: decolonial; Chinese: relational; Russian: civilizational (anti-positivist); Western: contested/reflexive; UN: legal positivism + pragmatism
Source log	Lesson text, Sections 2.2–2.5; Lapid (1989); Wendt (1992); Cox (1981); Hansen (2006); Enloe (2004); Qin (2018); Wai (2018)
Summary	3–5 sentences synthesizing the lesson

SECTION 5 — FEYNMAN COMPRESSION

Step 1: Explain the difference between positivism and post-positivism to a smart non-specialist in 150–200 words, without using jargon. If you must use "epistemology" or "discourse," define them in plain language.

Step 2: Mark every point where you hesitated or used a term you could not define.

Step 3: Reread only the gaps. Rewrite.

Step 4: Produce one analogy for the linguistic turn. Then state where the analogy breaks down. (Example: "The linguistic turn is like realizing that a map does not just describe terrain — it **creates** the terrain by deciding what counts as a road and what counts as a border." Where it breaks down: terrain exists independently of the map, whereas post-structuralists argue that reality is constituted by discourse.)

SECTION 6 — SPACED-REPETITION FLASHCARDS

Produce 12–15 cards. Use the following types:

Type	Example
Definition	What are the four commitments of positivism?
Mechanism	How does securitization theory explain the move from normal politics to security?
Application	A state frames a cyberattack as an "act of war." What epistemological move is this?
Comparison	How do critical theory and post-structuralism differ in their political projects?
Source	What is Cox's distinction between problem-solving and critical theory?
Debate	What is the strongest objection to the post-structuralist claim that "there is nothing outside discourse"?
Reconstruction	How would an African decolonial scholar critique positivist IR?
Occlusion	What does the Chinese relational approach fail to see about power?
Adjudication	Which epistemology best explains the "war on terror" frame, and what does it miss?
Visual	Label the four commitments of positivism on a diagram.

Tag each card: `L4`, `epistemology`, `post-positivism`, `perspective`, `difficulty`.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence audit

Rate confidence (0–100%) before checking:

Objective	Confidence
Define positivism's four commitments	
Distinguish critical theory and post-structuralism	
Apply the linguistic turn to a security case	
Reconstruct the five perspectives on epistemology	
Evaluate the political consequences of epistemological choice	

After exercises, rate accuracy. Calculate the gap.

7.2 Three-question debrief

1. What did I misunderstand about the relationship between the linguistic turn and material reality?

2. Which perspective was easiest to reconstruct? Which was hardest? What does that suggest about my default epistemology?
3. What will I do differently in Lesson 5?

7.3 Error log

Date	Lesson	Error type	Correct understanding	Card created?
	L4			

SECTION 8 — CHEATSHEET (Module 1)

Add this row to your Module 1 cheatsheet:

Column	Content
Core concepts	Positivism; post-positivism; linguistic turn; discourse; securitization; epistemic violence; reflexivity; relationality
Key mechanisms	Speech act → securitization → extraordinary measures; problem-solving theory → reproduction of order; critical theory → denaturalization; epistemic violence → erasure of non-Western knowledge
Theories and authors	Lapid (third debate); Cox (problem-solving vs. critical theory); Hansen (discourse analysis); Enloe (feminist curiosity); Qin (relational theory); Wai (epistemic violence)
Cases and evidence	War on terror; 2015 migration crisis; Niger 2023; BRI representations
Debates	Can IR be a science? Is discourse constitutive of reality? Whose knowledge counts?
Falsifiers	What evidence would show that a discourse is not constitutive — that material reality determines representation?
Cross-links	L5 (realism); L7 (constructivism); L8 (critical/post-colonial/feminist); L24 (cognitive warfare); L58 (forecasting)

SECTION 9 — REVIEW SCHEDULE

Review	Timing	Format
R1	Today	Retrieval warm-up + card creation
R2	2–3 days	Cue-column recall + hinge variant
R3	1 week	Mixed quiz with L1–L4 cards
R4	3–4 weeks	Interleaved problem combining L4 with L5–L8 (theory) and L24 (cognitive warfare)
R5	End of Module 1	Cheatsheet reconstruction from memory

SECTION 10 — COMPLETION CHECKLIST

- ☐ Retrieval warm-up completed from memory
- ☐ Five learning objectives read and understood
- ☐ Four key ideas studied with mechanisms and scope conditions
- ☐ Perspective comparison matrix filled from memory, then checked
- ☐ Worked example (war on terror) studied and self-explained
- ☐ Problem pair (2015 migration crisis) attempted and compared
- ☐ Independent memo produced (500–600 words)
- ☐ Hinge question answered correctly (or reteaching completed)
- ☐ Data lab completed before independent memo
- ☐ Three dual-coded visuals drawn
- ☐ Cornell notes with cue column, source log, and summary
- ☐ Feynman explanation written, gaps identified, rewritten
- ☐ 12–15 flashcards created with tags
- ☐ Confidence audit and error-log entry
- ☐ Cheatsheet entry added
- ☐ R2 review scheduled

- **On securitization:** Barry Buzan, Ole Wæver, and Jaap de Wilde, *Security: A New Framework for Analysis* (1998).

End of Lesson 4. Say **"Next"** when you are ready for Lesson 5 (Realism: Classical, Structural, Neoclassical).

6. Realism: Classical, Structural, and Neoclassical — Power, Anarchy, and the Tragedy of Great-Power Politics

---

LESSON METADATA

Field	Entry
Lesson number and title	L5 — Realism: Classical, Structural, Neoclassical
Module	Module 1: Epistemological and Ontological Foundations
Prerequisites	L1 (puzzles, levels, power, perspectives); L2 (law and institutions); L3 (causal inference); L4 (positivism and post-positivism)
Interleaved links	Forward to L6 (liberalism — realism's foil), L7 (constructivism — the social construction of anarchy), L12 (Cold War), L15–19 (IPE — realist political economy), L21 (nuclear deterrence), L35 (post-Soviet ontology), L41–46 (Iran and West Asia), L47 (US–China rivalry)
Reading load	This lesson only. Optional further reading at the end.
Content channels	Canon (quoted and summarized); primary texts (Thucydides, Morgenthau, Waltz, Mearsheimer, Jervis, Rose, Yan Xuetong, quoted and analyzed); data lab (SIPRI military expenditure); five perspectives

Field	Entry
Bloom ceiling	Evaluate (adjudicate between realist variants and between realism and its critics)
Estimated study time	7–9 hours including exercises

Note on self-containment: Every argument, quotation, and example you need is inside this document. Where I cite Thucydides, Morgenthau, Waltz, Mearsheimer, Jervis, or any other scholar, I summarize the argument fully enough that you do not need the original to complete the lesson. The "Further Reading" section is optional.

SECTION 0 — Why This Lesson Exists

Realism is the **most influential** and the **most misunderstood** tradition in International Relations. It is the language of great-power politics, the default framework of foreign ministries, and the theory that every IR student must master — even those who eventually reject it.

It is misunderstood because it is not one theory. Realism is a **family** of arguments that share a core commitment — that international politics is shaped by **anarchy, power, and self-interest** — but disagree profoundly about the **mechanisms** that connect anarchy to state behavior, the **level of analysis** at which causes are located, and the **scope conditions** under which realist predictions hold.

This lesson reconstructs the realist family in depth:

1. **Classical realism** (Thucydides, Machiavelli, Hobbes, Morgenthau, Carr) — which locates the cause of conflict in **human nature** and the **lust for power**.
2. **Structural realism or neorealism** (Waltz) — which locates the cause in the **structure of the international system** (anarchy and polarity), not in human nature.
3. **Offensive realism** (Mearsheimer) — a variant of structural realism that predicts states will **maximize power** and seek hegemony, not merely balance.
4. **Defensive realism** (Jervis, Waltz in some readings) — a variant that predicts states will **maintain the status quo** when possible, and that the security dilemma, not aggressive intentions, is the main cause of conflict.
5. **Neoclassical realism** (Rose, Schweller, Zakaria) — which argues that **systemic pressures must be translated through domestic politics** — leaders, coalitions, ideologies — before they produce foreign policy.
6. **The security dilemma** (Herz, Jervis) — the mechanism that connects anarchy to conflict without requiring aggressive intentions.

By the end, you can take any realist claim and answer: *Which variant is this? What mechanism does it specify? What level of analysis does it use? What does it predict, and under what scope conditions? And what do the five perspectives — African, Chinese, Russian, Western, and UN — make of it?*

SECTION 1 — PRE-CLASS PRIMING

1.1 Retrieval warm-up (from memory, before reading further)

1. From L1: Name the four levels of analysis and give one cause located at each level for a single event.
2. From L1: Distinguish the first, second, and third faces of power.
3. From L3: What is **selection on the dependent variable**, and why does it bias inference?
4. From L4: What are the four commitments of positivism, and which one does post-structuralism reject most fundamentally?

Check against Lessons 1–4 before proceeding.

1.2 Orientation questions

Hold these in mind:

- If anarchy is the defining condition of international politics, why do states ever cooperate?
- Is the security dilemma an objective feature of anarchy or a product of states' beliefs about each other?
- Why do some states seek hegemony while others are satisfied with the status quo?
- Is realism a **description** of how the world works, a **prescription** for how states should behave, or a **self-fulfilling prophecy**?

1.3 Vocabulary pre-teach

Provisional definitions; revise by the end:

Anarchy; self-help; relative gains; security dilemma; spiral model; deterrence model; balance of power; bandwagoning; buck-passing; polarity; hegemonic stability; offensive realism; defensive realism; neoclassical realism; status quo states; revisionist states; unitary actor assumption; black-boxing; moral realism; civilizational realism.

SECTION 2 — LESSON CORE

2.1 Learning objectives

By the end of this lesson, you can:

1. **Reconstruct** the five variants of realism — classical, structural (defensive), offensive, neoclassical, and the security dilemma — and distinguish their mechanisms, levels of analysis, and scope conditions.
2. **Apply** each variant to a single case (e.g., the Ukraine war) and explain where their predictions diverge.
3. **Evaluate** the realist claim that anarchy produces competition, using evidence from cases of sustained cooperation (e.g., the EU, ASEAN, the post-1945 liberal order).
4. **Reconstruct** how African, Chinese, Russian, Western, and UN traditions engage with realism, and **adjudicate** among them on a specific case.
5. **Critique** realism's silences — what it does not see about hierarchy, race, colonialism, and domestic politics — without dismissing its insights.

2.2 KEY IDEA 1 — Realism is a family, not a theory: five variants with distinct mechanisms

The claim: All realisms share a core commitment — that international politics is shaped by anarchy, power, and self-interest — but they disagree about **why** anarchy produces competition, **where** the cause is located, and **what** states will do. Confusing the variants is the most common error in realist analysis.

The table below maps the family. Each row is a distinct theory, not a version of one theory.

Variant	Key figures	Locus of cause	Core mechanism	Prediction
Classical realism	Thucydides, Machiavelli, Hobbes, Morgenthau, Carr	Human nature	*Lust for power* (animus dominandi); the drive to dominate is inherent in humans and expressed through states	States will seek power even when security is assured
Structural realism (defensive)	Waltz	International structure	*Anarchy* + *self-help*: states must help themselves; balancing is the default; states seek security, not power	States balance against threats; over-expansion is self-defeating
Offensive realism	Mearsheimer	International structure	*Anarchy* + *uncertainty about intentions*: states can never be sure of others' intentions; survival requires maximizing power; hegemony is the ultimate goal	Rising powers seek regional hegemony; great-power war is likely
Neoclassical realism	Rose, Schweller, Zakaria	Structure + domestic politics	*Systemic pressures are filtered through domestic intervening variables*: leaders, coalitions, ideologies shape how states respond	Foreign policy is a product of both systemic incentives and domestic politics

Variant	Key figures	Locus of cause	Core mechanism	Prediction
Security dilemma	Herz, Jervis	Anarchy + uncertainty	*Defensive measures appear offensive to others*, triggering a spiral of armament and conflict even when no state wants war	Arms races, crises, and wars can occur without aggressive intentions

Why this matters. The claim "realism predicts the Ukraine war" is **ambiguous** until you specify which variant:

- **Classical realism** predicts that Russia, like any great power, will seek to dominate its neighborhood because that is what great powers do.
- **Defensive realism** predicts that Russia would balance against NATO but would not necessarily invade — because over-expansion is self-defeating.
- **Offensive realism** predicts that Russia will seek regional hegemony in its near abroad, because survival requires it — and that Ukraine is the most likely flashpoint.
- **Neoclassical realism** asks why Russia responded the way it did — what domestic coalitions, ideologies, and leadership dynamics shaped the response — and explains why the response took the form it did.
- **Security dilemma** predicts that NATO enlargement, even if defensively motivated, appeared offensive to Russia, triggering a spiral that neither side fully controlled.

These are **not the same prediction**. They are different theories with different mechanisms and different policy implications.

2.3 KEY IDEA 2 — Classical realism: power as a human drive, not a systemic necessity

The claim: Classical realism locates the cause of international conflict in **human nature**. The drive to dominate — what Morgenthau called the *animus dominandi* — is inherent in humans and is expressed through states. Anarchy matters, but it is not the primary cause; it is the condition that allows the human drive for power to express itself without restraint.

Thucydides (c. 431 BCE). The Athenian historian is often treated as the first realist. His *History of the Peloponnesian War* contains the **Melian Dialogue**, in which Athenian envoys tell the Melians, before destroying their city: **"the strong do what they can and the weak suffer what they must."** This is the most quoted sentence in the realist canon. But Thucydides' account is more complex than the quotation suggests: he also shows that Athenian hubris led to catastrophic defeat in Sicily, suggesting that over-expansion is self-defeating. The Melian Dialogue is not a neutral description; it is a warning about the **corruption of power**.

Niccolò Machiavelli (1513/1532). In *The Prince*, Machiavelli advises the ruler that he must be willing to use **force and fraud** because "the lion cannot protect himself from traps, and the fox cannot defend himself from wolves." The prince must combine both. Machiavelli is not simply a theorist of power; he is a theorist

of **the autonomy of politics** — the claim that political action has its own logic and cannot be judged by ordinary morality.

Thomas Hobbes (1651). *Leviathan* describes the **state of nature** as a "war of all against all" in which "the life of man [is] solitary, poor, nasty, brutish, and short." Hobbes's solution is the **sovereign** — a single authority with a monopoly on legitimate violence, which can impose order. In international politics, there is no global sovereign, so the state of nature persists between states. This is the **anarchy** that structural realists later formalize.

Hans Morgenthau (1948). *Politics Among Nations* is the founding text of American classical realism. Morgenthau's six principles of political realism are worth stating in full:

1. Political realism believes that politics is governed by objective laws that have their roots in **human nature**.
2. The core concept of realism is **interest defined in terms of power**.
3. Interest defined as power is an **objective category** that is universally valid, but its content varies with time and place.
4. Political realism is aware of the **moral significance** of political action, but it is also aware of the **tension between morality and successful political action**.
5. Political realism refuses to identify the **particular aspirations** of a particular nation with the **moral laws that govern the universe**.
6. The realist is convinced of the **autonomy of the political sphere** — the political sphere is not a mere function of the economic or moral sphere.

Morgenthau's realism is **tragic**: the drive for power is inherent, order is precarious, and the best that can be hoped for is a **balance of power** that maintains a fragile peace. He is not a moralist, but he is not a cynic either — he insists that morality matters, even if it cannot be the sole basis of policy.

E. H. Carr (1939). *The Twenty Years' Crisis* is a critique of **utopianism** (the belief that international politics can be governed by law and morality) and an argument for realism as **the recognition of power**. Carr's realism is directed at the liberal internationalism of the interwar period, which he saw as failing to confront the realities of power. But Carr's realism is **historicist** — he argues that the content of "morality" varies across time and place, and that utopianism is itself a product of a particular historical context (the dominance of the satisfied powers). This is a crucial insight: realism is not a universal truth; it is a **historical product** of a specific moment.

What classical realism contributes: It provides a **psychological** account of power — the drive to dominate is not merely a response to anarchy; it is rooted in human nature. It also provides a **tragic sensibility** — the recognition that power is dangerous and that the best political arrangements are fragile.

What classical realism occludes: It can naturalize aggression (if power-seeking is human nature, then nothing can be done about it); it can underplay the **institutional and normative** factors that mitigate the drive for power; it can be **tautological** (states seek power because they are states, and states seek power because they are driven by human nature — which is not an explanation, but a restatement of the outcome).

2.4 KEY IDEA 3 — Structural realism (Waltz): anarchy, self-help, and the logic of balancing

The claim: Kenneth Waltz's *Theory of International Politics* (1979) is the most influential work of IR theory in the twentieth century. Its central move is to **abstract from human nature** and locate the cause of state behavior in the **structure of the international system**. Anarchy — the absence of a central authority — produces a logic of **self-help**: states must rely on their own resources for survival. The distribution of **capabilities** (polarity) determines the structure of the system, and states **balance** against the most powerful.

The core argument. Waltz's theory rests on three propositions:

1. **The international system is anarchic.** There is no central authority above states, and states must provide for their own security.
2. **Anarchy produces self-help.** Because there is no authority to enforce agreements or protect states, states must look to their own resources and prioritize **relative gains** — how much power they have relative to others — over absolute gains.
3. **The structure of the system determines outcomes.** The distribution of capabilities (unipolar, bipolar, multipolar) shapes the behavior of states. In a bipolar system, the two superpowers balance each other; in a multipolar system, balancing is more complex and the risk of war is higher.

The claim about human nature. Waltz explicitly *brackets* human nature. He argues that if human nature were the cause of war, then war would be inevitable — but it is not, because the structure of the system varies. Bipolarity, he argued, was more stable than multipolarity, because the two superpowers could manage their competition and avoid the diffusion of power that produced the First World War.

Balancing vs. bandwagoning. Waltz argues that states in an anarchic system will **balance** against the most powerful actor rather than **bandwagon** with it. Balancing can be **internal** (building up military capability) or **external** (forming alliances). Bandwagoning — joining the stronger side — is risky because it leaves the weaker state dependent on the stronger. This is why the balance of power is the default behavior of states.

The security dilemma and defensive realism. A key mechanism in structural realism is the **security dilemma**, first formulated by John Herz (1950) and developed by Robert Jervis (1978). Herz described it as a **"structural notion"** of the security dilemma in which groups and individuals are "insecure" because they cannot be sure of the intentions of others. Jervis distinguished two models:

- **The deterrence model:** States are aggressive because they are aggressive; the solution is to deter them with superior power.
- **The spiral model:** States are defensive, but their defensive measures appear offensive to others, triggering a spiral of armament and conflict. The solution is to reassure the other side, not to escalate.

Jervis argues that the spiral model is often more accurate than the deterrence model: **"the means of security for one state are, in the eyes of the other, the means of aggression."** This is the mechanism that explains how wars can occur even when no state wants one.

What structural realism contributes: It provides a **parsimonious** theory of international politics — a small number of assumptions (anarchy, self-help, polarity) generate predictions about state behavior. It also provides a **systemic** account of war and peace, avoiding the reductionism of human-nature explanations.

What structural realism occludes: It **black-boxes** the state — it treats states as unitary rational actors and ignores domestic politics. It can underplay **norms and institutions** — the ways in which states can transcend the logic of self-help. It can underplay **hierarchy** — the ways in which the international system is not just

anarchic but also stratified by race, colonial history, and economic dependency.

Scope condition: Structural realism is most powerful in explaining the behavior of **great powers** in **security** issues. It is least powerful in explaining **cooperation** (e.g., the EU) or the behavior of **weak states** (e.g., small African states whose survival depends more on regional institutions than on balancing).

2.5 KEY IDEA 4 — Offensive realism, neoclassical realism, and the security dilemma: three refinements

The previous sections covered classical and structural realism. This section covers three refinements that are essential to contemporary realist analysis.

2.5.1 Offensive realism (Mearsheimer) **Core commitment.** John Mearsheimer's *The Tragedy of Great Power Politics* (2001) is a variant of structural realism that draws a more **pessimistic** conclusion from anarchy. Mearsheimer accepts Waltz's premise that anarchy produces self-help, but argues that it produces **offensive** behavior, not merely balancing.

The five assumptions. Mearsheimer's theory rests on five assumptions:

1. The international system is **anarchic**.
2. Great powers **possess offensive military capability**.
3. States can **never be certain about the intentions of other states**.
4. The **primary goal** of states is survival.
5. States are **rational actors** — they calculate costs and benefits.

The tragedy. From these assumptions, Mearsheimer derives the **tragedy**: states cannot be sure of others' intentions, so they must maximize their power to ensure their survival. The ultimate goal is **regional hegemony** — dominating one's own region — because a regional hegemon is the only state that can be secure. Mearsheimer predicts that **great-power war is likely** because the structure of the system provides incentives for aggression.

The contrast with Waltz. Waltz is a **defensive realist**: he argues that states seek **security**, not power, and that over-expansion is self-defeating. Mearsheimer is an **offensive realist**: he argues that states seek **power** because security is never assured. The difference is not merely academic — it has policy implications. Waltz would argue that the US should not over-expand; Mearsheimer would argue that the US should maximize its power and prevent any rival from achieving regional hegemony.

What offensive realism contributes: It provides a **parsimonious** and **pessimistic** account of great-power behavior. It explains why rising powers seek to expand and why status quo powers resist.

What it occludes: It can underplay **domestic politics** — the ways in which leaders, coalitions, and ideologies shape foreign policy. It can underplay **norms and institutions** — the ways in which states can signal their intentions and build trust. It can be **falsified** by cases of sustained cooperation (e.g., the EU) and by cases where states do not maximize power (e.g., post-war Germany and Japan).

Scope condition: Offensive realism is most powerful in explaining the behavior of **great powers** in **security** issues where the stakes are high. It is least powerful in explaining cooperation, the behavior of weak states, and the role of ideas.

2.5.2 Neoclassical realism (Rose, Schweller, Zakaria) **Core commitment.** Neoclassical realism argues that **systemic pressures are necessary but not sufficient** to explain foreign policy. The international system provides **incentives** and **constraints**, but how states respond depends on **domestic intervening variables** — leaders, coalitions, ideologies, and state-society relations. Neoclassical realism is a **bridge** between structural realism and foreign-policy analysis.

The mechanism. Gideon Rose, in his 1998 review article that coined the term, described neoclassical realism as a theory in which "the scope and ambition of a country's foreign policy is driven first and foremost by its place in the international system and specifically by its relative material power capabilities," but in which "the impact of such power capabilities on foreign policy is indirect and complex, because systemic pressures must be translated through intervening variables at the unit level."

What it contributes: It explains **why states with similar structural positions sometimes behave differently**. For example, why did the US and the Soviet Union respond differently to their respective declines? Why did Britain and France respond differently to the rise of Germany? Neoclassical realism answers these questions by examining the domestic coalitions, ideologies, and leadership styles that shaped foreign policy.

What it occludes: It can **overcomplicate** the theory, making it difficult to test. It can **underplay** the autonomy of systemic pressures — the ways in which structure constrains foreign policy regardless of domestic politics.

Scope condition: Neoclassical realism is most powerful in explaining **foreign policy** (not international outcomes), and in cases where there is **variation** in how states respond to similar structural pressures.

2.5.3 The security dilemma (Herz, Jervis) **Core commitment.** The security dilemma is the mechanism that explains how **conflict can occur without aggressive intentions**. States that are motivated by security — not aggression — can still produce a spiral of armament and war, because their defensive measures appear offensive to others.

The mechanism. Jervis's spiral model works as follows:

1. State A is uncertain about State B's intentions.
2. State A takes defensive measures (e.g., builds up its military).
3. State B interprets A's measures as offensive and responds with its own buildup.
4. State A interprets B's response as confirmation of its hostile intentions and escalates further.
5. The spiral produces conflict even though neither state wanted it.

The deterrence model vs. the spiral model. Jervis distinguishes:

- **Deterrence model:** The other side is aggressive; the solution is to **deter** it with superior power.
- **Spiral model:** The other side is defensive but uncertain; the solution is to **reassure** it and avoid actions that appear threatening.

What the security dilemma contributes: It explains **unintended conflict** — wars that occur even when neither side wants them. It also provides a **policy tool**: understanding the security dilemma can help states avoid escalation.

What it occludes: It can underplay **genuinely aggressive intentions** — some states *are* revisionist, and reassuring them can be dangerous. It can also be **difficult to test**: how do you know whether the other side is defensive but uncertain, or genuinely aggressive?

2.6 KEY IDEA 5 — The five perspectives engage realism differently, and each engagement is political

The claim: Realism is often treated as a **universal** theory of international politics. But the five perspectives — African, Chinese, Russian, Western, and UN — engage with realism in distinct ways, and each engagement reflects a different political project. Reconstructing these engagements is essential to adjudicating realism's claims.

2.6.1 The African perspective (primary) **Core commitments.** African scholars and statesmen have a **complex** relationship with realism. On one hand, realism's emphasis on power and self-help resonates with the experience of weak states in an unequal international system. On the other hand, realism's **Eurocentrism** — its erasure of colonial history, racial hierarchy, and the structural inequalities of the world economy — makes it inadequate for understanding the African condition.

The critique of Eurocentrism. African and post-colonial scholars argue that realism was **forged in the context of European great-power politics** and reflects European experiences (the Peloponnesian War, the Thirty Years' War, the Napoleonic Wars). It treats these experiences as universal, while erasing the **colonial violence** that shaped the international system. Siba Grovogui's work shows that the sovereignty and anarchy that realism describes were **never extended to Africans** in the same way — African polities were treated as quasi-sovereign or non-sovereign, and their subjugation was justified by racial hierarchy.

The critique of the state-as-unitary-actor assumption. Realism assumes that the state is a **unitary rational actor** whose primary goal is survival. But many African states are **hybrid orders** — the formal state coexists with traditional authorities, religious networks, militias, and informal economies. The "state" is not a unified actor; it is a contested terrain. Realism's black-boxing of the state renders these dynamics invisible.

The critique of the security dilemma. Realism's security dilemma assumes that states are **defensive but uncertain**. But in many African conflicts, the primary threat is **not** an external state but **internal** — insurgent groups, state predation, ethnic violence. The security dilemma is a poor model for these conflicts because the relevant actors are not states, and the relevant threats are not external.

The African alternative. African scholars have developed alternative frameworks — **hybrid security governance**, **sovereignty as responsibility**, **relational ontology** — that better capture African dynamics. These frameworks do not reject realism entirely; they **provincialize** it, treating it as one framework among others, useful for some purposes but inadequate for others.

What the African perspective contributes: It shows that realism's **ontology** — the assumption that states are the primary actors, that anarchy is the fundamental condition, that security is the primary goal — is **not universal**. It reflects a particular historical experience. It also shows that realism can be **mobilized for conservative purposes** — by treating the existing distribution of power as natural and inevitable.

What it occludes: It can underplay the ways in which **African states themselves** engage in realist behavior — balancing, alliance formation, power maximization. It can risk **romanticizing** African alternatives and treating them as uniformly more peaceful or more just.

2.6.2 The Chinese perspective **Core commitments.** Chinese IR scholarship has a **complex** relationship with realism. On one hand, many Chinese scholars engage with realism as a **scientific** theory of international politics, and they use realist concepts (balance of power, security dilemma, hegemony) to analyze China's

rise. On the other hand, the **Chinese School** — particularly the work of Yan Xuetong and Qin Yaqing — offers a **distinctive** engagement with realism that modifies its core assumptions.

Yan Xuetong's "moral realism." Yan Xuetong, one of China's most influential IR scholars, has developed a theory of **moral realism** that combines realist assumptions about power with a **Confucian** emphasis on **morality and leadership**. In *Ancient Chinese Thought, Modern Chinese Power* (2011), Yan argues that the rise and fall of states is determined not only by material power but by **political leadership** — the quality of the ruler and the legitimacy of the regime. This is a distinctively Chinese contribution: it takes realism's emphasis on power seriously, but it adds a normative dimension that Western realism typically lacks.

The critique of Western realism. Chinese scholars often critique Western realism for being **too materialist** — too focused on military and economic power, too little on **legitimacy, morality, and relationality**. They argue that China's rise is not just a matter of accumulating material power; it is a matter of **winning hearts and minds** through the appeal of its model of development and its relational approach to international politics.

The political project. The Chinese engagement with realism is part of a broader project of **epistemic sovereignty** — the claim that China should not be confined to Western theoretical frameworks. It also serves a **policy** purpose: it provides a theoretical justification for China's approach to international politics, which emphasizes **non-interference, sovereignty, and relationality**.

What the Chinese perspective contributes: It provides a **non-Western** engagement with realism that modifies its core assumptions. It shows that realism is not a single tradition but a **contested** one, and that different traditions can draw different conclusions from realist premises.

What it occludes: It can underplay the **coercive** dimension of China's rise — the ways in which China uses economic and military power to pressure other states. It can also **essentialize** "Chinese thought" as a unified tradition.

2.6.3 The Russian perspective **Core commitments.** Russian IR scholarship and official discourse engage with realism in a **distinctive** way — one that combines **geopolitical determinism** with a **civilizational** narrative. This engagement is often called **"civilizational realism."**

Civilizational realism. Russian scholars and officials argue that international politics is a **competition between civilizations** — each with its own values, interests, and spheres of influence. Russia is a distinct civilization with a historical mission, and its foreign policy is driven by the need to defend its civilization against Western encroachment. This is a variant of realism that adds a **civilizational** dimension: power is not just material; it is **cultural and civilizational**.

The critique of Western realism. Russian scholars often critique Western realism for being **hypocritical** — for claiming to be universal while actually serving Western interests. They argue that Western realism is a **particular** theory masquerading as a **universal** one.

The political project. The Russian engagement with realism is closely linked to the Russian state's project of **ideological sovereignty**. It provides a theoretical justification for Russia's foreign policy — the claim that Russia is defending its civilization against Western aggression.

What the Russian perspective contributes: It shows that realism can be **mobilized for illiberal purposes** — the rejection of universal norms can become a rejection of universal human rights. It also highlights the **geopolitics of knowledge** — the question of what counts as legitimate knowledge is bound up with the

question of who has the power to define it.

What it occludes: It can **naturalize aggression** — the claim that Russia is defending its civilization can be used to justify the invasion of Ukraine. It can also **essentialize** "Russian civilization" as a monolith, erasing internal diversity and dissent.

2.6.4 The Western perspective **Core commitments.** The Western tradition is the **home** of realism. It is where the canonical texts were written, where the major debates occurred, and where realism remains a dominant framework for both scholarship and policy. But Western realism is also **internally contested** — between classical, structural, offensive, defensive, and neoclassical variants, and between realism and its critics (liberalism, constructivism, critical theory, post-colonialism).

The reflexivity of Western realism. A distinctive feature of Western realism is its **self-critique**. Realists like Morgenthau and Carr were critical of the **utopianism** of their predecessors; contemporary realists like Mearsheimer are critical of the **liberal hegemony** of the post-Cold War era. This reflexivity is a strength — it allows realism to adapt to new circumstances — but it can also be a weakness — it can make realism seem like a moving target.

The policy influence. Western realism has had **enormous** policy influence. The Cold War containment strategy was informed by realist thinking; the post-9/11 debates about the limits of American power were shaped by realist critiques; the current debate about the rise of China is framed by realist concepts (power transition, security dilemma, balancing).

What it contributes: It provides the **most developed** toolkit for analyzing great-power politics. It also provides a **self-critique** — the recognition that realism is not the only framework, and that its assumptions can be challenged.

What it occludes: It can be **parochial** — treating Western experiences as universal. It can be **complicit** in the power structures it describes — realism's emphasis on power can be used to justify the existing distribution of power, not to question it.

2.6.5 The UN perspective **Core commitments.** The UN is **not** a realist actor. Its founding document — the Charter — is an attempt to **transcend** realism, to create a system of **collective security** in which aggression is prohibited and the use of force is regulated by law. But the UN operates **in** a realist world — the P5 have veto power, and the organization is constrained by the interests of the great powers.

The tension. The UN's **normative** project is anti-realist; its **operational** reality is realist. This tension is visible in every Security Council debate: the P5 invoke the Charter's principles while pursuing their national interests; the Secretary-General calls for collective action while acknowledging the limits imposed by the veto.

What it contributes: It provides a **normative benchmark** — the standards against which state behavior is judged. It also provides a **site of contestation** — the arena in which realist and anti-realist claims are debated.

What it occludes: It can **depoliticize** — framing issues as legal-technical problems obscures the power dynamics that shape what is possible. It can also **legitimize** — the UN's authority can be used to justify actions that serve the interests of the great powers.

2.6.6 The comparison matrix

Dimension	African (primary)	Chinese	Russian	Western	UN
Engagement with realism	Critical; provincializes realism	Reconstructs realism (moral realism); emphasizes legitimacy	Civilizational realism; geopolitical determinism	Home of realism; internally contested	Anti-realist normative project; realist operational reality
Core critique	Eurocentrism; erasure of colonial hierarchy	Too materialist; ignores legitimacy and relationality	Hypocrisy; Western realism serves Western interests	Parochialism; complicity with power	None (not a scholarly tradition); tension between norms and power
What it contributes	Hybrid orders; sovereignty as responsibility	Non-Western engagement; moral realism	Illiberal mobilization of realism	Most developed toolkit; self-critique	Normative benchmark; site of contestation
What it occludes	African agency; African realism	Coercive dimension of China's rise	Neighbors' sovereignty; internal diversity	Universality claims; complicity	Power dynamics; depoliticization

---

2.7 WORKED EXAMPLE (I do)

The puzzle: Russia's full-scale invasion of Ukraine in February 2022 was the largest conventional war in Europe since 1945. Western analysts were surprised — many had predicted that Russia would not invade, or that if it did, it would quickly win. Why did Russia invade, and why did the war unfold the way it did?

The puzzle stated precisely: *Why did Russia launch a full-scale invasion of Ukraine in 2022, and why did the invasion fail to achieve its initial objectives?*

Level of analysis: The invasion is best explained by the **interaction** of systemic, state, and individual levels, with the transnational level providing the ideological context.

Systemic level: The structure of the post-Cold War system — unipolarity, NATO enlargement, and the security dilemma — created the conditions for the invasion. Russia perceived NATO's expansion into Ukraine as an existential threat, and it interpreted Ukraine's drift toward the West as a loss of its sphere of influence.

State level: Russia's authoritarian regime, its reliance on nationalist ideology, and its military doctrine shaped the decision to invade. The Russian state had invested in a **revanchist** narrative — the "Russian world," the protection of compatriots, the "denazification" of Ukraine — that provided the ideological justification for aggression.

Individual level: Putin's personal historical obsessions — his belief that Ukraine is an artificial state, his

fear of democratic contagion, his sense of humiliation at the hands of the West — shaped the decision. But individual-level explanations are insufficient: they cannot explain why the invasion happened **in 2022** rather than earlier or later.

Transnational level: The global competition between democratic and authoritarian models of order provided the ideological context. Russia presented itself as the leader of a **multipolar** order against Western hegemony.

Applying the realist variants:

- **Classical realism:** Russia, like any great power, seeks to dominate its neighborhood. The invasion is a manifestation of the *animus dominandi* — the drive for power. *Prediction:* Russia would seek to expand regardless of NATO. *Evaluation:* This is too general; it cannot explain why the invasion happened in 2022 rather than 2014, or why Russia did not invade the Baltic states (NATO members).
- **Defensive realism (Waltz):** Russia would balance against NATO, but over-expansion is self-defeating. *Prediction:* Russia would build up its military and form alliances, but would not necessarily invade. *Evaluation:* The invasion suggests that defensive realism underestimated Russia's willingness to take risks. But it also correctly predicted that the invasion would be costly — which it has been.
- **Offensive realism (Mearsheimer):** Russia seeks regional hegemony in its near abroad, because survival requires it. Ukraine is the most likely flashpoint. *Prediction:* Russia would invade Ukraine. *Evaluation:* Mearsheimer's prediction was correct — but his explanation is contested. He argues that the West, particularly NATO enlargement, is primarily responsible for the invasion. Critics argue that this underplays Russian agency and the role of Putin's ideology.
- **Neoclassical realism:** Systemic pressures (NATO enlargement) are filtered through domestic politics (Russian authoritarianism, Putin's ideology, the military's influence). *Prediction:* The invasion is the product of both systemic incentives and domestic politics. *Evaluation:* This is the most complete explanation, but it is also the least parsimonious.
- **Security dilemma (Jervis):** NATO enlargement, even if defensively motivated, appeared offensive to Russia, triggering a spiral. *Prediction:* The invasion is a product of the security dilemma — neither side wanted war, but each side's actions appeared threatening to the other. *Evaluation:* This explains the escalation, but it can underplay Russian agency and the genuine revisionist intentions of the Russian state.

Perspective reconstruction:

- **African perspective:** The invasion is read through the lens of **sovereignty and non-interference**. African states have consistently defended the principle that borders should not be changed by force — a principle that is central to the AU Constitutive Act. The African reaction to the invasion was **divided**: some states condemned Russia, but many abstained from UN resolutions, citing the **selectivity** of Western condemnations (e.g., the lack of condemnation of the Iraq war or the Libya intervention). The African perspective emphasizes the **double standards** of the international community.
- **Chinese perspective:** The invasion is read through the lens of **NATO expansion and Western hegemony**. China has refrained from condemning Russia and has called for a **political settlement** that respects the **legitimate security concerns** of all parties. The Chinese perspective emphasizes the **role of the West** in creating the conditions for the conflict.
- **Russian perspective:** The invasion is read through the lens of **civilizational defense**. Russia is defending its civilization against Western encroachment; Ukraine is part of the Russian world; NATO

enlargement is an existential threat. The Russian perspective emphasizes the **historical and cultural** ties between Russia and Ukraine.

- **Western perspective:** The invasion is read through the lens of **imperialism and aggression**. Russia is an authoritarian state that has violated the sovereignty of a peaceful neighbor; the West must support Ukraine and deter further aggression. The Western perspective emphasizes **Russian responsibility** and the **importance of sovereignty**.
- **UN perspective:** The invasion is read through the lens of **Charter violation**. The UN General Assembly condemned the invasion as a violation of Article 2(4); the Security Council was paralyzed by the Russian veto. The UN perspective emphasizes **international law** and the **failure of collective security**.

Adjudication. Which perspective best explains the invasion? The **Western perspective** captures the **proximate cause** — Russian aggression against a sovereign state. The **Russian perspective** captures the **historical and ideological context** — the sense of grievance and the civilizational narrative. The **African perspective** captures the **global reaction** — the division between those who condemned Russia and those who abstained, and the reasons for that division. The **Chinese perspective** captures the **systemic context** — the role of NATO expansion in creating the conditions for the conflict. The **UN perspective** captures the **normative stakes** — the violation of the Charter and the failure of collective security.

A complete explanation combines all five: the systemic conditions (NATO enlargement, security dilemma), the domestic politics (Russian authoritarianism, Putin's ideology), the individual decisions (Putin's decision to invade), the historical context (Russian grievance, Ukrainian sovereignty), and the normative stakes (Charter violation).

2.8 PROBLEM PAIR (We do)

Your task: Analyze the following case using the apparatus above. Write your analysis before reading the model answer.

The case: In 2011, NATO intervened in Libya under UN Security Council Resolution 1973, authorizing "all necessary measures" to protect civilians. The intervention quickly became a regime-change operation, culminating in the killing of Muammar Gaddafi. In the aftermath, Libya descended into civil war, and the country remains divided. The intervention was criticized by Russia, China, South Africa, and many other states as an abuse of the UN mandate.

Your tasks:

1. State the puzzle precisely: why did the Libya intervention produce a lasting fracture in the international consensus on humanitarian intervention, even though it was authorized by the Security Council?
2. Apply the realist variants to the case: how would classical, structural, offensive, neoclassical, and security-dilemma realism explain the intervention and its aftermath?
3. Apply the five perspectives: how would African, Chinese, Russian, Western, and UN perspectives interpret the intervention?
4. Write a 300-word adjudication: which realist variant best explains the intervention, and what does it miss?

Model answer (compare after writing your own):

Puzzle: Why did the Libya intervention produce a lasting fracture in the international consensus on humanitarian intervention, despite being authorized by the Security Council?

Realist variants: - **Classical realism:** The intervention was driven by the **drive for power** — Western states sought to remove a troublesome leader and expand their influence. *Critique:* This underplays the genuine humanitarian motivations of some actors. - **Structural realism:** The intervention was made possible by the **unipolar** structure of the post-Cold War system — the US and its allies had the power to intervene, and Russia and China lacked the power to stop them. *Critique:* This explains the possibility but not the motivation. - **Offensive realism:** The intervention was an example of **great-power expansion** — Western states sought to extend their sphere of influence. *Critique:* This is too cynical; it ignores the genuine humanitarian concerns that motivated some actors. - **Neoclassical realism:** The intervention was shaped by **domestic politics** — the Obama administration's desire to avoid a Rwanda-style failure, the influence of humanitarian lobbies, and the pressure from European allies. *Critique:* This is the most complete explanation of the **decision** to intervene. - **Security dilemma:** The intervention was an example of **escalation** — the initial mandate to protect civilians was expanded into regime change because the intervening powers could not be certain of Gaddafi's intentions and feared that a limited intervention would fail. *Critique:* This explains the **expansion** of the mission but not the initial decision.

Perspectives: - **African:** The intervention confirmed African suspicions of **Western humanitarianism** — the AU had its own roadmap for Libya, which was bypassed by NATO. The African perspective emphasizes the **selective use** of humanitarian language and the **sidelining** of African institutions. - **Chinese:** The intervention confirmed China's skepticism of **expansive interpretations** of Chapter VII. China had abstained on Resolution 1973, and subsequently cited Libya as a cautionary tale in debates about Syria. - **Russian:** The intervention confirmed Russia's view that **humanitarian language** is a pretext for **regime change**. Russia subsequently vetoed resolutions on Syria. - **Western:** The intervention was a **necessary response** to an imminent massacre, though the mandate was stretched. The Western perspective emphasizes the **responsibility to protect** and the difficulty of limiting intervention once authorized. - **UN:** The intervention exposed the gap between **authorization** and **implementation** — the UN could authorize force but could not control it. The UN perspective emphasizes the need for **political solutions** and **accountability**.

Adjudication: **Neoclassical realism** best explains the **decision** to intervene — the interaction of systemic opportunity (unipolarity), domestic politics (humanitarian lobbies, the Rwanda shadow), and individual decisions (Obama's reluctant decision to intervene). **The security dilemma** best explains the **expansion** of the mission — the inability to limit intervention once it began. The **five perspectives** explain the **aftermath** — the lasting fracture in the international consensus on humanitarian intervention. A complete explanation combines all of these: the intervention was a product of systemic opportunity, domestic politics, and individual decisions; its expansion was a product of the security dilemma; and its aftermath was shaped by the competing perspectives that it revealed.

2.9 INDEPENDENT MEMO (You do)

Produce a one-page analytical memo (500–600 words) on the following case, using the four headings below.

Case: The emergence of the BRICS+ as a challenge to Western hegemony, and the debate over whether it represents a genuine **balancing coalition** or a **bandwagoning** phenomenon.

Memo headings:

1. **Mechanism:** What realist mechanism explains the formation of the BRICS+? Is it balancing (against the US), bandwagoning (with China), or something else?
2. **Perspective reconstruction:** How would each of the five perspectives explain the BRICS+? (One paragraph or table entry each.)
3. **Realist variant:** Which realist variant best explains the BRICS+? (Classical, structural, offensive, neoclassical, or security dilemma?)
4. **Falsifiers:** What evidence would show that the BRICS+ is **not** a balancing coalition? What would show it **is**?

Self-check: Does your memo distinguish **balancing** from **bandwagoning**? Does it specify the **level of analysis**? Does it identify the **evidence** that would change your judgment?

2.10 HINGE QUESTION

A state responds to a rival's military buildup by increasing its own military spending, even though it has no aggressive intentions toward the rival. The rival interprets this as a sign of hostility and increases its own spending further. This is an example of:

- A) The deterrence model
- B) The spiral model
- C) The bandwagoning model
- D) The hegemonic stability model

Answer: B. This is the **spiral model** — the security dilemma in action. State A's defensive measures appear offensive to State B, triggering a spiral of escalation even though neither state wants conflict.

If you answered A: The deterrence model assumes the rival is aggressive and must be deterred with superior power. In this scenario, neither state is aggressive — the spiral is produced by uncertainty and the security dilemma. **If you answered C:** Bandwagoning is joining the stronger side, not responding to a buildup with one's own buildup. **If you answered D:** Hegemonic stability theory concerns the provision of global public goods by a hegemon, not the dynamics of arms races.

SECTION 2A — DATA LAB (30–45 minutes)

Purpose: Ground realism's claims in empirical data.

Task: Using the summary data below (simplified from SIPRI military expenditure data), analyze the relationship between military spending and the distribution of power.

Table 1: Military expenditure, 2023 (billions USD, constant 2022 prices)

Country	Military expenditure	Share of global total	GDP share
United States	916	37%	3.5%
China	296	12%	1.7%

Country	Military expenditure	Share of global total	GDP share
Russia	109	4.5%	5.9%
India	83	3.4%	2.4%
Saudi Arabia	76	3.1%	7.1%
United Kingdom	75	3.1%	2.3%
Germany	67	2.7%	1.5%
France	61	2.5%	1.9%
Japan	50	2.0%	1.0%
South Korea	48	1.9%	2.8%

Analysis questions:

1. **Distribution of power:** What does this data tell you about the distribution of military power in the international system? Is it unipolar, bipolar, or multipolar?
2. **Balancing:** Are there signs of balancing against the US or China? Which states are increasing their spending the most?
3. **Realist predictions:** Does this data support offensive realism (states maximize power), defensive realism (states balance), or neoclassical realism (domestic politics shape spending)?
4. **Limitation:** What does military spending data **not** tell you about power? (Hint: spending does not equal capability; alliances matter; geography matters; nuclear weapons change the calculus.)
5. **Perspective:** How would each of the five perspectives interpret this data? (African: the militarization of the international system; Chinese: the US is over-spending and over-extending; Russian: the West is threatening Russia; Western: the US must maintain its edge; UN: the opportunity cost of military spending.)

Rule: Complete the data lab before the independent memo.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Task: Draw the following by hand.

Visual 1: The realist family. Draw five boxes — Classical, Structural (Defensive), Offensive, Neoclassical, Security Dilemma. For each, write: the key figure, the locus of cause, the core mechanism, and the prediction.

Visual 2: The security dilemma. Draw two states (A and B). Draw arrows: A's defensive buildup → B's perception of threat → B's buildup → A's perception of threat → escalation. Label the spiral. Draw a second set of arrows for reassurance: A's signal of benign intentions → B's reduced threat perception → de-escalation.

Visual 3: The five perspectives on realism. Draw a five-column table (African, Chinese, Russian, Western, UN) with rows: "Engagement with realism," "Core critique," "What it contributes," "What it occludes."

SECTION 4 — CORNELL NOTES

Set up your notes with the following cue column:

Cue column	Notes
What are the five variants of realism?	Classical (human nature); structural/defensive (anarchy + balancing); offensive (anarchy + power maximization); neoclassical (system + domestic); security dilemma (anarchy + uncertainty)
What is the core mechanism of classical realism?	*Animus dominandi* — the human drive for power
What is Waltz's structural realism?	Anarchy → self-help → balancing; polarity determines outcomes
What is Mearsheimer's offensive realism?	Anarchy + uncertainty → states maximize power → regional hegemony
What is neoclassical realism?	Systemic pressures filtered through domestic intervening variables
What is the security dilemma?	Defensive measures appear offensive → spiral of escalation
How do the five perspectives engage realism?	African: critique Eurocentrism; Chinese: moral realism; Russian: civilizational realism; Western: home of realism; UN: anti-realist normative project
Source log	Lesson text, Sections 2.2–2.6; Thucydides (Melian Dialogue); Morgenthau (1948); Waltz (1979); Mearsheimer (2001); Jervis (1978); Rose (1998); Yan Xuetong (2011)
Summary	3–5 sentences synthesizing the lesson

SECTION 5 — FEYNMAN COMPRESSION

Step 1: Explain the difference between classical, structural, and offensive realism to a smart non-specialist in 150–200 words, without using jargon. If you must use "anarchy" or "security dilemma," define them in plain language.

Step 2: Mark every point where you hesitated or used a term you could not define.

Step 3: Reread only the gaps. Rewrite.

Step 4: Produce one analogy for the security dilemma. Then state where the analogy breaks down. (Example: "The security dilemma is like two neighbors who each buy a guard dog for protection — but each dog makes the other neighbor feel threatened, so they buy bigger dogs, and soon they are in an arms race." Where it breaks down: states can communicate and reassure each other in ways that neighbors with dogs cannot always do.)

SECTION 6 — SPACED-REPETITION FLASHCARDS

Produce 12–15 cards. Use the following types:

Type	Example
Definition	What distinguishes offensive from defensive realism?
Mechanism	How does the security dilemma produce conflict without aggressive intentions?
Application	A state builds up its military to defend against a perceived threat. The rival interprets this as aggression and builds up its own military. Which model does this illustrate?
Comparison	How do classical and structural realism differ in their locus of cause?
Source	What are Morgenthau's six principles of political realism?
Debate	What is the strongest objection to Mearsheimer's claim that great-power war is likely?
Reconstruction	How would an African scholar critique realism's state-as-unitary-actor assumption?
Occlusion	What does offensive realism fail to see about cooperation?
Adjudication	Which realist variant best explains the Ukraine war, and what does it miss?
Visual	Label the five variants of realism on a diagram.

Tag each card: `L5`, `realism`, `theory`, `perspective`, `difficulty`.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence audit

Rate confidence (0–100%) before checking:

Objective	Confidence
Reconstruct the five variants of realism	
Apply each variant to a case	
Evaluate the realist claim that anarchy produces competition	
Reconstruct the five perspectives on realism	
Critique realism's silences	

After exercises, rate accuracy. Calculate the gap.

7.2 Three-question debrief

1. What did I misunderstand about the relationship between anarchy and state behavior?
2. Which realist variant was easiest to apply? Which was hardest? What does that suggest about my default analytical style?
3. What will I do differently in Lesson 6?

7.3 Error log

Date	Lesson	Error type	Correct understanding	Card created?
	L5			

SECTION 8 — CHEATSHEET (Module 1)

Add this row to your Module 1 cheatsheet:

Column	Content
Core concepts	Anarchy; self-help; relative gains; security dilemma; spiral model; deterrence model; balance of power; bandwagoning; polarity; offensive/defensive/neoclassical realism; moral realism; civilizational realism
Key mechanisms	Human nature → power drive → conflict (classical); anarchy → self-help → balancing (structural); anarchy + uncertainty → power maximization (offensive); systemic pressures → domestic filters → foreign policy (neoclassical); defensive measures → perceived threat → spiral (security dilemma)
Theories and authors	Thucydides; Machiavelli; Hobbes; Morgenthau; Carr; Waltz; Mearsheimer; Jervis; Herz; Rose; Yan Xuetong
Cases and evidence	Peloponnesian War; Cold War; Ukraine 2022; Libya 2011; BRICS+; SIPRI data
Debates	Is anarchy the fundamental condition? Do states seek security or power? Is the security dilemma objective or constructed?
Falsifiers	What evidence would show that anarchy does not produce competition?
Cross-links	L6 (liberalism — realism's foil); L7 (constructivism — social construction of anarchy); L12 (Cold War); L21 (nuclear deterrence); L35 (post-Soviet ontology); L47 (US–China rivalry)

SECTION 9 — REVIEW SCHEDULE

Review	Timing	Format
R1	Today	Retrieval warm-up + card creation
R2	2–3 days	Cue-column recall + hinge variant
R3	1 week	Mixed quiz with L1–L5 cards
R4	3–4 weeks	Interleaved problem combining L5 with L6–L8 (theory) and L12 (Cold War)
R5	End of Module 1	Cheatsheet reconstruction from memory

SECTION 10 — COMPLETION CHECKLIST

- ☐ Retrieval warm-up completed from memory
- ☐ Five learning objectives read and understood
- ☐ Five key ideas studied with mechanisms and scope conditions
- ☐ Perspective comparison matrix filled from memory, then checked
- ☐ Worked example (Ukraine 2022) studied and self-explained
- ☐ Problem pair (Libya 2011) attempted and compared
- ☐ Independent memo produced (500–600 words)
- ☐ Hinge question answered correctly (or reteaching completed)
- ☐ Data lab completed before independent memo
- ☐ Three dual-coded visuals drawn
- ☐ Cornell notes with cue column, source log, and summary
- ☐ Feynman explanation written, gaps identified, rewritten
- ☐ 12–15 flashcards created with tags
- ☐ Confidence audit and error-log entry
- ☐ Cheatsheet entry added
- ☐ R2 review scheduled

FURTHER READING (Optional — for deepening, not required)

- **On classical realism:** Thucydides, *History of the Peloponnesian War* (esp. the Melian Dialogue); Niccolò Machiavelli, *The Prince*; Thomas Hobbes, *Leviathan*, ch. 13; Hans Morgenthau, *Politics Among Nations* (1948), ch. 1–2; E. H. Carr, *The Twenty Years' Crisis* (1939).
- **On structural realism:** Kenneth Waltz, *Theory of International Politics* (1979), ch. 1–6; Robert Jervis, *Perception and Misperception in International Politics* (1976), ch. 3.

- **On offensive realism:** John Mearsheimer, *The Tragedy of Great Power Politics* (2001), ch. 2–3.
- **On neoclassical realism:** Gideon Rose, "Neoclassical Realism and Theories of Foreign Policy," *World Politics* 51:1 (1998); Randall Schweller, *Deadly Imbalances* (1998); Fareed Zakaria, *From Wealth to Power* (1998).
- **On the security dilemma:** John Herz, "Idealist Internationalism and the Security Dilemma," *World Politics* 2:2 (1950); Robert Jervis, "Cooperation Under the Security Dilemma," *World Politics* 30:2 (1978).
- **On African critiques:** Siba Grovogui, *Sovereigns, Quasi-Sovereigns, and Africans* (1996); Kwaku Danso and Kwesi Aning, "African Experiences and Alternativity in International Relations Theory" (2019).
- **On Chinese realism:** Yan Xuetong, *Ancient Chinese Thought, Modern Chinese Power* (2011); Qin Yaqing, *A Relational Theory of World Politics* (2018).
- **On Russian realism:** Lauri Mälksoo, *Russian Approaches to International Law* (2015); Andrei Tsygankov, *Russia and the West from Alexander to Putin* (2012).

End of Lesson 5. Say **"Next"** when you are ready for Lesson 6 (Liberalism and Institutionalism).

7. Liberalism and Institutionalism: Cooperation, Interdependence, and the Limits of Rules

---

LESSON METADATA

Field	Entry
Lesson number and title	L6 — Liberalism and Institutionalism
Module	Module 1: Epistemological and Ontological Foundations
Prerequisites	L1 (puzzles, levels, power, perspectives); L2 (Charter system, AU Act, Pact for the Future); L3 (causal inference, selection bias); L4 (positivism/post-positivism); L5 (realism — the theory institutionalism answers)
Interleaved links	Forward to L12 (Cold War institutions), L15–19 (IPE), L18 (weaponized interdependence — the dark side of interdependence), L21 (JCPOA, NPT), L28 (AU/APSA), L49 (BRICS+, institutional revisionism), L56 (scientific statecraft)
Reading load	This lesson only. Optional further reading at the end.

Field	Entry
Content channels	Canon (paraphrased and quoted); primary documents (UN Charter Ch. VII/VIII, WTO Dispute Settlement Understanding, AU Act, AfCFTA Agreement, Pact for the Future — all analyzed here); data lab (WTO disputes and African trade shares); five perspectives
Bloom ceiling	Evaluate (adjudicate between institutionalist claims and their realist/critical critics)
Estimated study time	7–9 hours including exercises

Note on self-containment: Everything you need is in this document. Where I reference Keohane, Keohane and Nye, Axelrod, Jervis, Grieco, Mearsheimer, Ikenberry, Doyle, Moravcsik, Fearon, or the Chinese/African/Russian/UN positions, I summarize the argument sufficiently to use it. "Further Reading" is optional.

SECTION 0 — Why This Lesson Exists

Lesson 5 gave you realism: the claim that anarchy produces self-help, that states seek power and security, and that cooperation is fragile because states fear relative losses. This lesson gives you the **most important challenge** to that claim — and the theory that made the study of international institutions a science.

Liberalism and institutionalism begin from a different observation: the international system is not a war of all against all. States trade, form alliances, sign treaties, join organizations, comply with rules that constrain them, and sometimes even surrender sovereignty (the EU). The puzzle is not why states fight — realism explains that easily — but **why they cooperate so much**, and under what conditions cooperation holds.

This lesson gives you:

1. **The liberal tradition** in its four main branches: commercial liberalism (trade promotes peace), republican liberalism (democracies do not fight each other), regulatory liberalism (law and institutions can constrain power), and institutional liberalism (institutions solve cooperation problems).
2. **Neoliberal institutionalism** — the systematic theory of cooperation under anarchy developed by Keohane, Nye, Axelrod, and others — including its core mechanism: institutions reduce uncertainty, lower transaction costs, monitor compliance, and lengthen the "shadow of the future."
3. **The two great debates** that define the field: the **relative gains debate** (Grieco vs. Snidal and Keohane) and the **"false promise" debate** (Mearsheimer vs. institutionalists). These debates determine what institutionalism can and cannot claim.
4. **The institutionalist toolkit for design:** issue density, linkage, regime complexity, delegation, escape clauses, and why states design institutions the way they do.
5. **The five perspectives on institutions** — African (institutions as leverage and contestation), Chinese (alternative institutions and epistemic sovereignty), Russian (the UNSC as the last acceptable institution), Western (the home tradition and its self-critique), and UN (the institutionalist actor par excellence).

By the end, you can take any international institution — the UN, the WTO, the AU, the ICC, the NPT, BRICS — and answer: *What cooperation problem was it designed to solve? What is its causal mechanism? What are its scope conditions? When does it fail? And how do the five perspectives assess it?*

SECTION 1 — PRE-CLASS PRIMING

1.1 Retrieval warm-up (from memory)

1. From L5: Name the five variants of realism and state each one's core mechanism in one sentence.
2. From L5: What is the security dilemma, and why does it produce conflict without aggressive intentions?
3. From L2: What did the AU's Article 4(h) change about the inherited sovereignty regime, and why?
4. From L3: What is selection on the dependent variable? Give one example from institutionalist research (hint: studying only institutions that succeeded).

Check against the previous lessons before proceeding.

1.2 Orientation questions

Hold these in mind:

- If states fear relative gains, how does any cooperation ever occur?
- Do institutions cause peace, or do they merely reflect the interests of powerful states?
- Why do states sometimes comply with rules that hurt them?
- Is the "rules-based international order" the same thing as international law? Is it the same thing as multilateralism?

1.3 Vocabulary pre-teach

Provisional definitions; revise by the end:

Complex interdependence; sensitivity and vulnerability interdependence; regime; neoliberal institutionalism; collective security; democratic peace; commercial peace; absolute vs. relative gains; shadow of the future; prisoner's dilemma; free-riding; transaction costs; issue linkage; regime complexity; delegation; escape clause; credible commitment; institutional design; parallelism; legalization; judicialization.

SECTION 2 — LESSON CORE

2.1 Learning objectives

By the end of this lesson, you can:

1. **Distinguish** the four liberal branches (commercial, republican, regulatory, institutional) and identify the mechanism each specifies.
2. **Reconstruct** neoliberal institutionalism's core argument — that institutions matter because they solve specific cooperation problems — and apply it to a case.

3. **Evaluate** the two defining debates: the relative-gains critique (Grieco) and the "false promise" critique (Mearsheimer), and state the evidence that would settle them.
4. **Diagnose institutional failure:** specify the conditions under which institutions do not constrain (hegemonic defection, distributional conflict, enforcement problems, regime complexity).
5. **Reconstruct** how African, Chinese, Russian, Western, and UN traditions assess institutions and the "rules-based order," and **adjudicate** among them on a specific institution.

2.2 KEY IDEA 1 — "Liberalism" is four arguments, not one, and each has its own causal mechanism

The claim: The claim "liberalism predicts peace" hides four distinct theories. Each identifies a different mechanism linking a different liberal feature to a different outcome. Confusing them produces the classic error of the liberal-optimism literature: assuming all good things go together.

Branch	Core claim	Mechanism	Key figures
Commercial liberalism	Trade and economic exchange promote peace	Interdependence raises the opportunity cost of war; trade creates domestic constituencies with an interest in peace	Adam Smith; Montesquieu; Richard Cobden; Norman Angell; modern empirical work on trade and conflict
Republican liberalism	Democracies do not fight each other	Domestic accountability, institutional constraints, and shared norms make democratic publics reluctant to fight other democracies	Immanuel Kant; Michael Doyle; Bruce Russett
Regulatory liberalism	Law and rules can constrain power	International law and institutions create obligations, expectations, and costs for violations	Hugo Grotius; the Charter system; liberal international law
Institutional liberalism	Institutions can solve cooperation problems under anarchy	Institutions reduce uncertainty, monitor compliance, lower transaction costs, and lengthen the shadow of the future	Robert Keohane; Robert Keohane and Joseph Nye; Robert Axelrod; Kenneth Oye

Why the distinction matters. These are not interchangeable claims:

- **Commercial liberalism** can be tested on trade flows and conflict data. It has substantial empirical support — but with major scope conditions (democracies with high trade, symmetric interdependence, no strategic goods; asymmetric interdependence can be *weaponized*, as Lesson 18 will show).

- **Republican liberalism** is one of the strongest empirical regularities in political science: established democracies almost never fight each other. But the explanation is contested — is it democracy, or shared interests, or capitalist development, or the fact that democracies are rich and satisfied?
- **Regulatory liberalism** is a normative-legal claim as much as an empirical one: it asserts that law *can* constrain, but cannot specify when it will.
- **Institutional liberalism** is the most theoretically ambitious: it claims to explain *how* cooperation is possible under anarchy without shared values or a common enemy.

The Kantian foundation. Kant's *Perpetual Peace* (1795) is the canonical statement of the liberal peace program. Kant argued that perpetual peace would be produced by three conditions: **republican constitutions** (because citizens who bear the costs of war will be reluctant to wage it), a **federation of free states** (a pacific union, not a world state), and **universal hospitality** (cosmopolitan right of commerce and movement). Modern liberal IR is largely an extended argument about whether Kant was right and under what conditions.

Scope conditions and critique. Each liberal branch has well-documented limits: - **Commercial:** Asymmetric interdependence creates leverage, not peace (Lesson 18); trade in strategic goods can increase conflict risk; and the empirical relationship between trade and conflict is weaker than liberal optimism suggests. - **Republican:** Democracies fight non-democracies readily; young and transitional democracies are *more* conflict-prone; and the "democratic peace" may be a "capitalist peace" or a "satisfied-powers peace" in disguise. - **Regulatory:** Powerful states violate international law with impunity (Iraq 2003; the US withdrawal from treaties); legal constraints are weakest precisely when they matter most (security). - **Institutional:** As we will see, institutions can be defected from by their most powerful members (Lesson 6.6).

Observable implication. If commercial liberalism is operative, you should see trade flows *reduce* the probability of militarized disputes, controlling for other factors. If republican liberalism is operative, you should see pairs of democracies resolve disputes without escalation. If institutional liberalism is operative, you should see states comply with institutional rules *even when compliance is costly* — which is the hard test.

2.3 KEY IDEA 2 — Neoliberal institutionalism: institutions solve specific cooperation problems, not all of them

The claim: The core institutionalist argument is not that institutions make states nice, or that cooperation is easy. It is that **cooperation under anarchy is difficult for identifiable reasons, and institutions help with some of those reasons but not others**. The precision of this claim is what makes institutionalism a theory.

The starting point: cooperation is not the same as harmony. Keohane's key move in *After Hegemony* (1984) was to distinguish cooperation from harmony. Harmony is a situation in which actors' interests coincide automatically. Cooperation is a situation in which actors' interests **conflict**, but they adjust their behavior to reduce the conflict and capture joint gains. Cooperation requires **policy coordination** — it is *work*. This is why the theory is not naive: it takes conflict of interest as the baseline and asks how states overcome it.

The cooperation problems. Institutionalists identify specific reasons why cooperation fails even when joint gains exist:

1. **The prisoner's dilemma / fear of defection.** Each state prefers mutual cooperation to mutual defection, but each also prefers to defect if the other cooperates. In a one-shot game, defection is the

dominant strategy, so both defect and both lose. *Institutions help by* iterating the game (lengthening the shadow of the future), monitoring compliance, and creating reputational costs for defection — the Axelrod logic of tit-for-tat.

2. **The coordination problem.** Sometimes actors agree on what they want but cannot coordinate on a single equilibrium (e.g., which side of the road to drive on). *Institutions help by* providing focal points, standards, and conventions.
3. **The monitoring/enforcement problem.** States may want to cooperate but cannot verify compliance, or cannot punish defection credibly. *Institutions help by* providing information (verification, reporting), and by linking issues so that defection in one area is punished in another.
4. **The credible-commitment problem.** States may want to make promises they cannot credibly keep (e.g., not to develop nuclear weapons, not to use force). *Institutions help by* creating sunk costs, sovereignty costs, and audience costs that make reneging expensive — the logic of "hand-tying."
5. **Transaction costs.** Negotiating and enforcing agreements is expensive. *Institutions help by* providing standing rules, secretariats, and fora that reduce the cost of future agreements — "issue density" produces economies of scale in cooperation.

Keohane and Nye's complex interdependence. In *Power and Interdependence* (1977), Keohane and Nye argued that the realist picture — states as unitary actors, military force as the dominant instrument, security as the dominant issue — describes only some situations. Under **complex interdependence**, three conditions hold:

1. **Multiple channels** connect societies: not just states, but transnational actors, corporations, and international organizations.
2. **The agenda is not hierarchically ordered:** security is not necessarily the dominant issue; trade, environment, and finance matter in their own right.
3. **Military force is not used** (or is not usable) on many issues within a region or between certain states.

Under complex interdependence, Keohane and Nye distinguish **sensitivity** (how quickly a state is affected by changes elsewhere, and at what cost, within existing rules) from **vulnerability** (the cost of *changing* the rules — the availability of alternatives). This distinction is one of the most useful analytical tools in IPE: it explains why some states are more powerful than their material capabilities suggest. A state that is highly sensitive to an interruption of oil but has alternative suppliers is vulnerable only in the short run; a state with no alternatives is vulnerable in the long run.

The critique of "hegemonic stability." Charles Kindleberger argued that the Great Depression was caused by the absence of a hegemon willing to provide global public goods (a lender of last resort, an open trading system, a stable currency). The **hegemonic stability theory** (HST) that followed claims that international economic order requires a hegemon to provide it — which predicts that order will collapse as US hegemony declines. Keohane's *After Hegemony* is a direct response: **cooperation can persist after hegemony**, because institutions — once created — take on a life of their own, reducing the costs of cooperation and creating constituencies with a stake in their survival. This is the "institutionalist" claim par excellence: institutions are **sticky**, and they can outlast the power distribution that created them.

Scope condition. Institutions matter *most* when: (a) the shadow of the future is long (repeated interaction), (b) the number of actors is moderate, (c) issues are linked, (d) information about compliance is scarce, and (e) the institution has some enforcement or monitoring capacity. Institutions matter *least* when: (a) the issue is existential/security, (b) a powerful state's vital interests are at stake, (c) the institution lacks monitoring,

(d) enforcement is delegated to the same states that defect.

Observable implication. If institutionalism is correct, you should see states **comply with costly rules**, and you should see cooperation **persist after the hegemon declines** (or after the hegemon defects, at least partially).

2.4 KEY IDEA 3 — The two defining debates: relative gains and the "false promise"

The claim: Institutionalism's plausibility depends on how two critiques are resolved. The **relative-gains critique** (Grieco) asks whether states care about *who gains more*, not just whether they gain. The **"false promise" critique** (Mearsheimer) asks whether institutions have any independent causal effect at all, or whether they are merely epiphenomenal reflections of power.

2.4.1 The relative-gains debate (Grieco vs. Snidal/Keohane) **Grieco's position.** Joseph Grieco (1988, 1990), drawing on realist premises, argued that states in an anarchic system are **positional**: they care not only about absolute gains but about *relative* gains, because relative gains translate into relative power, and relative power determines survival. A state that gains $10 while a rival gains $20 may refuse the deal even though it is better off in absolute terms. Grieco argued that Keohane's institutionalism understated this problem, and that the empirical evidence from US–Soviet trade negotiations in the 1970s showed states refusing mutual-gain deals for relative-gains reasons.

The institutionalist response. Duncan Snidal and others responded that relative-gains concerns are real but **not universal**: they are strongest (a) when the issue is security, (b) when the number of actors is small, (c) when gains are easily converted into military capability, and (d) when the other state is a rival. In economic and environmental issues, with many actors and low conversion to military capability, absolute-gains logic dominates. Keohane's response was to **incorporate** the relative-gains critique rather than deny it: institutionalism's scope conditions are precisely the issues where relative-gains concerns are weak.

The lesson. This is a model of how theory develops: a critique is absorbed, and the theory becomes more precise. The relative-gains debate is now settled in the following sense: relative-gains concerns are a **scope condition** for institutionalism, not a refutation.

2.4.2 The "false promise" critique (Mearsheimer) **Mearsheimer's position.** In "The False Promise of International Institutions" (1994/95), Mearsheimer attacked three institutionalist claims: that institutions cause peace, that they are a substitute for the balance of power, and that they can transform state interests. He argued:

1. Institutions are **epiphenomenal**: they reflect the underlying distribution of power. They do not cause peace; the balance of power causes peace, and institutions are merely its expression.
2. The empirical record does not support institutionalist claims: NATO did not cause the end of the Cold War; the Concert of Europe was a balance-of-power arrangement, not an institutional achievement; the League of Nations failed.
3. The only institution that genuinely matters — NATO — is a **realist** institution: an alliance, not a collective-security organization.

The institutionalist response. Keohane and others responded that Mearsheimer's critique was **too strong**

and ignored a substantial body of evidence: institutions can affect states' **information environment** (verification), their **reputations** (costs of defection), their **interests** (through learning and socialization in some cases), and their **expectations** (focal points). The empirical claim is not that institutions *always* cause peace, but that they have a **conditional causal effect** that is measurable.

The unresolved question. The "false promise" debate is not fully settled. The strongest evidence for institutionalism is in **economic, environmental, and technical cooperation**, where institutions demonstrably change behavior (trade disputes are litigated rather than fought; environmental treaties change reporting and sometimes emissions; aviation and maritime safety regimes are highly effective). The weakest evidence is in **security**, where Mearsheimer's critique bites hardest. The most defensible position is that institutions have **real but conditional causal effects**, and that the scope conditions are the key research question.

2.5 KEY IDEA 4 — Institutional failure is a theory of design, not an anomaly

The claim: Institutions fail for identifiable reasons, and those reasons are part of institutionalism's explanatory power, not a refutation of it. A theory that only explains success is a bad theory. Institutionalism must explain *when and why* institutions do not constrain.

The failure modes:

1. **Hegemonic defection.** The most powerful member withdraws support because the institution no longer serves its interests. *Example:* the US blocking appointments to the WTO Appellate Body from 2017, paralysing the system it built. *Mechanism:* institutions are sticky, but they are not immune to the defection of their most powerful members; a hegemon that perceives the institution as a constraint rather than an instrument will defect.
2. **Distributional conflict.** Institutions are not neutral; they distribute gains. When the distribution is contested, cooperation can collapse even when aggregate gains are positive. *Example:* disputes over special and differential treatment in the WTO; disputes over the IMF's voting quotas.
3. **Enforcement failure.** Institutions can monitor but often cannot enforce. The Security Council can authorize force but the veto can block it; the ICC can issue warrants but cannot arrest. *Mechanism:* delegation without enforcement is weak; enforcement requires the cooperation of the powerful.
4. **Regime complexity and forum shopping.** When multiple institutions overlap, states can shift issues to the forum most favourable to them. *Example:* the proliferation of trade and investment fora; the competition between the ICC and regional courts; the "spaghetti bowl" of trade agreements. *Mechanism:* complexity creates opportunities for strategic behavior, and it dilutes the constraining effect of any single institution.
5. **Design flaws.** Institutions with escape clauses, unanimity requirements, or weak monitoring are less constraining. *Example:* the UNFCCC's consensus decision-making; the WTO's consensus rule, which allows a single member to block reform.
6. **Preference change and interest divergence.** Institutions are designed for the preferences of their founders. When preferences change, institutions can become misfits. *Example:* the IMF's governance reflects 1944 power, not 2025 power.
7. **Legitimacy deficits.** Institutions that are seen as illegitimate — because their decision-making is unrepresentative, or because their norms are contested — are less effective. *Example:* the ICC's contested legitimacy in Africa (see the problem pair).

The rational-design literature. Koremenos, Lipson, and Snidal's "rational design" framework (2001) argues that institutional features — membership, scope, centralization, control, flexibility — are **deliberate responses** to cooperation problems. Institutions are not random; they are designed to solve specific problems, and their design can be predicted from the characteristics of the problem. This literature is the best answer to Mearsheimer: it shows that institutions are not epiphenomenal, because their *design* varies in ways that track the underlying cooperation problem.

Observable implication. If institutional failure is a design theory, then you should be able to predict failure from design features: institutions with weak monitoring, consensus rules, and unrepresentative governance should fail more often, all else equal.

2.6 KEY IDEA 5 — The five perspectives assess institutions differently, and those assessments are political

The claim: The "rules-based international order" is not a neutral description. It is a **contested political project**, and the five perspectives assess it differently. The African perspective is primary not because it is more correct but because the course's empirical center of gravity is Africa, and because African states have been both the objects and the agents of institutional contestation.

2.6.1 The African perspective (primary) **Core commitments.** African states are not passive recipients of the liberal institutional order. They are **architects, users, and critics** of institutions. Three commitments define the African engagement:

1. **Institutions as leverage.** African states use institutions — the AU, ECOWAS, the UN, the ICC, the AfCFTA — to amplify their bargaining power, to pool sovereignty for collective purposes, and to convert external competition into concessions. The **AfCFTA** (Agreement Establishing the African Continental Free Trade Area, entered into force 2019) is the most ambitious example: a project of **economic sovereignty** designed to move Africa from the periphery of global value chains to a position of greater bargaining leverage.
2. **Institutions as sites of contestation.** African states have consistently contested the **design** and **legitimacy** of global institutions. The **Ezulwini Consensus** (2005) is the AU's common position on UN Security Council reform, demanding at least two permanent seats with veto power for Africa and five non-permanent seats — a direct challenge to the 1945 distribution of power embedded in the Council. African states have also contested the ICC (see the problem pair), the IMF's governance, and the conditionality attached to lending.
3. **Sovereignty as the foundation.** African institutionalism begins from sovereignty, not from a post-sovereign liberal order. The AU's Article 4(g) enshrines non-interference; Article 4(h) creates a *collective* exception. African states are skeptical of institutions that claim authority over their domestic affairs without their consent — which is why they have been wary of R2P, of the ICC, and of liberal interventionism.

The TWAIL critique. Third World Approaches to International Law argue that international institutions were **constituted through colonialism** and continue to reproduce hierarchy. The IMF's conditionality, the WTO's intellectual-property regime, and the Security Council's composition are not neutral arrangements; they embed the interests of the powerful. The African critique is not a rejection of institutions *per se* —

African states have built some of the most innovative institutions in the world (the AU's peace and security architecture, the AfCFTA, the African Development Bank) — it is a rejection of **hierarchical** institutions that claim universal authority while excluding the majority world.

What this perspective contributes: It shows that institutional **design** and **legitimacy** matter as much as institutional **effectiveness**. An institution that is effective but illegitimate will not be obeyed. It also shows that African states are **agents**, not just objects, of institutional politics.

What it occludes: It can underplay the **effectiveness** of some global institutions for African states (e.g., the WHO, the WTO's dispute settlement for weaker members, the UN's peacekeeping). It can also risk treating "African position" as monolithic, when African states disagree profoundly (e.g., on the ICC, on UNSC reform, on intervention).

2.6.2 The Chinese perspective **Core commitments.** China's engagement with institutions is **instrumental and revisionist** — but in a specific sense. China does not seek to destroy the post-1945 institutional order; it seeks to **reform it** and to **build parallel institutions** that reflect its interests and its vision of order.

1. **The UN as the core.** China consistently emphasizes the UN-centered international system and the Charter as its foundation. It opposes "hegemonism," "unilateralism," and the "rules-based order" framing that it sees as a Western attempt to replace the Charter with ad hoc rules. It supports a multipolar order in which the UNSC remains the central authority for peace and security.
2. **Alternative and complementary institutions.** China has built and supported institutions that operate outside Western-dominated frameworks: the **Asian Infrastructure Investment Bank (AIIB,** 2016), the **New Development Bank** (with BRICS), the **Shanghai Cooperation Organisation (SCO)**, the **Forum on China–Africa Cooperation (FOCAC,** 2000), and the **Belt and Road Initiative** (2013). These are not simply alternatives; they are **complementary** institutions that give China agenda-setting power and provide developing states with options.
3. **Relational institutionalism.** Chinese scholars (Qin Yaqing) argue that institutions should be understood relationally — as processes of relationship-building, not just as rule-sets. This leads to a preference for **flexible, consensus-based, non-legalized** forms of cooperation (the "Beijing Consensus" style) over highly legalized Western institutions.

The political project. China's institutional strategy is part of its broader project of **epistemic and institutional sovereignty**: the claim that the international order should not be defined by a single civilization's rules, and that developing states should have alternatives to Western-dominated institutions.

What this perspective contributes: It shows that institutionalism is not a Western monopoly, and that the **design** of institutions reflects the **interests and ontologies** of their architects. It also shows that institutional competition — not just institutional cooperation — is a feature of the contemporary order.

What it occludes: It can underplay the **coercive** dimension of China's institutional leadership — the ways in which debt, dependency, and conditionality operate in Chinese-led institutions. It can also underplay the genuine commitment of many Chinese officials and scholars to multilateralism.

2.6.3 The Russian perspective **Core commitments.** Russia's engagement with institutions is defined by the **defence of the UNSC** and the **rejection of the liberal institutional order**. Russia does not reject institutions wholesale; it rejects the *liberal* institutional order, and it defends the *great-power* institutional order.

1. **The UNSC as the last acceptable institution.** Russia treats the Security Council as the core of the international order, precisely because the veto protects Russian interests. It opposes reform of the Council (especially the abolition of the veto), and it uses the Council as a platform to contest Western narratives. The Russian Foreign Ministry's framing emphasizes the UN Charter as the basis of international order, and multipolarity as the reality the West refuses to accept.
2. **Rejection of liberal institutionalism.** Russia rejects R2P, humanitarian intervention, and the liberal claim that institutions can transcend sovereignty. It sees these as instruments of Western hegemony. The 2022 invasion of Ukraine was justified in part by the claim that Western institutions (NATO, the EU) had encroached on Russia's sphere of influence.
3. **Alternative institutions.** Russia has promoted the **Eurasian Economic Union (EAEU)**, the **SCO**, and **BRICS+** as alternatives to Western-dominated institutions. These are not simply economic arrangements; they are projects of **institutional counter-hegemony**.

The political project. Russia's institutional strategy is to **defend the veto** (the last great-power prerogative in the institutional order) and to **build alternatives** that reduce Western institutional dominance.

What this perspective contributes: It shows that institutionalism's **distributional** dimension is central — institutions are not neutral, and powerful states will defend the institutions that protect their power. It also shows that institutional **design** (the veto) is itself a political achievement that some states will defend at all costs.

What it occludes: It can naturalize obstruction — the veto can be used to block collective action on genocide or aggression, as in Syria and Ukraine. It can also underplay the genuine dissatisfaction of many states with the liberal order, which Russia exploits without necessarily representing.

2.6.4 The Western perspective Core commitments. The Western tradition is the **home** of institutionalism, and it remains the most important source of institutional theory and practice. But it is also internally contested — between **liberal internationalists**, who believe institutions can progressively solve global problems, and **realist critics**, who believe institutions are epiphenomenal.

1. **Liberal internationalism.** The dominant Western position holds that institutions — the UN, the WTO, the IMF, NATO, the EU — are the foundation of international order. Ikenberry's *After Victory* (2001) is the canonical statement: the US after 1945 built an institutional order that was **strategically restrained** (binding itself) and **institutionally embedded** (giving other states a stake), which made it acceptable to others and durable over time. This is a theory of **institutional statecraft**: the hegemon builds institutions to make its power legitimate and durable.
2. **Institutional design and legalization.** Western scholarship has developed the most sophisticated toolkit for understanding institutional design: Abbott and Snidal on **legalization** (obligation, precision, delegation); Koremenos, Lipson, and Snidal on **rational design**; Alter on **judicialization** and the politics of international courts. This literature is the best answer to Mearsheimer: it shows that institutions vary in their design in ways that track the underlying cooperation problem.
3. **Self-critique.** Western institutionalism has its own internal critics: realists (Mearsheimer), critical theorists (Cox), post-colonial scholars (Grovogui), and feminists (Enloe), who argue that the liberal institutional order is hierarchical, exclusionary, and complicit in reproducing global inequality.

What this perspective contributes: It provides the **most developed** theory of institutions and the **most systematic** toolkit for analyzing institutional design. It also provides the **self-critique** that makes the tradition

dynamic.

What it occludes: It can be **parochial** — treating Western institutions as universal models. It can be **complacent** — assuming that institutions will hold even when the hegemon defects (the WTO Appellate Body, the Paris Agreement, the JCPOA). And it can be **complicit** — the "rules-based order" can be a vehicle for Western power, as its critics argue.

2.6.5 The UN perspective **Core commitments.** The UN is the **institutionalist actor par excellence**. Its founding document — the Charter — is a constitution for a society of states; its institutions — the General Assembly, the Security Council, the ICJ, the specialized agencies — are the core of the multilateral system; its normative discourse is the most explicit statement of institutionalist principles in world politics.

1. **The Charter as the institutional foundation.** The UN frames itself as the guardian of the Charter — the rules on sovereignty, non-interference, the prohibition on force, and collective security. Its authority rests on the claim that these rules are **universal** and **binding**, not merely the preferences of the powerful.
2. **Multilateralism as method.** The UN's normative voice insists that global problems — climate, pandemics, AI, peace and security — require **collective, multilateral solutions**. The *Pact for the Future* (2024) is the most recent statement: a recommitment to "multilateralism, solidarity and international law," with commitments on Security Council reform, nuclear disarmament, and the governance of emerging technologies.
3. **Adaptation and reform.** The UN acknowledges that its institutions must adapt: peace operations must be "adaptable, inclusive, politically grounded"; the international financial architecture must be reformed; the Security Council must be made more representative. The UN's own discourse identifies the **gap between principle and practice** — the veto, selective enforcement, and the failure to implement Charter norms — as the central institutional problem.

What this perspective contributes: It provides the **normative benchmark** — the standards against which institutional performance is judged. It also provides the **institutional record** — the resolutions, reports, and debates that are essential evidence for any analysis.

What it occludes: It can **depoliticize** — framing institutional failures as technical problems obscures the power dynamics that produce them. It can **legitimize** — the UN's authority can be used to justify actions that serve the interests of the powerful. And it can **underplay** its own structural bias — the P5 veto is not a technical flaw but a constitutional feature that protects great-power interests.

2.6.6 The comparison matrix

Dimension	African (primary)	Chinese	Russian	Western	UN
Stance toward institutions	Architects, users, critics; leverage and contestation	Instrumental and revisionist; build alternatives	Defend UNSC; reject liberal institutionalism	Home of institutionalism; internally contested	Institutionalist actor par excellence

Dimension	African (primary)	Chinese	Russian	Western	UN
Key institution	AU, AfCFTA, ECOWAS; UNSC reform	AIIB, SCO, FOCAC, BRI; UN-centered	UNSC, EAEU, SCO, BRICS+	UN, WTO, IMF, NATO, EU	The Charter system
Core critique	Hierarchical, exclusionary institutions	Western-dominated rules; "rules-based order" as hegemony	Liberal institutionalism as Western hegemony	(Self-critique) parochialism, complacency	(Self-critique) gap between principle and practice
What it contributes	Legitimacy and design matter; African agency	Institutional competition; relational design	Distributional dimension; veto as political achievement	Most developed toolkit; self-critique	Normative benchmark; institutional record
What it occludes	Effectiveness of some global institutions; diversity of African positions	Coercive dimension of Chinese institutions	Obstruction; exploitation of dissatisfaction	Universality claims; complicity	Power dynamics; structural bias

2.7 WORKED EXAMPLE (I do)

The puzzle: The WTO's dispute settlement system was the most legalized and judicialized institution in the international system. From 1995 to 2019, it resolved hundreds of trade disputes, and compliance rates were high. Yet from 2017, the United States — the institution's principal architect — blocked appointments to the Appellate Body, and by December 2019 the body was paralysed. Why did the hegemon that built the most legalized institution in history destroy its central mechanism?

The puzzle stated precisely: *Why did the United States undermine the WTO Appellate Body, an institution it created and that served its interests for two decades?*

Level of analysis:

- **Systemic:** The distribution of power shifted. China's rise changed the WTO's distributional consequences: the institution that served US interests in 1995 no longer served them in 2017. The US perceived the dispute settlement system as constraining its ability to respond to Chinese state capitalism.
- **State:** US domestic politics — the bipartisan turn against trade liberalization, the influence of protectionist constituencies, and the Trump administration's "America First" agenda — made defection politically attractive.
- **Institutional:** The Appellate Body's design features — compulsory jurisdiction, binding decisions,

appellate review, precedent-like reasoning — made it unusually constraining. The US objected to "judicial overreach": the AB's treatment of domestic law as factual, its issuance of advisory opinions, its failure to meet the 90-day deadline, and its reliance on precedent. These were **design features** that the US had accepted in 1995 but now rejected.

- **Individual:** The Trump administration's transactional approach to institutions and its willingness to break norms shaped the timing and form of the defection.

Applying the theoretical apparatus:

- **Institutionalism predicts** that institutions are sticky and that cooperation persists after hegemony. The WTO's dispute settlement system is a test case: it persisted for two decades, and its **dispute settlement continued** in modified form (the MPIA, the Multi-Party Interim Appeal Arbitration Arrangement, which the EU and others created in 2020). This is partial support for institutionalism: the institution adapted, and cooperation did not collapse entirely.
- **But institutionalism also predicts** the conditions for failure: when the hegemon's vital interests are at stake, when the issue is strategic (not technical), and when the institution is highly constraining, defection is likely. The WTO case fits the scope conditions of institutional failure.
- **The relative-gains critique** is relevant: the US perceived the WTO as producing relative gains for China, and it defected.
- **The rational-design literature** explains why the AB was designed as it was (to solve the credible-commitment problem) and why it became vulnerable (because the US had not anticipated the distributional consequences).
- **The hegemonic-stability critique:** the US had provided the public good of a legalized trading system, but it withdrew when the good became costly. This is a classic HST prediction, and it challenges Keohane's optimism about post-hegemonic cooperation.

Perspective reconstruction:

- **African perspective:** The WTO's dispute settlement system was never equally accessible to African states, which lacked the legal capacity and resources to use it. The paralysis of the AB is a symptom of the **hierarchical** character of the institution: it worked for the powerful, and when it stopped working for the most powerful, it was dismantled. African states' response has been to pursue **regional** alternatives (the AfCFTA's dispute settlement mechanism) and to demand reform of the global system.
- **Chinese perspective:** The AB's paralysis confirms China's view that the "rules-based order" is a **Western instrument** that is abandoned when it no longer serves Western interests. China has responded by strengthening the WTO's **multilateral** character and by building alternative institutions. It frames its own approach as defending the **UN-centered** system against unilateralism.
- **Russian perspective:** The AB's paralysis confirms Russia's view that institutions are **instruments of power**, not neutral arbiters. Russia is a marginal player in the WTO (it joined in 2012), and it interprets the US defection as evidence of Western hypocrisy and the collapse of the liberal order.
- **Western perspective:** The AB's paralysis is a **crisis of the liberal order**, caused by the hegemon's defection. Western scholars debate whether the cause is US domestic politics, Chinese state capitalism, or the institution's design. The policy response — the MPIA — is an attempt to preserve the institutionalist project without the hegemon.
- **UN perspective:** The AB's paralysis is not a UN issue directly, but it exemplifies the UN's broader

concern: the **erosion of multilateralism** and the **rule of law** in international affairs. The UN's *Pact for the Future* calls for reform of the international financial architecture and for a recommitment to multilateral institutions — precisely because cases like the WTO show how fragile they are.

Adjudication. Which theory best explains the AB's paralysis? **Neoclassical institutionalism** (if we may coin a term) best captures the interaction: the systemic shift (China's rise) changed the distributional consequences of the institution; domestic politics (US trade policy) made defection politically viable; and the institution's **design features** (compulsory jurisdiction, binding review) made it unusually constraining. The **relative-gains critique** explains why the US defected. **Hegemonic stability theory** explains why the institution became vulnerable. **Institutionalism** explains why the system did not collapse entirely — the MPIA and continued dispute settlement show that institutions are sticky, even in crisis.

A complete explanation holds all four: **systemic change, domestic politics, institutional design, and hegemonic defection**. No single theory captures the whole.

2.8 PROBLEM PAIR (We do)

Your task: Analyze the following case using the apparatus above. Write your analysis before reading the model answer.

The case: The International Criminal Court (ICC), established by the Rome Statute (1998, in force 2002), is the first permanent international court with jurisdiction over genocide, war crimes, crimes against humanity, and aggression. African states were among its strongest supporters at Rome. Yet by 2017, the African Union had adopted a **non-binding strategy of collective withdrawal**, and Burundi, South Africa, and The Gambia notified withdrawal (The Gambia and South Africa later reversed). In 2023, the ICC issued an arrest warrant for Vladimir Putin, and South Africa — an ICC member — faced a dilemma when Putin was expected to attend a BRICS summit. The ICC's legitimacy in Africa is contested.

Your tasks:

1. State the puzzle precisely: why did the ICC — an institution that African states helped build — become the object of African contestation?
2. Apply institutionalism's claims: what cooperation problem was the ICC designed to solve? What is its causal mechanism? What are its scope conditions?
3. Apply the relative-gains and "false promise" critiques to the ICC.
4. Reconstruct the African and Western perspectives on the ICC. How do they differ in their assessment of the institution's legitimacy?
5. Write a 300-word adjudication: is the ICC's legitimacy crisis a **design failure**, a **distributional conflict**, or a **legitimacy deficit** — or all three?

Model answer (compare after writing your own):

Puzzle: Why did the ICC, an institution that African states supported at its creation, become the object of African contestation and threatened withdrawal?

Institutionalism's claims: The ICC was designed to solve a **credible-commitment problem**: states wanted to commit to ending impunity for the worst crimes, but they could not credibly promise to prosecute their own leaders. The ICC solves this by **delegating** prosecution to an independent court. Its mechanism is **judi-**

cialization: the court issues indictments, warrants, and judgments that create legal obligations and political costs. Its scope conditions: it works when states are willing to cooperate (arrest suspects), when the court's legitimacy is accepted, and when the P5 do not block referrals.

Relative-gains critique: African states perceived the ICC as producing **asymmetric costs**: the court investigated and indicted African leaders disproportionately (before 2016, all of the ICC's active investigations were in Africa), while it did not investigate alleged crimes by Western states (e.g., Iraq, Afghanistan). The distributional conflict is real: the ICC's enforcement depends on the cooperation of the powerful, and the powerful are rarely its targets.

"False promise" critique: The ICC's critics — including the AU — argue that the court is **epiphenomenal**: it reflects the power of Western states, which use it to prosecute their adversaries while shielding their own. The African critique is not that the court is ineffective, but that it is **selective**.

African perspective: The AU's position is that the ICC has become a **neo-colonial** institution that targets African leaders while ignoring Western crimes. The AU's 2017 withdrawal strategy was a demand for **reform** — particularly the exemption of sitting heads of state, and a greater role for African courts. The African perspective emphasizes **legitimacy** and **distributional fairness**, not effectiveness. It is also a demand for **African agency**: African states want to resolve African conflicts through African institutions (the AU's own criminal jurisdiction, which has been proposed but not yet established).

Western perspective: Western states and scholars defend the ICC as a **universal** institution and argue that the African critique is misplaced: the court investigates where the evidence leads, and African states themselves referred many cases. The Western perspective emphasizes **legal universalism** and the importance of **accountability**.

Adjudication: The ICC's legitimacy crisis is **all three** — a design failure (the court's dependence on great-power cooperation makes it selectively effective), a distributional conflict (African states bear the costs of enforcement without shaping the court's agenda), and a legitimacy deficit (the court's authority is contested because its composition and its enforcement are seen as unequal). Institutionalism explains **why** the ICC was created and **how** it works; it does not explain **why** it became contested. The African perspective explains the contestation; the Western perspective explains the defense. A complete analysis must hold both: the ICC is a **genuine institutional achievement** and a **contested political project**.

2.9 INDEPENDENT MEMO (You do)

Produce a one-page analytical memo (500–600 words) on the following case, using the four headings below.

Case: The African Continental Free Trade Area (AfCFTA), which entered into force in 2019. Proponents argue it will boost intra-African trade, create a single market of 1.3 billion people, and increase Africa's bargaining power in global supply chains. Critics argue that implementation is slow, that overlapping regional economic communities (the "spaghetti bowl") undermine it, and that it will not overcome the structural barriers of poor infrastructure, weak states, and external dependency.

Memo headings:

1. **Mechanism:** What cooperation problem does the AfCFTA solve? Apply institutionalism's mecha-

nisms: reducing transaction costs, lengthening the shadow of the future, monitoring, credible commitment. Which mechanisms are plausibly operative here?
2. **Perspective reconstruction:** How would each of the five perspectives assess the AfCFTA? (African, Chinese, Russian, Western, UN — one paragraph each or a table.)
3. **Design and failure:** What design features of the AfCFTA (flexibility, escape clauses, dispute settlement, implementation timelines) predict success or failure? What are the scope conditions?
4. **Falsifiers:** What evidence would show the AfCFTA is working? What evidence would show it is not? Specify observable implications.

Self-check: Does your memo distinguish the AfCFTA's **stated goals** from its **causal mechanism**? Does it specify **scope conditions**? Does it reconstruct the African perspective as **agency**, not just critique?

2.10 HINGE QUESTION

Two states are negotiating a trade agreement. State A would gain $100 million and State B would gain $200 million. State A refuses the agreement, even though it would be better off in absolute terms, because it fears that State B's larger gain will translate into greater military capability. This is an example of:

- A) Absolute-gains logic
- B) Relative-gains logic
- C) The security dilemma
- D) Complex interdependence

Answer: B. State A is refusing a mutually beneficial agreement because it cares about **relative** gains, not just absolute gains. This is Grieco's critique of institutionalism: positional concerns can block cooperation even when joint gains exist.

If you answered A: Absolute-gains logic would predict that State A accepts the deal, because it is better off in absolute terms. The scenario describes the opposite. **If you answered C:** The security dilemma concerns defensive measures appearing offensive and triggering a spiral. The scenario is about bargaining over gains, not about armament spirals. **If you answered D:** Complex interdependence describes multiple channels, a non-hierarchical agenda, and limited use of force — not the relative-gains logic of bargaining.

SECTION 2A — DATA LAB (30–45 minutes)

Purpose: Ground institutionalism's claims in empirical data.

Task: Using the summary data below, analyze the relationship between institutional membership and cooperation.

Table 1: WTO dispute settlement — disputes initiated and compliance (illustrative)

Period	Disputes initiated	Share involving developing countries	Compliance with rulings (estimated)
1995–2000	180	35%	~80%

Period	Disputes initiated	Share involving developing countries	Compliance with rulings (estimated)
2001–2010	250	45%	~80%
2011–2019	180	50%	~75%
2020–2024 (post-AB paralysis)	120	55%	~50% (estimated)

Table 2: Intra-regional trade shares (2023, approximate)

Region	Intra-regional trade share
European Union	~60%
Asia (ASEAN+3)	~55%
North America (USMCA)	~50%
Africa	~15%
Latin America	~25%

Analysis questions:

1. **Institutional effects:** What does the WTO data suggest about compliance with institutional rulings? Does compliance persist after the Appellate Body's paralysis? What are the alternative explanations (e.g., reputation, reciprocity, power)?
2. **Regional variation:** Why is intra-African trade so low, despite the AfCFTA? What does this suggest about the scope conditions of institutionalism? (Hint: infrastructure, border costs, colonial trade patterns, the "spaghetti bowl" of RECs.)
3. **Institutionalism vs. realism:** Does the data support institutionalism (institutions cause cooperation) or realism (power and interests cause cooperation)? What evidence would distinguish them?
4. **Perspective:** How would each of the five perspectives interpret the AfCFTA data? (African: the project is young and the structural barriers are legacies of colonialism; Chinese: infrastructure investment is the key to unlocking trade; Russian: the liberal trade order is not the answer; Western: the AfCFTA needs deeper institutional design; UN: the AfCFTA supports the SDGs and regional integration.)
5. **Limitation:** What does the data **not** tell you? (Hint: trade shares do not measure the *distribution* of gains; institutional membership does not measure institutional *effectiveness*; and low intra-African trade may reflect colonial-era infrastructure that oriented African economies outward.)

Rule: Complete the data lab before the independent memo.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Task: Draw the following by hand.

Visual 1: The four liberal branches. Draw four boxes — Commercial, Republican, Regulatory, Institutional. For each, write: the core claim, the mechanism, one key figure, and one scope condition.

Visual 2: The cooperation problem. Draw a 2×2 prisoner's dilemma matrix. Label the strategies (cooperate/defect) for State A and State B. Write the payoffs in each cell (e.g., mutual cooperation = 3,3; mutual defection = 1,1; A defects/B cooperates = 4,0; A cooperates/B defects = 0,4). Then draw arrows showing how institutions change the payoffs: iteration (shadow of the future), monitoring (information), and issue linkage (punishment).

Visual 3: The five perspectives on institutions. Draw a five-column table (African, Chinese, Russian, Western, UN) with rows: "Stance toward institutions," "Key institution," "Core critique," "Key occlusion."

SECTION 4 — CORNELL NOTES

Set up your notes with the following cue column:

Cue column	Notes
What are the four liberal branches?	Commercial; republican; regulatory; institutional
What is the difference between cooperation and harmony?	Harmony = interests coincide; cooperation = interests conflict but actors coordinate to capture joint gains
What cooperation problems do institutions solve?	Prisoner's dilemma (defection); coordination (focal points); monitoring; credible commitment; transaction costs
What is complex interdependence?	Multiple channels; non-hierarchical agenda; limited use of force; sensitivity vs. vulnerability
What is the relative-gains critique?	Grieco: states are positional; relative gains matter; institutionalism understates this
What is the "false promise" critique?	Mearsheimer: institutions are epiphenomenal; power causes outcomes, not institutions
What are the modes of institutional failure?	Hegemonic defection; distributional conflict; enforcement failure; regime complexity; design flaws; preference change; legitimacy deficits
How do the five perspectives assess institutions?	African: leverage and contestation; Chinese: instrumental/revisionist; Russian: defend UNSC, reject liberal institutionalism; Western: home tradition + self-critique; UN: institutionalist actor par excellence
Source log	Lesson text, Sections 2.2–2.6; Keohane (1984); Keohane & Nye (1977); Axelrod (1984); Grieco (1988); Mearsheimer (1994/95); Koremenos, Lipson & Snidal (2001); Ikenberry (2001); AfCFTA Agreement; UN Pact for the Future
Summary	3–5 sentences synthesizing the lesson

SECTION 5 — FEYNMAN COMPRESSION

Step 1: Explain the institutionalist argument to a smart non-specialist in 150–200 words, without using jargon. If you must use "anarchy," "regime," or "shadow of the future," define them in plain language.

Step 2: Mark every point where you hesitated or used a term you could not define.

Step 3: Reread only the gaps. Rewrite.

Step 4: Produce one analogy for institutions. Then state where the analogy breaks down. (Example: "Institutions are like traffic rules — they coordinate behavior and reduce the risk of collisions, but they only work if most drivers follow them and if the police can enforce them." Where it breaks down: international institutions have no police, and the most powerful drivers can ignore the rules with impunity.)

SECTION 6 — SPACED-REPETITION FLASHCARDS

Produce 12–15 cards. Use the following types:

Type	Example
Definition	What is the difference between sensitivity and vulnerability interdependence?
Mechanism	How do institutions lengthen the shadow of the future?
Application	A state complies with a WTO ruling even though it loses the case. What institutionalist mechanism explains this?
Comparison	How do commercial and republican liberalism differ in their mechanisms?
Source	What did Keohane argue in *After Hegemony* about cooperation after hegemony?
Debate	What is the strongest objection to Mearsheimer's "false promise" critique?
Reconstruction	How would an African TWAIL scholar assess the WTO dispute settlement system?
Occlusion	What does liberal institutionalism fail to see about hierarchy and race?
Adjudication	Which theory best explains the WTO Appellate Body's paralysis, and what does it miss?
Visual	Label the four liberal branches on a diagram.

Tag each card: `L6`, `institutionalism`, `liberalism`, `perspective`, `difficulty`.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence audit

Rate confidence (0–100%) before checking:

Objective	Confidence
Distinguish the four liberal branches	
Reconstruct neoliberal institutionalism's core argument	
Evaluate the relative-gains and "false promise" debates	
Diagnose institutional failure	
Reconstruct the five perspectives on institutions	

After exercises, rate accuracy. Calculate the gap.

7.2 Three-question debrief

1. What did I misunderstand about the relationship between institutions and power?
2. Which liberal branch was easiest to apply? Which was hardest? What does that suggest about my default analytical style?
3. What will I do differently in Lesson 7?

7.3 Error log

Date	Lesson	Error type	Correct understanding	Card created?
	L6			

SECTION 8 — CHEATSHEET (Module 1)

Add this row to your Module 1 cheatsheet:

Column	Content
Core concepts	Complex interdependence; sensitivity/vulnerability; regime; neoliberal institutionalism; relative vs. absolute gains; shadow of the future; credible commitment; delegation; legalization; regime complexity; institutional design
Key mechanisms	Institutions reduce uncertainty → lengthen shadow of the future → cooperation; monitoring → compliance; issue linkage → punishment; delegation → credible commitment; hegemonic defection → institutional failure

Column	Content
Theories and authors	Kant; Doyle; Keohane & Nye; Keohane; Axelrod; Grieco; Mearsheimer; Koremenos, Lipson & Snidal; Ikenberry; Abbott & Snidal
Cases and evidence	WTO Appellate Body paralysis; ICC and Africa; AfCFTA; EU; JCPOA; NPT
Debates	Do institutions matter? Relative vs. absolute gains; is the "rules-based order" universal or Western?
Falsifiers	What evidence would show that institutions have no independent causal effect? What would show they do?
Cross-links	L5 (realism — the foil); L7 (constructivism — social construction of cooperation); L18 (weaponized interdependence); L21 (JCPOA); L28 (AU/APSA); L49 (institutional revisionism)

SECTION 9 — REVIEW SCHEDULE

Review	Timing	Format
R1	Today	Retrieval warm-up + card creation
R2	2–3 days	Cue-column recall + hinge variant
R3	1 week	Mixed quiz with L1–L6 cards
R4	3–4 weeks	Interleaved problem combining L6 with L7–L8 (theory) and L18 (weaponized interdependence)
R5	End of Module 1	Cheatsheet reconstruction from memory

SECTION 10 — COMPLETION CHECKLIST

- ☐ Retrieval warm-up completed from memory
- ☐ Five learning objectives read and understood
- ☐ Five key ideas studied with mechanisms and scope conditions
- ☐ Perspective comparison matrix filled from memory, then checked
- ☐ Worked example (WTO Appellate Body) studied and self-explained
- ☐ Problem pair (ICC and Africa) attempted and compared
- ☐ Independent memo produced (500–600 words)
- ☐ Hinge question answered correctly (or reteaching completed)

- ☐ Data lab completed before independent memo
- ☐ Three dual-coded visuals drawn
- ☐ Cornell notes with cue column, source log, and summary
- ☐ Feynman explanation written, gaps identified, rewritten
- ☐ 12–15 flashcards created with tags
- ☐ Confidence audit and error-log entry
- ☐ Cheatsheet entry added
- ☐ R2 review scheduled

FURTHER READING (Optional — for deepening, not required)

- **On liberal theory:** Immanuel Kant, *Perpetual Peace* (1795); Michael Doyle, "Kant, Liberal Legacies, and Foreign Affairs," *Philosophy & Public Affairs* (1983); Bruce Russett, *Grasping the Democratic Peace* (1993).
- **On complex interdependence:** Robert Keohane and Joseph Nye, *Power and Interdependence* (1977), ch. 1–3.
- **On neoliberal institutionalism:** Robert Keohane, *After Hegemony* (1984), ch. 1–6; Kenneth Oye (ed.), *Cooperation Under Anarchy* (1986); Robert Axelrod, *The Evolution of Cooperation* (1984).
- **On the relative-gains debate:** Joseph Grieco, "Anarchy and the Limits of Cooperation," *International Organization* (1988); Duncan Snidal, "Relative Gains and the Pattern of International Cooperation," *American Political Science Review* (1991).
- **On the "false promise" debate:** John Mearsheimer, "The False Promise of International Institutions," *International Security* (1994/95); Robert Keohane and Lisa Martin, "The Promise of Institutionalist Theory," *International Security* (1995).
- **On institutional design:** Barbara Koremenos, Charles Lipson, and Duncan Snidal, "The Rational Design of International Institutions," *International Organization* (2001); Kenneth Abbott and Duncan Snidal, "Hard and Soft Law in International Governance," *International Organization* (2000).
- **On the liberal order:** G. John Ikenberry, *After Victory* (2001); G. John Ikenberry, *Liberal Leviathan* (2011).
- **On African institutionalism:** the AU Constitutive Act; the AfCFTA Agreement; the Ezulwini Consensus (2005); Siba Grovogui, *Sovereigns, Quasi-Sovereigns, and Africans* (1996); TWAIL scholarship (Makau Mutua, "What Is TWAIL?").
- **On Chinese and Russian institutional strategies:** Qin Yaqing, *A Relational Theory of World Politics* (2018); the AIIB Articles of Agreement; the SCO Charter; the EAEU Treaty; Russian Foreign Ministry statements on the UN Charter and multipolarity.
- **On the UN:** UN Charter; *Pact for the Future* (2024); UN Secretary-General's reports on multilateralism and institutional reform.

End of Lesson 6. Say **"Next"** when you are ready for Lesson 7 (Constructivism and the English School).

8. Constructivism and the English School: The Social Construction of International Reality

---

LESSON METADATA

Field	Entry
Lesson number and title	L7 — Constructivism and the English School
Module	Module 1: Epistemological and Ontological Foundations
Prerequisites	L1 (puzzles, levels, power, perspectives); L2 (Charter system, AU Act); L3 (causal inference); L4 (positivism/post-positivism); L5 (realism — the theory constructivism challenges); L6 (institutionalism — the theory constructivism extends)
Interleaved links	Forward to L8 (critical/post-colonial/feminist theory), L9–14 (historical construction of order), L24 (cognitive warfare — the weaponization of constructed identities), L28 (Pan-Africanism and AU norms), L35 (post-Soviet ontology — the ontological security crisis par excellence), L42 (Iranian identity and *Velayat-e Faqih*), L47 (US–China identity competition)
Reading load	This lesson only. Optional further reading at the end.
Content channels	Canon (quoted and summarized); primary texts (Wendt, Onuf, Kratochwil, Finnemore & Sikkink, Mitzen, Steele, Bull, Wight, Buzan, Zhang, Qin, quoted and analyzed); data lab (UN voting patterns and norm diffusion); five perspectives
Bloom ceiling	Evaluate (adjudicate between constructivist and English School claims, and between them and their critics)
Estimated study time	7–9 hours including exercises

Note on self-containment: Every argument, quotation, and example you need is inside this document. Where I cite Wendt, Onuf, Kratochwil, Finnemore and Sikkink, Mitzen, Steele, Bull, Wight, Buzan, or any other scholar, I summarize the argument fully enough that you do not need the original to complete the lesson. "Further Reading" is optional.

SECTION 0 — Why This Lesson Exists

Lessons 5 and 6 gave you the two dominant traditions in IR. **Realism** says anarchy produces self-help, states seek power, and cooperation is fragile. **Institutionalism** says institutions can solve cooperation problems even under anarchy, and that cooperation can persist after hegemony declines. Both traditions share a common premise: **states are the basic units of international politics, with given interests and identities.** Realism assumes states want power and security; institutionalism assumes states want to maximize joint gains. Neither asks where those wants come from.

Constructivism asks that question. Its core claim — stated most famously by Alexander Wendt — is that **anarchy is what states make of it**. Anarchy does not automatically produce self-help, competition, or security dilemmas. It produces whatever states' **shared understandings** make of it. If states understand each other as enemies, anarchy produces war; if they understand each other as rivals, anarchy produces competition; if they understand each other as friends, anarchy can produce a security community in which war is unthinkable. Interests and identities are **socially constructed**, not exogenously given.

The English School asks a related question: is there a **society** of states, not just a **system**? Hedley Bull's *The Anarchical Society* (1977) argued that states do not merely interact; they share norms, rules, and institutions — sovereignty, diplomacy, international law, the balance of power — that constitute a **society** even in the absence of a world government. The English School provides the conceptual vocabulary for analyzing how norms and institutions create order, and how that order can be **pluralist** (respecting sovereignty and difference) or **solidarist** (pursuing shared values like human rights and justice).

This lesson gives you:

1. **The constructivist challenge** to rationalist IR: anarchy is what states make of it; identities and interests are endogenous; norms constitute actors.
2. **The mechanisms of social construction:** norms (regulative and constitutive), the logic of appropriateness, the norm life cycle, socialization, and ontological security.
3. **The English School framework:** international system vs. international society vs. world society; pluralism vs. solidarism; primary vs. secondary institutions; the expansion of international society.
4. **The relationship between constructivism and the English School** — they are not the same, but they share a common insight: international politics is shaped by shared ideas, not just material power.
5. **The five perspectives on constructivism and the English School** — African (colonial genealogy, Pan-African norm entrepreneurship), Chinese (relational constructivism, hierarchical society), Russian (civilizational constructivism, ontological insecurity), Western (the home tradition and its internal debates), and UN (the institutional embodiment of international society).

By the end, you can take any international outcome — a war, a norm, an institution, an identity — and answer: *How was it socially constructed? By whom? Through what mechanisms? What does its construction make possible and what does it foreclose? And how do the five perspectives reconstruct it?*

SECTION 1 — PRE-CLASS PRIMING

1.1 Retrieval warm-up (from memory)

1. From L5: Name the five variants of realism and state each one's core mechanism in one sentence.

2. From L5: What is the security dilemma, and how does it produce conflict without aggressive intentions?
3. From L6: What is the difference between cooperation and harmony in Keohane's institutionalism?
4. From L6: What are the two defining critiques of institutionalism (relative gains; "false promise"), and how does institutionalism respond?

Check against the previous lessons before proceeding.

1.2 Orientation questions

Hold these in mind:

- If anarchy is what states make of it, what are the limits of that "making"? Can states construct any world they want?
- Is the "international community" a real thing, or a fiction that the powerful invoke?
- How do norms change? Do they emerge from the powerful, from entrepreneurs, from crises, or from all three?
- Why do states sometimes act against their material interests to preserve their identity or status?

1.3 Vocabulary pre-teach

Provisional definitions; revise by the end:

Social construction; constitutive vs. regulative norms; logic of appropriateness; logic of consequences; norm entrepreneur; norm life cycle; norm cascade; socialization; internalization; ontological security; biographical continuity; anxiety management; international system; international society; world society; pluralism; solidarism; primary institutions; secondary institutions; standard of civilization; expansion of international society; relationality; zhongyong; civilizational state.

SECTION 2 — LESSON CORE

2.1 Learning objectives

By the end of this lesson, you can:

1. **Reconstruct** Wendt's constructivist argument — anarchy is what states make of it — and distinguish it from realism and institutionalism.
2. **Apply** the mechanisms of social construction — constitutive norms, the norm life cycle, the logic of appropriateness, socialization — to a case of norm change.
3. **Explain** ontological security and its implications for state behavior, including cases where states act against material interests to preserve identity.
4. **Distinguish** the English School's three concepts — international system, international society, world society — and its two positions — pluralism and solidarism — and apply them to the "expansion of international society."
5. **Reconstruct** how the African, Chinese, Russian, Western, and UN traditions engage with constructivism and the English School, and **adjudicate** among them on a specific case.

2.2 KEY IDEA 1 — Anarchy is what states make of it: identities and interests are socially constructed

The claim: The core constructivist claim is not that "ideas matter" — that is trivially true — but that **the identities and interests of states are produced through social interaction**, not exogenously given. Realism and institutionalism both assume that states have fixed interests (power, security, or gains) and that the international system is a strategic environment in which those interests are pursued. Constructivism argues that the international system is a **social environment** in which states' identities and interests are **constituted** through interaction.

Wendt's argument. Alexander Wendt's 1992 article "Anarchy is What States Make of It" is the founding text of constructivist IR. Wendt's argument has three steps:

1. **Anarchy does not logically entail self-help.** Waltz argued that anarchy produces self-help because states must rely on their own resources. Wendt responds: anarchy is a **condition**, not a **cause**. What anarchy produces depends on the **shared understandings** that states bring to their interactions. If states understand each other as enemies, anarchy produces a security dilemma. If they understand each other as rivals, anarchy produces competition within rules. If they understand each other as friends, anarchy can produce a **security community** — a group of states that do not expect to fight each other (the EU is the paradigm case).
2. **Identities and interests are endogenous to interaction.** States do not have fixed interests that exist prior to their interactions. Their interests are **constituted** by their identities, and their identities are **produced** through interaction. The US did not have an interest in containing the Soviet Union before the US had constructed the Soviet Union as an adversary. The identity "adversary" and the interest "containment" were produced together through the Cold War.
3. **Social structures are constituted by shared ideas, not just material capabilities.** Wendt distinguishes between the **material** structure of power (which realists emphasize) and the **ideational** structure of shared understandings (which constructivists emphasize). The same material distribution of power can produce different outcomes depending on the shared understandings. Five hundred British nuclear weapons are less threatening to the US than five North Korean nuclear weapons, because the US shares an identity of "friend" with Britain and "adversary" with North Korea.

The "three cultures of anarchy." Wendt's later work (*Social Theory of International Politics*, 1999) developed this argument into a typology of three "cultures of anarchy":

Culture	How states relate	Logic of interaction	Example
Hobbesian	As enemies	War of all against all; the logic of kill or be killed	Pre-Westphalian Europe; the state of nature
Lockean	As rivals	Competitive coexistence; sovereignty is recognized, but war is legitimate	The Westphalian system; the Cold War

Culture	How states relate	Logic of interaction	Example
Kantian	As friends	Security community; war is unthinkable within the community	The EU; the North Atlantic security community

The mechanism. The shift from one culture to another is produced by **interaction**: states send signals of their intentions, interpret the signals of others, and gradually build or destroy shared understandings. Wendt's key example is the end of the Cold War: the US and the Soviet Union shifted from a Lockean culture of rivalry to a Kantian culture of friendship, not because the material balance of power changed, but because their **ideas about each other** changed.

Onuf and the "world of our making." Nicholas Onuf's *World of Our Making* (1989) is the other founding text of constructivism. Onuf's argument is more radical than Wendt's: he argues that **all** of international politics is constructed through **rules and speech acts**. Rules do not just regulate behavior; they **constitute** the actors and the situations in which they operate. Onuf's constructivism is therefore closer to post-structuralism than Wendt's: it emphasizes the **linguistic** production of reality, not just the cognitive.

Scope conditions. Constructivism is most powerful when: 1. **Identities are contested or in flux** (e.g., post-Cold War Europe, post-colonial Africa, post-Soviet Russia). 2. **Norms are new or changing** (e.g., the emergence of R2P, the evolution of sovereignty norms). 3. **Interaction is repeated and dense** (e.g., the EU, ASEAN, the AU). 4. **Material explanations are indeterminate** (e.g., why did the Cold War end peacefully? Why do some states join NATO and others do not?).

What constructivism contributes: It explains **change** — how the international system evolves, how norms emerge and diffuse, how identities are transformed. It also explains **why states sometimes act against material interests** — to preserve identity, status, or ontological security.

What constructivism occludes: It can underplay **material power** — the ways in which economic and military capabilities constrain what can be constructed. It can underplay **genuine conflict of interest** — if everything is constructed, it becomes difficult to say which constructions are better or worse. And it can be **methodologically difficult** — it is hard to test constructivist claims against positivist standards of evidence.

Observable implication. If constructivism is operative, you should see states **changing their identities and interests** through interaction — e.g., Germany and France moving from "enemies" to "friends" through European integration; South Africa moving from "pariah" to "norm entrepreneur" through the anti-apartheid struggle and post-apartheid diplomacy.

2.3 KEY IDEA 2 — Norms constitute and regulate: the logic of appropriateness and the norm life cycle

The claim: Constructivism's central empirical mechanism is the **norm**. Norms are not just rules that constrain behavior; they are **shared expectations** that constitute identities, define appropriate behavior, and produce the social world in which states operate. Understanding norms — how they emerge, diffuse, and become internalized — is the key to understanding social construction.

Constitutive vs. regulative norms. A crucial distinction, developed by John Searle and applied to IR by

Onuf, Kratochwil, and others:

- **Regulative norms** "regulate" pre-existing activities. They tell actors what they should do within a given activity. *Example:* traffic rules regulate driving, but they do not constitute the activity of driving.
- **Constitutive norms** "constitute" the activity itself. They create the possibility of the activity. *Example:* the rules of chess constitute the game; without them, there is no game. Similarly, the norm of sovereignty **constitutes** the state as a sovereign entity — it is not a rule that states obey or violate, but the rule that makes "statehood" possible in the first place.

The logic of appropriateness. James March and Johan Olsen distinguished two logics of action:

- **Logic of consequences:** Actors calculate costs and benefits and choose the action that maximizes expected utility. This is the logic of rational choice, realism, and institutionalism.
- **Logic of appropriateness:** Actors ask "What kind of situation is this? What is my role? What is the appropriate behavior for someone like me in this situation?" They act according to **norms and identities**, not just interests.

The logic of appropriateness is the mechanism by which norms influence behavior. States do not just calculate; they **interpret their identity and the situation**, and they act in ways that are consistent with that interpretation.

The norm life cycle. Martha Finnemore and Kathryn Sikkink's 1998 article "International Norm Dynamics and Political Change" provides the most influential model of how norms emerge and diffuse. The model has three stages:

1. **Norm emergence:** Norm entrepreneurs — individuals or organizations — attempt to persuade a critical mass of states to adopt a new norm. *Example:* the anti-slavery movement; the anti-landmine campaign; the campaign for the ICC.
2. **Norm cascade:** Once a critical mass of states adopts the norm (often a "tipping point" of about one-third of states), the norm begins to cascade. States adopt it not because they are convinced but because they want to be seen as legitimate by their peers. *Mechanism:* socialization, shaming, and the desire for status.
3. **Norm internalization:** The norm becomes taken for granted — it is no longer contested, and it shapes behavior automatically. *Example:* the prohibition on slavery; the prohibition on chemical weapons; the norm of decolonization.

Socialization. How do norms diffuse? The key mechanism is **socialization** — the process through which actors are inducted into the norms and identities of a community. Alastair Iain Johnston's *Social States* (2008) shows that states can be socialized into new norms through **instrumental adaptation** (imitating successful states), **social influence** (wanting to be seen as legitimate), and **persuasion** (genuinely changing beliefs). The EU and NATO are paradigmatic cases of socialization: candidate states adopt norms not just because they are forced to, but because they want to be accepted as members.

Observable implication. If the norm life cycle is operative, you should see (a) the emergence of new norms through entrepreneurial advocacy, (b) a cascade once a critical mass of states adopts them, and (c) internalization such that violations become rare and costly.

Scope condition. The norm life cycle is not universal. It works best when the norm is **specific**, **consistent with existing norms**, and **endorsed by powerful actors**. It works least well when the norm is **contested**

(e.g., R2P, humanitarian intervention, the ban on autonomous weapons).

2.4 KEY IDEA 3 — Ontological security: states seek identity continuity, not just physical survival

The claim: One of the most important constructivist contributions to IR is the concept of **ontological security** — the security of a state's **self-identity**, not just its physical survival. States do not just want to survive; they want to be **who they are**, and they will sometimes act against their material interests to preserve their identity.

The concept. Ontological security was developed by Anthony Giddens in sociology and applied to IR by Jennifer Mitzen and Brent Steele.

- **Mitzen's argument:** States seek **biographical continuity** — a stable sense of self that persists over time. Ontological security is achieved through **routines** — repeated practices that confirm the state's identity. Even adversarial relationships can provide ontological security: the US and the Soviet Union during the Cold War were each other's **significant other** — the enemy that confirmed the other's identity. The end of the Cold War was not just a material event; it was an **identity crisis** for both the US and Russia, which had to reconstruct their identities without the other as a permanent enemy.
- **Steele's argument:** States care about **honor, status, and reputation** — not just material interests. When a state's identity is threatened, it may act to defend its identity even at high material cost. Steele's *Ontological Security in International Relations* (2008) argues that states have an "identity security dilemma": their actions to preserve their identity can trigger anxiety and conflict.

The mechanism. Ontological security is maintained through:

1. **Routines:** Repeated practices that confirm identity. *Example:* the regular meetings of the EU Council, which confirm the member states' identities as "Europeans."
2. **Narratives:** Stories that states tell about themselves. *Example:* the "century of humiliation" narrative in China, which confirms China's identity as a rising power correcting historical wrongs.
3. **Significant others:** External actors who confirm the state's identity by opposing or supporting it. *Example:* Britain's relationship with the US, which confirms Britain's identity as a great-power ally; Russia's relationship with the West, which confirms Russia's identity as a sovereign great power.
4. **Anxiety management:** When routines are disrupted, states experience anxiety, and they may engage in **defensive identity practices** to restore ontological security.

The Russian case. The collapse of the Soviet Union was the most dramatic ontological security crisis of the twentieth century. Russia lost its empire, its ideology, and its identity as a superpower. The Putin regime has constructed a new narrative — Russia as a "sovereign civilization" defending traditional values against Western liberalism — that provides ontological security. The Ukraine war can be read, in part, as a **defensive identity practice**: Ukraine's drift toward the West threatens Russia's narrative of itself as the leader of the Russian world.

The Chinese case. China's "century of humiliation" narrative is a paradigmatic case of ontological security. The narrative constructs China's identity as a victim of imperialism that is now rising to correct historical wrongs. This narrative shapes Chinese responses to perceived slights — e.g., the response to NATO's bombing of the Chinese embassy in Belgrade in 1999, or the response to criticism of China's human rights record.

What ontological security contributes: It explains **why states sometimes act against material interests** — to preserve identity, status, and honor. It also explains **why conflicts can persist** even when material conditions change — because the conflict provides ontological security for the parties involved.

What it occludes: It can be **tautological** — any action can be explained as serving ontological security, so the concept can become unfalsifiable. It can underplay **material constraints** — states cannot always afford to preserve their identity at high material cost. And it can be **hard to operationalize** — how do you measure ontological security?

2.5 KEY IDEA 4 — The English School: international system, international society, world society

The claim: The English School provides a distinct framework for analyzing international order — one that is neither purely realist (power) nor purely liberal (cooperation) but **social**: it asks whether states form a **society**, not just a **system**, and how that society is constituted and expanded.

The three concepts. Hedley Bull's *The Anarchical Society* (1977) is the canonical statement. Bull distinguishes:

1. **International system:** Two or more states interact with sufficient frequency that their behavior affects each other. The system is defined by **interaction** — trade, war, diplomacy. Interaction may be conflictual or cooperative; the system exists as long as states interact.
2. **International society:** A group of states **conscious of common interests and common rules**, and **sharing institutions**. The society is defined by **shared norms and institutions** — sovereignty, diplomacy, international law, the balance of power, war. States in an international society recognize each other as legitimate members and are bound by common rules.
3. **World society:** A society of **individuals**, not just states — a cosmopolitan order in which human beings, not states, are the primary subjects. The concept is aspirational: it describes the possibility of a global civil society or a cosmopolitan order that transcends the society of states.

The English School's key insight. The international order is neither a war of all against all (as realism suggests) nor a liberal institutional order (as institutionalism suggests). It is an **anarchical society** — a society without a government, held together by shared norms and institutions. The English School asks: **What are the institutions that sustain international society, and how do they work?**

Primary vs. secondary institutions. This is one of the most useful concepts in the English School (especially as developed by Barry Buzan). It distinguishes:

- **Primary institutions:** Deep, historically evolved practices that constitute international society. They are not created by any single act; they emerge over time. *Examples:* sovereignty, territoriality, diplomacy, great-power management, the balance of power, international law, war, nationalism, the market.
- **Secondary institutions:** Formal, created organizations. They are the specific, contemporary instantiations of primary institutions. *Examples:* the UN, the WTO, the ICC, the AU, NATO.

The distinction is crucial: the UN is a **secondary institution** that instantiates several **primary institutions** (sovereignty, international law, diplomacy, great-power management). It can fail as a secondary institution while the primary institutions it embodies continue to function. This is why the UN's paralysis does not mean the collapse of international society.

Pluralism vs. solidarism. The English School contains two positions:

- **Pluralism:** International society is a society of sovereign states with diverse values and interests. The primary goal is **order**, not justice. Sovereignty and non-interference are the key institutions; intervention is a threat to order. The pluralist position is associated with Bull and with the "classical" English School.
- **Solidarism:** International society has a deeper set of shared values — human rights, democracy, the rule of law — and can legitimately intervene to enforce them. The primary goal is **justice**, not just order. The solidarist position is associated with Nicholas Wheeler, Tim Dunne, and others.

The tension. The pluralism/solidarism debate is the English School's version of the realism/liberalism debate. Pluralists see order as fragile and intervention as dangerous; solidarists see order as compatible with justice and intervention as necessary. The debate is particularly relevant to Africa, where the AU's Article 4(h) is a **solidarist** innovation within a **pluralist** framework.

The expansion of international society. The English School's historical narrative is the **expansion** of European international society to the rest of the world. Bull and Adam Watson's *The Expansion of International Society* (1984) traces how the European society of states — with its specific institutions (sovereignty, diplomacy, international law) — expanded through colonialism, decolonization, and the entry of non-European states into the international system. The expansion was not neutral: it imposed European institutions on the rest of the world, and it produced resistance, adaptation, and contestation. This is the English School's most important contribution to the study of Africa: it provides a framework for understanding how African states entered the international society, what they made of it, and how they have shaped it.

What the English School contributes: It provides the **conceptual vocabulary** for analyzing international order as a social phenomenon — not just power (realism) or institutions (institutionalism). It also provides the **historical narrative** of the expansion of international society, which is essential for understanding the post-colonial world.

What it occludes: It can be **Eurocentric** — the "expansion" narrative is told from the perspective of the expanding powers, not the expanded. It can **underplay material power** — the English School's focus on norms and institutions can obscure the role of coercion and exploitation. And it can be **conservative** — the pluralist emphasis on order can justify inaction in the face of injustice.

2.6 KEY IDEA 5 — The five perspectives engage constructivism and the English School differently, and each engagement is political

The claim: Constructivism and the English School are not neutral frameworks. They are **traditions** with specific historical origins and political implications. The five perspectives — African, Chinese, Russian, Western, and UN — engage with them differently, and those engagements are political.

2.6.1 The African perspective (primary) Core commitments. African scholars engage with constructivism and the English School in three distinct ways:

1. **Sovereignty as a social construct with a colonial genealogy.** African constructivists accept that sovereignty is socially constructed, but they insist that its construction was **colonial**. The sovereignty that African states inherited was not a neutral institution; it was a product of the Berlin Conference, the

mandate system, and the decolonization struggle. The African critique is that Western constructivism often treats sovereignty as an abstract social construct, ignoring the **racial hierarchy** that structured its construction and continues to structure its application.

2. **Pan-Africanism as norm entrepreneurship.** African states and intellectuals have been **norm entrepreneurs** in international society. The OAU's enshrinement of non-interference, the AU's Article 4(h), the Ezulwini Consensus on UNSC reform, and the AU's Agenda 2063 are all examples of African agency in shaping international norms. The African perspective emphasizes that African states are **not just objects** of norm diffusion but **creators** of norms.
3. **The AU as an international society.** The AU is a self-conscious project of building an **African international society** — a regional society of states with its own norms, institutions, and identity. The AU's Constitutive Act is a constitution-like document that establishes a set of primary institutions for the African region. The African perspective uses the English School's vocabulary to analyze the AU, but it also critiques the English School for its Eurocentrism.

The critique of the English School. African scholars critique the English School's "expansion" narrative for being **Eurocentric**: it treats the expansion of European international society as the story of international society, rather than as the story of European imperialism. The African perspective insists that the history of international society must include the **resistance and agency** of colonized peoples — the Bandung Conference, the Non-Aligned Movement, the anti-apartheid struggle, and the creation of the AU.

What this perspective contributes: It shows that constructivism and the English School can be **deployed for decolonial purposes** — to analyze how norms were constructed to serve colonial interests, and how they can be reconstructed to serve African interests. It also shows that African states are **agents** of international society, not just subjects of it.

What it occludes: It can underplay the **genuine diversity** of African positions — not all African states agree on norms (e.g., on the ICC, on intervention, on UNSC reform). It can also risk **essentializing** "African norms" as a unified tradition.

2.6.2 The Chinese perspective **Core commitments.** Chinese scholars have developed a distinctive engagement with constructivism, which is often called **relational constructivism**.

1. **Qin Yaqing's relational theory.** Qin Yaqing, the founder of the Chinese School of relational theory, argues that **relations, not states, are the basic units** of international politics. This is a constructivist argument, but it is grounded in **Chinese philosophy** — the **yin-yang** dialectic and the **zhongyong** (doctrine of the mean) — rather than in Western social theory. Qin's relationalism is a **constructivism without norms**: it emphasizes the **process** of interaction and the **relationships** that constitute actors, rather than the norms that constrain them.
2. **The English School and Chinese thought.** Chinese scholars have engaged with the English School because it provides a framework for analyzing international society **without** assuming a Western liberal order. The English School's concept of a **hierarchical international society** resonates with Chinese thinking about **Tianxia** (all under heaven) — a hierarchical order in which the legitimate ruler provides order for all.
3. **Civilizational state.** The Chinese concept of the **civilizational state** is a constructivist claim: China is not a nation-state but a **civilization** that has persisted for millennia. This claim shapes China's identity and interests — it justifies a foreign policy oriented toward **civilizational survival** rather than just territorial security.

The political project. The Chinese engagement with constructivism is part of the broader project of **epistemic sovereignty** — the claim that Chinese thought provides an **alternative** to Western social theory, and that China should not be confined to Western frameworks.

What this perspective contributes: It provides a **constructivism from below** — a theory that starts from relationships and processes rather than from states and norms. It also shows that the English School's concepts can be **provincialized** — used to analyze non-Western forms of international society.

What it occludes: It can underplay the **coercive dimension** of Chinese power — the ways in which relationships can be hierarchical and exploitative. It can also **essentialize** "Chinese thought" as a unified tradition.

2.6.3 The Russian perspective **Core commitments.** Russian scholarship and official discourse engage with constructivism through the lens of **civilizational identity** and **ontological security**.

1. **Civilizational constructivism.** Russian scholars argue that Russia is a **distinct civilization** with its own values, history, and mission. This is a constructivist claim — Russian identity is constructed — but it is used to justify a **realist** foreign policy: Russia must defend its civilization against Western encroachment. The "Russian world" (*Russkiy mir*) is a constructivist concept — a transnational community united by language, culture, and Orthodox Christianity — that provides ontological security for Russia.
2. **Ontological insecurity after the Cold War.** The collapse of the Soviet Union produced a profound ontological security crisis. Russia lost its identity as a superpower, its empire, and its ideology. The Putin regime's construction of Russia as a "sovereign civilization" is a response to this crisis. The Ukraine war can be analyzed as an **ontological security practice**: Russia is defending its narrative of itself as a great power with a sphere of influence.
3. **The critique of Western constructivism.** Russian scholars critique Western constructivism for being **normative** — for assuming that the spread of liberal norms is progressive and that resistance to them is illegitimate. The Russian perspective insists that **all** identities are constructed, including Western identities, and that the Western claim to universality is itself a construction.

The political project. The Russian engagement with constructivism is **defensive**: it uses constructivist concepts to defend a **realist** foreign policy and to resist the spread of liberal norms.

What this perspective contributes: It shows that constructivism can be used for **illiberal purposes** — to construct a civilizational identity that justifies aggression. It also shows that **ontological insecurity** is a real and powerful force in international politics.

What it occludes: It can naturalize aggression by framing it as a defense of identity. It can also treat "Russian civilization" as a monolith, erasing internal diversity and dissent.

2.6.4 The Western perspective **Core commitments.** The Western tradition is the **home** of both constructivism and the English School. Both emerged from Western academic debates, and both remain predominantly Western in their institutional locations and their empirical focus.

1. **Constructivism: from critical to mainstream.** Constructivism began as a **critical** challenge to rationalist IR — Wendt's 1992 article was a direct response to Waltz. But over time, it became **mainstream**: it is now taught in every IR department, published in the top journals, and used by governments and international organizations. This mainstreaming has strengths (constructivism is now part of the dis-

ciplinary toolkit) and weaknesses (it has lost some of its critical edge).

2. **The English School: a distinct tradition.** The English School is a **distinct** Western tradition — neither realist nor liberal, but **social**. Its key figures — Wight, Bull, Watson, Buzan, Dunne — are all Western, and its historical focus is overwhelmingly on the **European** experience. The English School's strengths are its historical depth and its conceptual vocabulary; its weaknesses are its Eurocentrism and its conservatism.

The internal debates. Western constructivism and the English School are internally contested:

- **Thin vs. thick constructivism:** "Thin" constructivism (Wendt) accepts the basic rationalist framework and adds ideas; "thick" constructivism (Onuf, Kratochwil) rejects the rationalist framework altogether and emphasizes the **linguistic** constitution of reality.
- **Pluralism vs. solidarism:** The English School's central debate, as described above.
- **Critical vs. problem-solving:** Whether constructivism should be a critical theory (Cox) or a problem-solving theory (Wendt).

What this perspective contributes: It provides the **most developed** versions of both constructivism and the English School, and the most systematic **self-critique** of each.

What it occludes: It can be **parochial** — treating Western experiences as universal. It can be **self-referential** — a debate among Western scholars about Western scholars, with little engagement with non-Western traditions. And it can be **complicit** — constructivism's emphasis on norms and identities can be used to obscure the material power that shapes which norms and identities prevail.

2.6.5 The UN perspective **Core commitments.** The UN is the **institutional embodiment** of international society. Its Charter is a constitution for the society of states; its institutions — the General Assembly, the Security Council, the ICJ — are the core of the multilateral system; its normative discourse is the most explicit statement of international society's shared values.

1. **The UN as a norm entrepreneur.** The UN has been a **norm entrepreneur** in international society. The Universal Declaration of Human Rights (1948), the Genocide Convention (1948), the decolonization resolutions (1960), the R2P framework (2005), the Sustainable Development Goals (2015), and the *Pact for the Future* (2024) are all examples of UN norm entrepreneurship. The UN's norms are not just rules; they are **constitutive** of international society's identity.
2. **The UN as an arena of contestation.** The UN is not just a norm entrepreneur; it is also an **arena** in which norms are contested. The Security Council is divided between the P5; the General Assembly is divided between blocs; the Human Rights Council is divided between the West and the rest. The UN's normative discourse is a **compromise** between competing visions of international society — pluralist and solidarist, Western and post-colonial, liberal and conservative.
3. **The UN as the institutionalization of the English School's "international society."** The UN is the closest thing to an **institutionalized** international society. Its Charter enshrines the primary institutions of sovereignty, non-interference, and the prohibition on force; its organs instantiate the secondary institutions of diplomacy, law, and collective security. The UN's **legitimacy** rests on its claim to represent the society of states.

What this perspective contributes: It provides the **normative benchmark** — the standards against which international society's performance is judged. It also provides the **institutional record** — the resolutions,

reports, and debates that are essential evidence for any analysis.

What it occludes: It can **depoliticize** — framing norms as universal obscures the power dynamics that shape them. It can **legitimize** — the UN's authority can be used to justify actions that serve the interests of the powerful. And it can **underplay** the gap between the UN's normative commitments and its actual practice.

2.6.6 The comparison matrix

Dimension	African (primary)	Chinese	Russian	Western	UN
Engagement with constructivism	Sovereignty as colonial construct; Pan-African norm entrepreneurship	Relational constructivism; civilizational state	Civilizational constructivism; ontological insecurity	Home of constructivism; thin vs. thick; critical vs. problem-solving	Norm entrepreneur; arena of contestation
Engagement with English School	AU as African international society; critique of Eurocentrism	Hierarchical society; Tianxia	Civilizational society; sphere of influence	Home of English School; pluralism vs. solidarism	Institutional embodiment of international society
Key contribution	Colonial genealogy; African agency	Relational process; alternative ontology	Ontological security; illiberal constructivism	Most developed versions; self-critique	Normative benchmark; institutional record
Key occlusion	Diversity of African positions	Coercive dimension of relationships	Naturalization of aggression	Parochialism; complicity	Power dynamics; gap between norms and practice

---

2.7 WORKED EXAMPLE (I do)

The puzzle: The **Responsibility to Protect (R2P)** was adopted unanimously by the UN General Assembly at the 2005 World Summit. It seemed to be a new global norm — a commitment that states would protect populations from genocide, war crimes, ethnic cleansing, and crimes against humanity, and that the international community would intervene if a state failed to do so. Yet in the two decades since, R2P has been invoked inconsistently and has been contested by many states, particularly in Africa and the Global South. Why did a norm that seemed to have universal support become so contested?

The puzzle stated precisely: *Why did R2P, adopted unanimously in 2005, fail to become an internalized international norm, and why is it contested by the very states it was designed to protect?*

Constructivist analysis:

- **Norm emergence:** R2P emerged from the **norm entrepreneurship** of the International Commission on Intervention and State Sovereignty (ICISS), established by the Canadian government in 2000. The Commission's report reframed sovereignty as **responsibility** — a state that fails to protect its population loses its claim to sovereignty. This was a **constitutive** move: it changed the meaning of sovereignty.
- **Norm cascade:** R2P cascaded after the 2005 World Summit, when it was endorsed by the General Assembly and the Security Council. States adopted it because it was endorsed by the UN and because they wanted to be seen as legitimate. But the cascade was **shallow**: many states endorsed R2P without fully internalizing it.
- **Norm internalization:** R2P has **not** been internalized. It is invoked inconsistently; it is contested by Russia, China, and many African states; and it has not changed state behavior in cases like Syria, Myanmar, and Gaza.

The contestation. Why has R2P not been internalized? Constructivism suggests several reasons:

1. **The norm is contested in its content.** What counts as "failure to protect"? Who decides? The ICISS report said the Security Council should decide, but the Council is divided.
2. **The norm is contested in its application.** The Libya intervention (2011) was justified in R2P terms, but it became a regime-change operation, which confirmed the suspicions of Russia, China, and many African states that R2P is a **Western instrument**.
3. **The norm is contested in its genealogy.** Many African and post-colonial states see R2P as a **recolonization** of the humanitarian impulse — a new "standard of civilization" that justifies intervention in the Global South.
4. **The norm is contested in its distribution.** R2P is invoked against weak states but not against powerful ones. This **selectivity** undermines its legitimacy.

The African perspective. The African engagement with R2P is **complex**. On one hand, the AU's Article 4(h) is a **solidarist** innovation — a collective right of intervention in genocide, war crimes, and crimes against humanity. On the other hand, African states have been **skeptical** of R2P because it has been used selectively and because it threatens the sovereignty that African states fought for. The African position is not a rejection of R2P but a **demand for its multilateralization** — intervention should be authorized by the UN or the AU, not by ad hoc Western coalitions.

The Chinese and Russian perspectives. China and Russia have consistently contested R2P, framing it as a Western instrument for regime change. They emphasize **sovereignty and non-interference**, and they argue that R2P is a violation of the UN Charter. Their position is a **pluralist** one: order requires respecting sovereignty, not intervening to enforce justice.

The Western perspective. Western states are the **principal advocates** of R2P, but they are also its **principal violators**: they invoke it selectively and they resist its application to their own actions. The Western position is **solidarist** in rhetoric but **pluralist** in practice.

The UN perspective. The UN has tried to **institutionalize** R2P through the office of the Special Adviser on the Prevention of Genocide and the Responsibility to Protect, and through the "three pillars" framework (the state's responsibility to protect; the international community's responsibility to assist; the international community's responsibility to intervene). The UN's position is that R2P is a **Charter-based** norm, not a Western imposition.

Adjudication. Which theory best explains R2P's contested status?

- **Constructivism** explains the **emergence** of R2P and its **shallow cascade**. It also explains why the norm has not been internalized: the norm is contested in its content, application, and genealogy.
- **The English School** explains the **pluralism/solidarism** tension: R2P is a solidarist norm in a pluralist international society. The contestation is not a failure of R2P; it is a **structural feature** of international society.
- **Realism** explains **why R2P is invoked selectively**: the powerful invoke it when it serves their interests and ignore it when it does not.
- **Post-colonial theory** explains **why R2P is contested in the Global South**: it reproduces the colonial trope of the "civilized" intervening in the "uncivilized."

A complete explanation combines all four: R2P is a **genuinely new norm** that emerged through entrepreneurship and cascaded through the UN system; but its **internalization** has been blocked by the **pluralist structure** of international society, the **selective application** of the norm by the powerful, and the **post-colonial suspicion** that it is a new form of Western interventionism. The contestation over R2P is not a failure of the norm; it is a **window into the deeper contestation** over what international society is and should be.

2.8 PROBLEM PAIR (We do)

Your task: Analyze the following case using the apparatus above. Write your analysis before reading the model answer.

The case: The **African Union's Constitutive Act** (2000) created a novel set of norms for the African region: it retained **non-interference** (Article 4(g)) but added a **right of the Union to intervene** in a member state in cases of genocide, war crimes, and crimes against humanity (Article 4(h)), and a **condemnation of unconstitutional changes of government** (Article 4(p)). The AU has invoked Article 4(p) to suspend member states after coups (Mali, Guinea, Burkina Faso, Niger, Gabon), but it has never invoked Article 4(h) to intervene in a member state. Why did the AU create a norm it has never used?

Your tasks:

1. State the puzzle precisely: why did the AU create a right of intervention (Article 4(h)) that it has never invoked?
2. Apply the constructivist mechanisms: how did the norm emerge? Who were the norm entrepreneurs? What was the norm cascade? Has it been internalized?
3. Apply the English School: is the AU a **pluralist** or **solidarist** international society? How does Article 4(h) fit into the pluralism/solidarism debate?
4. Reconstruct the African perspective: how do African states themselves explain the gap between the norm's creation and its non-use?
5. Write a 300-word adjudication: is the AU's Article 4(h) a **failed norm**, a **symbolic norm**, or a **norm in waiting**?

Model answer (compare after writing your own):

Puzzle: Why did the AU create a right of intervention in Article 4(h) that it has never invoked?

Constructivist analysis: - **Norm emergence:** Article 4(h) emerged from the **learning process** after the

Rwandan genocide (1994). The OAU's absolute non-interference was widely seen as having enabled the genocide. The norm entrepreneurs were African leaders and intellectuals — particularly those involved in the AU's creation — who argued that the OAU's principle of non-interference had to be modified to prevent future atrocities. - **Norm cascade:** The norm cascaded within Africa because it was endorsed by the AU Assembly and because it was consistent with the emerging global norm of R2P. But the cascade was **regional**, not global. - **Norm internalization:** The norm has **not** been internalized in practice. The AU has never invoked Article 4(h) to intervene. This suggests that the norm is **symbolic** rather than operational.

English School analysis: The AU is a **pluralist** international society with **solidarist** aspirations. Article 4(g) enshrines pluralism; Article 4(h) enshrines solidarism. The tension between them is the AU's central normative dilemma. The AU's non-use of Article 4(h) reflects the **pluralist** structure of the AU: member states are reluctant to authorize intervention in each other's affairs, even when the norm permits it.

African perspective: African states themselves explain the gap in three ways: 1. **The norm is a last resort.** Article 4(h) is designed for **grave circumstances** — genocide, war crimes, crimes against humanity — and these have not occurred (or have not been recognized as occurring) in cases where the AU could intervene. 2. **The AU lacks capacity.** The AU does not have the military capacity to intervene without external support, and external support (e.g., from the UN or Western powers) is politically problematic. 3. **The norm is a deterrent.** The **existence** of Article 4(h) may deter atrocities, even if it is never invoked. The norm's **symbolic** function is as important as its operational function.

Adjudication: Article 4(h) is best understood as a **norm in waiting** — a norm that has been created but not yet operationalized. It is not a failed norm, because it has shaped the AU's discourse and its institutional architecture (the AU's Peace and Security Council, the African Standby Force). It is not merely symbolic, because it has been invoked as a **normative resource** in debates about intervention. It is a **norm in waiting** because the conditions for its invocation — grave circumstances, AU capacity, and political will — have not yet coincided. The constructivist framework explains the norm's emergence and its shallow internalization; the English School explains the pluralist structure that constrains its use; the African perspective explains the **agency** of African states in creating and interpreting the norm.

2.9 INDEPENDENT MEMO (You do)

Produce a one-page analytical memo (500–600 words) on the following case, using the four headings below.

Case: The **"century of humiliation"** narrative in Chinese foreign policy. The narrative — which recounts China's victimization by foreign powers from the First Opium War (1839–42) to the founding of the People's Republic (1949) — is central to Chinese identity and shapes China's responses to perceived slights, its emphasis on sovereignty and non-interference, and its skepticism of Western human-rights criticism.

Memo headings:

1. **Mechanism:** How does the "century of humiliation" narrative function as a constructivist mechanism? What identities and interests does it constitute? What does it make possible and what does it foreclose?
2. **Ontological security:** How does the narrative provide ontological security for China? What anxieties does it manage? What would happen if the narrative were disrupted?
3. **Perspective reconstruction:** How would each of the five perspectives interpret the narrative?

(African, Chinese, Russian, Western, UN — one paragraph each or a table.)

4. **Falsifiers:** What evidence would show that the narrative is **not** a significant cause of Chinese foreign policy? What would show that it **is**?

Self-check: Does your memo distinguish the narrative's **constitutive** effects (how it shapes identity) from its **regulative** effects (how it constrains behavior)? Does it specify the **mechanism** by which the narrative influences policy?

2.10 HINGE QUESTION

A scholar argues: "The Cold War ended peacefully because Gorbachev and Reagan changed their ideas about each other. The material balance of power did not change significantly, but the shared understandings did." Which theoretical tradition does this argument most clearly belong to?

- A) Structural realism
- B) Neoliberal institutionalism
- C) Constructivism
- D) Offensive realism

Answer: C. The argument claims that the end of the Cold War was caused by a change in **shared understandings** (ideas), not by a change in the material balance of power. This is the core constructivist claim: ideas and identities are causally significant, and they can change independently of material conditions.

If you answered A: Structural realism would explain the end of the Cold War through changes in the distribution of power (e.g., Soviet decline), not through changes in ideas. **If you answered B:** Neoliberal institutionalism would explain the end of the Cold War through institutions (e.g., the CSCE, arms control agreements), not primarily through changes in ideas. **If you answered D:** Offensive realism would predict that the Cold War would end in conflict, not peacefully, because states maximize power.

SECTION 2A — DATA LAB (30–45 minutes)

Purpose: Ground constructivism's claims in empirical data.

Task: Using the summary data below, analyze the diffusion of **human rights norms** and **sovereignty norms** across the international system.

Table 1: Ratification of core human rights treaties (number of states parties, selected years)

Treaty	1980	1990	2000	2010	2020
ICCPR	60	90	145	165	173
CEDAW	50	100	165	186	189
Convention on the Rights of the Child	0	100	191	193	196
Rome Statute (ICC)	—	—	20	114	123
Convention Against Torture	20	60	120	147	170

Table 2: UN General Assembly votes on R2P-related resolutions (illustrative)

Resolution	Year	In favor	Against	Abstain
World Summit Outcome (R2P paragraphs)	2005	190	0	0 (adopted by consensus)
Syria humanitarian access	2014	120	13	40
Myanmar R2P resolution	2019	130	8	30
Gaza ceasefire	2023	120	14	45

Analysis questions:

1. **Norm cascade:** What does the ratification data suggest about the cascade of human rights norms? Is there evidence of a **tipping point**? Which norms have cascaded most fully?
2. **Norm internalization:** Does ratification equal internalization? What evidence would you need to distinguish **formal** adoption from **genuine** internalization? (Hint: ratification is a formal act; internalization would require evidence of compliance and normative acceptance.)
3. **Contestation:** What does the R2P voting data suggest about the **contestation** of norms? Why has R2P not cascaded as fully as human rights treaties?
4. **Perspective:** How would each of the five perspectives interpret the data? (African: human rights norms are universal but their application is selective; Chinese: human rights norms are Western instruments; Russian: human rights norms are instruments of Western hegemony; Western: human rights norms are progressive; UN: human rights norms are Charter-based.)
5. **Limitation:** What does the data **not** tell you? (Hint: ratification does not measure compliance; voting does not measure belief; and the data does not capture **informal** norms.)

Rule: Complete the data lab before the independent memo.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Task: Draw the following by hand.

Visual 1: The three cultures of anarchy. Draw three boxes — Hobbesian, Lockean, Kantian. For each, write: the relationship (enemies, rivals, friends), the logic of interaction (kill or be killed, competitive coexistence, security community), and one example.

Visual 2: The norm life cycle. Draw a three-stage cycle: Norm emergence → Norm cascade → Norm internalization. For each stage, write the key actors, the mechanism, and one example.

Visual 3: The English School's three concepts. Draw three concentric circles: International system (outer), International society (middle), World society (inner). For each, write the defining feature and one example.

SECTION 4 — CORNELL NOTES

Set up your notes with the following cue column:

Cue column	Notes
What is constructivism's core claim?	Anarchy is what states make of it; identities and interests are socially constructed through interaction
What are the three cultures of anarchy?	Hobbesian (enemies); Lockean (rivals); Kantian (friends)
What is the difference between regulative and constitutive norms?	Regulative norms regulate pre-existing activities; constitutive norms constitute the activity itself
What is the norm life cycle?	Emergence → cascade → internalization (Finnemore & Sikkink)
What is ontological security?	The security of a state's self-identity; states seek biographical continuity and manage anxiety
What are the English School's three concepts?	International system (interaction); international society (shared norms and institutions); world society (individuals)
What is the pluralism/solidarism debate?	Pluralism: order through sovereignty and non-interference; solidarism: order through shared values and intervention
What are primary vs. secondary institutions?	Primary: deep, historically evolved practices (sovereignty, diplomacy); secondary: formal organizations (UN, WTO)
How do the five perspectives engage constructivism and the English School?	African: colonial genealogy + agency; Chinese: relational constructivism; Russian: civilizational constructivism; Western: home tradition; UN: institutional embodiment
Source log	Lesson text, Sections 2.2–2.6; Wendt (1992, 1999); Onuf (1989); Kratochwil (1989); Finnemore & Sikkink (1998); Mitzen (2006); Steele (2008); Bull (1977); Buzan (2004)
Summary	3–5 sentences synthesizing the lesson

SECTION 5 — FEYNMAN COMPRESSION

Step 1: Explain the constructivist argument to a smart non-specialist in 150–200 words, without using jargon. If you must use "anarchy," "norms," or "identity," define them in plain language.

Step 2: Mark every point where you hesitated or used a term you could not define.

Step 3: Reread only the gaps. Rewrite.

Step 4: Produce one analogy for social construction. Then state where the analogy breaks down. (Example: "Social construction is like the game of chess — the pieces have no meaning outside the rules of the game,

and the rules create the possibilities for action. But unlike chess, international politics has no rulebook that exists independently of the players; the rules themselves are contested and changing." Where it breaks down: chess has a fixed rulebook, whereas international politics has no fixed rules — the rules are what the players are arguing about.)

SECTION 6 — SPACED-REPETITION FLASHCARDS

Produce 12–15 cards. Use the following types:

Type	Example
Definition	What is the difference between constitutive and regulative norms?
Mechanism	How does the norm life cycle explain the diffusion of human rights norms?
Application	A state changes its identity from "enemy" to "friend" through repeated interaction. Which constructivist mechanism does this illustrate?
Comparison	How do the English School's three concepts (system, society, world society) differ?
Source	What did Wendt mean by "anarchy is what states make of it"?
Debate	What is the strongest objection to the constructivist claim that "ideas matter"?
Reconstruction	How would an African post-colonial scholar critique the English School's "expansion" narrative?
Occlusion	What does constructivism fail to see about material power?
Adjudication	Which theory best explains the contestation over R2P, and what does it miss?
Visual	Label the three cultures of anarchy on a diagram.

Tag each card: `L7`, `constructivism`, `English School`, `norms`, `perspective`, `difficulty`.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence audit

Rate confidence (0–100%) before checking:

Objective	Confidence
Reconstruct Wendt's constructivist argument	
Apply the norm life cycle to a case	

Objective	Confidence
Explain ontological security and its implications	
Distinguish the English School's three concepts	
Reconstruct the five perspectives on constructivism and the English School	

After exercises, rate accuracy. Calculate the gap.

7.2 Three-question debrief

1. What did I misunderstand about the relationship between ideas and material power?
2. Which perspective was easiest to reconstruct? Which was hardest? What does that suggest about my default analytical style?
3. What will I do differently in Lesson 8?

7.3 Error log

Date	Lesson	Error type	Correct understanding	Card created?
	L7			

SECTION 8 — CHEATSHEET (Module 1)

Add this row to your Module 1 cheatsheet:

Column	Content
Core concepts	Social construction; anarchy is what states make of it; constitutive vs. regulative norms; logic of appropriateness; norm life cycle; ontological security; international system/society/world society; pluralism/solidarism; primary vs. secondary institutions
Key mechanisms	Interaction → shared understandings → identities/interests; norm entrepreneurship → cascade → internalization; routines → ontological security; expansion of international society → contestation
Theories and authors	Wendt; Onuf; Kratochwil; Finnemore & Sikkink; Mitzen; Steele; Bull; Wight; Watson; Buzan; Qin Yaqing

Column	Content
Cases and evidence	End of the Cold War; R2P; ICC and Africa; AU Article 4(h); "century of humiliation"; human rights treaty ratification
Debates	Do ideas matter independently of power? Is international society pluralist or solidarist? Is constructivism critical or problem-solving?
Falsifiers	What evidence would show that ideas do not matter — that material power determines outcomes regardless of shared understandings?
Cross-links	L4 (post-positivism — the epistemology of constructivism); L5 (realism — the foil); L6 (institutionalism — the extension); L8 (critical theory — the radicalization); L24 (cognitive warfare — the weaponization of constructed identities); L28 (AU norms); L35 (post-Soviet ontology); L42 (Iranian identity)

SECTION 9 — REVIEW SCHEDULE

Review	Timing	Format
R1	Today	Retrieval warm-up + card creation
R2	2–3 days	Cue-column recall + hinge variant
R3	1 week	Mixed quiz with L1–L7 cards
R4	3–4 weeks	Interleaved problem combining L7 with L4 (post-positivism) and L8 (critical theory)
R5	End of Module 1	Cheatsheet reconstruction from memory

SECTION 10 — COMPLETION CHECKLIST

- ☐ Retrieval warm-up completed from memory
- ☐ Five learning objectives read and understood
- ☐ Five key ideas studied with mechanisms and scope conditions
- ☐ Perspective comparison matrix filled from memory, then checked
- ☐ Worked example (R2P) studied and self-explained
- ☐ Problem pair (AU Article 4(h)) attempted and compared

- ☐ Independent memo produced (500–600 words)
- ☐ Hinge question answered correctly (or reteaching completed)
- ☐ Data lab completed before independent memo
- ☐ Three dual-coded visuals drawn
- ☐ Cornell notes with cue column, source log, and summary
- ☐ Feynman explanation written, gaps identified, rewritten
- ☐ 12–15 flashcards created with tags
- ☐ Confidence audit and error-log entry
- ☐ Cheatsheet entry added
- ☐ R2 review scheduled

FURTHER READING (Optional — for deepening, not required)

- **On constructivism:** Alexander Wendt, "Anarchy is What States Make of It," *International Organization* (1992); Alexander Wendt, *Social Theory of International Politics* (1999), ch. 1–3; Nicholas Onuf, *World of Our Making* (1989); Friedrich Kratochwil, *Rules, Norms, and Decisions* (1989).
- **On norms:** Martha Finnemore and Kathryn Sikkink, "International Norm Dynamics and Political Change," *International Organization* (1998); Martha Finnemore, *National Interests in International Society* (1996); Alastair Iain Johnston, *Social States* (2008).
- **On ontological security:** Jennifer Mitzen, "Ontological Security in World Politics," *European Journal of International Relations* (2006); Brent Steele, *Ontological Security in International Relations* (2008); Anthony Giddens, *Modernity and Self-Identity* (1991).
- **On the English School:** Hedley Bull, *The Anarchical Society* (1977); Martin Wight, *Systems of States* (1977); Hedley Bull and Adam Watson, *The Expansion of International Society* (1984); Barry Buzan, *From International to World Society?* (2004); Tim Dunne, *Inventing International Society* (1998); Nicholas Wheeler, *Saving Strangers* (2000).
- **On African engagement:** Siba Grovogui, *Sovereigns, Quasi-Sovereigns, and Africans* (1996); the AU Constitutive Act; the Ezulwini Consensus (2005); Kwaku Danso and Kwesi Aning, "African Experiences and Alternativity in International Relations Theory" (2019).
- **On Chinese constructivism:** Qin Yaqing, *A Relational Theory of World Politics* (2018); Zhao Tingyang, *Tianxia* (2021); Yan Xuetong, *Ancient Chinese Thought, Modern Chinese Power* (2011).
- **On Russian constructivism:** Andrei Tsygankov, *Russia and the West from Alexander to Putin* (2012); Lauri Mälksoo, *Russian Approaches to International Law* (2015); the Valdai Club reports on Russian identity and multipolarity.
- **On R2P:** ICISS, *The Responsibility to Protect* (2001); the 2005 World Summit Outcome Document, paragraphs 138–139; Alex Bellamy, *Responsibility to Protect* (2015); UN Secretary-General reports on R2P.

End of Lesson 7. Say **"Next"** when you are ready for Lesson 8 (Critical, Marxist, Post-Colonial, and Feminist/Queer IR).

9. Critical, Marxist, Post-Colonial, and Feminist/Queer IR: The Politics of Knowledge, Class, Race, and Gender

LESSON METADATA

Field	Entry
Lesson number and title	L8 — Critical, Marxist, Post-Colonial, and Feminist/Queer IR
Module	Module 1: Epistemological and Ontological Foundations
Prerequisites	L4 (positivism/post-positivism, the linguistic turn); L5 (realism); L6 (institutionalism); L7 (constructivism, ontological security)
Interleaved links	Forward to L9–14 (historical architecture), L15–19 (IPE — world-systems, dependency), L27–34 (African state formation, conflict political economy), L41–46 (West Asia — sectarian and gendered framings), L50 (transnational non-state actors), L51 (climate geopolitics)
Reading load	This lesson only. Optional further reading at the end.
Content channels	Canon (quoted and summarized); primary texts (Marx, Lenin, Luxemburg, Rodney, Nkrumah, Fanon, Cabral, Cox, Gramsci, Said, Spivak, Quijano, Mutua, Grovogui, Enloe, Tickner, Peterson, Weber, Crenshaw, Lugones, Oyěwùmí, Butler, Puar — all paraphrased and analyzed here); data lab (value-chain and labor data); five perspectives
Bloom ceiling	Evaluate (adjudicate between critical traditions and between them and mainstream IR)
Estimated study time	8–10 hours including exercises

Note on self-containment: Every argument, quotation, and example you need is inside this document. Where I cite Marx, Lenin, Rodney, Nkrumah, Fanon, Cox, Gramsci, Said, Spivak, Quijano, Enloe, Tickner, Peterson, Weber, Crenshaw, Lugones, Oyěwùmí, Butler, or Puar, I summarize the argument fully enough that you do not need the original to complete the lesson. "Further Reading" is optional.

SECTION 0 — Why This Lesson Exists

Lessons 5–7 gave you the **mainstream** theoretical landscape. Realism, institutionalism, and constructivism disagree profoundly, but they share a set of **unexamined premises**: that states are the natural units of international politics, that anarchy is the fundamental condition, that the international system is a realm of formal equality among sovereigns, and that the scholar's own position — class, race, gender, colonial location — is irrelevant to the validity of their knowledge.

This lesson assembles the **traditions that interrogate those premises**. They are not "add-ons" to IR; they are **independent theorizations** of what the international is. Each begins from a different question:

- **Marxism and historical materialism:** Who owns the means of production, and how does the capitalist world-economy structure international politics? Why does the majority world remain poor despite formal independence?
- **Critical theory:** Whose interests does "problem-solving" theory serve? What would it mean for theory to be **emancipatory**?
- **Post-colonial and decolonial IR:** How was the international system constituted through colonial conquest and racial hierarchy, and how does that constitution persist? Whose knowledge counts, and whose is erased?
- **Feminist and queer IR:** How do gendered and sexualized logics constitute states, militaries, security, and the international itself? Who is made invisible by the discipline's supposedly neutral categories?

The African perspective is **primary** in this lesson, because Africa is where these traditions have been most productive — and because African scholars have produced some of the most important work in each tradition, not as "applications" of European theory but as original theorization.

This lesson has five key ideas:

1. **Marxism and historical materialism:** the capitalist world-economy as the structuring force of international politics.
2. **Critical theory:** theory is never neutral; the distinction between problem-solving and critical theory.
3. **Post-colonial and decolonial IR:** the colonial constitution of the international, and the politics of knowledge.
4. **Feminist and queer IR:** the gendered and sexualized constitution of states, security, and the international.
5. **The five perspectives** on these traditions, and the **adjudication** among them.

By the end, you can take any international outcome and ask: *Who owns the means of production? Whose knowledge is being privileged? Whose bodies are being governed? Whose labor is invisible? And how do the five perspectives reconstruct it?*

SECTION 1 — PRE-CLASS PRIMING

1.1 Retrieval warm-up (from memory)

1. From L5: What are the five variants of realism, and what is each one's core mechanism?
2. From L6: What is the difference between cooperation and harmony in Keohane's institutionalism?

3. From L7: What did Wendt mean by "anarchy is what states make of it"?
4. From L7: What is the difference between constitutive and regulative norms, and what is the norm life cycle?

Check against the previous lessons before proceeding.

1.2 Orientation questions

Hold these in mind:

- Why is Africa poor despite decades of development aid and formal independence?
- Whose knowledge counts as "theory" in IR, and whose is treated as "case material"?
- Is the state a neutral container of political authority, or is it gendered and racialized?
- What does it mean to say that "the personal is international"?

1.3 Vocabulary pre-teach

Provisional definitions; revise by the end:

Historical materialism; mode of production; base and superstructure; surplus value; primitive accumulation; imperialism; neo-colonialism; unequal exchange; dependency; world-systems; core/periphery/semi-periphery; hegemony (Gramscian); organic intellectuals; problem-solving vs. critical theory; emancipation; Orientalism; subaltern; epistemic violence; coloniality of power; coloniality of gender; intersectionality; standpoint theory; gendered ontology of the state; militarized masculinity; homonationalism; queer IR.

SECTION 2 — LESSON CORE

2.1 Learning objectives

By the end of this lesson, you can:

1. **Reconstruct** the Marxist and world-systems account of international inequality, distinguishing it from liberal and realist accounts.
2. **Apply** Cox's distinction between problem-solving and critical theory to a mainstream IR theory (realism or institutionalism).
3. **Explain** the post-colonial and decolonial critique of IR — Orientalism, subalternity, epistemic violence, coloniality of power — and apply it to a specific case.
4. **Reconstruct** the feminist and queer critique of IR — gendered ontology of the state, militarized masculinity, intersectionality, homonationalism — and apply it to a specific case.
5. **Reconstruct** how the African, Chinese, Russian, Western, and UN traditions engage with these critical traditions, and **adjudicate** among them on a specific case.

2.2 KEY IDEA 1 — Marxism and world-systems: the capitalist world-economy as the structuring force of international politics

The claim: For Marxist and world-systems approaches, the fundamental structure of international politics is **not anarchy** (realism) or **institutions** (institutionalism) or **shared ideas** (constructivism). It is **capitalism** — a global system of production, exchange, and accumulation that distributes power and wealth unequally, and that reproduces that inequality through political, military, and ideological means.

The core concepts.

Historical materialism. Marx's central claim is that the **mode of production** — the way a society organizes the production of goods — shapes the **social relations** of that society, including its politics, law, culture, and ideas. Marx's famous formulation: "The mode of production of material life conditions the general process of social, political and intellectual life. It is not the consciousness of men that determines their being, but, on the contrary, their being determines their consciousness." The **base** (the economic structure) shapes the **superstructure** (the state, law, culture, ideology) — though Marx and Engels also insisted that the relationship is not one-way.

Surplus value and exploitation. For Marx, capitalism is defined by the extraction of **surplus value** from labor. Workers produce more value than they are paid in wages, and the difference — surplus value — is appropriated by the capitalist. This is not a moral complaint; it is a structural analysis of how capitalism works. The same logic operates internationally: capital in the core extracts surplus value from labor in the periphery.

Primitive accumulation. Marx argued that capitalism was born through **primitive accumulation** — the violent dispossession of peasants, the enclosure of commons, the colonization of the Americas, the slave trade, and the expropriation of land. Rosa Luxemburg extended this argument: capitalism **requires** non-capitalist spaces to exploit and expand into. Colonialism was not an aberration of capitalism; it was **constitutive** of it.

Lenin and imperialism. V. I. Lenin's *Imperialism, the Highest Stage of Capitalism* (1917) argued that imperialism is the **monopoly stage** of capitalism: as competition within the core drives down profits, capitalists export capital to the periphery, where labor is cheap and resources are abundant. Imperialism is therefore not a policy choice but a **structural necessity** of monopoly capitalism. Lenin's argument was contested by other Marxists (e.g., Kautsky's "ultra-imperialism" thesis, which predicted that capitalists would cooperate rather than compete), but it established the framework for later dependency and world-systems theory.

Dependency theory. In the 1960s and 1970s, Latin American, African, and Caribbean scholars developed **dependency theory** as a critique of modernization theory. Andre Gunder Frank's formulation — "the development of underdevelopment" — argued that the periphery is not undeveloped because it is isolated from capitalism; it is underdeveloped **because of** its integration into capitalism on unequal terms. The periphery specializes in raw materials; the core specializes in manufactured goods; the terms of trade favor the core; and the surplus is transferred from periphery to core through unequal exchange.

Samir Amin. The Egyptian political economist Samir Amin developed dependency theory into a theory of **delinking** — the argument that the periphery cannot develop within the capitalist world-system and must delink from it to pursue autonomous development. Amin's work is one of the most important non-Western contributions to international political economy.

Walter Rodney. The Guyanese historian Walter Rodney's *How Europe Underdeveloped Africa* (1972) is the most influential application of dependency theory to Africa. Rodney argued that Africa's underdevelopment

was **produced** by European colonialism: the slave trade, the extraction of resources, the destruction of local industries, and the imposition of monoculture economies. His central claim: "Underdevelopment is not the absence of development; it is a product of the development of capitalism."

Kwame Nkrumah. Ghana's first president, in *Neo-Colonialism: The Last Stage of Imperialism* (1965), argued that formal independence did not end colonial exploitation. "The State which is subject to it is, in theory, independent and has all the outward trappings of international sovereignty. In reality its economic system and thus its political policy is directed from outside." Nkrumah's concept of **neo-colonialism** became a foundational concept in African IR.

World-systems analysis. Immanuel Wallerstein's **world-systems analysis** generalizes dependency theory into a historical sociology of the capitalist world-economy. The world-system has three zones:

- **Core:** high-wage, high-technology, high-profit production; strong states; diversified economies.
- **Periphery:** low-wage, low-technology, low-profit production; weak states; monoculture economies.
- **Semi-periphery:** intermediate; a mix of core and peripheral production; often the site of political contestation.

The key insight is that the **world-system is a single unit of analysis** — it is not a collection of separate national economies but a single division of labor. Giovanni Arrighi's *The Long Twentieth Century* (1994) added a theory of **hegemonic cycles**: hegemony is not just military dominance but a combination of production, finance, and military power, and hegemonic powers rise and decline through predictable cycles.

Gramscian hegemony. Antonio Gramsci's concept of **hegemony** — developed in his *Prison Notebooks* — is the most important Marxist contribution to IR after Lenin. For Gramsci, hegemony is not just coercion but **consent**: a ruling class maintains power not only through force but through **ideological** dominance — by making its worldview appear as common sense. Robert Cox applied this to IR: **hegemony** is "an order within a world economy with a dominant mode of production which penetrates into all countries and links into other subordinate modes of production," supported by "a complex of international social relationships which connect the social classes of the different countries," and expressed in "a particular configuration of forces" — material, institutional, and ideational.

What Marxism and world-systems contribute: They explain **structural inequality** — why the majority world remains poor despite formal independence and decades of development aid. They explain **the colonial origins of capitalism** — why slavery, dispossession, and extraction were not aberrations but constitutive of the system. They explain **the role of ideology** — how the powerful make their interests appear as universal common sense.

What they occlude: They can be **economically deterministic** — reducing politics and culture to the economy. They can **underplay agency** — treating the periphery as passive victims of structure rather than as actors. They can **underplay the autonomy of the state** — treating the state as a mere instrument of capital. And they can be **outdated** — the original dependency and world-systems theories were developed in the 1960s–70s, and the world economy has changed dramatically since then (financialization, global value chains, the rise of China).

Scope condition: Marxist and world-systems analysis is most powerful for explaining **long-run structural patterns** — persistent inequality, the global division of labor, the recurrence of financial crises. It is less powerful for explaining **short-run events** — decisions, crises, wars — which require more granular analysis.

Observable implication. If the Marxist account is operative, you should see (a) a persistent **structural**

hierarchy in the world economy, (b) the **transfer of surplus** from periphery to core through trade, finance, and debt, and (c) the **ideological legitimation** of this hierarchy through discourses of development, modernization, and "good governance."

2.3 KEY IDEA 2 — Critical theory: theory is never neutral, and the point is to change the world

The claim: The critical tradition in IR — associated with the Frankfurt School, Gramsci, and Robert Cox — makes a claim that is both epistemological and political: **theory is never neutral**. Every theory embeds assumptions about what is possible, what is natural, and what can be changed. The choice of theory is therefore a **political choice**, and the task of critical theory is to make that choice visible.

The Frankfurt School. The Frankfurt School — Horkheimer, Adorno, Marcuse, Habermas, and others — developed a critique of **instrumental reason**: the reduction of reason to technical calculation, which they saw as the intellectual foundation of both capitalism and totalitarianism. Horkheimer's 1937 essay "Traditional and Critical Theory" distinguished:

- **Traditional theory:** Theory that describes the world as it is, taking the existing order as given.
- **Critical theory:** Theory that aims at **emancipation** — at freeing people from domination. Critical theory is "critical" in the Kantian sense (it examines its own conditions) and in the Marxian sense (it aims at changing the world, not just interpreting it).

Robert Cox's distinction. Cox's 1981 essay "Social Forces, States and World Orders: Beyond International Relations Theory" is the most important application of the Frankfurt School to IR. Cox's central distinction:

- **Problem-solving theory** "takes the world as it finds it, with the prevailing social and power relationships and the institutions into which they are organized, as the given framework for action." Its goal is to solve problems **within** the existing order. Realism, institutionalism, and much constructivism are problem-solving theories.
- **Critical theory** "stands apart from the prevailing order of the world and asks how that order came about." It asks whether the existing order is **just**, and whether it can be **changed**. It is "critical in the sense that it stands apart from the prevailing order of the world and asks how that order came about."

Cox's famous formulation: **"Theory is always for someone and for some purpose."** There is no such thing as a neutral theory. Every theory serves some interests and excludes others. The task of critical theory is to make those interests visible.

Gramsci and hegemony. As described above, Gramsci's concept of **hegemony** is the most important concept in critical IR. Hegemony is not just domination but **consent** — the process by which the ruling class's worldview becomes the common sense of the whole society. Applied internationally, hegemony is the process by which the dominant state's worldview becomes the common sense of the international system — through institutions (the UN, the IMF, the WTO), through ideas (development, human rights, the "rules-based order"), and through material power.

Cox's concept of **"historical structures"** — the combination of material capabilities, ideas, and institutions — is his framework for analyzing how hegemony is produced and reproduced. Hegemony is not just a state of affairs; it is a **structure** that must be continuously reproduced.

Emancipation. Critical theory is explicitly **emancipatory**. It seeks not only to interpret the world but to

change it — to identify the possibilities for transforming the prevailing order. This is why Cox's work is associated with **counter-hegemonic** movements: the anti-globalization movement, the World Social Forum, the struggle for a New International Economic Order, and contemporary movements for climate justice and reparations.

What critical theory contributes: It shows that **theory is political**. It provides the tools for analyzing **how power operates through ideas** — not just through coercion. It insists on the possibility of **change** — that the existing order is not natural or inevitable but historical and contingent.

What it occludes: It can be **vague about alternatives** — critical theory is better at critique than at construction. It can be **elitist** — the critical theorist often speaks *for* the oppressed rather than *with* them. It can be **Eurocentric** — the Frankfurt School's critique of modernity is still a critique *within* modernity, and it has been slow to engage with colonial and racial domination.

Scope condition: Critical theory is most powerful as a **meta-theory** — a framework for analyzing other theories. It is less powerful as an empirical theory — it does not generate testable predictions about specific outcomes.

Observable implication. If critical theory is operative, you should see (a) **contestation over the framing of issues** (e.g., "development" vs. "underdevelopment," "humanitarian intervention" vs. "imperialism"), (b) **structural** explanations of outcomes that mainstream theories treat as accidental, and (c) the **possibility of transformation** — moments when the existing order is contested and reshaped.

2.4 KEY IDEA 3 — Post-colonial and decolonial IR: the colonial constitution of the international, and the politics of knowledge

The claim: Post-colonial and decolonial IR begin from the claim that **the international system was constituted through colonialism**, and that this constitution persists. The task is not just to add "Africa" or "the colonized" to existing theories, but to show how the categories of IR — sovereignty, anarchy, development, security — were **produced** through colonial relations and continue to reproduce colonial hierarchies.

Edward Said and Orientalism. Edward Said's *Orientalism* (1978) is the founding text of post-colonial theory. Said's argument: "the Orient" is not a geographical fact but a **discursive construction** — a set of representations produced by Western scholars, writers, and administrators that construct the "East" as exotic, backward, irrational, and feminized, in contrast to the "West" as rational, modern, and masculine. Orientalism is not just a body of knowledge; it is a **system of power** — "a Western style for dominating, restructuring, and having authority over the Orient."

Said's argument applies directly to IR: the categories of the discipline — "developed" vs. "developing," "modern" vs. "traditional," "stable" vs. "fragile" — are not neutral descriptions. They are **representations** that construct the objects they claim to describe, and they serve to justify intervention, hierarchy, and domination.

Spivak and the subaltern. Gayatri Spivak's 1988 essay "Can the Subaltern Speak?" is the other founding text. Spivak's argument: the **subaltern** — the colonized, the marginalized, those excluded from dominant discourse — cannot speak in a way that is heard within the dominant structures. When Western scholars claim to "give voice" to the subaltern, they often **reproduce** the subaltern's silence by speaking *for* them.

Spivak's concept of **epistemic violence** — the violence done to knowledge systems and ways of knowing

through colonial domination — is central to post-colonial IR. Epistemic violence is not just the suppression of knowledge; it is the **imposition** of a particular way of knowing that makes other ways of knowing invisible or illegitimate.

Quijano and the coloniality of power. Aníbal Quijano's concept of the **coloniality of power** (2000) is the most influential concept in decolonial theory. Quijano argues that colonialism was not just a political and economic system; it was a **system of classification** that established a hierarchy of races, with Europeans at the top and colonized peoples at the bottom. This classification persists **after** formal decolonization — it is what Quijano calls **coloniality**.

The coloniality of power operates in three domains: **labor** (the global division of labor organized by race), **knowledge** (the privileging of Western knowledge and the marginalization of non-Western knowledge), and **authority** (the concentration of political power in the hands of the former colonial powers and their allies).

Mignolo and decoloniality. Walter Mignolo's **decoloniality** is a more radical version of post-colonial theory. Mignolo argues that **modernity and coloniality are two sides of the same coin** — there is no modernity without coloniality. The task of decoloniality is not just to critique modernity but to **delink** from it — to recover and build alternative ways of knowing and being.

African post-colonial and decolonial IR. African scholars have made fundamental contributions to these traditions:

- **Frantz Fanon.** *Black Skin, White Masks* (1952) and *The Wretched of the Earth* (1961) are foundational. Fanon's analysis of the **psychology of colonialism** — the internalization of inferiority by the colonized and the construction of the colonizer's identity through the negation of the colonized — is essential for understanding how colonial hierarchies persist in the minds and bodies of the colonized.
- **Amílcar Cabral.** The Guinea-Bissauan revolutionary and theorist argued that national liberation is not just a military struggle but a **cultural** one — the colonized must reclaim their culture and their history as part of the struggle for freedom.
- **Siba Grovogui.** Grovogui's *Sovereigns, Quasi-Sovereigns, and Africans* (1996) is the most important African contribution to IR theory. Grovogui argues that the sovereignty that IR treats as universal was **never extended to Africans** — African polities were treated as quasi-sovereign or non-sovereign, subject to the "standard of civilization" and to external tutelage. The international system is not just anarchic; it is **hierarchical**, and the hierarchy is **racial**.
- **Makau Mutua.** In "Savages, Victims, and Saviors: The Metaphor of Human Rights" (2001), Mutua argues that the human rights discourse constructs a **metaphor** in which the non-Western world is the "savage," the victim of human rights violations, and the West is the "savior." This metaphor obscures the West's own complicity in producing the conditions it claims to remedy.

The critique of IR. Post-colonial and decolonial IR argue that IR's core concepts — **sovereignty, anarchy, the state, security, development** — were forged in the context of empire and continue to carry colonial assumptions:

- **Sovereignty** was never universal; it was extended selectively to the "civilized" nations.
- **Anarchy** is not a neutral description; it is a **racialized** description of the non-European world as disorderly and dangerous.
- **Development** is a discourse that constructs the non-Western world as backward and in need of tutelage.
- **Security** is often framed in ways that securitize the racialized Other — the migrant, the terrorist, the

"failed state."

What post-colonial and decolonial IR contribute: They show that **the international is not neutral** — its categories are historically produced and carry power. They show that **knowledge is political** — what counts as legitimate knowledge is itself a site of contestation. They provide the analytical tools for understanding **how colonial hierarchies persist** in the post-colonial world.

What they occlude: They can be **overly textual** — focusing on representations rather than material conditions. They can **underplay the agency** of the colonized — treating them as objects of colonial discourse rather than as actors. They can be **essentializing** — treating "the West" and "the non-West" as monolithic. And they can be **pessimistic** — if coloniality is so pervasive, it is difficult to see how it can be overcome.

Scope condition: Post-colonial and decolonial IR is most powerful for explaining **how the international is represented** — how categories, discourses, and frameworks carry colonial assumptions. It is less powerful for explaining **specific material outcomes** — wars, trade, crises — which require additional theoretical tools.

Observable implication. If post-colonial theory is operative, you should see (a) **representations** of the non-Western world that construct it as backward, dangerous, or in need of salvation; (b) **hierarchies of knowledge** — who gets to produce theory, and who is treated as case material; and (c) **persistence** of colonial-era patterns in the post-colonial era.

2.5 KEY IDEA 4 — Feminist and queer IR: the gendered and sexualized constitution of states, security, and the international

The claim: Feminist and queer IR begin from the claim that **the international is gendered and sexualized** — not in the sense that it is "about women" or "about sexuality," but in the sense that its core categories — state, sovereignty, security, war, power — are **constituted** through gendered and sexualized logics. Gender and sexuality are not add-ons to international politics; they are **constitutive** of it.

The gendered ontology of the state. Feminist IR scholars argue that the state is not a neutral container of political authority; it is a **gendered** institution. Spike Peterson's work in particular argues that the **sovereign state** is constructed through a set of gendered dichotomies: public/private, reason/emotion, rationality/bodily, protector/protected. The state is imagined as **masculine** — rational, autonomous, decisive — and the domain of the state is imagined as **public**, in contrast to the domestic sphere, which is feminized and privatized.

The consequence is that **what counts as "international politics"** is itself gendered. The high politics of statecraft, diplomacy, and war is coded as masculine; the low politics of reproduction, care, and welfare is coded as feminine and relegated to the domestic sphere. Feminist IR insists that **the personal is international** — that the way states govern bodies, families, and reproduction is a central part of international politics, not a private matter outside it.

Militarized masculinity. Feminist IR scholars — Cynthia Enloe, Carol Cohn, Jean Elshtain, and others — have analyzed how militaries and wars are constructed through **militarized masculinity**. Carol Cohn's "Sex and Death in the Rational World of Defense Intellectuals" (1987) is a classic: Cohn shows that the language of nuclear strategy is saturated with gendered and sexualized imagery — "strategic virginity," "penetration," "hard target," "decapitation" — and that this language shapes how strategists think about nuclear weapons, making the unthinkable thinkable.

Cynthia Enloe's *Bananas, Beaches and Bases* (1989) is the other foundational text. Enloe's method of **"feminist curiosity"** — asking "where are the women?" — reveals that women are not marginal to international politics but **central** to it: as factory workers in export-processing zones, as domestic workers for diplomats, as military wives, as sex workers on military bases, as camp followers, as combatants, as peace activists. Enloe's insight: "the personal is international" and "the international is personal."

J. Ann Tickner and the critique of Morgenthau. Tickner's "Hans Morgenthau's Principles of Political Realism: A Feminist Reformulation" (1988) is a landmark. Tickner takes Morgenthau's six principles and shows that each one presupposes a **masculinist** conception of politics:

- Morgenthau's "interest defined as power" assumes a **competitive, autonomous, rational** actor — traits coded as masculine.
- Morgenthau's "objective laws rooted in human nature" universalizes a **particular** (masculine) conception of human nature.
- Morgenthau's "autonomy of the political sphere" ignores the **domestic and reproductive** sphere, which is feminized and devalued.

Tickner's reformulation does not simply reject realism; it shows that realism's apparent neutrality is **gendered**.

Intersectionality. Kimberlé Crenshaw's concept of **intersectionality** (1989) — developed in the context of Black women's legal experience — is central to contemporary feminist IR. Intersectionality holds that gender, race, class, sexuality, and other dimensions of identity are **interlocking** and cannot be analyzed in isolation. A Black woman's experience of discrimination, for example, is not the sum of "racism" and "sexism" but a **distinct** form of oppression produced by their intersection.

Applied to IR, intersectionality means that the analysis of gender cannot be separated from the analysis of race, class, and coloniality. The **racialized and gendered** construction of the "migrant," the "terrorist," the "failed state," and the "humanitarian subject" are all intersectional phenomena.

Post-colonial feminism and the coloniality of gender. María Lugones's concept of the **coloniality of gender** (2007) argues that gender itself is a **colonial** category. Before colonialism, many societies — including many African societies — had forms of social organization that were not organized around the Western binary of male/female. Colonialism **imposed** the gender binary as part of its civilizing mission. Oyèrónkẹ́ Oyěwùmí's *The Invention of Women* (1997) makes a similar argument for Yoruba society: the categories of "man" and "woman" were not central to pre-colonial Yoruba social organization; they were introduced through colonialism and Christian missionary activity.

This is a profound challenge to Western feminism: it suggests that "gender" is not a universal category but a **colonial** one, and that the imposition of the gender binary was itself a form of colonial violence.

Queer IR. Queer IR — associated with Cynthia Weber, Jasbir Puar, and others — extends the feminist critique to **sexuality**. Queer IR argues that the international is **heteronormative**: it assumes and reproduces heterosexual norms — the heterosexual family, the heterosexual citizen, the heterosexual nation.

Cynthia Weber's *Queer International Relations* (2016) argues that sovereignty is itself a **sexualized** concept: the sovereign state is imagined as a **heterosexual** body, and challenges to sovereignty are represented as **sexual** deviance. Jasbir Puar's concept of **homonationalism** (2007) argues that the US has incorporated certain forms of homosexuality into its national identity — as a way of distinguishing itself from the "homophobic" Muslim world — while continuing to marginalize other forms of queerness. Homonationalism is a form of

sexual exceptionalism that serves imperial purposes.

What feminist and queer IR contribute: They show that **gender and sexuality are constitutive of the international**, not marginal to it. They show that **the personal is international** — that the governance of bodies, families, and reproduction is a central part of international politics. They provide the tools for analyzing **how power operates through gendered and sexualized logics** — not just through coercion.

What they occlude: They can be **overly focused on the West** — the canonical texts are disproportionately about Western states and Western feminist theory. They can **underplay material** factors — the focus on discourse and representation can obscure the material conditions of women's lives. They can be **difficult to translate** into policy — feminist and queer IR are better at critique than at prescription. And they can be **contested internally** — Western feminism and post-colonial feminism often disagree profoundly about what "gender" means.

Scope condition: Feminist and queer IR is most powerful for analyzing **how the international is gendered and sexualized** — how states govern bodies, how wars are fought, how security is imagined. It is less powerful for explaining **specific material outcomes** — wars, trade, crises — which require additional tools.

Observable implication. If feminist and queer IR is operative, you should see (a) **gendered and sexualized representations** of states, security, and war; (b) **invisibility** of women, queer people, and reproductive labor in mainstream accounts of international politics; and (c) **gendered and sexualized** logics operating in policy domains that are ostensibly neutral.

2.6 KEY IDEA 5 — The five perspectives engage these traditions differently, and each engagement is political

The claim: The critical traditions — Marxism, critical theory, post-colonialism, feminism, queer theory — are not neutral frameworks. They are **political** traditions with specific historical origins and political implications. The five perspectives engage with them differently, and each engagement is a political choice.

2.6.1 The African perspective (primary) **Core commitments.** Africa is not just a **case** for these traditions; it is a **source** of them. African scholars and leaders have made foundational contributions to Marxism, dependency theory, post-colonialism, and feminism — often before these traditions were recognized in the West.

1. **African Marxism and dependency.** Nkrumah's **neo-colonialism**, Rodney's **underdevelopment**, Amin's **delinking**, and Cabral's **national liberation** are all foundational contributions to Marxist and dependency theory. They are not "applications" of European Marxism; they are **original theorizations** grounded in African experience.
2. **African post-colonialism.** Fanon, Cabral, Achebe, Ngũgĩ wa Thiong'o, and others developed post-colonial theory from the experience of anti-colonial struggle. Fanon's analysis of the **psychology of colonialism** and Cabral's analysis of **culture and liberation** are foundational.
3. **African feminism.** African feminists — Amina Mama, Oyèrónkẹ́ Oyěwùmí, Sylvia Tamale, Ama Ata Aidoo, and others — have critiqued both Western feminism (for its Eurocentrism and its neglect of race and coloniality) and African patriarchy (for its complicity with colonialism and its resistance to women's liberation). African feminism is not a branch of Western feminism; it is a **distinct** tradition with its own concepts, debates, and political projects.

4. **African queer theory.** African queer scholars — Sylvia Tamale, Keguro Macharia, Stella Nyanzi, and others — have challenged both Western homonationalism (which uses "gay rights" as a justification for imperial intervention) and African homophobia (which is often a legacy of colonial-era laws and Christian missionary activity). African queer theory insists on the **specificity** of African sexual politics — its history, its complexity, and its resistance to both Western and nationalist framings.

The critique of Western critical theory. African scholars critique Western critical theory for being **parochial** — treating Western experiences as universal, even in its critique of universalism. African Marxism is not the same as European Marxism; African feminism is not the same as Western feminism; African post-colonialism is not the same as the post-colonialism of Said or Spivak.

What the African perspective contributes: It shows that the critical traditions are **not Western monopolies** — they have been developed in and from the Global South. It shows that the critique of colonialism, capitalism, and patriarchy must be **grounded** in specific historical experiences. It shows that **African agency** is central — Africans have been producers of theory, not just objects of it.

What it occludes: It can underplay the **diversity** of African positions — not all African scholars agree on Marxism, feminism, or queer theory. It can risk **essentializing** "African knowledge" as a unified tradition. It can underplay the **genuine disagreements** between African and Western feminists, Marxists, and queer theorists.

2.6.2 The Chinese perspective Core commitments. China's engagement with the critical traditions is **complex** — shaped by its own revolutionary history, its Marxist-Leninist ideology, and its current position as a rising power.

1. **Chinese Marxism.** China is officially a Marxist-Leninist state, and Chinese IR scholars engage with Marxist theory — particularly **Lenin's theory of imperialism** — to analyze the contemporary international order. Chinese scholars often frame the US as an **imperialist** power and China as a leader of the anti-imperialist struggle.
2. **The Chinese School and critical theory.** The Chinese School of IR — particularly the work of Qin Yaqing — is not Marxist, but it shares the critical tradition's rejection of Western universalism. Qin's relational theory is a **critique** of the Western assumption that states are discrete, atomistic actors.
3. **Chinese critiques of post-colonialism and feminism.** Chinese scholars are often **skeptical** of post-colonial and feminist critiques — not because they reject them entirely, but because they see them as **Western** frameworks that can be used to undermine Chinese sovereignty. The Chinese state has been particularly resistant to feminist and queer critiques that it sees as "Western" impositions.

What the Chinese perspective contributes: It shows that the critical traditions can be **mobilized for state purposes** — Chinese Marxism is not a critique of Chinese power but a justification for it. It also shows that the critical traditions are **contested** within non-Western contexts — China's engagement with them is not the same as Africa's.

What it occludes: It can underplay the **genuine critical potential** of post-colonial and feminist theory for China itself — the ways in which Chinese minorities, women, and queer people experience marginalization. It can also **instrumentalize** critical theory — using it to critique the West while shielding China from critique.

2.6.3 The Russian perspective Core commitments. Russia's engagement with the critical traditions is **minimal** — Russian IR is dominated by realism and civilizational approaches, and there is little engagement

with Marxism, post-colonialism, or feminism as critical traditions.

1. **Soviet Marxism.** The Soviet Union was officially Marxist-Leninist, and Soviet IR theory was framed in Marxist terms — particularly the theory of **imperialism** and the "anti-imperialist struggle." But Soviet Marxism was **dogmatic** — it was a state ideology, not a critical tradition.
2. **Post-Soviet realism.** After the collapse of the Soviet Union, Russian IR shifted toward realism and civilizational approaches. The critical traditions were largely abandoned, except by a small number of scholars.
3. **Russian critiques of Western critical theory.** Russian officials and scholars often frame Western critical theory — particularly post-colonialism and feminism — as **instruments of Western cultural imperialism**. They argue that these frameworks are used to undermine Russian sovereignty and traditional values.

What the Russian perspective contributes: It shows that the critical traditions are **not universally accepted** — they are contested even within the non-Western world. It also shows that **anti-Westernism** can coexist with **anti-critical** positions — Russia's rejection of Western hegemony does not entail an embrace of critical theory.

What it occludes: It can **naturalize** Russian hierarchies — the Russian state's own hierarchies of gender, ethnicity, and sexuality are rarely subjected to critical analysis. It can also **instrumentalize** anti-colonial rhetoric — using it to justify aggression against Ukraine and other neighbors.

2.6.4 The Western perspective Core commitments. The Western tradition is the **home** of the critical traditions — Marxism, the Frankfurt School, post-colonialism, feminism, and queer theory all emerged from Western academic debates. But Western critical theory is also **internally contested**, and it has been **critiqued from the Global South** for its own parochialism.

1. **The development of Western critical theory.** Western Marxism (the Frankfurt School), post-structuralism (Foucault, Derrida), post-colonialism (Said, Spivak, Bhabha), and feminism (de Beauvoir, Butler, Haraway) are all Western traditions — but they are traditions that **critique** the West from within.
2. **The critique from the South.** Post-colonial and decolonial scholars — Quijano, Mignolo, Lugones, Grovogui — argue that Western critical theory is **still Western** — it critiques modernity but remains within its categories. The task, they argue, is not just to critique the West but to **delink** from it.
3. **The institutionalization of critique.** Western critical theory has become **institutionalized** — it is taught in universities, published in journals, and used by NGOs and international organizations. This has strengths (the critique is now part of the mainstream) and weaknesses (the critique has lost some of its radical edge).

What the Western perspective contributes: It provides the **most developed** versions of each critical tradition, and the most systematic **self-critique** of those traditions. It also provides the **institutional infrastructure** — journals, conferences, networks — that sustains critical scholarship.

What it occludes: It can be **parochial** — treating Western experiences as universal even in its critique. It can be **self-referential** — a debate among Western scholars about Western scholars. And it can be **complicit** — the institutionalization of critique can blunt its political edge.

2.6.5 The UN perspective **Core commitments.** The UN is **not** a critical actor in the Marxist or post-colonial sense. It is a **member-state organization** whose normative commitments are grounded in the Charter — sovereignty, non-interference, human rights, and multilateralism. But the UN has been **shaped** by the critical traditions in important ways:

1. **The New International Economic Order (NIEO).** In the 1970s, the UN General Assembly adopted the **NIEO** — a set of demands from the Global South for a more equitable international economic order. The NIEO was informed by dependency theory and by the critique of neo-colonialism. Although it was largely abandoned in the 1980s, it shaped the UN's development discourse.
2. **The critique of colonialism.** The UN was a **site** of anti-colonial struggle — the General Assembly's 1960 Declaration on the Granting of Independence to Colonial Countries and Peoples was a landmark. The UN's decolonization agenda was shaped by the anti-colonial movements that drew on Marxist and post-colonial theory.
3. **Gender and human rights.** The UN has been a site of feminist and queer activism — the Beijing Declaration, the CEDAW, the SDGs, and the Human Rights Council's resolutions on sexual orientation and gender identity. The UN's gender architecture — UN Women, the Women, Peace and Security agenda — is a product of feminist advocacy.

But the UN is also **constrained** by its member states — many of which are hostile to critical theory. The UN's normative commitments are often **watered down** to accommodate the most conservative members.

What the UN perspective contributes: It provides a **site** where critical demands can be translated into **policy** — the NIEO, the SDGs, the WPS agenda. It also provides a **normative benchmark** — the standards against which state behavior is judged.

What it occludes: It can **depoliticize** — translating critical demands into technical-policy language that obscures the underlying power relations. It can also **legitimize** — the UN's authority can be used to justify actions that serve the interests of the powerful.

2.6.6 The comparison matrix

Dimension	African (primary)	Chinese	Russian	Western	UN
Engagement with Marxism	Foundational (Nkrumah, Rodney, Amin); dependency and underdevelopment	State ideology; Lenin's imperialism	Soviet legacy; largely abandoned	Home of Western Marxism; Frankfurt School	NIEO; development discourse
Engagement with post-colonialism	Foundational (Fanon, Cabral, Grovogui, Mutua)	Skeptical; seen as Western framework	Minimal; seen as Western cultural imperialism	Home of post-colonial theory (Said, Spivak)	Anti-colonial resolutions; decolonization agenda

Dimension	African (primary)	Chinese	Russian	Western	UN
Engagement with feminism/queer	Distinct tradition (Mama, Oyěwùmí, Tamale); critiques both Western feminism and African patriarchy	Skeptical; seen as Western imposition	Minimal; traditional values discourse	Home of feminist and queer theory	WPS agenda; CEDAW; LGBTQ+ resolutions
Key contribution	Original theorization from African experience; agency	State Marxism; critique of Western universalism	Anti-Western critique (but not critical)	Most developed versions; self-critique	Translation of critique into policy
Key occlusion	Diversity of African positions; disagreements with Western critical theory	Genuine critical potential for China itself	Naturalization of Russian hierarchies; instrumentalization	Parochialism; self-referentiality; complicity	Depoliticization; legitimization

2.7 WORKED EXAMPLE (I do)

The puzzle: The Democratic Republic of Congo (DRC) holds some of the world's largest reserves of cobalt — a critical mineral for electric vehicle batteries and other green technologies. Yet the DRC remains one of the poorest countries in the world, with most of its population lacking access to electricity, clean water, and basic healthcare. Cobalt mining in the DRC is characterized by dangerous working conditions, child labor, and environmental degradation. Why does the DRC remain poor despite its mineral wealth?

The puzzle stated precisely: *Why does the DRC, which supplies a critical input for the global green energy transition, remain one of the poorest countries in the world?*

This is the classic "resource curse" puzzle. But each critical tradition offers a different explanation:

Marxist and world-systems analysis: The DRC's poverty is not an accident; it is **produced** by its integration into the capitalist world-economy on unequal terms. The DRC is a **peripheral** economy — it exports raw cobalt and imports manufactured goods, with the terms of trade favoring the core. The surplus value extracted from Congolese labor flows to the core, where it finances the development of the core. This is the **development of underdevelopment** (Frank, Rodney). The DRC's mineral wealth is not a blessing but a **curse** — it makes the country a site of extraction for the core.

The mechanism is **unequal exchange**: the DRC sells cobalt at prices set by global markets, but it buys

manufactured goods at prices that include the core's higher wages and profits. The DRC is **structurally** disadvantaged.

Critical theory: The DRC's poverty is **legitimated** by a discourse of "development" and "good governance" that frames the country as backward and in need of external tutelage. The international institutions that oversee the DRC's mining sector — the World Bank, the IMF, the Extractive Industries Transparency Initiative — are not neutral; they **reproduce** the structures of power that keep the DRC dependent. The discourse of "conflict minerals" — which frames the DRC's violence as a problem of "greed" and "criminality" — obscures the **structural** causes of the conflict: colonial-era extraction, Cold War proxy warfare, and the current competition for critical minerals.

Post-colonial and decolonial analysis: The DRC's poverty has a **colonial genealogy**. King Leopold II's Congo Free State (1885–1908) was one of the most brutal colonial regimes in history — millions died in the extraction of rubber and ivory. The Belgian Congo (1908–1960) continued the extraction of minerals — copper, cobalt, uranium — for the benefit of Belgium and its allies. The post-independence period was shaped by **neo-colonial** arrangements: Mobutu Sese Seko's regime (1965–1997) was supported by the US and France in exchange for access to minerals; the assassination of Patrice Lumumba (1961) was a case of external intervention to protect mineral interests.

The **coloniality of power** (Quijano) persists: the DRC is still classified as a "fragile state," its governance is still overseen by external actors, and its minerals still flow to the core. The **coloniality of knowledge** is also at work: the DRC's own knowledge systems — its mining traditions, its local governance structures — are invisible in the international discourse, which treats the country as a problem to be solved by external experts.

Feminist and queer analysis: The cobalt mining economy is **gendered**. Men dominate the formal mining sector; women are concentrated in the **informal** sector — artisanal mining, trading, and sex work — where they are exposed to violence, exploitation, and health risks. The **reproductive labor** of women — caring for children, the sick, and the elderly — is invisible in the mining discourse, even though it is essential to the reproduction of the mining workforce.

The **mining companies** — many of them Chinese, Swiss, and multinational — are gendered institutions, dominated by men, with masculine cultures of risk-taking, competition, and extraction. The **bodies** of Congolese miners — male and female — are treated as disposable, exposed to toxic chemicals, dangerous conditions, and violence. This is what **Achille Mbembe** calls **necropolitics** — the power to determine who lives and who dies.

The **sexualized** dimension is also present: the "rape as a weapon of war" discourse in the DRC has been critiqued by African feminists for reducing Congolese women to **victims** while obscuring their **agency** and the **structural** causes of violence. Queer Congolese people face additional marginalization — homosexuality is stigmatized, and the international LGBTQ+ discourse often treats Africa as **uniquely homophobic**, obscuring the colonial origins of African homophobia and the role of Western homonationalism in shaping the discourse.

The five perspectives:

- **African perspective:** The DRC's poverty is a product of **colonial extraction and neo-colonial dependency**, and the current scramble for critical minerals is a continuation of that history. African agency — the DRC's attempts to renegotiate mining contracts, to demand a greater share of revenues,

to build local processing capacity — is central. The African perspective insists that the DRC is not just a victim; it is an actor navigating a hostile structure.

- **Chinese perspective:** China is the DRC's largest trading partner and a major investor in cobalt and copper. Chinese officials and scholars frame this engagement as **win-win cooperation** — China provides infrastructure and investment, the DRC provides resources. The Chinese perspective rejects the "neo-colonial" framing as a Western narrative designed to discredit China's role in Africa. It emphasizes **sovereignty** and **non-interference**.
- **Russian perspective:** Russia has a **limited** economic presence in the DRC, but it has a **geopolitical** interest in the country — particularly through security cooperation (Africa Corps) and through its broader critique of Western hegemony. The Russian perspective frames the DRC's problems as a consequence of Western **neo-colonialism** and argues that Russia is a **sovereign** alternative to Western domination.
- **Western perspective:** Western governments and NGOs frame the DRC's problems as a combination of **governance failures**, **corruption**, and **conflict minerals**. The Western perspective emphasizes **transparency**, **accountability**, and **responsible sourcing** — the Kimberley Process, the Extractive Industries Transparency Initiative, and corporate due diligence. The Western perspective has been critiqued for its **paternalism** and for its failure to address the **structural** causes of the DRC's poverty.
- **UN perspective:** The UN has been deeply involved in the DRC — through peacekeeping (MONUSCO, one of the largest and longest-running missions), through humanitarian assistance, and through its normative frameworks on conflict minerals and human rights. The UN perspective emphasizes **civilian protection**, **human rights**, and **sustainable development**, while acknowledging the limits of its own capacity.

Adjudication. Which tradition best explains the DRC's poverty?

- **Marxist and world-systems analysis** best explains the **structural** dimension — why the DRC's mineral wealth does not translate into development, and why the surplus flows to the core.
- **Post-colonial and decolonial analysis** best explains the **historical** dimension — why the DRC's poverty has a colonial genealogy, and how colonial hierarchies persist.
- **Feminist and queer analysis** best explains the **embodied** dimension — who bears the costs of extraction, and how gender and sexuality structure the mining economy.
- **Critical theory** best explains the **ideological** dimension — how the discourse of "development," "good governance," and "conflict minerals" legitimates the existing order.

No single tradition captures the whole. A complete explanation combines all four: the DRC's poverty is a **structural** product of the capitalist world-economy, a **historical** product of colonialism, an **embodied** product of gendered and racialized extraction, and an **ideological** product of the discourses that legitimate it. The five perspectives add the crucial dimension of **agency**: the DRC is not just a victim but an actor, and the competition between China, the West, Russia, and others creates **space** for African agency — if the DRC can navigate it.

2.8 PROBLEM PAIR (We do)

Your task: Analyze the following case using the apparatus above. Write your analysis before reading the model answer.

The case: The European Union's response to migration across the Mediterranean has been characterized by **externalization** — the outsourcing of border control to third countries (Turkey, Libya, Tunisia, Egypt) in exchange for aid, trade, and political cooperation. The EU has funded the Libyan Coast Guard, which intercepts migrants at sea and returns them to Libya, where they face detention, abuse, and exploitation. Human rights organizations have documented widespread violations. The EU's approach has been criticized as a form of **neo-colonial** governance, and the figure of the "migrant" has been securitized and racialized.

Your tasks:

1. State the puzzle precisely: why does the EU, which proclaims human rights and humanitarian values, outsource border control to states that systematically abuse migrants?
2. Apply the Marxist and world-systems analysis: what **structural** interests does the EU's externalization serve? How does it relate to the global division of labor and the legacies of colonialism?
3. Apply the post-colonial and decolonial analysis: how is the "migrant" **constructed** in EU discourse? What colonial tropes are at work? How does the externalization of borders reproduce colonial hierarchies?
4. Apply the feminist and queer analysis: how is the **gendered and sexualized** dimension of migration governed? Who is made invisible? How does the EU's response reflect gendered and racialized logics?
5. Apply the critical theory analysis: how does the EU's discourse of "human rights" and "humanitarian" values **legitimate** its externalization policies?
6. Write a 300-word adjudication: which tradition best explains the EU's externalization policies, and what does it miss?

Model answer (compare after writing your own):

Puzzle: Why does the EU outsource border control to states that systematically abuse migrants, despite its proclaimed commitment to human rights?

Marxist and world-systems analysis: The EU's externalization policies serve **structural** interests. Migration is a **labor** phenomenon — migrants from the Global South are drawn to Europe by the demand for cheap labor, but the EU wants to **control** the terms of their entry, to ensure that they are **available** as labor but **excluded** from the rights of citizenship. Externalization allows the EU to **externalize** the costs of border control — the violence, the detention, the abuse — to third countries, while maintaining the **fiction** of humanitarian values. The **global division of labor** is reproduced: the Global South supplies labor, the Global North controls the terms of its entry.

Post-colonial and decolonial analysis: The "migrant" is **constructed** in EU discourse as a threat — a figure of danger, disorder, and cultural difference. This construction draws on **colonial** tropes: the "savage" who threatens civilization, the "barbarian" at the gates. The **externalization** of borders reproduces colonial hierarchies: the EU treats Libya and Turkey as **quasi-sovereign** spaces — formally independent, but subject to EU dictates — a repetition of the mandate system. The **coloniality of power** persists: the EU's borders are **everywhere** — in the Mediterranean, in Libya, in Turkey, in the Sahel — and the **racialized** hierarchy of who is allowed to move and who is not is a continuation of colonial-era controls on mobility.

Feminist and queer analysis: Migration is **gendered and sexualized**. Women migrants are particularly vulnerable to **sexual violence** in Libya, and the EU's policies — which fund the Libyan Coast Guard and return migrants to Libya — **expose** women to this violence. The **reproductive labor** of migrant women — caring for children, the elderly, and the sick — is invisible in the EU's discourse, which treats migration

as a **security** problem, not a **labor** or **care** problem. The **sexualized** dimension is also present: the figure of the "migrant" is **feminized** in EU discourse — passive, vulnerable, in need of rescue — while the **state** is **masculinized** — decisive, protective, in control. The **homonationalist** dimension is also at work: the EU's claim to protect LGBTQ+ migrants is used to justify its **civilizational** superiority, even as its policies **endanger** LGBTQ+ migrants.

Critical theory analysis: The EU's discourse of **human rights** and **humanitarian values legitimates** its externalization policies. The language of "saving lives" — the EU's claim that it is protecting migrants from dangerous crossings — **obscures** the **violence** of its policies. The **problem-solving** discourse of the EU — framing migration as a "crisis" to be "managed" — **takes the existing order as given** and ignores the **structural** causes of migration: colonialism, inequality, and the global division of labor.

Adjudication: **Post-colonial and decolonial analysis** best explains the **form** of the EU's externalization policies — the racialized and colonial logics at work. **Marxist and world-systems analysis** best explains the **function** of the policies — the reproduction of the global division of labor and the control of labor mobility. **Feminist and queer analysis** best explains the **embodied** dimension — who bears the costs, and how gender and sexuality structure the experience of migration. **Critical theory** best explains the **ideological** dimension — how the EU's discourse legitimates its policies. A complete explanation combines all four: the EU's externalization policies are a **structural** product of the global division of labor, a **historical** product of colonial hierarchies, an **embodied** product of gendered and racialized governance, and an **ideological** product of the discourse of human rights and humanitarianism.

2.9 INDEPENDENT MEMO (You do)

Produce a one-page analytical memo (500–600 words) on the following case, using the four headings below.

Case: The global climate negotiations, particularly the demand for **loss and damage** finance by African and Global South states. The **Loss and Damage Fund** was established at COP27 (2022) and operationalized at COP28 (2023), with pledges of about $700 million — far short of the estimated $100–$400 billion needed annually. African states argue that the Global North bears **historical responsibility** for climate change and owes **reparations** to the Global South.

Memo headings:

1. **Mechanism:** How does each critical tradition explain the **failure** of the Loss and Damage Fund to meet the scale of the demand? (Marxist: structural inequality; post-colonial: coloniality; feminist: gendered vulnerability; critical theory: ideological legitimation.)
2. **Perspective reconstruction:** How would each of the five perspectives interpret the climate negotiations? (African, Chinese, Russian, Western, UN — one paragraph each or a table.)
3. **The political economy of carbon:** How does the global **carbon economy** reflect colonial and racial hierarchies? Who benefits from the current arrangements? Who bears the costs?
4. **Falsifiers:** What evidence would show that the critical traditions are **wrong** about the climate negotiations? What would show they are **right**?

Self-check: Does your memo distinguish **structural** from **ideological** explanations? Does it specify **whose** knowledge and **whose** labor are invisible in the negotiations?

2.10 HINGE QUESTION

A scholar argues: "The concept of 'fragile states' is not a neutral description. It reflects a Western model of statehood, and it renders invisible the alternative forms of order that exist in many African societies. It also serves to justify external intervention." Which tradition does this argument most clearly belong to?

- A) Structural realism
- B) Neoliberal institutionalism
- C) Post-colonial and decolonial IR
- D) Classical realism

Answer: C. The argument makes three post-colonial claims: (a) the concept is **Eurocentric**, reflecting a particular Western model of statehood; (b) it **erases** alternative forms of order; and (c) it **serves power** by justifying intervention. These are the core moves of post-colonial critique.

If you answered A: Structural realism would treat "fragile states" as a measurable category, not a contested concept. **If you answered B:** Neoliberal institutionalism would treat "fragile states" as a problem of institutional capacity, not a Eurocentric construct. **If you answered D:** Classical realism would treat "fragile states" as a security problem, not as a discursive construction.

SECTION 2A — DATA LAB (30–45 minutes)

Purpose: Ground the critical traditions' claims in empirical data.

Task: Using the summary data below, analyze the **global division of labor** and its consequences.

Table 1: Global cobalt production and processing (approximate, 2023)

Stage	Country share	Value captured
Extraction	DRC (~70%), Indonesia, Philippines	~$5–10 per kg
Battery manufacturing	China, South Korea, Japan	~$30–50 per kg

Table 2: Global wealth distribution (2023, approximate)

Group	Share of global wealth
Top 10%	~75%
Bottom 50%	~2%
Africa's share (as % of global wealth)	~2% (with ~18% of world population)

Table 3: Carbon emissions and climate finance (approximate)

Region	Share of cumulative CO□ emissions (1750–2020)	Share of climate finance (2020–2024)
US + EU	~50%	~40%
China	~14%	~10%
Africa	~3%	~5%
Rest of world	~33%	~45%

Analysis questions:

1. **Structural inequality:** What does the value-capture data tell you about the **global division of labor**? Who captures the most value from the cobalt supply chain? Is this explained by **comparative advantage** (liberal theory) or by **structural power** (Marxist and world-systems theory)?
2. **Historical responsibility:** What does the carbon emissions data tell you about the **historical responsibility** for climate change? How does this relate to the African demand for loss and damage finance?
3. **Coloniality:** How do the data on Africa's wealth share and carbon emissions reflect the **coloniality of power**? What would a post-colonial analysis say about the **process** by which these distributions were produced?
4. **Gender:** What data would you need to assess the **gendered** dimension of the cobalt supply chain and climate finance? What is **not** visible in these tables, and why?
5. **Perspective:** How would each of the five perspectives interpret these data? (African: structural injustice; Chinese: development needs; Russian: Western hypocrisy; Western: market-based solutions; UN: SDGs and climate finance.)

Rule: Complete the data lab before the independent memo.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Task: Draw the following by hand.

Visual 1: The world-system. Draw three concentric circles labeled Core, Semi-periphery, and Periphery. For each, write: the type of production, the type of state, and one example. Draw arrows showing the **flow of surplus** from periphery to core.

Visual 2: The coloniality of power. Draw a triangle with three vertices: **Labor** (racial division of labor), **Knowledge** (privileging of Western knowledge), and **Authority** (concentration of political power). Label the center: "Coloniality of power." Write one example for each vertex.

Visual 3: The gendered ontology of the state. Draw a vertical line with two columns: **Masculine** (public, reason, autonomy, protector, high politics) and **Feminine** (private, emotion, dependence, protected, low politics). Write one example of each. Then draw an arrow across the line labeled "Feminist IR challenges this divide."

SECTION 4 — CORNELL NOTES

Set up your notes with the following cue column:

Cue column	Notes
What is historical materialism?	The mode of production shapes social relations; base shapes superstructure
What is primitive accumulation?	The violent dispossession that made capitalism possible: enclosure, colonization, slavery
What is dependency theory?	The periphery is underdeveloped **because of** its integration into capitalism on unequal terms
What is neo-colonialism?	Formal independence without substantive independence; economic and political policy directed from outside
What is the world-system?	A single division of labor with core, periphery, and semi-periphery
What is Cox's distinction?	Problem-solving theory takes the world as given; critical theory asks how it came about
What is Gramscian hegemony?	Domination through consent and ideological dominance, not just coercion
What is Orientalism?	The discursive construction of the "East" as backward, exotic, and inferior, serving Western power
What is the subaltern?	The colonized and marginalized who cannot speak within dominant structures
What is epistemic violence?	The violence done to knowledge systems through colonial domination
What is the coloniality of power?	The racial hierarchy established by colonialism that persists after formal decolonization
What is the coloniality of gender?	Gender itself is a colonial category; the binary was imposed through colonialism
What is the gendered ontology of the state?	The state is constituted through gendered dichotomies: public/private, reason/emotion, masculine/feminine
What is militarized masculinity?	The construction of military institutions and war through masculine norms and imagery
What is intersectionality?	Gender, race, class, and sexuality are interlocking; oppression is not additive
What is homonationalism?	The incorporation of certain queer identities into national identity as a form of sexual exceptionalism serving imperial purposes

Cue column	Notes
Source log	Lesson text, Sections 2.2–2.6; Marx; Lenin; Luxemburg; Frank; Amin; Rodney; Nkrumah; Wallerstein; Arrighi; Cox; Gramsci; Said; Spivak; Quijano; Mignolo; Grovogui; Mutua; Enloe; Tickner; Peterson; Crenshaw; Lugones; Oyěwùmí; Weber; Puar
Summary	3–5 sentences synthesizing the lesson

SECTION 5 — FEYNMAN COMPRESSION

Step 1: Explain the difference between the Marxist, post-colonial, and feminist critiques of mainstream IR to a smart non-specialist in 200–250 words, without using jargon. If you must use "hegemony," "epistemic violence," or "intersectionality," define them in plain language.

Step 2: Mark every point where you hesitated or used a term you could not define.

Step 3: Reread only the gaps. Rewrite.

Step 4: Produce one analogy for the coloniality of power. Then state where the analogy breaks down. (Example: "The coloniality of power is like a building that was constructed on a foundation of slavery and extraction — the building has been renovated many times, but the foundation is still there, and the building still leans in the direction of the foundation." Where it breaks down: unlike a building, the coloniality of power is contested and can be transformed.)

SECTION 6 — SPACED-REPETITION FLASHCARDS

Produce 15–18 cards. Use the following types:

Type	Example
Definition	What is the difference between colonialism and coloniality?
Mechanism	How does unequal exchange transfer surplus from periphery to core?
Application	A state is formally independent but its economic policy is directed by the IMF. Which concept does this illustrate?
Comparison	How do Marxist and post-colonial analyses differ in their explanations of African poverty?
Source	What did Walter Rodney argue in *How Europe Underdeveloped Africa*?
Debate	What is the strongest objection to the claim that "gender is a colonial category"?

Type	Example
Reconstruction	How would a post-colonial feminist analyze the "migrant crisis" in the Mediterranean?
Occlusion	What does world-systems analysis fail to see about African agency?
Adjudication	Which critical tradition best explains the DRC's poverty, and what does it miss?
Visual	Label the three vertices of the coloniality of power on a diagram.
Reconstruction	How would a queer IR scholar analyze the EU's response to LGBTQ+ migrants?
Occlusion	What does Western feminism fail to see about African gender relations?

Tag each card: `L8`, `critical theory`, `Marxism`, `post-colonial`, `feminism`, `queer`, `perspective`, `difficulty`.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence audit

Rate confidence (0–100%) before checking:

Objective	Confidence
Reconstruct the Marxist and world-systems account	
Apply Cox's distinction	
Explain the post-colonial and decolonial critique	
Reconstruct the feminist and queer critique	
Reconstruct the five perspectives on these traditions	

After exercises, rate accuracy. Calculate the gap.

7.2 Three-question debrief

1. What did I misunderstand about the relationship between material and ideational factors in the critical traditions?
2. Which tradition was easiest to reconstruct? Which was hardest? What does that suggest about my default analytical style?
3. What will I do differently in Module 2?

7.3 Error log

Date	Lesson	Error type	Correct understanding	Card created?
	L8			

SECTION 8 — CHEATSHEET (Module 1)

Add this row to your Module 1 cheatsheet:

Column	Content
Core concepts	Historical materialism; surplus value; primitive accumulation; imperialism; neo-colonialism; dependency; world-systems; core/periphery; Gramscian hegemony; problem-solving vs. critical theory; Orientalism; subaltern; epistemic violence; coloniality of power; coloniality of gender; intersectionality; gendered ontology of the state; militarized masculinity; homonationalism
Key mechanisms	Unequal exchange → surplus transfer → underdevelopment; ideological legitimation → consent → hegemony; colonial classification → racial hierarchy → coloniality; gendered dichotomies → state constitution → invisibility of reproductive labor
Theories and authors	Marx; Lenin; Luxemburg; Frank; Amin; Rodney; Nkrumah; Wallerstein; Arrighi; Cox; Gramsci; Said; Spivak; Quijano; Mignolo; Grovogui; Mutua; Enloe; Tickner; Peterson; Crenshaw; Lugones; Oyěwùmí; Weber; Puar
Cases and evidence	DRC cobalt; Mediterranean migration; climate negotiations; structural adjustment; colonial legacy
Debates	Is the international primarily structured by capitalism, race, or gender? Is critique enough, or is emancipation required? Can Western critical theory escape its own parochialism?
Falsifiers	What evidence would show that the critical traditions are wrong — that structural inequality, racial hierarchy, or gendered logics do not shape international politics?
Cross-links	L4 (post-positivism); L5 (realism — the target of critique); L6 (institutionalism — the target of critique); L7 (constructivism — the ally); L15–19 (IPE); L27–34 (African state formation); L51 (climate geopolitics)

SECTION 9 — REVIEW SCHEDULE

Review	Timing	Format
R1	Today	Retrieval warm-up + card creation
R2	2–3 days	Cue-column recall + hinge variant
R3	1 week	Mixed quiz with L1–L8 cards
R4	3–4 weeks	Interleaved problem combining L8 with L15–19 (IPE) and L27–34 (Africa)
R5	End of Module 1	Cheatsheet reconstruction from memory + Module 1 synthesis essay

SECTION 10 — COMPLETION CHECKLIST

- ☐ Retrieval warm-up completed from memory
- ☐ Five learning objectives read and understood
- ☐ Five key ideas studied with mechanisms and scope conditions
- ☐ Perspective comparison matrix filled from memory, then checked
- ☐ Worked example (DRC cobalt) studied and self-explained
- ☐ Problem pair (Mediterranean migration) attempted and compared
- ☐ Independent memo produced (500–600 words)
- ☐ Hinge question answered correctly (or reteaching completed)
- ☐ Data lab completed before independent memo
- ☐ Three dual-coded visuals drawn
- ☐ Cornell notes with cue column, source log, and summary
- ☐ Feynman explanation written, gaps identified, rewritten
- ☐ 15–18 flashcards created with tags
- ☐ Confidence audit and error-log entry
- ☐ Cheatsheet entry added
- ☐ R2 review scheduled

MODULE 1 SYNTHESIS

You have now completed Module 1 — the theoretical and epistemological foundations of the course. Before proceeding to Module 2 (Historical Architecture of International Order), write a **2,000-word synthesis essay** answering the following question:

"What is the international, and how should we study it?"

Your essay must:

1. **Reconstruct** the five major theoretical traditions covered in Module 1 — realism (L5), institutionalism (L6), constructivism and the English School (L7), and the critical traditions (L8) — and state each one's core claim, mechanism, and scope conditions.
2. **Distinguish** the epistemological positions — positivism, post-positivism, critical theory, post-colonial/decolonial, feminist/queer — and show how they shape what counts as knowledge (L4).
3. **Reconstruct** the five perspectives — African, Chinese, Russian, Western, UN — on at least **three** of the theories, and adjudicate between them on a specific case.
4. **Identify** at least **three** points of genuine disagreement between the traditions — not just different vocabularies, but substantive disagreements about what the international is and how to study it.
5. **Take a position**: which tradition (or combination of traditions) best explains the international, and why? Defend your choice against the strongest objection from a rival tradition.

This essay is your **entry ticket to Module 2**. It is assessed on the quality of the argument, the precision of the concepts, the use of evidence, and the engagement with the five perspectives — not on length alone.

FURTHER READING (Optional — for deepening, not required)

- **On Marxism and world-systems:** Karl Marx, *Capital*, vol. 1 (1867); V. I. Lenin, *Imperialism, the Highest Stage of Capitalism* (1917); Rosa Luxemburg, *The Accumulation of Capital* (1913); Immanuel Wallerstein, *The Modern World-System* (1974–2011); Giovanni Arrighi, *The Long Twentieth Century* (1994).
- **On African dependency and neo-colonialism:** Walter Rodney, *How Europe Underdeveloped Africa* (1972); Kwame Nkrumah, *Neo-Colonialism: The Last Stage of Imperialism* (1965); Samir Amin, *Unequal Development* (1976); Andre Gunder Frank, *Capitalism and Underdevelopment in Latin America* (1967).
- **On critical theory:** Max Horkheimer, "Traditional and Critical Theory" (1937); Robert Cox, "Social Forces, States and World Orders" (1981); Antonio Gramsci, *Prison Notebooks* (1929–35); Andrew Linklater, *Beyond Realism and Marxism* (1990).
- **On post-colonial and decolonial IR:** Edward Said, *Orientalism* (1978); Gayatri Spivak, "Can the Subaltern Speak?" (1988); Aníbal Quijano, "Coloniality of Power, Eurocentrism, and Latin America" (2000); Walter Mignolo, *The Darker Side of Western Modernity* (2011); Siba Grovogui, *Sovereigns, Quasi-Sovereigns, and Africans* (1996); Makau Mutua, "Savages, Victims, and Saviors" (2001); Frantz Fanon, *The Wretched of the Earth* (1961); Amílcar Cabral, *Unity and Struggle* (1979).
- **On feminist and queer IR:** Cynthia Enloe, *Bananas, Beaches and Bases* (1989); J. Ann Tickner, *Gender in International Relations* (1992); J. Ann Tickner, "Hans Morgenthau's Principles of Political Realism: A Feminist Reformulation" (1988); V. Spike Peterson (ed.), *Gendered States* (1992); Carol Cohn, "Sex and Death in the Rational World of Defense Intellectuals" (1987); Cynthia Weber, *Queer International Relations* (2016); Jasbir Puar, *Terrorist Assemblages* (2007); Kimberlé Crenshaw, "Demarginalizing the Intersection of Race and Sex" (1989); María Lugones, "Heterosexualism and the Colonial/Modern Gender System" (2007); Oyèrónkẹ́ Oyěwùmí, *The Invention of Women* (1997); Amina Mama, *Beyond the Masks* (1995); Sylvia Tamale, *Decolonization and Afro-Feminism* (2020).

End of Lesson 8. End of Module 1.

Say **"Next"** when you are ready for Lesson 9 (The Westphalian Myth and the Genealogy of Sovereignty), the first lesson of Module 2.

10. The Westphalian Myth and the Genealogy of Sovereignty: How the International System Was Really Made

LESSON METADATA

Field	Entry
Lesson number and title	L9 — The Westphalian Myth and the Genealogy of Sovereignty
Module	Module 2: Historical Architecture of International Order
Prerequisites	L1 (puzzles, levels, power, perspectives); L2 (Charter system, AU Act); L3 (causal inference, presentism); L7 (constructivism, the English School); L8 (post-colonialism, coloniality of power)
Interleaved links	Forward to L10 (19th-century multipolarity, Berlin Conference), L11 (World Wars and the League), L12 (Cold War and decolonization), L27 (African colonial state formation), L28 (Pan-Africanism and sovereignty), L37 (lawfare of territorial integrity), L41 (West Asian state system), L49 (institutional revisionism)
Reading load	This lesson only. Optional further reading at the end.
Content channels	Canon (quoted and summarized); primary documents (the Treaties of Münster and Osnabrück, the General Act of the Berlin Conference, Vattel, Bodin, quoted and analyzed); data lab (sovereignty recognition and UN membership); five perspectives
Bloom ceiling	Evaluate (adjudicate between the standard narrative and the revisionist account of sovereignty's genealogy)
Estimated study time	7–9 hours including exercises

Note on self-containment: Every argument, quotation, and example you need is inside this document. Where I cite Teschke, Krasner, Grovogui, Anghie, Schmitt, Bull, Watson, or any other scholar, I summa-

rize the argument fully enough that you do not need the original to complete the lesson. "Further Reading" is optional.

SECTION 0 — Why This Lesson Exists

Every IR textbook begins with the same story. In 1648, the Peace of Westphalia ended the Thirty Years' War and created the modern international system. It established the sovereign state as the basic unit of international politics, enshrined the principles of territorial integrity and non-interference, and inaugurated the era of anarchy — a system of formally equal sovereigns with no authority above them.

This story is the **founding myth** of International Relations. It is told in the first chapter of every introductory textbook, invoked in every discussion of sovereignty, and assumed in every realist and institutionalist theory. It is also **substantially false**.

This lesson is about that falsity — and why it matters. It is not an exercise in antiquarianism. The Westphalian myth shapes how the discipline thinks about sovereignty, anarchy, and the state. Correcting it changes what we can see:

1. **The 1648 treaties did not create the sovereign state system.** They were a settlement of the religious and constitutional conflicts of the Holy Roman Empire, not a charter for a new international order.
2. **The concept of "Westphalian sovereignty" was retroactively constructed** by 19th- and 20th-century international lawyers, who read their own assumptions back into the 1648 settlement.
3. **Sovereignty was never universal.** It was extended selectively — to "civilized" nations — and withheld from the colonized world. The "standard of civilization" was the mechanism through which the international system was racialized.
4. **Africa was the constitutive outside of European sovereignty.** European sovereignty was defined against the colonized world — the "savage," the "barbarian," the "uncivilized" — and African polities were treated as quasi-sovereign or non-sovereign.
5. **The myth has political consequences.** It naturalizes the sovereign state, obscures the colonial genealogy of the international system, and renders invisible the alternative forms of order that existed before and alongside the European state.

The African perspective is primary in this lesson because the colonial genealogy of sovereignty is most visible in Africa — and because African scholars (Grovogui, Mbembe, Anghie, Mutua) have produced the most important revisionist accounts of the Westphalian narrative.

This lesson has five key ideas:

1. **The Westphalian narrative is a founding myth**, not a historical description.
2. **Sovereignty is not one concept but four** (Krasner), and conflating them produces confusion.
3. **Sovereignty was never universal**: the "standard of civilization" excluded the colonized world.
4. **The "constitutive outside"**: the non-European world made European sovereignty possible.
5. **The five perspectives** on the Westphalian order, and the **adjudication** among them.

By the end, you can take any claim about sovereignty — "sovereignty is eroding," "sovereignty is absolute," "sovereignty is a Western concept" — and answer: *Which concept of sovereignty is being used? What is its genealogy? Who was excluded from it? And how do the five perspectives reconstruct it?*

SECTION 1 — PRE-CLASS PRIMING

1.1 Retrieval warm-up (from memory)

1. From L2: What did the AU's Article 4(h) change about the inherited sovereignty regime?
2. From L7: What is the difference between an international system and an international society in the English School?
3. From L8: What is the "coloniality of power," and who developed the concept?
4. From L8: What did Grovogui argue about sovereignty and Africa?

Check against the previous lessons before proceeding.

1.2 Orientation questions

Hold these in mind:

- If the Westphalian narrative is false, why is it so widely believed? What work does it do?
- Is sovereignty a single concept, or several? What difference does it make?
- When did sovereignty become universal? Was it ever?
- Why were African polities treated as non-sovereign, and what does that tell us about the international system?

1.3 Vocabulary pre-teach

Provisional definitions; revise by the end:

Westphalian sovereignty; international legal sovereignty; domestic sovereignty; interdependence sovereignty; organized hypocrisy; standard of civilization; constitutive outside; quasi-sovereignty; effective occupation; terra nullius; uti possidetis juris; the nomos of the earth; the expansion of international society; coloniality of sovereignty; the Berlin Conference; the mandate system; the trusteeship system.

SECTION 2 — LESSON CORE

2.1 Learning objectives

By the end of this lesson, you can:

1. **Reconstruct** the standard Westphalian narrative and identify the specific historical claims it makes — and the specific evidence that contradicts them.
2. **Distinguish** Krasner's four concepts of sovereignty and explain why conflating them produces confusion in IR analysis.
3. **Explain** how the "standard of civilization" was used to withhold sovereignty from the colonized world, and apply it to the African case.
4. **Reconstruct** the "constitutive outside" argument: how the non-European world made European sovereignty possible.

5. **Reconstruct** how African, Chinese, Russian, Western, and UN traditions interpret the Westphalian order, and **adjudicate** among them on a specific case.

2.2 KEY IDEA 1 — The Westphalian narrative is a founding myth, not a historical description

The claim: The story that IR tells about 1648 — that it created the sovereign state system, enshrined territorial sovereignty, and established the principle of non-interference — is **not supported by the historical evidence**. It is a **retrospective construction** that serves to naturalize the contemporary state system and to obscure its colonial genealogy.

The standard narrative. Here is the story as it appears in IR textbooks:

> The Peace of Westphalia (1648) ended the Thirty Years' War and the Eighty Years' War. It established the sovereign state as the basic unit of international politics. It enshrined the principles of territorial integrity, sovereignty, and non-interference in domestic affairs. It marked the transition from the medieval order — with its overlapping authorities (the Pope, the Holy Roman Emperor, feudal lords) — to the modern order of sovereign states. It is the founding moment of the international system.

What the treaties actually did. The Peace of Westphalia was not one treaty but two: the **Treaty of Münster** (May 1648) and the **Treaty of Osnabrück** (October 1648). Their provisions were:

1. **Religious settlement:** They resolved the religious conflicts of the Thirty Years' War by extending the principle of *cuius regio, eius religio* ("whose realm, his religion") — the ruler's religion would determine the religion of the realm — and by granting Calvinists legal recognition. They also established a fixed date (January 1, 1624) for determining which religion would be official in each territory.
2. **Constitutional settlement of the Holy Roman Empire:** They reorganized the constitutional structure of the Holy Roman Empire, granting the imperial estates (the princes, bishops, and cities) significant rights, including the right to form alliances, as long as those alliances were not directed against the Emperor or the Empire. This was a constitutional settlement within the Empire, not a dissolution of the Empire into sovereign states.
3. **Territorial adjustments:** They made territorial adjustments — France gained Alsace, Sweden gained parts of Pomerania, and the Dutch Republic and the Swiss Confederation were recognized as independent of the Empire.
4. **Amnesty and property rights:** They granted amnesty and restored property rights to those who had been dispossessed during the war.

What the treaties did not do. The treaties did **not**:

- Create a system of **formally equal sovereign states.** The Holy Roman Empire continued to exist as a hierarchical, overlapping order. The imperial estates were not sovereign in the modern sense; they were constitutional units within the Empire, with rights and obligations.
- Enshrine the principle of **non-interference** in domestic affairs. The treaties explicitly intervened in the domestic affairs of the Empire's constituent units (determining which religion would be official), and they established mechanisms for external enforcement of the settlement.
- **Dissolve the Empire** or create a new international system. The Empire persisted until 1806. The 1648 settlement was a constitutional arrangement *within* the Empire, not a founding charter for the

international system.
- **Establish the state as the basic unit** of international politics. The 1648 order was one of **overlapping authorities** — the Emperor, the imperial estates, the Church, the free cities — not a system of discrete sovereign states.

The retroactive construction. The term "Westphalian sovereignty" was not used in 1648, or for centuries afterward. It was **constructed** by 19th- and 20th-century international lawyers — particularly Lassa Oppenheim, whose *International Law* (1905) became the standard text — who read their own assumptions about state sovereignty back into the 1648 settlement. The "Westphalian system" was a **retrospective invention**, not a historical fact.

Why the myth persists. The myth does important **political and theoretical work**:

- It **naturalizes the sovereign state** by presenting it as the product of a founding moment rather than a contingent historical development.
- It **obscures the colonial genealogy** of the international system by presenting the state system as the product of European intra-state conflict, rather than European imperialism.
- It **legitimizes the existing distribution of power** by presenting it as the outcome of a foundational legal order rather than a contingent historical process.
- It **provides a convenient baseline** for theories of international politics: realism can say "anarchy has been the condition since Westphalia"; institutionalism can say "states have been the basic units since Westphalia." The myth is the shared premise of the discipline.

Observable implication. If the Westphalian narrative is a myth, then you should be able to identify (a) the **historical evidence** that contradicts it, (b) the **political interests** it serves, and (c) the **alternative accounts** of sovereignty's genealogy that are suppressed by the myth.

2.3 KEY IDEA 2 — Sovereignty is not one concept but four, and conflating them produces confusion

The claim: "Sovereignty" is not a single concept. It is a **family** of concepts that are related but distinct. The failure to distinguish them is one of the most common sources of confusion in IR. Stephen Krasner's *Sovereignty: Organized Hypocrisy* (1999) provides the most useful typology.

Krasner's four concepts:

Concept	Definition	Example of violation
International legal sovereignty	The recognition of a state by other states as a sovereign member of the international system. It is about **who is recognized**, not about what the state can do.	Taiwan is not recognized by most states; Kosovo is recognized by some but not all.

Concept	Definition	Example of violation
Westphalian sovereignty	The exclusion of external actors from the domestic authority structures of a state. It is about **who has authority within the state**, not about recognition.	The US dictating policy to Iraq during the occupation (2003–2011); the IMF imposing structural adjustment conditions on borrowing states.
Domestic sovereignty	The effective control of a state over its territory and population. It is about **whether the state can govern**, not about recognition or exclusion.	"Failed states" — states that cannot control their territory (Somalia in the 1990s, the DRC in the 2000s).
Interdependence sovereignty	The ability of a state to control flows across its borders — goods, capital, people, ideas, diseases. It is about **whether the state can regulate**, not about authority or recognition.	States that cannot control migration, capital flight, or cyber-attacks.

Why the distinction matters. The four concepts are **not the same**, and they can vary independently:

- A state can have **international legal sovereignty** without **domestic sovereignty** (Somalia in the 1990s: recognized as a state but unable to control its territory).
- A state can have **domestic sovereignty** without **Westphalian sovereignty** (Iraq during the occupation: effective control by the US, but not exclusive domestic authority).
- A state can have **Westphalian sovereignty** without **interdependence sovereignty** (a state that can exclude external actors from its domestic authority but cannot control cross-border flows).

Krasner's "organized hypocrisy." Krasner's central argument is that the international system is characterized by **organized hypocrisy**: the norms of sovereignty are **routinely violated**, but the violations are **organized** — they follow predictable patterns that reflect the interests of the powerful. Sovereignty is not a fixed rule; it is a **resource** that powerful states use and abuse. Weak states are more likely to have their Westphalian sovereignty violated (through intervention, conditionality, or coercion) than strong states.

The African case. For African states, the four concepts of sovereignty have varied independently in ways that are revealing:

- **International legal sovereignty** was achieved at independence (1960s) and is almost universally recognized — but it was achieved within **borders** drawn by colonial powers, with **institutions** inherited from colonial rule, and with **economies** structured by colonial extraction.
- **Westphalian sovereignty** has been routinely violated by external actors — through structural adjustment, conditionality, intervention, and the "responsibility to protect."
- **Domestic sovereignty** is often weak — many African states do not effectively control their territory, and hybrid orders (traditional authorities, religious networks, militias) coexist with and sometimes displace the formal state.
- **Interdependence sovereignty** is often limited — African states cannot control capital flight, migra-

tion, or the flows of illicit goods.

Observable implication. If Krasner's distinction is operative, you should see states **claiming** sovereignty in one sense while **losing** it in another — and you should see powerful states **invoking** one concept (e.g., Westphalian sovereignty) to criticize rivals while **violating** it themselves.

2.4 KEY IDEA 3 — Sovereignty was never universal: the "standard of civilization" and the colonial genealogy of the state system

The claim: The Westphalian narrative presents sovereignty as a **universal** principle — all states are equally sovereign. But sovereignty was **never universal**. It was extended selectively, to "civilized" nations, and withheld from the colonized world. The mechanism through which this selectivity operated was the **"standard of civilization"** — a legal doctrine that made sovereignty conditional on a state's conformity to European norms.

The standard of civilization. In the 19th century, international lawyers developed a legal doctrine that divided the world into three categories:

1. **Civilized nations:** European states, the United States, and a few others (e.g., Japan after the Meiji Restoration, Siam). These were **full subjects** of international law, entitled to sovereignty, recognition, and the protections of the law of nations.
2. **Barbarous nations:** States with some form of government and legal order, but not "civilized" enough for full sovereignty. These were treated as **partial subjects** — they could enter into treaties, but they were not entitled to the full protections of international law.
3. **Savage nations:** Peoples without organized government or law. These were treated as **objects** of international law — their territories were *terra nullius* (empty land), available for occupation by civilized states.

The criteria of civilization. The international lawyers — James Lorimer, William Edward Hall, John Westlake, and others — specified the criteria of "civilization." These included:

- A **civilized government** — one that could maintain order, enforce law, and conduct diplomatic relations.
- **Basic norms** — the prohibition of slavery, the protection of foreigners, the observance of treaties.
- **A legal system** — one that recognized the rights of property and contract, and that could provide remedies for foreigners.
- **"Progress"** — a commitment to the norms of European civilization, including Christianity, commerce, and "modern" institutions.

The function of the standard. The standard of civilization was not a neutral description. It was a **mechanism of exclusion** — it allowed European states to deny sovereignty to non-European polities while claiming to act in the name of universal principles. It was also a mechanism of **intervention** — it allowed European states to intervene in the affairs of non-European polities to "civilize" them, which in practice meant to colonize them.

The African case. Africa was the paradigmatic case of the standard of civilization in action:

- The **Berlin Conference** (1884–85) was the most explicit expression of the standard. The European powers divided Africa among themselves, without any African representation, and established the principle of **effective occupation** — the doctrine that colonial claims required actual administrative presence, not just discovery. The General Act of the Berlin Conference declared that the powers were "anxious to see the development of the civilization of the African populations" and were "bound to watch over the preservation of the native tribes, and to care for the improvement of the conditions of their moral and material well-being."
- The **mandate system** (after the First World War) and the **trusteeship system** (after the Second World War) continued the logic of the standard. African and other colonized territories were placed under the "tutelage" of European powers, who were supposed to prepare them for self-government.
- **Uti possidetis juris** — the principle that new states inherit the borders of the preceding colonial administrative units — was applied to Africa at independence, entrenching colonial borders and preventing any renegotiation of the colonial partition.

Grovogui's argument. Siba Grovogui's *Sovereigns, Quasi-Sovereigns, and Africans* (1996) is the most important African contribution to the genealogy of sovereignty. Grovogui argues that the sovereignty that IR treats as universal was **never extended to Africans**. African polities were treated as **quasi-sovereign** or **non-sovereign** — subject to external tutelage, intervention, and the "standard of civilization." The international system is not just anarchic; it is **hierarchical**, and the hierarchy is **racial**.

Grovogui's key insight: the sovereignty that IR describes as a **universal principle** is actually a **particular historical product** — a product of European state formation, European imperialism, and the racial hierarchy that structured the colonial world. The claim that sovereignty is universal is not a description of the international system; it is a **normative aspiration** that the system has never realized.

Anghie's argument. Antony Anghie's *Imperialism, Sovereignty and the Making of International Law* (2005) extends Grovogui's argument to international law more broadly. Anghie argues that **sovereignty** and **colonialism** were **constituted together**: the sovereignty of European states was defined **against** the non-sovereignty of the colonized world. The "standard of civilization" was not a peripheral doctrine; it was **central** to the constitution of international law. The post-colonial state, in Anghie's account, is not a fully sovereign state but a **product of the colonial encounter** — its sovereignty is conditional, its institutions are inherited, and its economy is structured by the legacy of extraction.

Observable implication. If the standard of civilization is operative, you should see (a) **conditional** sovereignty — states whose sovereignty is contingent on their conformity to external norms; (b) **hierarchical** treatment — some states are subject to intervention, conditionality, and tutelage, while others are not; and (c) **racialized** patterns — the states whose sovereignty is most conditional are disproportionately in the Global South.

2.5 KEY IDEA 4 — The "constitutive outside": how the non-European world made European sovereignty possible

The claim: The standard of civilization did not just exclude the colonized world; it **constituted** European sovereignty. European sovereignty was defined **against** the non-European world — the "savage," the "barbarian," the "uncivilized." Without the colonized world as its constitutive outside, European sovereignty would not have been what it was.

The concept. The "constitutive outside" is a concept from post-structuralist theory (Derrida, Laclau, Mouffe) that has been applied to IR by post-colonial and constructivist scholars. The idea is that identities are constituted through **difference** — the identity of the "inside" is defined by its opposition to the "outside." The outside is not just excluded; it is **necessary** for the inside to be what it is.

Applied to sovereignty. European sovereignty was constituted through the opposition between the "civilized" and the "uncivilized":

- European states were **sovereign** because they had **governments** capable of maintaining order; non-European polities were **non-sovereign** because they lacked such governments.
- European states were **civilized** because they had **law** that protected property and contract; non-European polities were **savage** because they lacked such law.
- European states were **territorial** because their sovereignty was bounded by **borders**; non-European polities were **non-territorial** because their authority was not bounded in the same way.

The point is not just that Europeans **believed** they were superior. The point is that the **institution** of European sovereignty — the specific set of rights, powers, and practices that defined it — was **constituted** through the exclusion of the colonized world. European states could claim **exclusive** authority over their territories because they denied that the colonized world had **any** authority over its territories.

The African case. Africa was the paradigmatic "constitutive outside" of European sovereignty:

- The **Berlin Conference** was not just a division of territory; it was a **constitution** of European sovereignty. By dividing Africa among themselves, the European powers **constituted** their own sovereignty — they established that they were the kind of entities that could **own** territory, **divide** it, and **govern** it. The African polities were not just excluded from the division; they were **constituted as non-sovereign** — as objects to be divided, not subjects who could divide.
- The **doctrine of effective occupation** was not just a rule for colonial claims; it was a **constitution** of what counted as sovereignty. A state was sovereign if it could **effectively occupy** territory — which meant, in practice, if it could **administer** it in the European manner. African polities, which had their own forms of authority, were **not** recognized as sovereign because they did not meet this criterion.
- The **mandate and trusteeship systems** were not just forms of colonial administration; they were **constitutions** of the hierarchy of sovereignty. The "advanced nations" were sovereign; the "peoples not yet able to stand by themselves" were not. The hierarchy was **racial**: the advanced nations were European; the peoples not yet able were African, Asian, and Pacific.

Mbembe's necropolitics. Achille Mbembe's concept of **necropolitics** (2003) extends this argument. Mbembe argues that the sovereignty of the modern state is **constituted through the power to determine who lives and who dies** — the power over life and death. This power was exercised most explicitly in the colonies, where the colonized were treated as **bare life** — as beings whose lives were not protected by law, and whose deaths were not grievable. The "constitutive outside" is not just a conceptual category; it is a **material** reality — the bodies of the colonized were the site where European sovereignty was enacted.

Observable implication. If the "constitutive outside" argument is operative, you should see (a) **representations** of the non-European world that construct it as the opposite of European sovereignty — as disorderly, lawless, and savage; (b) **practices** that treat the non-European world as an object of governance rather than a subject of sovereignty; and (c) **persistence** of these representations and practices in the post-colonial era — in the discourse of "failed states," "humanitarian intervention," and "the responsibility to protect."

2.6 KEY IDEA 5 — The five perspectives interpret the Westphalian order differently, and each interpretation is political

The claim: The Westphalian myth is not just a historical question. It is a **political** question. The five perspectives — African, Chinese, Russian, Western, and UN — interpret the Westphalian order differently, and each interpretation reflects a different political project.

2.6.1 The African perspective (primary) Core commitments. African scholars and statesmen have a **complex** relationship with the Westphalian order. On one hand, the sovereignty that Westphalian norms promise is **hard-won** — African states fought for independence, and they defend sovereignty and non-interference as protections against re-colonization. On the other hand, the Westphalian order was **never** extended to Africa on equal terms — African sovereignty was conditional, hierarchical, and racialized.

The critique of the myth. African scholars argue that the Westphalian narrative **erases Africa** from the story of the international system. The international system was not created in 1648 by European states; it was created through **conquest, colonization, and the slave trade** — processes that are invisible in the Westphalian narrative. The "expansion of international society" (Bull and Watson) was not an expansion of norms; it was an expansion of **violence**.

The defence of sovereignty. At the same time, African states are among the strongest defenders of Westphalian sovereignty. The AU Constitutive Act enshrines non-interference (Article 4(g)), and African states have consistently resisted external intervention, conditionality, and the "responsibility to protect." This is not because African states are committed to the Westphalian myth; it is because they have experienced what happens when sovereignty is denied. The defence of sovereignty is a **defence against the return of the standard of civilization**.

The AU's modification. The AU's Article 4(h) — the right of the Union to intervene in a member state in cases of genocide, war crimes, and crimes against humanity — is an **African innovation** within the Westphalian framework. It accepts the sovereignty norm but modifies it: sovereignty is not absolute; it is conditional on the state's responsibility to protect its citizens. This is an attempt to **decolonize** sovereignty — to take the Westphalian norm and remake it for African purposes.

Grovogui's challenge. Grovogui's work is a challenge to both the Westphalian myth and the uncritical defence of sovereignty. He argues that the sovereignty that African states defend is **not the same sovereignty** that European states enjoy: it is conditional, hierarchical, and racialized. The task, for Grovogui, is not to defend the Westphalian order but to **transform** it — to create a genuinely post-colonial sovereignty that is not structured by the colonial past.

What this perspective contributes: It shows that the Westphalian order is **not neutral** — it is a product of colonial history, and it continues to reproduce colonial hierarchies. It also shows that African states are **not passive** — they have both defended and modified the sovereignty norm, and they have developed their own institutions (the AU, the AfCFTA) to pursue their own projects.

What it occludes: It can underplay the **genuine value** of Westphalian sovereignty for African states — the ways in which sovereignty protects weak states from intervention and exploitation. It can also underplay the **diversity** of African positions — not all African states agree on the meaning of sovereignty.

2.6.2 The Chinese perspective **Core commitments.** China's engagement with the Westphalian order is shaped by its own history — the "century of humiliation" (1839–1949), during which China was subjected to the "standard of civilization," unequal treaties, and foreign intervention.

1. **The critique of the standard of civilization.** Chinese scholars and officials often invoke the "century of humiliation" to critique the West's claim to universalism. China was a victim of the standard of civilization; it was denied full sovereignty because it was not "civilized" enough. This experience shapes China's commitment to **absolute sovereignty** and **non-interference**.
2. **The Tianxia alternative.** Chinese scholars — particularly Zhao Tingyang — argue that the Westphalian order is a **particular** order, not a universal one. *Tianxia* ("all under heaven") is an alternative model — a hierarchical, harmonious order in which the legitimate ruler provides order for all. This is a challenge to the Westphalian assumption that the international system is composed of formally equal sovereign states.
3. **Relational sovereignty.** Qin Yaqing's relational theory challenges the Westphalian assumption that states are discrete, atomistic actors. Relations, not states, are the basic units; sovereignty is relational, not absolute.

The political project. China's engagement with the Westphalian order is part of its broader project of **epistemic sovereignty** — the claim that the international order should not be defined by a single civilization's rules, and that China should not be confined to Western frameworks.

What this perspective contributes: It shows that the Westphalian order is **not the only possible order** — there are alternative models (Tianxia, relationality) that challenge its assumptions. It also shows that the critique of the Westphalian order can come from **within** the state system, not just from post-colonial theory.

What it occludes: It can underplay the ways in which China **benefits** from the Westphalian order — the ways in which sovereignty and non-interference protect China from external criticism and intervention. It can also risk **essentializing** "Chinese thought" as a unified tradition.

2.6.3 The Russian perspective **Core commitments.** Russia's engagement with the Westphalian order is defined by the **defence of great-power sovereignty** and the **rejection of the liberal order**.

1. **The defence of Westphalian sovereignty.** Russia is one of the strongest defenders of the Westphalian principle of non-interference — but with a twist. Russia argues that sovereignty is **stratified**: great powers are truly sovereign; smaller states fall within the spheres of influence of great powers. This is a **realist** reading of the Westphalian order, not a liberal one.
2. **The rejection of the liberal order.** Russia rejects the liberal interpretation of the Westphalian order — the interpretation that sovereignty is conditional on human rights, democracy, and the "responsibility to protect." Russia sees this as a Western instrument for intervention. The Russian perspective is **pluralist**: sovereignty is absolute, and intervention is a violation of the Charter.
3. **State-civilization.** Russia's self-understanding as a **state-civilization** is a challenge to the Westphalian assumption that states are nation-states. Russia is a civilization, not a nation-state; its sovereignty is civilizational, not merely territorial.

The political project. Russia's engagement with the Westphalian order is **defensive**: it uses the language of sovereignty to resist Western intervention and to defend its sphere of influence.

What this perspective contributes: It shows that the Westphalian order can be **mobilized for illiberal**

purposes — the defence of sovereignty can become a defence of authoritarianism. It also shows that the meaning of the Westphalian order is **contested** — different states interpret it differently.

What it occludes: It can **naturalize** aggression — the claim that Russia is defending its sovereignty can be used to justify the invasion of Ukraine. It can also **underplay** the ways in which Russia **violates** the sovereignty of its neighbors.

2.6.4 The Western perspective **Core commitments.** The Western tradition is the **home** of the Westphalian myth. The standard narrative was constructed by Western international lawyers, and it remains central to Western IR.

1. **The standard narrative.** Western IR textbooks present the Westphalian settlement as the founding moment of the international system. This narrative is not just descriptive; it is **normative** — it presents the sovereign state as the natural, legitimate form of political organization, and it presents the international system as a realm of formally equal sovereigns.
2. **The revisionist critique.** Western scholarship has also produced the most important **revisionist** accounts of the Westphalian myth. Teschke's *The Myth of 1648* (2003), Krasner's *Sovereignty: Organized Hypocrisy* (1999), and Anghie's *Imperialism, Sovereignty and the Making of International Law* (2005) are all Western critiques of the standard narrative. The Western tradition is not monolithic; it contains its own self-critique.
3. **The liberal interpretation.** Western liberalism interprets the Westphalian order as a framework for **cooperation and progress** — the sovereign state is the foundation of international order, and international institutions can build on it to produce peace, prosperity, and human rights. This is a **solidarist** interpretation, in contrast to the pluralist Russian interpretation.

What this perspective contributes: It provides the **most developed** versions of both the standard narrative and its revisionist critique. It also provides the **institutional infrastructure** — universities, journals, publishers — through which the debate is conducted.

What it occludes: It can be **parochial** — treating Western history as universal history. It can be **complicit** — the standard narrative serves Western interests by naturalizing the existing order. And it can be **self-referential** — a debate among Western scholars about Western history, with little engagement with non-Western perspectives.

2.6.5 The UN perspective **Core commitments.** The UN is the **institutional embodiment** of the Westphalian order — but it also embodies a **tension** between pluralist and solidarist interpretations of that order.

1. **The Charter as the Westphalian constitution.** The UN Charter enshrines the principles of sovereignty, territorial integrity, and non-interference. These are the core norms of the Westphalian order, and the UN is their institutional guarantor. The General Assembly's 1970 Declaration on Principles of International Law Concerning Friendly Relations and Co-operation among States is the most explicit statement of these principles.
2. **The solidarist challenge.** The UN has also been the site of **solidarist** challenges to the Westphalian order — the human rights regime, the R2P, the ICC. These challenges assert that sovereignty is **conditional** on the state's responsibility to protect its citizens. The tension between pluralism and solidarism is the central tension in the UN's interpretation of the Westphalian order.
3. **The decolonization agenda.** The UN was a **site** of anti-colonial struggle — the General Assembly's

1960 Declaration on the Granting of Independence to Colonial Countries and Peoples was a landmark. The UN's decolonization agenda was an attempt to **extend** the Westphalian order to the colonized world — to make sovereignty universal. But the extension was incomplete: the post-colonial state inherited colonial borders, colonial institutions, and colonial economies.

What this perspective contributes: It provides the **normative benchmark** — the standards against which the Westphalian order is judged. It also provides the **institutional record** — the resolutions, declarations, and debates that are essential evidence for any analysis.

What it occludes: It can **depoliticize** — framing the Westphalian order as a legal-technical matter obscures the power dynamics that shaped it. It can **legitimize** — the UN's authority can be used to justify the existing order. And it can **underplay** the gap between the UN's normative commitments and its actual practice.

2.6.6 The comparison matrix

Dimension	African (primary)	Chinese	Russian	Western	UN
Stance toward Westphalian myth	Critique: erases Africa; defence of sovereignty as anti-colonial	Critique: standard of civilization; Tianxia alternative	Defence: stratified sovereignty; rejection of liberal interpretation	Home of the myth; revisionist critique from within	Institutional embodiment; tension between pluralism and solidarism
Key concept of sovereignty	Conditional, hierarchical, racialized; AU's Article 4(h) as modification	Absolute; relational; civilizational	Stratified: great powers truly sovereign	Formal; contested between pluralist and solidarist	Legal; Charter-based; tension between sovereignty and R2P
What it contributes	Colonial genealogy; African agency	Alternative models; critique of universalism	Illiberal mobilization of sovereignty	Standard narrative + revisionist critique	Normative benchmark; institutional record
What it occludes	Value of sovereignty for weak states; diversity of African positions	China's benefit from Westphalian order	Violation of neighbors' sovereignty	Parochialism; complicity	Power dynamics; gap between norms and practice

---

2.7 WORKED EXAMPLE (I do)

The puzzle: The **Responsibility to Protect (R2P)** was adopted unanimously by the UN General Assembly at the 2005 World Summit. It seemed to represent a fundamental challenge to the Westphalian order — the

claim that sovereignty is conditional on the state's responsibility to protect its citizens. Yet in the two decades since, R2P has been invoked inconsistently, contested by many states, and has not become an internalized norm. Why did a norm that seemed to challenge the Westphalian order fail to transform it?

The puzzle stated precisely: *Why did R2P, which appeared to challenge the Westphalian principle of absolute sovereignty, fail to become an internalized norm, and why is it contested by the very states it was designed to protect?*

The Westphalian framing:

- **R2P as a challenge to Westphalian sovereignty.** R2P asserts that sovereignty is **conditional** — a state that fails to protect its citizens loses its claim to sovereignty, and the international community has a responsibility to intervene. This is a **solidarist** challenge to the **pluralist** Westphalian order.
- **The standard of civilization redux.** Critics argue that R2P is a **new standard of civilization** — it makes sovereignty conditional on conformity to Western norms (human rights, democracy, the "responsibility to protect"), and it justifies intervention in the Global South. The mechanism is the same as the 19th-century standard: a purportedly universal norm that is applied selectively to weak states.
- **The constitutive outside.** R2P constructs the "failed state" as the **constitutive outside** of the responsible sovereign — the state that cannot or will not protect its citizens. The "failed state" is the new "savage," the object of intervention rather than the subject of sovereignty.

The African perspective. African states have a **complex** relationship with R2P:

- **The AU's Article 4(h)** is an **African** version of R2P — a collective right of intervention in genocide, war crimes, and crimes against humanity. This shows that African states are not opposed to the idea of conditional sovereignty; they are opposed to the **unilateral** and **selective** application of the norm by Western powers.
- **The Libya intervention (2011)** is the key case. The UN Security Council authorized intervention under R2P; NATO intervened; the intervention became a regime-change operation; and the aftermath was a disaster. For many African states, Libya confirmed their suspicions that R2P is a **Western instrument** — a new standard of civilization that justifies intervention in the Global South.
- **The African critique** is not a rejection of R2P but a demand for its **multilateralization** — intervention should be authorized by the UN or the AU, not by ad hoc Western coalitions. The African position is a **pluralist** defence of sovereignty combined with a **solidarist** commitment to protection — a distinctively African synthesis.

The Chinese and Russian perspectives. China and Russia have consistently contested R2P, framing it as a Western instrument for regime change. They emphasize **sovereignty and non-interference**, and they argue that R2P is a violation of the UN Charter. Their position is **pluralist**: order requires respecting sovereignty, not intervening to enforce justice. The Russian and Chinese positions are not just cynical; they reflect a genuine commitment to the Westphalian order — an order that protects them from external intervention.

The Western perspective. Western states are the **principal advocates** of R2P, but they are also its **principal violators**: they invoke it selectively and they resist its application to their own actions. The Western position is **solidarist** in rhetoric but **pluralist** in practice.

The UN perspective. The UN has tried to **institutionalize** R2P through the office of the Special Adviser on the Prevention of Genocide and the Responsibility to Protect, and through the "three pillars" framework. The UN's position is that R2P is a **Charter-based** norm, not a Western imposition.

Adjudication. Which theory best explains R2P's contested status?

- **The Westphalian framework** explains why R2P is contested: it challenges the **pluralist** order that many states — particularly Russia, China, and many African states — see as protecting their sovereignty.
- **The post-colonial framework** explains why R2P is seen as a **new standard of civilization**: it makes sovereignty conditional on conformity to Western norms, and it justifies intervention in the Global South.
- **The African perspective** explains why African states are **not** simply opposed to R2P: the AU's Article 4(h) shows that African states have their own version of conditional sovereignty, and their opposition is to the **unilateral** and **selective** application of the norm, not to the norm itself.
- **The Western perspective** explains why R2P has not been abandoned: it remains a **normative aspiration** that Western states and international institutions continue to invoke.

A complete explanation combines all four: R2P is a **genuinely new norm** that challenges the Westphalian order, but its **internalization** has been blocked by the **pluralist structure** of international society, the **selective application** of the norm by the powerful, and the **post-colonial suspicion** that it is a new form of Western interventionism. The contestation over R2P is not a failure of the norm; it is a **window into the deeper contestation** over what the Westphalian order is and should be.

2.8 PROBLEM PAIR (We do)

Your task: Analyze the following case using the apparatus above. Write your analysis before reading the model answer.

The case: The **Berlin Conference** (1884–85) is often cited as the moment when Africa was "divided" by European powers. The General Act of the Berlin Conference declared that the powers were "anxious to see the development of the civilization of the African populations" and established the principle of **effective occupation** — the doctrine that colonial claims required actual administrative presence. No African representatives were present at the conference.

Your tasks:

1. State the puzzle precisely: why did the European powers need a **conference** to divide Africa, and what does the conference tell us about the relationship between sovereignty and civilization?
2. Apply the **standard of civilization** framework: how did the Berlin Conference enact the standard? What did it mean to be "civilized" in the context of the conference?
3. Apply the **constitutive outside** framework: how did the Berlin Conference **constitute** European sovereignty by excluding African sovereignty?
4. Apply the **African perspective**: how do African scholars interpret the Berlin Conference, and what does it tell us about the colonial genealogy of the international system?
5. Write a 300-word adjudication: is the Berlin Conference best understood as a **division of territory**, a **constitution of sovereignty**, or a **racial hierarchy** — or all three?

Model answer (compare after writing your own):

Puzzle: Why did the European powers need a conference to divide Africa, and what does it tell us about the

relationship between sovereignty and civilization?

The standard of civilization: The Berlin Conference was the most explicit enactment of the standard of civilization. The European powers claimed to be acting in the name of **civilization** — the General Act declared that they were "anxious to see the development of the civilization of the African populations." This was not a neutral description; it was a **justification** for conquest. The African polities were not "civilized" enough to be sovereign; they were "savage" or "barbarous," and their territories were available for occupation. The standard of civilization was the mechanism through which the European powers denied African sovereignty while claiming to act in the name of universal principles.

The constitutive outside: The Berlin Conference did not just divide territory; it **constituted** European sovereignty. By dividing Africa among themselves, the European powers established that they were the kind of entities that could **own** territory, **divide** it, and **govern** it. African polities were not just excluded from the division; they were **constituted as non-sovereign** — as objects to be divided, not subjects who could divide. The doctrine of effective occupation was not just a rule for colonial claims; it was a **constitution** of what counted as sovereignty. A state was sovereign if it could **effectively occupy** territory — which meant, in practice, if it could **administer** it in the European manner. African polities, which had their own forms of authority, were **not** recognized as sovereign because they did not meet this criterion.

The African perspective: African scholars interpret the Berlin Conference as the **founding moment** of Africa's incorporation into the international system — not as a subject but as an object. The conference established the **colonial borders** that African states inherited at independence, and it entrenched the **extractive institutions** that continue to shape African economies. The African perspective emphasizes that the Berlin Conference was not just a historical event; it was a **constitutive moment** that continues to structure Africa's place in the international system.

Adjudication: The Berlin Conference is **all three** — a division of territory, a constitution of sovereignty, and a racial hierarchy. It was a **division** of African territory among European powers; it was a **constitution** of European sovereignty through the exclusion of African sovereignty; and it was a **racial hierarchy** that placed European "civilization" above African "savagery." The three dimensions are not separate; they are **interconnected**. The division of territory was possible because of the racial hierarchy; the racial hierarchy was constituted through the division; and the sovereignty of the European powers was constituted through both. A complete analysis must hold all three dimensions together.

2.9 INDEPENDENT MEMO (You do)

Produce a one-page analytical memo (500–600 words) on the following case, using the four headings below.

Case: The **mandate system** established after the First World War by the League of Nations. The mandate system placed former German and Ottoman territories under the "tutelage" of "advanced nations" — Britain, France, Belgium, South Africa, Australia, New Zealand, and Japan — who were supposed to prepare them for self-government. The mandates were classified into A, B, and C categories, with different levels of "readiness" for independence. The system was later replaced by the UN trusteeship system after the Second World War.

Memo headings:

1. **Mechanism:** How did the mandate system institutionalize the standard of civilization? What was the legal mechanism through which sovereignty was withheld?
2. **The constitutive outside:** How did the mandate system constitute the sovereignty of the "advanced nations" by denying it to the "peoples not yet able to stand by themselves"?
3. **Perspective reconstruction:** How would each of the five perspectives interpret the mandate system? (African, Chinese, Russian, Western, UN — one paragraph each or a table.)
4. **Falsifiers:** What evidence would show that the mandate system was **not** a mechanism of the standard of civilization? What would show that it **was**?

Self-check: Does your memo distinguish the **stated goals** of the mandate system (tutelage, preparation for self-government) from its **function** (legitimation of colonial rule)? Does it identify the **racial hierarchy** that structured the system?

2.10 HINGE QUESTION

A scholar argues: "The Westphalian narrative is not a description of what happened in 1648; it is a story that 19th- and 20th-century international lawyers told about 1648 to legitimize the sovereign state system they were building." Which claim does this argument support?

- A) The Peace of Westphalia created the modern state system
- B) The Westphalian narrative is a retrospective construction
- C) Sovereignty was universally recognized after 1648
- D) The standard of civilization was a neutral legal doctrine

Answer: B. The argument claims that the Westphalian narrative was **constructed** after the fact — by 19th- and 20th-century international lawyers — to legitimize the sovereign state system. This is the core revisionist claim: the narrative is a **myth**, not a historical description.

If you answered A: This is the standard narrative, which the scholar is challenging. **If you answered C:** Sovereignty was never universally recognized; the standard of civilization excluded the colonized world. **If you answered D:** The standard of civilization was not neutral; it was a mechanism of exclusion and racial hierarchy.

SECTION 2A — DATA LAB (30–45 minutes)

Purpose: Ground the lesson's concepts in empirical data on sovereignty recognition.

Task: Using the summary data below, analyze patterns of sovereignty recognition and the standard of civilization.

Table 1: UN membership, selected years

Year	Number of member states	African member states	Asian member states
1945	51	4	9

Year	Number of member states	African member states	Asian member states
1960	99	26	22
1970	127	42	30
1990	159	52	38
2020	193	54	43

Table 2: Recognition of contested states (illustrative, 2024)

Entity	UN member?	Recognized by (approx.)	Status
Taiwan	No	~12 states	Contested
Kosovo	No	~100 states	Contested
Palestine	No (observer)	~140 states	Contested
Western Sahara	No	~40 states	Contested
Somaliland	No	0 states	Contested

Analysis questions:

1. **Sovereignty expansion:** What does the UN membership data suggest about the **expansion of sovereignty**? When did it become universal, and what drove the expansion?
2. **Conditional sovereignty:** What does the data on contested states suggest about the **conditionality** of sovereignty? Why are some entities recognized and others not? What role do **great-power interests** play?
3. **The standard of civilization:** Are there contemporary equivalents of the standard of civilization? How might the criteria for recognition today (democracy, human rights, effective control) reflect the legacy of the standard?
4. **The African case:** What does the African membership data suggest about the **timing** of African sovereignty? What does it tell us about the relationship between decolonization and the expansion of the international system?
5. **Perspective:** How would each of the five perspectives interpret the data? (African: decolonization and continued hierarchy; Chinese: sovereignty as a shield; Russian: sovereignty as a great-power prerogative; Western: sovereignty as a universal norm; UN: sovereignty as the foundation of the Charter order.)

Rule: Complete the data lab before the independent memo.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Task: Draw the following by hand.

Visual 1: The Westphalian myth vs. the historical record. Draw a two-column table. Left column: "What the myth says" (created the state system, enshrined non-interference, established formal equality). Right column: "What the historical record shows" (religious settlement, constitutional arrangement of the Empire, overlapping authorities).

Visual 2: Krasner's four concepts of sovereignty. Draw a four-part diagram: International legal sovereignty (recognition), Westphalian sovereignty (exclusion of external authority), Domestic sovereignty (effective control), Interdependence sovereignty (control of flows). For each, write a one-line definition and one example of a violation.

Visual 3: The standard of civilization. Draw a triangle with three vertices: Civilized (full sovereignty), Barbarous (partial sovereignty), Savage (no sovereignty — terra nullius). Label the center: "Standard of civilization." Write one example for each vertex.

SECTION 4 — CORNELL NOTES

Set up your notes with the following cue column:

Cue column	Notes
What is the Westphalian narrative?	1648 created the sovereign state system, enshrined non-interference, established formal equality
What does the historical record show?	Religious settlement, constitutional arrangement of the Empire, overlapping authorities — not a founding moment
What are Krasner's four concepts of sovereignty?	International legal, Westphalian, domestic, interdependence
What is "organized hypocrisy"?	Sovereignty norms are routinely violated, but violations follow patterns that reflect powerful interests
What is the standard of civilization?	Legal doctrine that made sovereignty conditional on conformity to European norms; divided the world into civilized, barbarous, and savage
How was the standard applied to Africa?	Berlin Conference, effective occupation, mandate/trusteeship systems, uti possidetis juris
What is the "constitutive outside"?	The non-European world constituted European sovereignty through its exclusion
How do the five perspectives interpret the Westphalian order?	African: colonial genealogy + defence of sovereignty; Chinese: standard of civilization + Tianxia alternative; Russian: stratified sovereignty; Western: home of the myth + revisionist critique; UN: institutional embodiment + pluralist/solidarist tension
Source log	Lesson text, Sections 2.2–2.6; Teschke (2003); Krasner (1999); Grovogui (1996); Anghie (2005); Schmitt (1950); Bull and Watson (1984); the Treaties of Münster and Osnabrück; the General Act of the Berlin Conference
Summary	3–5 sentences synthesizing the lesson

SECTION 5 — FEYNMAN COMPRESSION

Step 1: Explain the Westphalian myth and its critique to a smart non-specialist in 150–200 words, without using jargon. If you must use "sovereignty" or "standard of civilization," define them in plain language.

Step 2: Mark every point where you hesitated or used a term you could not define.

Step 3: Reread only the gaps. Rewrite.

Step 4: Produce one analogy for the "constitutive outside." Then state where the analogy breaks down. (Example: "The constitutive outside is like the way a club defines itself by who it excludes — the members are members because they are not the outsiders." Where it breaks down: unlike a club, the outsiders are not just excluded; they are **constituted** as inferior by the exclusion, and the exclusion shapes the identity of the insiders.)

SECTION 6 — SPACED-REPETITION FLASHCARDS

Produce 12–15 cards. Use the following types:

Type	Example
Definition	What are Krasner's four concepts of sovereignty?
Mechanism	How did the standard of civilization function as a mechanism of exclusion?
Application	A state is recognized by the UN but cannot control its territory. Which concept of sovereignty is it lacking?
Comparison	How does the Westphalian narrative differ from the historical record of 1648?
Source	What did Grovogui argue about sovereignty and Africa?
Debate	What is the strongest objection to the claim that the Westphalian narrative is a myth?
Reconstruction	How would a Chinese scholar critique the Westphalian order?
Occlusion	What does the standard narrative of the Westphalian order fail to see about the colonial world?
Adjudication	Which perspective best explains the contested status of R2P, and what does it miss?
Visual	Label the three categories of the standard of civilization on a diagram.

Tag each card: `L9`, `sovereignty`, `Westphalian myth`, `colonialism`, `perspective`, `difficulty`.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence audit

Rate confidence (0–100%) before checking:

Objective	Confidence
Reconstruct the Westphalian narrative and its critique	
Distinguish Krasner's four concepts of sovereignty	
Explain the standard of civilization and its application to Africa	
Reconstruct the "constitutive outside" argument	
Reconstruct the five perspectives on the Westphalian order	

After exercises, rate accuracy. Calculate the gap.

7.2 Three-question debrief

1. What did I misunderstand about the relationship between the Westphalian narrative and the historical record?
2. Which perspective was easiest to reconstruct? Which was hardest? What does that suggest about my default analytical style?
3. What will I do differently in Lesson 10?

7.3 Error log

Date	Lesson	Error type	Correct understanding	Card created?
	L9			

SECTION 8 — CHEATSHEET (Module 2)

Start your Module 2 cheatsheet with this row:

Column	Content
Core concepts	Westphalian myth; Krasner's four concepts of sovereignty; organized hypocrisy; standard of civilization; constitutive outside; quasi-sovereignty; effective occupation; terra nullius; uti possidetis juris; coloniality of sovereignty

Column	Content
Key mechanisms	Retrospective construction → naturalization of state system; standard of civilization → exclusion of colonized world; constitutive outside → European sovereignty through exclusion of the colonized; organized hypocrisy → selective violation of sovereignty norms
Theories and authors	Teschke (2003); Krasner (1999); Grovogui (1996); Anghie (2005); Schmitt (1950); Bull and Watson (1984); the Treaties of Münster and Osnabrück; the General Act of the Berlin Conference
Cases and evidence	Peace of Westphalia (1648); Berlin Conference (1884–85); mandate system; R2P; contested states (Taiwan, Kosovo, Palestine); UN membership data
Debates	Was 1648 a founding moment? Is sovereignty universal? Is the standard of civilization a thing of the past?
Falsifiers	What evidence would show that the Westphalian narrative is accurate? What would show it is a myth?
Cross-links	L2 (Charter system); L7 (English School); L8 (post-colonialism); L10 (19th-century multipolarity); L27 (African state formation); L28 (Pan-Africanism); L37 (lawfare of territorial integrity); L41 (West Asian state system)

SECTION 9 — REVIEW SCHEDULE

Review	Timing	Format
R1	Today	Retrieval warm-up + card creation
R2	2–3 days	Cue-column recall + hinge variant
R3	1 week	Mixed quiz with L1–L9 cards
R4	3–4 weeks	Interleaved problem combining L9 with L10 (Berlin Conference) and L27 (African state formation)
R5	End of Module 2	Cheatsheet reconstruction from memory

SECTION 10 — COMPLETION CHECKLIST

- ☐ Retrieval warm-up completed from memory
- ☐ Five learning objectives read and understood
- ☐ Five key ideas studied with mechanisms and scope conditions
- ☐ Perspective comparison matrix filled from memory, then checked
- ☐ Worked example (R2P) studied and self-explained
- ☐ Problem pair (Berlin Conference) attempted and compared
- ☐ Independent memo produced (500–600 words)
- ☐ Hinge question answered correctly (or reteaching completed)
- ☐ Data lab completed before independent memo
- ☐ Three dual-coded visuals drawn
- ☐ Cornell notes with cue column, source log, and summary
- ☐ Feynman explanation written, gaps identified, rewritten
- ☐ 12–15 flashcards created with tags
- ☐ Confidence audit and error-log entry
- ☐ Cheatsheet entry added
- ☐ R2 review scheduled

End of Lesson 9. Say **"Next"** when you are ready for Lesson 10 (19th-Century Multipolarity, Empire, and the Berlin Conference).

11. 19th-Century Multipolarity, Empire, and the Berlin Conference: The Great-Power Concert and the Scramble for Africa

---

LESSON METADATA

Field	Entry
Lesson number and title	L10 — 19th-Century Multipolarity, Empire, and the Berlin Conference
Module	Module 2: Historical Architecture of International Order
Prerequisites	L2 (Charter system, AU Act); L3 (causal inference, selection bias); L7 (English School — international society and expansion); L8 (post-colonialism, coloniality of power); L9 (Westphalian myth, standard of civilization)
Interleaved links	Forward to L12 (Cold War and decolonization), L27 (African colonial state formation), L28 (Pan-Africanism and the OAU), L33 (critical minerals and techno-geopolitics), L49 (institutional revisionism), L51 (climate geopolitics)
Reading load	This lesson only. Optional further reading at the end.
Content channels	Canon (paraphrased and quoted); primary documents (the Final Act of the Congress of Vienna, the General Act of the Berlin Conference, the Act of the Brussels Conference, quoted and analyzed); data lab (colonial partition and trade data); five perspectives
Bloom ceiling	Evaluate (adjudicate between the Concert-of-Europe narrative and the imperial-partition narrative, and between the five perspectives on both)
Estimated study time	8–10 hours including exercises

Note on self-containment: Every argument, quotation, and example you need is inside this document. Where I cite Kissinger, Schroeder, Hobsbawm, Lenin, Robinson and Gallagher, Pakenham, Förster,

Grovogui, Rodney, Nkrumah, or any other scholar, I summarize the argument fully enough that you do not need the original to complete the lesson. "Further Reading" is optional.

SECTION 0 — Why This Lesson Exists

Lesson 9 dismantled the Westphalian myth and showed that sovereignty was never universal — it was extended selectively, through the "standard of civilization," to the "civilized" nations and withheld from the colonized world. This lesson takes the next historical step: it reconstructs the **19th-century international system** — the era in which the modern state system was **actually** consolidated, and in which Africa was violently incorporated into it.

The 19th century is often presented in IR textbooks as the golden age of **multipolarity** — the "Concert of Europe," in which five great powers (Britain, France, Prussia/Germany, Austria, and Russia) managed their rivalries through diplomacy, congresses, and the balance of power. This is the reference point for contemporary debates about multipolarity, the "return of great-power politics," and the lessons of history for the 21st century.

But the 19th century was also the **age of empire** — the period in which European powers conquered almost all of Africa and much of Asia, imposed the "standard of civilization" on the non-European world, and established the **colonial hierarchies** that persist to this day. The Berlin Conference (1884–85), which divided Africa among the European powers, was the most explicit expression of this imperial order.

The two histories — the Concert of Europe and the scramble for Africa — are not separate. They are **interconnected**. The same great powers that managed their rivalries through the Concert also competed for colonies in Africa. The balance of power in Europe was **constituted** through the partition of Africa. And the racial hierarchy that justified the partition was **constitutive** of the European order.

This lesson gives you:

1. **The Concert of Europe** — the great-power management system that produced a century of relative peace among the European powers (1815–1914), and the debates about why it worked and why it failed.
2. **The "new imperialism"** — the wave of European conquest in Africa and Asia between 1870 and 1914, and the competing explanations: economic (Hobson, Lenin), strategic (Robinson and Gallagher), and cultural (the "civilizing mission").
3. **The Berlin Conference** — the rules of the scramble, the doctrine of effective occupation, and the **constitution** of European sovereignty through the partition of Africa.
4. **The African experience** — conquest, resistance, collaboration, and the legacies of the partition: artificial borders, extractive institutions, and the colonial state.
5. **The five perspectives** on 19th-century multipolarity and the Berlin Conference — African (primary), Chinese, Russian, Western, and UN — and the **adjudication** among them.

By the end, you can take any claim about multipolarity — "multipolarity is more war-prone," "the Concert of Europe shows that great powers can manage their rivalries," "the 19th century was a golden age of diplomacy" — and answer: *Whose peace? Whose diplomacy? Whose order? And how do the five perspectives reconstruct it?*

SECTION 1 — PRE-CLASS PRIMING

1.1 Retrieval warm-up (from memory)

1. From L9: What is the Westphalian myth, and what does the historical record actually show about 1648?
2. From L9: What are Krasner's four concepts of sovereignty, and why does conflating them produce confusion?
3. From L9: What is the "standard of civilization," and how did it function as a mechanism of exclusion?
4. From L8: What is the "coloniality of power," and who developed the concept?

Check against the previous lessons before proceeding.

1.2 Orientation questions

Hold these in mind:

- Why did the great powers of Europe manage to avoid a general war for a century after 1815, and why did they fail in 1914?
- Was the Concert of Europe a model of peaceful multipolarity, or a system for managing imperial competition?
- Why did European powers partition Africa in the 1880s and 1890s, and why did they need a conference to do it?
- What does the Berlin Conference tell us about the relationship between European peace and African conquest?

1.3 Vocabulary pre-teach

Provisional definitions; revise by the end:

Concert of Europe; Congress of Vienna; balance of power; collective security; great-power management; spheres of influence; the Eastern Question; the "new imperialism"; informal empire; formal empire; effective occupation; hinterland doctrine; terra nullius; the "civilizing mission"; social Darwinism; the "scramble for Africa"; protectorate; annexation; concession; the dual mandate; colonial state; extractive institutions; resistance; collaboration.

SECTION 2 — LESSON CORE

2.1 Learning objectives

By the end of this lesson, you can:

1. **Reconstruct** the Concert of Europe as a great-power management system, and evaluate the competing explanations for its success and failure.
2. **Distinguish** the competing explanations of the "new imperialism" — economic, strategic, and cultural — and apply them to the African case.

3. **Analyze** the Berlin Conference as a **constitution** of the rules of the scramble, and explain the doctrine of effective occupation and its consequences.
4. **Reconstruct** the African experience of conquest, resistance, and collaboration, and the legacies of the partition.
5. **Reconstruct** how African, Chinese, Russian, Western, and UN traditions interpret 19th-century multipolarity and the Berlin Conference, and **adjudicate** among them on a specific case.

2.2 KEY IDEA 1 — The Concert of Europe was a great-power management system, not a system of equal sovereigns

The claim: The Concert of Europe (1815–1914) was the most successful great-power management system in modern history. It produced a century of relative peace among the European powers — no general war between the great powers from 1815 to 1914. But its success depended on **exclusions**: the exclusion of smaller states from decision-making, the exclusion of the colonized world from sovereignty, and the exclusion of domestic populations from political participation. The Concert was not a model of peaceful multipolarity; it was a model of **oligarchic management**.

The Congress of Vienna (1814–15). After the Napoleonic Wars, the great powers — Britain, Russia, Prussia, Austria, and (after 1818) France — met at Vienna to reconstruct the European order. The settlement was based on three principles:

1. **Legitimacy:** The restoration of legitimate monarchs who had been deposed by Napoleon.
2. **Compensation:** Territorial compensation for the powers that had made sacrifices in the war.
3. **Balance of power:** A territorial settlement designed to prevent any single power from dominating Europe.

The Congress of Vienna was not a democratic assembly. It was a **great-power concert** — the major powers decided the fate of Europe, and the smaller states were consulted but not empowered. The Final Act of the Congress of Vienna (June 1815) was signed by the eight signatory powers (Britain, Russia, Prussia, Austria, France, Sweden, Spain, and Portugal), and it established the territorial and constitutional order of Europe.

The Concert system. After 1815, the great powers developed a set of **informal practices** for managing their rivalries:

- **Congresses and conferences:** Periodic meetings to address crises and coordinate policy. The Congress of Aix-la-Chapelle (1818), the Congress of Troppau (1820), the Congress of Laibach (1821), and the Congress of Verona (1822) were the early congresses. Later, the Concert managed crises through ad hoc conferences — the London Conference on Belgium (1830–31), the Paris Congress after the Crimean War (1856), the Berlin Congress (1878) after the Russo-Turkish War.
- **Consultation:** The great powers consulted each other before taking major actions, and they sought collective agreement on major issues.
- **Compensation:** When one power gained territory or influence, the others expected compensation — a principle that helped maintain the balance.
- **Intervention:** The great powers reserved the right to intervene in the affairs of smaller states to maintain the balance — e.g., the French intervention in Spain (1823), the French intervention in Italy (1849).

The "Concert" as a security community. Some scholars — particularly those in the English School tradition — argue that the Concert was more than a balance-of-power system. It was a **security community** — a group of states that had developed shared norms, mutual trust, and a commitment to managing their rivalries peacefully. The Concert was based on the **shared understanding** that a general war would be catastrophic, and that the great powers had a common interest in preventing it.

The failure of the Concert. The Concert collapsed in 1914. Why? The standard explanations:

1. **The rise of Germany.** After unification in 1871, Germany became the most powerful state in Europe. Its rise destabilized the balance of power, and its aggressive diplomacy (the "New Course" under Wilhelm II) alienated the other powers.
2. **The alliance system.** The rigid alliance system — the Triple Alliance (Germany, Austria-Hungary, Italy) and the Triple Entente (Britain, France, Russia) — turned a local crisis (the assassination of Archduke Franz Ferdinand) into a general war.
3. **The decline of the Ottoman Empire.** The "Eastern Question" — the management of the Ottoman Empire's decline — was a recurring source of great-power tension, and the Balkan Wars (1912–13) destabilized the region.
4. **Nationalism and militarism.** The rise of aggressive nationalism, the arms race (particularly the naval race between Britain and Germany), and the influence of military planning (the Schlieffen Plan) made escalation more likely.
5. **The breakdown of consultation.** The great powers stopped consulting each other and began to act unilaterally. The Concert's informal practices broke down, and there was no institutional mechanism to manage the July Crisis.

The revisionist interpretation. Recent scholarship — particularly by Paul Schroeder — argues that the Concert was more fragile than it appears, and that its "success" was contingent on specific conditions: the exhaustion of the great powers after the Napoleonic Wars, the absence of a revisionist power, and the willingness of the great powers to prioritize order over conquest. When these conditions changed — with the rise of Germany and the intensification of imperial competition — the Concert collapsed.

What the Concert contributes: It provides a model of **great-power management** — the idea that the great powers can cooperate to manage their rivalries and prevent general war. This model is invoked in contemporary debates about multipolarity: can the US and China manage their rivalry the way the European powers managed theirs?

What it occludes: It occludes the **exclusions** on which the Concert depended — the exclusion of smaller states, the exclusion of the colonized world, and the exclusion of domestic populations. The Concert was a peace among the great powers, not a peace among peoples. It was compatible with — indeed, it depended on — the **conquest of Africa** and the **suppression of democracy** in Europe.

Observable implication. If the Concert was a great-power management system, you should see (a) **consultation** among the great powers, (b) **compensation** as a principle of settlement, and (c) **exclusion** of smaller states and non-European peoples from decision-making.

2.3 KEY IDEA 2 — The "new imperialism" was a product of European multipolarity, industrial capitalism, and the "civilizing mission"

The claim: The "new imperialism" — the wave of European conquest in Africa and Asia between 1870 and 1914 — was not a single phenomenon with a single cause. It was the product of **three interacting factors**: the dynamics of European multipolarity (strategic competition), the dynamics of industrial capitalism (economic competition), and the dynamics of European culture (the "civilizing mission").

The facts of the scramble. Between 1870 and 1914, European powers conquered almost all of Africa:

- In 1870, European powers controlled about **10%** of Africa — mainly coastal enclaves and Algeria (French) and the Cape Colony (British).
- By 1914, they controlled about **90%** — only Ethiopia and Liberia remained independent.
- The partition was formalized through a series of treaties, conferences, and military campaigns. The Berlin Conference (1884–85) established the rules; the "effective occupation" doctrine provided the legal justification; and the military campaigns (the "pacification" of resistance movements) enforced the partition.

Explanation 1: Economic imperialism. The classic Marxist explanation — developed by J. A. Hobson (*Imperialism*, 1902) and V. I. Lenin (*Imperialism, the Highest Stage of Capitalism*, 1917) — argues that the "new imperialism" was driven by **economic** factors:

- **Hobson:** Imperialism is the product of **underconsumption** — the failure of domestic demand to absorb the surplus produced by capitalism. Capitalists export capital to the colonies to find new markets and new sources of raw materials, and they use the state to protect their investments. Hobson's solution was **social reform** at home — redistribute income to increase domestic demand and reduce the need for imperial expansion.
- **Lenin:** Imperialism is the **highest stage** of capitalism — the stage of **monopoly capitalism**. As competition within the core drives down profits, capitalists export capital to the periphery, where labor is cheap and resources are abundant. The great powers divide the world among themselves, and the competition for colonies leads to war. Lenin's prediction was that imperialism would lead to inter-imperialist war — which seemed to be confirmed by the First World War.

Explanation 2: Strategic imperialism. The "Robinson and Gallagher" thesis — developed by John Gallagher and Ronald Robinson in their 1953 article "The Imperialism of Free Trade" — argues that the "new imperialism" was driven by **strategic** factors: the competition for **influence** and **security**. The European powers were not primarily interested in colonies for their economic value; they were interested in **strategic positions** — naval bases, coaling stations, trade routes, and buffer zones. The "scramble for Africa" was a product of **great-power rivalry**, not economic necessity.

Robinson and Gallagher distinguished between **formal empire** (direct colonial rule) and **informal empire** (economic and political influence without formal rule). They argued that Britain preferred informal empire where possible — because it was cheaper — but resorted to formal empire when informal influence was threatened by rivals. The "new imperialism" was therefore a **defensive** response to the rise of rival powers, not a product of capitalist expansion per se.

Explanation 3: Cultural imperialism. The "civilizing mission" — the ideology that European powers had a **duty** to "civilize" the "backward" peoples of Africa and Asia — was not just a justification for imperialism; it was a **cause**. The European powers genuinely believed that they were bringing **civilization** — Christianity,

commerce, law, and "modern" institutions — to the "savage" world. This belief was reinforced by **social Darwinism** — the application of evolutionary theory to human societies, which suggested that the "fit" nations would inevitably conquer the "unfit."

The "civilizing mission" was particularly important in **France** (the *mission civilisatrice*) and **Britain** (the "white man's burden," a phrase from Rudyard Kipling's 1899 poem). It was also central to the **Berlin Conference** — the General Act declared that the powers were "anxious to see the development of the civilization of the African populations."

The interaction of the three factors. The "new imperialism" cannot be reduced to any single cause. The economic, strategic, and cultural factors interacted:

- **Economic competition** drove the powers to seek new markets and raw materials, but the economic value of African colonies was often **exaggerated** (most colonies were not profitable).
- **Strategic competition** drove the powers to seek naval bases and buffer zones, but the strategic value of African territory was often **symbolic** (prestige, status, the fear of being left behind).
- **Cultural ideology** provided the **justification** for conquest, but it was also a **motive** — the belief that Europeans had a duty to civilize was genuinely held by many imperialists.

What this explanation contributes: It shows that the "new imperialism" was **overdetermined** — multiple factors pushed in the same direction. It also shows that the partition of Africa was **contingent** — it was not inevitable, and it was not the product of a single cause. The partition was the outcome of specific decisions, made by specific actors, in specific historical circumstances.

What it occludes: It can **underplay African agency** — the role of African resistance, collaboration, and initiative in shaping the partition. It can also **underplay the violence** of the partition — the military campaigns, the massacres, the destruction of African societies. And it can **underplay the legacies** of the partition — the artificial borders, the extractive institutions, and the colonial state.

Observable implication. If the "new imperialism" explanation is operative, you should see (a) **economic** competition for markets and raw materials, (b) **strategic** competition for naval bases and buffer zones, and (c) **cultural** ideology justifying conquest.

2.4 KEY IDEA 3 — The Berlin Conference established the rules of the scramble, and the doctrine of effective occupation constitutionally excluded African sovereignty

The claim: The Berlin Conference (1884–85) was not just a diplomatic meeting; it was a **constitutional moment** — it established the **rules** of the scramble for Africa, and it **constituted** European sovereignty through the partition of Africa. The doctrine of **effective occupation** was the legal mechanism through which African sovereignty was denied and European sovereignty was asserted.

The context. In the early 1880s, the "scramble for Africa" was already underway. King Leopold II of Belgium had established the Congo Free State (1885) as his personal possession; France had expanded into West Africa and the Congo; Britain had expanded into southern and eastern Africa; and Germany had begun to claim territories in southwest and east Africa. The competition was creating tensions among the European powers, and the Berlin Conference was convened to **regulate** the competition — to establish rules that would prevent the scramble from escalating into a European war.

The General Act of the Berlin Conference (February 1885). The General Act was signed by 14 powers — Austria-Hungary, Belgium, Denmark, France, Germany, Great Britain, Italy, the Netherlands, Portugal, Russia, Spain, Sweden-Norway, Turkey, and the United States. The Act established several key principles:

1. **Freedom of trade** in the Congo basin and its tributaries — a principle that reflected the economic interests of the powers.
2. **The abolition of the slave trade** — a humanitarian principle that was also a justification for colonial rule.
3. **The neutrality** of the Congo basin — a principle that was intended to prevent the basin from becoming a theater of great-power conflict.
4. **The principle of effective occupation** — the most important provision. The Act declared that the powers could claim sovereignty over African territories only if they **effectively occupied** them — if they established **administrative** presence, **military** control, and **economic** development. The Act stated: "The Signatory Powers… recognize the obligation to insure the establishment of authority in the regions occupied by them on the coasts of the African Continent sufficient to protect existing rights, and, as the case may be, freedom of trade and of transit under the conditions agreed upon."

The doctrine of effective occupation. The doctrine was not a neutral rule; it was a **mechanism of exclusion**. African polities had their own forms of authority — kingdoms, chiefdoms, confederations, empires — but they did not have **administrative** presence in the European sense. The doctrine of effective occupation therefore **denied** that African polities were sovereign. Sovereignty was defined as **effective occupation** — which meant, in practice, **European-style administration**. African polities were not "occupying" their territories effectively; they were "savage" or "barbarous" — and their territories were therefore **available** for occupation by European powers.

The "hinterland doctrine." The General Act was ambiguous about the **hinterland** — the interior of Africa, beyond the coast. The doctrine of effective occupation was initially applied only to the coast, but it was soon extended to the interior. The "hinterland doctrine" — the principle that a power that occupied the coast had a right to the interior — led to a race for the interior, as the powers sought to claim as much territory as possible before their rivals. The doctrine was formalized in subsequent agreements, particularly the Anglo-French agreement of 1890 and the Anglo-German agreement of 1890.

The "constitution" of European sovereignty. The Berlin Conference did not just divide African territory; it **constituted** European sovereignty. By dividing Africa among themselves, the European powers established that they were the kind of entities that could **own** territory, **divide** it, and **govern** it. African polities were not just excluded from the division; they were **constituted as non-sovereign** — as objects to be divided, not subjects who could divide. The doctrine of effective occupation was not just a rule for colonial claims; it was a **constitution** of what counted as sovereignty.

The African perspective. African scholars — Grovogui, Rodney, Nkrumah, and others — emphasize that the Berlin Conference was a **founding moment** of Africa's incorporation into the international system — not as a subject but as an object. The conference established the **colonial borders** that African states inherited at independence, and it entrenched the **extractive institutions** that continue to shape African economies.

What the Berlin Conference contributes: It shows that the partition of Africa was a **constitutional** moment — it established the rules that governed the scramble, and it constituted European sovereignty through the exclusion of African sovereignty. It also shows that international law was not a neutral framework; it was a **mechanism** through which the powerful legitimized their conquests.

What it occludes: It can underplay **African agency** — the role of African resistance, collaboration, and initiative in shaping the partition. It can also underplay the **violence** of the partition — the military campaigns, the massacres, the destruction of African societies.

Observable implication. If the Berlin Conference was a constitutional moment, you should see (a) the **legal** justification of conquest through the doctrine of effective occupation, (b) the **exclusion** of African polities from the definition of sovereignty, and (c) the **persistence** of the colonial borders and institutions in the post-colonial era.

2.5 KEY IDEA 4 — The African experience: conquest, resistance, collaboration, and the legacies of the partition

The claim: The partition of Africa was not a peaceful administrative process; it was a **violent conquest** that was resisted, negotiated, and collaborated with by African societies. The legacies of the partition — artificial borders, extractive institutions, and the colonial state — continue to shape African politics today.

Conquest. The European conquest of Africa was achieved through **military force** — the "pacification" campaigns that subdued African resistance. The conquest was made possible by the **technological gap** — particularly the Maxim gun (the first machine gun, invented in 1884) — and by the **divide-and-rule** tactics that exploited rivalries among African polities.

The conquest was extremely **violent**. The German campaign against the Herero and Nama in Southwest Africa (1904–08) was the first **genocide** of the 20th century — an estimated 80% of the Herero and 50% of the Nama were killed. The Belgian Congo Free State (1885–1908) was a **horror** — an estimated 10 million people died from forced labor, disease, and violence in the rubber extraction regime. The British "pacification" of the Mau Mau in Kenya (1952–60) involved mass detention and torture.

Resistance. African societies **resisted** the conquest. The resistance took many forms:

- **Military resistance:** The Zulu Wars (1879), the Mahdist War in Sudan (1881–99), the Herero and Nama uprising (1904–08), the Maji Maji rebellion in German East Africa (1905–07), and many others.
- **Political resistance:** Diplomatic missions to European capitals, petitions to the League of Nations, and the formation of anti-colonial movements.
- **Cultural resistance:** The preservation of African languages, religions, and traditions in the face of colonial "civilization."
- **Everyday resistance:** Flight, evasion, foot-dragging, and the "hidden transcripts" of resistance that James Scott describes.

Collaboration. Not all African societies resisted; many **collaborated** with the European powers. Collaboration took many forms:

- **Military collaboration:** African soldiers (the "askari") fought for the European powers in both world wars.
- **Political collaboration:** African chiefs and elites who served as intermediaries between the colonial state and African societies.
- **Economic collaboration:** African merchants and entrepreneurs who profited from colonial trade.

Collaboration was not simply betrayal; it was often a **strategy** — a way for African actors to pursue their own

interests within the constraints of colonial rule. The "collaboration" thesis — developed by Ronald Robinson — argues that the partition was possible only because African elites collaborated with the European powers.

The legacies of the partition. The partition left deep legacies:

1. **Artificial borders.** The colonial borders were drawn by Europeans, often without regard for African ethnic, linguistic, or political boundaries. The borders divided communities and grouped rivals together. At independence, African states accepted the colonial borders — through the principle of **uti possidetis juris** — to avoid a continent-wide war of secession. But the borders remain a source of conflict.
2. **Extractive institutions.** The colonial economy was organized around **extraction** — the export of raw materials and the import of manufactured goods. The colonial state invested in infrastructure (railways, ports, roads) that served extraction, not development. The extractive institutions — the mining companies, the plantation economies, the tax systems — persisted after independence.
3. **The colonial state.** The colonial state was **authoritarian**, **centralized**, and **coercive** — it was designed to control African populations and extract resources. At independence, African states inherited these institutions, and they have shaped post-colonial politics — the "neo-patrimonial" state, the "gatekeeper" state, and the "failed" state.
4. **The color line.** The partition entrenched a **racial hierarchy** — the "civilized" Europeans above the "savage" Africans. This hierarchy persisted after independence, in the form of **neo-colonialism** — the continued economic and political dominance of the former colonial powers.

What the African experience contributes: It shows that the partition was not a peaceful administrative process; it was a **violent conquest** that was resisted, negotiated, and collaborated with. It also shows that the legacies of the partition — artificial borders, extractive institutions, the colonial state — continue to shape African politics.

What it occludes: It can underplay the **diversity** of African experiences — the partition affected different regions in different ways, and some African societies were able to avoid conquest for decades. It can also underplay the **agency** of African actors — the ways in which they shaped the partition, not just resisted it.

Observable implication. If the African experience is operative, you should see (a) **violent conquest**, (b) **resistance** and **collaboration**, and (c) **legacies** of the partition in contemporary African politics.

2.6 KEY IDEA 5 — The five perspectives interpret 19th-century multipolarity and the Berlin Conference differently, and each interpretation is political

The claim: The 19th-century international system — the Concert of Europe and the scramble for Africa — is not a neutral historical object. It is a **contested** historical legacy, and the five perspectives — African, Chinese, Russian, Western, and UN — interpret it differently. Each interpretation reflects a different political project.

2.6.1 The African perspective (primary) **Core commitments.** African scholars and leaders interpret the 19th century as the **founding moment of Africa's subordination** to the international system. The Berlin Conference is seen as the **original sin** — the moment when Africa was divided among European powers, without African representation, and the rules were established that continue to shape Africa's place in the

world.

The critique of the Concert. African scholars argue that the Concert of Europe was **compatible** with the conquest of Africa — indeed, it **depended** on it. The great powers managed their rivalries in Europe by **compensating** each other with colonies in Africa and Asia. The "balance of power" in Europe was **constituted** through the partition of Africa. The Concert was not a model of peaceful multipolarity; it was a model of **imperial management**.

The legacy. African scholars emphasize the **legacies** of the partition: artificial borders, extractive institutions, the colonial state, and the racial hierarchy. These legacies continue to shape African politics — the "failed state," the "resource curse," the "conflict trap." The African perspective insists that these problems are **not** African failures; they are **products** of the colonial partition.

Agency. At the same time, African scholars emphasize **African agency** — the role of African resistance, collaboration, and initiative in shaping the partition. The partition was not a **unilateral** imposition; it was a **negotiated** process in which African actors pursued their own interests. The African perspective insists that Africans were **not passive victims**; they were actors navigating a hostile structure.

The critique of Western IR. African scholars critique Western IR for **erasing** the colonial partition from its history of the international system. The standard narrative — Westphalia (1648) → the Concert of Europe (1815) → the World Wars (1914–45) → the Cold War (1947–91) → the liberal order — is a **Eurocentric** narrative that treats the partition of Africa as a footnote, not as a **constitutive** moment. The African perspective insists that the international system cannot be understood without the colonial partition.

What this perspective contributes: It shows that the 19th-century international system was **not** a peaceful order; it was an **imperial** order. It also shows that the legacies of the partition continue to shape African politics, and that these legacies are **structural**, not accidental.

What it occludes: It can underplay the **genuine achievements** of the Concert — the century of relative peace among the European powers. It can also risk **essentializing** "African experience" as a unified narrative, when different African societies experienced the partition in different ways.

2.6.2 The Chinese perspective Core commitments. China's engagement with the 19th-century international system is shaped by its own experience of the "century of humiliation" — the period from the First Opium War (1839–42) to the founding of the People's Republic (1949), during which China was subjected to the "standard of civilization," unequal treaties, and foreign intervention.

The parallel with Africa. Chinese scholars often draw a **parallel** between China's experience and Africa's: both were subjected to the "standard of civilization," both were partitioned by European powers, and both were denied full sovereignty. The Berlin Conference is seen as **analogous** to the "unequal treaties" that China was forced to sign — both were mechanisms through which European powers denied sovereignty to non-European peoples.

The critique of the Concert. Chinese scholars argue that the Concert of Europe was an **oligarchic** system — a club of great powers that managed their rivalries at the expense of the rest of the world. The Concert was not a model of peaceful multipolarity; it was a model of **great-power hegemony**. The Chinese perspective insists that a genuine multipolar order must be **democratic** — it must include all states, not just the great powers.

The alternative. Chinese scholars — particularly those associated with the "Chinese School" — argue that

the Westphalian order is a **particular** order, not a universal one. *Tianxia* ("all under heaven") is an alternative model — a hierarchical, harmonious order in which the legitimate ruler provides order for all. The Chinese perspective insists that the international order must be grounded in **relationality** and **mutual respect**, not in the balance of power.

What this perspective contributes: It shows that the critique of the 19th-century order can come from **within** the state system — not just from post-colonial theory. It also shows that the 19th-century order is not the only possible order; there are alternative models.

What it occludes: It can underplay the ways in which China **benefits** from the current order — the ways in which sovereignty and non-interference protect China from external criticism. It can also risk **essentializing** "Chinese thought" as a unified tradition.

2.6.3 The Russian perspective **Core commitments.** Russia's engagement with the 19th-century international system is shaped by its role as a **great power** — a participant in the Concert of Europe, a rival of Britain in the "Great Game" in Central Asia, and a defender of the Ottoman Empire's Christian subjects.

The Concert as a model. Russian scholars and officials often invoke the Concert of Europe as a **model** for contemporary great-power management. The Concert was a system in which the great powers — including Russia — managed their rivalries through consultation and compensation. The Russian perspective argues that the current international system needs a **new Concert** — a great-power management system that includes Russia as an equal participant.

The critique of the West. Russian scholars argue that the West has **betrayed** the Concert tradition — by expanding NATO, by intervening in the former Yugoslavia and Iraq, and by ignoring Russia's security interests. The Russian perspective insists that a genuine multipolar order must respect the **spheres of influence** of the great powers — a principle that Russia sees as implicit in the Concert.

The critique of the Berlin Conference. Russian scholars are **ambivalent** about the Berlin Conference. On one hand, Russia participated in the conference (as one of the 14 signatories) and gained some territory in Central Asia. On the other hand, Russia was **excluded** from the African partition — it did not have colonies in Africa, and it resented the dominance of Britain and France. The Russian perspective emphasizes that the Berlin Conference was a **Western** project — a division of the world among the Western powers, with Russia as a marginal participant.

What this perspective contributes: It shows that the Concert can be invoked for **illiberal** purposes — the defence of spheres of influence can become a justification for aggression. It also shows that the 19th-century order is **contested** — different states interpret it differently.

What it occludes: It can **naturalize** aggression — the claim that Russia is defending its sphere of influence can be used to justify the invasion of Ukraine. It can also **underplay** the ways in which Russia **violated** the sovereignty of its neighbors in the 19th century — the conquest of Central Asia, the suppression of the Polish uprising (1830–31), and the Caucasian War (1817–64).

2.6.4 The Western perspective **Core commitments.** The Western tradition is the **home** of the Concert of Europe and the "new imperialism." The standard narrative presents the Concert as a **model of great-power management** — a system that produced a century of relative peace among the European powers. The Berlin Conference is presented as a **diplomatic** achievement — a peaceful division of Africa among the European powers.

The standard narrative. Western IR textbooks present the Concert as a **success** — a system that managed the transition from the Napoleonic Wars to a stable multipolar order. The Concert is invoked in contemporary debates about multipolarity: can the US and China manage their rivalry the way the European powers managed theirs?

The revisionist critique. Western scholarship has also produced the most important **revisionist** accounts of the 19th century. Paul Schroeder's *The Transformation of European Politics* (1994) argues that the Concert was more fragile than it appears; Robinson and Gallagher's "The Imperialism of Free Trade" (1953) argues that the "new imperialism" was driven by strategic competition, not economic necessity; and the "cultural turn" in imperial history has emphasized the role of the "civilizing mission" in shaping imperial policy.

The silence on Africa. Western IR has been **slow** to incorporate the partition of Africa into its history of the international system. The standard narrative — Westphalia → the Concert → the World Wars → the Cold War → the liberal order — treats the partition as a **footnote**, not as a constitutive moment. The Western perspective is **parochial** — it treats the European experience as universal history.

What this perspective contributes: It provides the **most developed** versions of the Concert narrative and the most systematic **self-critique** of that narrative.

What it occludes: It can **erase** the colonial partition from the history of the international system. It can also **naturalize** the existing order by presenting it as the product of a benign diplomatic tradition, rather than a violent imperial conquest.

2.6.5 The UN perspective **Core commitments.** The UN is the **institutional embodiment** of the post-1945 order, and its interpretation of the 19th century is shaped by its **anti-colonial** commitments.

The critique of the Berlin Conference. The UN's decolonization agenda — the 1960 Declaration on the Granting of Independence to Colonial Countries and Peoples — was a **repudiation** of the Berlin Conference. The Declaration affirmed the right of all peoples to self-determination, and it declared that "the subjection of peoples to alien subjugation, domination and exploitation constitutes a denial of fundamental human rights." The UN's decolonization agenda was an attempt to **undo** the partition of Africa — to extend sovereignty to the colonized world.

The legacy. The UN acknowledges the **legacies** of the partition — the artificial borders, the extractive institutions, and the colonial state. The UN's development agenda — the SDGs, the "sustainable development" framework — is an attempt to address these legacies. The UN's peacekeeping operations are often deployed in countries where the legacies of the partition — artificial borders, ethnic divisions, weak states — have contributed to conflict.

The limits. The UN is also **constrained** by its member states — many of which are the former colonial powers. The UN's critique of the 19th century is **selective** — it condemns the partition of Africa, but it does not address the **ongoing** legacies of colonialism (e.g., the permanent members of the Security Council are the former colonial powers, and the IMF and World Bank are dominated by the West).

What this perspective contributes: It provides the **normative benchmark** — the standards against which the 19th-century order is judged. It also provides the **institutional record** — the resolutions, declarations, and debates that are essential evidence for any analysis.

What it occludes: It can **depoliticize** — framing the legacies of the partition as technical-development problems obscures the power dynamics that produce them. It can also **underplay** the ways in which the UN

itself reproduces the hierarchies of the 19th century — the P5 veto, the dominance of the West in international financial institutions.

2.6.6 The comparison matrix

Dimension	African (primary)	Chinese	Russian	Western	UN
Stance toward the Concert	Critique: compatible with imperial conquest	Critique: oligarchic great-power club	Model: great-power management, spheres of influence	Home of the standard narrative; revisionist critique from within	Ambivalent: normative repudiation, but constrained by P5
Stance toward the Berlin Conference	Founding moment of Africa's subordination	Parallel with the "century of humiliation"	Marginal participant; Western project	Diplomatic achievement; footnote in standard narrative	Repudiation: decolonization as undoing the partition
Key contribution	Colonial genealogy; African agency	Alternative models; critique of great-power hegemony	Illiberal mobilization of the Concert	Standard narrative + revisionist critique	Normative benchmark; institutional record
Key occlusion	Achievements of the Concert; diversity of African experience	China's benefit from the current order	Violation of neighbors' sovereignty; Russian imperialism	Erasure of the colonial partition	Selective critique; reproduction of 19th-century hierarchies

---

2.7 WORKED EXAMPLE (I do)

The puzzle: The **Concert of Europe** produced a century of relative peace among the great powers — no general war from 1815 to 1914. Yet the same period saw the **most intense wave of imperial conquest** in modern history — the partition of Africa and the expansion of European empires in Asia. How can a system be simultaneously peaceful and violent?

The puzzle stated precisely: *How did the Concert of Europe produce a century of relative peace among the great powers while also producing the most intense wave of imperial conquest in modern history?*

The standard narrative. The standard narrative presents the Concert as a **success** — a system of great-power management that prevented a general war. The Concert was based on **consultation**, **compensation**, and **balance of power**. The great powers managed their rivalries through diplomacy, and they avoided the kind of general war that had devastated Europe during the Napoleonic Wars.

The revisionist narrative. The revisionist narrative argues that the Concert was **compatible** with imperial conquest — indeed, it **depended** on it. The great powers managed their rivalries in Europe by **compensating** each other with colonies in Africa and Asia. The "balance of power" in Europe was **constituted** through the partition of Africa. The Concert was not a model of peaceful multipolarity; it was a model of **imperial management**.

The mechanism. The mechanism that connects the Concert to the partition is **compensation**. When one power gained territory or influence in Europe, the others expected compensation — often in the form of colonies. The partition of Africa provided a **safety valve** for great-power competition — it allowed the powers to compete for territory without going to war in Europe. The Berlin Conference (1884–85) was the most explicit expression of this logic: it established the **rules** of the scramble, and it **regulated** the competition so that it did not escalate into a European war.

The African perspective. The African perspective emphasizes that the Concert's "peace" was **purchased** at the expense of Africa. The great powers avoided war in Europe by **dividing** Africa among themselves. The "peace" of the Concert was a **peace among the great powers**, not a peace among peoples. It was compatible with — indeed, it depended on — the **conquest** of Africa.

The Chinese and Russian perspectives. Chinese and Russian scholars draw a similar conclusion: the Concert was an **oligarchic** system — a club of great powers that managed their rivalries at the expense of the rest of the world. The Chinese perspective emphasizes the **parallel** with China's "century of humiliation"; the Russian perspective emphasizes the **spheres of influence** that the Concert established.

The Western perspective. Western scholars have been **slow** to acknowledge the connection between the Concert and the partition. The standard narrative treats them as **separate** — the Concert is about European peace; the partition is about African conquest. The revisionist critique — particularly the work of Robinson and Gallagher — has begun to integrate the two, but the integration is still incomplete.

The UN perspective. The UN's decolonization agenda was a **repudiation** of the partition, but it has not fully addressed the connection between the Concert and the partition. The UN's normative framework — the Charter, the 1960 Declaration — is anti-colonial, but the UN's institutional structure — the P5 veto, the dominance of the West — reproduces the hierarchies of the 19th century.

Adjudication. Which perspective best explains the **connection** between the Concert and the partition?

- **The African perspective** best explains the **function** of the partition — it was a **safety valve** for great-power competition, a way to manage rivalries without going to war in Europe.
- **The revisionist Western perspective** (Robinson and Gallagher) best explains the **mechanism** — the partition was driven by strategic competition, not economic necessity.
- **The Chinese and Russian perspectives** best explain the **critique** — the Concert was an oligarchic system that managed its rivalries at the expense of the rest of the world.
- **The UN perspective** best explains the **normative stakes** — the partition was a violation of the right to self-determination, and the decolonization agenda was an attempt to undo it.

A complete explanation combines all four: the Concert and the partition are **two sides of the same coin**. The Concert was a system of great-power management that **depended** on the partition of Africa. The "peace" of the Concert was a **peace among the great powers**, purchased at the expense of Africa. The partition was not an aberration of the Concert; it was **constitutive** of it.

2.8 PROBLEM PAIR (We do)

Your task: Analyze the following case using the apparatus above. Write your analysis before reading the model answer.

The case: The **Berlin Conference** (1884–85) established the rules of the scramble for Africa, including the doctrine of **effective occupation**. The doctrine declared that European powers could claim sovereignty over African territories only if they established **effective occupation** — administrative presence, military control, and economic development. African polities, which had their own forms of authority, were **not** recognized as sovereign because they did not meet the European criterion of effective occupation.

Your tasks:

1. State the puzzle precisely: why did the European powers need a **doctrine** of effective occupation to justify the partition of Africa? What did the doctrine **do** that military conquest alone could not?
2. Apply the **standard of civilization** framework: how did the doctrine of effective occupation enact the standard? What did it mean to be "civilized" in the context of the doctrine?
3. Apply the **constitutive outside** framework: how did the doctrine of effective occupation **constitute** European sovereignty by excluding African sovereignty?
4. Apply the **African perspective**: how do African scholars interpret the doctrine of effective occupation, and what does it tell us about the colonial genealogy of the international system?
5. Write a 300-word adjudication: is the doctrine of effective occupation best understood as a **legal rule**, a **mechanism of exclusion**, or a **constitution of sovereignty** — or all three?

Model answer (compare after writing your own):

Puzzle: Why did the European powers need a doctrine of effective occupation to justify the partition of Africa?

The standard of civilization: The doctrine of effective occupation was the **legal mechanism** through which the standard of civilization was applied to Africa. The doctrine defined sovereignty as **effective occupation** — administrative presence, military control, and economic development. African polities, which had their own forms of authority, were **not** recognized as sovereign because they did not meet the European criterion. The doctrine was not a neutral rule; it was a **mechanism of exclusion** that denied African sovereignty while claiming to apply a universal principle.

The constitutive outside: The doctrine of effective occupation did not just exclude African sovereignty; it **constituted** European sovereignty. By defining sovereignty as effective occupation, the doctrine established that European powers were the kind of entities that could **own** territory, **divide** it, and **govern** it. African polities were not just excluded from the definition; they were **constituted as non-sovereign** — as objects to be divided, not subjects who could divide.

The African perspective: African scholars interpret the doctrine of effective occupation as a **legal fiction** — a mechanism through which European powers legitimized their conquest. The doctrine was not a description of reality; it was a **justification** for conquest. African polities had their own forms of authority — kingdoms, chiefdoms, confederations, empires — but they were not recognized as sovereign because they did not meet the European criterion. The doctrine was a **constitution** of the racial hierarchy that structured the international system.

Adjudication: The doctrine of effective occupation is **all three** — a legal rule, a mechanism of exclusion,

and a constitution of sovereignty. It was a **legal rule** that established the conditions for claiming sovereignty; it was a **mechanism of exclusion** that denied African sovereignty; and it was a **constitution** of European sovereignty through the exclusion of African sovereignty. The three dimensions are not separate; they are **interconnected**. The legal rule was possible because of the mechanism of exclusion; the mechanism of exclusion was constituted through the legal rule; and the sovereignty of the European powers was constituted through both. A complete analysis must hold all three dimensions together.

2.9 INDEPENDENT MEMO (You do)

Produce a one-page analytical memo (500–600 words) on the following case, using the four headings below.

Case: The **"dual mandate"** — the ideology developed by Frederick Lugard, the British colonial administrator in Nigeria and Hong Kong, in his book *The Dual Mandate in British Tropical Africa* (1922). Lugard argued that British colonialism served a **dual mandate**: to develop the resources of Africa for the benefit of the world (the "civilizing mission"), and to develop the African peoples for their own benefit (the "trusteeship" doctrine). The dual mandate was used to justify British colonial rule in Africa.

Memo headings:

1. **Mechanism:** How did the dual mandate function as a **justification** for colonial rule? What did it make possible and what did it foreclose?
2. **The constitutive outside:** How did the dual mandate **constitute** British sovereignty by denying African sovereignty? What role did the "civilizing mission" play in this constitution?
3. **Perspective reconstruction:** How would each of the five perspectives interpret the dual mandate? (African, Chinese, Russian, Western, UN — one paragraph each or a table.)
4. **Falsifiers:** What evidence would show that the dual mandate was **not** a justification for colonial rule? What would show that it **was**?

Self-check: Does your memo distinguish the **stated goals** of the dual mandate (development, trusteeship) from its **function** (legitimation of colonial rule)? Does it identify the **racial hierarchy** that structured the dual mandate?

2.10 HINGE QUESTION

A scholar argues: "The Concert of Europe was not a model of peaceful multipolarity. It was a system of great-power management that depended on the partition of Africa. The 'peace' of the Concert was purchased at the expense of Africa." Which claim does this argument support?

- A) The Concert of Europe prevented all wars in the 19th century
- B) The Concert of Europe was compatible with imperial conquest
- C) The Concert of Europe was a model of democratic governance
- D) The Concert of Europe was a system of equal sovereigns

Answer: B. The argument claims that the Concert was **compatible** with imperial conquest — indeed, it **depended** on the partition of Africa. The "peace" of the Concert was purchased at the expense of Africa.

If you answered A: The Concert prevented a **general war** among the great powers, but it did not prevent all wars — the Crimean War (1853–56), the Franco-Prussian War (1870–71), and the Balkan Wars (1912–13) were all fought during the Concert period. **If you answered C:** The Concert was an **oligarchic** system, not a democratic one. It was a club of great powers, not a parliament of states. **If you answered D:** The Concert was a system of **great-power management**, not a system of equal sovereigns. Smaller states were excluded from decision-making.

SECTION 2A — DATA LAB (30–45 minutes)

Purpose: Ground the lesson's concepts in empirical data on the partition of Africa.

Task: Using the summary data below, analyze the relationship between the Concert of Europe and the partition of Africa.

Table 1: European control of African territory, selected years

Year	Percentage of African territory under European control	Key events
1870	~10%	Coastal enclaves; Algeria (French); Cape Colony (British)
1880	~20%	French expansion in West Africa; British expansion in southern Africa
1885	~30%	Berlin Conference; Congo Free State established
1900	~90%	Scramble completed; only Ethiopia and Liberia independent
1914	~90%	Partition formalized; colonial administration established

Table 2: Major African resistance movements, 1880–1914

Movement	Years	Colonial power	Outcome
Zulu Wars	1879	Britain	Zulu defeat; Zululand annexed
Mahdist War	1881–99	Britain (Egypt)	Mahdist defeat; Sudan conquered
Herero and Nama uprising	1904–08	Germany	Genocide; ~80% Herero killed
Maji Maji rebellion	1905–07	Germany	Defeat; ~250,000–300,000 killed
Mau Mau rebellion	1952–60	Britain	Defeat; Kenya independent 1963

Table 3: European military expenditure and imperial expansion, 1870–1914 (illustrative)

Country	Military expenditure 1870 (million £)	Military expenditure 1914 (million £)	African colonies (approx. area, million km²)
Britain	25	77	9.5
France	15	45	10.0
Germany	5	50	2.5
Belgium	1	5	2.3
Portugal	2	5	2.1

Analysis questions:

1. **Timing:** What does the data on European control of African territory suggest about the **timing** of the scramble? When did it accelerate, and why?
2. **Resistance:** What does the data on African resistance movements suggest about **African agency**? Were Africans passive victims or active resistants?
3. **Military expenditure:** What does the correlation between military expenditure and imperial expansion suggest about the relationship between the Concert and the partition? Does the data support the **economic** explanation (imperialism as a product of capitalism) or the **strategic** explanation (imperialism as a product of great-power competition)?
4. **Perspective:** How would each of the five perspectives interpret the data? (African: violent conquest and resistance; Chinese: parallel with China's humiliation; Russian: great-power competition; Western: strategic competition and the "civilizing mission"; UN: decolonization and self-determination.)
5. **Limitation:** What does the data **not** tell you? (Hint: the data does not capture the **experience** of colonization; it does not measure the **legacies** of the partition; and it does not distinguish between different forms of colonial rule.)

Rule: Complete the data lab before the independent memo.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Task: Draw the following by hand.

Visual 1: The Concert of Europe and the partition of Africa. Draw a circle labeled "Concert of Europe" (great-power management, consultation, compensation, balance of power) and a circle labeled "Partition of Africa" (Berlin Conference, effective occupation, colonial conquest). Draw an arrow from the Concert to the partition, labeled "compensation and safety valve." Draw an arrow from the partition to the Concert, labeled "constitution of European sovereignty."

Visual 2: The three explanations of the "new imperialism." Draw a three-part diagram: Economic (Hobson, Lenin — underconsumption, monopoly capitalism, capital export), Strategic (Robinson and Gallagher — great-power competition, naval bases, buffer zones), Cultural (the "civilizing mission," social Darwinism, the "white man's burden"). Draw arrows showing how the three interact.

Visual 3: The doctrine of effective occupation. Draw a two-column table. Left column: "What the doctrine says" (sovereignty requires effective occupation — administrative presence, military control, economic development). Right column: "What the doctrine does" (denies African sovereignty, constitutes European sovereignty, legitimizes conquest).

SECTION 4 — CORNELL NOTES

Set up your notes with the following cue column:

Cue column	Notes
What was the Concert of Europe?	Great-power management system (1815–1914); consultation, compensation, balance of power
What were the principles of the Congress of Vienna?	Legitimacy, compensation, balance of power
Why did the Concert collapse?	Rise of Germany, alliance system, Eastern Question, nationalism and militarism, breakdown of consultation
What was the "new imperialism"?	Wave of European conquest in Africa and Asia, 1870–1914
What are the three explanations of the "new imperialism"?	Economic (Hobson, Lenin), strategic (Robinson and Gallagher), cultural ("civilizing mission")
What was the Berlin Conference?	1884–85 meeting that established the rules of the scramble for Africa
What was the doctrine of effective occupation?	Sovereignty requires effective occupation — administrative presence, military control, economic development
How did the doctrine of effective occupation function?	Denied African sovereignty; constituted European sovereignty; legitimized conquest
How do the five perspectives interpret the 19th century?	African: founding moment of subordination + agency; Chinese: parallel with humiliation; Russian: great-power management + spheres of influence; Western: standard narrative + revisionist critique; UN: decolonization as undoing the partition
Source log	Lesson text, Sections 2.2–2.6; Kissinger (1957); Schroeder (1994); Hobsbawm (1987); Lenin (1917); Hobson (1902); Robinson and Gallagher (1953); Pakenham (1991); Förster (1985); Grovogui (1996); Rodney (1972); Nkrumah (1965); the Final Act of the Congress of Vienna; the General Act of the Berlin Conference
Summary	3–5 sentences synthesizing the lesson

SECTION 5 — FEYNMAN COMPRESSION

Step 1: Explain the relationship between the Concert of Europe and the partition of Africa to a smart non-specialist in 200–250 words, without using jargon. If you must use "multipolarity," "balance of power," or "effective occupation," define them in plain language.

Step 2: Mark every point where you hesitated or used a term you could not define.

Step 3: Reread only the gaps. Rewrite.

Step 4: Produce one analogy for the Concert of Europe. Then state where the analogy breaks down. (Example: "The Concert of Europe was like a club of wealthy homeowners who agreed not to fight each other — but they paid for their peace by seizing the land of their poorer neighbors." Where it breaks down: unlike a homeowners' club, the Concert was not a voluntary association of equals; it was a system of great-power management that excluded most states and all colonized peoples.)

SECTION 6 — SPACED-REPETITION FLASHCARDS

Produce 12–15 cards. Use the following types:

Type	Example
Definition	What was the Concert of Europe?
Mechanism	How did the Concert of Europe manage great-power rivalries?
Application	A European power claims sovereignty over an African territory because it has established an administrative presence. Which doctrine does this illustrate?
Comparison	How do the economic, strategic, and cultural explanations of the "new imperialism" differ?
Source	What did Robinson and Gallagher argue about the "new imperialism"?
Debate	What is the strongest objection to the claim that the Concert of Europe was a model of peaceful multipolarity?
Reconstruction	How would an African scholar interpret the Berlin Conference?
Occlusion	What does the standard narrative of the Concert of Europe fail to see about the partition of Africa?
Adjudication	Which perspective best explains the relationship between the Concert and the partition, and what does it miss?
Visual	Label the three explanations of the "new imperialism" on a diagram.

Tag each card: `L10`, `19th century`, `Concert of Europe`, `Berlin Conference`, `imperialism`,

`perspective`, `difficulty`.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence audit

Rate confidence (0–100%) before checking:

Objective	Confidence
Reconstruct the Concert of Europe and its explanations	
Distinguish the three explanations of the "new imperialism"	
Analyze the Berlin Conference and the doctrine of effective occupation	
Reconstruct the African experience of conquest, resistance, and collaboration	
Reconstruct the five perspectives on the 19th century	

After exercises, rate accuracy. Calculate the gap.

7.2 Three-question debrief

1. What did I misunderstand about the relationship between the Concert of Europe and the partition of Africa?
2. Which perspective was easiest to reconstruct? Which was hardest? What does that suggest about my default analytical style?
3. What will I do differently in Lesson 11?

7.3 Error log

Date	Lesson	Error type	Correct understanding	Card created?
	L10			

SECTION 8 — CHEATSHEET (Module 2)

Add this row to your Module 2 cheatsheet:

Column	Content
Core concepts	Concert of Europe; Congress of Vienna; balance of power; great-power management; compensation; the Eastern Question; "new imperialism"; formal vs. informal empire; effective occupation; hinterland doctrine; "civilizing mission"; social Darwinism; scramble for Africa; protectorate; annexation; dual mandate
Key mechanisms	Consultation + compensation + balance of power → Concert; economic + strategic + cultural factors → "new imperialism"; effective occupation → denial of African sovereignty + constitution of European sovereignty; compensation → safety valve for great-power competition → partition of Africa
Theories and authors	Kissinger (1957); Schroeder (1994); Hobsbawm (1987); Lenin (1917); Hobson (1902); Robinson and Gallagher (1953); Pakenham (1991); Förster (1985); Grovogui (1996); Rodney (1972); Nkrumah (1965)
Cases and evidence	Congress of Vienna (1815); Berlin Conference (1884–85); Herero and Nama genocide (1904–08); Maji Maji rebellion (1905–07); the "dual mandate"
Debates	Was the Concert a success or a failure? Was the "new imperialism" driven by economics, strategy, or culture? Is the Concert a model for contemporary multipolarity?
Falsifiers	What evidence would show that the Concert was **not** compatible with imperial conquest? What would show that it **was**?
Cross-links	L9 (Westphalian myth); L12 (Cold War and decolonization); L27 (African colonial state formation); L28 (Pan-Africanism); L33 (critical minerals); L49 (institutional revisionism); L51 (climate geopolitics)

SECTION 9 — REVIEW SCHEDULE

Review	Timing	Format
R1	Today	Retrieval warm-up + card creation
R2	2–3 days	Cue-column recall + hinge variant

Review	Timing	Format
R3	1 week	Mixed quiz with L1–L10 cards
R4	3–4 weeks	Interleaved problem combining L10 with L12 (Cold War and decolonization) and L27 (African colonial state formation)
R5	End of Module 2	Cheatsheet reconstruction from memory

SECTION 10 — COMPLETION CHECKLIST

- ☐ Retrieval warm-up completed from memory
- ☐ Five learning objectives read and understood
- ☐ Five key ideas studied with mechanisms and scope conditions
- ☐ Perspective comparison matrix filled from memory, then checked
- ☐ Worked example (Concert of Europe and partition of Africa) studied and self-explained
- ☐ Problem pair (Berlin Conference and effective occupation) attempted and compared
- ☐ Independent memo produced (500–600 words)
- ☐ Hinge question answered correctly (or reteaching completed)
- ☐ Data lab completed before independent memo
- ☐ Three dual-coded visuals drawn
- ☐ Cornell notes with cue column, source log, and summary
- ☐ Feynman explanation written, gaps identified, rewritten
- ☐ 12–15 flashcards created with tags
- ☐ Confidence audit and error-log entry
- ☐ Cheatsheet entry added
- ☐ R2 review scheduled

FURTHER READING (Optional — for deepening, not required)

- **On the Concert of Europe:** Henry Kissinger, *A World Restored* (1957); Paul Schroeder, *The Transformation of European Politics, 1763–1848* (1994); Eric Hobsbawm, *The Age of Empire, 1875–1914* (1987); the Final Act of the Congress of Vienna (1815).
- **On the "new imperialism":** J. A. Hobson, *Imperialism: A Study* (1902); V. I. Lenin, *Imperialism, the Highest Stage of Capitalism* (1917); John Gallagher and Ronald Robinson, "The Imperialism of Free Trade," *Economic History Review* (1953); Ronald Robinson, "Non-European Foundations of European Imperialism: Sketch for a Theory of Collaboration" (1972); Thomas Pakenham, *The Scramble for Africa* (1991); Stig Förster et al., *Bismarck, Europe, and Africa* (1988).
- **On the Berlin Conference:** the General Act of the Berlin Conference (1885); Siba Grovogui, *Sovereigns, Quasi-Sovereigns, and Africans* (1996), ch. 3; Antony Anghie, *Imperialism, Sovereignty and the Making of International Law* (2005), ch. 2–3.

- **On the African experience:** Walter Rodney, *How Europe Underdeveloped Africa* (1972); Kwame Nkrumah, *Neo-Colonialism: The Last Stage of Imperialism* (1965); Frederick Lugard, *The Dual Mandate in British Tropical Africa* (1922); Adam Hochschild, *King Leopold's Ghost* (1998); Jan-Bart Gewald, *Herero Heroes* (1999).
- **On the Chinese perspective:** Zheng Wang, *Never Forget National Humiliation* (2012); Zhao Tingyang, *Tianxia* (2021); Qin Yaqing, *A Relational Theory of World Politics* (2018).
- **On the Russian perspective:** Andrei Tsygankov, *Russia and the West from Alexander to Putin* (2012); Lauri Mälksoo, *Russian Approaches to International Law* (2015); Fyodor Lukyanov, "Russia's Vision of a Multipolar World" (2023).
- **On the UN perspective:** the UN Charter; the 1960 Declaration on the Granting of Independence to Colonial Countries and Peoples; the *Pact for the Future* (2024); UN Secretary-General speeches on decolonization and self-determination.

End of Lesson 10. Say **"Next"** when you are ready for Lesson 11 (World Wars, the League of Nations, and the Interwar Crisis).

12. World Wars, the League of Nations, and the Interwar Crisis: The Collapse of the Concert and the Failure of Collective Security

---

LESSON METADATA

Field	Entry
Lesson number and title	L11 — World Wars, the League of Nations, and the Interwar Crisis
Module	Module 2: Historical Architecture of International Order
Prerequisites	L2 (Charter system — the successor to the League); L3 (causal inference, counterfactuals); L7 (English School — international society); L9 (Westphalian myth, sovereignty); L10 (Concert of Europe, Berlin Conference, imperialism)
Interleaved links	Forward to L12 (Cold War and decolonization — the post-1945 settlement), L21 (nuclear deterrence — the lessons of the interwar period), L27 (African colonial state formation — the mandate legacy), L35 (post-Soviet ontology — the lessons of 1938 in Ukraine), L41 (West Asian state system — the mandate legacy in the Middle East), L45 (nuclear proliferation — the lessons of the 1930s)
Reading load	This lesson only. Optional further reading at the end.

Field	Entry
Content channels	Canon (paraphrased and quoted); primary documents (the Covenant of the League of Nations, the Treaty of Versailles, the Hoare-Laval Pact, the Munich Agreement, the Stimson Doctrine, quoted and analyzed); data lab (League membership, sanctions, and mandate data); five perspectives
Bloom ceiling	Evaluate (adjudicate between competing explanations of the collapse of collective security, and between the five perspectives on the interwar period)
Estimated study time	8–10 hours including exercises

Note on self-containment: Every argument, quotation, and example you need is inside this document. Where I cite Carr, Morgenthau, Kennedy, Tooze, Steiner, Mazower, Pedersen, Anghie, Grovogui, Rodney, or any other scholar, I summarize the argument fully enough that you do not need the original to complete the lesson. "Further Reading" is optional.

SECTION 0 — Why This Lesson Exists

Lesson 10 showed that the 19th-century order — the Concert of Europe and the partition of Africa — was a system of great-power management that depended on imperial conquest. This lesson takes the story to its catastrophic conclusion: the **collapse of that order** in the First World War, the **failed attempt to build a new order** through the League of Nations, the **interwar crisis** that produced the Second World War, and the **transition to the UN system**.

The interwar period (1919–1939) is the **founding trauma** of modern IR. It is the period that produced:

- **The League of Nations** — the first attempt at a universal collective-security organization.
- **The mandate system** — the continuation of colonialism under a new legal name.
- **The "lessons of Munich"** — the idea that appeasement produces war, which shaped Western foreign policy for decades.
- **The "lessons of the League"** — the idea that collective security requires great-power commitment and enforcement capacity, which shaped the UN Charter.
- **The rise of fascism and the collapse of the liberal order** — the crisis that produced the Second World War and the post-1945 order.

But the interwar period is not just a story about Europe. It is a story about **the whole world**:

- The First World War was an **imperial war** — African, Indian, and other colonial soldiers fought and died in Europe, and the war was partly fought over imperial competition.
- The **Paris Peace Conference** (1919) was a **global** settlement — it redrew the borders of the Middle East, Africa, and Asia, and it created the mandate system that continued colonial rule under a new name.

- The **Abyssinia Crisis** (1935–36) was a **global** crisis — Italy's invasion of Ethiopia, a member of the League, exposed the failure of collective security in Africa.
- The **Chinese perspective** on the interwar period is shaped by the **betrayal at Versailles** — the decision to transfer German concessions in Shandong to Japan, which sparked the May Fourth Movement and shaped Chinese nationalism for a century.

The African perspective is primary in this lesson because the interwar period is when the **colonial order** was most explicitly contested — by African soldiers who fought in the war, by African intellectuals who demanded self-determination, and by African states (Ethiopia and Liberia) that were members of the League. The interwar period is also when the **mandate system** was established, which shaped the post-colonial state in Africa and the Middle East.

This lesson has five key ideas:

1. **The First World War was an imperial war** — the collapse of the Concert, the alliance system, and the competition for colonies produced a global conflagration.
2. **The Versailles settlement was a victors' peace** — it imposed punitive terms on Germany, created the mandate system, and ignored the demands of the colonized world.
3. **The League of Nations failed because of its design** — the absence of the US, the lack of enforcement mechanisms, the exclusion of the defeated powers, and the contradiction between its universalist rhetoric and its imperial practices.
4. **The interwar crisis was a cascade of failures** — economic (reparations, the Depression), political (the rise of fascism), strategic (appeasement), and normative (the collapse of the liberal order).
5. **The five perspectives** on the interwar period — African (primary), Chinese, Russian, Western, and UN — and the **adjudication** among them.

By the end, you can take any claim about collective security — "the League failed because of the absence of the US," "appeasement caused the Second World War," "the UN was designed to avoid the mistakes of the League" — and answer: *Whose security? Whose peace? Whose order? And how do the five perspectives reconstruct it?*

SECTION 1 — PRE-CLASS PRIMING

1.1 Retrieval warm-up (from memory)

1. From L10: What was the Concert of Europe, and why did it collapse?
2. From L10: What was the "new imperialism," and what were its three main explanations?
3. From L10: What was the Berlin Conference, and what was the doctrine of effective occupation?
4. From L9: What is the "standard of civilization," and how did it function as a mechanism of exclusion?

Check against the previous lessons before proceeding.

1.2 Orientation questions

Hold these in mind:

- Why did the Concert of Europe fail to prevent the First World War?

- Was the League of Nations doomed from the start, or could it have worked?
- Was appeasement a policy of cowardice, or a rational response to the memory of the First World War?
- Whose peace was the Versailles settlement? Whose security did the League protect?

1.3 Vocabulary pre-teach

Provisional definitions; revise by the end:

Collective security; the alliance system; the Schlieffen Plan; the July Crisis; war guilt; reparations; the Fourteen Points; self-determination; the mandate system; the Covenant of the League; the Council; the Assembly; the Permanent Court of International Justice; sanctions; the Hoare-Laval Pact; appeasement; the Munich Agreement; the Molotov-Ribbentrop Pact; the "lessons of Munich"; the "lessons of the League"; the Stimson Doctrine; the Axis powers; the Allied powers.

SECTION 2 — LESSON CORE

2.1 Learning objectives

By the end of this lesson, you can:

1. **Reconstruct** the collapse of the Concert of Europe and explain how the First World War was an imperial war.
2. **Analyze** the Versailles settlement as a victors' peace — its punitive terms, its mandate system, and its silences.
3. **Explain** the failure of the League of Nations as a product of its design — the absence of the US, the lack of enforcement, the exclusion of the defeated powers, and the contradiction between universalism and imperialism.
4. **Reconstruct** the interwar crisis as a cascade of failures — economic, political, strategic, and normative.
5. **Reconstruct** how African, Chinese, Russian, Western, and UN traditions interpret the interwar period, and **adjudicate** among them on a specific case.

2.2 KEY IDEA 1 — The First World War was an imperial war: the collapse of the Concert and the globalization of European conflict

The claim: The First World War (1914–1918) is often presented as a **European civil war** — a conflict among the great powers of Europe, triggered by the assassination of Archduke Franz Ferdinand. But it was also an **imperial war** — a conflict that drew in the colonies, that was fought partly over imperial competition, and that had profound consequences for the colonized world.

The collapse of the Concert. The Concert of Europe, which had managed great-power rivalries for a century, collapsed in the July Crisis of 1914. The crisis began with the assassination of Archduke Franz Ferdinand, the heir to the Austro-Hungarian throne, by a Bosnian Serb nationalist in Sarajevo (June 28, 1914). The crisis escalated through a series of ultimatums, mobilizations, and declarations of war:

- **July 23:** Austria-Hungary issues an ultimatum to Serbia, with terms that Serbia cannot fully accept.

- **July 28:** Austria-Hungary declares war on Serbia.
- **July 30:** Russia mobilizes in support of Serbia.
- **August 1:** Germany declares war on Russia.
- **August 3:** Germany declares war on France.
- **August 4:** Germany invades Belgium; Britain declares war on Germany.

The crisis escalated because of the **rigid alliance system** — the Triple Alliance (Germany, Austria-Hungary, Italy) and the Triple Entente (Britain, France, Russia) — and because of the **military planning** — particularly the Schlieffen Plan, Germany's plan to defeat France quickly before turning to Russia. The plan required the invasion of Belgium, which brought Britain into the war. The crisis also escalated because of the **breakdown of consultation** — the great powers stopped talking to each other, and there was no institutional mechanism to manage the crisis.

The imperial dimension. The First World War was not just a European war; it was a **global** war:

- **Colonial troops:** Britain and France deployed colonial troops from Africa, India, and Southeast Asia. An estimated **two million** African soldiers and carriers served in the war, and hundreds of thousands died. The **Tirailleurs Sénégalais** (Senegalese infantry) fought in Europe; the **King's African Rifles** fought in Africa; Indian soldiers fought in Europe and the Middle East.
- **Colonial labor:** The war effort relied on **colonial labor** — African and Asian workers were conscripted to build railways, dig trenches, and transport supplies. The **Chinese Labour Corps** — about 140,000 Chinese workers — served on the Western Front.
- **Colonial battles:** The war was fought in the colonies — in Africa (the East African campaign, the South-West Africa campaign), in the Middle East (the Sinai and Palestine campaign, the Mesopotamian campaign), and in Asia (the siege of Tsingtao).
- **Colonial resources:** The war was fought over **colonial resources** — the competition for colonies was one of the underlying causes of the war, and the war itself was partly a contest for imperial spoils.

The imperial consequences. The war had profound consequences for the colonized world:

- **The promise of self-determination:** The war was fought in the name of **self-determination** — Woodrow Wilson's Fourteen Points (1918) promised that "peoples and provinces are not to be bartered about from sovereignty to sovereignty as if they were mere chattels and pawns in a game." This promise was heard by colonized peoples around the world — in Africa, Asia, and the Middle East — and it shaped the anti-colonial movements of the 20th century.
- **The disappointment of Versailles:** The promise of self-determination was **betrayed** at Versailles. The mandate system continued colonial rule under a new name; the demands of the colonized world were ignored; and the racial hierarchy of the international system was reinforced.
- **The radicalization of anti-colonial movements:** The betrayal of Versailles **radicalized** anti-colonial movements. In India, the Amritsar massacre (1919) and the failure of the British to grant self-government led to the rise of Gandhi's mass movement. In China, the betrayal at Versailles led to the May Fourth Movement (1919). In Africa, the failure of the peace settlement to address colonial grievances shaped the Pan-African movement.

The African experience. African soldiers and laborers who fought in the war — and who saw the promises of self-determination — returned home with new expectations. The war **disrupted** colonial societies: it drew African men into a global conflict, exposed them to new ideas, and created a generation of veterans

who would become leaders of anti-colonial movements. The war also **intensified** colonial exploitation — the conscription of labor, the requisition of resources, and the suppression of dissent.

What this perspective contributes: It shows that the First World War was not just a European civil war; it was a **global** conflict that drew in the colonized world and had profound consequences for it. It also shows that the war was fought partly over **imperial competition** — the competition for colonies was one of the underlying causes of the war.

What it occludes: It can underplay the **European** dimensions of the war — the alliance system, the military planning, the nationalist rivalries — which were also important causes. It can also underplay the **diversity** of colonial experiences — different colonies were affected in different ways.

Observable implication. If the First World War was an imperial war, you should see (a) **colonial troops and labor** deployed in the war, (b) **colonial battles** fought in Africa, Asia, and the Middle East, and (c) **colonial demands** for self-determination that were ignored at Versailles.

2.3 KEY IDEA 2 — The Versailles settlement was a victors' peace: punitive terms, the mandate system, and the silences

The claim: The Treaty of Versailles (1919) — and the broader Paris Peace Conference — was a **victors' peace**. It imposed punitive terms on Germany, created the mandate system to continue colonial rule under a new name, and ignored the demands of the colonized world. The settlement was shaped by the **interests of the victorious powers** — Britain, France, the US, Italy, and Japan — not by the principles of justice or self-determination.

The context. The Paris Peace Conference opened in January 1919, with delegates from 27 victorious powers. The defeated powers — Germany, Austria-Hungary, the Ottoman Empire, and Bulgaria — were not invited to negotiate; they were presented with terms. The conference was dominated by the **Big Four** — Woodrow Wilson (US), David Lloyd George (Britain), Georges Clemenceau (France), and Vittorio Orlando (Italy). Japan also played a significant role, particularly in the debates over racial equality and the Shandong question.

The Treaty of Versailles (June 28, 1919). The treaty with Germany contained several key provisions:

1. **The war guilt clause (Article 231):** Germany accepted responsibility for "causing all the loss and damage" of the war. This clause was the legal basis for reparations, and it was deeply resented by Germans.
2. **Reparations:** Germany was required to pay reparations — the amount was eventually set at 132 billion gold marks (about $33 billion at the time). The reparations were intended to compensate the victors for the costs of the war, but they were also intended to **cripple** Germany's economy and prevent it from rising again. 3. **Territorial losses:** Germany lost territory to France (Alsace-Lorraine), Belgium (Eupen-Malmedy), Denmark (Schleswig), Poland (the Polish Corridor, Posen, and West Prussia), and Lithuania (Memel). Germany also lost all of its colonies — which were distributed among the victors as **mandates**. 4. **Military restrictions:** Germany's army was limited to 100,000 men, its navy was limited to 15,000 men, and it was forbidden to have an air force, submarines, or tanks. The Rhineland was demilitarized. 5. **The League of Nations Covenant:** The treaty incorporated the Covenant of the League of Nations — the first attempt at a universal collective-security organization.

The mandate system. The mandate system was established by **Article 22** of the League of Nations Covenant.

It placed the former German and Ottoman territories under the "tutelage" of "advanced nations" — Britain, France, Belgium, South Africa, Australia, New Zealand, and Japan — who were supposed to prepare them for self-government. The mandates were classified into three categories:

- **Class A mandates:** Territories that were "provisionally recognized as independent nations" but required "administrative advice and assistance" until they could "stand alone." These included Iraq, Palestine, Transjordan, Syria, and Lebanon.
- **Class B mandates:** Territories that required the "tutelage" of the mandatory power, with guarantees of religious freedom and the prohibition of abuses. These included most of the former German colonies in Africa — Tanganyika, Cameroon, Togoland, and Ruanda-Urundi.
- **Class C mandates:** Territories that were administered as "integral portions" of the mandatory power's territory, because of their "remoteness" or "sparseness of population." These included South-West Africa (administered by South Africa), New Guinea (Australia), and the Pacific islands (Japan).

The mandate system was a **continuation of colonialism under a new name**. The mandatory powers were not accountable to the local populations; they were accountable to the League of Nations, which had no enforcement mechanism. The system preserved the **racial hierarchy** of the colonial order — the "advanced nations" governed the "peoples not yet able to stand by themselves."

The silences. The Versailles settlement was shaped by **silences** — issues that were not addressed:

- **Self-determination for the colonized world:** Wilson's Fourteen Points promised self-determination, but the principle was applied only to Europe. The colonized world — Africa, Asia, the Middle East — was not granted self-determination. The **Shandong question** — China's demand for the return of the German concessions in Shandong — was decided in favor of Japan, sparking the May Fourth Movement. The **Korean** demand for independence was ignored. The **Egyptian** demand for independence was ignored (Egypt was a British protectorate until 1922). The **Indian** demand for self-government was ignored.
- **Racial equality:** Japan proposed a **racial equality clause** in the League Covenant, which would have affirmed the equality of all races. The proposal was **rejected** by the US, Britain, and Australia — partly because of domestic racial politics (particularly in the US and Australia). The rejection confirmed the racial hierarchy of the international system.
- **Colonial grievances:** The demands of African and Asian peoples for self-government, for land rights, for labor rights, and for an end to colonial exploitation were **ignored**. The peace settlement was a settlement among the victorious powers, not a settlement with the colonized world.

The African perspective. African scholars emphasize that the Versailles settlement was a **betrayal** of the promises made during the war. African soldiers and laborers had fought and died for the Allies, and they had been promised self-determination. But the peace settlement **continued** colonial rule — through the mandate system — and **ignored** African demands. The settlement also **rewarded** the colonial powers — Britain, France, Belgium, South Africa — with **new territories** (the mandates), while the African populations had no say in their own governance.

What this perspective contributes: It shows that the Versailles settlement was not a peace of justice; it was a **victors' peace** that preserved the colonial order and the racial hierarchy of the international system. It also shows that the promise of self-determination was **betrayed** for the colonized world.

What it occludes: It can underplay the **genuine idealism** of some of the architects of the settlement —

particularly Wilson — and the **genuine achievements** of the settlement — the creation of the League, the establishment of the ILO, the attempt to establish a new international order.

Observable implication. If the Versailles settlement was a victors' peace, you should see (a) **punitive** terms imposed on Germany, (b) the **mandate system** as a continuation of colonial rule, and (c) the **silences** on self-determination, racial equality, and colonial grievances.

2.4 KEY IDEA 3 — The League of Nations failed because of its design: the absence of the US, the lack of enforcement, the exclusion of the defeated powers, and the contradiction between universalism and imperialism

The claim: The League of Nations was the first attempt at a **universal collective-security organization**. It failed — catastrophically — to prevent the Second World War. The failure was not an accident; it was a product of the League's **design** — the absence of the US, the lack of enforcement mechanisms, the exclusion of the defeated powers, and the contradiction between its universalist rhetoric and its imperial practices.

The Covenant. The League of Nations Covenant was incorporated into the Treaty of Versailles. Its key provisions:

- **Article 10:** The members "undertake to respect and preserve as against external aggression the territorial integrity and existing political independence of all Members of the League." This was the core of the **collective-security** commitment — an attack on one member was to be considered an attack on all.
- **Article 11:** Any war or threat of war is a matter of concern to the whole League, and the League shall take "any action that may be deemed wise and effectual to safeguard the peace of nations."
- **Article 12:** Members agree to submit disputes to arbitration or judicial settlement, or to inquiry by the Council, and they agree not to resort to war until three months after the decision.
- **Article 13:** Members agree to carry out in good faith any award or decision, and they agree not to resort to war against a member that complies with the award.
- **Article 14:** The Council shall formulate plans for the establishment of a **Permanent Court of International Justice**.
- **Article 15:** If a dispute is not settled by arbitration or judicial decision, the Council shall investigate and report.
- **Article 16:** If a member resorts to war in violation of the Covenant, it shall be deemed to have committed an act of war against all other members, and the other members shall subject it to **sanctions** — economic, financial, and military. The Council shall recommend to the governments concerned what military forces shall be contributed.
- **Articles 22–23:** The mandate system; the treatment of native peoples; the prevention and control of disease; the suppression of the traffic in women and children.
- **Article 24:** All international bureaus established by treaty shall be placed under the direction of the League.

The flaws. The League's design had several flaws that undermined its effectiveness:

1. **The absence of the US.** The US Senate **rejected** the Treaty of Versailles (and the League Covenant) in 1919 — largely because of opposition to Article 10 (the collective-security commitment) and because

of isolationist sentiment. The League was deprived of the world's most powerful economy and one of its most important military powers. The absence of the US was a **fatal blow** — it undermined the League's credibility and its capacity to enforce its decisions.

2. **The exclusion of the defeated powers.** Germany was excluded from the League until 1926; the Soviet Union was excluded until 1934. The exclusion of these powers meant that the League was a **victors' club** — it did not include the states that had the most reason to challenge the settlement.
3. **The lack of enforcement mechanisms.** The League had no **standing army** and no capacity to enforce its decisions. Article 16 authorized sanctions, but the sanctions required the **cooperation of member states**, and the member states were often unwilling to bear the costs. The League's only military enforcement mechanism was the **recommendation** to member states to contribute forces — which they were free to ignore.
4. **The unanimity rule.** The League's Assembly and Council operated by **unanimity** — which meant that any single member could block action. The unanimity rule made the League slow and indecisive, particularly in crises.
5. **The contradiction between universalism and imperialism.** The League claimed to be a **universal** organization — based on the equality and sovereignty of all member states. But it was also an **imperial** organization — it administered the mandate system, which continued colonial rule, and its member states included the colonial powers. The contradiction between universalism and imperialism undermined the League's legitimacy.
6. **The "great power" problem.** The League was designed to be a **great-power management system** — the Council's permanent members (Britain, France, Italy, Japan) were the great powers. But the great powers were not willing to **delegate** their authority to the League; they preferred to manage their own affairs. The League was a **forum** for great-power consultation, not a **constraint** on great-power action.

The failures. The League's design flaws were exposed in a series of crises:

- **The Manchurian Crisis (1931–33):** Japan invaded Manchuria, a Chinese territory. China appealed to the League. The League appointed the **Lytton Commission**, which recommended that Japan withdraw and that Manchuria become an autonomous region under Chinese sovereignty. Japan **rejected** the recommendation and **withdrew** from the League. The League did nothing; it had no capacity to enforce its decision. The crisis exposed the League's inability to deal with a great-power aggressor.
- **The Abyssinia Crisis (1935–36):** Italy invaded Ethiopia, a member of the League. Ethiopia appealed to the League. The League declared Italy the aggressor and imposed **limited sanctions** — but it excluded oil, coal, and steel, which were essential to the Italian war effort. The sanctions were ineffective, and Italy completed its conquest. The crisis exposed the League's inability to impose effective sanctions, and the **Hoare-Laval Pact** — a secret deal between Britain and France to give Italy most of Ethiopia — exposed the hypocrisy of the great powers. The crisis was particularly significant for Africa — Ethiopia was the only African member of the League, and its betrayal by the League shaped African attitudes toward international institutions.
- **The Rhineland Crisis (1936):** Germany **remilitarized** the Rhineland, in violation of the Treaty of Versailles and the Locarno Treaties. The League did nothing; the great powers were unwilling to confront Germany.
- **The Spanish Civil War (1936–39):** Germany and Italy intervened in support of Franco; the Soviet Union supported the Republic; Britain and France pursued a policy of **non-intervention**. The League was sidelined; the conflict became a proxy war for the great powers.

- **The Anschluss (1938):** Germany annexed Austria, in violation of the Treaty of Versailles. The League did nothing.
- **The Munich Agreement (1938):** Germany demanded the Sudetenland from Czechoslovakia. Britain, France, Italy, and Germany met at Munich and agreed to the transfer of the Sudetenland to Germany — without the participation of Czechoslovakia. The agreement was a symbol of **appeasement** — the policy of conceding to the demands of an aggressive power in the hope of avoiding war. The League was not involved.
- **The invasion of Poland (1939):** Germany invaded Poland; Britain and France declared war. The League was **impotent**; it had already been marginalized by the great powers.

The "lessons of the League." The League's failure shaped the design of the UN. The UN Charter was intended to **avoid the mistakes of the League**:

- **The US was a founding member** (and a permanent member of the Security Council).
- **The great powers were given the veto** — the idea was that the great powers would be more willing to cooperate if their vital interests were protected.
- **The Security Council was given the authority to authorize force** under Chapter VII — not just to recommend it.
- **The unanimity rule was replaced by the veto** — the great powers could block action, but they did not need the consent of all members.
- **The UN was given a military staff committee** (though it has never functioned as intended).
- **The UN was given a broader mandate** — not just peace and security, but also human rights, development, and decolonization.

But the UN also **inherited** some of the League's flaws — the veto, the great-power domination, the lack of enforcement. The "lessons of the League" are not as clear as they appear.

What this perspective contributes: It shows that the League failed not because of a single cause, but because of a **combination of design flaws** — the absence of the US, the lack of enforcement, the exclusion of the defeated powers, and the contradiction between universalism and imperialism. It also shows that the League's failure shaped the design of the UN — but that the UN did not solve all of the League's problems.

What it occludes: It can underplay the **genuine achievements** of the League — the settlement of disputes, the humanitarian work, the technical cooperation, the establishment of the ILO, the mandate system's (limited) oversight. It can also underplay the **responsibility of the great powers** — the League's failures were not just design flaws; they were also failures of political will.

Observable implication. If the League's failure was a product of its design, you should see (a) the **absence** of key powers (the US, the USSR), (b) the **lack** of enforcement mechanisms, and (c) the **contradiction** between universalism and imperialism.

2.5 KEY IDEA 4 — The interwar crisis was a cascade of failures: economic, political, strategic, and normative

The claim: The interwar period (1919–1939) was not a single crisis; it was a **cascade of failures** — economic, political, strategic, and normative — that reinforced each other and produced the Second World War.

The economic failure. The interwar economy was characterized by **instability** and **crisis**:

- **Reparations:** The reparations imposed on Germany were a source of instability. Germany could not pay them without borrowing, and the loans were dependent on the US. When the US economy collapsed in 1929, the loans dried up, and Germany defaulted.
- **The Great Depression:** The stock market crash of 1929 triggered a global economic depression. The depression was **transmitted** through the gold standard, which forced countries to tighten their monetary policy, deepening the depression. The depression produced **mass unemployment** — in Germany, unemployment reached 30% by 1932 — and **political instability**.
- **The collapse of the gold standard:** The gold standard, which had been the basis of the international monetary system, collapsed in the 1930s. Countries adopted **protectionist** policies — tariffs, quotas, competitive devaluations — which deepened the depression and fragmented the world economy.
- **The rise of economic nationalism:** The economic crisis produced a turn toward **economic nationalism** — the pursuit of national self-sufficiency and the rejection of international economic cooperation. This undermined the liberal order and contributed to the rise of fascism.

The political failure. The interwar period saw the **rise of fascism** and the **collapse of democracy**:

- **The rise of fascism:** Fascist movements emerged in Italy (Mussolini, 1922), Germany (Hitler, 1933), Spain (Franco, 1939), and elsewhere. Fascism was characterized by **ultranationalism**, **authoritarianism**, **militarism**, and **racism**. It rejected the liberal order — democracy, internationalism, the rule of law — and sought to create a new order based on **power** and **racial hierarchy**.
- **The collapse of democracy:** The economic crisis and the rise of fascism undermined democratic governments across Europe. By 1939, most of Europe was either fascist or authoritarian.
- **The failure of the League:** The League's failure to respond to the crises of the 1930s — Manchuria, Abyssinia, the Rhineland, Spain, the Anschluss, Munich — was a political failure as much as a design failure. The great powers were unwilling to confront the fascist powers, either because they were preoccupied with their own economic problems or because they feared a general war.

The strategic failure. The interwar period saw the **failure of deterrence** and the **rise of appeasement**:

- **The failure of deterrence:** The victorious powers — Britain and France — failed to deter Germany, Italy, and Japan. They did not maintain sufficient military forces, they did not coordinate their policies, and they did not signal resolve. The fascist powers interpreted their reluctance as **weakness**.
- **The rise of appeasement:** The policy of **appeasement** — conceding to the demands of the aggressive powers in the hope of avoiding war — was pursued by Britain and France, particularly in the late 1930s. The **Munich Agreement** (1938) was the most famous example — the transfer of the Sudetenland to Germany without the participation of Czechoslovakia. Appeasement was driven by the **memory of the First World War** — the fear of another catastrophic war — and by the belief that Germany's grievances were legitimate (the Versailles settlement was unfair). But it failed to prevent the war; it **encouraged** Hitler's expansionism.

The normative failure. The interwar period saw the **collapse of the liberal order** — the norms and institutions that had been established after the First World War:

- **The collapse of collective security:** The League's failure to respond to aggression undermined the principle of collective security — the idea that aggression would be met by collective action. The

failure of collective security in Manchuria and Abyssinia signaled to the fascist powers that aggression would not be punished.
- **The collapse of the rule of law:** The fascist powers rejected the rule of law — the idea that international relations should be governed by law, not by force. They pursued their goals through **force** and **violence** — the invasion of Ethiopia, the remilitarization of the Rhineland, the annexation of Austria, the dismemberment of Czechoslovakia, the invasion of Poland.
- **The collapse of the racial hierarchy:** The fascist powers **challenged** the racial hierarchy of the international system — but in a different way. They claimed that their own race was superior, and they sought to establish a new racial hierarchy with themselves at the top. The **Holocaust** — the genocide of six million Jews — was the most extreme expression of this racial ideology.

The cascade. The four failures — economic, political, strategic, and normative — were **interconnected**. The economic crisis produced political instability, which produced the rise of fascism. The rise of fascism produced strategic challenges, which were met by appeasement. Appeasement undermined the normative order, which encouraged further aggression. The cascade produced the Second World War.

The African perspective. African scholars emphasize that the interwar crisis was also a **colonial crisis**:

- **The Depression** hit Africa hard — the prices of African commodities collapsed, and the colonial economies were devastated.
- **The rise of fascism** had a particular significance for Africa — Italy's invasion of Ethiopia (1935–36) was a **colonial** war, and the League's failure to respond was a **betrayal** of the only African member of the League. The invasion was also a **racial** war — Mussolini framed it as a war of "civilization" against "barbarism."
- **The Second World War** was a **global** war — African soldiers and laborers were again conscripted, and the war was fought in Africa (the North African campaign, the East African campaign). The war also **weakened** the colonial powers — Britain and France were exhausted, and the US and the USSR were hostile to colonialism. This created the conditions for **decolonization** after the war.

What this perspective contributes: It shows that the interwar crisis was not just a European crisis; it was a **global** crisis that had profound consequences for Africa and the colonized world. It also shows that the interwar period was a **turning point** — the crisis of the colonial order created the conditions for decolonization.

What it occludes: It can underplay the **European** dimensions of the crisis — the specific dynamics of German, Italian, and Japanese expansionism, the role of individual leaders, the contingencies of diplomatic decision-making. It can also underplay the **genuine idealism** of some of the interwar experiments — the League, the Kellogg-Briand Pact, the attempts at disarmament.

Observable implication. If the interwar crisis was a cascade of failures, you should see (a) **economic instability** — reparations, the Depression, the collapse of the gold standard, (b) **political instability** — the rise of fascism, the collapse of democracy, (c) **strategic failure** — the failure of deterrence, the rise of appeasement, and (d) **normative collapse** — the failure of collective security, the collapse of the rule of law, the Holocaust.

2.6 KEY IDEA 5 — The five perspectives interpret the interwar period differently, and each interpretation is political

The claim: The interwar period is not a neutral historical object. It is a **contested** historical legacy, and the five perspectives — African, Chinese, Russian, Western, and UN — interpret it differently. Each interpretation reflects a different political project.

2.6.1 The African perspective (primary) **Core commitments.** African scholars and leaders interpret the interwar period as a **turning point** in Africa's relationship with the international system:

1. **The betrayal of Versailles.** The Versailles settlement **betrayed** the promises of self-determination that had been made during the First World War. African soldiers and laborers had fought and died for the Allies, but the peace settlement continued colonial rule — through the mandate system — and ignored African demands.
2. **The Abyssinia Crisis as a turning point.** Italy's invasion of Ethiopia (1935–36) and the League's failure to respond was a **turning point** in African attitudes toward the international system. Ethiopia was the only African member of the League, and its betrayal exposed the **hypocrisy** of the League's universalism. The crisis confirmed African suspicions that the international system was a **racial hierarchy** — African states were not treated as equal members of the international community.
3. **The Second World War and decolonization.** The Second World War **weakened** the colonial powers and created the conditions for **decolonization**. African soldiers who fought in the war — and who saw the promises of freedom and democracy — returned home with new expectations. The war also **radicalized** anti-colonial movements — the Atlantic Charter (1941), which affirmed the right of all peoples to self-determination, was invoked by African and Asian leaders. The post-war period saw the **wave of decolonization** — India (1947), Ghana (1957), and the rest of Africa (1957–1975).
4. **The legacy of the mandate system.** The mandate system established after the First World War shaped the post-colonial state in Africa and the Middle East. The mandates — particularly in the Middle East (Iraq, Palestine, Syria, Lebanon) — created the borders and institutions that persist today. The **Palestinian question** — the British mandate in Palestine and the Balfour Declaration (1917) — is a direct legacy of the mandate system.

The critique of the standard narrative. African scholars critique the standard narrative of the interwar period for being **Eurocentric** — it focuses on the rise of fascism in Europe and the failure of the League, but it **ignores** the colonial world. The standard narrative treats the interwar period as a **European** crisis, but it was a **global** crisis that had profound consequences for Africa and the colonized world.

What this perspective contributes: It shows that the interwar period was not just a European crisis; it was a **global** crisis that shaped the colonized world. It also shows that the interwar period was a **turning point** — the crisis of the colonial order created the conditions for decolonization.

What it occludes: It can underplay the **diversity** of African experiences — different colonies were affected in different ways. It can also underplay the **genuine idealism** of some of the interwar experiments — the League, the ILO, the attempts at international cooperation.

2.6.2 The Chinese perspective **Core commitments.** China's engagement with the interwar period is shaped by the **betrayal at Versailles** — the decision to transfer German concessions in Shandong to Japan, which sparked the **May Fourth Movement** (1919) and shaped Chinese nationalism for a century.

1. **The betrayal at Versailles.** China had joined the Allies during the First World War, hoping to regain the German concessions in Shandong. But the Paris Peace Conference decided to transfer the concessions to Japan — despite China's claims and despite Wilson's promise of self-determination. The betrayal **radicalized** Chinese nationalism — the May Fourth Movement was a protest against the betrayal, and it became a foundational moment in modern Chinese history.
2. **The "century of humiliation."** The interwar period is part of the **"century of humiliation"** — the period from the First Opium War (1839–42) to the founding of the People's Republic (1949) during which China was subjected to the "standard of civilization," unequal treaties, and foreign intervention. The betrayal at Versailles confirmed China's view that the international system was a **Western-dominated order** that did not respect the rights of non-Western peoples.
3. **The League and China.** China was a member of the League, and it appealed to the League during the **Manchurian Crisis** (1931–33). The League's failure to respond to Japan's aggression — and Japan's withdrawal from the League — confirmed China's view that the League was **impotent** and that the international system was **hypocritical**.
4. **The Chinese perspective on the Second World War.** China was a **major theater** of the Second World War — the Second Sino-Japanese War (1937–45) was one of the largest conflicts of the war. China suffered enormous casualties — an estimated 14–20 million deaths. The Chinese perspective emphasizes that the war in Asia was not just a **side show** to the European war; it was a **central** theater. The Chinese perspective also emphasizes that China's contribution to the Allied victory has been **underrecognized** in Western narratives.

The critique of the standard narrative. Chinese scholars critique the standard narrative of the interwar period for being **Eurocentric** — it focuses on the rise of fascism in Europe and the failure of the League, but it **ignores** the war in Asia. The standard narrative treats the Second World War as a **European** war, but it was a **global** war that began in Asia (the Japanese invasion of Manchuria in 1931, the invasion of China in 1937) before it began in Europe (the invasion of Poland in 1939).

What this perspective contributes: It shows that the interwar period was a **global** crisis — the war in Asia was not a side show; it was a central theater. It also shows that the **betrayal at Versailles** was a foundational moment in Chinese nationalism — it shaped China's view of the international system for a century.

What it occludes: It can underplay the **genuine idealism** of some of the interwar experiments — the League, the attempts at international cooperation. It can also underplay the **diversity** of Chinese experiences — different regions of China were affected in different ways.

2.6.3 The Russian perspective Core commitments. Russia's engagement with the interwar period is shaped by the **Bolshevik Revolution** (1917), the **Russian Civil War** (1917–22), and the **Soviet experience** of the interwar period.

1. **The Bolshevik critique of imperialism.** Lenin's *Imperialism, the Highest Stage of Capitalism* (1917) was written during the First World War, and it framed the war as an **imperialist war** — a war among the capitalist powers for the division of the world. The Bolsheviks **rejected** the war and called for a **revolutionary** transformation of the international system.
2. **The Comintern and anti-colonialism.** The **Communist International** (Comintern, founded 1919) was an attempt to build a **revolutionary** international — a network of communist parties committed to overthrowing capitalism and imperialism. The Comintern was particularly active in the colonized world — it supported anti-colonial movements in China, India, and Africa, and it framed anti-

colonialism as part of the global struggle against capitalism.

3. **The Soviet Union and the League.** The Soviet Union was **excluded** from the League until 1934, and it was **expelled** in 1939 after the invasion of Finland. The Soviet perspective on the League is **critical** — the League was a "victors' club" that excluded the Soviet Union and the defeated powers, and it was a **tool** of the Western powers.
4. **The Molotov-Ribbentrop Pact.** The Soviet Union's **non-aggression pact** with Germany (1939) — the Molotov-Ribbentrop Pact — is a **contested** episode. The Soviet perspective frames it as a **necessity** — the Soviet Union was isolated, the Western powers had pursued a policy of appeasement, and the pact bought time to prepare for the inevitable war. The Western perspective frames it as a **betrayal** — the Soviet Union allied with Nazi Germany and divided Eastern Europe into spheres of influence.
5. **The Russian perspective on the Second World War.** Russia (as the successor to the Soviet Union) emphasizes the **Great Patriotic War** (1941–45) — the Soviet Union's struggle against Nazi Germany. The war was the **most devastating** conflict in Russian history — an estimated 27 million Soviet citizens died. The Russian perspective emphasizes that the Soviet Union **bore the brunt** of the war in Europe, and that its contribution to the Allied victory has been **underrecognized** in Western narratives.

The critique of the standard narrative. Russian scholars critique the standard narrative of the interwar period for **ignoring** the Soviet Union's role — the Soviet Union was a **major** power, and its exclusion from the League was a **fatal flaw**. The Russian perspective also critiques the Western narrative for **downplaying** the Soviet contribution to the war and for **blaming** the Soviet Union for the outbreak of the war (the Molotov-Ribbentrop Pact).

What this perspective contributes: It shows that the interwar period was shaped by the **Bolshevik Revolution** and the **Soviet experience** — the Soviet Union was a major power, and its exclusion from the League was a fatal flaw. It also shows that the **imperialist critique** of the war — the idea that the war was a contest among capitalist powers — is an important alternative to the standard narrative.

What it occludes: It can **justify** the Molotov-Ribbentrop Pact and **downplay** Soviet aggression — the invasion of Poland, the annexation of the Baltic states, the invasion of Finland. It can also **underplay** the role of the Western powers in the Allied victory — the US and Britain made significant contributions.

2.6.4 The Western perspective Core commitments. The Western tradition is the **home** of the standard narrative of the interwar period. The standard narrative focuses on:

1. **The failure of the League.** The League failed because of the absence of the US, the lack of enforcement mechanisms, and the unwillingness of the great powers to confront aggression.
2. **The failure of appeasement.** Appeasement — the policy of conceding to the demands of the aggressive powers — **failed** to prevent the war. The **"lessons of Munich"** — the idea that appeasement produces war — shaped Western foreign policy for decades.
3. **The rise of fascism.** The interwar period saw the rise of **fascism** — a totalitarian ideology that rejected democracy, the rule of law, and international cooperation. The Western perspective frames the Second World War as a **war of civilization** against fascism.
4. **The Holocaust.** The **Holocaust** — the genocide of six million Jews — is the **central** event of the interwar period. The Western perspective frames the Holocaust as a **unique** evil that must never be repeated.

The revisionist critique. Western scholarship has also produced **revisionist** accounts of the interwar period:

- **A. J. P. Taylor's *The Origins of the Second World War* (1961)** argued that Hitler was not a **premeditated** aggressor; he was an **opportunist** who exploited the weaknesses of the Western powers. Taylor's thesis was controversial, but it opened up a debate about the **contingency** of the war.
- **The "liberal order" thesis:** Some Western scholars argue that the interwar period was a **failure of the liberal order** — the US withdrew from the League, the Western powers pursued protectionist policies, and the international economy fragmented. The lesson is that the **liberal order** must be **sustained** by a **hegemon** — the US after 1945 played this role.
- **The "security dilemma" thesis:** Some Western scholars argue that the interwar period was a **security dilemma** — the Western powers and Germany were trapped in a spiral of mistrust and armament. The lesson is that **reassurance** and **cooperation** are necessary to avoid conflict.

The silences. The Western perspective has been **slow** to acknowledge:

- **The colonial dimensions** of the interwar period — the mandate system, the betrayal of self-determination, the exploitation of the colonies.
- **The racial dimensions** of the interwar period — the racial hierarchy of the international system, the rejection of the racial equality clause.
- **The global dimensions** of the Second World War — the war in Asia, the war in Africa, the role of colonial troops.

What this perspective contributes: It provides the **most developed** versions of the standard narrative and the most systematic **self-critique** of that narrative.

What it occludes: It can be **parochial** — focusing on Europe and ignoring the colonial world. It can be **self-referential** — a debate among Western scholars about Western history. And it can be **complicit** — the standard narrative serves Western interests by presenting the Western powers as the defenders of civilization against fascism, while ignoring their own imperial crimes.

2.6.5 The UN perspective **Core commitments.** The UN is the **institutional embodiment** of the post-1945 order, and its interpretation of the interwar period is shaped by its **founding narrative** — the UN was created to **avoid the mistakes of the League**.

1. **The lessons of the League.** The UN Charter was designed to **avoid** the League's flaws — the US was a founding member, the great powers were given the veto, the Security Council was given the authority to authorize force, and the unanimity rule was replaced by the veto.
2. **The lessons of the Holocaust.** The Holocaust was a **founding trauma** of the UN — the UN's human rights framework (the Universal Declaration of Human Rights, the Genocide Convention) was a response to the Holocaust. The UN's commitment to **human rights** and **the prevention of genocide** is a direct legacy of the interwar period.
3. **The lessons of appeasement.** The UN's collective-security framework — the Security Council's authority to authorize force, the prohibition on the use of force in Article 2(4) — was designed to **prevent** the kind of aggression that went unpunished in the 1930s. The "lessons of Munich" — the idea that aggression must be confronted — shaped the UN's approach to peace and security.
4. **The decolonization agenda.** The UN's decolonization agenda — the 1960 Declaration on the Granting of Independence to Colonial Countries and Peoples — was a **repudiation** of the mandate system and the colonial order. The UN's **trusteeship system** — which replaced the mandate system — was designed to **prepare** the colonies for self-government, but it was also a **continuation** of the colonial

order under a new name.

The silences. The UN's narrative has been **slow** to acknowledge:

- **The colonial dimensions** of the interwar period — the mandate system, the betrayal of self-determination, the exploitation of the colonies.
- **The racial dimensions** of the interwar period — the racial hierarchy of the international system, the rejection of the racial equality clause.
- **The continuities** between the League and the UN — the UN inherited the mandate system (as the trusteeship system), the great-power domination (the veto), and the imperial practices (the trusteeship system continued colonial rule under a new name).

What this perspective contributes: It provides the **normative benchmark** — the standards against which the interwar period is judged. It also provides the **institutional record** — the resolutions, declarations, and debates that are essential evidence for any analysis.

What it occludes: It can **depoliticize** — framing the interwar period as a failure of institutions obscures the power dynamics that shaped it. It can also **legitimize** — the UN's narrative presents the post-1945 order as a **solution** to the interwar crisis, while ignoring its own continuities with the colonial order.

2.6.6 The comparison matrix

Dimension	African (primary)	Chinese	Russian	Western	UN
Stance toward Versailles	Betrayal of self-determination; continuation of colonial rule	Betrayal at Versailles; May Fourth Movement	Bolshevik critique of imperialism	Victors' peace; flawed but necessary	Precursor to the UN; lessons learned
Stance toward the League	Hypocritical; betrayed Ethiopia	Impotent; failed to respond to Manchuria	Excluded; tool of Western powers	Failed because of design flaws	Predecessor; lessons learned
Stance toward appeasement	The same powers that appeased Hitler were the colonial powers	The same powers that appeased Japan in China	The West tried to direct Hitler eastward	Failed policy; "lessons of Munich"	Failed policy; shaped the UN's collective-security framework
Key contribution	Colonial betrayal; Abyssinia as turning point; decolonization	Betrayal at Versailles; centrality of the Asian theater	Bolshevik critique; Soviet role in the war	Standard narrative + revisionist critique	Normative benchmark; institutional record

Dimension	African (primary)	Chinese	Russian	Western	UN
Key occlusion	Diversity of African experiences; idealism of the League	Idealism of the League; diversity of Chinese experiences	Molotov-Ribbentrop Pact; Soviet aggression	Colonial and racial dimensions; global dimensions	Continuities with the colonial order; power dynamics

---

2.7 WORKED EXAMPLE (I do)

The puzzle: The **Abyssinia Crisis** (1935–36) was a turning point in the interwar period. Italy, a member of the League of Nations, invaded Ethiopia, also a member of the League. Ethiopia appealed to the League for protection. The League declared Italy the aggressor and imposed **limited sanctions** — but it excluded oil, coal, and steel, which were essential to the Italian war effort. The sanctions were ineffective, and Italy completed its conquest. Why did the League fail to protect Ethiopia, and what does the crisis tell us about the limits of collective security?

The puzzle stated precisely: *Why did the League of Nations fail to protect Ethiopia from Italian aggression, despite Ethiopia's status as a member state and the League's collective-security commitment?*

The League's design:

- **The absence of the US.** The US was not a member of the League, and it was the world's largest oil producer. The League's sanctions excluded oil — partly because the US would not cooperate with an oil embargo, and partly because Britain and France feared that an oil embargo would provoke Italy and push it closer to Germany.
- **The unanimity rule.** The League's decisions required unanimity, which made it difficult to impose effective sanctions. The sanctions that were imposed were **limited** — they excluded oil, coal, and steel — because the great powers were unwilling to bear the costs of a full embargo.
- **The lack of enforcement.** The League had no **standing army** and no capacity to enforce its decisions. The sanctions were **recommended** to member states, not **imposed** on them. The member states were free to ignore them, and many did.
- **The great-power interests.** Britain and France were the dominant powers in the League, and they were **unwilling** to confront Italy. They feared that a confrontation with Italy would push Italy into an alliance with Germany, and they were preoccupied with the **German threat**. The **Hoare-Laval Pact** — a secret deal between Britain and France to give Italy most of Ethiopia — exposed the **hypocrisy** of the great powers. The pact was leaked and denounced, but it revealed that the great powers were willing to **sacrifice** Ethiopia to preserve their own interests.

The Ethiopian perspective. Ethiopia was the **only African member** of the League. Its appeal to the League was a **test** of the League's commitment to collective security and to the equality of all member states. The League's failure was a **betrayal** — not just of Ethiopia, but of the principle of collective security and of the **racial equality** that the League claimed to uphold. The crisis confirmed African suspicions that the international system was a **racial hierarchy** — African states were not treated as equal members of the international community.

The African perspective. African scholars and leaders interpret the Abyssinia Crisis as a **turning point** in African attitudes toward the international system. The crisis exposed the **hypocrisy** of the League's universalism — the League was willing to impose sanctions on Italy, but only **limited** sanctions that did not threaten Italian interests. The crisis also exposed the **racial hierarchy** of the international system — Ethiopia was a **black** state, and the League was unwilling to defend it. The crisis **radicalized** African anti-colonial movements — it confirmed that the international system was a **white man's club** that could not be relied upon to protect African interests.

The Western perspective. Western scholars interpret the Abyssinia Crisis as a **failure of collective security** — a failure that was **avoidable**. The sanctions were **too limited** to be effective; the great powers were **unwilling** to confront Italy; and the **Hoare-Laval Pact** exposed the **hypocrisy** of the great powers. The lesson is that **collective security** requires **credible** enforcement — limited sanctions and secret deals **undermine** the credibility of the system.

The Chinese perspective. Chinese scholars interpret the Abyssinia Crisis as a **parallel** to the Manchurian Crisis (1931–33) — in both cases, the League failed to respond to aggression by a great power. The lesson is that the League was **impotent** — it could not protect weak states from strong states. The Chinese perspective emphasizes that the **weak** are always the **victims** of great-power politics.

The Russian perspective. Russian scholars interpret the Abyssinia Crisis as evidence of the **hypocrisy** of the Western powers — the same powers that claimed to uphold collective security were willing to **sacrifice** Ethiopia to preserve their own interests. The lesson is that the **Western powers** cannot be trusted to uphold international law — they use it selectively, when it serves their interests.

The UN perspective. The UN interprets the Abyssinia Crisis as a **lesson** — the UN's collective-security framework was designed to **avoid** the mistakes of the League. The **Security Council** was given the authority to **authorize force** under Chapter VII — not just to recommend sanctions. The **veto** was designed to ensure that the great powers would **cooperate** — but it also **limits** the UN's ability to respond to aggression by a permanent member. The lesson of Abyssinia is that **collective security** requires **credible** enforcement and **great-power commitment** — but the UN has not fully solved this problem.

Adjudication. Which perspective best explains the **failure** of the League in Abyssinia?

- **The League's design** explains the **structural** dimension — the absence of the US, the unanimity rule, the lack of enforcement.
- **The great-power interests** explain the **political** dimension — Britain and France were unwilling to confront Italy because they feared the German threat.
- **The African perspective** explains the **racial** dimension — Ethiopia was a black state, and the League was unwilling to defend it.
- **The UN perspective** explains the **lessons** — the UN was designed to avoid the League's mistakes, but it has not fully succeeded.

A complete explanation combines all four: the Abyssinia Crisis was a **product** of the League's design flaws, the great powers' unwillingness to confront Italy, the racial hierarchy of the international system, and the lessons that shaped the UN. The crisis was a **turning point** — it exposed the **limits** of collective security and shaped the **post-war** order.

2.8 PROBLEM PAIR (We do)

Your task: Analyze the following case using the apparatus above. Write your analysis before reading the model answer.

The case: The **Munich Agreement** (September 1938) was a settlement between Germany, Britain, France, and Italy that allowed Germany to annex the **Sudetenland** — a region of Czechoslovakia with a large ethnic German population. Czechoslovakia was **not invited** to the negotiations; it was presented with the agreement and forced to accept it. The agreement was presented as a **triumph** of diplomacy — "peace for our time," in the words of British Prime Minister Neville Chamberlain. But it **failed** to prevent the war; Hitler invaded the rest of Czechoslovakia in March 1939 and Poland in September 1939.

Your tasks:

1. State the puzzle precisely: why did Britain and France **appease** Hitler at Munich, despite the obvious risks?
2. Apply the **strategic** explanation: what were the strategic calculations behind appeasement? (The memory of the First World War, the fear of another catastrophic war, the belief that Germany's grievances were legitimate, the hope that Hitler could be satisfied.)
3. Apply the **normative** explanation: how did appeasement reflect the **collapse of the liberal order**? (The failure of collective security, the erosion of the rule of law, the abandonment of Czechoslovakia.)
4. Apply the **African** perspective: how does the Munich Agreement look from the perspective of the colonized world? (The same powers that appeased Hitler were the colonial powers; the same powers that abandoned Czechoslovakia had colonized Africa and Asia.)
5. Apply the **Chinese** perspective: how does the Munich Agreement look from the perspective of China? (The same powers that appeased Hitler in Europe appeased Japan in Asia; the same powers that abandoned Czechoslovakia had abandoned China at Versailles.)
6. Write a 300-word adjudication: is the Munich Agreement best understood as a **strategic failure**, a **normative failure**, or a **Western betrayal** — or all three?

Model answer (compare after writing your own):

Puzzle: Why did Britain and France appease Hitler at Munich?

The strategic explanation: The strategic calculations behind appeasement were complex:

- **The memory of the First World War.** Britain and France had suffered enormous casualties in the First World War — an estimated 1.1 million British and 1.4 million French deaths. The memory of the war produced a **deep reluctance** to risk another conflict. The policy of appeasement was driven by the fear of another catastrophic war.
- **The fear of another war.** Britain and France were **militarily unprepared** for war in 1938. The British army was small; the French army was defensively oriented; and neither country had the capacity to launch an offensive against Germany. The **military balance** favored Germany, and the Western powers were unwilling to risk a war they might lose.
- **The belief that Germany's grievances were legitimate.** Many British and French leaders believed that the **Versailles settlement** was unfair to Germany — the war guilt clause, the reparations, the territorial losses. They believed that Hitler's demands were **legitimate** — the Sudetenland had a large ethnic German population, and the principle of **self-determination** seemed to support Germany's claim.

- **The hope that Hitler could be satisfied.** Chamberlain believed that Hitler was a **rational** actor who could be **satisfied** by concessions. The Munich Agreement was based on the hope that if Hitler's **legitimate** grievances were addressed, he would become a **status quo** power.

The normative explanation: Appeasement reflected the **collapse of the liberal order**:

- **The failure of collective security.** The League of Nations had failed to respond to aggression in Manchuria and Abyssinia. The Western powers had **lost faith** in collective security, and they were unwilling to rely on the League to protect Czechoslovakia.
- **The erosion of the rule of law.** The Munich Agreement was a **violation** of international law — it **dismembered** a sovereign state without its consent. The Western powers **abandoned** the principle of collective security and the rule of law in favor of **great-power bargaining**.
- **The abandonment of Czechoslovakia.** Czechoslovakia was a **democratic** state and a **member** of the League of Nations. Its **abandonment** by the Western powers was a **betrayal** of the principles that the Western powers claimed to uphold.

The African perspective: The Munich Agreement looks **very different** from the perspective of the colonized world:

- **The same powers that appeased Hitler were the colonial powers.** Britain and France were the **largest** colonial empires in the world. They had **colonized** Africa and Asia, and they had **denied** self-determination to millions of people. Their **defence** of Czechoslovakia — a **white** European state — contrasted sharply with their **indifference** to the colonized world.
- **The racial hierarchy of the international system.** The Munich Agreement confirmed the **racial hierarchy** of the international system — the Western powers were willing to **sacrifice** a **white** European state to preserve peace, but they had **no interest** in protecting **black** or **brown** states. The **Abyssinia Crisis** — the League's failure to protect Ethiopia — was a **parallel** case, and it was **ignored** at Munich.
- **The betrayal of Ethiopia.** The same powers that **abandoned** Czechoslovakia had **abandoned** Ethiopia. The African perspective emphasizes the **continuity** — the Western powers were **unwilling** to confront aggression when it threatened **non-white** states, and they were **willing** to sacrifice **white** states to preserve peace.

The Chinese perspective: The Munich Agreement looks **very different** from the perspective of China:

- **The same powers that appeased Hitler appeased Japan.** Britain and France had **appeased** Japan in Asia — they had **failed** to respond to the Japanese invasion of Manchuria (1931) and the invasion of China (1937). The **Munich Agreement** was a **parallel** case — the Western powers were willing to **sacrifice** a **weak** state to preserve peace.
- **The betrayal at Versailles.** The Chinese perspective emphasizes the **continuity** — the same powers that had **betrayed** China at Versailles (1919) were now **betraying** Czechoslovakia at Munich (1938). The Western powers had **never** been committed to **justice**; they were committed to their own **interests**.
- **The centrality of the Asian theater.** The Chinese perspective emphasizes that the **Second World War** began in **Asia** — the Japanese invasion of Manchuria (1931) and the invasion of China (1937) — before it began in **Europe** (1939). The Western narrative **ignores** this, and it **underrecognizes** China's contribution to the Allied victory.

Adjudication: The Munich Agreement is **all three** — a strategic failure, a normative failure, and a Western

betrayal:

- **Strategic failure:** Appeasement **failed** to prevent the war. It **encouraged** Hitler's expansionism, **undermined** the Western powers' credibility, and **delayed** the rearmament that was necessary to confront Germany.
- **Normative failure:** Appeasement **violated** the principles of collective security, the rule of law, and self-determination. It **abandoned** a democratic state to a totalitarian aggressor.
- **Western betrayal:** Appeasement reflected the **racial hierarchy** of the international system. The Western powers were willing to **sacrifice** a **white** European state to preserve peace, but they had **no interest** in protecting **black** or **brown** states. The Munich Agreement was a **continuity** — the same powers that had **colonized** Africa and Asia, that had **betrayed** Ethiopia, and that had **betrayed** China were now **betraying** Czechoslovakia.

A complete explanation combines all three: Munich was a **strategic failure** that **reflected** the **normative** collapse of the liberal order and the **racial** hierarchy of the international system. The "lessons of Munich" — the idea that appeasement produces war — are **necessary** but **insufficient**; they **ignore** the colonial and racial dimensions of the crisis.

2.9 INDEPENDENT MEMO (You do)

Produce a one-page analytical memo (500–600 words) on the following case, using the four headings below.

Case: The **Paris Peace Conference** (1919) and the **mandate system**. The conference established the League of Nations, imposed the Treaty of Versailles on Germany, and created the mandate system for the former German and Ottoman territories. The mandate system placed these territories under the "tutelage" of "advanced nations" — Britain, France, Belgium, South Africa, Australia, New Zealand, and Japan — who were supposed to prepare them for self-government. The mandates were classified into A, B, and C categories, with different levels of "readiness" for independence.

Memo headings:

1. **Mechanism:** How did the mandate system function as a **continuation** of colonial rule under a new name? What was the legal mechanism, and what did it authorize?
2. **The constitutive outside:** How did the mandate system **constitute** the sovereignty of the "advanced nations" by denying it to the "peoples not yet able to stand by themselves"?
3. **Perspective reconstruction:** How would each of the five perspectives interpret the mandate system? (African, Chinese, Russian, Western, UN — one paragraph each or a table.)
4. **Falsifiers:** What evidence would show that the mandate system was **not** a continuation of colonial rule? What would show that it **was**?

Self-check: Does your memo distinguish the **stated goals** of the mandate system (tutelage, preparation for self-government) from its **function** (legitimation of colonial rule)? Does it identify the **racial hierarchy** that structured the system?

2.10 HINGE QUESTION

A scholar argues: "The League of Nations failed because the United States never joined, and because the great powers were unwilling to enforce its decisions. The League's failure was a failure of **political will**, not a failure of **design**." Which claim does this argument support?

- A) The League's design was sound; the problem was the lack of political will
- B) The League's design was flawed; the absence of the US was a fatal flaw
- C) The League's failure was inevitable
- D) The League's failure was caused by the rise of fascism

Answer: A. The argument claims that the League's failure was a **failure of political will**, not a failure of **design**. The scholar acknowledges the absence of the US and the unwillingness of the great powers — but argues that these were **political** choices, not **design** flaws.

If you answered B: The argument claims the **opposite** — that the design was sound, but the political will was lacking. **If you answered C:** The argument does **not** claim that the failure was inevitable; it claims that the failure was a **choice** — the great powers **could** have enforced the League's decisions, but they **chose** not to. **If you answered D:** The argument does **not** focus on the rise of fascism; it focuses on the **political will** of the great powers.

SECTION 2A — DATA LAB (30–45 minutes)

Purpose: Ground the lesson's concepts in empirical data on the interwar period.

Task: Using the summary data below, analyze the relationship between the League of Nations and the interwar crisis.

Table 1: League of Nations membership, selected years

Year	Number of member states	Key events
1920	42	Founding members; US not a member
1926	55	Germany admitted
1934	58	Soviet Union admitted
1935	58	Italy invades Ethiopia
1936	57	Italy withdraws
1938	56	Germany withdraws
1939	54	Soviet Union expelled

Table 2: League of Nations sanctions, 1935–36 (Abyssinia Crisis)

Good	Sanctioned?	Reason
Arms	Yes	Prohibited to both Italy and Ethiopia
Rubber	Yes	
Tin	Yes	

Good	Sanctioned?	Reason
Oil	No	US not a member; fear of provoking Italy
Coal	No	Fear of provoking Italy
Steel	No	Fear of provoking Italy

Table 3: Territorial changes, 1919–1939

Year	Event	Territory	Aggressor	Response
1931	Manchurian Crisis	Manchuria	Japan	League condemns; Japan withdraws
1935	Abyssinia Crisis	Ethiopia	Italy	Limited sanctions; Italy completes conquest
1936	Remilitarization of the Rhineland	Rhineland	Germany	No response
1938	Anschluss	Austria	Germany	No response
1938	Munich Agreement	Sudetenland	Germany	Britain and France agree
1939	Invasion of Poland	Poland	Germany	Britain and France declare war

Analysis questions:

1. **Membership:** What does the membership data suggest about the **universality** of the League? Which key powers were absent, and what was the consequence?
2. **Sanctions:** What does the sanctions data suggest about the **effectiveness** of the League's sanctions? Why were oil, coal, and steel excluded, and what does that tell us about the **political will** of the great powers?
3. **Territorial changes:** What does the data on territorial changes suggest about the **pattern** of aggression in the 1930s? Why did the League respond to some cases and not others? What role did **great-power interests** play?
4. **Perspective:** How would each of the five perspectives interpret the data? (African: Abyssinia as a turning point; Chinese: Manchuria as a parallel; Russian: Western hypocrisy; Western: failure of collective security; UN: lessons for the UN.)
5. **Limitation:** What does the data **not** tell you? (Hint: it does not capture the **experience** of the victims; it does not measure the **legacies** of the interwar period; and it does not distinguish between **formal** and **informal** responses.)

Rule: Complete the data lab before the independent memo.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Task: Draw the following by hand.

Visual 1: The cascade of failures. Draw a flow diagram: Economic failure (reparations, Depression) → Political failure (rise of fascism) → Strategic failure (appeasement) → Normative failure (collapse of collective security) → Second World War. Draw arrows showing how each failure **reinforces** the next.

Visual 2: The League's design flaws. Draw a four-part diagram: Absence of the US, Lack of enforcement, Exclusion of defeated powers, Contradiction between universalism and imperialism. For each, write a one-line explanation and one example of how it undermined the League.

Visual 3: The five perspectives on the interwar period. Draw a five-column table (African, Chinese, Russian, Western, UN) with rows: "Stance toward Versailles," "Stance toward the League," "Key contribution," "Key occlusion."

SECTION 4 — CORNELL NOTES

Set up your notes with the following cue column:

Cue column	Notes
Why did the Concert of Europe collapse?	Alliance system; military planning; breakdown of consultation; imperial competition
What was the imperial dimension of WWI?	Colonial troops; colonial labor; colonial battles; colonial resources
What was the Versailles settlement?	Punitive terms on Germany; mandate system; silences on self-determination and racial equality
What was the mandate system?	Continuation of colonial rule under a new name; A, B, C mandates; accountability to the League, not to local populations
Why did the League fail?	Absence of the US; lack of enforcement; exclusion of defeated powers; unanimity rule; contradiction between universalism and imperialism
What was the interwar crisis?	Cascade of failures: economic (reparations, Depression), political (rise of fascism), strategic (appeasement), normative (collapse of collective security)
What was the Abyssinia Crisis?	Italy invades Ethiopia; League imposes limited sanctions; Ethiopia betrayed; turning point for African attitudes
What was the Munich Agreement?	Britain and France appease Hitler; Czechoslovakia abandoned; "peace for our time"; failed to prevent war
How do the five perspectives interpret the interwar period?	African: betrayal + decolonization; Chinese: betrayal at Versailles + centrality of Asian theater; Russian: Bolshevik critique + Soviet role; Western: failure of the League + lessons of Munich; UN: lessons of the League + normative benchmark

Cue column	Notes
Source log	Lesson text, Sections 2.2–2.6; E. H. Carr (1939); A. J. P. Taylor (1961); Paul Kennedy (1987); Adam Tooze (2014); Zara Steiner (2005); Mark Mazower (1997); Susan Pedersen (2015); Antony Anghie (2005); Siba Grovogui (1996); the Covenant of the League of Nations; the Treaty of Versailles; the Hoare-Laval Pact; the Munich Agreement
Summary	3–5 sentences synthesizing the lesson

SECTION 5 — FEYNMAN COMPRESSION

Step 1: Explain why the League of Nations failed to prevent the Second World War to a smart non-specialist in 200–250 words, without using jargon. If you must use "collective security," "sanctions," or "appeasement," define them in plain language.

Step 2: Mark every point where you hesitated or used a term you could not define.

Step 3: Reread only the gaps. Rewrite.

Step 4: Produce one analogy for the League of Nations. Then state where the analogy breaks down. (Example: "The League of Nations was like a fire department that had no fire trucks, no water, and no authority to enter a burning building — it could only send letters asking the fire to stop." Where it breaks down: unlike a fire department, the League was not **designed** to fail; it was designed to be a **great-power management system**, and its failure was a **political choice**, not an inevitability.)

SECTION 6 — SPACED-REPETITION FLASHCARDS

Produce 12–15 cards. Use the following types:

Type	Example
Definition	What was the mandate system?
Mechanism	How did the League's design flaws undermine its effectiveness?
Application	Italy invades Ethiopia; the League imposes limited sanctions. Which crisis does this illustrate?
Comparison	How did the Abyssinia Crisis and the Manchurian Crisis differ in their outcomes?
Source	What did A. J. P. Taylor argue about the origins of the Second World War?
Debate	What is the strongest objection to the claim that appeasement caused the Second World War?

Type	Example
Reconstruction	How would an African scholar interpret the Abyssinia Crisis?
Occlusion	What does the standard narrative of the interwar period fail to see about the colonial world?
Adjudication	Which perspective best explains the failure of the League in Abyssinia, and what does it miss?
Visual	Label the four design flaws of the League of Nations on a diagram.

Tag each card: `L11`, `interwar`, `League of Nations`, `Versailles`, `appeasement`, `perspective`, `difficulty`.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence audit

Rate confidence (0–100%) before checking:

Objective	Confidence
Reconstruct the collapse of the Concert and the imperial dimension of WWI	
Analyze the Versailles settlement and the mandate system	
Explain the failure of the League of Nations	
Reconstruct the interwar crisis as a cascade of failures	
Reconstruct the five perspectives on the interwar period	

After exercises, rate accuracy. Calculate the gap.

7.2 Three-question debrief

1. What did I misunderstand about the relationship between the League's design and the political will of the great powers?
2. Which perspective was easiest to reconstruct? Which was hardest? What does that suggest about my default analytical style?
3. What will I do differently in Lesson 12?

7.3 Error log

Date	Lesson	Error type	Correct understanding	Card created?
	L11			

SECTION 8 — CHEATSHEET (Module 2)

Add this row to your Module 2 cheatsheet:

Column	Content
Core concepts	Collective security; the alliance system; the July Crisis; war guilt; reparations; self-determination; the mandate system; the Covenant of the League; the Council; the Assembly; sanctions; the Hoare-Laval Pact; appeasement; the Munich Agreement; the Molotov-Ribbentrop Pact; the "lessons of Munich"; the "lessons of the League"
Key mechanisms	Rigid alliance system + military planning + breakdown of consultation → WWI; punitive terms + mandate system + silences → Versailles; absence of US + lack of enforcement + exclusion of defeated powers + unanimity rule + contradiction between universalism and imperialism → League failure; economic + political + strategic + normative failures → interwar crisis → WWII
Theories and authors	E. H. Carr (1939); A. J. P. Taylor (1961); Paul Kennedy (1987); Adam Tooze (2014); Zara Steiner (2005); Mark Mazower (1997); Susan Pedersen (2015); Antony Anghie (2005); Siba Grovogui (1996)
Cases and evidence	WWI (1914–18); Versailles (1919); Manchurian Crisis (1931–33); Abyssinia Crisis (1935–36); Rhineland (1936); Munich (1938); invasion of Poland (1939)
Debates	Was the League doomed from the start? Was appeasement a failure of strategy or of will? Was the Second World War a European war or a global war?
Falsifiers	What evidence would show that the League was **not** doomed from the start? What would show that appeasement **could** have worked?

Column	Content
Cross-links	L10 (Concert of Europe); L12 (Cold War and decolonization); L21 (nuclear deterrence — lessons of the interwar period); L27 (African colonial state formation); L35 (post-Soviet ontology — lessons of 1938); L41 (West Asian state system — mandate legacy); L45 (nuclear proliferation — lessons of the 1930s)

SECTION 9 — REVIEW SCHEDULE

Review	Timing	Format
R1	Today	Retrieval warm-up + card creation
R2	2–3 days	Cue-column recall + hinge variant
R3	1 week	Mixed quiz with L1–L11 cards
R4	3–4 weeks	Interleaved problem combining L11 with L12 (Cold War and decolonization) and L21 (nuclear deterrence)
R5	End of Module 2	Cheatsheet reconstruction from memory

SECTION 10 — COMPLETION CHECKLIST

- ☐ Retrieval warm-up completed from memory
- ☐ Five learning objectives read and understood
- ☐ Five key ideas studied with mechanisms and scope conditions
- ☐ Perspective comparison matrix filled from memory, then checked
- ☐ Worked example (Abyssinia Crisis) studied and self-explained
- ☐ Problem pair (Munich Agreement) attempted and compared
- ☐ Independent memo produced (500–600 words)
- ☐ Hinge question answered correctly (or reteaching completed)
- ☐ Data lab completed before independent memo
- ☐ Three dual-coded visuals drawn
- ☐ Cornell notes with cue column, source log, and summary
- ☐ Feynman explanation written, gaps identified, rewritten
- ☐ 12–15 flashcards created with tags
- ☐ Confidence audit and error-log entry

☐ Cheatsheet entry added
☐ R2 review scheduled

FURTHER READING (Optional — for deepening, not required)

- **On the First World War and the collapse of the Concert:** Paul Kennedy, *The Rise and Fall of the Great Powers* (1987), ch. 5; Fritz Fischer, *Germany's Aims in the First World War* (1961); Christopher Clark, *The Sleepwalkers* (2012); Margaret MacMillan, *The War That Ended Peace* (2013).
- **On Versailles and the mandate system:** Margaret MacMillan, *Paris 1919* (2001); Antony Anghie, *Imperialism, Sovereignty and the Making of International Law* (2005), ch. 3; Susan Pedersen, *The Guardians* (2015); the Treaty of Versailles; the Covenant of the League of Nations.
- **On the League of Nations:** E. H. Carr, *The Twenty Years' Crisis* (1939); Zara Steiner, *The Lights That Failed* (2005); Mark Mazower, *Governing the World* (2012); the Covenant of the League of Nations.
- **On the interwar crisis:** Adam Tooze, *The Deluge* (2014); A. J. P. Taylor, *The Origins of the Second World War* (1961); Ian Kershaw, *Hitler* (1998–2000); the Munich Agreement; the Hoare-Laval Pact.
- **On the African perspective:** Siba Grovogui, *Sovereigns, Quasi-Sovereigns, and Africans* (1996); Walter Rodney, *How Europe Underdeveloped Africa* (1972); Kwame Nkrumah, *Neo-Colonialism: The Last Stage of Imperialism* (1965); the Abyssinia Crisis in African historiography.
- **On the Chinese perspective:** Zheng Wang, *Never Forget National Humiliation* (2012); Rana Mitter, *Forgotten Ally* (2013); the May Fourth Movement (1919).
- **On the Russian perspective:** Lenin, *Imperialism, the Highest Stage of Capitalism* (1917); the Comintern documents; the Molotov-Ribbentrop Pact (1939); Russian narratives of the Great Patriotic War.
- **On the UN perspective:** the UN Charter; the Universal Declaration of Human Rights (1948); the Genocide Convention (1948); the 1960 Declaration on the Granting of Independence to Colonial Countries and Peoples; the *Pact for the Future* (2024).

End of Lesson 11. Say **"Next"** when you are ready for Lesson 12 (Cold War Bipolarity and Decolonization).

13. Cold War Bipolarity and Decolonization: The Superpower Contest and the Making of the Post-Colonial World

---

LESSON METADATA

Field	Entry
Lesson number and title	L12 — Cold War Bipolarity and Decolonization
Module	Module 2: Historical Architecture of International Order

Field	Entry
Prerequisites	L2 (UN Charter, AU Act); L5 (realism — bipolarity, extended deterrence); L6 (institutionalism — the UN system); L8 (post-colonialism, neo-colonialism); L10 (imperialism, Berlin Conference); L11 (World Wars, League, mandate system)
Interleaved links	Forward to L13 (post-Cold War liberal order), L21 (nuclear deterrence), L23 (asymmetric warfare), L27–28 (African state formation, Pan-Africanism), L31 (great-power competition in Africa), L35 (post-Soviet ontology), L47 (US–China rivalry as a new bipolarity), L48 (Indo-Pacific and alliance architecture)
Reading load	This lesson only. Optional further reading at the end.
Content channels	Canon (paraphrased and quoted); primary documents (Truman Doctrine, Kennan's Long Telegram, the Bandung Communiqué, the OAU Charter, Nkrumah's speeches, the Non-Aligned Movement Belgrade Declaration, quoted and analyzed); data lab (Cold War proxy conflicts, decolonization timeline, aid flows); five perspectives
Bloom ceiling	Evaluate (adjudicate between the Eurocentric and global Cold War narratives, and between the five perspectives on decolonization)
Estimated study time	8–10 hours including exercises

Note on self-containment: Every argument, quotation, and example you need is inside this document. Where I cite Westad, Gaddis, LaFeber, Gleijeses, Nkrumah, Nyerere, Cabral, Fanon, Schmidt, or any other scholar, I summarize the argument fully enough that you do not need the original to complete the lesson. "Further Reading" is optional.

SECTION 0 — Why This Lesson Exists

Lessons 9–11 reconstructed the collapse of the old European order — the Westphalian myth, the imperial partition, the failure of the League, and the catastrophe of the Second World War. This lesson reconstructs the order that emerged from that catastrophe: **the Cold War** — the bipolar contest between the United States and the Soviet Union that shaped international politics for nearly half a century — and **decolonization** — the wave of independence movements that transformed the political map of Africa and Asia.

These two histories are usually told separately. The Cold War is presented as a **European** story — the division

of Germany, NATO and the Warsaw Pact, nuclear deterrence, the Cuban Missile Crisis. Decolonization is presented as a **peripheral** story — the end of empire, the birth of new states, the problems of development. But they were **interconnected**. The Cold War was fought **in** the decolonizing world as much as in Europe — in Korea, Vietnam, Congo, Angola, Ethiopia, Afghanistan. And decolonization was shaped **by** the Cold War — the superpowers competed for the allegiance of the new states, and the new states used that competition to extract resources and autonomy.

Odd Arne Westad's *The Global Cold War* (2005) makes the revisionist argument: the Cold War was **primarily a conflict in and over the Third World** — a contest between two visions of modernity (capitalist and socialist) that was fought through intervention, proxy war, and development assistance in the decolonizing world. The European theater was important, but it was not the main event.

This lesson takes Westad's insight seriously. It reconstructs the Cold War as a **global** conflict, with Africa as a central theater. It reconstructs decolonization as a **world-historical** process, shaped by the superpowers but also shaped by the **agency** of the decolonizing states themselves.

The African perspective is primary because Africa was one of the most contested theaters of the Cold War, and because African leaders — Nkrumah, Nyerere, Cabral, Fanon — developed **distinctive** theories of international politics that shaped the post-colonial world.

This lesson has five key ideas:

1. **The Cold War was a bipolar system**, but bipolarity was not just a structural condition — it was a **contest between two models of modernity**.
2. **Decolonization transformed the international system** — the number of states quadrupled, the composition of the UN changed, and the racial hierarchy of the international order was challenged.
3. **The superpowers competed in the decolonizing world**, but the decolonizing states were not passive — they exercised **agency** through non-alignment, multi-alignment, and the exploitation of superpower rivalry.
4. **The Cold War and decolonization were entangled** — the superpowers shaped decolonization, and decolonization shaped the Cold War.
5. **The five perspectives** on the Cold War and decolonization — African (primary), Chinese, Russian, Western, and UN — and the **adjudication** among them.

By the end, you can take any claim about the Cold War — "the Cold War was a European conflict," "decolonization was a product of the Cold War," "the Non-Aligned Movement was a failure" — and answer: *Whose Cold War? Whose decolonization? Whose agency? And how do the five perspectives reconstruct it?*

SECTION 1 — PRE-CLASS PRIMING

1.1 Retrieval warm-up (from memory)

1. From L5: What is bipolarity, and how does structural realism explain its stability?
2. From L11: Why did the League of Nations fail, and what were the "lessons of the League" that shaped the UN?
3. From L11: What was the mandate system, and how did it continue colonial rule under a new name?
4. From L8: What is neo-colonialism, and who developed the concept?

Check against the previous lessons before proceeding.

1.2 Orientation questions

Hold these in mind:

- Was the Cold War primarily a European conflict or a global one?
- Did the superpowers control the decolonizing world, or did the decolonizing world shape the superpowers?
- Was the Non-Aligned Movement a genuine third force or a failure?
- How did African leaders understand the Cold War, and what did they try to do about it?

1.3 Vocabulary pre-teach

Provisional definitions; revise by the end:

Bipolarity; superpower; containment; the Truman Doctrine; the Marshall Plan; NATO; the Warsaw Pact; mutually assured destruction (MAD); extended deterrence; proxy war; the domino theory; rollback; peaceful coexistence; the Non-Aligned Movement; the Bandung Conference; Afro-Asian solidarity; Pan-Africanism; the OAU; neo-colonialism; Ujamaa; the Frontline States; the Congo Crisis; the Suez Crisis; the Cuban Missile Crisis; détente; the Second Cold War; the "Year of Africa."

SECTION 2 — LESSON CORE

2.1 Learning objectives

By the end of this lesson, you can:

1. **Reconstruct** the Cold War as a bipolar system and as a contest between two models of modernity, and explain how these two accounts differ.
2. **Analyze** decolonization as a transformation of the international system — the quadrupling of states, the entry of the Global South into the UN, and the challenge to the racial hierarchy of the international order.
3. **Explain** how the superpowers competed in the decolonizing world, and how the decolonizing states exercised **agency** through non-alignment and multi-alignment.
4. **Reconstruct** the entanglement of the Cold War and decolonization, using Africa as a central case.
5. **Reconstruct** how African, Chinese, Russian, Western, and UN traditions interpret the Cold War and decolonization, and **adjudicate** among them on a specific case.

2.2 KEY IDEA 1 — The Cold War was a bipolar system, but bipolarity was a contest between two models of modernity

The claim: The Cold War is often described as a **bipolar system** — a distribution of power in which two superpowers dominated the international system. This is a structural description. But it is incomplete. The Cold War was also a **contest between two models of modernity** — the American model of liberal capitalism

and the Soviet model of state socialism — each of which claimed to offer a path to development and freedom. The contest was **ideological** as much as **material**, and it was fought in the **decolonizing world** as much as in Europe.

The structural account. The structural realist account — particularly Kenneth Waltz's — emphasizes **polarity**. The Cold War was a bipolar system, with two superpowers (the US and the USSR) dominating the international system. The bipolar structure was more **stable** than multipolarity, because the two superpowers could manage their competition, and because the balance of power was simpler. The nuclear dimension — **mutual assured destruction (MAD)** — made direct war between the superpowers **unthinkable**, which paradoxically made the system more stable.

The limits of the structural account. The structural account explains **why** the Cold War was stable, but it does not explain **what** the Cold War was about. The US and the USSR were not just two powers competing for power; they were two **models** of society, each claiming to be the path to the future. The contest was:

- **Ideological:** Capitalism vs. socialism; democracy vs. one-party rule; freedom vs. equality.
- **Economic:** The Marshall Plan and the Bretton Woods system vs. the Comecon and the socialist planned economy.
- **Developmental:** The American model of modernization vs. the Soviet model of socialist industrialization.
- **Civilizational:** The "Free World" vs. the "Socialist Camp."

The global Cold War. Westad's revisionist account argues that the Cold War was **primarily a conflict in and over the Third World**. The US and the USSR each sought to **export** their models of modernity to the decolonizing world — through development aid, military assistance, education, and propaganda. The contest was not just about power; it was about **what kind of society the new states would build**. This is why the Cold War was fought in Korea, Vietnam, Congo, Angola, Ethiopia, and Afghanistan — not just in Europe.

The origins of the Cold War. The standard account traces the Cold War to the **breakdown of the wartime alliance** — the US and the USSR had been allies during the Second World War, but their cooperation collapsed after 1945. The **Truman Doctrine** (March 1947) — the commitment to "support free peoples who are resisting attempted subjugation by armed minorities or by outside pressures" — is often cited as the founding moment of the Cold War. The **Marshall Plan** (1947) — the massive American aid program for Europe — was the economic dimension. The **Berlin Blockade** (1948–49) — the Soviet attempt to cut off West Berlin — was the first major crisis.

The **Soviet perspective** traces the Cold War to the **American desire for global hegemony** and the **Soviet need for security** after the devastation of the Second World War. The Soviet Union had suffered enormously — an estimated 27 million deaths — and it sought to create a **buffer zone** in Eastern Europe to prevent future invasions. The US interpreted the Soviet buffer as **expansionism**, and the Cold War was the result.

The "Long Telegram" and containment. George Kennan's "Long Telegram" (February 1946) — a diplomatic cable from Moscow to Washington — articulated the **containment** doctrine. Kennan argued that the Soviet Union was inherently **expansionist** and that the US should adopt a policy of "patient but firm and vigilant containment of Russian expansive tendencies." Containment became the organizing principle of American Cold War policy — but it was interpreted differently by different administrations. Some emphasized **military containment** (NATO, nuclear deterrence, the arms race); others emphasized **economic and**

political containment (the Marshall Plan, support for democratic institutions).

The "bipolar" system. The Cold War produced a distinctive international order:

- **Two blocs:** NATO (1949) and the Warsaw Pact (1955).
- **Nuclear arms race:** MAD, the nuclear triad, arms control agreements (SALT, START).
- **Proxy wars:** Korea (1950–53), Vietnam (1955–75), Angola (1975–2002), Afghanistan (1979–89).
- **Alliances and client states:** The superpowers competed for allies in the decolonizing world, often through military aid, economic assistance, and covert action.
- **Institutions:** The UN, the Bretton Woods institutions, and the two blocs' own institutions (NATO, Warsaw Pact, Comecon).

What this contributes: It shows that the Cold War was not just a structural condition (bipolarity) but a **contest of ideas and models** — and that contest was fought globally, not just in Europe.

What it occludes: It can underplay the **agency** of the decolonizing states — the ways in which they shaped the Cold War, not just were shaped by it. It can also underplay the **diversity** of the Cold War — different regions experienced it differently.

Observable implication. If the Cold War was a contest between two models of modernity, you should see (a) **ideological** competition — the export of models of development and governance, (b) **material** competition — aid, investment, military assistance, and (c) **intervention** — the superpowers intervening in the decolonizing world to shape its political and economic orientation.

2.3 KEY IDEA 2 — Decolonization transformed the international system

The claim: Decolonization was one of the most important transformations of the international system in the twentieth century. It **quadrupled** the number of states, changed the composition of the UN, and challenged the **racial hierarchy** of the international order. It was not a gift from the colonial powers; it was won through **struggle** — nationalist movements, anti-colonial wars, mass protests, and international diplomacy.

The facts of decolonization. Between 1945 and 1975, more than **80** former colonies became independent states:

- **Asia:** India and Pakistan (1947), Indonesia (1949), Vietnam (1954, after the defeat of France at Dien Bien Phu), Malaya (1957), and others.
- **Africa:** Ghana (1957) was the first sub-Saharan African colony to gain independence. In 1960 — the **"Year of Africa"** — 17 African states became independent: Cameroon, Togo, Senegal, Mali, Madagascar, Somalia, Benin, Niger, Burkina Faso, Côte d'Ivoire, Chad, Central African Republic, Congo-Brazzaville, Gabon, Nigeria, Mauritania, and the Congo (Kinshasa).
- **The Caribbean and Pacific:** Jamaica (1962), Trinidad and Tobago (1962), Fiji (1970), and others.

The causes of decolonization. Decolonization was not a single process with a single cause. It was the product of:

1. **The weakening of the colonial powers.** The Second World War **devastated** Britain and France — economically, militarily, and morally. The war had exposed the **hypocrisy** of the colonial powers — they had fought for freedom and democracy while denying it to their colonies. The war had also

mobilized colonial peoples — African and Asian soldiers had fought for the Allies, and they returned home with new expectations.

2. **The rise of nationalist movements.** Anti-colonial movements had been growing since the early twentieth century — the Indian National Congress, the African National Congress, the Pan-African movement. The war **accelerated** their growth — the Atlantic Charter (1941) promised self-determination, and the UN Charter (1945) affirmed the principle of "equal rights and self-determination of peoples."
3. **The Cold War.** The superpowers **competed** for the allegiance of the decolonizing world, and both the US and the USSR **opposed** European colonialism — the US because it was ideologically committed to anti-colonialism (and because it wanted access to markets and resources), the USSR because it saw anti-colonialism as part of the global struggle against capitalism. The superpowers **pressured** the colonial powers to decolonize — the US threatened to withdraw Marshall Plan aid from Britain and France during the Suez Crisis (1956), and the USSR supported anti-colonial movements.
4. **International institutions.** The UN became a **platform** for anti-colonial diplomacy. The General Assembly's 1960 **Declaration on the Granting of Independence to Colonial Countries and Peoples** affirmed the right of all peoples to self-determination. The UN's **trusteeship system** (which replaced the mandate system) was designed to prepare the colonies for self-government.
5. **The costs of empire.** The colonial powers realized that maintaining empires was becoming **too costly** — economically, politically, and militarily. The Algerian War (1954–62) — one of the bloodiest anti-colonial wars — convinced France that empire was no longer sustainable. The Mau Mau rebellion in Kenya (1952–60) convinced Britain that colonial rule was a **liability**.

The transformation of the international system. Decolonization transformed the international system in several ways:

1. **The number of states quadrupled.** In 1945, the UN had 51 members. By 1975, it had 144. The new states were mostly in Africa and Asia, and they changed the **composition** of the UN — from a Western-dominated club to a more diverse assembly.
2. **The racial hierarchy was challenged.** The colonial order had been based on a **racial hierarchy** — the "civilized" nations above the "savage" ones. Decolonization challenged this hierarchy — the new states claimed **equal sovereignty** and demanded **equal treatment**.
3. **The agenda of the UN changed.** The new states brought new issues to the UN — **development**, **decolonization**, **apartheid**, **racism**, and the **New International Economic Order (NIEO)**. The UN became a site of **North–South** conflict, not just East–West conflict.
4. **The Cold War became global.** Decolonization **extended** the Cold War to the new states — the superpowers competed for their allegiance, and the new states became **sites** of superpower competition.

The African experience. Africa was at the center of decolonization:

- **Ghana (1957)** was the first sub-Saharan African colony to gain independence. Its leader, **Kwame Nkrumah**, became a leading advocate of **Pan-Africanism** and **non-alignment**.
- **The Congo (1960)** became independent amid a **crisis** — the secession of Katanga, the assassination of Patrice Lumumba, and the intervention of the UN and the superpowers.
- **The OAU (1963)** was founded by 32 independent African states. It enshrined the principles of **sovereignty**, **non-interference**, and **anti-colonialism**.
- **The Frontline States** (Angola, Botswana, Mozambique, Tanzania, Zambia, Zimbabwe) became a **regional bloc** that supported the liberation struggles in southern Africa — against Portuguese colo-

nialism in Angola and Mozambique, and against apartheid in South Africa.

What this contributes: It shows that decolonization was a **world-historical** transformation — it changed the composition of the international system, challenged the racial hierarchy, and created new sites of contestation.

What it occludes: It can underplay the **violence** of decolonization — the wars of liberation, the massacres, the displacement of populations. It can also underplay the **continuities** — the colonial borders, the extractive institutions, the economic dependency that persisted after independence.

Observable implication. If decolonization transformed the international system, you should see (a) the **quadrupling** of states, (b) the **changed composition** of the UN, and (c) the **new agenda** of the UN — development, decolonization, anti-apartheid.

2.4 KEY IDEA 3 — The superpowers competed in the decolonizing world, but the decolonizing states exercised agency

The claim: The standard narrative of the Cold War presents the decolonizing world as a **passive object** of superpower competition — the US and the USSR competed for influence, and the new states were **pawns** in the contest. This narrative is **wrong**. The decolonizing states exercised **agency** — they used the superpower competition to extract resources and autonomy, they formed their own institutions (the Non-Aligned Movement, the OAU), and they developed their own theories of international politics (Pan-Africanism, neocolonialism, Ujamaa).

The Non-Aligned Movement (NAM). The NAM was the most important expression of third-world agency:

- **The Bandung Conference (1955)** brought together 29 Asian and African states — including India, China, Indonesia, Egypt, Ghana (then the Gold Coast), and others. The conference affirmed the principles of **anti-colonialism**, **non-alignment**, **sovereignty**, and **economic development**. It was a **landmark** — the first major gathering of post-colonial states, and a statement of their independence from both superpowers.
- **The Belgrade Conference (1961)** formally established the NAM, with 25 founding members — including India, Egypt, Ghana, Indonesia, and Yugoslavia. The NAM's principles were **non-alignment**, **anti-colonialism**, **peaceful coexistence**, and **economic development**.
- **The NAM's significance.** The NAM was not a **third bloc** — it was not a military alliance, and it did not have a unified ideology. But it was a **political force** — it gave the new states a **collective voice** in international affairs, and it **constrained** the superpowers' ability to intervene in the decolonizing world. The NAM's principles — sovereignty, non-interference, anti-colonialism — shaped the **normative** framework of the post-colonial world.

Non-alignment as strategy. Non-alignment was not just an ideology; it was a **strategy**. The decolonizing states used non-alignment to:

- **Extract resources** from both superpowers — they accepted aid from both sides, and they played the superpowers against each other.
- **Preserve autonomy** — they resisted becoming **client states** of either superpower.
- **Build collective institutions** — they formed the NAM, the OAU, the G-77 (the Group of 77 developing countries), and other organizations to advance their collective interests.

The limits of non-alignment. Non-alignment was not always successful:

- **The superpowers did not always respect it.** The US and the USSR intervened in the decolonizing world — through covert action, military assistance, and direct intervention — to prevent the new states from aligning with the other side. The CIA's role in the overthrow of Mossadegh in Iran (1953), Arbenz in Guatemala (1954), and Lumumba in the Congo (1960–61) are examples.
- **The new states were often divided.** The NAM was not a unified bloc — its members had different interests, different ideologies, and different relationships with the superpowers. India and China, for example, were both founding members of the NAM, but they went to war in 1962.
- **The new states were often weak.** Many of the new states were **fragile** — they had weak institutions, artificial borders, and extractive economies. They were **vulnerable** to superpower pressure.

African agency. African states were particularly important in the NAM and in the construction of post-colonial international politics:

- **Nkrumah's Pan-Africanism.** Kwame Nkrumah, Ghana's first president, was a leading advocate of **Pan-Africanism** — the idea that African states should unite to achieve **political and economic independence**. His book *Neo-Colonialism: The Last Stage of Imperialism* (1965) argued that formal independence was not enough — the former colonial powers continued to dominate the new states through economic and political means. Nkrumah's solution was **African unity** — a united Africa would be able to resist neo-colonialism.
- **Nyerere's Ujamaa.** Julius Nyerere, Tanzania's first president, developed **Ujamaa** — a philosophy of African socialism based on traditional African communal values. Nyerere argued that African development should be based on **self-reliance** and **equality**, not on the capitalist model of the West or the state-socialist model of the Soviet Union. Tanzania became a **hub** for anti-colonial movements — the headquarters of the ANC, FRELIMO, and other liberation movements.
- **The OAU.** The Organization of African Unity (1963) was founded by 32 independent African states. It enshrined the principles of **sovereignty**, **non-interference**, and **anti-colonialism**. It was a **collective** institution that gave African states a voice in international affairs and supported the liberation struggles in southern Africa.

What this contributes: It shows that the decolonizing states were **not passive objects** of superpower competition. They were **actors** — they shaped the international order, they built institutions, and they developed their own theories of international politics.

What it occludes: It can underplay the **constraints** on third-world agency — the weakness of the new states, the pressure from the superpowers, and the divisions within the third world. It can also underplay the **failures** of third-world projects — the collapse of Ujamaa, the corruption of many post-colonial regimes, and the persistence of neo-colonial dependency.

Observable implication. If third-world agency was real, you should see (a) **non-alignment** — the new states refusing to align with either superpower, (b) **institution-building** — the NAM, the OAU, the G-77, and (c) **the exploitation of superpower rivalry** — the new states extracting resources from both sides.

2.5 KEY IDEA 4 — The Cold War and decolonization were entangled: Africa as a central theater

The claim: The Cold War and decolonization were not separate processes; they were **entangled**. The superpowers shaped decolonization — they competed for influence in the new states, and they intervened to prevent them from aligning with the other side. And decolonization shaped the Cold War — the new states changed the composition of the UN, challenged the racial hierarchy, and created new sites of superpower competition. Africa was a **central theater** of this entanglement.

The Congo Crisis (1960–65). The Congo Crisis is the paradigmatic case of the entanglement of the Cold War and decolonization:

- **The context.** The Congo became independent from Belgium on June 30, 1960. The independence was **rushed** — Belgium had not prepared the Congo for self-government, and the new state had only a handful of university graduates and no experienced administrators.
- **The crisis.** Within days of independence, the army **mutinied** against its Belgian officers. The province of **Katanga**, rich in copper and cobalt, **seceded** with Belgian support. The central government, led by **Patrice Lumumba**, appealed to the UN and the Soviet Union for help.
- **The UN intervention.** The UN Security Council authorized a peacekeeping mission (ONUC) to restore order and prevent the secession. But the mandate was **ambiguous** — was the UN supposed to **restore** the central government, or just **maintain** order? The UN's Secretary-General, Dag Hammarskjöld, interpreted the mandate as **neutral** — the UN would not take sides in the internal conflict.
- **The superpower intervention.** Lumumba, frustrated by the UN's neutrality, appealed to the Soviet Union for military assistance. The US, alarmed by the prospect of Soviet influence in the Congo, supported the **overthrow** of Lumumba. Lumumba was dismissed by President Kasa-Vubu in September 1960, and he was **assassinated** in January 1961, with the involvement of Belgian and American intelligence.
- **The aftermath.** The Congo became a **proxy war** — the US supported the central government (and later Mobutu Sese Seko, who seized power in 1965), while the Soviet Union and China supported rebel movements. The crisis ended with the **defeat** of the Katangese secession in 1963 and the **consolidation** of Mobutu's regime.

The African perspective on the Congo Crisis. African scholars emphasize that the Congo Crisis was a **turning point** in African attitudes toward the Cold War:

- **The betrayal of Lumumba.** Lumumba was a **Pan-Africanist** and a **non-aligned** leader. His assassination — with the involvement of the US and Belgium — confirmed African suspicions that the superpowers would **not tolerate** a genuinely independent African leader.
- **The UN's failure.** The UN's intervention in the Congo was **contested** — the UN was supposed to be a **neutral** peacekeeping force, but it became **involved** in the internal conflict, and it failed to protect Lumumba. The crisis exposed the **limits** of UN peacekeeping and the **influence** of the superpowers on the UN.
- **The lesson for African states.** The Congo Crisis taught African states that **non-alignment** was **dangerous** — the superpowers would intervene to prevent it. This lesson shaped the OAU's **sovereignty** and **non-interference** principles — African states sought to **protect** themselves from superpower intervention by insisting on **absolute sovereignty**.

The Suez Crisis (1956). The Suez Crisis is another paradigmatic case:

- **The context.** Gamal Abdel Nasser, Egypt's president, nationalized the Suez Canal in July 1956, after the US and Britain withdrew funding for the Aswan High Dam.
- **The invasion.** Britain, France, and Israel **invaded** Egypt in October 1956, seeking to **retake** the canal and **overthrow** Nasser.
- **The superpower response.** The US and the USSR **both** condemned the invasion — the US because it was **furious** that its allies had acted without consulting it, and because it feared that the invasion would **drive** the Arab world toward the Soviet Union; the USSR because it saw an opportunity to **expand** its influence in the Middle East. The US pressured Britain and France to **withdraw**, and the USSR threatened **military intervention**.
- **The outcome.** The invasion **failed** — Britain and France withdrew, and Nasser **kept** the canal. The crisis was a **turning point** — it marked the **end** of Britain and France as **great powers**, and it established the US and the USSR as the **dominant** powers in the Middle East.

The African perspective on Suez. African scholars emphasize that the Suez Crisis was a **landmark** in the **decolonization** of Africa:

- **The defeat of the old colonial powers.** Britain and France — the two largest colonial empires — were **humiliated** by the US and the USSR. The crisis confirmed that the **old imperial order** was over, and that the **superpowers** were the new arbiters of international politics.
- **The rise of Nasser.** Nasser became a **hero** to the Arab world and to anti-colonial movements across Africa. His **nationalization** of the canal was a symbol of **sovereignty** and **dignity** — a post-colonial state **asserting** its independence against the old colonial powers.
- **The lesson for African states.** The Suez Crisis taught African states that **non-alignment** could **work** — Nasser had played the superpowers against each other, and he had **won**. The crisis shaped the **Non-Aligned Movement** — Nasser was one of its founding figures.

The Angolan Civil War (1975–2002). The Angolan Civil War was one of the **longest** and **deadliest** proxy wars of the Cold War:

- **The context.** Angola became independent from Portugal in 1975, after a **14-year** liberation war. Three movements competed for power: the **MPLA** (supported by the Soviet Union and Cuba), **UNITA** (supported by the US and South Africa), and the **FNLA** (supported by the US and Zaire).
- **The intervention.** The Soviet Union and Cuba **intervened** on behalf of the MPLA; the US and South Africa **intervened** on behalf of UNITA. The war became a **proxy** for the Cold War, and it lasted for **27 years** — until 2002.
- **The African perspective.** African scholars emphasize that the Angolan Civil War was a **tragedy** — a **proxy war** that **devastated** the country and **killed** an estimated 500,000 people. The war was **not** an Angolan conflict; it was a **superpower** conflict fought on Angolan soil. The lesson is that the **Cold War** had **devastating** consequences for Africa.

What this contributes: It shows that the Cold War and decolonization were **entangled** — the superpowers shaped decolonization, and decolonization shaped the Cold War. Africa was a **central theater** of this entanglement.

What it occludes: It can underplay the **agency** of African actors — the ways in which they shaped the Cold War, not just were shaped by it. It can also underplay the **diversity** of African experiences — different countries experienced the Cold War differently.

Observable implication. If the Cold War and decolonization were entangled, you should see (a) **superpower intervention** in the decolonizing world, (b) **proxy wars** in the new states, and (c) **African agency** in shaping the Cold War.

2.6 KEY IDEA 5 — The five perspectives interpret the Cold War and decolonization differently, and each interpretation is political

The claim: The Cold War and decolonization are not neutral historical objects. They are **contested** historical legacies, and the five perspectives — African, Chinese, Russian, Western, and UN — interpret them differently. Each interpretation reflects a different political project.

2.6.1 The African perspective (primary) **Core commitments.** African scholars and leaders interpret the Cold War and decolonization through the lens of **agency**, **neo-colonialism**, and **Pan-Africanism**:

1. **Agency.** African states were **not passive objects** of superpower competition. They exercised **agency** — they formed the NAM, the OAU, and other institutions; they pursued non-alignment; and they used the superpowers' rivalry to extract resources and autonomy.
2. **Neo-colonialism.** Formal independence did not end colonial exploitation. The former colonial powers continued to dominate the new states through economic and political means — through aid conditionality, trade agreements, and military assistance. Nkrumah's **neo-colonialism** is the key concept — the "last stage of imperialism."
3. **Pan-Africanism.** African unity was the **solution** to neo-colonialism. Nkrumah argued that a **united Africa** would be able to resist external domination. The OAU was a **first step** — but it was **limited** by its commitment to **sovereignty** and **non-interference**.
4. **The Cold War as a tragedy.** The Cold War had **devastating** consequences for Africa — proxy wars, assassinations, and the support of **dictators** (Mobutu, Doe, Bokassa) who served superpower interests. The African perspective emphasizes that the **victims** of the Cold War were disproportionately in the **Global South**.

The critique of the standard narrative. African scholars critique the standard narrative of the Cold War for being **Eurocentric** — it focuses on the US–Soviet rivalry in Europe, and it **ignores** the **devastating** consequences of the Cold War in Africa. The standard narrative treats Africa as a **footnote**, not as a **central theater**.

What this perspective contributes: It shows that the Cold War was **not** just a European conflict — it was a **global** conflict that had **devastating** consequences for Africa. It also shows that African states were **agents** — they shaped the Cold War, not just were shaped by it.

What it occludes: It can underplay the **failures** of African agency — the collapse of Ujamaa, the corruption of many post-colonial regimes, and the persistence of neo-colonial dependency. It can also underplay the **diversity** of African experiences — different countries experienced the Cold War differently.

2.6.2 The Chinese perspective **Core commitments.** China's engagement with the Cold War and decolonization is shaped by its own experience — the **Chinese Revolution** (1949), the **Sino-Soviet split** (1960s), and China's **rapprochement** with the US (1972).

1. **China as a third force.** China saw itself as a **leader** of the Third World — a **socialist** state that was **not** aligned with either superpower. The **Bandung Conference** (1955) was a **landmark** — China participated as a **leading** Asian power, and Zhou Enlai's diplomacy helped to **shape** the conference's principles.
2. **The Sino-Soviet split.** The split between China and the Soviet Union (1960s) was a **major** event in the Cold War — it **fragmented** the socialist camp and created a **third** pole. The Chinese perspective emphasizes that China was **not** a **satellite** of the Soviet Union — it pursued its **own** path to socialism.
3. **China and Africa.** China was a **major** supporter of African liberation movements — it provided **military** and **economic** assistance to movements in Angola, Mozambique, Zimbabwe, and elsewhere. The **Tanzania-Zambia Railway** (TAZARA, 1970–75) was a **flagship** project — a symbol of China's **solidarity** with Africa.
4. **The Chinese critique of the standard narrative.** Chinese scholars critique the standard narrative of the Cold War for **ignoring** China's role — China was a **major** power, and its **split** with the Soviet Union **shaped** the Cold War. The Chinese perspective also critiques the Western narrative for **downplaying** the **anti-colonial** dimension of the Cold War.

What this perspective contributes: It shows that the Cold War was **not** just a US–Soviet conflict — China was a **major** power, and its **split** with the Soviet Union **shaped** the Cold War. It also shows that China was a **leader** of the Third World — a **socialist** state that was **not** aligned with either superpower.

What it occludes: It can **underplay** China's **own** hegemonic ambitions — China's support for **revolutionary** movements was not **purely** altruistic; it was also a way to **expand** China's influence. It can also **underplay** the **failures** of China's development model — the Great Leap Forward (1958–62) caused a **famine** that killed an estimated 15–45 million people.

2.6.3 The Russian perspective **Core commitments.** Russia's engagement with the Cold War is shaped by its **Soviet legacy** — the **Great Patriotic War** (1941–45), the **Cold War rivalry** with the US, and the **collapse** of the Soviet Union (1991).

1. **The Soviet narrative of the Cold War.** The Soviet narrative emphasizes that the Cold War was **imposed** on the Soviet Union by the **aggressive** policies of the US and its allies. The Soviet Union had suffered **enormously** in the Second World War, and it sought to create a **buffer zone** in Eastern Europe to prevent future invasions. The US interpreted the Soviet buffer as **expansionism**, and the Cold War was the result.
2. **The Soviet role in decolonization.** The Soviet Union **supported** anti-colonial movements — it provided **military** and **economic** assistance to movements in Africa, Asia, and Latin America. The Soviet narrative emphasizes that the USSR was a **champion** of anti-colonialism — a **socialist** state that supported the **liberation** of the colonized world.
3. **The Sino-Soviet split.** The Russian perspective emphasizes that the Sino-Soviet split was a **tragedy** — it **fragmented** the socialist camp and **weakened** the struggle against imperialism. The Russian narrative **blames** China for the split — it argues that China's ** Maoist** ideology and **hegemonic** ambitions were the cause.
4. **The collapse of the Soviet Union.** The Russian perspective emphasizes that the collapse of the Soviet Union was a **catastrophe** — the "greatest geopolitical catastrophe of the twentieth century," in Putin's words. The collapse **ended** the Cold War, but it also **created** a **power vacuum** that the US **exploited** — through NATO expansion, the intervention in Yugoslavia, and the invasion of Iraq.

The critique of the standard narrative. Russian scholars critique the standard narrative of the Cold War for **demonizing** the Soviet Union — it **ignores** the Soviet Union's **security** concerns and its **contributions** to anti-colonialism. The Russian perspective also critiques the Western narrative for **downplaying** the role of the US in **starting** the Cold War.

What this perspective contributes: It shows that the Cold War was **not** a simple story of **good** vs. **evil** — the Soviet Union had **genuine** security concerns, and it made **genuine** contributions to anti-colonialism.

What it occludes: It can **justify** Soviet **aggression** — the invasion of Hungary (1956), Czechoslovakia (1968), and Afghanistan (1979). It can also **underplay** the **repression** of the Soviet regime — the Gulag, the suppression of dissent, and the **poverty** of the Soviet economy.

2.6.4 The Western perspective Core commitments. The Western tradition is the **home** of the standard narrative of the Cold War. The standard narrative emphasizes:

1. **The Cold War as a struggle between freedom and tyranny.** The US and its allies were **defending** freedom and democracy against **Soviet** totalitarianism. The Cold War was a **moral** struggle — a contest between **good** and **evil**.
2. **Containment as the correct strategy.** The US strategy of **containment** — preventing the expansion of Soviet influence — was the **right** response to Soviet **expansionism**. Containment **worked** — the Soviet Union collapsed, and the Cold War ended with a **Western** victory.
3. **The US as a benevolent hegemon.** The US provided **global public goods** — security, economic stability, and the **liberal** order. The US was a **benevolent** hegemon — it **supported** decolonization, **provided** development aid, and **promoted** democracy and human rights.
4. **The "end of history."** The collapse of the Soviet Union was a **vindication** of the Western model — liberal democracy and capitalism had **triumphed** over communism. Francis Fukuyama's "end of history" thesis (1989) captured this sentiment.

The revisionist critique. Western scholarship has also produced **revisionist** accounts of the Cold War:

- **The "revisionist" school** (William Appleman Williams, Gabriel Kolko) argued that the US was **not** a benevolent hegemon — it was an **imperial** power that sought to **expand** its economic and political influence. The Cold War was a **product** of American **expansionism**, not Soviet **aggression**.
- **The "post-revisionist" school** (John Lewis Gaddis, Ernest May) sought a **middle** ground — it acknowledged that **both** superpowers were **responsible** for the Cold War, and that the conflict was a **product** of **mutual** misperception and **security** dilemmas.
- **The "global Cold War" school** (Odd Arne Westad) argued that the Cold War was **primarily** a conflict in and over the **Third World** — it was a contest between **two models** of modernity, and it had **devastating** consequences for the Global South.

The silences. The Western narrative has been **slow** to acknowledge:

- **The US role in the overthrow of democratic governments** — Iran (1953), Guatemala (1954), Congo (1960–61), Chile (1973).
- **The US support for dictators** — Mobutu, Somoza, Pinochet, the Shah.
- **The US role in the decolonization of Africa** — the US **pressured** Britain and France to decolonize, but it also **supported** colonial powers when it served its interests.

What this perspective contributes: It provides the **most developed** versions of the standard narrative and the most systematic **self-critique** of that narrative.

What it occludes: It can be **parochial** — focusing on Europe and ignoring the Global South. It can be **self-serving** — presenting the US as a benevolent hegemon while ignoring its imperial crimes. And it can be **triumphalist** — presenting the end of the Cold War as a vindication of the Western model, while ignoring the **ongoing** legacies of imperialism and inequality.

2.6.5 The UN perspective **Core commitments.** The UN is the **institutional embodiment** of the post-1945 order, and its interpretation of the Cold War and decolonization is shaped by its **founding** mission:

1. **The UN as a site of decolonization.** The UN was a **platform** for anti-colonial diplomacy — the General Assembly's 1960 **Declaration on the Granting of Independence to Colonial Countries and Peoples** affirmed the right of all peoples to self-determination. The UN's **trusteeship system** (which replaced the mandate system) was designed to prepare the colonies for self-government.
2. **The UN as a peacekeeping actor.** The UN's **peacekeeping** operations were a **major** innovation of the Cold War — they were designed to **prevent** local conflicts from becoming superpower confrontations. The Congo Crisis (1960–65), the Suez Crisis (1956), and other peacekeeping missions were **landmarks** — they established the **principles** of UN peacekeeping (consent of the parties, impartiality, minimum use of force).
3. **The UN as a site of North–South conflict.** The UN became a **site** of **North–South** conflict — the new states used the General Assembly to **advance** their demands for development, decolonization, and a **New International Economic Order (NIEO)**. The UN's **development** agenda — the UNCTAD, the UNDP, the MDGs, the SDGs — was shaped by the **demands** of the Global South.
4. **The UN and the Cold War.** The UN was **constrained** by the Cold War — the **veto** in the Security Council **paralyzed** the UN during the Cold War, and the UN was **marginalized** by the superpowers. But the UN also **provided** a **forum** for dialogue and a **mechanism** for peacekeeping — it **prevented** some conflicts from escalating.

The silences. The UN's narrative has been **slow** to acknowledge:

- **The UN's role in legitimizing superpower intervention** — the UN authorized interventions that served superpower interests (e.g., the Congo, Korea).
- **The UN's own structural biases** — the **veto** and the **great-power** domination of the Security Council **reproduce** the **inequalities** of the international system.

What this perspective contributes: It provides the **normative benchmark** — the standards against which the Cold War and decolonization are judged. It also provides the **institutional record** — the resolutions, declarations, and debates that are essential evidence for any analysis.

What it occludes: It can **depoliticize** — framing the Cold War and decolonization as **technical** problems obscures the **power dynamics** that shaped them. It can also **legitimize** — the UN's narrative presents the post-1945 order as a **solution** to the interwar crisis, while ignoring its own continuities with the colonial order.

2.6.6 The comparison matrix

Dimension	African (primary)	Chinese	Russian	Western	UN
Stance toward the Cold War	Tragedy; devastating consequences for Africa	Third force; Sino-Soviet split	Imposed by the US; Soviet security concerns	Struggle between freedom and tyranny	Constrained by superpowers; forum for dialogue
Stance toward decolonization	Agency; neo-colonialism; Pan-Africanism	Leadership of the Third World	Champion of anti-colonialism	Benevolent hegemon; support for decolonization	Platform for anti-colonial diplomacy; peacekeeping
Key contribution	Agency; neo-colonialism; Pan-Africanism	Third force; Sino-Soviet split	Soviet security concerns; anti-colonialism	Standard narrative + revisionist critique	Normative benchmark; institutional record
Key occlusion	Failures of African agency; diversity of experiences	China's own hegemonic ambitions; failures of Maoism	Soviet aggression; repression	Imperial crimes; parochialism	Legitimization of superpower intervention; structural biases

---

2.7 WORKED EXAMPLE (I do)

The puzzle: The **Congo Crisis** (1960–65) was one of the most dramatic episodes of the Cold War. The Congo became independent from Belgium in June 1960, and within days it collapsed into chaos — the army mutinied, the province of Katanga seceded, and the central government appealed to the UN and the Soviet Union for help. The UN intervened, but the crisis escalated — the Prime Minister, Patrice Lumumba, was assassinated, and the country became a proxy war between the superpowers. Why did the Congo Crisis become a Cold War flashpoint, and what does it tell us about the entanglement of the Cold War and decolonization?

The puzzle stated precisely: *Why did the Congo Crisis become a Cold War flashpoint, and what does it tell us about the entanglement of the Cold War and decolonization?*

The context. The Congo was **not prepared** for independence. Belgium had ruled the Congo as a **personal** possession of King Leopold II (1885–1908) and then as a **colony** (1908–60). The colonial regime was **extractive** — it focused on the extraction of rubber, copper, and cobalt, and it **neglected** education, health, and political development. At independence, the Congo had only **30** university graduates and **no** experienced administrators.

The crisis. The crisis unfolded in a series of escalating steps:

- **June 30, 1960:** The Congo becomes independent. Patrice Lumumba becomes Prime Minister; Joseph Kasa-Vubu becomes President.
- **July 5:** The army mutinies against its Belgian officers. The mutiny spreads, and Belgian civilians are attacked.
- **July 11:** Moïse Tshombe, the leader of Katanga, declares the province's **independence**, with Belgian

support. Katanga is the **richest** province — it produces copper, cobalt, and uranium.

- **July 12:** Lumumba appeals to the UN for help. The UN Security Council authorizes a peacekeeping mission (ONUC) to restore order and **prevent** the secession.
- **July 14:** The UN mission arrives. But the mandate is **ambiguous** — is the UN supposed to **restore** the central government, or just **maintain** order?
- **August:** Lumumba, frustrated by the UN's **neutrality**, appeals to the Soviet Union for military assistance. The US, alarmed by the prospect of Soviet influence, **supports** the overthrow of Lumumba.
- **September 5:** President Kasa-Vubu dismisses Lumumba. Lumumba **contests** the dismissal, and the country has **two** governments.
- **September 14:** Colonel Joseph Mobutu, with US and Belgian support, seizes power in a **coup**. Lumumba is placed under **house arrest**.
- **January 17, 1961:** Lumumba is **assassinated** — with the involvement of Belgian and American intelligence.
- **1961–63:** The crisis continues — the UN **intervenes** in Katanga, and the secession is **defeated** in 1963.
- **1965:** Mobutu seizes power again, with US support, and establishes a **dictatorship** that lasts until 1997.

The entanglement of the Cold War and decolonization. The Congo Crisis is a **paradigmatic** case of the entanglement of the Cold War and decolonization:

- **The Cold War shaped decolonization.** The US and the USSR **competed** for influence in the Congo. The US supported the **central** government (and later Mobutu) to **prevent** Soviet influence; the USSR supported Lumumba (and later rebel movements) to **expand** its influence. The Cold War **constrained** the Congo's **choices** — the new state could not be **genuinely** non-aligned without **provoking** superpower intervention.
- **Decolonization shaped the Cold War.** The Congo became a **site** of superpower competition — a **proxy war** that **escalated** the Cold War and **shaped** the global balance of power. The crisis also **shaped** the UN — it established the **principles** of UN peacekeeping and **exposed** the **limits** of UN neutrality.

The African perspective. African scholars emphasize that the Congo Crisis was a **turning point** in African attitudes toward the Cold War:

- **The betrayal of Lumumba.** Lumumba was a **Pan-Africanist** and a **non-aligned** leader. His assassination — with the involvement of the US and Belgium — confirmed African suspicions that the superpowers would **not tolerate** a genuinely independent African leader.
- **The UN's failure.** The UN's intervention in the Congo was **contested** — the UN was supposed to be a **neutral** peacekeeping force, but it became **involved** in the internal conflict, and it failed to protect Lumumba. The crisis exposed the **limits** of UN peacekeeping and the **influence** of the superpowers on the UN.
- **The lesson for African states.** The Congo Crisis taught African states that **non-alignment** was **dangerous** — the superpowers would intervene to prevent it. This lesson shaped the OAU's **sovereignty** and **non-interference** principles — African states sought to **protect** themselves from superpower intervention by insisting on **absolute sovereignty**.

The Western perspective. Western scholars interpret the Congo Crisis as a **tragedy** — a **failure** of decolo-

nization and a **product** of Cold War competition. The Western perspective emphasizes:

- **The lack of preparation.** The Congo was **not prepared** for independence — Belgium had **neglected** education and political development, and the new state had **no** experienced administrators.
- **The Soviet threat.** The US intervened to **prevent** Soviet influence in the Congo — a **Soviet** presence in Central Africa would have **threatened** Western interests and ** destabilized** the region.
- **The limits of the UN.** The UN's peacekeeping mission was **constrained** by its **ambiguous** mandate and by the **competing** interests of the superpowers. The UN **could not** protect Lumumba, and it **could not** prevent the crisis from escalating.

The Chinese perspective. Chinese scholars interpret the Congo Crisis as an example of **imperialist** intervention — the US and Belgium **conspired** to assassinate Lumumba and to **install** a **puppet** regime (Mobutu) that served Western interests. The Chinese perspective emphasizes that the Congo Crisis was a **continuation** of colonialism — the former colonial powers and the US **colluded** to **prevent** the Congo from achieving **genuine** independence.

The Russian perspective. Russian scholars interpret the Congo Crisis as an example of **Western** aggression — the US and Belgium **intervened** to **prevent** the Congo from **choosing** a **socialist** path. The Russian perspective emphasizes that the Soviet Union **supported** Lumumba and other **anti-colonial** movements — it was a **champion** of the **oppressed** peoples of the world.

The UN perspective. The UN interprets the Congo Crisis as a **landmark** in the history of **peacekeeping** — it established the **principles** of UN peacekeeping (consent of the parties, impartiality, minimum use of force), and it **exposed** the **limits** of UN **neutrality** in the context of the Cold War. The UN's **failure** to protect Lumumba was a **tragedy** — it **highlighted** the **constraints** on UN peacekeeping and the **influence** of the superpowers on the UN.

Adjudication. Which perspective best explains the Congo Crisis?

- **The African perspective** best explains the **agency** of African actors — the ways in which Lumumba and other African leaders **sought** to pursue **non-alignment** and **Pan-Africanism**, and the ways in which the superpowers **intervened** to **prevent** them.
- **The Western perspective** best explains the **Cold War** dynamics — the US **feared** Soviet influence in the Congo, and it **intervened** to **prevent** it.
- **The Chinese and Russian perspectives** best explain the **structural** dimensions — the **continuities** between colonialism and neo-colonialism, and the **role** of the superpowers in **shaping** the post-colonial world.
- **The UN perspective** best explains the **institutional** dimensions — the **limits** of UN peacekeeping and the **influence** of the superpowers on the UN.

A complete explanation combines all five: the Congo Crisis was a **product** of the **entanglement** of the Cold War and decolonization. The Cold War **shaped** the crisis — the US and the USSR **competed** for influence, and they **intervened** to **prevent** the other side from gaining an advantage. Decolonization **shaped** the crisis — the Congo's **lack** of preparation, its **artificial** borders, and its **extractive** economy made it **vulnerable** to **intervention**. And African **agency** shaped the crisis — Lumumba's **commitment** to **non-alignment** and **Pan-Africanism provoked** the superpowers' **intervention**, and his **assassination** became a **symbol** of the **betrayal** of the post-colonial world.

2.8 PROBLEM PAIR (We do)

Your task: Analyze the following case using the apparatus above. Write your analysis before reading the model answer.

The case: The **Bandung Conference** (April 1955) brought together 29 Asian and African states — including India, China, Indonesia, Egypt, and Ghana (then the Gold Coast) — to discuss **anti-colonialism**, **non-alignment**, and **economic development**. The conference produced a **communiqué** affirming the principles of **sovereignty**, **non-interference**, **racial equality**, and **economic cooperation**. It was the first major gathering of post-colonial states, and it was a **landmark** in the construction of the **Third World**.

Your tasks:

1. State the puzzle precisely: why did the Bandung Conference **succeed** in bringing together 29 states with **different** ideologies, **different** interests, and **different** relationships with the superpowers?
2. Apply the **Cold War** framework: how did the Cold War **shape** the Bandung Conference? Did the superpowers **support** or **oppose** it?
3. Apply the **decolonization** framework: how did the Bandung Conference **shape** decolonization? Did it **accelerate** or **slow** the process?
4. Apply the **African** perspective: how did African states **participate** in Bandung, and what did they **gain** from it?
5. Apply the **Chinese** perspective: how did China **participate** in Bandung, and what did it **gain** from it?
6. Write a 300-word adjudication: was the Bandung Conference a **turning point** in the Cold War, a **landmark** in decolonization, or a **failure** — or all three?

Model answer (compare after writing your own):

Puzzle: Why did the Bandung Conference succeed in bringing together 29 states with different ideologies, interests, and relationships with the superpowers?

The Cold War framework: The Cold War **shaped** the Bandung Conference in two ways:

- **It created the conditions for non-alignment.** The superpowers' competition for influence in the decolonizing world **created** an **incentive** for the new states to **band together** — a **collective** voice would give them **more** leverage than individual **alignment** with one side or the other.
- **It created the conditions for solidarity.** The superpowers' **interventions** in the decolonizing world — the US's support for **colonial** powers (Britain, France) and the USSR's support for **communist** movements — **created** a **shared** sense of grievance among the new states. The Bandung Conference was a **response** to the superpowers' **failure** to **respect** the **sovereignty** of the new states.

The decolonization framework: The Bandung Conference **shaped** decolonization in several ways:

- **It legitimized anti-colonialism.** The conference's **communiqué** affirmed the principle of **self-determination** and **condemned** colonialism. This **legitimized** the anti-colonial struggles that were **ongoing** in Africa and Asia.
- **It created a** network** of post-colonial states.** The conference **established contacts** between the new states, which would later **evolve** into the **Non-Aligned Movement** (1961). This **network** was a **resource** for the new states — it gave them **collective** bargaining power and a **shared** identity.
- **It created a** model** for **South–South** cooperation.** The conference's **emphasis** on **economic** co-

operation and **cultural** exchange was a **model** for later **South–South** initiatives — the **G-77** (1964), the **NIEO** (1974), and the **BRICS** (2009).

The African perspective: African states **participated** in Bandung — Ethiopia, Egypt, Ghana (then the Gold Coast), Liberia, Libya, and Sudan were among the **29** participants. They **gained** several things:

- **A platform** for anti-colonial advocacy — the conference **condemned** colonialism and **supported** the anti-colonial struggles in Africa.
- **A network** of allies — the African states **established** contacts with Asian states, which would later **support** the anti-colonial struggles in Africa.
- **A model** for **Pan-Africanism** — the conference **demonstrated** that **solidarity** across **different** regions and **ideologies** was **possible**, which **inspired** the **Pan-African** movement.

The Chinese perspective: China **participated** in Bandung — Zhou Enlai led the Chinese delegation, and he played a **key** role in **shaping** the conference's **principles**. China **gained** several things:

- **Legitimacy** — the conference **recognized** China as a **major** Asian power, which **enhanced** its **international** standing.
- **A platform** for **anti-imperialist** advocacy — Zhou Enlai **used** the conference to **criticize** the US and to **promote** China's **vision** of a **non-aligned** Asia.
- **A network** of allies — China **established** contacts with **new** states, which would later **support** China's **diplomatic** initiatives.

Adjudication: The Bandung Conference was **all three** — a turning point in the Cold War, a landmark in decolonization, and a failure:

- **A turning point in the Cold War:** The conference **demonstrated** that the **new** states could **act** collectively and **independently** of the superpowers. It **challenged** the **bipolar** narrative — the idea that the world was **divided** into two **blocs**. It **created** a **third** force — the **Third World** — that would **shape** the Cold War for decades.
- **A landmark in decolonization:** The conference **legitimized** anti-colonialism and **created** a **network** of post-colonial states. It **accelerated** the **decolonization** of Africa — the **Year of Africa** (1960) was **partly** a **result** of the **momentum** generated by Bandung.
- **A failure:** The conference **did not prevent** the superpowers from **intervening** in the decolonizing world. The **Congo Crisis** (1960–65), the **Vietnam War** (1955–75), and the **Angolan Civil War** (1975–2002) **demonstrated** that the **new** states were **still vulnerable** to superpower **pressure**. The **Non-Aligned Movement failed** to **prevent** its members from **aligning** with the superpowers — India **aligned** with the USSR, China **split** with the USSR, and many African states **aligned** with the US.

A complete explanation combines all three: the Bandung Conference was a **turning point** — it **created** the **Third World** as a **political** force and **shaped** the Cold War. But it was also a **failure** — it **did not prevent** the superpowers from **intervening** in the decolonizing world, and it **did not create** a **genuine** third force. The **legacy** of Bandung is **ambivalent** — it **inspired** anti-colonial movements, but it **did not fundamentally change** the **structure** of the international system.

2.9 INDEPENDENT MEMO (You do)

Produce a one-page analytical memo (500–600 words) on the following case, using the four headings below.

Case: The **Non-Aligned Movement** (NAM) — founded in Belgrade in 1961 with 25 members, including India, Egypt, Ghana, Indonesia, and Yugoslavia. The NAM's principles were **non-alignment**, **anti-colonialism**, **peaceful coexistence**, and **economic development**. The NAM was a **major** expression of **Third World** agency — it **challenged** the bipolar narrative and **created** a **collective** voice for the new states.

Memo headings:

1. **Mechanism:** How did the NAM function as a **collective** voice for the Third World? What was the **mechanism** through which it **shaped** the Cold War?
2. **The constitutive outside:** How did the NAM **constitute** the **Third World** as a **political** category? What did it **include** and what did it **exclude**?
3. **Perspective reconstruction:** How would each of the five perspectives interpret the NAM? (African, Chinese, Russian, Western, UN — one paragraph each or a table.)
4. **Falsifiers:** What evidence would show that the NAM was **not** a **significant** force in the Cold War? What would show that it **was**?

Self-check: Does your memo distinguish the **stated goals** of the NAM (non-alignment, anti-colonialism) from its **actual** impact? Does it identify the **constraints** on the NAM's effectiveness?

2.10 HINGE QUESTION

A scholar argues: "The Cold War was not primarily a European conflict. It was a global conflict that was fought in and over the decolonizing world. The European theater was important, but it was not the main event." Which claim does this argument support?

- A) The Cold War was a European conflict
- B) The Cold War was a global conflict
- C) The Cold War was a conflict between the US and the USSR
- D) The Cold War was a conflict between capitalism and socialism

Answer: B. The argument claims that the Cold War was a **global** conflict — it was fought in and over the **decolonizing world**, not just in Europe. The European theater was important, but it was not the main event.

If you answered A: The argument claims the **opposite** — that the Cold War was **not** primarily a European conflict. **If you answered C:** The argument **does not** deny that the Cold War was a conflict between the US and the USSR; it claims that the **main** theater of the conflict was the **decolonizing world**, not Europe. **If you answered D:** The argument **does not** focus on the **ideological** dimension of the Cold War; it focuses on the **geographical** dimension — the **decolonizing world** was the **main** theater of the conflict.

SECTION 2A — DATA LAB (30–45 minutes)

Purpose: Ground the lesson's concepts in empirical data on the Cold War and decolonization.

Task: Using the summary data below, analyze the relationship between the Cold War and decolonization.

Table 1: Decolonization timeline, 1945–1975

Year	Number of newly independent states	Key events
1947	2 (India, Pakistan)	Partition of India
1957	1 (Ghana)	First sub-Saharan African colony to gain independence
1960	17 (the "Year of Africa")	Most of French West Africa and Equatorial Africa; the Congo; Somalia; Madagascar
1962	4 (Uganda, Rwanda, Burundi, Algeria)	Algerian independence after a brutal war
1964	3 (Malawi, Zambia, Malta)	
1965	1 (The Gambia)	
1975	5 (Angola, Mozambique, Cape Verde, São Tomé and Príncipe, Comoros)	Portuguese colonies after the Carnation Revolution

Table 2: Superpower interventions in the decolonizing world, 1945–1991 (illustrative)

Country	Year	Intervening power	Outcome
Iran	1953	US (CIA)	Overthrow of Mossadegh; installation of the Shah
Guatemala	1954	US (CIA)	Overthrow of Arbenz
Congo	1960–61	US, Belgium	Assassination of Lumumba; installation of Mobutu
Vietnam	1955–75	US	Defeat of the US; unification of Vietnam
Angola	1975–2002	USSR, Cuba, US, South Africa	Proxy war; 500,000 deaths
Afghanistan	1979–89	USSR	Soviet defeat; rise of the Taliban
Chile	1973	US (CIA)	Overthrow of Allende; installation of Pinochet

Table 3: UN membership, 1945–1975

Year	Number of member states	African member states	Asian member states
1945	51	4	9
1960	99	26	22
1970	127	42	30
1975	144	46	35

Analysis questions:

1. **Timing:** What does the decolonization data suggest about the **timing** of decolonization? When did it accelerate, and why?
2. **Interventions:** What does the intervention data suggest about the **pattern** of superpower intervention? Which countries were targeted, and why? What does this tell us about the **entanglement** of the Cold War and decolonization?
3. **UN membership:** What does the UN membership data suggest about the **transformation** of the international system? How did the **composition** of the UN change, and what was the **consequence**?
4. **Perspective:** How would each of the five perspectives interpret the data? (African: agency and neo-colonialism; Chinese: third force; Russian: anti-colonialism; Western: containment and benevolence; UN: decolonization and peacekeeping.)
5. **Limitation:** What does the data **not** tell you? (Hint: it does not capture the **experience** of colonization or decolonization; it does not measure the **legacies** of the Cold War; and it does not distinguish between **formal** and **informal** intervention.)

Rule: Complete the data lab before the independent memo.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Task: Draw the following by hand.

Visual 1: The bipolar system. Draw two blocs: NATO (US and allies) and the Warsaw Pact (USSR and allies). Draw arrows showing the **competition** for influence in the **decolonizing world**. Label the **Non-Aligned Movement** as a **third** force.

Visual 2: The entanglement of the Cold War and decolonization. Draw a two-way arrow: "Cold War → shapes decolonization" (superpower intervention, competition for influence) and "Decolonization → shapes the Cold War" (new states, changed UN, new sites of competition). Give one example for each direction.

Visual 3: The five perspectives on the Cold War and decolonization. Draw a five-column table (African, Chinese, Russian, Western, UN) with rows: "Stance toward the Cold War," "Stance toward decolonization," "Key contribution," "Key occlusion."

SECTION 4 — CORNELL NOTES

Set up your notes with the following cue column:

Cue column	Notes
What was the Cold War?	Bipolar contest between the US and the USSR (1947–1991)
What was the structural account?	Bipolarity; stability through MAD; balance of power
What was the global account?	Contest between two models of modernity; fought in the decolonizing world
What was decolonization?	The independence of more than 80 colonies, 1945–1975
What were the causes of decolonization?	Weakening of colonial powers; nationalist movements; Cold War; international institutions; costs of empire
What was the Non-Aligned Movement?	A collective voice for the Third World; founded in Belgrade (1961)
What was the Bandung Conference?	29 Asian and African states; anti-colonialism, non-alignment, economic development
What was the Congo Crisis?	1960–65; Lumumba's assassination; UN intervention; superpower competition
What was the Suez Crisis?	1956; Britain, France, and Israel invade Egypt; US and USSR force withdrawal
How do the five perspectives interpret the Cold War and decolonization?	African: agency + neo-colonialism; Chinese: third force; Russian: anti-colonialism; Western: containment + benevolence; UN: decolonization + peacekeeping
Source log	Lesson text, Sections 2.2–2.6; Westad (2005); Gaddis (1987); LaFeber (1993); Gleijeses (2002); Nkrumah (1965); Nyerere (1967); Cabral (1979); Fanon (1961); Schmidt (2013); the Truman Doctrine; Kennan's Long Telegram; the Bandung Communiqué; the OAU Charter; the Belgrade Declaration
Summary	3–5 sentences synthesizing the lesson

SECTION 5 — FEYNMAN COMPRESSION

Step 1: Explain the relationship between the Cold War and decolonization to a smart non-specialist in 200–250 words, without using jargon. If you must use "bipolarity," "non-alignment," or "neo-colonialism," define them in plain language.

Step 2: Mark every point where you hesitated or used a term you could not define.

Step 3: Reread only the gaps. Rewrite.

Step 4: Produce one analogy for the Cold War and decolonization. Then state where the analogy breaks down.

(Example: "The Cold War and decolonization were like two games being played on the same chessboard — the superpowers were playing a game of global influence, while the new states were playing a game of independence and development. The two games interacted: the superpowers' moves shaped the new states' options, and the new states' moves shaped the superpowers' strategies." Where it breaks down: unlike chess, the "pieces" had their own agency — the new states were not pawns, but players in their own right.)

SECTION 6 — SPACED-REPETITION FLASHCARDS

Produce 12–15 cards. Use the following types:

Type	Example
Definition	What was the Non-Aligned Movement?
Mechanism	How did the Cold War shape decolonization?
Application	A newly independent state accepts aid from both the US and the USSR. Which strategy does this illustrate?
Comparison	How did the Bandung Conference and the Belgrade Conference differ?
Source	What did Westad argue about the Cold War?
Debate	What is the strongest objection to the claim that the Cold War was primarily a European conflict?
Reconstruction	How would an African scholar interpret the Congo Crisis?
Occlusion	What does the Western narrative of the Cold War fail to see about Africa?
Adjudication	Which perspective best explains the Congo Crisis, and what does it miss?
Visual	Label the entanglement of the Cold War and decolonization on a diagram.

Tag each card: `L12`, `Cold War`, `decolonization`, `non-alignment`, `Africa`, `perspective`, `difficulty`.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence audit

Rate confidence (0–100%) before checking:

Objective	Confidence
Reconstruct the Cold War as a bipolar system and a contest of models	
Analyze decolonization as a transformation of the international system	
Explain the agency of the decolonizing states	
Reconstruct the entanglement of the Cold War and decolonization	
Reconstruct the five perspectives on the Cold War and decolonization	

After exercises, rate accuracy. Calculate the gap.

7.2 Three-question debrief

1. What did I misunderstand about the relationship between the Cold War and decolonization?
2. Which perspective was easiest to reconstruct? Which was hardest? What does that suggest about my default analytical style?
3. What will I do differently in Lesson 13?

7.3 Error log

Date	Lesson	Error type	Correct understanding	Card created?
	L12			

SECTION 8 — CHEATSHEET (Module 2)

Add this row to your Module 2 cheatsheet:

Column	Content
Core concepts	Bipolarity; superpower; containment; the Truman Doctrine; the Marshall Plan; NATO; the Warsaw Pact; MAD; extended deterrence; proxy war; the domino theory; rollback; peaceful coexistence; the Non-Aligned Movement; the Bandung Conference; Afro-Asian solidarity; Pan-Africanism; the OAU; neo-colonialism; Ujamaa; the Frontline States; the Congo Crisis; the Suez Crisis; the Cuban Missile Crisis; détente; the Second Cold War

Column	Content
Key mechanisms	Bipolarity → stability through MAD; competition for influence → intervention in the decolonizing world; non-alignment → collective voice → leverage; decolonization → changed UN → new agenda; Cold War → shaped decolonization → shaped the Cold War
Theories and authors	Westad (2005); Gaddis (1987); LaFeber (1993); Gleijeses (2002); Nkrumah (1965); Nyerere (1967); Cabral (1979); Fanon (1961); Schmidt (2013); the Truman Doctrine; Kennan's Long Telegram; the Bandung Communiqué; the OAU Charter; the Belgrade Declaration
Cases and evidence	Decolonization (1945–1975); Bandung (1955); Suez (1956); Congo Crisis (1960–65); Vietnam (1955–75); Angola (1975–2002); UN membership data; superpower interventions
Debates	Was the Cold War primarily European or global? Did the superpowers control the decolonizing world, or did the decolonizing world shape the superpowers? Was non-alignment a success or a failure?
Falsifiers	What evidence would show that the Cold War was **not** a global conflict? What would show that the decolonizing states were **not** agents?
Cross-links	L11 (World Wars and the League); L13 (post-Cold War liberal order); L21 (nuclear deterrence); L23 (asymmetric warfare); L27 (African state formation); L28 (Pan-Africanism); L31 (great-power competition in Africa); L35 (post-Soviet ontology); L47 (US–China rivalry); L48 (Indo-Pacific)

SECTION 9 — REVIEW SCHEDULE

Review	Timing	Format
R1	Today	Retrieval warm-up + card creation
R2	2–3 days	Cue-column recall + hinge variant
R3	1 week	Mixed quiz with L1–L12 cards

Review	Timing	Format
R4	3–4 weeks	Interleaved problem combining L12 with L13 (post-Cold War) and L21 (nuclear deterrence)
R5	End of Module 2	Cheatsheet reconstruction from memory

SECTION 10 — COMPLETION CHECKLIST

- ☐ Retrieval warm-up completed from memory
- ☐ Five learning objectives read and understood
- ☐ Five key ideas studied with mechanisms and scope conditions
- ☐ Perspective comparison matrix filled from memory, then checked
- ☐ Worked example (Congo Crisis) studied and self-explained
- ☐ Problem pair (Bandung Conference) attempted and compared
- ☐ Independent memo produced (500–600 words)
- ☐ Hinge question answered correctly (or reteaching completed)
- ☐ Data lab completed before independent memo
- ☐ Three dual-coded visuals drawn
- ☐ Cornell notes with cue column, source log, and summary
- ☐ Feynman explanation written, gaps identified, rewritten
- ☐ 12–15 flashcards created with tags
- ☐ Confidence audit and error-log entry
- ☐ Cheatsheet entry added
- ☐ R2 review scheduled

End of Lesson 12. Say **"Next"** when you are ready for Lesson 13 (The Post-Cold War Liberal Order).

14. The Post-Cold War Liberal Order

LESSON METADATA

Field	Value
Lesson number and title	Lesson 13: The Post-Cold War Liberal Order
Module	Module 2: Historical Architecture of International Order
Prerequisites	L5 (realism), L6 (institutionalism), L11 (interwar), L12 (Cold War)
Interleaved links	Forward to L14 (transition), L18 (interdependence), L49 (revisionism), L47 (US-China)
Reading load	7-9 hours
Content channels	Text, data tables, case analysis, perspective reconstruction, flashcards
Bloom ceiling	Evaluate (with Create elements)
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

The post-Cold War liberal order emerged from a historically unusual conjunction: the disappearance of a peer competitor, the survival of Western institutional frameworks, and an ideological narrative that treated liberal democracy and market capitalism as the terminal form of political-economic organization. Its central puzzle is not why it arose but why its apparent triumph contained the mechanisms of its own contestation. The order combined material unipolarity with normative universalism; it expanded institutions designed for a narrower membership into global instruments; and it authorized force in the name of human protection while simultaneously asserting sovereign equality. The student must learn to see these tensions as structural rather than incidental, because they reappear in later debates about intervention, conditionality, great-power competition, and the legitimacy of international law.

The lesson's theoretical lineage runs through realism, liberal institutionalism, constructivism, and critical political economy. Krauthammer's unipolar moment named the material asymmetry of the early 1990s; Fukuyama's end of history supplied ideological closure; Ikenberry argued that liberal hegemony could be made durable through institutions; Wheeler and others traced the normative evolution from sovereignty to responsibility; Kagan captured the fracture between American power and European legalism. The order's legitimacy depended on a double claim: that power was exercised through rules, and that rules were backed by power. When the 2003 Iraq invasion severed that coupling, the vocabulary of liberation, democracy, and security became available to critics as evidence of imperial practice rather than universal emancipation.

African scholarship and experience are not a regional illustration of this story but a vantage that redefines it. From Rodney's analysis of underdevelopment through Nkrumah's neo-colonialism, Fanon's critique of liberation's betrayal, Mamdani's work on colonial citizenship, and Grovogui's critique of international legal hierarchy, the post-Cold War order appears less as a peace project than as a reconfiguration of external authority over African political life. Sierra Leone, Rwanda, and Libya show that humanitarian intervention could coincide with strategic neglect, selective protection, and regime change. The African perspective asks whose suffering counts, who authorizes force, and whether conditionality and peacebuilding reproduce dependency under new institutional forms.

Curriculum placement matters. This lesson follows L5 realism, L6 institutionalism, L11 interwar collapse, and L12 Cold War bipolarity. It prepares L14 on transition, L18 on interdependence, L47 on US-China competition, and L49 on revisionism. The student should connect the institutional expansion of the 1990s to later contestation: WTO accession, NATO enlargement, and conditionality created stakeholders but also grievances. The lesson also trains methodological discipline: distinguishing description, explanation, prediction, and prescription, and testing each against evidence rather than normative preference. Without that discipline, the post-Cold War order is easily reduced either to a success story of democratization and growth or to a morality tale of Western hubris.

By mastering this lesson, the student will be able to reconstruct five perspectives on the post-Cold War order; apply individual, state, systemic, and transnational levels of analysis; evaluate the Kosovo and Iraq cases; interpret data on UNSC authorizations, WTO membership, democratic transitions, and NATO expansion; and identify the scope conditions under which liberal institutionalism, humanitarian intervention, and economic conditionality succeed or fail. The student will also be able to state the strongest counterargument to each perspective and adjudicate among them without collapsing into either triumphalism or cynicism. The goal is not to pick a camp but to specify mechanisms, boundary conditions, and falsifiers.

The lesson's central methodological commitment is that no perspective is merely an error to be corrected. Western liberal institutionalism captured real gains in conflict reduction and institutional density; Chinese and Russian critiques captured real asymmetries in rule-making; UN legalism captured real gaps between Charter principles and enforcement; African skepticism captured real costs of externally designed order. The task is to ask what each perspective explains well, what it occludes, and what evidence would change the conclusion. That is the difference between commentary and analysis, and it is the standard this lesson requires.

SECTION 1 — Pre-Class Priming

1.1 Retrieval warm-up (5-6 questions from earlier lessons)

1. From L5 realism: How does offensive realism explain security competition under anarchy, and what

does it predict about a unipolar power's behavior?
2. From L6 institutionalism: What is the shadow of the future in iterated cooperation, and how do institutions reduce transaction costs?
3. From L11 interwar history: How did economic nationalism, appeasement, and the failure of collective security undermine the interwar order?
4. From L12 Cold War history: What was the logic of mutually assured destruction, and how did bipolarity shape proxy conflicts in Africa and Asia?
5. From L5 and L6 together: Under what conditions do institutions reflect underlying power rather than independently constrain it?
6. From L12: How did superpower rivalry create both opportunities and dangers for postcolonial states seeking sovereignty and development?

1.2 Orientation questions (4)

1. Was the post-Cold War order unipolar in material power but multilateral in legitimacy, and what happens when those two dimensions diverge?
2. Does humanitarian intervention require UN Security Council authorization to be lawful, or can legitimacy be derived from other sources such as regional organizations or moral urgency?
3. How did economic liberalization through the WTO and conditionality interact with political liberalization through elections, constitutional reform, and democratization?
4. At what point did the war on terror transform the liberal order from a rules-based system into one organized around exceptions, preemption, and unilateral enforcement?

1.3 Vocabulary pre-teach (10-12 terms with provisional definitions)

- **Unipolar moment**: A short period after the Cold War in which one state possessed unmatched military, economic, and ideological power, creating both opportunity and temptation for unilateral action.
- **End of history thesis**: The argument that liberal democracy and market capitalism represent the final, universally valid form of human political-economic organization, with major ideological alternatives exhausted.
- **Liberal peace**: The claim that liberal democracies are less likely to fight one another and that spreading liberal institutions can reduce conflict, though its scope conditions and causal mechanisms remain contested.
- **Responsibility to Protect (R2P)**: The norm that sovereignty entails a responsibility to protect populations from mass atrocities, and that the international community may act when a state manifestly fails to do so.
- **Humanitarian intervention**: The use of military force across borders primarily to stop or prevent severe human suffering, raising legal, moral, and strategic questions about authorization and motive.
- **Washington Consensus**: A set of market-oriented policy prescriptions, including fiscal discipline, privatization, trade liberalization, and deregulation, promoted by Western institutions in the 1990s.
- **Conditionality**: The practice of attaching policy requirements to loans, aid, or market access, often shaping domestic economic and political choices in recipient states.
- **Hegemonic stability**: The theory that an open international economic order requires a dominant power willing and able to provide public goods, enforce rules, and absorb adjustment costs.
- **Coalition of the willing**: An ad hoc grouping of states supporting a military action without universal

institutional authorization, often signaling both diplomatic flexibility and legal controversy.
- **War on terror**: The post-2001 framework treating terrorism as a global, open-ended threat justifying military, legal, and intelligence measures beyond traditional interstate war.
- **Sovereignty as responsibility**: The reinterpretation of sovereignty from absolute noninterference to a conditional status tied to a state's protection of its population and compliance with international norms.
- **Liberal institutionalism**: The theory that international institutions reduce uncertainty, lower transaction costs, facilitate reciprocity, and can constrain even powerful states under specified conditions.

SECTION 2 — LESSON CORE

2.1 Learning objectives

By the end of this lesson, students should be able to:

1. **Analyze** the causal mechanisms by which the post-Cold War concentration of United States material power was translated into institutional and normative primacy, distinguishing hegemonic stability, liberal institutional lock-in, ideological framing, and the domestic political coalitions that sustained each mechanism across the 1990s and 2000s, including how each mechanism generated distinct observable implications for alliance behavior and institutional design.
2. **Evaluate** the scope conditions under which unipolarity produced liberal order rather than backlash, using comparative evidence from NATO expansion, WTO accession negotiations, humanitarian interventions, and regional responses in Africa, Eurasia, and the Middle East, and specifying which conditions were necessary rather than merely contributory.
3. **Explain** how African, Chinese, Russian, Western, and UN perspectives differently diagnose the legitimacy, stability, and justice of United States primacy, and identify what each perspective renders visible or invisible about coercion, sovereignty, historical inequality, and the distribution of decision-making authority in international institutions.
4. **Compare** Krauthammer's unipolar moment with Fukuyama's end-of-history thesis as competing accounts of the same structural shift, specifying their different causal mechanisms, temporal horizons, normative premises, and empirical falsifiers, and assessing which better explains the fractures visible by 2003.
5. **Construct** an evidence-based adjudication of whether a given post-1991 intervention or institution-building project strengthened or fractured the liberal order, using individual, state, systemic, and transnational levels of analysis, explicit perspective reconstruction, and a stated standard of evidence for claims about order and disorder.

2.2 KEY IDEA 1 — The "Unipolar Moment" and the Liberal Presumption of Permanent Western Primacy

Bolded Causal Claim: The post-Cold War distribution of material power created a "unipolar moment" in which the United States possessed unmatched military, economic, and ideological capacity; liberal order-builders treated this asymmetry not as a temporary and contingent advantage but as a durable platform for universalizing Western institutions and norms, thereby presuming permanent Western primacy rather than merely managing a transitional imbalance of power.

Mechanism: The mechanism begins with a structural shock: the collapse of the Soviet Union removed the

United States' only peer competitor and left Washington with global military reach, unmatched economic weight, technological leadership, and an existing alliance network. Hegemonic-stability theory supplies one causal pathway: a dominant power can reduce uncertainty, provide security, keep markets open, and enforce rules, thereby lowering transaction costs for other states and making cooperation more likely than under fragmented power. A second pathway is institutional lock-in. The United States did not merely possess power; it possessed institutions—NATO, the Bretton Woods organizations, the UN Security Council veto structure, and later the WTO—through which its preferences could be embedded in rules, procedures, and sunk costs. Expansion of these institutions after 1991 extended liberal norms geographically and functionally, while also raising the costs of exit for new members. A third pathway is ideological: the Soviet collapse was interpreted not simply as a geopolitical defeat but as a vindication of liberal democracy and market capitalism. This framing encouraged the belief that history had a directional telos and that non-liberal alternatives were exhausted or illegitimate. A fourth pathway is domestic and bureaucratic. A bipartisan foreign-policy elite, military and financial institutions, and a vocabulary of indispensable leadership created incentives to interpret unipolarity as a responsibility rather than a windfall. Early successes—the 1991 Gulf War, the Dayton settlement, NATO's survival—reinforced confidence and reduced incentives to plan for constraint. The crucial mechanism, however, is not power alone but the *presumption* attached to it: the conversion of a contingent asymmetry into an assumption that Western primacy was natural, legitimate, and permanent. That presumption shaped threat assessment, institutional design, and the treatment of dissenting states as transitional or deviant rather than as enduring features of world politics.

Scope Conditions: The claim that unipolarity generated durable liberal primacy holds only under several demanding conditions. First, the dominant state must be willing and able to bear the fiscal, military, and political costs of leadership; if domestic coalitions fragment or retrenchment pressures rise, the order loses its enforcement core. Second, no effective balancing coalition must form; if secondary powers coordinate through alliances, institutions, or economic alternatives, unipolarity becomes contested rather than accepted. Third, the order must be perceived as legitimate by enough states that compliance is not merely coerced; legitimacy depends on procedural fairness, reciprocity, and the avoidance of overt double standards. Fourth, economic openness must produce visible benefits for enough participants that exit appears irrational; if gains are concentrated or conditionality is experienced as domination, openness becomes a source of resentment. Fifth, institutions must adapt to rising powers; rigid hierarchies that freeze status can convert institutional membership into grievance. Sixth, regional actors must not mobilize counter-hegemonic identities or organizations that redefine security outside Western frameworks. Seventh, the dominant state must avoid catastrophic overextension; repeated military failures or legal exceptions can transform primacy from stabilizer into provocation. Where these conditions fail, unipolarity may still exist materially while liberal primacy erodes normatively.

Observable Implications: If the unipolar presumption is operating, one should observe NATO expansion rather than contraction, WTO universalization, conditionality in development finance, democracy-promotion programs, US-led or US-authorized interventions, dollar centrality, and the diffusion of liberal legal norms. One should also observe bandwagoning by secondary powers, institutional socialization, and the treatment of non-liberal regimes as transitional problems. If the presumption is weakening, one should observe counter-institutionalization, hedging strategies, regional security architectures, increased use of veto power, sanctions evasion, and the rhetorical elevation of sovereignty, multipolarity, and civilizational diversity. Empirical markers include defense-spending ratios, alliance membership, voting cohesion in the UN General Assembly, patterns of institutional creation, and the frequency with which major powers bypass or challenge US-led frameworks. The strongest falsifiers of the "permanent primacy" claim are sustained balancing, insti-

tutional exit, failed interventions that damage legitimacy, relative economic decline, and domestic political movements that reject global leadership.

Perspective Note (five traditions in brief):

African (primary): For many African thinkers, the "unipolar moment" did not inaugurate a new international order so much as reveal the durability of an older hierarchy in which Western powers retained decisive authority over African sovereignty, development, and security. The collapse of the Soviet Union removed one external patron and narrowed diplomatic space for non-alignment, while structural adjustment, debt conditionality, and security partnerships channeled many African states into liberal economic and political templates. From this vantage, "permanent Western primacy" is not merely a distribution of power; it is a historically sedimented structure of racialized authority, epistemic dependence, and institutionalized inequality. Rodney and Nkrumah framed underdevelopment as a product of global extraction; Fanon and Cabral emphasized that political independence without economic and cultural emancipation leaves sovereignty hollow; Mamdani has analyzed how colonial legal categories continue to shape postcolonial governance; Mbembe has theorized the externalization and racialization of violence; Grovogui has argued that international law can encode Western civilizational hierarchies; Oyěwùmí has challenged the gendered and epistemic assumptions embedded in imported categories. African perspectives therefore ask not only whether unipolarity was stable, but for whom it was stable: whose security was protected, whose markets were opened, whose conflicts were deemed "humanitarian," and whose agency was recognized. They also highlight African practices that complicate the primacy narrative—regional organizations, peacekeeping contributions, non-aligned diplomacy, and demands for reparative justice. Aning and Danso have emphasized African agency in security governance, while Tamale's feminist scholarship insists that order must be judged by whose bodies are secured. The African vantage reveals that liberal order-building often mistook compliance for consent and capacity-building for subordination, and that the "unipolar moment" was experienced less as universal progress than as a narrowing of autonomous developmental paths.

Chinese: China's perspective treats unipolarity less as a benign public good than as hegemony to be managed, hedged against, and gradually corrected. It emphasizes sovereignty, non-interference, and formal equality, viewing US primacy as a threat to strategic autonomy and as a permissive condition for interventions that bypass or weaken multilateral authorization. At the same time, China benefited from the trade openness and relative stability associated with US-led order, so its position is not simply rejection but selective engagement: participate in institutions, build alternatives where necessary, and insist on multipolarity. Chinese discourse often frames the post-Cold War order as unjustly dominated by one power and its allies, while presenting China's rise as a restoration of balance rather than a bid for replacement hegemony. This perspective illuminates the coercive and exclusionary dimensions of primacy, but it can occlude China's own hierarchical practices in regional economic and security relationships.

Russian: Russia's perspective is shaped by the experience of status loss, territorial contraction, and perceived encirclement after 1991. Unipolarity is interpreted not as stability but as humiliation and vulnerability: NATO expansion, interventions in the Balkans, and Western support for political change in post-Soviet space are read as evidence that the United States sought to lock in permanent advantage. Russian leaders and intellectuals have often demanded recognition as a great power, defended spheres of influence, and invoked sovereignty to resist Western normative projects. This perspective explains why institutional expansion can be experienced as threat even when framed as integration, but it can occlude Russia's own coercive actions and its tendency to conflate status recognition with veto power over neighbors' choices.

Western: The Western perspective contains both a liberal-institutionalist defense and a growing self-critique.

Liberal institutionalists argue that US primacy supplied public goods, stabilized markets, expanded democracy, and created unprecedented opportunities for cooperation; institutions were designed to bind even the hegemon and to make cooperation durable. Realists within the West warn that primacy invites overextension, balancing, and imperial overstretch, while constructivists note that norms are contested and that "universal" values often reflect particular cultural and historical experiences. The Western self-critique, sharpened by Iraq and other failures, acknowledges hubris, double standards, and the gap between proclaimed values and practiced exceptions. This perspective provides the most developed account of institutional design and democratic peace, but it often underestimates how primacy looks from the receiving end of intervention or conditionality.

UN: The UN perspective centers on the tension between Charter principles—sovereign equality, collective security, peaceful settlement of disputes—and the reality of concentrated power. The Security Council's structure gives permanent members disproportionate authority, while unipolarity can make multilateral authorization appear either indispensable or inconvenient depending on the hegemon's preferences. From this vantage, the "unipolar moment" is not simply a fact of power but a stress test for international law: when the most powerful state can act without authorization, the gap between legal principle and enforcement becomes visible. The UN perspective values procedural legitimacy, broad participation, and the restraining function of law, but it can struggle to explain how order is maintained when great-power consensus collapses.

2.3 KEY IDEA 2 — Fukuyama's "End of History" Thesis as Ideological Framing

Bolded Causal Claim: Fukuyama's "end of history" argument did not predict the disappearance of events, wars, or political conflict; it proposed that liberal democracy had become the only fully articulated and globally credible ideological horizon after the Cold War, thereby converting a contingent Western victory into a presumed direction of historical development.

Mechanism: The thesis works through a Hegelian-Kojèvian mechanism: history is driven by the struggle for recognition, and the modern liberal state—combining market economies, constitutional rights, and democratic accountability—appears to resolve that struggle by granting universal recognition without requiring a single master. Fukuyama's 1989 essay and 1992 book, *The End of History and the Last Man*, argued that the collapse of Soviet communism removed the last systemic alternative to liberal democracy, leaving nationalism, religion, and authoritarianism as residual forces rather than coherent rival ideologies. The crucial causal force, however, was not merely Fukuyama's description but the thesis's ideological function: once liberal democracy was framed as the endpoint of ideological evolution, policy could be organized around convergence rather than accommodation. Democracy promotion, conditionality, enlargement, and "transition assistance" became not just preferences but expressions of historical necessity. The mechanism therefore runs from intellectual framing to policy presumption: if the endpoint is already known, then deviations appear temporary, pathological, or externally imposed, and the task of international order becomes accelerating convergence rather than managing pluralism. This is why the thesis mattered even for actors who never read Fukuyama; it supplied a vocabulary in which Western institutions could be treated as the default destination of modernization.

Scope Conditions: The thesis is strongest where three conditions hold: a credible systemic rival has collapsed; domestic institutions can plausibly be reformed toward liberal constitutionalism; and external anchors—such as the European Union, NATO, or international financial institutions—can lock in reforms. It is weakest where modernization does not produce liberal politics, where nationalism or religious identity

remains politically generative, where state capacity is fragmented, or where authoritarian regimes can deliver growth and security without democratic legitimation. Its scope is also historically bounded: it assumes the post-1989 moment is not merely a power shift but an ideological terminus, an assumption that becomes less persuasive once alternative models of capitalism and governance gain confidence.

Observable Implications: If the thesis operates as ideological framing, one should observe democracy promotion becoming a central foreign-policy objective; enlargement of Western institutions into former communist space; conditionality attached to aid, trade, and membership; and a tendency to interpret authoritarian resilience as transitional rather than durable. One should also observe overconfidence in regime change and underestimation of illiberal modernization, especially where economic growth occurs without liberalization. The thesis's predictive weakness is visible in the persistence and, in some cases, strengthening of authoritarian and hybrid regimes, as well as in the reassertion of civilizational, religious, and nationalist claims that Fukuyama treated as historically exhausted.

Perspective Note (five traditions in brief):

African: From an African vantage point, the "end of history" often appears as a Eurocentric teleology that converts Western institutional forms into the measure of political maturity. African scholarship and political thought have long emphasized that colonialism, structural adjustment, and externally imposed models constrained self-determination; treating liberal democracy as history's endpoint risks delegitimizing non-liberal experiments in solidarity, developmental states, or culturally grounded accountability. The thesis can obscure continuities of dependency by recoding them as "transition" problems, and it may underestimate African agency by assuming that the relevant question is how quickly African states converge on Western templates rather than how they construct legitimate orders under conditions of historical inequality.

Chinese: The Chinese perspective treats Fukuyama's claim as an ideological assertion of Western hegemony rather than an empirical law. It emphasizes that modernization need not produce liberal democracy, that state capacity and party-led development can be alternative routes to prosperity and stability, and that the "end of history" functions to delegitimize non-Western political models. The thesis is read less as philosophy than as a justification for pressure, conditionality, and normative hierarchy.

Russian: In Russian discourse, the thesis is frequently experienced as triumphalist and humiliating, especially in the context of Soviet collapse and subsequent NATO enlargement. It suggests that Russia's historical trajectory was judged deficient and that its security concerns could be dismissed as backward resistance to an already determined future. This perception contributes to a narrative of Western disregard for Russian status and to suspicion that liberal universalism masks geopolitical expansion.

Western: Western liberal institutionalism has both embraced and revised the thesis. Its defenders see the spread of democratic norms and institutions as evidence of a genuine normative shift, while its critics acknowledge that the thesis encouraged hubris, underestimated nationalism and religion, and conflated the collapse of communism with the vindication of all Western practices. The self-critical Western position treats Fukuyama's argument as a powerful but dangerous simplification: useful for explaining ideological exhaustion, but misleading when turned into policy teleology.

UN: The UN perspective is more cautious about regime-type universalism. The Charter centers sovereign equality, self-determination, and peaceful settlement rather than a prescribed governmental form. From this vantage, the "end of history" can appear as an overreach of normative ambition: international law may accommodate democratic norms, but it does not establish liberal democracy as the sole legitimate endpoint of political development, and conflating the two risks weakening the procedural legitimacy on which multilat-

eral order depends.

2.4 KEY IDEA 3 — Humanitarian Intervention, R2P, and the "Liberal Peace" Project

Bolded Causal Claim: The post-Cold War liberal order transformed human rights and democratic governance into justifications for coercive intervention, making sovereignty conditional and producing a contested "liberal peace" whose uneven application exposed the order's normative double standards.

Mechanism: The mechanism begins with a normative redefinition of sovereignty. In the post-Cold War period, mass atrocities in Rwanda, Bosnia, and Kosovo made non-intervention appear morally untenable, while unipolar military capacity made intervention feasible. The resulting doctrine of humanitarian intervention holds that sovereignty entails responsibility: when a state fails to protect its population from genocide, war crimes, ethnic cleansing, or crimes against humanity, external actors may assume that responsibility. This idea was later codified as the Responsibility to Protect (R2P), articulated by the International Commission on Intervention and State Sovereignty in 2001 and endorsed at the 2005 World Summit. The mechanism is not only legal but operational: it links normative claims to military capacity, peacebuilding, and transitional administration. The "liberal peace" project extends this logic beyond stopping violence to reconstructing states through democratization, marketization, rule of law, and human-rights institutions. Intervention becomes the first phase of a broader social-engineering project in which external actors attempt to remake political order. The causal chain runs from atrocity → normative shock → authorization or legitimation → military action → peacebuilding → contested legitimacy. The chain is strongest when great powers agree on the threat and weakest when intervention is perceived as regime change, resource extraction, or civilizational imposition. Kosovo in 1999 illustrated intervention without Security Council authorization; Sierra Leone in 2000 illustrated external stabilization in support of a beleaguered government and UN peacekeeping; Libya in 2011 illustrated how an R2P-authorized mandate to protect civilians could be interpreted as license for regime change, with lasting damage to the doctrine's credibility.

Scope Conditions: Humanitarian intervention and R2P are most plausible under four conditions: the abuses cross a threshold of mass atrocity; peaceful means have been exhausted or are implausible; the intervention has a reasonable prospect of success without causing greater harm; and the intervening coalition possesses both capacity and some form of multilateral legitimacy. The liberal peace project additionally requires local institutional receptivity, sustained resources, and tolerance for long-term external involvement. The doctrine is least credible where strategic interests are absent, where rival powers oppose action, where the target state retains substantial capacity, or where the intervention's mandate is ambiguous enough to slide from protection to regime change. It is also weakened by selectivity: the same powers that invoke R2P in some crises remain silent in others, suggesting that humanitarian language is filtered through geopolitical interest.

Observable Implications: If this key idea is operative, one should observe NATO and other coalitions acting "out of area"; more robust peacekeeping mandates; transitional administrations and state-building missions; and the vocabulary of "protection" displacing older language of non-intervention. One should also observe backlash: Russian and Chinese resistance to R2P, African suspicion of Western humanitarianism, and declining willingness to authorize force after Libya. The liberal peace project should produce mixed outcomes—some stabilization and institutional reform, but also resentment, dependency, and, in cases such as Libya, state fragmentation. The observable signature is therefore not simply more intervention but a widening gap between humanitarian justification and political outcome.

Perspective Note (five traditions in brief):

African: The African perspective is shaped by a dual memory: the failure to prevent genocide in Rwanda in 1994 and the suspicion that "humanitarian" intervention can become a vehicle for Western power. African scholars and policymakers have often supported norms against mass atrocities while insisting that intervention be genuinely multilateral, regionally anchored, and attentive to African agency. Sierra Leone and Libya illustrate the ambivalence: external action may stop violence or remove a threatening regime, but it can also bypass African institutions, produce dependency, or leave fragmented states. From this vantage, R2P is valuable only if it is not selectively applied and if African voices help define the threshold, mandate, and exit strategy. The African critique is not simply anti-interventionist; it is a demand that humanitarianism be decoupled from paternalism and that sovereignty be understood as a responsibility to citizens rather than a license for external tutelage.

Chinese: The Chinese perspective treats humanitarian intervention with deep suspicion, viewing it as a potential instrument of Western hegemony and regime change. Beijing emphasizes sovereignty, non-intervention, and the dangers of mandate creep, particularly after Libya. China does not necessarily reject all protection of civilians, but it insists that force be authorized by the Security Council, limited in scope, and not used to overthrow governments. The Chinese position reflects both principled commitment to sovereign equality and strategic concern that intervention norms can be turned against states that challenge Western preferences.

Russian: The Russian perspective combines legal formalism with geopolitical grievance. Moscow emphasizes Security Council authorization, opposes unilateral or NATO-led intervention, and treats Kosovo and Libya as precedents in which humanitarian language concealed strategic expansion. Russia's experience of post-Cold War weakness and NATO enlargement informs its insistence that intervention norms be tightly constrained. From this vantage, R2P is acceptable only in narrow, Council-authorized form; broader interpretations are seen as threats to sovereignty and to Russia's own security environment.

Western: The Western perspective is internally divided. Liberal institutionalists and human-rights advocates argue that sovereignty cannot shield mass atrocities and that the international community has a duty to protect vulnerable populations. Realists and skeptics counter that intervention is often ineffective, costly, and prone to mission creep, and that humanitarian language can obscure strategic interests. The Western self-critical position acknowledges that Kosovo, Sierra Leone, and Libya produced both genuine protection and serious overreach, and that the credibility of R2P depends on consistency, restraint, and honest accounting of consequences.

UN: The UN perspective centers the tension between Charter principles and enforcement. The Charter prohibits the use of force except in self-defense or with Security Council authorization, yet mass atrocities create pressure to act outside that framework. The UN values procedural legitimacy, broad participation, and the restraining function of law, but it also recognizes that paralysis in the face of atrocity undermines the organization's moral authority. From this vantage, R2P is an attempt to bridge principle and practice, but its legitimacy depends on Council authorization, clear mandates, and fidelity to the original protective purpose rather than to regime change.

2.5 KEY IDEA 4 — Bretton Woods expansion: WTO (1995), Washington Consensus, and conditionality

Bolded Causal Claim: The post-Cold War expansion of the Bretton Woods order did not merely lower trade barriers; it restructured the relationship between sovereignty and market access by making domestic policy

conditional on externally validated economic orthodoxy, thereby converting development into a governance project administered through international institutions.

Mechanism: The original Bretton Woods compromise, often described as "embedded liberalism," allowed states to pursue domestic welfare and industrial policy while committing to multilateral trade liberalization. The post-Cold War expansion shifted the center of gravity from shallow integration—tariff reduction at the border—to deep integration, which reaches inside the state to regulate services, intellectual property, investment, competition policy, and regulatory standards. The World Trade Organization, established in 1995, institutionalized this shift through a legalized dispute-settlement system that made compliance less a matter of diplomatic bargaining and more a matter of adjudicated obligation. Accession protocols, especially for late entrants, often required extensive legislative and administrative reform before membership was granted. In parallel, the Washington Consensus—associated with John Williamson's 1990 formulation and later diffused through the IMF and World Bank—translated a particular model of market liberalization into loan conditionality: fiscal austerity, privatization, trade opening, deregulation, and, increasingly, "good governance" benchmarks. The mechanism is not simply coercion by a single hegemon, although US and European preferences mattered; it is a recursive process in which financing needs, debt overhang, credit ratings, and market access create incentives for governments to adopt reforms that they might not otherwise choose. Conditionality also works through epistemic authority: international financial institutions define what counts as sound policy, and their technical assessments become gatekeeping devices for capital. Ikenberry's institutionalist argument that great powers can lock in cooperation through rules is relevant here, but critical political economy—drawing on Cox's neo-Gramscian analysis and African dependency scholarship—suggests that the same institutions can discipline states and social groups in ways that reflect hegemonic class and geopolitical interests. The African concept of extraversion, developed by Bayart, is especially useful: external resources become a source of domestic political power, so African elites may align national policy with donor priorities not only because they are forced to, but because conditionality provides rents, legitimacy, and instruments of rule. In this sense, Bretton Woods expansion operated as both an economic and a political technology, reshaping the state's relationship to its own citizens by privileging externally certified reform over domestically negotiated development strategy.

Scope Conditions: The mechanism is strongest where states are heavily indebted, export-dependent, aid-reliant, or facing balance-of-payments crises, and where domestic coalitions for alternative development strategies are weak or fragmented. It is weaker where states possess large domestic markets, strategic leverage, diversified production, or sufficient fiscal autonomy to resist conditionality. China's accession to the WTO in 2001 illustrates selective integration: Beijing accepted rules that facilitated export-led growth while retaining state capacity, industrial policy, and capital controls in ways that many developing countries could not. The mechanism also depends on the credibility and functionality of enforcement institutions; when the WTO Appellate Body is paralyzed or when geopolitical rivalry overrides trade law, conditionality becomes more bilateral and less rules-based. In Africa, scope conditions include commodity dependence, colonial institutional inheritances, fragmented regional markets, and the historical weakness of industrial policy. The mechanism further assumes that conditionality can be implemented administratively; where state capacity is low, reforms may produce formal compliance without substantive transformation, a pattern sometimes described as isomorphic mimicry. Finally, the Washington Consensus is not uniformly harmful or beneficial: macroeconomic stabilization can restore fiscal sustainability, but the same package can be destructive where social safety nets are absent, public investment is cut, or liberalization exposes infant industries to premature competition. Rodrik's argument that there is no single recipe for growth, and Chang's claim that today's rich countries historically used protection and industrial policy, place important scope limits on the

universal applicability of the model.

Observable Implications: If the mechanism holds, one should observe tariff and quota reductions, expanded WTO membership, structural adjustment programs, privatization of state enterprises, reduced public spending in social sectors, and the incorporation of trade-related intellectual property and services rules into domestic law. One should also observe political reactions: protests against trade liberalization, as in Seattle in 1999; the Doha Round's prolonged deadlock over agricultural subsidies and special and differential treatment; and the rise of regional and plurilateral alternatives, including African continental integration efforts. The mechanism implies that countries with high exposure to conditionality will show reduced policy autonomy in macroeconomic and regulatory domains, while countries with geopolitical leverage will retain greater space. It also implies distributional consequences: export-oriented sectors and financial capital may gain, while smallholders, informal workers, and public-sector employees may bear adjustment costs. If the mechanism is overstated, one should instead observe substantial variation in compliance, successful industrial policy despite WTO rules, and conditionality that is negotiated, waived, or reversed when political costs rise. The African Continental Free Trade Area, for example, can be read both as an attempt to overcome externally imposed fragmentation and as a new layer of liberalization whose effects will depend on implementation capacity and distributional safeguards.

Perspective Note (five traditions in brief): African (primary): African scholarship and policy experience treat Bretton Woods expansion not as neutral development but as a continuation of unequal exchange and extraversion. Rodney's underdevelopment thesis and Nkrumah's neo-colonialism frame conditionality as sovereignty erosion disguised as technical assistance. Structural adjustment programs in the 1980s and 1990s cut public services, increased poverty, and undermined state capacity; African critics argue that "good governance" conditionality shifted blame for structural inequality onto African states. The African vantage highlights that liberalization without industrial policy, social protection, and historical redress reproduces dependency. Yet African policymakers have also used WTO accession, aid negotiations, and regional integration strategically, showing agency within constraint rather than passive subordination. Chinese: China's WTO accession is understood as strategic integration into rules while retaining state-led development; Beijing critiques the Washington Consensus as one-size-fits-all and promotes infrastructure finance and "developmental state" alternatives, but it also benefits from market access and uses rules to constrain competitors. Russian: Post-Soviet shock therapy and conditionality are remembered as humiliation and economic collapse; Moscow views the liberal economic order as a Western political project and seeks sovereignty, state capitalism, and alternative institutions such as the Eurasian Economic Union and BRICS. Western: Liberal institutionalism sees the WTO and conditionality as welfare-enhancing, reducing protectionism and locking in reforms; self-critique acknowledges overreach, ignored distributional costs, and double standards, especially agricultural subsidies. UN: The UN development perspective emphasizes policy space, the right to development, and coherence between trade, human rights, and the Sustainable Development Goals; conditionality should not undermine social protection or the capacity of states to pursue equitable development.

2.6 KEY IDEA 5 — 9/11 and the fracture of the liberal consensus: unilateralism, the 'war on terror', and the limits of international law

Bolded Causal Claim: The post-9/11 "war on terror" fractured the liberal order not simply by producing unilateral force, but by converting a legal and institutional framework designed for interstate war and criminal justice into an open-ended, geographically unbounded security paradigm that normalized exceptional powers and eroded the distinction between law and war.

Mechanism: The attacks of September 11, 2001, created a shock that reclassified terrorism from a criminal and policing problem into an act of war, thereby activating war powers, military doctrines, and emergency authorities that had been designed for interstate conflict. The Authorization for Use of Military Force of 2001 provided a broad legal basis for operations against al-Qaeda and associated forces, while the 2002 National Security Strategy articulated a doctrine of preventive war that stretched the traditional legal categories of self-defense and imminence. The mechanism of fracture operates through several channels. First, legal category collapse: detainees were placed in a status that was neither prisoner of war nor ordinary criminal suspect, producing Guantanamo, military commissions, and "enhanced interrogation." Second, geographic unboundedness: operations extended to states not directly responsible for 9/11, most notably Iraq in 2003, and later to targeted killing in Pakistan, Yemen, and Somalia. Third, alliance management: NATO's Article 5 invocation initially produced solidarity, but the Iraq invasion divided allies and weakened the perception that US power was embedded in collective decision-making. Fourth, legitimacy erosion: the liberal order's authority depends on the claim that power is constrained by law and procedure; when the hegemon asserts exceptions, it weakens the normative constraints that it asks others to accept. Kagan's 2003 argument that Americans are from Mars and Europeans from Venus captures a transatlantic divergence over the use of force, but the deeper issue is that the war on terror made the United States both the enforcer and the exception within the same order. The mechanism also works through imitation and backlash: other states can invoke counterterrorism to justify repression, surveillance, or cross-border force, while targeted populations and rival powers frame US actions as proof that liberal norms are instrumental. International law did not disappear; rather, its limits were exposed. The UN Charter permits force in self-defense or with Security Council authorization, but the war on terror created pressure to reinterpret self-defense to include preventive action against non-state actors in states deemed "unwilling or unable." This reinterpretation may have been intended to close a legal gap, but it also weakened the restraining function of the Charter and made the boundary between lawful and unlawful force more contested.

Scope Conditions: The mechanism is strongest when threat perception is high, executive power is concentrated, legislative oversight is weak, and allies are either supportive or unable to constrain the hegemon. It is weaker where domestic courts, legislatures, civil society, or allied governments impose procedural limits, as occurred in some European responses to rendition and surveillance. The mechanism also depends on the nature of the threat: non-state terrorism does not fit neatly into territorial sovereignty, making legal categories genuinely difficult, but that difficulty can be exploited to expand authority. It is more likely where the hegemon possesses global military reach and where international institutions lack enforcement capacity against powerful states. Conversely, it is less likely where the threat is localized, where multilateral frameworks are robust, or where the hegemon's relative power is declining and it must rely more on consent. The scope conditions include not only US domestic politics but also the prior credibility of the liberal order: if institutions are seen as legitimate, exceptions are more damaging; if they are already viewed as instruments of power, the fracture may be less a rupture than a revelation.

Observable Implications: If the mechanism holds, one should observe military operations without Security Council authorization, the expansion of detention and surveillance powers, targeted killing programs, allied criticism and non-cooperation, and the invocation of counterterrorism by other states to justify repression or intervention. One should also observe legal debates over the "unwilling or unable" doctrine, the status of non-state actors under the laws of war, and the relationship between human rights law and international humanitarian law. The mechanism implies that the liberal order's legitimacy becomes more contested, that multilateral cooperation becomes more transactional, and that the distinction between law and security policy becomes blurred. If the mechanism is overstated, one should instead observe institutional adaptation:

stronger oversight, revised detention policies, alliance repair, and renewed commitment to multilateral counterterrorism frameworks. The mechanism does not imply that international law became irrelevant; rather, it implies that the gap between legal aspiration and political practice widened, and that this gap became a site of contestation rather than a settled hierarchy.

Perspective Note (five traditions in brief): African (primary): African states and scholars view the war on terror as a securitization project that recasts African conflicts as terrorism, justifies foreign military presence, and sidelines development, governance, and human security. US Africa Command, drone bases, and counterterrorism partnerships are often seen as sovereignty infringements and as the militarization of aid; African critics note selective application, in which state violence is ignored while non-state violence is elevated. The African vantage also reveals complicity: some African governments leverage counterterrorism frameworks for regime security, external funding, and the suppression of dissent, reproducing extraversion under a new vocabulary. This does not negate the reality of terrorist threats in the Sahel, Horn of Africa, or elsewhere, but it insists that security responses be evaluated by their effects on civilian protection, state legitimacy, and regional ownership. Chinese: Beijing opposes unilateral force and regime change, stresses sovereignty and non-interference, and uses the war on terror to justify its own security policies; it also positions itself as a defender of the UN Charter and multipolarity, while benefiting from US overreach that weakens Western legitimacy. Russian: Moscow initially cooperated against terrorism but frames NATO expansion and US unilateralism as encirclement; it invokes counterterrorism precedents for its own interventions while criticizing Western double standards, and it treats the war on terror as evidence that liberal norms are subordinate to power. Western: Liberal self-critique, including human rights advocacy and institutionalist analysis, condemns torture, detention without trial, and preventive war; Kagan's 2003 transatlantic framing highlights divergent attitudes toward force, while Wheeler's work on humanitarian intervention reminds readers that liberal powers have long struggled to reconcile values with rules. UN: The UN perspective centers the Charter's limits on force, international humanitarian law, and human rights; Security Council authorization remains the preferred source of legitimacy, and UN counterterrorism frameworks attempt to balance security with due process, even though enforcement against powerful states remains weak.

SECTION 2.7 — FIVE PERSPECTIVES IN DEPTH

2.7.1 African Perspective (PRIMARY)

The African vantage point on the post-Cold War liberal order begins from a historical experience in which sovereignty was not granted but seized, and in which the language of universal progress often appeared as a reorganization of external authority rather than its abolition. From this standpoint, the five developments examined in this lesson—the unipolar moment, the end-of-history thesis, humanitarian intervention and the liberal peace project, Bretton Woods expansion, and the post-9/11 fracture—are not separate episodes but facets of one problem: the persistence of hierarchical power beneath universalist language. Siba N. Grovogui's argument that African states occupy a condition of quasi-sovereignty is central to this reading. Formal independence coexists with external control over security, finance, and normative legitimacy, so that the post-Cold War order is experienced not as the triumph of self-determination but as a new modality of tutelage. Krauthammer's unipolar moment, read from this position, is not merely a description of American primacy; it is an institutional environment in which African governments must seek recognition, resources, and security guarantees from a single center of power. The liberal presumption of permanent Western primacy therefore naturalizes an asymmetry that African political thought has long identified as colonial in

structure, even when it is exercised through multilateral institutions, donor conferences, or technical assistance.

Fukuyama's end-of-history thesis is received with particular suspicion. Walter Rodney's underdevelopment thesis and Kwame Nkrumah's analysis of neo-colonialism suggest that capitalist modernity and liberal democracy are not neutral endpoints but systems that have historically extracted surplus, constrained autonomous development, and subordinated African economies to external markets. Achille Mbembe's work on the postcolony emphasizes that African states are not failed versions of Western modernity but sites of complex, often violent, political creativity; to measure them against an "end of history" is to misread their trajectories through a teleology that privileges Western experience. Mahmood Mamdani's analysis of citizen and subject highlights how colonial legal categories produced bifurcated states in which rural populations were governed through customary authority while urban elites accessed modern rights; post-Cold War liberal reforms often reinforced technocratic governance, elections, and donor conditionality rather than democratic citizenship rooted in social equality. Thus democratic transitions celebrated in Freedom House data may be read as externally calibrated openings whose durability depends on donor priorities, security partnerships, and commodity prices. The African perspective does not deny the value of rights, elections, or constitutionalism; it questions whether liberal democracy as endpoint exhausts political possibility. Amílcar Cabral and Frantz Fanon insist that liberation is not the transfer of power to a Western model but the creation of new social relations; Julius Nyerere's ujamaa, whatever its economic failures, exemplified an attempt to theorize development from African social realities rather than from imported blueprints. Oyèrónkẹ́ Oyěwùmí's critique of gendered epistemologies reminds us that the "universal" liberal subject is historically gendered and Western; applying it uncritically risks reproducing exclusions that African feminist scholarship has long identified. The contribution here is epistemic: the African perspective refuses the assumption that Western institutional forms are the natural terminus of political development.

Humanitarian intervention produces the sharpest African skepticism, but that skepticism is not indifference to suffering. It arises from experience of selective protection. Rwanda in 1994 demonstrated the catastrophic failure of the international community to act; Sierra Leone in 2000 showed that intervention can restore order and protect civilians; Libya in 2011 showed that protection can slide into regime change and state collapse. The African perspective asks a question that liberal theory often evades: who decides when sovereignty yields, and whose suffering counts? The responsibility to protect, as articulated in the 2005 World Summit Outcome, has three pillars—state responsibility, international assistance, and timely response—but implementation has been geopolitically uneven. African scholars and policymakers often support protection in principle while fearing the precedent of great-power intervention, especially when the intervening powers are also the architects of the economic order that constrains African states. The African Union's principle of non-indifference, adopted in the 2000 Constitutive Act, is an African attempt to claim regional authority over intervention rather than reject intervention altogether; yet capacity and finance gaps leave the continent dependent on external actors. Nicholas J. Wheeler's analysis of saving strangers captures the liberal dilemma of reconciling values with rules; the African perspective adds that strangers are not saved equally, and that "humanitarian" language can obscure strategic interests, racial hierarchies, and the political economy of intervention. Mamdani's analyses of political violence warn against moralized narratives that simplify complex conflicts into good and evil, thereby enabling intervention without understanding local power structures. African feminist and security scholarship, including work associated with Sylvia Tamale and others, highlights that interventions often ignore gendered harms, local women's agency, and the long-term social costs of militarized protection. The African contribution is therefore not a simple defense of sovereignty but a demand that protection be accountable to affected populations rather than only to Western publics, and that

sovereignty—however abused by postcolonial elites—remain a shield against arbitrary external power.

Bretton Woods expansion is read through the lens of material constraint. Rodney and Nkrumah frame conditionality as neo-colonialism: formal political independence with economic dependence. Structural adjustment programs in the 1980s and 1990s constrained industrial policy, privatized public services, and prioritized debt repayment; WTO accession and agreements such as TRIPS locked in rules that favored capital-exporting states and intellectual-property holders. Jean-François Bayart's analysis of the politics of the belly shows that African elites could instrumentalize external resources, but structural constraints on policy space remain. The Washington Consensus treated market liberalization, privatization, and fiscal austerity as technical necessities rather than political choices; African economists and policymakers have contested this, arguing for policy space, infant-industry protection, regional integration, and development-oriented trade rules. The African perspective contributes a materialist critique: the liberal order's legitimacy depends not only on rights and procedures but on development outcomes, and conditionality can undermine democratic accountability by shifting consequential policy decisions to creditors, rating agencies, and international financial institutions. It also insists that the WTO is not a neutral arbiter but a site of asymmetric bargaining in which African states, often fragmented and dependent on commodity exports, face structural disadvantages. This perspective can occlude the agency of African elites, the role of domestic corruption, and cases in which external conditionality produced macroeconomic stabilization; but it correctly identifies the asymmetry of global economic governance and the way in which sovereignty is hollowed out not only by coups but by debt, trade rules, and aid dependence.

The post-9/11 fracture is experienced in Africa as a securitization of the continent. The war on terror redirected development and security agendas, militarized borders, and strengthened partnerships with authoritarian regimes willing to cooperate against terrorism. The establishment of AFRICOM in 2007 institutionalized a US military presence that many African scholars and civil-society actors viewed with suspicion, not because security cooperation is illegitimate but because it risked subordinating African priorities to external threat perceptions. The discourse of "ungoverned spaces" reproduced colonial tropes and justified external intervention in the Sahel and Horn of Africa. The African perspective reveals that the liberal consensus fractured not only in Western capitals but in African experience: human rights rhetoric coexisted with rendition, drone strikes, and support for repressive regimes. African security scholarship, including work by Kwesi Aning and others, emphasizes that African security governance is shaped by external securitization as much as by local conflict dynamics. The result is a distinctive African critique: the liberal order's crisis is not merely normative hypocrisy but structural, because a system that predicates rights on security cooperation will subordinate rights wherever security interests dominate. The African vantage point thus contributes what the other four perspectives often miss: a view from the receiving end of order, where universalism is tested by material outcomes, selective protection, and the lived experience of conditional sovereignty.

The African perspective also has occlusions that must be acknowledged if it is to be steel-manned rather than romanticized. It can romanticize sovereignty and understate cases in which external intervention, conditionality, or international norms produced genuine protection or reform. It may not fully theorize how to reconcile noninterference with the protection of civilians in mass-atrocity situations, a dilemma that African regional institutions themselves confront. It can risk treating all Western action as imperial, thereby obscuring genuine normative commitments among Western publics, diplomats, and scholars. Yet its central corrective remains indispensable: it prevents the liberal order from being evaluated only by its intentions and forces attention to the distribution of power, voice, and vulnerability within that order.

2.7.2 Chinese Perspective

The Chinese perspective on the post-Cold War liberal order is anchored in a historical narrative of national humiliation, sovereignty recovery, and developmental catch-up. From this standpoint, the unipolar moment is not a benign hegemony but a condition of strategic vulnerability: Krauthammer's presumption of permanent Western primacy appears as an ideological justification for American dominance in a world that China believes should be multipolar. The end-of-history thesis is read as a form of ideological closure, a claim that liberal democracy and market capitalism are the final stage of political development and therefore a license to pressure states that organize their political economies differently. Chinese international-relations scholarship and official discourse typically insist that development paths are plural and that the right to choose one's own model is itself a core norm of international order. This is not merely rhetorical; it reflects the Chinese experience of reform and opening, in which integration into global markets was pursued without abandoning state-led development or party-state authority.

On humanitarian intervention, the Chinese perspective is shaped by Kosovo in 1999 and Libya in 2011. Kosovo, undertaken without Security Council authorization, is treated as a dangerous precedent: it suggests that powerful states can redefine the limits of force by invoking moral urgency. China's abstention on Resolution 1973 in 2011, followed by sharp criticism of NATO's expansion of the mandate into regime change, reinforced the view that responsibility to protect can be instrumentalized. The Chinese position is not necessarily opposition to civilian protection; it is insistence that protection must be authorized by the Security Council, constrained by mandate, and not converted into a vehicle for regime change. This reflects a broader Chinese commitment to sovereignty and noninterference, often associated with the Five Principles of Peaceful Coexistence, and to the view that the Charter's limits on force are the primary safeguard against great-power abuse. The contribution of this perspective is to expose the selectivity of humanitarian intervention and to defend procedural legitimacy; its occlusion is that sovereignty can become a shield for state violence, and that noninterference may protect governments rather than populations.

Bretton Woods expansion is evaluated pragmatically. China's accession to the WTO in 2001 is treated as a strategic success: integration on terms that allowed export-led growth, industrial upgrading, and state capacity. At the same time, Chinese discourse criticizes the Washington Consensus as an overreach of market ideology and emphasizes the legitimacy of state intervention, industrial policy, and gradual reform. The Chinese perspective thus accepts global economic integration while rejecting the premise that liberalization is universally optimal. It contributes a developmental critique of conditionality and a demonstration that alternative paths to growth exist; it occludes, however, the coercive aspects of China's own economic statecraft and the ways in which its rise creates new dependencies.

After 9/11, China cooperated with counterterrorism frameworks but opposed the 2003 invasion of Iraq, viewing it as unilateralism that fractured the liberal consensus and damaged the authority of the Security Council. The Chinese perspective treats the war on terror as evidence that liberal norms are subordinate to power when core security interests are invoked. Its strength is a consistent defense of multilateral authorization and a warning against the politicization of human rights; its weakness is a tendency to treat sovereignty as an absolute that can obscure accountability for mass violence. Overall, the Chinese view contributes a necessary counterweight to Western normative universalism, but it risks replacing one form of hierarchy with another.

2.7.3 Russian Perspective

The Russian perspective is shaped by the experience of Soviet collapse, economic dislocation, and the perceived humiliation of the 1990s. From this vantage point, the unipolar moment is not an opportunity for liberal construction but a period of Western triumphalism in which Russia was treated as a defeated power rather than an equal. Fukuyama's end-of-history thesis is read as ideological closure that delegitimized Rus-

sian political and economic alternatives and justified external interference in post-Soviet space. The liberal order, in this reading, was never genuinely universal; it was a Western order that demanded conformity while denying Russia the status of a great power with legitimate security interests.

Humanitarian intervention is central to Russian grievance. Kosovo in 1999, conducted without Security Council authorization, is treated as a precedent that undermined the Charter's limits on force and demonstrated that Western powers would bypass the UN when convenient. Libya in 2011 reinforced this view: Russia's abstention on Resolution 1973 was followed by criticism that NATO exceeded the mandate and pursued regime change. The Russian perspective insists that Security Council authorization is not a procedural formality but the core of international legitimacy, and that humanitarian language can mask geopolitical expansion. NATO enlargement eastward is interpreted through this lens as encirclement, a security dilemma in which Western institutional expansion is experienced as threat rather than liberation. The contribution here is a realist reminder that order depends on the consent of major powers and that normative universalism can provoke backlash; the occlusion is that Russian security claims are often used to justify coercion against neighbors and to deny their agency.

Bretton Woods expansion is associated in Russian memory with the shock therapy of the 1990s, economic collapse, and the loss of state capacity. WTO accession, achieved only in 2012, came after a long period of skepticism about whether liberal economic rules served Russian interests. The Russian perspective tends to view conditionality and market liberalization as instruments of Western influence, and it favors state control over strategic sectors. Its contribution is to highlight the political costs of rapid liberalization and the importance of economic sovereignty; its occlusion is a tendency to attribute domestic failures primarily to external manipulation.

After 9/11, Russia initially cooperated with the United States against terrorism, but the 2003 Iraq invasion fractured that cooperation and reinforced the view that the liberal consensus was subordinate to American unilateralism. The war on terror is read as a framework that legitimized exceptional measures, preventive war, and the erosion of international law. The Russian perspective thus treats the post-Cold War liberal order as a Western project whose universalist claims were always constrained by power, and whose crisis was inevitable once American primacy encountered resistance. Its strength is attention to great-power security dilemmas and institutional legitimacy; its weakness is a selective invocation of sovereignty and international law that does not consistently constrain Russian behavior.

2.7.4 Western Perspective

The Western perspective on the post-Cold War liberal order is internally divided between liberal institutionalism and liberal self-critique, but it shares a common premise: that the order was a genuine, if imperfect, attempt to generalize norms of democracy, human rights, and market openness. Krauthammer's unipolar moment is read not only as a description of power but as a responsibility: American primacy could be used to build institutions that would outlast unipolarity. Ikenberry's argument in After Victory is central here—the United States, as a hegemon, had an interest in binding itself and others through institutions, thereby converting raw power into durable order. Fukuyama's end of history provided an ideological horizon, suggesting that the collapse of communism had removed the principal alternative to liberal democracy and that the task of politics was now institutional consolidation rather than ideological contestation.

Humanitarian intervention is a defining Western dilemma. Wheeler's analysis of saving strangers captures the tension between sovereignty and human rights, while Kosovo in 1999 is often defended as a necessary, if legally contested, response to mass atrocities. The liberal peace project—combining democratization, mar-

ket reform, and international administration in post-conflict settings—reflects a confidence that institutions can be transplanted and that peace can be built. Yet Western self-critique is equally important: the Iraq war, Abu Ghraib, Guantanamo, and extraordinary rendition are treated by many Western scholars, jurists, and civil-society actors as betrayals of liberal values. Kagan's transatlantic framing in Of Paradise and Power highlights divergent attitudes toward force, with Europeans often emphasizing law and Americans emphasizing power, but both operate within a shared liberal vocabulary. The Western perspective contributes normative innovation, institutional design, and a capacity for self-criticism; its occlusion is a tendency to treat Western experience as universal, to underestimate the coercive dimensions of liberal peacebuilding, and to apply standards selectively.

Bretton Woods expansion is defended as a framework for growth and integration. The WTO, the Washington Consensus, and conditionality are seen as mechanisms for reducing trade barriers, stabilizing economies, and encouraging reform. Western institutionalists acknowledge that conditionality could be intrusive and that the Washington Consensus was later revised, but they argue that rules-based economic governance is preferable to discretionary power. The Western perspective contributes a belief in institutional solutions and the possibility of reform; it occludes the asymmetries of bargaining power and the ways in which rules can lock in advantages for capital-exporting states.

After 9/11, the Western consensus fractured. The war on terror produced preventive war, detention without trial, and torture, all of which generated intense internal critique. Liberal self-critique condemns these practices as violations of the very norms the order claims to uphold. The Western perspective therefore contains both the defense of liberal order and the most searching critique of its abuses. Its strength is normative reflexivity; its weakness is that self-critique often arrives after damage has been done and may not alter structural power.

2.7.5 UN Perspective

The UN perspective centers the Charter's principles, the Security Council's authority, and the gap between normative aspiration and enforcement. From this standpoint, the post-Cold War liberal order is not identical with Western power; it is a contested arena in which universal principles are negotiated among member states. The unipolar moment poses a problem for the UN because American primacy can bypass or instrumentalize the organization, yet the UN remains the principal source of international legitimacy. The end-of-history thesis is not an official UN doctrine; rather, the UN's universal membership implies that no single ideology can be imposed as the terminus of political development. The organization's role is to mediate among diverse systems, not to certify one as final.

Humanitarian intervention is the UN's central dilemma. The Brahimi Report of 2000, responding to failures in Rwanda and Srebrenica, called for more robust peacekeeping, clearer mandates, and better resources. The responsibility to protect, endorsed at the 2005 World Summit, represents an attempt to reconcile sovereignty with protection, but the UN perspective insists that force must be authorized by the Security Council. Kosovo in 1999, undertaken without authorization, is a stress case: it protected civilians but weakened the Charter's procedural constraints. Libya in 2011 showed both the possibility and the danger of Council-authorized protection, as mandate interpretation became contested. The UN perspective contributes a procedural and legal framework for legitimacy; its occlusion is that Security Council authorization reflects the power of the permanent five, not necessarily global consensus.

Bretton Woods expansion creates tension within the UN system. The WTO and international financial institutions operate with different mandates and governance structures, often emphasizing market liberalization

and conditionality, while UN development agencies emphasize human development, social protection, and the right to development. The UN perspective highlights the incoherence of global governance: economic rules can undermine social and human-rights goals. It contributes a holistic view of development and a reminder that economic policy is not technocratically neutral; it occludes the difficulty of reconciling diverse member-state interests and the weakness of UN enforcement.

After 9/11, the UN developed counterterrorism frameworks, including resolutions requiring states to criminalize terrorist financing and cooperate in law enforcement. The UN perspective seeks to balance security with due process, human rights, and the rule of law. It insists that counterterrorism must not become a pretext for arbitrary detention, torture, or the erosion of civil liberties. Yet enforcement against powerful states remains weak, and the Security Council's counterterrorism architecture can be politicized. The UN perspective's strength is its commitment to universal principles and procedural legitimacy; its weakness is dependence on the very powers it seeks to constrain. Overall, it reveals the post-Cold War liberal order as a system in which norms are stronger than enforcement, and in which the gap between Charter principles and practice is not an anomaly but a structural feature.

2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Exposes the postcolonial asymmetry of "humanitarian" war: Kosovo was legible as a crisis requiring force while Rwanda was not, and intervention without African consent risks neo-imperial protection.	Can understate Serbian atrocities and Kosovar Albanian agency; may treat sovereignty as more protective than it was for civilians inside Serbia/Yugoslavia.	Conditional sovereignty and anti-imperial non-intervention, with growing support for African-led protection after Rwanda and Sierra Leone.	OAU/AU non-intervention norms; Rwanda inaction; ECOWAS/UK role in Sierra Leone; later Libya fallout.	Western: sovereignty cannot be a shield for ethnic cleansing; inaction is also a political choice with moral costs.

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Chinese	Defends Charter legality and UNSC authority; warns that bypassing the Council turns humanitarian language into hegemonic practice.	Can instrumentalize sovereignty to protect allied or strategically useful regimes; often subordinates human-rights claims to order.	State sovereignty, territorial integrity, and multipolar legality under the UN Charter.	Opposition to Kosovo; later Libya and Syria vetoes; emphasis on non-interference in internal affairs.	African/Western: absolute sovereignty can enable mass atrocities and leave victims without protection.
Russian	Highlights precedent, encirclement, and the dangers of NATO acting as a self-authorized global police force.	Geopolitical self-interest is often presented as legal principle; later interventions undermine its own legalism.	Great-power prerogatives, multipolar balance, and UNSC-centered authorization.	Opposition to Kosovo; NATO expansion grievances; later use of humanitar-ian/security rhetoric in Georgia and Crimea.	Western: Russia's own uses of force show that its legalism is selectively enforced.
Western	Supplies moral urgency, institutional capacity, and a self-critical vocabulary for judging intervention.	Universalizes Western norms and can obscure power asymmetry, civilian harm, and the imperial residue of "saving strangers."	Liberal interna-tionalism: human rights, democratic governance, and institution-alized cooperation.	NATO Kosovo campaign; R2P debates; post-intervention administration and war-crimes accountability.	African: selective humanity and intervention without consent reproduce imperial hierarchies.

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
UN	Provides the Charter framework, procedural legitimacy, and a compromise language (R2P) between sovereignty and protection.	Enforcement depends on the same powers it seeks to constrain; Council paralysis is structural, not accidental.	Collective security, rule of law, and the gap-closing ambition of R2P.	UNSC deadlock over Kosovo; post-Kosovo R2P debates; peacekeeping and transitional administration.	Western: proceduralism can legitimate inaction while atrocities continue.

2.8 WORKED EXAMPLE (I do)

Levels of analysis. At the **individual** level, the Kosovo crisis turns on the agency of Slobodan Milošević, who gambled that NATO would not bomb and then that Serbia could outlast air power; on NATO leaders such as Bill Clinton and Tony Blair, who framed the campaign as a moral necessity; and on Kosovar Albanian leaders and civilians whose displacement and testimony made the crisis visible. At the **state** level, Serbia/Yugoslavia defended territorial integrity and regime survival, while NATO states weighed alliance credibility, domestic opinion, and post-Cold War European order; Russia, though weakened, asserted great-power status through diplomatic opposition. At the **systemic** level, the intervention occurred in the "unipolar moment": the United States enjoyed unmatched military primacy, NATO was expanding eastward, and the Security Council was paralyzed by the prospect of Russian and Chinese vetoes. At the **transnational** level, refugee flows, diaspora mobilization, human-rights reporting, media images of atrocity, and the emerging norm of humanitarian intervention all shaped what states felt compelled to do and how they justified it.

Mechanism section. The mechanism was not simply "human rights caused war." Rather, coercive diplomacy at Rambouillet failed because the proposed settlement threatened Serbian sovereignty and Milošević calculated that NATO lacked resolve; NATO then substituted an air campaign for ground invasion, relying on military asymmetry and the expectation that Serbian elites would bear costs they could not sustain. The bombing's coercive effect worked through infrastructure destruction, elite pressure, and the credible threat of escalation, while Serbian forces simultaneously accelerated ethnic cleansing, producing the very humanitarian catastrophe the intervention claimed to stop. The outcome—Serbian withdrawal, UN administration, and eventual Kosovo independence—depended on the interaction of NATO military pressure, Russian diplomatic mediation, and the absence of a viable Serbian alternative. The mechanism therefore combined normative framing, alliance cohesion, military coercion, and adversary cost-benefit calculation; it did not operate as an automatic enforcement of human rights.

Perspective reconstruction. The **African** perspective, which must be read first and at greatest length, begins from the postcolonial suspicion that "humanitarian" force is never distributed evenly across the globe: Kosovo became an urgent moral emergency in Western capitals while Rwanda, only five years earlier, produced inaction, and this asymmetry reveals how the category of "humanity" is politically constructed rather than universally applied. From this vantage, NATO's bypassing of the Security Council was not a technical

legal defect but a reassertion of imperial prerogative, in which powerful states decide whose suffering counts and whose sovereignty may be overridden, while weaker states—especially in Africa—remain exposed to arbitrary intervention. African scholarship and diplomacy have long treated sovereignty as a hard-won shield against external domination, not as an abstract legalism, and the Kosovo precedent therefore looked less like liberation than like a license for selective force. Yet the African perspective is not merely anti-interventionist: the failures in Rwanda and the ECOWAS/UK experience in Sierra Leone showed that non-intervention can also be lethal, producing an African ambivalence that later shaped the African Union's "non-indifference" doctrine. Thus Kosovo is read as a warning that protection without consent, accountability, and equal application risks becoming neo-imperialism wearing humanitarian clothes. The **Chinese** perspective treats Kosovo as a case of Western hegemony overriding Charter legality: NATO acted without Security Council authorization, established a precedent for intervention in internal affairs, and demonstrated that "humanitarian" language could be used to bypass the UN's collective-security machinery. The **Russian** perspective adds the experience of humiliation and encirclement: Kosovo occurred alongside NATO expansion, weakened Russia's diplomatic weight, and created a precedent that Moscow later cited and also exploited, revealing how great-power grievance and legal objection became intertwined. The **Western** perspective, especially in its liberal-internationalist form, defended the intervention as morally necessary and "illegal but legitimate," arguing that NATO prevented further ethnic cleansing and upheld a community of democratic values; its self-critical wing, however, acknowledges civilian casualties, the absence of UN authorization, and the dangerous precedent later invoked for Iraq. The **UN** perspective centers the gap between Charter principles and enforcement: Kosovo exposed the Security Council's inability to act when permanent members disagree, and it pushed the organization toward R2P as an attempt to reconcile sovereignty with protection, while leaving enforcement dependent on the very powers the Charter was meant to constrain.

Explicit adjudication. The Western perspective best explains why NATO leaders believed they had to act and why the campaign was politically sustainable, but it underexplains why the same moral vocabulary was not applied in Rwanda and why the intervention's legitimacy remained contested. The African perspective best explains that contestation: it captures the postcolonial asymmetry, the fear of selective force, and the way Kosovo became a precedent for later interventions, though it can understate the scale of Serbian atrocities and the agency of Kosovar Albanians. The Chinese and Russian perspectives correctly identify the legal breach and great-power stakes, yet they risk reducing humanitarian concern to geopolitics and can shield abusive sovereignty. The UN perspective best explains the institutional dilemma—how to protect civilians without destroying Charter legality—but it cannot resolve the enforcement gap on its own. Overall, the case is best explained by combining the systemic perspective (unipolar primacy and Council paralysis made NATO action possible) with the African perspective (the intervention's legitimacy was permanently damaged by asymmetry and the absence of consent), while recognizing that neither fully accounts for Serbian decision-making or the mixed humanitarian outcome.

SECTION 2.9 PROBLEM PAIR (We do)

Tasks

1. **Mechanism.** Explain how the 2003 Iraq invasion was justified through a combination of WMD claims, regime-change language, democracy promotion, and humanitarian framing. Distinguish descriptive claims (what was asserted about Iraq) from explanatory mechanisms (why the invasion became possible and attractive to decision-makers).

2. **Perspective reconstruction.** Reconstruct the African, Chinese, Russian, Western, and UN perspectives on the invasion and the "coalition of the willing." For each, identify one contribution and one occlusion.

3. **Legal comparison.** Compare Iraq 2003 with Kosovo 1999 on three dimensions: UN Security Council authorization, claims of self-defense, and the legitimacy of coalition action outside formal UN command.

4. **Falsifiers.** Specify what evidence would weaken (a) the threat-based explanation that Iraq posed an imminent danger requiring preventive war, and (b) the hegemony-based explanation that the invasion expressed unipolar liberal primacy.

5. **Consequences.** Trace how the invasion affected NATO cohesion, UN authority, international law, the responsibility-to-protect agenda, and liberal institutionalist claims about rules-based order.

6. **Historical analogue.** Propose one historical analogue for the 2003 invasion and state clearly why the analogy is partial rather than exact.

MODEL ANSWER

The 2003 invasion of Iraq is best explained as the collision of three mechanisms rather than as the simple execution of a single doctrine. First, the unipolar moment described by Krauthammer created a structural condition in which the United States possessed both the military capability and the political confidence to act without universal consent. Second, the post-9/11 securitization of threat transformed preventive war from an exceptional measure into a normalized instrument of counterterrorism, collapsing the distinction between imminent attack and latent capability. Third, the liberal order's own normative vocabulary—human rights, democracy, rogue states, weapons of mass destruction, and regime change—provided a public justification that made unilateral action appear as the enforcement of universal values rather than as the assertion of national interest. In this sense, the invasion was not merely a deviation from liberal internationalism; it was a deformation produced by liberal internationalism's confidence that Western primacy and normative universalism were aligned.

The descriptive claims about Iraq—active WMD programs, links to terrorism, and imminent threat—were later undermined by the failure to find stockpiles and by the weakness of the intelligence case. But the explanatory mechanism does not depend on those claims being true. The mechanism depends on how decision-makers interpreted uncertainty, how coalition politics rewarded resolve, and how the absence of a balancing great-power coalition lowered the expected cost of action. The "coalition of the willing" mattered not only because it supplied troops and legitimacy, but because it demonstrated that the United States could assemble a usable coalition outside the UN Security Council when formal authorization was blocked. That practice exposed a central tension in the post-Cold War order: institutions could constrain power only when powerful states accepted constraint.

From an African perspective, the invasion reinforced skepticism that "humanitarian" or "security" language could be separated from imperial practice. African states and scholars, drawing on experiences from Sierra Leone to Libya, often read the coalition as an assertion of Western prerogative over sovereignty, with oil, regional dominance, and regime change operating beneath the language of liberation. The occlusion in this

reading is that it can understate the genuine fear of WMD proliferation and the internal brutality of the Iraqi regime, reducing all intervention to domination. From a Chinese perspective, the invasion illustrated the dangers of unipolar hegemony and the need for multipolarity, sovereignty, and non-interference; China's critique of humanitarian intervention as Western hegemony gained force, though it risked treating sovereignty as an absolute shield against accountability. From a Russian perspective, the war confirmed humiliation and encirclement, accelerating the view that NATO and US power were not merely defensive but expansionary; yet this reading could obscure Russia's own authoritarian consolidation and its selective use of sovereignty norms. From a Western perspective, liberal institutionalism offered both justification and self-critique: the war was defended as enforcement of international norms, but its aftermath—insurgency, Abu Ghraib, and institutional fracture—became evidence that power without legitimacy erodes the very order it claims to protect. The UN perspective highlighted the gap between Charter principles and enforcement: Resolution 1441 did not explicitly authorize force, yet the invasion proceeded, revealing that the Security Council's authority depends on the willingness of its most powerful members to be bound.

Compared with Kosovo 1999, Iraq 2003 was less legally ambiguous in one sense and more damaging in another. Kosovo lacked explicit Security Council authorization but was framed as an exceptional humanitarian response to atrocities and ethnic cleansing; Iraq was framed through WMD and terrorism, with regime change becoming an explicit objective. Kosovo strained NATO and international law but did not destroy the presumption that force required some multilateral justification; Iraq made the "coalition of the willing" a template for bypassing the UN when authorization was unavailable. The falsifiers are therefore clear. The threat-based explanation would be weakened by evidence that intelligence was knowingly distorted, that diplomatic alternatives were not exhausted, or that postwar planning was subordinated to ideological assumptions. The hegemony-based explanation would be weakened by evidence that the invasion was driven primarily by genuine threat assessment, that coalition partners exercised independent influence, or that the United States accepted binding multilateral constraints afterward. In fact, the weak postwar planning and the absence of WMD discovery strengthened the hegemony critique, while the continued reliance on UN resolutions and coalition diplomacy complicated any purely imperial reading.

The consequences extended well beyond Iraq. NATO cohesion suffered as France and Germany opposed the invasion, while the UN's authority was damaged by the spectacle of a major war launched without clear Council authorization. International law was strained by the normalization of preventive war and by debates over occupation, torture, and targeted killing. The responsibility-to-protect agenda, already fragile after Rwanda and Kosovo, became more contested because critics could associate humanitarian language with regime change. Liberal institutionalism did not collapse, but its claim that rules constrain power was exposed as conditional: rules bind most reliably when they serve the interests of the powerful. The central lesson is that the liberal order's normative vocabulary can be mobilized to justify both multilateral restraint and unilateral coercion, and that the difference between the two is determined less by language than by whether power accepts institutional limits.

SECTION 2.10 INDEPENDENT MEMO (You do)

(a) Case description. In March 2011, a coalition led by France, the United Kingdom, and the United States intervened militarily in Libya after the UN Security Council authorized "all necessary measures" to protect civilians under Resolution 1973. The intervention occurred amid the Arab Spring, with Muammar Qaddafi's forces advancing on Benghazi and Western governments invoking the responsibility to protect. NATO subsequently assumed command, Qaddafi was overthrown and killed, and Libya descended into prolonged

fragmentation, militia rule, and competing governments. The case is often cited as the moment when R2P moved from principle to practice—and then became deeply contested.

(b) Required memo headings (prompts).
Mechanism: Explain the causal chain linking the Arab Spring, civilian-protection claims, Security Council authorization, NATO command, regime change, and state collapse. Distinguish what happened from why it happened.
Perspective reconstruction: Reconstruct African, Chinese, Russian, Western, and UN readings of the intervention, noting each perspective's contribution and occlusion.
Historical analogue: Compare Libya 2011 with one earlier case (for example, Kosovo 1999 or Iraq 2003) and state the limits of the analogy.
Falsifiers: Identify evidence that would weaken your explanation of why the intervention produced state collapse rather than protection.

(c) Self-check. Before submitting, ask whether your memo clearly distinguishes description (what occurred in Libya), explanation (why the outcome occurred), prediction (what your mechanism implies for future interventions), and prescription (what actors should do differently).

SECTION 2.11 HINGE QUESTION

Question. Which option best captures the mechanism by which the 2003 Iraq invasion fractured the post-Cold War liberal consensus?

A. The invasion failed because the UN Security Council lacked the military capacity to enforce its resolutions, proving that international institutions are epiphenomenal.
B. The invasion showed that the liberal order's normative vocabulary could be used to justify unilateral action, while the absence of WMD and weak postwar planning exposed the gap between universalist claims and coercive practice.
C. The invasion was caused primarily by Iraqi aggression against Kuwait in 1990, making 2003 a delayed enforcement of Resolution 678.
D. The invasion succeeded in establishing a stable democratic Iraq, demonstrating that liberal interventionism is self-correcting.

Correct answer: B.

Distractor diagnosis.
- **A** is wrong because it confuses institutional weakness with institutional irrelevance; the fracture occurred partly because institutions were invoked and then bypassed, not because they lacked capacity alone.
- **C** is wrong because it collapses 1990 and 2003 into a single causal chain; the 2003 decision involved distinct claims about WMD, terrorism, and regime change rather than mere delayed enforcement.
- **D** is wrong because it misstates the outcome and ignores the insurgency, state collapse, and normative backlash that made Iraq a central case of liberal-order fracture.

SECTION 2A — DATA LAB

2A.1 Summary Tables

Table 1 — UNSC Authorizations of Force, 1990–2003 (selected major operations)

Year	Crisis / Operation	Key Resolution(s)	Chapter VII Authorization?	Outcome by 2003
1990–91	Iraq / Kuwait (Desert Storm)	678	Yes	Authorized coalition; Iraqi defeat
1992–93	Somalia (UNITAF / UNOSOM II)	794, 837	Yes	Authorized; mission ended 1995
1993–95	Bosnia (safe areas)	836, 844	Yes (limited mandate)	Authorized but ineffective; Dayton 1995
1994	Haiti	940	Yes	Authorized; Aristide restored
1999	Kosovo	None (draft vetoed by Russia and China)	No	NATO acted without authorization; UNMIK established post hoc
2001	Afghanistan	1368, 1373 (self-defense, Art. 51)	Disputed framing	Authorized in principle; ISAF later authorized
2003	Iraq	1441 (no explicit force authorization)	Disputed	US/UK claimed implied authorization; France and Russia disagreed

Table 2 — Institutional Expansion, 1990–2003 (approximate figures)

Institution / Indicator	1990	1995	2000	2003
WTO members (GATT contracting parties pre-1995)	~100 (GATT)	~128	~140	~146
NATO members	16	16	19	19
Countries rated "Free" (Freedom House)	~65	~79	~86	~89
UN peacekeeping personnel deployed (thousands)	~11	~75	~38	~45

Table 3 — Democratic Transitions and Interventions, 1989–2003 (selected)

Case	Year	Type of Action	UNSC Authorization?	Outcome by 2003
Panama	1989	Regime change (US)	No	Democratic transition; Noriega removed
Haiti	1994	Restoration of elected government	Yes (940)	Fragile democracy; Aristide restored
Bosnia	1995	Dayton peace implementation	Yes (IFOR/SFOR)	Frozen peace; ethnic partition
Kosovo	1999	Humanitarian intervention	No	UNMIK protectorate; final status unresolved
Sierra Leone	2000	British intervention + UNAMSIL	Yes (ECOMOG/UNAMSIL)	Stabilized; RUF defeated
Afghanistan	2001	Regime change (US-led)	Yes (1386 ISAF)	Fragile state; Taliban regrouping
Iraq	2003	Regime change (US-led)	Disputed	Occupation; insurgency emerging

Note: Figures are approximate and drawn from publicly available institutional records (WTO, NATO, Freedom House, UN Department of Peace Operations). They are presented as illustrative benchmarks, not as precise statistical series.

2A.2 Analysis Questions

1. Trend. Describe the trend in UNSC authorizations of force between 1990 and 2003. What changed around 1999, and what does the 2003 Iraq case add?

Between 1990 and 1995, the Security Council authorized force in every major crisis where it was invoked: Iraq/Kuwait, Somalia, Bosnia (in limited form), and Haiti. This period represents the high-water mark of post-Cold War collective security, when the permanent members' convergence after the Soviet collapse made Chapter VII action feasible. The trend breaks around 1999. Kosovo was the first major post-Cold War use of force by a Western coalition without UNSC authorization, after Russia and China signaled vetoes. The 2001 Afghanistan case partially restored the pattern—Resolution 1386 authorized ISAF—but the legal framing rested on Article 51 self-defense rather than a clean Chapter VII mandate for regime change. The 2003 Iraq case then shattered whatever remained of the consensus: Resolution 1441 demanded Iraqi compliance but did not explicitly authorize force, and the US and UK claimed implied authorization while France, Russia, and most of the Council disagreed. The trend, therefore, is not a simple decline but a bifurcation: authorization remained available for cases where the permanent members agreed (Sierra Leone, Afghanistan)

but became impossible where they disagreed (Kosovo, Iraq), with the latter cases proceeding unilaterally or through coalitions of the willing. The 2003 case adds the critical observation that the fracture was not merely procedural but normative: the same vocabulary of "threats to peace" and "material breach" was deployed to justify opposite conclusions by different Council members.

2. Level of analysis. At which level—individual, state, systemic, or transnational—is the expansion of NATO membership best explained? Justify your answer.

The expansion of NATO from 16 members in 1990 to 19 by 1999 (and 26 by 2004) is best explained at the **systemic level**, though with important state-level and transnational modifiers. At the systemic level, the collapse of the Soviet Union removed the structural constraint that had frozen European security architecture for four decades; the unipolar moment (Krauthammer 1990) created a permissive environment in which the dominant power could reshape institutions. The systemic logic is visible in the timing: expansion accelerated only after the Soviet collapse, and the 1999 round (Poland, Hungary, Czech Republic) coincided with the Kosovo crisis, suggesting that NATO expansion was partly a response to the perceived need to stabilize the post-communist space. At the state level, individual Central and Eastern European governments actively lobbied for membership, driven by security fears of Russian resurgence—a state-level preference that the systemic environment made satisfiable. At the transnational level, normative convergence around liberal democracy and market economics (the "democratic peace" thesis) provided an ideological justification for expansion, framing it as the extension of a zone of peace rather than as geopolitical aggrandizement. The individual level is least explanatory: while particular leaders (Clinton, Albright, Kohl) mattered, the structural opportunity and the demand from applicant states would likely have produced expansion under different leadership. The systemic level dominates because it explains both the possibility and the direction of change; state and transnational factors explain the speed and the legitimation.

3. Perspective reconstruction. How would each of the five perspectives interpret the gap between WTO membership growth (Table 2) and the absence of UNSC authorization for Kosovo (Table 1)?

The **African perspective** would read the gap as evidence that the liberal order's economic and security tracks operated on different logics: WTO expansion delivered formal equality of membership while security decisions remained monopolized by the permanent members. From this vantage, Kosovo's lack of authorization was not an anomaly but a revelation of who actually governs. African scholars such as Grovogui and Aning would note that the same Council that could not agree on Kosovo had, a decade earlier, authorized interventions in Africa (Somalia, Rwanda's non-intervention) with devastating consequences, suggesting that the authorization gap is less about rules than about whose suffering counts.

The **Chinese perspective** would interpret the gap as proof that economic multilateralism (WTO) is tolerated by the West because it serves Western commercial interests, while security multilateralism (UNSC) is bypassed when it obstructs Western strategic preferences. The Chinese critique, articulated in Beijing's opposition to Kosovo and its later positions on Libya and Syria, treats humanitarian intervention as a Trojan horse for regime change, with WTO membership growth as the carrot and UNSC bypass as the stick.

The **Russian perspective** would see the gap as the core of post-Cold War humiliation: Russia was admitted to the G8 and the WTO track but excluded from security decision-making when its interests were directly affected (Kosovo, a traditional Russian sphere). The Russian reading treats the gap not as institutional dysfunction but as deliberate marginalization, with NATO expansion and Kosovo as twin evidence that the liberal order was a vehicle for Western, not universal, security.

The **Western perspective** would explain the gap through the lens of institutionalism and its limits: WTO

expansion represented successful multilateralism because trade interests converged, while Kosovo's authorization failure reflected the Council's structural flaw (veto power) in the face of mass atrocity. Western self-critique, visible in Ikenberry's work, would acknowledge that the gap exposed the tension between sovereignty and human rights that the Charter never resolved.

The **UN perspective** would treat the gap as the central institutional pathology of the post-Cold War order: the Charter's principles (sovereign equality, collective security) were honored in the economic sphere but subverted in the security sphere, producing a legitimacy deficit that the Brahimi Report (2000) and later the Responsibility to Protect (2005) attempted, imperfectly, to address.

4. Interpretation. Does the data support the claim that the post-Cold War liberal order was "rules-based"? What evidence cuts both ways?

The data offer partial support, and the answer depends on which rules and which domain. Evidence for the "rules-based" claim: WTO membership grew from ~128 to ~146 between 1995 and 2003, suggesting that states voluntarily bound themselves to a multilateral trade regime with dispute settlement; NATO expansion proceeded through formal accession protocols; Freedom House recorded a net increase in "Free" countries from ~65 to ~89; and the UN authorized force in multiple cases (Somalia, Haiti, Bosnia, Sierra Leone, Afghanistan). Evidence against: Kosovo (1999) and Iraq (2003) were major uses of force without clear UNSC authorization; the WTO's rules were criticized as asymmetric (Washington Consensus conditionality imposed on developing countries); and the "Free" country count, while rising, masked democratic backsliding and the fragility of transitions (Haiti, Afghanistan). The most defensible interpretation is that the order was rules-based in the economic domain and in cases where great-power interests converged, but that the rules were selectively enforced and structurally subordinate to power in the security domain. The "rules-based" label, in other words, describes a tendency, not a system: it captures the aspiration and the partial reality, but occludes the unilateral exceptions that became more frequent after 1999.

5. Limitation. What are the principal limitations of using UNSC authorization counts as a proxy for the health of the liberal order?

First, **authorization counts conflate legality with legitimacy**: a Council vote may be legally valid but politically coerced (as critics argued regarding Resolution 1441), or legally absent but morally defended (as Kosovo's supporters argued). Second, **the metric ignores non-UNSC mechanisms of order**: regional organizations (ECOWAS in Sierra Leone, NATO in Kosovo), bilateral arrangements, and informal coalitions also structured international behavior, and their exclusion from the count understates the complexity of order. Third, **authorization counts are sensitive to the veto structure**, not to underlying consensus: a single permanent member's opposition can produce a "no authorization" outcome even when a majority of states and global public opinion favor action, as in Kosovo. Fourth, **the metric is binary and misses quality**: authorized missions (Somalia, Bosnia) often failed, while unauthorized ones (Kosovo) sometimes achieved their immediate objectives, so authorization status is a poor predictor of effectiveness. Fifth, **the count is endogenous to power**: the US and its allies could choose to seek or bypass authorization based on expected outcomes, making the metric a measure of strategic calculation as much as of institutional health. Finally, **the data are incomplete and contested**: the legal status of Resolution 1441, for example, remains disputed among international lawyers, so any count that codes it as "not authorized" or "authorized" embeds a legal judgment that the data alone cannot settle.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1: Timeline of the Post-Cold War Liberal Order, 1989–2003

What to draw. A horizontal timeline running left to right across the page, divided into three bands. The top band is labeled "Institutional Expansion"; the middle band "Security Crises and Interventions"; the bottom band "Ideological Framing." Draw a vertical dashed line at 1999 labeled "Kosovo: the fracture point."

Labels to place. Top band: 1991 (Gulf War, UNSC authorized), 1995 (WTO established, Dayton), 1999 (NATO +3 members), 2001 (China joins WTO), 2003 (Iraq). Middle band: 1992–93 (Somalia), 1994 (Rwanda, Haiti), 1995 (Bosnia), 1999 (Kosovo, no UNSC auth), 2000 (Sierra Leone), 2001 (Afghanistan), 2003 (Iraq, disputed auth). Bottom band: 1989 (Fukuyama, "end of history"), 1990 (Krauthammer, "unipolar moment"), 1992 (Fukuyama book), 2000 (Brahimi Report), 2003 (Kagan, "Of Paradise and Power").

Perspective overlay. Annotate the timeline with five colored arrows or margin notes: African (red) marks 1994 Rwanda and 2000 Sierra Leone with the note "whose suffering counts?"; Chinese (blue) marks 1999 Kosovo with "hegemony"; Russian (green) marks 1999 and 2003 with "encirclement"; Western (orange) marks 1995 and 2001 with "rules-based order"; UN (purple) marks 2000 Brahimi with "legitimacy gap." The 1999 dashed line should be the visual center of gravity, with the post-1999 period shaded slightly darker to indicate fracture.

Visual 2: Levels-of-Analysis Diagram for the Kosovo Intervention (1999)

What to draw. Four concentric circles (or nested boxes) labeled from innermost to outermost: Individual, State, Systemic, Transnational. Place Kosovo at the center as the case. Draw arrows from each level pointing inward toward the case, and annotate each arrow with a causal claim.

Labels to place. Individual level: "Clinton/Blair moral conviction; Albright's 'indispensable nation' rhetoric; Milosevic's ethnic cleansing as trigger." State level: "US hegemonic capacity; UK alliance; Russian opposition; Serbian state sovereignty claim." Systemic level: "Unipolar moment; NATO as regional hegemon; UNSC veto paralysis; absence of Soviet counterweight." Transnational level: "Human rights norms; R2P precursor discourse; NGO advocacy; media coverage of atrocities; liberal peace ideology."

Perspective overlay. Draw a small legend in the corner with five colored dots: African (red) notes that the diagram's "human rights" transnational level omits African precedents (Rwanda 1994); Chinese (blue) notes that the systemic level's "unipolar moment" is precisely the problem; Russian (green) notes that the state level's "Russian opposition" was overridden; Western (orange) notes that the individual level's moral conviction is the engine; UN (purple) notes that the diagram's center should be the Charter, not the intervention. The overlay should make visible that each perspective selects a different level as primary.

Visual 3: Perspective Wheel on the Liberal Order as a Whole

What to draw. A circle divided into five sectors, one per perspective, arranged clockwise: African (top, largest sector, ~40% of circle), Chinese, Russian, Western, UN. In the center, place a smaller circle labeled "Post-Cold War Liberal Order (1989–2003)." Draw spokes from center to each sector boundary. Along each spoke, write the perspective's core verdict on the liberal order.

Labels to place. African sector: "Skeptical: humanitarian intervention as selective sovereignty; Sierra Leone, Rwanda, Libya as evidence." Chinese sector: "Critical: humanitarian intervention as Western hegemony; sovereignty as shield." Russian sector: "Resentful: humiliation, encirclement, marginalization from

security decisions." Western sector: "Ambivalent: liberal institutionalism plus self-critique; rules-based but power-laden." UN sector: "Aspirational: gap between Charter principles and enforcement; legitimacy deficit."

Perspective overlay. Annotate the African sector with a thicker border and a note: "Primary perspective—reveals what the other four occlude: the racialized and geographic selectivity of 'humanitarian' action." Add a small inset box titled "Occlusion map" listing, for each perspective, what it cannot see: African (cannot fully account for great-power security dilemmas); Chinese (cannot account for genuine normative commitment); Russian (cannot account for institutional learning); Western (cannot account for its own power); UN (cannot account for enforcement without power). The visual should make the African sector visually dominant, consistent with the lesson's framing.

SECTION 4 — CORNELL NOTES

Cue Column | Notes Column

Cue	Notes
Unipolar moment	Krauthammer (1990): US as sole superpower; presumption of permanent Western primacy. Scope: 1991–2003, arguably ended by Iraq. Mechanism: absence of counterweight permits institutional reshaping.
End of history	Fukuyama (1989, 1992): liberal democracy as final form of government; ideological convergence. Critique: premature; ignored illiberal alternatives (China, Russia, Islamism).
Humanitarian intervention	Kosovo 1999 (no UNSC auth); Sierra Leone 2000 (UK + UNAMSIL); Libya 2011 (R2P). Tension: sovereignty vs. human rights. Wheeler (2000): "saving strangers."
R2P	Responsibility to Protect (2005, but roots in 1990s). Three pillars: prevent, react, rebuild. Controversy: Libya 2011 seen as regime change, not protection.
Liberal peace	Project of exporting democracy + markets + rights. Mechanism: conditionality (Washington Consensus). Critique: cultural imperialism; state-building failures.
Bretton Woods expansion	WTO 1995; IMF/World Bank conditionality. Washington Consensus: privatization, deregulation, fiscal discipline. Critique: asymmetric rules; "market fundamentalism."
Conditionality	Loans contingent on policy reform. Mechanism: leverage over developing states. African critique: sovereignty erosion; "structural adjustment" harms.

Cue	Notes
9/11 fracture	Unilateralism; "war on terror"; limits of international law. Kagan (2003): US as Mars, Europe as Venus. Mechanism: security imperative overrides multilateralism.
Kosovo case	1999 NATO bombing without UNSC auth. Justification: humanitarian emergency. Critique: precedent for unilateralism; Russian/Chinese opposition.
Brahimi Report	2000: UN peacekeeping reform; rapid deployment; clear mandates. Response to Rwanda/Srebrenica failures.
Five perspectives	African (primary): skepticism; Chinese: hegemony critique; Russian: humiliation; Western: institutionalism + self-critique; UN: Charter-enforcement gap.
Levels of analysis	Individual (leaders), state (interests), systemic (unipolarity), transnational (norms). Kosovo: all four operative.

Source log. Krauthammer (1990), "The Unipolar Moment," *Foreign Affairs*; Fukuyama (1989), "The End of History?," *The National Interest*; Fukuyama (1992), *The End of History and the Last Man*; Ikenberry (2001), *After Victory*; Wheeler (2000), *Saving Strangers*; Kagan (2003), *Of Paradise and Power*; Brahimi Report (2000), *Report of the Panel on United Nations Peace Operations*; Grovogui (1996), *Sovereigns, Quasi Sovereigns, and Africans*; Mbembe (2001), *On the Postcolony*; Mamdani (2009), *Saviors and Survivors*; Bayart (2009), *The State in Africa*; Rodney (1972), *How Europe Underdeveloped Africa*; Nkrumah (1965), *Neo-Colonialism*; Nyerere (1968), *Freedom and Socialism*; Cabral (1973), *Return to the Source*; Fanon (1961), *The Wretched of the Earth*; Aning (2009), "Unintended Consequences"; Danso (2010), "Ghana and the Responsibility to Protect"; Tamale (2011), "Nudity, Protest and the Law"; Oyěwùmí (1997), *The Invention of Women*.

Summary (3–5 sentences). The post-Cold War liberal order rested on a unipolar presumption (Krauthammer 1990) and an ideological conviction that liberal democracy was the endpoint of political development (Fukuyama 1989/1992). Its institutional expression—WTO expansion, NATO enlargement, and the humanitarian intervention agenda—delivered genuine multilateral gains but also generated the conditions for its own fracture, visible in Kosovo (1999) and Iraq (2003). The African perspective reveals that the order's "humanitarian" vocabulary was selectively applied, with African cases (Rwanda, Sierra Leone, Libya) exposing the gap between universalist claims and geopolitical practice. By 2003, the consensus had fractured into competing visions of order, setting the stage for the multipolar contestation that defines the contemporary era.

SECTION 5 — FEYNMAN COMPRESSION

Step 1 — Explain without jargon. Imagine a world where one country is so powerful that no other country can challenge it. That country believes its way of life—democracy, free markets, human rights—is the best way for everyone. So it builds institutions (like the WTO and NATO) and sometimes uses force (like in Kosovo) to spread or protect that way of life. For a while, this works: more countries join the institutions, more become democracies. But then two things happen. First, the powerful country starts breaking its own rules when they get in the way—bombing without UN permission, invading Iraq on disputed grounds. Second, other countries (China, Russia, and many in Africa) notice that the rules are applied unevenly: interventions happen where the powerful country has interests, not where suffering is greatest. The result is that by 2003, the "liberal order" is still standing but badly cracked, and the world is moving toward a competition among several powers rather than one.

Step 2 — Mark gaps. (a) I have not yet explained *why* the US chose unilateralism in Iraq specifically—was it ideology, threat perception, or domestic politics? (b) I have not distinguished clearly between the "liberal peace" as a normative project and the "liberal order" as an institutional structure; they overlap but are not identical. (c) I have not addressed whether the African critique (selective intervention) is better explained by racism, by geopolitical interest, or by institutional incapacity. (d) I have not specified the mechanism by which WTO conditionality translated into political outcomes in developing countries. (e) I have not explained why Russia and China, despite opposing Kosovo, did not block the post-hoc UNMIK arrangement.

Step 3 — Reread verification. Re-reading the source material confirms the following corrections: Krauthammer's "unipolar moment" was explicitly framed as temporary, not permanent—my Step 1 overstates the "permanent" claim and should be revised to "presumed durable." Fukuyama's thesis was about ideological convergence, not US power per se; the two are often conflated but are analytically distinct. The Brahimi Report (2000) was a response to peacekeeping failures (Rwanda, Srebrenica), not to Kosovo specifically, though Kosovo informed its urgency. Wheeler's (2000) "saving strangers" provides the normative vocabulary for humanitarian intervention but does not resolve the authorization problem. Ikenberry (2001) argues that the liberal order is "sticky" and self-reinforcing even after unipolarity fades—a claim that my Step 1's "badly cracked" framing understates. Kagan (2003) captures the transatlantic split but should not be read as predicting permanent US-European estrangement.

Step 4 — Analogy with explicit limits. The post-Cold War liberal order is like a homeowner's association (HOA) in a neighborhood where one homeowner is vastly wealthier than the others. The wealthy homeowner writes the bylaws (WTO rules, NATO standards), enforces them selectively (intervening in Kosovo but not Rwanda), and occasionally ignores them entirely (Iraq 2003). The other homeowners (China, Russia, African states) chafe at the rules but also benefit from the property-value stability the HOA provides. The analogy captures the asymmetry of power and the selective enforcement of rules, but it breaks down in three ways: (i) states are not homeowners—they can exit, form rival associations, or use violence; (ii) the "wealthy homeowner" is not a single actor but a coalition (US + Europe + Japan) with internal disagreements; and (iii) the HOA metaphor implies a voluntary contract, whereas the liberal order was partly imposed through conditionality and military force.

Step 5 — Rewrite. The post-Cold War liberal order (1989–2003) was a historically specific configuration in which unipolar power (Krauthammer 1990) combined with ideological conviction (Fukuyama 1989/1992) to produce an institutional project: expanding the WTO, NATO, and the democratic-peace zone while developing a humanitarian-intervention doctrine (Kosovo 1999, Sierra Leone 2000). This project delivered measurable gains—more democracies, more trade integration, more authorized interventions—but also gen-

erated its own contradictions: selective application of rules, bypassing of the UNSC when inconvenient, and conditionality that eroded sovereignty in the developing world. The African perspective reveals that the order's "humanitarian" vocabulary was geographically and racially selective, with African suffering (Rwanda 1994) receiving less urgent response than European suffering (Kosovo 1999). By 2003, the fracture was visible: the US invaded Iraq on disputed legal grounds, China and Russia opposed the war, and the UN's legitimacy deficit (Brahimi 2000) remained unresolved. The order did not collapse—it was, as Ikenberry (2001) argued, "sticky"—but it lost its claim to universality, and the world entered a period of contested multipolarity in which the liberal order became one order among several rather than the order.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L13	definition	What is the "unipolar moment"?	Krauthammer's 1990 term for the brief post-Cold War interval in which the United States stood as the sole superpower with no peer competitor, creating both opportunity and temptation to act unilaterally. It presumes that primacy is temporary unless institutionalized.	Western framing treats it as opportunity; African and Russian readings treat it as the license for unilateral intervention.

Tag	Card Type	Front	Back	Perspective Note
L13	mechanism	How did the "unipolar moment" translate into policy?	The absence of a peer competitor lowered the perceived cost of military action and shifted US strategy toward shaping the international environment rather than merely balancing against threats. This mechanism operated through NATO expansion, humanitarian interventions, and regime-change wars.	Chinese and Russian perspectives read the same mechanism as hegemonic expansion disguised as order-building.
L13	source	What did Krauthammer (1990) actually argue?	Krauthammer argued that unipolarity was a fleeting condition requiring active consolidation through alliances and institutions before rivals emerged; he warned against both isolationism and overreach. The essay is often misread as triumphalist when it was partly cautionary.	The cautionary half is usually dropped in Western policy discourse, which African critics cite as evidence of bad faith.

Tag	Card Type	Front	Back	Perspective Note
L13	definition	What is Fukuyama's "end of history" thesis?	Fukuyama's 1989/1992 argument that liberal democracy had proven itself the final form of human government, ending ideological competition and leaving only technical adjustment. It was a claim about the exhaustion of alternatives, not about the end of events.	African scholars such as Mamdani read it as a foreclosure of political imagination that delegitimized non-liberal paths to development.
L13	mechanism	How did "end of history" function as ideology?	By declaring the contest over, it reframed all resistance to liberal norms as backwardness or pathology, lowering the threshold for intervention and conditionality. The mechanism is discursive: it converts a contingent political victory into a universal telos.	This is the core of the African critique: the thesis erased the legitimacy of alternative modernities.

Tag	Card Type	Front	Back	Perspective Note
L13	application	What happened in Kosovo 1999?	NATO bombed Yugoslavia without UN Security Council authorization to halt atrocities against Kosovar Albanians, producing a contested precedent for humanitarian intervention outside Charter procedures. It split the international community over legality versus legitimacy.	African states were divided: some saw protection of civilians; others saw precedent for great-power override of sovereignty.
L13	mechanism	What is R2P and how does it work?	The Responsibility to Protect (2005 World Summit) holds that sovereignty entails responsibility to protect populations from mass atrocities, and that the international community must act when states fail. Its mechanism runs from prevention to reaction to rebuilding, with Security Council authorization as the legal gate.	The African Union's Ezulwini Consensus accepts R2P in principle but insists on Security Council reform and regional consent.

Tag	Card Type	Front	Back	Perspective Note
L13	comparison	How does humanitarian intervention differ from UN Charter use of force?	Charter Article 2(4) prohibits force; Article 51 permits self-defense; Chapter VII permits Security Council-authorized action. Humanitarian intervention claims a moral exception to this legal architecture, creating tension between legality and legitimacy.	UN perspective centers this gap; Western perspective often privileges legitimacy over strict legality.
L13	source	What did the Brahimi Report (2000) recommend?	The Brahimi Report called for more robust UN peacekeeping, clearer mandates, better intelligence, and adequate resources, while warning against overreach. It sought to professionalize peace operations after Rwanda and Srebrenica.	African troop-contributing countries cite Brahimi to demand equitable burden-sharing and command voice.

Tag	Card Type	Front	Back	Perspective Note
L13	mechanism	How did Washington Consensus conditionality operate?	The Washington Consensus prescribed fiscal discipline, privatization, and trade liberalization as conditions for IMF/World Bank lending, embedding policy prescriptions in financial leverage. The mechanism is conditionality: access to capital contingent on structural reform.	African critics (Rodney, Nkrumah lineage) read it as neo-colonial economic control; Chinese critics read it as Western institutional capture.
L13	application	What did WTO accession (1995) change?	The WTO created a binding dispute-settlement system and expanded trade rules into services, IP, and agriculture, locking in liberalization. For developing states it meant market access in exchange for policy constraints.	African states gained formal voice but often lacked capacity to use dispute settlement; Chinese accession (2001) later reshaped the system.

Tag	Card Type	Front	Back	Perspective Note
L13	debate	How did 9/11 fracture the liberal consensus?	The "war on terror" shifted US strategy toward preventive war, unilateralism, and coercive regime change, straining alliances and international law. The fracture was between liberal institutionalism and security-first unilateralism.	Russian and Chinese perspectives saw confirmation of US hegemony; African states faced new counterterrorism conditionality.
L13	reconstruction	How does the African perspective read the liberal order?	From within African scholarship, the liberal order appears as a project that promised development and protection but delivered conditionality, selective intervention, and sovereignty erosion, while African agency was marginalized in its design.	This is the primary lens of the lesson: the order's gaps are visible only from its periphery.

Tag	Card Type	Front	Back	Perspective Note
L13	occlusion	What does the Chinese perspective occlude?	The Chinese critique of Western hegemony occludes China's own growing economic leverage and its selective use of sovereignty norms, especially in Africa and in maritime disputes. It also understates internal repression.	Recognizing occlusion does not invalidate the critique; it bounds its applicability.
L13	adjudication	How should one adjudicate the 2003 Iraq invasion?	The invasion combined liberal vocabulary (democracy promotion) with unilateral force absent UN authorization, producing a legitimacy crisis. Adjudication requires separating the normative claim from the procedural violation and weighing both.	African, Russian, and Chinese perspectives converge on procedural illegality; Western self-critique converges on strategic failure.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence audit (score 0–100)

Competency	Self-score (0–100)	Calibration note
Defining the "unipolar moment" and its policy effects		
Explaining Fukuyama's thesis and its ideological function		
Reconstructing the Kosovo 1999 case and its legal controversy		
Explaining R2P's three pillars and the Ezulwini Consensus		
Tracing Washington Consensus conditionality mechanisms		
Analyzing WTO expansion and developing-state capacity gaps		
Explaining the 9/11 fracture and unilateralism		

Competency	Self-score (0–100)	Calibration note
Reconstructing all five perspectives without caricature		
Adjudicating between competing explanations of a case		

7.2 Three-question debrief

1. Which of the five perspectives did you find hardest to steel-man, and what evidence would change your view?
2. Where did you conflate description of the liberal order with prescription for it?
3. Which mechanism (unipolarity, ideology, intervention, conditionality, fracture) do you understand least well, and what is your plan to repair it?

7.3 Error-log

Common Misconception	Correction	Evidence
"End of history" meant no more wars or events.	It meant the exhaustion of ideological alternatives to liberal democracy, not the end of conflict.	Fukuyama (1992) explicitly distinguished events from ideological evolution.
Humanitarian intervention is always illegal under the UN Charter.	It is legally contested: Charter Article 2(4) prohibits force, but R2P and state practice create a legitimacy-based exception without clear legal codification.	Kosovo 1999 and the 2005 World Summit Outcome Document.
The Washington Consensus was a conspiracy against the Global South.	It was a set of policy prescriptions embedded in financial conditionality; its effects were contested and varied by country.	Ikenberry (2001) on institutional lock-in; African critical scholarship on structural adjustment.
NATO expansion was purely defensive.	It was read by Russia as encirclement; the same policy has competing security interpretations.	Russian perspective in Section 2.7.3.
R2P authorizes automatic military intervention.	R2P requires Security Council authorization for coercive action; its first pillars are prevention and state responsibility.	Brahimi Report (2000); 2005 World Summit Outcome.

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Unipolar moment; end of history; humanitarian intervention; R2P; liberal peace; Washington Consensus; conditionality; unilateralism; fracture of consensus	Absence of peer competitor lowers cost of force; ideology converts victory into telos; intervention overrides sovereignty; conditionality leverages capital; 9/11 shifts to security-first unilateralism	Krauthammer (1990); Fukuyama (1992); Ikenberry (2001); Wheeler (2000); Kagan (2003); Brahimi Report (2000)	Kosovo 1999; Sierra Leone 2000; Libya 2011; WTO 1995; 9/11; Iraq 2003; NATO expansion	Legality vs. legitimacy of intervention; universalism vs. sovereignty; institutionalism vs. unilateralism; African agency vs. conditionality	A peer competitor emerging before 2000; R2P used without UNSC authorization repeatedly; conditionality producing convergence rather than backlash	L5 realism; L6 institutionalism; L11 interwar; L12 Cold War; L14 transition; L18 interdependence; L47 US-China; L49 revisionism

SECTION 9 — REVIEW SCHEDULE

- **R1 (Day 1, 20 min):** Re-read Section 2.2 and 2.3; recite the unipolar-moment and end-of-history mechanisms aloud; check against flashcards.
- **R2 (Day 3, 30 min):** Reconstruct the Kosovo case at all four levels of analysis; write one paragraph per perspective.
- **R3 (Day 7, 45 min):** Complete the independent memo for Iraq 2003; compare against the model answer; log errors.
- **R4 (Day 14, 60 min):** Re-derive the comparison matrix from memory; verify against Section 2.7.6; focus on African and Chinese perspectives.
- **R5 (Day 30, 90 min):** Full timed reconstruction of all five key ideas plus adjudication of a novel case; update error log.

SECTION 10 — COMPLETION CHECKLIST

☐ I can define the "unipolar moment" and explain its policy mechanism.
☐ I can state Fukuyama's thesis and distinguish it from "no more events."
☐ I can reconstruct Kosovo 1999 with levels of analysis and all five perspectives.
☐ I can explain R2P's three pillars and the Ezulwini Consensus.
☐ I can trace Washington Consensus conditionality and its African critique.
☐ I can describe WTO expansion and developing-state capacity gaps.
☐ I can explain the 9/11 fracture and unilateralism.
☐ I can steel-man all five perspectives without caricature.

☐ I can identify what each perspective occludes.
☐ I can adjudicate between competing explanations using evidence.
☐ I have completed the confidence audit honestly.
☐ I have logged at least three errors in the error log.
☐ I have drawn or described the three visuals.
☐ I have written the independent memo.
☐ I have answered the hinge question correctly.
☐ I can link this lesson to L5, L6, L11, L12, L14, L18, L47, L49.
☐ I can state one falsifier for each key idea.
☐ I can explain why the African perspective is primary in this lesson.

FURTHER READING (Optional)

Unipolarity and primacy - Krauthammer (1990), "The Unipolar Moment." - Ikenberry (2001), *After Victory*.

Ideology and the end of history - Fukuyama (1992), *The End of History and the Last Man*.

Humanitarian intervention and R2P - Wheeler (2000), *Saving Strangers*. - Brahimi Report (2000), *Report of the Panel on United Nations Peace Operations*.

Unilateralism and the war on terror - Kagan (2003), "Power and Weakness."

African and critical perspectives - Mamdani, M. (2009), *Saviors and Survivors* (on Darfur and intervention). - Rodney, W. (1972), *How Europe Underdeveloped Africa* (on structural conditionality lineage).

Chinese and Russian perspectives - General realist and sovereignty-focused scholarship on humanitarian intervention (consult course bibliography).

End of Lesson 13. Say **Next** when you are ready.

---

15. Contemporary Transition and Competing Visions of World Order

LESSON METADATA

Field	Value
Lesson number and title	Lesson 14 — Contemporary Transition and Competing Visions of World Order
Module	Module 2: Historical Architecture of International Order
Prerequisites	L9 (Westphalia), L11 (interwar), L12 (Cold War), L13 (liberal order)
Interleaved links	Forward to L15–19 (IPE), L20–26 (warfare), L47–51 (systemic rivalry), L52–57 (techno-geopolitics)
Reading load	7-9 hours

Field	Value
Content channels	Text core, data lab, dual-coded visual anchor, Cornell notes, flashcards, worked example, problem pair, independent memo
Bloom ceiling	Analyze–Evaluate–Create
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

The central puzzle of this lesson is deceptively simple to state and extraordinarily difficult to resolve: the unipolar moment that followed the Cold War is ending, but what is replacing it is not a single, coherent order. It is a contest among at least five distinct projects for organizing world politics, each carrying its own account of legitimacy, its own institutional preferences, and its own reading of history. The student who masters this lesson will be able to stop treating "the decline of the West" or "the rise of the rest" as slogans and instead diagnose them as competing, testable claims about power, rules, and recognition. The transition under study is not merely a redistribution of material capabilities; it is a struggle over the vocabulary in which world order is described, the institutions through which it is administered, and the actors who are entitled to speak in its name. That struggle is the subject of the entire module's closing movement, and it sets the stage for everything that follows in the curriculum, from international political economy to systemic rivalry and techno-geopolitics.

To place the lesson in the curriculum: Lessons 9 through 13 traced the historical architecture of international order from the Westphalian settlement through the interwar collapse, the Cold War's bipolar stability, and the post-1945 liberal institutional order. Lesson 14 asks the question that those lessons make unavoidable—what happens when the hegemonic power that underwrote that architecture can no longer sustain it alone, and when the actors who were incorporated into it on subordinate terms begin to demand revision? The answer is not a clean succession, as in a relay race, but a layered, contested, and often incoherent transition in which old institutions persist while new ones are built alongside them, and in which the same event—say, a war in Europe or an expansion of a club of emerging economies—can be read as evidence of decline, of resilience, of fragmentation, or of renewal depending on the vantage point adopted. The lesson therefore trains the student to hold multiple, genuinely incompatible readings of the same evidence in suspension and to adjudicate among them on the basis of mechanism and scope conditions rather than ideological affinity.

The first thing the student will be able to do after mastering this lesson is to decompose the empirical debate about unipolar decline into its component claims and to see that "decline" is not a single variable but a bundle of distinct propositions about military preponderance, economic weight, institutional centrality, normative authority, and alliance cohesion. Scholars such as Schweller, Mearsheimer, and Acharya do not disagree merely about facts; they disagree about which facts matter and about the causal mechanisms that connect material shifts to order-level outcomes. The student will learn to ask, of any claim about decline: decline of what, measured how, over what horizon, and with what predicted consequence for the behavior of other actors? This is the difference between commentary and analysis, and it is the skill the lesson is built to cultivate.

The second capability is perspective reconstruction. The lesson presents five competing order-projects—

African strategic autonomy, Chinese relational-Tianxia, Russian multipolarity, Western liberal institutionalism, and UN Charter multilateralism—and requires the student to reconstruct each from within, showing what it contributes and what it occludes. This is not a matter of listing positions; it is a matter of identifying the historical grievance, the normative premise, the institutional preference, and the theory of change that animate each project, and of seeing how the same empirical developments are recruited into different narratives. The African perspective is treated as primary throughout, not as a regional case study, because the African vantage point reveals something the other four systematically miss: that the contemporary transition is not only a great-power contest but a demand for the right to define the terms of participation in world order, a demand rooted in the experience of colonial subordination, structural adjustment, and the unfinished business of sovereignty. Without that vantage, the other four perspectives appear more coherent than they are.

The third capability is critical engagement with the phrase "rules-based international order," which has become one of the most contested pieces of political vocabulary in contemporary diplomacy. The student will learn to treat it not as a description but as a claim, and to ask the three questions that expose its politics: who wrote the rules, who enforces them, and who is bound by them. The answers differ sharply depending on whether one adopts a Western, Chinese, Russian, African, or UN perspective, and the lesson shows that the phrase functions simultaneously as a genuine normative commitment, as a legitimating device for asymmetric power, and as a rallying point for actors who seek to hold the powerful to standards they themselves often evade. The student will be able to evaluate when the phrase illuminates and when it obscures.

The fourth capability is institutional analysis. The lesson examines the fracturing of the Bretton Woods system through the creation of the Asian Infrastructure Investment Bank, the New Development Bank, and BRICS payment-system initiatives, and it asks whether these are genuine alternatives to Western-led institutions or parallel structures that reproduce similar hierarchies under new management. The student will learn to distinguish institutional revisionism from institutional exit, to assess the gap between announced ambition and operational capacity, and to see how institutional competition itself becomes a arena of order-making. This connects directly to the forward-linked lessons on international political economy and on techno-geopolitics, where the material and infrastructural dimensions of order will be developed further.

The fifth capability is evidence-based adjudication. The worked example takes the 2022 Ukraine war and the global response—sanctions, UN voting, African and Global South abstentions, and the Chinese peace plan—and shows how the five perspectives reconstruct the same events differently, and how a careful analyst can weigh those reconstructions against evidence rather than simply choosing the one that feels most congenial. The problem pair does the same for the 2023 BRICS+ expansion, asking whether it is a genuine challenge to Western order or a forum of convenience. The data lab supplies UNGA voting patterns, BRICS+ GDP shares, and AIIB lending figures as the empirical ground on which these adjudications must rest. Throughout, the student is trained to separate description from explanation, prediction from prescription, and to recognize that the same data can support different inferences depending on the mechanism invoked.

A final word on method. This lesson is not a survey of current events, and it is not a scorecard of which power is winning. It is an exercise in structural reasoning about order: about how orders are constituted, contested, and transformed; about the relationship between material power and normative authority; and about the conditions under which a transition produces a new stable order rather than prolonged fragmentation. The student should leave the lesson with a set of analytical tools—levels of analysis, mechanism identification, scope conditions, perspective reconstruction, falsifier specification—that can be applied to cases not covered here, including those that will arise after this text is written. That transferability, not the mastery of any

particular headline, is the measure of success.

SECTION 1 — Pre-Class Priming

1.1 Retrieval Warm-Up Answer each question from memory before consulting notes. These draw on Lessons 9, 11, 12, and 13.

1. **Westphalian sovereignty (L9).** State the two core principles of the 1648 settlement that are most often cited in contemporary debates about non-intervention, and identify one way in which each principle has been qualified or eroded in practice since 1945.

2. **Interwar collapse (L11).** What were the three institutional or normative failures that the interwar period is conventionally said to have exposed, and which of them is most directly echoed in contemporary debates about the "rules-based international order"?

3. **Cold War bipolarity (L12).** Explain the stability-instability paradox and give one example of how it shaped superpower behavior in a regional conflict. Why does the paradox not straightforwardly apply to a multipolar transition?

4. **Liberal order (L13).** Distinguish "embedded liberalism" from "neoliberalism" as models of economic order, and identify one institutional expression of each. Which of the two is more vulnerable to the charge of having been imposed asymmetrically?

5. **Hegemonic stability (L13).** State the core claim of hegemonic stability theory and name its two most common critiques from the perspective of smaller or weaker states. How does the theory's predictive power change when hegemony is in relative decline rather than absolute collapse?

6. **Levels of analysis (L1).** List the four levels of analysis used throughout this curriculum (individual, state, systemic, transnational) and give one example of a claim about world-order transition that is best analyzed at each level.

1.2 Orientation Questions These questions frame the lesson's central puzzle and should be revisited after completing the core sections.

1. If material power is shifting toward the Global South but institutional power remains concentrated in Western-led bodies, is the contemporary transition better described as a change in the distribution of capabilities or as a change in the legitimacy of the order? What evidence would distinguish the two readings?

2. The phrase "rules-based international order" is used by Western governments as a term of praise and by several non-Western governments as a term of critique. What does each side mean by it, and is there a shared referent underneath the disagreement, or are the two sides talking about different things entirely?

3. Does the expansion of BRICS+ in 2023 represent a structural challenge to Western order, or does it reproduce the very hierarchies it claims to oppose? What would have to be true for it to be the former rather than the latter?

4. From an African vantage point, what is the difference between "multipolarity" as a description of power distribution and "strategic autonomy" as a political project? Why might an actor prefer the second to the first even if the first is empirically accurate?

1.3 Vocabulary Pre-Teach The following terms are used throughout the lesson. Provisional definitions are given; refine them as you read.

1. **Unipolarity** — a systemic distribution of power in which one state possesses a preponderance of material capabilities across military, economic, and institutional dimensions, with no peer competitor. Provisional; the lesson will show that unipolarity is a matter of degree and domain, not a binary condition.
2. **Multipolarity** — a distribution in which three or more states possess sufficient capabilities to act as independent centers of power. Provisional; the lesson distinguishes multipolarity as an empirical description from multipolarity as a normative project.
3. **Poly-order** — a condition in which multiple, partially overlapping orders coexist, each with its own rules, institutions, and membership, rather than a single hierarchy with one set of rules. Provisional; contrast with both unipolarity and classical multipolarity.
4. **Strategic autonomy** — the capacity of a state or region to make independent decisions on security, economic, and diplomatic questions without subordination to an external power. Provisional; in the African context it is tied to Agenda 2063 and to the rejection of conditionality.
5. **Relational Tianxia** — a Chinese ordering concept emphasizing harmony through relationship, mutual benefit, and the absence of a single hegemon, often contrasted with Western contractual and rules-based models. Provisional; the lesson treats it as a political project with internal tensions, not as a transparent description of Chinese practice.
6. **Sovereign democracy** — a Russian concept holding that democracy must be adapted to national civilizational and historical conditions and that external promotion of universal democratic standards is illegitimate interference. Provisional; the lesson examines its use in justifying non-interference and multipolarity.
7. **Civilizational state** — a state understood not merely as a political unit but as the bearer of a distinct civilization with its own historical trajectory and normative claims, used to resist universalist standards. Provisional; applied to Russia and China in particular.
8. **Rules-based international order (RBIO)** — the network of treaties, institutions, and norms that govern interstate behavior, especially as invoked by Western governments since the 1990s. Provisional; the lesson treats this as a contested phrase whose meaning depends on who speaks it.
9. **Institutional revisionism** — efforts by dissatisfied actors to modify the rules, voting weights, or mandates of existing institutions, or to create parallel institutions, without necessarily exiting the system. Provisional; distinguished from revolutionary exit.
10. **BRICS+** — the expanded grouping of Brazil, Russia, India, China, South Africa plus new members admitted in 2023–2024, presented by participants as a platform for multipolarity and by critics as a heterogeneous forum of convenience. Provisional; the lesson adjudicates between these readings.

11. **Multi-alignment** — a strategy of maintaining cooperative relationships with multiple major powers simultaneously rather than aligning exclusively with one. Provisional; distinguished from non-alignment by its active, transactional character.
12. **Global South** — a political category denoting states that share a history of colonial subordination and a present-day demand for greater voice in global governance, not merely a geographic designation. Provisional; the lesson examines its construction and its limits as an analytical category.

SECTION 2 — LESSON CORE

2.1 Learning objectives

By the end of this lesson the student will be able to:

1. **Analyze** the empirical debate over unipolar decline and multipolar emergence by comparing Schweller's realist acceptance of multipolarity, Mearsheimer's tragic great-power logic, and Acharya's "multiplex" alternative, specifying the evidence each privileges (relative GDP and military shares, institutional creation, voting blocs) and the evidence each discounts (nuclear deterrence, economic interdependence, regional agency).

2. **Evaluate** the five competing order-projects—African strategic autonomy, Chinese relational-Tianxia, Russian multipolarity, Western liberal institutionalism, and UN Charter multilateralism—by reconstructing each from within, identifying its core normative claim, its mechanism of order-production, and its characteristic occlusion.

3. **Synthesize** the "Global South" as an emergent political category by tracing its genealogy through the NAM and G-77, its reactivation through BRICS+, and its internal heterogeneity, distinguishing descriptive, explanatory, and prescriptive uses of the term.

4. **Critique** the phrase "rules-based international order" by interrogating who authored the rules, who enforces them, who is bound by them, and how the phrase functions as both a normative claim and a political weapon in contemporary contestation.

5. **Create** an evidence-based assessment of institutional revisionism—using AIIB, NDB, and BRICS payment-system initiatives—by specifying falsifiers that would distinguish a genuine challenge to Bretton Woods from a forum of convenience, and by adjudicating between competing interpretations on the basis of lending volumes, governance structures, and member behavior.

These objectives are assessable through the worked example (2022 Ukraine war), the problem pair (2023 BRICS+ expansion), and the independent memo, each of which requires the student to move between description, explanation, prediction, and prescription without conflating them.

2.2 KEY IDEA 1 — Decline of unipolarity and return of multipolarity: the empirical debate

Bolded Causal Claim: The unipolar moment that followed the Soviet collapse has ended; the international system is transitioning toward multipolarity, but whether this transition yields a stable balance of power, a contested hegemonic rivalry, or a "multiplex" order of overlapping authorities remains theoretically and empirically disputed among realists, liberals, and constructivists.

Mechanism: The mechanism is relative power diffusion operating through four channels. First, economic convergence: the share of global GDP (PPP) held by the United States has declined from roughly two-fifths in the early postwar decades to roughly one-quarter today, while China, India, Brazil, Indonesia, and Nigeria have expanded their productive capacity, creating a broader distribution of material capabilities. Second, military-technological diffusion: precision munitions, cyber capabilities, space assets, and nuclear second-strike forces have proliferated, eroding the monopoly on force that underwrote unipolar primacy and raising the cost of coercive intervention. Third, institutional entrepreneurship: rising and middle powers have created parallel institutions—the Asian Infrastructure Investment Bank (AIIB), the New Development Bank (NDB), the Shanghai Cooperation Organisation (SCO), and an expanded BRICS—that both reflect and accelerate the redistribution of authority. Fourth, ideational delegitimation: the 2003 Iraq War, the 2008 financial crisis, and the uneven COVID-19 response weakened the claim that the United States and its allies possessed a universally valid model of governance, opening space for alternative narratives of order. Schweller (2018) reads these trends as the natural exhaustion of unipolarity: hegemons face free-riding, overextension, and domestic fatigue, and multipolarity is not a pathology to be resisted but a condition to be managed. Mearsheimer (2019) reads the same trends through offensive realism: the liberal international order was "bound to fail" because great powers cannot tolerate peer competitors in their regions, and the United States' attempt to remake the world in its image provoked the very balancing that now constrains it. Acharya (2018) rejects the binary of unipolarity-versus-multipolarity altogether, arguing that power is diffusing not only to states but to regional organizations, multinational corporations, civil-society networks, and normative communities, producing a "multiplex" world order in which multiple, overlapping, and sometimes contradictory principles of legitimacy coexist. The mechanism is therefore not a single causal chain but a contested interpretation of the same structural shifts: relative decline, institutional proliferation, and ideational fragmentation.

Scope Conditions: The unipolar-decline claim holds under conditions of sustained relative decline of the hegemon and the rise of at least two peer competitors with global reach; it weakens if the United States retains a decisive technological and military edge, if rising powers remain regionally contained or internally constrained, or if economic interdependence creates "complex interdependence" that dampens conflict. The claim also assumes that power is fungible across domains—military, economic, institutional, ideational—which constructivists dispute. Acharya's multiplex alternative applies most strongly where regional organizations and non-state actors have acquired genuine authority, as in the African Union's peace-and-security architecture or ASEAN's centrality in East Asian diplomacy; it applies weakly where hard security remains dominated by great-power bilateralism. Nuclear deterrence is a scope condition for all three accounts: it prevents systemic war and thus slows any transition, but it does not prevent the erosion of unipolar authority in non-military domains. Finally, the claim is time-horizon sensitive: short-term shocks (wars, financial crises) can accelerate or retard perceived transitions without altering underlying capability distributions.

Observable Implications: If the transition is genuine, one should observe (a) declining G7 share and rising BRICS+ share of global GDP at PPP; (b) narrowing but still substantial US military-spending dominance alongside Chinese and, to a lesser extent, Russian modernization; (c) proliferation of non-Western institutions

with real lending and decision-making capacity; (d) increased hedging and multi-alignment among middle powers, visible in abstentions on UN resolutions and in diversified security partnerships; (e) weaponization of interdependence—sanctions, export controls, payment-system fragmentation; (f) regional security orders that operate with decreasing reference to Washington; and (g) a growing gap between Western normative vocabulary ("rules-based order") and the practices of much of the Global South. If, conversely, unipolarity is merely "stretched" rather than ended, one should observe continued US centrality in crisis management, alliance cohesion under pressure, and the failure of parallel institutions to achieve scale. The 2022–2024 period offers mixed evidence: sanctions against Russia demonstrated Western financial power, while abstentions by African, Asian, and Latin American states on Ukraine resolutions demonstrated the limits of that power's normative reach.

Perspective Note (five traditions in brief):

African (primary): African scholarship reads the transition not as a simple return to great-power multipolarity but as a reconfiguration of constraints and opportunities whose meaning depends on whether African agency can be exercised within it. Nkrumah's neo-colonialism thesis warns that formal multipolarity may reproduce extraction through new patrons rather than end it; Rodney's underdevelopment analysis suggests that power diffusion among Northern centers does not automatically benefit the periphery; and Mamdani's citizen/subject distinction highlights how international order is experienced through domestic authoritarian bargains that great-power competition often reinforces. Conversely, Nyerere's non-alignment and ujamaa, Cabral's "return to the source," and Fanon's call for a new humanism frame multipolarity as an opening for strategic autonomy and multi-alignment—African states engaging China, Russia, the West, the Gulf, and India simultaneously without exclusive alignment. Grovogui's critique of "the gaze" and Bayart's "politics of the belly" remind that African agency is exercised within structures of extraversion that predate and outlast any single hegemon. Tamale and Oyěwùmí gender the analysis: multipolar competition frequently bypasses women's security and reproduces patriarchal bargains. Aning and Danso emphasize African institutional agency through the AU, AfCFTA, and regional economic communities. The African vantage reveals what the Western great-power debate misses: for Africa, multipolarity is not new—colonialism itself was a multipolar competition among empires—and the decisive question is not which state is hegemon but whether any order permits autonomous development. Multi-alignment is therefore a strategy of survival and advancement, not a default or a failure of commitment.

Chinese: China frames the transition as the end of unipolar hegemony and the rise of a "community of shared future for mankind," opposing "Cold War mentality," "bloc confrontation," and "hegemonism." Multipolarity is normatively desirable; the "Global South" is a partner in democratizing international relations. Tianxia (all-under-heaven) relational ontology, articulated by Zhao Tingyang, posits harmony through relational networks rather than Westphalian sovereignty, while Qin Yaqing's relational theory and Yan Xuetong's moral realism debate how China should exercise rising power. In practice, China operates within the Westphalian state system while promoting "win-win" cooperation and non-interference. The occlusion is significant: the framing downplays asymmetries in Belt and Road financing, debt-sustainability concerns, and the coercive dimensions of economic statecraft, and it presents Chinese interests as universal interests.

Russian: Russia's 2023 Foreign Policy Concept declares a "new era" of multipolarity and civilizational diversity, rejecting Western universalism and "neocolonial" practices. "Sovereign democracy" and civilizational-state framing—drawing on Eurasianist traditions from Danilevsky through Dugin—justify resistance to liberal normative hegemony and position Russia as a pole defending state sovereignty and traditional values. The occlusion is equally significant: the framing masks Russia's power asymmetry with China, its economic

dependence, and its own coercive use of force in Ukraine, which undermines the sovereignty principle it claims to defend.

Western: The Western debate splits between primacists, who argue the United States must maintain leadership and defend the liberal order, and restrainers, who favor offshore balancing and acceptance of multipolarity. Mearsheimer's offensive realism predicts tragic competition; Schweller sees multipolarity as natural and urges adaptation; liberal institutionalists such as Ikenberry argue the liberal order can be reformed and is resilient due to institutional lock-in and shared interests. The occlusion is the tendency to treat Western preferences as universal norms, to underestimate non-Western agency, and to frame multipolarity as a threat rather than a legitimate aspiration.

UN: Charter multilateralism treats multipolarity as compatible with sovereign equality and collective security, but the crisis of Security Council representativeness and the veto power undermine institutional legitimacy. The UN perspective emphasizes rules, procedures, universal membership, and development goals. Its occlusion is that power politics constrains institutional reform, so the UN often reflects rather than transcends great-power competition, and its universalist claims are tested by selective enforcement.

SECTION 2.3 KEY IDEA 2 — Five competing order-projects

Bolded Causal Claim: The contemporary transition in world order is best understood not as a simple redistribution of material power but as a contest among five competing order-projects—African strategic autonomy, Chinese relational Tianxia, Russian multipolarity, Western liberal institutionalism, and UN Charter multilateralism—each of which proposes a different answer to the question of how authority, obligation, and community should be organized beyond the state.

Mechanism: Each order-project operates through three interlocking channels: a material channel that builds or captures institutions, finance, and security guarantees; a normative channel that defines legitimacy, rights, development, and sovereignty; and a coalition channel that mobilizes states through summits, voting blocs, regional organizations, and diplomatic language. The contest is not a zero-sum replacement of one hegemon by another; it is a layered struggle over which vocabulary will govern which issue area. African strategic autonomy, as articulated in the African Union's Agenda 2063 and in the practice of multi-alignment, treats order as an arena for collective self-determination and development rather than as a hierarchy of patrons. It seeks the capacity to choose partners, to set continental agendas, and to avoid new dependencies, drawing on Pan-Africanist traditions associated with Nkrumah and Nyerere and on critical scholarship that stresses African agency, extraversion, and the historical construction of sovereignty. Chinese relational Tianxia, expressed through the "community of shared future for mankind," Belt and Road connectivity, and the Global Development, Global Security, and Global Civilization Initiatives, treats order as a network of relationships in which development, non-interference, and multipolarity are privileged over liberal conditionality. Russian multipolarity, restated in the 2023 Foreign Policy Concept, treats order as a concert of civilizational states and sovereign democracies in which Western hegemony is the principal threat and the UN Charter is invoked as a shield against intervention. Western liberal institutionalism treats order as a rules-based system of markets, alliances, human rights, and institutionalized cooperation, with legitimacy anchored in democratic governance and economic openness. UN Charter multilateralism treats order as a legal framework of sovereign equality, collective security, and universal membership, with legitimacy anchored in procedure, development goals, and the aspiration to transcend power politics. The mechanism of contestation is normative entrepreneurship combined with institutional creation: when a project cannot dominate existing

institutions, it builds parallel or complementary ones, seeks recognition through summit declarations, and reframes the meaning of shared terms such as sovereignty, development, and rules. The BRICS Johannesburg II Declaration of 2023 is one such performative moment, not because it creates a new order, but because it publicly stages an alternative vocabulary of multipolarity, development finance, and institutional reform. The result is not a single successor order but a plural and overlapping order in which different projects are hegemonic in different domains—finance, security, trade, climate, and digital governance.

Scope Conditions: This five-project contest becomes visible under four conditions: first, the erosion of unipolar capacity to enforce preferences without prohibitive cost; second, the availability of alternative patrons, financiers, and security providers; third, domestic political demand within rising and middle powers for sovereignty, development, and recognition; and fourth, institutional veto points in the existing order that allow challengers to block or dilute Western initiatives. It is weakened where one power retains overwhelming dominance, where local elites are fully aligned with an external patron, or where regional rivalries prevent coalition formation. It is also conditioned by communicative infrastructure: summits, media, think tanks, and academic discourse are necessary to sustain each project as a recognizable vision rather than a mere tactical position. The contest is therefore not automatic; it requires entrepreneurs who can translate material grievances into normative claims.

Observable Implications: If this mechanism is operating, one should observe the proliferation of summit diplomacy and declarations with competing vocabularies; the creation or expansion of parallel institutions such as the Asian Infrastructure Investment Bank, the New Development Bank, and African Union peace and security structures; voting divergence in the UN General Assembly on Ukraine, Gaza, and sanctions; explicit naming of order visions in national policy documents; multi-alignment behavior by states that refuse exclusive bloc membership; and contestation over the meaning of the phrase "rules-based international order." One should also observe borrowing across projects: African strategic autonomy may use liberal institutional language while rejecting conditionality; Chinese relationalism may invoke UN Charter sovereignty while adding hierarchical relational obligations; Russian multipolarity may invoke Charter principles while contesting Western interpretations; Western liberal institutionalism may invoke universalism while practicing exclusion; and UN Charter multilateralism may provide a common grammar while lacking enforcement. These borrowings are not incoherence; they are the mechanism by which competing projects seek legitimacy within the same discursive field.

Perspective Note (five traditions in brief): *African (primary):* The African perspective is the longest and most theoretically generative here because it treats order not as an abstract systemic condition but as a lived field of sovereignty, development, and historical repair. From within African scholarship—Grovogui on the construction of sovereignty and quasi-sovereignty, Mbembe on necropolitics and the postcolony, Bayart on extraversion, Mamdani on the colonial state and citizen-subject distinction, Rodney on underdevelopment, and Nkrumah, Nyerere, Cabral, and Fanon on liberation and Pan-Africanism—strategic autonomy appears as a project of collective self-determination rather than mere non-alignment. The African vantage point reveals that Western liberal institutionalism often universalizes historically particular arrangements, that Chinese relationalism can reproduce dependency through infrastructure and debt, that Russian multipolarity can instrumentalize anti-Western rhetoric while pursuing its own sphere of influence, and that UN Charter multilateralism can be procedurally inclusive yet materially constrained by Security Council privilege. African strategic autonomy is therefore not neutrality between great powers; it is an attempt to convert multi-alignment into agenda-setting capacity, as seen in Agenda 2063, the African Continental Free Trade Area, and the African Union's peace and security architecture. Its contribution is to show that order is experienced through development, recognition, and the capacity to refuse. Its occlusion is that elite extraversion,

internal governance deficits, and uneven continental integration can make autonomy more rhetorical than material, and that "African" agency is itself heterogeneous across states, classes, and regions. *Chinese:* The Chinese perspective contributes a relational and development-first critique of Western universalism, emphasizing connectivity, non-interference, and multipolarity; it occludes the asymmetries embedded in bilateral relationships and the political costs of economic dependence. *Russian:* The Russian perspective contributes a sharp critique of unipolar dominance and a defense of sovereign equality; it occludes the coercive dimensions of its own regional policy and the contradiction between Charter rhetoric and the 2022 invasion of Ukraine. *Western:* The Western perspective contributes institutional predictability, market integration, and rights-based legitimacy; it occludes the tendency to treat Western preferences as universal norms and to underestimate non-Western agency. *UN:* The UN perspective contributes universal membership, legal procedure, and development frameworks; it occludes the fact that power politics constrains institutional reform and that the organization often reflects rather than transcends great-power competition.

SECTION 2.4 KEY IDEA 3 — The "Global South" as emergent political category

Bolded Causal Claim: The "Global South" has become a politically consequential category not because it denotes a coherent geography, economy, or ideology, but because it aggregates heterogeneous grievances against hierarchical global governance into a usable diplomatic identity that can be mobilized in crises such as Ukraine, Gaza, and debt distress.

Mechanism: The category is built through historical layering and political construction. The Non-Aligned Movement, founded at Belgrade in 1961, and the Group of 77, established in 1964, created institutional habits of Southern solidarity around decolonization, development, and sovereignty. These habits did not disappear after the Cold War; they were archived in UN caucuses, summit routines, and diplomatic vocabularies. The category was revived and rebranded as "Global South" after the 2008 financial crisis, when Western economic management lost credibility; it was reinforced by COVID-19 vaccine inequity, by the spillover effects of sanctions after the 2022 Ukraine war, and by recurring debt and climate injustices. The mechanism has four parts. First, grievance aggregation: diverse states experience conditionality, unequal representation, technology gaps, and climate vulnerability as common injuries, even when their material interests differ. Second, identity construction: "Global South" functions as strategic essentialism, allowing heterogeneous states to claim moral and political weight without requiring ideological uniformity. Third, institutional coordination: the G77 plus China in UN forums, BRICS+ summits, African Union positions, and regional blocs provide platforms for collective bargaining and statement-making. Fourth, crisis mobilization: events such as Ukraine, Gaza, or sovereign debt distress activate the category by making Western double standards or exclusion visible. The BRICS+ expansion of 2023—adding Saudi Arabia, Iran, the United Arab Emirates, Egypt, Ethiopia, and Argentina—illustrates the mechanism: it is not a coherent bloc but a variable-geometry coalition that uses the language of the Global South to demand representation, development finance, and multipolarity. The category is therefore less a sociological fact than a diplomatic technology. It enables middle powers to bargain collectively while preserving bilateral flexibility, but it also creates expectations of solidarity that may be disappointed by intra-South rivalries, such as India-China tensions, Saudi-Iran competition, or Nile disputes between Egypt and Ethiopia. Its power lies in its capacity to convert dispersed grievances into a recognizable political subject.

Scope Conditions: The Global South category becomes politically consequential under five conditions: first, a perceived crisis of Western legitimacy, whether through financial instability, military intervention, vaccine inequity, or selective enforcement of international law; second, sufficient economic weight among Southern

states to make coordination meaningful rather than merely symbolic; third, institutional forums that allow collective voice, including the UN General Assembly, BRICS+, and regional organizations; fourth, rhetorical entrepreneurs—state leaders, diplomats, and intellectuals—who can name and sustain the category; and fifth, crises that highlight inequality or double standards. The category weakens when internal rivalries dominate, when economic interests diverge sharply, as between energy exporters and importers, or when Southern states prefer bilateral deals with great powers over collective bargaining. It is also vulnerable to external imposition: Western analysts, Chinese diplomacy, and Russian propaganda may each use "Global South" to serve their own strategic narratives, sometimes flattening African, Latin American, and Asian specificities into a single geopolitical bloc.

Observable Implications: If this mechanism is operating, one should observe clustering in UN General Assembly voting on Ukraine resolutions, Gaza, and sanctions; the expansion and institutionalization of BRICS+; G77 statements that frame development, climate finance, and institutional reform as Southern demands; abstentions or alternative resolutions by African, Asian, and Latin American states in crises involving great powers; demands for Security Council reform and greater voice in the IMF and World Bank; and the increasing use of "Global South" in policy documents, media, and academic discourse. One should also observe limits: the category does not predict uniform behavior, and abstention should not be mistaken for alignment with Russia or China. Abstention may express sovereignty, non-alignment, grievance against Western double standards, or simple risk management. The Data Lab focus on UNGA voting by region, BRICS+ GDP share relative to the G7, and AIIB versus World Bank lending is designed to test whether the category corresponds to measurable institutional and economic shifts or remains primarily rhetorical.

Perspective Note (five traditions in brief): *African (primary):* The African perspective is the longest and most critical here because African states and scholars have both contributed to and been partially submerged by the Global South category. From within African thought—Grovogui on sovereignty and quasi-sovereignty, Mbembe on the postcolony and necropolitics, Bayart on extraversion, Mamdani on the bifurcated state, Rodney on underdevelopment, and Fanon, Cabral, Nkrumah, and Nyerere on liberation—the Global South can appear as a continuation of Bandung and non-alignment, but also as a category that risks obscuring African specificity. African strategic autonomy may conflict with the leadership claims of BRICS+ members, especially where China or Russia seeks to define the Southern agenda. The African vantage point reveals that the Global South is not a natural community but a political construction whose benefits depend on whether it amplifies African agency or subordinates it to larger powers. It contributes the insight that Southern solidarity must be evaluated by its effects on continental integration, development finance, and sovereignty, not merely by its opposition to the West. Its occlusion is that African states themselves are divided by regime type, economic structure, and regional rivalry, and that elite invocations of the Global South may serve domestic legitimation as much as international bargaining. *Chinese:* The Chinese perspective contributes a powerful use of the Global South category to legitimize multipolarity, development finance, and non-interference; it occludes the power asymmetries within BRICS+ and the possibility that Southern solidarity may be instrumentalized for Chinese strategic goals. *Russian:* The Russian perspective contributes anti-hegemonic rhetoric and a challenge to Western dominance; it occludes the fact that its own actions in Ukraine have tested the credibility of its claims to defend sovereignty and Charter principles. *Western:* The Western perspective often treats the Global South as a set of swing states, development partners, or governance problems; it contributes aid, trade, and institutional access; it occludes structural inequality and the historical production of hierarchy. *UN:* The UN perspective contributes universal development frameworks, multilateral forums, and the language of sovereign equality; it occludes the gap between universalist claims and the enforcement power of the Security Council, and the tendency for Southern demands to be diluted in

bureaucratic process.

2.5 KEY IDEA 4 — The "Rules-Based International Order" as a Contested Phrase

Bolded Causal Claim: The phrase "rules-based international order" is not a neutral description of an agreed legal regime but a political claim that naturalizes a historically specific, Western-authored hierarchy; contestation over who writes the rules, who enforces them, and who is bound by them is therefore constitutive of contemporary order politics rather than a deviation from it.

Mechanism: The mechanism is semantic capture combined with asymmetric enforcement. First, the phrase conflates three analytically distinct things: (a) the UN Charter and treaty-based international law; (b) institutional regimes such as trade, finance, and arms control; and (c) politically asserted norms such as freedom of navigation, market openness, human-rights conditionality, and alliance solidarity. By collapsing these layers into one vocabulary, powerful states can present preferences as rules and dissent as rule-breaking. Second, authorship is historically concentrated: the post-1945 order was drafted by victorious powers, embedded Western legal categories, and carried forward the "standard of civilization" logic that African and post-colonial scholars have long identified as a technology of hierarchy (Grovogui; Mamdani; Rodney). Third, enforcement capacity is unevenly distributed: sanctions, financial exclusion, conditionality, military alliances, and control over key currencies allow some actors to enforce rules while others experience rules as constraints. Fourth, bindingness is stratified: great powers reserve exceptions through vetoes, non-ratification, targeted sanctions, and claims of self-defense, while weaker states face compliance costs. Fifth, contestation is not simply rejection of rules but competing constitutionalism: African, Chinese, Russian, and other actors invoke "rules" too, but redefine their content around sovereignty, non-intervention, development rights, and procedural equality. Acharya's (2018) idea of a "multiplex" order is useful here because it suggests that order is no longer organized around a single rule-maker; rather, multiple actors generate partially overlapping rules, and legitimacy becomes the central battlefield. The mechanism therefore runs from discursive conflation to hierarchical authorship, then to selective enforcement, and finally to counter-claims that seek to pluralize the meaning of order.

Scope Conditions: The phrase is most effective where hegemonic power, alliance discipline, and financial interdependence make compliance cheaper than defiance. It works best when rules are codified in institutions that powerful states control and when violations can be framed as threats to collective security or market stability. It weakens when rules conflict with core sovereignty, when enforcement is visibly selective, or when historical memory of unequal treaties and colonial legal regimes makes "universal" language suspect. It also weakens when the same actors who invoke rules are seen to exempt themselves, because the phrase then loses performative legitimacy. The scope condition is therefore not merely power but perceived impartiality: rules bind most effectively when enforcement appears reciprocal, and they become contested when enforcement appears to track geopolitical alignment.

Observable Implications: One implication is voting behavior in multilateral forums. Broad condemnation of territorial aggression can coexist with significant abstentions when enforcement is perceived as selective; this pattern suggests that many states accept the substantive rule while questioning the legitimacy of the enforcement coalition. Another implication is the selective use of sanctions: extensive coercive measures against some violators alongside limited accountability for others produce a credibility gap that non-Western actors routinely cite. A third implication is institutional demand: calls for UN Security Council reform, equitable representation in financial institutions, and "reformed multilateralism" are not rejections of order but

demands to renegotiate authorship. A fourth implication is rhetorical convergence: China's "true multilateralism," Russia's critique of "rules-based order," and African demands for strategic autonomy all use the language of rules while contesting their content. A fifth implication is that the phrase itself has become a diagnostic indicator: when diplomats invoke "rules-based order," they are often signaling alignment rather than describing a settled legal consensus.

Perspective Note (five traditions in brief): *African (primary):* The African vantage point begins from the historical experience that international rules have often functioned as instruments of subordination: colonial legal regimes, unequal treaties, externally imposed economic conditionality, and racialized standards of sovereignty. African scholarship—Rodney on underdevelopment, Nkrumah on neo-colonialism, Mamdani on the bifurcated state, Grovogui on international legal universalism—treats sovereignty not as an abstract given but as a historically contested achievement against hierarchy. From this perspective, the "rules-based order" is not self-evidently legitimate; its legitimacy depends on who authored the rules, whether enforcement is impartial, and whether rules protect developmental space rather than merely discipline weaker states. African multi-alignment and abstentions are therefore better understood as strategic autonomy than as neutrality: they refuse conscription into enforcement regimes whose application is uneven. AU Agenda 2063 frames continental integration, industrialization, and self-reliance as forms of rule-making capacity, not mere compliance. The contribution of this perspective is to expose the historical production of legal hierarchy and to insist that equality of sovereignty must be substantive, not rhetorical. Its occlusion is that it can understate instances in which rules—especially territorial integrity and non-aggression—protect weaker states from predation, and it can be weakened when internal governance deficits make external claims to equal sovereignty less persuasive. *Chinese:* China presents itself as a defender of the UN Charter and "true multilateralism," opposing "small circles," bloc confrontation, and the unilateral rewriting of rules. It argues that rules must evolve through inclusive consultation and reflect multipolar realities, and it links order to development, connectivity, and the "community of shared future." Its contribution is to challenge Western monopoly over legitimacy and to demand procedural inclusion; its occlusion is that it can obscure coercive practices in its own region, ambiguity over maritime claims, and the gap between universalist rhetoric and power-political competition. *Russian:* Russia frames the "rules-based order" as ideological cover for Western hegemony, NATO expansion, and selective enforcement, while invoking sovereign equality, civilizational diversity, and the UN Charter. Its contribution is to expose double standards and the asymmetry between rule-makers and rule-takers; its occlusion is that its own use of force against Ukraine has severely tested the credibility of its claims to defend Charter principles. *Western:* The Western perspective treats the rules-based order as a liberal peace project: human rights, open markets, collective security, and institutionalized cooperation. It sees enforcement as defense of norms against revisionist challengers. Its contribution is the creation of durable legal and institutional frameworks; its occlusion is the historical production of hierarchy, selective enforcement, and the tendency to conflate US or allied preferences with universal rules. *UN:* The UN perspective anchors order in the Charter: sovereign equality, non-use of force, peaceful settlement of disputes, and development. Its contribution is universalist language and inclusive forums; its occlusion is the enforcement gap created by Security Council privilege, the tendency for Southern demands to be diluted in bureaucratic process, and the difficulty of reconciling universal norms with great-power politics.

2.6 KEY IDEA 5 — Institutional Revisionism and the Fracturing of Bretton Woods: AIIB, NDB, and BRICS Payment Systems

Bolded Causal Claim: The creation of parallel financial institutions and payment infrastructures by BRICS and China does not simply duplicate Bretton Woods institutions but constitutes institutional revisionism

that fragments global financial governance, producing overlapping authority and competing standards while remaining partially dependent on the dollar-centered system.

Mechanism: The mechanism begins with a voice deficit. The Bretton Woods institutions were created in 1944 with governance structures reflecting mid-century power; over time, economic weight shifted faster than voting shares, conditionality practices, and leadership conventions, producing grievances among emerging economies. Institutional revisionism then operates through the simultaneous use of voice and exit: dissatisfied states demand reform of existing institutions while creating alternatives that embody their preferences. Hirschman's (1970) framework is useful here because it captures why actors do not simply leave the system; they build parallel institutions to increase bargaining leverage, signal dissatisfaction, and create fallback options. The Asian Infrastructure Investment Bank (AIIB), launched with Chinese leadership, and the New Development Bank (NDB), created by BRICS, are the clearest examples: they provide development finance with governance arrangements that give emerging economies greater ownership, emphasize infrastructure and "Southern" priorities, and challenge the monopoly of the World Bank and regional development banks. Their revisionism is not only material but normative: they promote non-interference, country ownership, and development-first lending, in contrast to the conditionality and policy reform traditions of Bretton Woods institutions. Payment-system initiatives—CIPS, BRICS payment mechanisms, local-currency settlement, and projects such as mBridge—extend revisionism into the monetary domain by seeking to reduce dependence on SWIFT, lower sanctions exposure, and create channels for trade settlement outside the dollar. Yet the mechanism is constrained by network effects: the dollar's liquidity, the depth of US Treasury markets, convertibility, legal predictability, and the fact that many new institutions still co-finance with, benchmark against, or operate alongside Bretton Woods institutions. The result is not replacement but layering: overlapping institutions, forum shopping, competing standards, and a gradual pluralization of financial governance.

Scope Conditions: Institutional revisionism succeeds where three conditions align: large infrastructure gaps, dissatisfaction with existing conditionality, and the availability of capital from a major state willing to underwrite new institutions. It is strongest in regions where Western finance is scarce or politically conditional and where borrowers value speed and fewer policy conditions. It is weaker where new institutions lack scale, credit history, or operational capacity, and where member states have conflicting interests—such as India-China rivalry or Saudi-Iranian tensions—that limit collective action. It is also constrained by the dollar system: alternatives can reduce transaction dependence at the margins, but they cannot quickly replicate the liquidity, trust, and legal infrastructure that sustain dollar dominance. Sanctions can accelerate demand for alternatives, but secondary sanctions and compliance risk can deter adoption. The scope condition is therefore not merely institutional creation but sustained convergence between grievance, capacity, and member-state cohesion.

Observable Implications: One implication is institutional proliferation: AIIB membership has expanded well beyond Asia, and NDB lending has grown, including local-currency operations, while co-financing with established institutions shows that new banks are embedded in rather than fully separate from the existing system. Another implication is governance contestation: debates over quota reform, leadership selection, and conditionality in the IMF and World Bank persist, indicating that voice deficits remain unresolved. A third implication is financial fragmentation: bilateral local-currency trade, alternative payment rails, and BRICS discussions of settlement mechanisms indicate incremental diversification, but not a systemic displacement of the dollar. A fourth implication is metric asymmetry: BRICS+ accounts for a larger share of global GDP at purchasing-power parity than the G7, yet the G7 retains greater nominal GDP, financial-market depth, and institutional control. This gap between economic weight and financial power is precisely what revisionist institutions seek to narrow. A fifth implication is that the BRICS Johannesburg II Declaration

(2023) explicitly calls for reform of Bretton Woods institutions and greater use of local currencies, signaling that institutional revisionism is now an organized diplomatic project rather than a set of isolated initiatives.

Perspective Note (five traditions in brief): *African (primary):* African states view AIIB and NDB as potential sources of infrastructure finance aligned with AU Agenda 2063, offering alternatives to Western conditionality and expanding the menu of development partners. The contribution of this perspective is to insist on African agency: financing should support continental priorities such as transport corridors, energy, and industrialization, and African governments should have voice in institutional design rather than merely borrowing from externally governed banks. African scholarship on extraversion and dependency—Bayart on the "politics of the belly," Nkrumah on neo-colonialism, Rodney on underdevelopment—warns that institutional alternatives can reproduce dependency if they are not governed by African priorities and if debt sustainability is ignored. Multi-alignment means engaging all institutions while demanding transparency, local benefit, and African representation. The occlusion is that this perspective can understate the risks of opacity, debt distress, and asymmetric creditor power in new institutions, and it can be weakened when African governments lack the capacity to negotiate as a bloc. *Chinese:* China frames the AIIB as high-standard multilateralism and a contribution to the "community of shared future," emphasizing development, connectivity, and non-interference. Its contribution is capital, infrastructure, and an institutional platform that elevates emerging-economy ownership; its occlusion is that it can obscure geopolitical competition, debt concerns, and asymmetry in decision-making within China-led institutions. *Russian:* Russia supports a multipolar financial architecture and de-dollarization as ways to reduce sanctions vulnerability and Western financial hegemony. Its contribution is to challenge the political use of financial infrastructure; its occlusion is that alternatives remain shallow, uptake is uneven, and Russian advocacy is shaped by its own exposure to sanctions. *Western:* The Western perspective acknowledges development needs but worries about standards, transparency, debt sustainability, and strategic fragmentation. Its contribution is the scale, safeguards, and creditworthiness of existing institutions; its occlusion is the history of conditionality, underrepresentation, and the tendency to treat Western governance norms as universal. *UN:* The UN perspective supports development finance, infrastructure, and the Sustainable Development Goals, while invoking universal norms of accountability and inclusion. Its contribution is a legitimizing framework for multilateral development; its occlusion is that it can mask power asymmetries in new institutions and the gap between universalist claims and the actual distribution of voice and resources.

SECTION 2.7 FIVE PERSPECTIVES IN DEPTH

2.7.1 African Perspective (PRIMARY)

The African perspective on the contemporary transition is best understood not as a regional variant of multipolarity but as a distinct epistemic and political standpoint produced by the long experience of being governed within an international order that was built, in large part, through colonial conquest, racialized sovereignty, and extractive political economy. African international-relations scholarship has repeatedly insisted that the discipline's core categories—sovereignty, anarchy, order, development, security—were not discovered as neutral descriptions but were forged in the context of European imperial expansion and its afterlives. Grovogui's critique of the "sovereigns, quasi sovereigns, and Africans" structure of international law, Mbembe's analysis of necropolitics and the planetary entanglement of violence and resource extraction, Bayart's concept of extraversion, Mamdani's distinction between citizen and subject, Rodney's account of how Europe underdeveloped Africa, and Fanon's analysis of colonial violence and its psychological and institutional

residues all converge on a single claim: the contemporary "rules-based international order" cannot be evaluated as if it were a neutral framework whose only problem is recent strain. From this vantage point, the transition away from unipolarity is not merely a redistribution of power among great powers; it is a reopening of questions about who counts as a sovereign, whose development model is legitimate, and whose suffering is visible in global governance. Acharya (2018) argues that the emerging order is multiplex rather than merely multipolar; the African perspective pushes this argument further by asking whether multiplexity can be meaningful if the hierarchies of recognition produced by colonialism remain intact.

This standpoint also reframes the familiar language of multipolarity. For many African thinkers and policymakers, multipolarity is not an abstract systemic condition but a practical opportunity to reduce dependence on any single external patron. Nkrumah's pan-Africanism, Nyerere's emphasis on self-reliance and nonalignment, and Cabral's insistence that liberation must be rooted in the material realities of the people rather than imported slogans all provide a lineage for what is now called strategic autonomy or multi-alignment. The African Union's Agenda 2063, with its aspirations for continental integration, industrialization, peace and security architecture, and financial independence, is the institutional expression of this lineage. It does not reject international cooperation; rather, it seeks to make cooperation conditional on African agency, African priorities, and African ownership. In this sense, African strategic autonomy is not neutrality in the Cold War sense of standing aside from great-power competition. It is an active, selective, and issue-specific practice: aligning with different partners on different questions, resisting external imposition, and using the competition among major powers to expand room for maneuver. The abstentions of many African states on United Nations General Assembly resolutions concerning Ukraine in 2022–2024 are intelligible through this lens. They were not simply endorsements of Russian aggression, nor were they merely expressions of indifference. They reflected a cluster of concerns: the defense of sovereignty as a universal principle, opposition to selective sanctions that harm food and energy security, resentment at the prioritization of European crises over African ones, and a refusal to be conscripted into a binary alignment that would reproduce Cold War patterns. To read these abstentions as "pro-Russian" is to impose a bipolar interpretive grid that the African perspective explicitly rejects.

The African vantage point contributes something the other four perspectives cannot fully supply: a theory of order as hierarchy of recognition. Western liberal institutionalism tends to treat the post-1945 order as a set of rules and institutions that, however imperfect, created a framework for cooperation and development. Chinese and Russian perspectives tend to treat the same order as a vehicle for Western hegemony and to propose multipolarity as its corrective. The UN perspective treats the Charter as a universal legal framework whose crisis is one of compliance and reform. The African perspective, by contrast, asks a prior question: who was recognized as a full sovereign subject when the rules were written, and whose sovereignty remains conditional in practice? This question is not merely historical. It shapes contemporary debates over debt sustainability, climate finance, vaccine equity, migration, and the allocation of Security Council seats. Mamdani's analysis of the colonial state's bifurcated structure, in which "citizens" and "subjects" were governed differently, has an international analogue: some states are treated as rule-makers and others as rule-takers, some as security providers and others as security problems. Mbembe's work on the "becoming-black of the world" and the planetary distribution of vulnerability suggests that the contemporary transition is not only about the rise of China or the return of Russia but about whether the global order can accommodate forms of life and knowledge that were historically excluded from its design. Oyěwùmí's critique of the gendered and epistemic assumptions embedded in Western social theory, and Tamale's feminist insistence on centering African women's agency, further show that even emancipatory discourses of multipolarity can reproduce hierarchies if they remain state-centric and elite-driven. The African perspective therefore does not simply

add "Africa" to a list of regions; it challenges the ontological premises of international-relations theory itself.

At the same time, this perspective has scope conditions and blind spots that must be acknowledged. It can risk romanticizing non-alignment or strategic autonomy by understating the material constraints that shape African states' choices: debt dependence, aid dependence, commodity export structures, security partnerships, and the limited fiscal capacity of regional institutions. Bayart's concept of extraversion is double-edged: African elites have historically used external resources to maintain domestic power, which means that "strategic autonomy" can be as much a rhetorical resource as a material condition. The African Union's consensus-based decision-making and its dependence on external funding can limit its ability to act collectively, even when its normative commitments are clear. Moreover, an overemphasis on sovereignty and non-intervention can occlude internal authoritarianism, gendered violence, and the rights of minorities, particularly when sovereignty is invoked by governments rather than by peoples. Aning and Danso's work on African agency in security governance reminds us that agency is not automatically emancipatory; it can be exercised by states, elites, insurgents, or communities in ways that conflict with one another. The African perspective is strongest when it treats sovereignty not as an absolute shield but as a contested and relational achievement, and when it connects external autonomy to internal democratization. Its contribution to the study of world order is therefore not a finished alternative model but a set of critical questions: who is included in "the international," whose knowledge counts, whose development is prioritized, and whose security is purchased at whose expense?

In the context of the five key ideas of this lesson, the African perspective illuminates each of them differently. The decline of unipolarity is not merely a shift from one hegemon to several; it is a moment in which the historical monopoly of Western powers over the definition of legitimate order is weakened, creating space for alternative claims. The five competing order-projects are not equal alternatives from an African standpoint: liberal institutionalism is judged by its colonial and conditional legacies; Chinese relationalism by its development promise and its potential for new dependencies; Russian multipolarity by its anti-hegemonic rhetoric and its imperial practice; UN multilateralism by its universalist language and its unequal structure. The "Global South" is not a natural geographic category but a political project shaped by shared experiences of marginalization and by the attempt to convert that experience into collective bargaining power. The phrase "rules-based international order" is exposed as a contested slogan whose rules were not universally authored and whose enforcement is uneven. Finally, institutional revisionism—AIIB, NDB, BRICS payment systems—is read not as a simple challenge to Western dominance but as a field in which African states must navigate between new opportunities and new forms of dependence. The African perspective thus frames the lesson's central puzzle: the contemporary transition is not only about who leads the international system, but about whether the system can be reconstituted on terms that recognize the full sovereignty, equality, and agency of those who were historically treated as objects of order rather than authors of it.

2.7.2 Chinese Perspective

The Chinese perspective on the contemporary transition is organized around the claim that the post-Cold War unipolar order is neither legitimate nor sustainable, and that the movement toward multipolarity represents not disorder but the democratization of international relations. From within this viewpoint, the central problem of world order is hegemony: the concentration of military, financial, technological, and normative power in a single state and its alliance system. The Chinese narrative draws on a long historical memory of the "century of humiliation," on the experience of exclusion from the post-1945 order, and on the more recent success of state-led development. It presents China's rise not as a bid for hegemony but as the restoration of a more plural and equitable distribution of power. The vocabulary of "community of shared future

for mankind," "win-win cooperation," and "multipolarity" is not merely diplomatic rhetoric; it expresses a relational ontology in which order is achieved through mutual benefit, sovereign equality, and the avoidance of zero-sum competition. The concept of Tianxia, often invoked in Chinese political discourse, can be steel-manned not as a claim to imperial universalism but as an aspiration to a world in which differences are managed through reciprocity rather than domination. In this reading, the Westphalian state system is not rejected but supplemented by a thicker ethic of relational responsibility.

This perspective contributes a powerful critique of the "rules-based international order" as a phrase that obscures the question of who wrote the rules and who is bound by them. Chinese officials and scholars frequently argue that the United States invokes rules when they serve its interests and bypasses them when they do not, citing interventions, sanctions, and the selective application of international law. The Chinese position holds that legitimate rules must be negotiated multilaterally, must reflect the interests of developing countries, and must not be used as instruments of coercion. It also reframes development as a right rather than a reward for compliance with Western governance standards. Institutions such as the Asian Infrastructure Investment Bank, the New Development Bank, and the Belt and Road Initiative are presented as responses to a genuine deficit in infrastructure finance and as alternatives to institutions whose conditionality and governance structures are seen as unrepresentative. The BRICS Johannesburg II Declaration (2023) echoes this critique by calling for greater representation of developing countries and reform of global governance. The BRICS+ expansion is interpreted as evidence that a growing number of states seek a more multipolar and less Western-centric system. China's peace proposals, including its position on the Ukraine war, are framed as efforts to promote dialogue, sovereignty, and a security architecture that does not rely on military blocs. From this standpoint, the UN Charter's principles of sovereignty and non-interference are not obstacles to order but its foundation, and the crisis of multilateralism is caused by the instrumentalization of universal norms for geopolitical ends.

The Chinese perspective's strength lies in its capacity to articulate the grievances of states that feel excluded from global governance and to mobilize material resources for development. It offers a coherent alternative to the assumption that Western liberal democracy is the only legitimate endpoint of political development. It also forces a necessary debate about double standards in the application of international law. Yet its occlusions are significant. The emphasis on sovereignty and non-interference can shield authoritarian practices and can be invoked selectively, particularly in relation to China's own territorial claims and its treatment of minorities. The language of "win-win" cooperation can obscure asymmetries of power between China and its partners, especially in debt, resource extraction, and technology dependence. The Belt and Road Initiative has generated legitimate concerns about transparency, environmental standards, and debt sustainability, even if these concerns are sometimes exaggerated by geopolitical rivals. Moreover, the Chinese perspective tends to conflate opposition to Western hegemony with support for China's own strategic interests, making it difficult to distinguish between multipolarity as a global public good and multipolarity as a vehicle for Chinese influence. Its vision of a "community of shared future" remains under-specified in institutional terms: it is not yet clear how a relational order would resolve disputes over territory, human rights, or security without recourse to power. The perspective is therefore most persuasive as a critique of unipolarity and as a demand for greater voice for the Global South, and least persuasive when it presents China's own rise as automatically benign or when it treats sovereignty as an absolute that overrides all other norms.

2.7.3 Russian Perspective

The Russian perspective on the contemporary transition is rooted in a rejection of the post-Cold War unipolar order and in the assertion that Russia is a distinct civilization with legitimate great-power interests that cannot

be subordinated to Western norms. The 2023 Russian Foreign Policy Concept frames the international system as undergoing a "profound transformation" toward multipolarity, in which the dominance of the "collective West" is giving way to a more just and polycentric world. From within this viewpoint, the central problem is not Russian revisionism but Western overreach: the expansion of NATO, the promotion of liberal democratic norms as universal, the use of sanctions and financial power as weapons, and the disregard for Russia's security concerns. The concept of "sovereign democracy" holds that political legitimacy derives from a state's own historical and cultural traditions rather than from external standards, and that no single model of governance can be imposed on all societies. The "civilizational state" framing goes further, presenting Russia not merely as a nation-state but as a distinct civilization with its own values, historical mission, and sphere of legitimate influence. This perspective draws on a deep sense of historical grievance, including the collapse of the Soviet Union, the perceived broken promises regarding NATO expansion, the Kosovo precedent, and the experience of economic shock therapy in the 1990s.

The Russian contribution to the debate over world order is its insistence that security is indivisible and that the expansion of military alliances to the borders of a major power creates a security dilemma that cannot be dismissed as mere paranoia. It also highlights the hypocrisy of a "rules-based order" that, in its view, applies international law selectively: Western states invoke sovereignty when it suits them and override it when they deem it necessary. The Russian perspective supports multipolarity not only as a distribution of power but as a pluralism of political and cultural models. It argues that the UN Charter's principles of sovereignty and non-intervention should be the supreme framework for international relations, and that attempts to enforce liberal norms through intervention or sanctions undermine the very order they claim to defend. In the context of institutional revisionism, Russia supports alternative financial and political arrangements that reduce dependence on Western-controlled institutions, including BRICS and the Eurasian Economic Union. Its narrative of anti-colonialism and anti-hegemony resonates with many states in the Global South, particularly those that have experienced sanctions, intervention, or conditional lending.

The occlusions of the Russian perspective are, however, severe and cannot be treated as incidental. The 2022 invasion of Ukraine is a direct violation of the sovereignty and territorial integrity principles that the perspective claims to uphold. The gap between Russia's defense of Westphalian sovereignty in the abstract and its denial of Ukrainian sovereignty in practice is not a minor inconsistency; it is a fundamental contradiction that undermines the credibility of its normative claims. The "civilizational state" rhetoric can function as an imperial ideology, justifying domination over neighboring peoples and the suppression of dissent at home. The concept of "sovereign democracy" has been used to legitimize authoritarian consolidation, the restriction of political competition, and the manipulation of elections. Moreover, Russia's use of energy, information, and military force as instruments of coercion demonstrates that its opposition to Western hegemony does not necessarily imply a commitment to a more equitable or peaceful order. The perspective is strongest when it identifies genuine tensions in liberal internationalism—such as the tension between universal norms and great-power security, or between intervention and sovereignty—and weakest when it presents Russia's own actions as defensive necessities while denying agency to its neighbors. A steel-man of the Russian position must therefore separate its valid critique of unipolarity and double standards from its attempt to legitimize aggression and imperial control. Its contribution to the contemporary transition is real but bounded: it has helped to expose the fragility of Western normative dominance, but it has not offered a credible alternative order that can command broad legitimacy beyond a narrow circle of aligned states.

2.7.4 Western Perspective

The Western perspective on the contemporary transition is best described as liberal institutionalism under

strain. From within this viewpoint, the post-1945 order, however imperfect, created an unprecedented framework for cooperation, prosperity, and the gradual expansion of human rights and democratic governance. The central problem of the current transition is not that the order was illegitimate but that it is being challenged by authoritarian powers, undermined by populist nationalism, and strained by its own overreach. The Western narrative emphasizes the role of alliances, institutions, trade, and norms in preventing great-power war, promoting development, and managing global problems such as climate change, pandemics, and financial crises. It treats the "rules-based international order" as a genuine, if incomplete, achievement: a body of treaties, institutions, and practices that, however unevenly, constrain arbitrary power and provide mechanisms for dispute resolution. The decline of unipolarity is acknowledged, but it is interpreted as a dangerous moment in which the guardrails of order are weakening, not as a welcome correction to Western dominance.

This perspective contributes a powerful account of institutional capacity and normative aspiration. The scale and creditworthiness of the Bretton Woods institutions, the security guarantees provided by NATO, the humanitarian and development work of UN agencies, and the legal frameworks governing trade, human rights, and the law of the sea represent real achievements that are not easily replicated by newer institutions. Western scholars and policymakers argue that the problem is not the absence of rules but the failure of some states to comply with them, and that the appropriate response is reform and reinforcement rather than abandonment. The Western perspective also insists that certain norms—prohibition of aggression, human rights, non-proliferation—are not merely Western preferences but universal commitments embedded in the UN Charter and international law. From this standpoint, the rise of China and the assertiveness of Russia are not simply expressions of multipolarity but challenges to a legal and normative framework that has benefited the world as a whole. The Western response to the Ukraine war—sanctions, military assistance, diplomatic mobilization, and UN resolutions—is presented as a defense of the Charter order against aggression, not as a defense of Western hegemony.

The occlusions of the Western perspective are equally important. Its tendency to treat Western governance norms as universal can obscure the historical specificity of liberal democracy and the diversity of legitimate political arrangements. Its record of intervention, regime change, and conditional lending has generated deep resentment in many parts of the Global South, and its failure to reform international institutions to reflect contemporary power distributions has undermined its credibility. The Western perspective often underestimates the extent to which the "rules-based order" is perceived as a Western order, and it can treat legitimate grievances about underrepresentation, debt, and historical injustice as mere propaganda. It also faces an internal contradiction: it champions a rules-based order while sometimes exempting itself from the rules, whether through the use of force without Security Council authorization, the maintenance of unequal voting structures, or the application of sanctions that harm third parties. Mearsheimer's critique of liberal hegemony, though controversial, captures an important internal Western debate: the attempt to spread liberal democracy by force may have produced backlash and instability rather than order. Schweller's analysis of unipolarity's end suggests that the transition is not simply a matter of defending the old order but of adapting to a world in which power is more diffuse. The Western perspective is therefore most convincing when it defends specific, widely shared norms and institutional capacities, and least convincing when it conflates those norms with Western strategic interests or treats the existing order as self-evidently legitimate. Its challenge in the contemporary transition is to distinguish between defending universal principles and defending a historically unequal distribution of power.

2.7.5 UN Perspective

The UN perspective on the contemporary transition is that of Charter multilateralism in crisis. From within

this viewpoint, the international system is not merely an arena of competing powers but a legal and institutional order whose legitimacy derives from the UN Charter and the universal principles it enshrines: sovereign equality, territorial integrity, non-intervention, peaceful settlement of disputes, and collective security. The UN perspective does not deny the reality of power politics, but it insists that power must be exercised within a framework of law and that the legitimacy of order depends on the consent and participation of all states. The central problem of the transition is therefore not the decline of any single power but the erosion of multilateral norms, the paralysis of the Security Council, and the gap between the universalist claims of the Charter and the unequal distribution of voice and resources in the system. The UN perspective is distinct from the Western perspective in that it does not identify the "rules-based order" with any particular alliance or regional bloc; it identifies it with the Charter itself, which is formally universal and which includes states with radically different political systems and interests.

This perspective contributes a legitimizing framework for global governance and a set of norms that remain indispensable even in a multipolar world. The UN Charter, the Universal Declaration of Human Rights, the Sustainable Development Goals, and the various conventions on climate, trade, and security provide a common language and a set of benchmarks against which state behavior can be judged. The UN system also provides forums in which weaker states can amplify their voices, as seen in the General Assembly's role in expressing global opinion on the Ukraine war and in the long-standing demands for Security Council reform. The UN perspective supports development finance, infrastructure, and the SDGs, while invoking universal norms of accountability and inclusion. It can accommodate the grievances of the Global South by framing them as demands for the fulfillment of Charter promises rather than as rejections of multilateralism. In this sense, the UN perspective offers a possible bridge between competing order-projects: it can validate African demands for sovereignty and development, Chinese demands for multipolarity and non-interference, Russian demands for sovereign equality, and Western demands for normative constraints, provided that all are subordinated to a genuinely universal framework.

The occlusions of the UN perspective are structural rather than merely rhetorical. The Security Council's veto power concentrates authority in five states, three of which are Western or Western-aligned, and this concentration undermines the claim that the system is based on sovereign equality. The UN's dependence on member-state contributions and on the political will of powerful states means that its capacity to enforce norms is uneven and often selective. The UN perspective can mask power asymmetries in new institutions by invoking universalist language that does not correspond to the actual distribution of voice and resources. It can also treat the Charter as a static text rather than as a living framework that must be reinterpreted in light of decolonization, climate change, and technological transformation. The gap between the UN's normative aspirations and its operational capacity is particularly visible in crises such as Ukraine, where the Security Council is paralyzed by the veto of a permanent member that is itself a party to the conflict. The UN perspective is therefore most credible when it acknowledges its own institutional limitations and supports reform, and least credible when it presents the existing system as already legitimate. Its contribution to the contemporary transition is to remind all competing projects that order without law is merely power, and that law without power is merely aspiration. The challenge is to find institutional forms that can reconcile these two truths in a world where no single power can impose its will and no universal consensus yet exists on the terms of coexistence.

2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Reveals multi-alignment and strategic autonomy as rational, agentic responses to great-power competition; shows that Global South abstentions are active non-alignment rather than neutrality; centers the agency of states historically excluded from rule-making	May understate the material costs of non-alignment for small states; risks romanticizing sovereignty without addressing internal governance deficits and elite capture	Equitable multipolarity with African agency; reform of global governance to reflect demographic and economic weight; Agenda 2063 as normative horizon	AU Agenda 2063; African abstentions on UNGA Ukraine resolutions (2022–2024); BRICS+ expansion including Egypt and Ethiopia; AU admission to G20 (2023)	**Western:** Non-alignment in the face of aggression undermines the collective security norms that ultimately protect small states; abstention is complicity by another name

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Chinese	Offers relational ontology (Tianxia) as a genuine alternative to Westphalian sovereignty; demonstrates that economic interdependence can be leveraged for political influence; provides institutional alternatives (AIIB, BRI, NDB) that diversify global governance	Understates coercive dimensions of economic statecraft; obscures asymmetries in bilateral relationships; presents self-interest as universalism; conflates development finance with political alignment	Community of shared future for mankind; multipolarity with Chinese characteristics; development-first ordering; relational harmony over contractual individualism	AIIB membership exceeding 100 countries; BRI infrastructure investments across 150+ states; Chinese peace plan for Ukraine (February 2023); Global Development Initiative	**African:** Relational hierarchy may reproduce dependency under new management; "shared future" rhetoric can mask asymmetric power in bilateral deals

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Russian	Articulates civilizational pluralism and sovereign democracy as a critique of liberal universalism; exposes double standards in Western application of international law; names the security dilemma that Western narratives ignore	Legitimizes aggression as anti-hegemony; conflates regime security with state sovereignty; ignores agency of neighboring states; presents imperial restoration as multipolarity	Multipolarity as anti-unipolarity; civilizational states as legitimate actors; rejection of liberal normative monopoly; sovereign equality without conditionality	Russian Foreign Policy Concept (2023); UNGA voting patterns; sanctions resilience; BRICS expansion advocacy	**UN:** Sovereignty claims cannot override Charter prohibition on use of force; "civilizational state" rhetoric is a license for domination
Western	Provides institutional framework (NATO, EU, Bretton Woods) that delivered unprecedented prosperity and security; articulates human rights and democracy as universal norms; mobilized unprecedented sanctions coalition	Treats contingent historical arrangements as natural; underestimates resentment generated by asymmetric application of rules; conflates order with US hegemony; presents "rules-based order" as if rules were self-evident	Liberal international order; rules-based system; democracy promotion; human rights universalism; institutional-ized cooperation	Sanctions coalition on Russia (2022); NATO expansion and cohesion; G7 coordination; World Bank/IMF lending volumes	**Russian/African:** "Rules-based order" is a post-hoc justification for power asymmetry; rules are written by and for the powerful

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
UN	Provides universal legal framework (Charter); legitimizes collective action; offers forum for Global South voice; humanitarian operations; normative anchor for all competing projects	Institutional paralysis (veto); gap between normative aspiration and enforcement; Western dominance of Secretariat and funding; presents existing system as already legitimate	Charter multi-lateralism; sovereign equality; collective security; rule of law; human rights	UNGA resolutions on Ukraine (2022–2024); ICJ rulings; humanitarian operations; peacekeeping missions	**All perspectives:** The system is structurally incapable of enforcing its own norms against great powers; law without power is aspiration

---

2.8 WORKED EXAMPLE (I do)

Case: The 2022 Ukraine War and the Global Response

The Russian invasion of Ukraine in February 2022 is the most consequential test of the contemporary international order since the end of the Cold War. It is not merely a regional war; it is a prism through which every competing vision of world order refracts. The case is analytically productive precisely because no single perspective adequately explains the full pattern of responses — the sanctions coalition, the UN voting record, the African and Global South abstentions, the Chinese peace plan, and the BRICS expansion that followed. The task is to disaggregate the causal mechanisms at work and to adjudicate among the five perspectives.

Levels of Analysis

At the *individual* level, the decision to invade was shaped by Vladimir Putin's assessment of NATO expansion, his reading of Western resolve following the Afghanistan withdrawal, and his historical narrative of Russian-Ukrainian unity. Volodymyr Zelensky's decision to remain in Kyiv and mobilize national resistance transformed what Moscow expected to be a three-day operation into a protracted war. Joe Biden's decision to declassify intelligence and build a sanctions coalition before the invasion, rather than after, altered the diplomatic landscape. These individual choices were not epiphenomenal; they shaped the trajectory of the conflict and the global response.

At the *state* level, Russia's invasion reflected a security dilemma: Moscow perceived NATO enlargement as an existential threat, while NATO members perceived Russian aggression as confirming the need for enlargement. Ukraine's statehood — its sovereignty, territorial integrity, and right to self-determination —

became the contested object. African states faced a different state-level calculus: many had historical ties to Russia (Soviet-era support for liberation movements), economic dependencies (wheat, fertilizer, energy), and a principled commitment to non-alignment rooted in the Bandung and Non-Aligned Movement traditions. The abstention of 17 African states on the March 2022 UNGA resolution condemning Russia was not a single decision but 17 distinct state-level calculations.

At the *systemic* level, the war occurred during a documented transition from unipolarity to multipolarity. The United States could no longer unilaterally shape outcomes; China, India, Brazil, and South Africa pursued independent positions. The nuclear dimension — Russia's implicit threats and NATO's restraint — reflected systemic deterrence logic. The war accelerated the fragmentation of the international order: it strengthened NATO (Finland and Sweden joined), weakened the UN Security Council (Russia's veto), and catalyzed BRICS expansion.

At the *transnational* level, the war operated through networks that transcended state boundaries. Sanctions regimes targeted Russian banks, oligarchs, and energy exports, but their effects rippled through global supply chains — wheat prices spiked, fertilizer shortages threatened African agriculture, and energy costs rose worldwide. Refugee flows (over 6 million Ukrainians) strained European systems. Information warfare — competing narratives about the war's causes and conduct — played out across global media and social platforms. The transnational dimension also includes the role of private actors: SWIFT, insurance companies, and shipping firms became instruments of geopolitical coercion.

Mechanism

The global response to the Ukraine war was produced by the interaction of four mechanisms. First, the *security dilemma mechanism*: NATO expansion and Russian threat perception created a spiral in which each side's defensive measures were read as offensive by the other. This mechanism, central to Mearsheimer's (2019) argument, explains the war's origins but not the global response. Second, the *institutional path dependence mechanism*: the existing alliance structures (NATO, EU) provided ready-made channels for coordinated response, while the absence of equivalent structures in the Global South meant that responses were fragmented and state-specific. Third, the *economic interdependence as weapon mechanism*: sanctions leveraged the dollar's dominance and SWIFT's centrality, but also revealed the costs of weaponizing interdependence — inflation, energy crises, and food insecurity in the Global South. Fourth, the *normative contestation mechanism*: the war became a battleground over the meaning of sovereignty, self-determination, and the "rules-based order." Western states framed it as a defense of the UN Charter; Russia framed it as a defense of multipolarity against Western hegemony; African states framed it as a conflict in which they had no stake but bore disproportionate costs.

The critical mechanism for understanding the *global* response — as opposed to the European response — is the *multi-alignment mechanism*. African and other Global South states did not simply choose sides; they pursued multiple, sometimes contradictory, relationships simultaneously. They condemned the invasion in principle (most African states voted for the March 2022 UNGA resolution) while refusing to join sanctions, maintaining economic ties with Russia, and abstaining on subsequent resolutions. This is not neutrality; it is strategic autonomy — the active management of multiple partnerships to maximize agency and minimize dependency.

Perspective Reconstruction

African (primary): The African perspective begins from the recognition that the Ukraine war is a European conflict with global consequences, and that African states are expected to bear costs — food insecurity,

energy price spikes, inflation — for a war they did not start and in which they have no direct stake. The abstention of 17 African states on the March 2022 UNGA resolution, and the larger number of abstentions on subsequent resolutions, reflects not sympathy for Russia but a principled refusal to be conscripted into a great-power conflict. African states remember that Western powers have invoked the UN Charter selectively — intervening in Libya (2011) under Resolution 1973 while ignoring African Union mediation efforts, and supporting coups or authoritarian regimes when convenient. The African perspective also notes the hypocrisy of Western demands for solidarity: African states that requested debt relief during COVID-19 were denied, while Western states mobilized hundreds of billions for Ukraine. The AU's admission to the G20 in 2023 and the expansion of BRICS to include Egypt and Ethiopia are read as evidence that African agency is growing, not as a rejection of the West but as a diversification of partnerships. The African perspective's strongest claim is that multi-alignment is not fence-sitting but a sophisticated strategy for maximizing sovereignty in a system designed to constrain it.

Chinese: The Chinese perspective frames the war as a symptom of NATO expansion and US hegemony, while simultaneously positioning China as a potential mediator. Beijing's February 2023 peace plan — calling for a ceasefire, resumption of peace talks, and opposition to unilateral sanctions — reflects China's interest in stability (for its Belt and Road investments and energy security) and its desire to present itself as a responsible great power. China abstained on UNGA resolutions condemning Russia, consistent with its strategic partnership with Moscow, but also voted for resolutions affirming Ukraine's territorial integrity, revealing the tension in its position. The Chinese perspective emphasizes economic interdependence: sanctions harm global supply chains, and China's role as the world's largest trading partner gives it leverage that it chooses not to fully deploy against Russia. The occlusion in the Chinese perspective is its failure to acknowledge that its "neutrality" effectively benefits Russia by preventing a unified global response, and that its peace plan lacks enforcement mechanisms or accountability for aggression.

Russian: The Russian perspective frames the invasion as a defensive response to NATO expansion, the 2014 Maidan revolution (characterized as a Western-backed coup), and the alleged persecution of Russian speakers in eastern Ukraine. The war is presented as a struggle against Western hegemony and for a multipolar world in which civilizational states have equal standing. The Russian perspective points to Western double standards — interventions in Iraq, Libya, and Yugoslavia — as evidence that the "rules-based order" is applied selectively. The occlusion is severe: the perspective cannot account for Ukrainian agency, the documented war crimes, or the fact that NATO expansion was driven by the demand of Eastern European states seeking protection from Russian coercion, not by Western imposition. The Russian perspective also cannot explain why the global response, even among non-Western states, was predominantly critical of the invasion.

Western: The Western perspective frames the war as an unprovoked act of aggression against a sovereign state, a violation of the UN Charter, and a threat to the rules-based international order. The sanctions coalition — involving the US, EU, UK, Japan, and others — is presented as a defense of international law and a demonstration that aggression carries costs. NATO's revitalization and expansion are framed as defensive responses to Russian aggression. The Western perspective's strength is its institutional capacity for coordinated action; its occlusion is its tendency to treat the existing order as legitimate and to understate the role of NATO expansion in producing Russian insecurity. The Western perspective also struggles to explain the abstentions: if the war is truly about defending the UN Charter, why did so many states refuse to join the response? The answer — that these states perceive Western hypocrisy and fear economic retaliation — is uncomfortable for the Western narrative.

UN: The UN perspective frames the war through the Charter: Article 2(4) prohibits the use of force, Article 51 permits self-defense, and the Security Council is paralyzed by Russia's veto. The General Assembly's resolutions — condemning the invasion, demanding withdrawal, and suspending Russia from the Human Rights Council — represent the international community's voice, even if they lack enforcement. The UN perspective's strength is its legal clarity and its provision of a forum for global deliberation; its occlusion is the gap between its normative aspirations and its operational capacity. The UN cannot enforce its resolutions against a permanent member of the Security Council. The UN perspective is most credible when it acknowledges this limitation and supports reform, and least credible when it presents the existing system as already legitimate.

Explicit Adjudication

No single perspective fully explains the global response to the Ukraine war. The Western perspective best explains the *institutional* response — the sanctions coalition, NATO revitalization, and the legal framing — but it occludes the conditions that produced the war and cannot account for the abstentions. The Russian perspective explains Moscow's decision-making but fails as an explanation of the global response, which was predominantly critical of Russia even among non-Western states. The Chinese perspective explains Beijing's hedging strategy but cannot justify its effective protection of Russia from unified global pressure. The UN perspective provides the legal framework but cannot explain enforcement failures.

The African perspective, combined with the systemic-level analysis of multipolar transition, provides the most complete explanation of the *global* response — specifically, the pattern of abstentions and the refusal to join sanctions. The mechanism is multi-alignment: African and other Global South states are not choosing between Russia and the West but pursuing strategic autonomy in a system where neither pole can impose its will. This explains why 35 states abstained on the March 2022 UNGA resolution, why most African states refused to join sanctions, and why BRICS expanded in 2023. The African perspective's limitation is that it may understate the genuine normative stakes — the war *did* violate the UN Charter, and the principle of territorial integrity *does* matter for small states. The best synthesis is that the global response to Ukraine was shaped by the intersection of systemic transition (declining unipolarity), institutional path dependence (existing alliances), and multi-alignment (Global South strategic autonomy). The Western perspective captures the first two; the African perspective captures the third. Together, they explain more than either alone. The case ultimately demonstrates that in a multipolar world, no single power can mobilize universal compliance, and that the "international community" is not a unified actor but a contested space in which competing visions of order struggle for legitimacy.

SECTION 2.9 PROBLEM PAIR (We do)

Tasks

1. **Case specification.** Identify the six 2023 BRICS+ invitees and classify each by its most plausible primary motive: access to development finance, sanctions relief, hedging between great powers, regional status, or domestic regime legitimation. Distinguish formal accession from rhetorical alignment.
2. **Mechanism mapping.** Specify three mechanisms through which BRICS+ expansion could alter world order: (a) institutional, through NDB and AIIB lending; (b) financial, through local-currency settlement and payment-system interoperability; and (c) diplomatic, through UNGA voting cohesion and

Security Council reform advocacy. For each mechanism, state the intermediate step that must occur before membership size becomes order-changing power.

3. **Levels of analysis.** Explain how the expansion looks different at the individual level (leader legitimation and elite bargaining), the state level (regime survival, fiscal need, and sanctions exposure), the systemic level (unipolar decline and multipolar opportunity), and the transnational level (capital flows, commodity pricing, and private banking adaptation).

4. **Perspective reconstruction.** Reconstruct the African, Chinese, Russian, Western, and UN interpretations of the expansion in two to three sentences each. For each, identify one contribution the perspective makes and one reality it risks occluding.

5. **Evidence adjudication.** Using three indicators—BRICS+ share of global GDP at PPP, NDB/AIIB lending relative to World Bank/IMF volumes, and UNGA voting cohesion on Ukraine-related resolutions—argue whether the expansion is better described as a genuine challenge to Western order or as a forum of convenience.

6. **Falsifiers.** State two observations that would refute the "genuine challenge" hypothesis and two observations that would refute the "forum of convenience" hypothesis. Make each falsifier concrete and time-bound.

MODEL ANSWER

The 2023 BRICS+ expansion is best understood neither as the birth of a cohesive anti-Western bloc nor as a merely symbolic diplomatic gesture, but as a case of competitive institutional layering whose order-challenging potential remains contingent on mechanisms that are not yet fully institutionalized. The expansion enlarged the forum's demographic and economic weight, yet weight is not automatically power; power in international order terms requires rule-making capacity, enforcement credibility, and sustained coordination among members whose interests are only partially aligned. Read through the Johannesburg II Declaration (2023), the expansion is framed as a step toward multipolarity, reform of global governance, and greater representation for the Global South. That framing is politically significant, but declarations are not institutions, and representation claims do not by themselves create alternative rules.

At the state level, the invitees pursued markedly different objectives. Saudi Arabia and the United Arab Emirates appeared to seek hedging, investment diversification, and greater strategic autonomy without severing security ties to the United States. Iran sought diplomatic legitimacy and channels for sanctions-resistant trade. Egypt and Ethiopia sought development finance, infrastructure investment, and enhanced regional standing. Argentina's trajectory was politically contested and later reversed, which itself illustrates that accession was not a simple expression of structural anti-Western alignment. This heterogeneity is not an incidental complication; it is the central mechanism limiting bloc cohesion. A forum whose members disagree on sanctions, energy pricing, regional security, and relations with Washington cannot easily become a rule-making order.

The African perspective is primary here because African states approach BRICS+ through the lens of strategic autonomy and multi-alignment rather than through a binary choice between Western and anti-Western orders. AU Agenda 2063 emphasizes self-reliance, industrialization, and a stronger African voice in global governance, and BRICS+ is attractive partly because it promises leverage without requiring exclusive alignment. African abstentions on Ukraine-related UNGA resolutions in 2022-2024 are better read as assertions of sovereign equality and non-alignment than as evidence of a new bloc. This vantage point reveals what Western and Russian readings often occlude: many Global South states are not seeking to replace one hege-

mon with another, but to enlarge bargaining space among multiple centers of power.

The Chinese perspective treats BRICS+ as a platform for multipolarity and for a community of shared future, with development and connectivity at the center. Yet Beijing's bilateral economic leverage means that the forum's collective identity remains thin; Chinese leadership can advance multipolarity without requiring full institutional cohesion. The Russian perspective, articulated in the 2023 Foreign Policy Concept, treats BRICS+ as evidence of a civilizational multipolar order and as a vehicle for sanctions-resistant trade and sovereign equality. Moscow's reliance on the forum for diplomatic legitimacy, however, reveals asymmetry rather than equality among members. The Western perspective interprets expansion as institutional revisionism and as evidence that the liberal order is under strain. Mearsheimer (2019) argues that the liberal international order is structurally vulnerable to great-power competition, but that argument does not imply that any challenger coalition is automatically coherent. Schweller (2018) similarly cautions against conflating the diffusion of power with the emergence of shared purpose. The UN perspective is more ambivalent: BRICS+ claims to represent the Global South, but representativeness without procedural accountability risks reproducing the exclusion it criticizes.

The decisive evidence is not membership size but three mechanisms. First, whether NDB and AIIB lending displaces Bretton Woods conditionality in volume, terms, and borrower autonomy. Second, whether BRICS payment systems achieve interoperability beyond bilateral experiments and local-currency pilots. Third, whether voting cohesion emerges on sanctions, Security Council reform, and trade disputes. Current evidence supports a bounded verdict: BRICS+ is a forum of convenience with genuine but contingent order-challenging potential. It has expanded diplomatic space for multi-alignment and created institutional alternatives, but it has not yet generated a common security doctrine, a unified financial architecture, or a binding ruleset. If payment systems remain fragmented and members continue to hedge between Washington, Beijing, and Moscow, the expansion will resemble a diplomatic marketplace rather than a new order. If, however, NDB lending scales, local-currency settlement becomes routine, and voting cohesion hardens, the same expansion could become the institutional embryo of a multipolar order. Acharya (2018) is useful here: order may fragment into overlapping regional and functional regimes rather than split into two blocs. The case is therefore best explained as competitive institutional layering, not as a simple replacement of Western order.

SECTION 2.10 INDEPENDENT MEMO (You do)

(a) Case description

In 2024, a coalition of African and Middle Eastern states deepened participation in BRICS-linked payment and development-finance initiatives while continuing to negotiate IMF programs, Western security partnerships, and bilateral trade agreements with the European Union. A proposed regional development facility promised local-currency infrastructure lending, but its capitalization remained modest and its governance rules were still under negotiation. At the United Nations, the same states split on resolutions concerning sanctions enforcement and Security Council reform, with some supporting BRICS+ positions and others abstaining or aligning with Western sponsors. Financial data showed rising local-currency settlement in bilateral trade but no systemic displacement of dollar clearing. Your task is to determine whether this pattern constitutes institutional revisionism that is measurably weakening Bretton Woods, or whether it is a form of strategic hedging that leaves the underlying order intact while expanding diplomatic bargaining space.

(b) Required memo headings (prompts)

- **Mechanism:** Identify the causal process linking state hedging to institutional change; specify scope conditions, intermediate steps, and observable implications.
- **Perspective reconstruction:** Reconstruct the African, Chinese, Russian, Western, and UN interpretations of the case; for each, state what it contributes and what it occludes.
- **Historical analogue:** Compare the case with a prior episode of institutional layering or multipolar coalition-building; justify the analogy and state its limits.
- **Falsifiers:** List two to three observations that would refute your preferred explanation, and make each concrete and time-bound.

(c) Self-check line

Self-check: Have you distinguished description (what happened), explanation (why it happened), prediction (what follows), and prescription (what should be done)?

SECTION 2.11 HINGE QUESTION

Question: The 2023 BRICS+ expansion is best interpreted as:

A. A cohesive anti-Western bloc that has already replaced Bretton Woods institutions.
B. A forum of convenience whose members hedge across orders; its challenge to Western order is contingent on institutionalization.
C. A purely symbolic diplomatic gesture with no material implications for global governance.
D. An African-led project of strategic autonomy that excludes great-power competition.

Correct answer: B.

Distractor diagnoses

- **A** conflates membership expansion with institutional capacity. It ignores the heterogeneity of invitee motives, the absence of a common security doctrine, and the fact that NDB and AIIB lending has not displaced Bretton Woods conditionality in volume or terms.

- **C** treats the absence of full systemic replacement as the absence of change. It ignores rising local-currency settlement, expanding development-finance alternatives, and the diplomatic leverage created by a larger Global South platform.

- **D** misattributes leadership and purpose. African states seek multi-alignment and strategic autonomy, not exclusion of great powers, and BRICS+ includes non-African great powers whose interests are not subordinate to African priorities.

SECTION 2A — DATA LAB

Table 1 — UNGA Voting on Ukraine Resolutions, 2022–2024 (selected resolutions, approximate vote counts)

Resolution	Date	In favor	Against	Abstain	Not voting	African abstentions (approx.)	Asian abstentions (approx.)
ES-11/1 (aggression)	Mar 2022	141	5	35	12	~17	~10
ES-11/3 (HRC suspension)	Apr 2022	93	24	58	18	~24	~18
ES-11/4 (territorial integrity)	Oct 2022	143	5	35	10	~16	~9
ES-11/5 (Charter principles)	Feb 2023	141	7	32	13	~17	~8
ES-11/6 (just peace)	Feb 2023	141	7	32	13	~17	~8
ES-11/7 (two-year mark)	Feb 2024	141	7	32	13	~17	~8

Source: UN General Assembly voting records (public). Figures are approximate; abstention counts by region are author estimates derived from public vote tallies and should be treated as indicative, not authoritative.

Table 2 — BRICS+ vs G7 Share of Global GDP (PPP), approximate

Bloc	Members (as of 2024)	Share of global GDP (PPP, approx.)	Share of global population (approx.)
G7	US, UK, France, Germany, Italy, Canada, Japan	~30%	~10%
BRICS (original five)	Brazil, Russia, India, China, South Africa	~32%	~42%
BRICS+ (post-2024 expansion)	+ Saudi Arabia, Iran, UAE, Egypt, Ethiopia (Argentina declined)	~35–37%	~46%
G20 (full)	19 states + EU	~85%	~85%

Source: IMF World Economic Outlook (PPP estimates, commonly cited in policy commentary). Figures are approximate and shift with exchange-rate and growth assumptions; PPP comparisons are sensitive to methodology.

Table 3 — AIIB vs World Bank Group Lending, approximate cumulative/approved

Institution	Founded	Cumulative approved financing (approx., USD bn)	Annual new commitments (approx., USD bn)	Largest borrowers (indicative)
World Bank (IBRD + IDA)	1944	~$1,000+ (cumulative since founding)	~$60–75	India, China, Brazil, Indonesia, Turkey
AIIB	2016	~$45–55	~$8–12	India, Turkey, Indonesia, Egypt, Bangladesh
NDB (BRICS bank)	2015	~$30–35	~$8–10	India, China, Brazil, South Africa, Russia
ADB	1966	~$300+	~$20–25	India, China, Indonesia, Philippines, Vietnam

Source: Institution annual reports and public databases. Figures are approximate and vary by fiscal year and counting convention (approved vs. disbursed).

Analysis Questions

1. Trend. Across the six UNGA resolutions in Table 1, the "in favor" count stays roughly stable (141–143) while abstentions fluctuate between 32 and 58. What does the stability of the "in favor" bloc alongside the volatility of abstentions suggest about the structure of global opinion on the Ukraine war? Does the data support a narrative of "global consensus" or of "polarized non-alignment"?

2. Level of analysis. The BRICS+ GDP share in Table 2 is a systemic-level aggregate. Explain why a state-level analyst and a transnational-level analyst would draw different conclusions from the same 35–37% figure. What does the aggregate hide about intra-BRICS+ power asymmetry, and what does it reveal about the shifting center of global economic gravity?

3. Perspective reconstruction (all five). Reconstruct how each of the five perspectives would read Table 1's abstention patterns: (a) African strategic-autonomy view; (b) Chinese relational-Tianxia view; (c) Russian multipolarity view; (d) Western liberal-institutional view; (e) UN Charter-multilateral view. For each, identify one thing the perspective illuminates and one thing it occludes.

4. Interpretation. Table 3 shows AIIB cumulative lending at roughly 4–5% of World Bank cumulative lending, yet AIIB is frequently framed in Western commentary as a "challenge" to the Bretton Woods order. Is this framing proportionate to the quantitative evidence? Under what conditions would a small lender constitute a systemic challenge, and under what conditions would it be a complement?

5. Limitation. All three tables rely on approximate, publicly reported figures. Identify the three most consequential data limitations for drawing policy conclusions from this lab, and explain how each limitation would bias a researcher toward over- or under-estimating the challenge to Western institutional primacy.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — "The Multipolar Shift: GDP (PPP) and Institutional Lending, 2000–2024"

What to draw: A two-panel hand-drawn chart on a single page. Left panel: a stacked-area or line chart with the x-axis labeled "Year (2000–2024)" and the y-axis "Share of global GDP (PPP, %)." Draw three lines: (1) "G7" sloping downward from ~45% to ~30%; (2) "BRICS+" sloping upward from ~20% to ~36%; (3) "Rest of world" roughly flat or slightly rising. Right panel: a bar chart with x-axis "Institution" (World Bank, AIIB, NDB, ADB) and y-axis "Cumulative lending (USD bn, log scale)." Draw World Bank bar tallest, AIIB and NDB bars much shorter, ADB mid-height.

Labels to place: On the left panel, annotate the 2008 financial crisis as a vertical dashed line and the 2022 Ukraine war as a second vertical dashed line. On the right panel, label each bar with its founding year in parentheses (e.g., "World Bank (1944)"). Add a footnote: "PPP = purchasing power parity; lending figures approximate."

Perspective overlay to annotate: In the margin, draw five small icons or colored dots (one per perspective) with a one-line reading: African (green): "Rising share = leverage for strategic autonomy"; Chinese (red): "Multipolarity as natural correction"; Russian (blue): "End of unipolar moment"; Western (orange): "Relative decline, not absolute collapse"; UN (purple): "Aggregate growth ≠ governance reform."

Visual 2 — "UNGA Vote Map: Ukraine Resolutions, March 2022 vs. February 2024"

What to draw: Two side-by-side world maps (hand-drawn, simplified continents). On the first map (March 2022, ES-11/1), color countries: green = in favor, red = against, yellow = abstain, grey = not voting. On the second map (February 2024, ES-11/7), use the same color scheme. Draw a legend in the corner. The visual should make the persistence of the yellow (abstain) band across Africa, South/Southeast Asia, and parts of Latin America immediately visible.

Labels to place: Title each map with resolution number and date. Add a small table beneath: "Abstentions by region: Africa ~17; Asia ~8; Latin America ~4; Middle East ~3 (approx., Feb 2024)."

Perspective overlay to annotate: Draw five arrows from the abstention band to margin notes: African: "Non-alignment as principle, not neutrality"; Chinese: "Abstention = space for mediation"; Russian: "Evidence of Western isolation"; Western: "Failure to build global coalition"; UN: "Charter consensus fraying at edges."

Visual 3 — "The Five Order-Projects: A Venn Diagram of Competing Visions"

What to draw: Five overlapping circles (Venn diagram) labeled: (1) African strategic autonomy, (2) Chinese relational-Tianxia, (3) Russian multipolarity, (4) Western liberal institutionalism, (5) UN Charter multilateralism. In the center intersection, write "Shared vocabulary: sovereignty, development, peace." In pairwise intersections, write the shared element (e.g., African ∩ Chinese = "anti-hegemony"; Chinese ∩

Russian = "multipolarity"; Western ∩ UN = "rules-based order"; African ∩ UN = "decolonization legacy"). In non-overlapping crescents, write the distinctive claim (e.g., African crescent: "Agenda 2063"; Chinese crescent: "community of shared future"; Russian crescent: "sovereign democracy"; Western crescent: "liberal values"; UN crescent: "Charter Article 2(4)").

Labels to place: Title: "Five Competing Order-Projects, 2024." Add a scale bar or note: "Circle size = rhetorical reach (not empirical weight)."

Perspective overlay to annotate: This visual IS the perspective overlay. Add a marginal note: "No single circle contains the others; the diagram's value is in showing overlap without hierarchy. The African circle is drawn largest to reflect the lesson's primary framing."

SECTION 4 — CORNELL NOTES

Cue Column | Notes Column (with source log)

Cue	Notes (source log in brackets)
What is unipolarity's decline?	Shift from US-dominated post-1991 order to distributed power; debated whether structural or cyclical. [Mearsheimer 2019; Schweller 2018]
Schweller's argument	"Unipolar moment" ending; US overextension; rising powers challenge but do not yet replace. [Schweller 2018]
Mearsheimer's argument	Offensive realism: great-power competition returns; US should offshore-balance; liberal hegemony failed. [Mearsheimer 2019]
Acharya's argument	"Multiplex" world: not multipolar (few poles) but many actors, multiple modernities; non-Western agency central. [Acharya 2018]
Five order-projects	African strategic autonomy; Chinese relational-Tianxia; Russian multipolarity; Western liberal institutionalism; UN Charter multilateralism. [AU Agenda 2063; BRICS Johannesburg II Declaration 2023; Russian Foreign Policy Concept 2023]
African strategic autonomy	Multi-alignment, not non-alignment; Agenda 2063; rejection of binary bloc logic; "African solutions to African problems." [AU Agenda 2063; Grovogui; Mbembe]
Chinese relational-Tianxia	"Community of shared future for mankind"; relational ontology; multipolarity as ethical project; BRI/AIIB as institutional expression. [Acharya 2018]

Cue	Notes (source log in brackets)
Russian multipolarity	"Sovereign democracy"; civilizational state; anti-hegemony; Eurasian integration; 2023 Foreign Policy Concept. [Russian Foreign Policy Concept 2023]
Western liberal institutionalism	Rules-based order; NATO/EU; democracy promotion; under strain from populism and relative decline. [Mearsheimer 2019]
UN Charter multilateralism	Article 2(4); collective security; reform paralysis (Security Council); universal membership. [UN Charter]
Global South as category	BRICS+, G-77, NAM legacies; not a geography but a political position; heterogeneity problem. [BRICS Johannesburg II Declaration 2023]
"Rules-based order" contested	Who wrote rules, who enforces, who is bound; double standards critique. [Acharya 2018; Grovogui]
Institutional revisionism	AIIB, NDB, BRICS payment systems; parallel institutions vs. reform-from-within. [BRICS Johannesburg II Declaration 2023]
Ukraine war case	Sanctions, UNGA votes, African/Global South abstentions, Chinese peace plan; tests all five perspectives. [UNGA records]
BRICS+ expansion	Saudi Arabia, Iran, UAE, Egypt, Ethiopia, Argentina (declined); challenge or forum of convenience? [BRICS Johannesburg II Declaration 2023]

Summary (3–5 sentences): The contemporary transition from unipolarity to multipolarity is not a single event but a contested process interpreted differently by five order-projects. The African perspective, framed through strategic autonomy and Agenda 2063, treats multi-alignment as a principled rejection of binary bloc logic rather than neutrality. Quantitative evidence—GDP (PPP) shifts, UNGA abstention patterns, and parallel institutional lending—supports a narrative of relative Western decline but not of imminent replacement. The "rules-based international order" functions as a contested phrase whose meaning depends on who is assumed to have authored and enforced the rules. BRICS+ expansion and parallel institutions like the AIIB are best understood as institutional revisionism whose systemic significance remains empirically unsettled.

SECTION 5 — FEYNMAN COMPRESSION

Step 1 — Explain without jargon. Imagine the world after the Cold War as a classroom where one student (the United States) was the teacher's pet with all the answers. Now several other students (China, India, Russia, Brazil, South Africa, and others) have grown taller and louder. Some want to rewrite the classroom rules; some want a second teacher; some want to sit in the back and not take sides. The "rules-based order"

is like the classroom rules written by the old teacher's pet—everyone agrees rules are good, but not everyone agrees these are the right rules or that the pet should be the only one enforcing them. BRICS+ is a study group that meets after class; it is not yet a rival school, but it is not just a book club either. The African countries in the study group are there to make sure the group does not become another club run by one big member.

Step 2 — Mark gaps. I am unsure whether BRICS+ has any institutional capacity beyond summit declarations; I am unsure whether "strategic autonomy" is a coherent doctrine or a post-hoc label for hedging; I am unsure whether the AIIB's lending is genuinely additional or merely displaces World Bank projects; I am unsure whether UNGA abstentions reflect principled non-alignment or transactional hedging.

Step 3 — Reread verification. Re-reading Acharya (2018) confirms that "multiplex" is not "multipolar"—the distinction matters because it shifts agency from great powers to middle and small powers. Re-reading the BRICS Johannesburg II Declaration (2023) confirms that expansion was framed as "inclusive multilateralism," not anti-Western bloc formation, though Western readings dispute this. Re-reading the Russian Foreign Policy Concept (2023) confirms the "civilizational state" framing and the explicit rejection of Western universalism. Re-reading AU Agenda 2063 confirms that African strategic autonomy is anchored in a continental development vision, not merely reactive hedging.

Step 4 — Analogy with explicit limits. The classroom analogy captures the shift in relative voice and the contest over rule-authorship, but it breaks down on three points: (1) states are not students—they have armies, currencies, and veto powers; (2) the "teacher" (the US) is not leaving the classroom, only losing its monopoly on grading; (3) the study group (BRICS+) has no enforcement mechanism, so the analogy overstates its institutional weight. The analogy is useful for intuition, dangerous for prediction.

Step 5 — Rewrite. The contemporary transition is best understood as a contest over who authors and enforces international rules, not as a simple power shift. Five order-projects—African strategic autonomy, Chinese relational-Tianxia, Russian multipolarity, Western liberal institutionalism, and UN Charter multilateralism—offer competing answers. Quantitative evidence shows relative Western economic decline and persistent Global South non-alignment in UNGA voting, but does not establish that any alternative order has consolidated. BRICS+ and parallel institutions like the AIIB are institutional revisionism whose systemic weight is real but bounded; they are neither a replacement for Bretton Woods nor merely a forum of convenience. The African perspective, reconstructed from within through Agenda 2063 and multi-alignment, reveals that the central question is not "which bloc wins" but "who gets to define the terms of participation."

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L14	Definition	What is "unipolarity" and what empirical debate surrounds its decline?	Unipolarity denotes a distribution of material power in which one state possesses preponderant capabilities across military, economic, and institutional dimensions. The debate over its decline pits Schweller's argument that unipolarity is structurally durable because no peer competitor can match US power, against Mearsheimer's claim that China's rise is producing a bipolar or multipolar system, and Acharya's argument that the very concept of unipolarity misreads a world of multiple centers of authority.	African scholars (Grovogui, Mbembe) treat "decline" as a Western framing that ignores how African states have always operated in a multipolar reality.

Tag	Card Type	Front	Back	Perspective Note
L14	Mechanism	How does “multipolarity” emerge as a structural condition rather than merely a power shift?	Multipolarity emerges when the distribution of capabilities crosses a threshold where no single state can unilaterally set the terms of order, and when secondary powers acquire both the capacity and the willingness to resist primacy. The mechanism runs through relative economic growth, military modernization, institutional entrepreneurship, and the erosion of hegemonic legitimacy.	Chinese thinkers (Qin Yaqing) describe this as a shift from “hierarchy” to “relational” order, not a simple power transition.

Tag	Card Type	Front	Back	Perspective Note
L14	Application	What did UNGA voting on Ukraine resolutions 2022–2024 reveal about Global South alignment?	Voting patterns showed strong Western support for resolutions condemning Russia, significant African and Asian abstentions, and a core of states (Eritrea, Mali, Nicaragua, Syria, North Korea) voting against. Abstentions were not endorsements of invasion but expressions of strategic autonomy, non-alignment legacies, and grievances about selective enforcement of international law.	African abstentions reflected NAM legacies and resentment of double standards, not pro-Russian sympathy.
L14	Comparison	What are the five competing order-projects identified in Lesson 14?	(1) African strategic autonomy/multi-alignment; (2) Chinese relational-Tianxia/community of shared future; (3) Russian multi-polarity/sovereign democracy; (4) Western liberal institutionalism; (5) UN Charter multilateralism. Each proposes a different answer to who writes rules, who enforces them, and who is bound.	The African project is primary: it frames the others as external impositions to be navigated, not joined.

Tag	Card Type	Front	Back	Perspective Note
L14	Source	What is Acharya's (2018) core argument about world order?	Acharya argues that the "liberal international order" was never truly global or liberal, and that emerging powers are not seeking to overthrow it but to reform and pluralize it. He emphasizes "multiplexity"—multiple, overlapping orders rather than a single hierarchy.	Acharya's "multiplexity" resonates with African calls for plural, non-hierarchical order.

Tag	Card Type	Front	Back	Perspective Note
L14	Debate	How do Schweller and Mearsheimer disagree on the durability of unipolarity?	Schweller (2018) argues unipolarity is remarkably durable because rising powers face structural constraints and the US retains unmatched military and economic advantages. Mearsheimer (2019) argues unipolarity is already ending as China becomes a peer competitor, producing intense security competition. The disagreement turns on whether economic interdependence restrains or accelerates rivalry.	African realists (Aning, Danso) note both ignore African agency in shaping outcomes.

Tag	Card Type	Front	Back	Perspective Note
L14	Reconstruction	What does "African strategic autonomy" mean as an order-project?	It denotes the pursuit of decision-making independence across security, economic, and diplomatic domains, drawing on NAM and Nkrumah-era non-alignment, AU Agenda 2063, and contemporary multi-alignment. It rejects binary bloc logic and insists on African-defined interests, including reform of global governance.	This is the primary perspective: autonomy is not neutrality but active, interest-driven engagement.
L14	Occlusion	What does the Western "liberal order" narrative occlude?	It occludes the coercive foundations of that order (intervention, sanctions, unequal trade), the selective application of rules, and the agency of non-Western actors in shaping institutions. It presents a historically contingent arrangement as universal and natural.	African scholars (Mamdani, Rodney) expose the colonial continuities in "liberal" order.

Tag	Card Type	Front	Back	Perspective Note
L14	Adjudication	Is BRICS+ a genuine challenge to Western order or a forum of convenience?	Evidence cuts both ways: BRICS+ has created alternative institutions (NDB, AIIB) and payment initiatives, but members have divergent interests, no shared security architecture, and continued reliance on Western markets. Adjudication requires specifying the dimension—financial, security, normative—and the time horizon.	African members (Ethiopia, Egypt) see BRICS+ as leverage, not replacement.
L14	Visual	What does the comparison matrix of five perspectives reveal?	The matrix shows each perspective's key contribution, occlusion, normative stance, best evidence, and strongest objection. It reveals that no single perspective captures the full picture; African strategic autonomy exposes the paternalism in others, while Chinese relationalism and Russian multipolarity share anti-hegemonic language but differ on hierarchy.	The matrix is the lesson's central integrative tool.

Tag	Card Type	Front	Back	Perspective Note
L14	Definition	What is the "rules-based international order" and why is it contested?	It is a phrase denoting governance by agreed norms, institutions, and law. It is contested because critics (Russia, China, Global South) argue the rules were written by Western powers, are enforced selectively, and bind weaker states more than strong ones. Defenders argue it provides predictability and restraint.	African jurists (Tamale) note the phrase often substitutes for "Western-led" order.
L14	Mechanism	How does "institutional revisionism" fracture Bretton Woods?	Revisionism operates through creating parallel institutions (AIIB, NDB), alternative payment systems, and new lending norms that reduce dependence on the IMF/World Bank. The mechanism is competitive institutionalism: not destroying old institutions but diluting their monopoly and offering exit options.	African states use revisionist institutions as bargaining leverage, not exit.

Tag	Card Type	Front	Back	Perspective Note
L14	Source	What does the BRICS Johannesburg II Declaration (2023) assert?	It asserts commitment to multipolarity, reform of global governance, use of local currencies, and expansion of membership. It frames BRICS as a platform for the Global South and calls for a more representative UN Security Council.	The Declaration echoes AU Agenda 2063's call for African agency.
L14	Application	How does AIIB lending compare to World Bank lending as evidence of order transition?	AIIB has grown rapidly in infrastructure finance, often co-financing with the World Bank, suggesting complementarity as much as competition. The metric of "challenge" depends on whether one measures volume, conditionality, or governance voice. AIIB gives China greater agenda-setting power but has not displaced the Bank.	African borrowers value AIIB speed but worry about transparency gaps.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence Audit (score 0–100)

Topic	Confidence (0–100)	Evidence of Mastery	Gap to Close
Defining unipolarity/multipolarity		Can state Schweller/Mearsheimer/Acharya positions	Distinguish structural from perceptual multipolarity
Five order-projects		Can name all five and their core claims	Steel-man each from within
African strategic autonomy		Can cite NAM, AU Agenda 2063	Connect to contemporary multi-alignment practice
UNGA voting patterns		Can describe abstention clusters	Explain variation within Africa
BRICS+ expansion		Can list new members	Assess security vs economic dimensions
Rules-based order contestation		Can state both sides	Identify who is bound/enforced
Institutional revisionism		Can name AIIB, NDB	Compare conditionality regimes
Perspective reconstruction		Can summarize five views	Adjudicate with evidence
Worked example (Ukraine)		Can describe sanctions/voting	Link to African abstentions
Data lab interpretation		Can read tables	Specify falsifiers

7.2 Three-Question Debrief

1. Which of the five perspectives did you find hardest to steel-man from within, and what does that difficulty reveal about your own normative commitments?
2. In the worked example, did you conflate description of the Ukraine war's global response with explanation of why states voted as they did? If so, where?
3. Which falsifier for the "BRICS+ as genuine challenge" claim would you now test first, and what evidence would change your mind?

7.3 Error-Log

Common Misconception	Correction	Evidence
"Multipolarity means equal power among several states."	Multipolarity means no single state dominates; power can be highly unequal among multiple centers.	Mearsheimer (2019) distinguishes bipolar from multipolar by number of great powers, not equality.
"African abstentions on Ukraine meant support for Russia."	Abstentions expressed strategic autonomy and non-alignment, not endorsement of invasion.	UNGA voting records 2022–2024; AU statements.

Common Misconception	Correction	Evidence
"BRICS+ has replaced the G7 economically."	BRICS+ GDP share (PPP) exceeds G7, but per capita, financial depth, and reserve currency status lag; PPP is not power.	World Bank/IMF data; BRICS Johannesburg II Declaration (2023).
"The rules-based order is universally accepted."	The phrase is contested; many states view it as Western-authored and selectively enforced.	Russian Foreign Policy Concept (2023); AU Agenda 2063.
"AIIB is destroying the World Bank."	AIIB co-finances with the Bank and has not displaced it; competition is partial.	AIIB annual reports; World Bank co-financing data.
"China's rise automatically produces multipolarity."	Multipolarity requires willingness and capacity to resist primacy; economic size alone is insufficient.	Acharya (2018) on multiplexity vs. power transition.

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Unipolarity; multipolarity; multiplexity; strategic autonomy; rules-based order; institutional revisionism; BRICS+; Global South	Relative growth; military modernization; institutional entrepreneurship; competitive institutionalism; multi-alignment; abstention as signaling	Schweller (2018); Mearsheimer (2019); Acharya (2018); Ikenberry; Yan Xuetong; Karaganov	UNGA Ukraine votes 2022–2024; BRICS+ expansion 2023; AIIB vs World Bank lending; AU Agenda 2063	Durability of unipolarity; BRICS+ as challenge vs forum; rules as universal vs Western	BRICS+ security integration; AIIB displacement of Bank; African voting cohesion	L9 Westphalia; L11 interwar; L12 Cold War; L13 liberal order; L15-19 IPE; L47-51 systemic rivalry

SECTION 9 — REVIEW SCHEDULE

- **R1 (Day 1):** Re-read Section 2.7 comparison matrix and restate each perspective's occlusion in one sentence.
- **R2 (Day 3):** Reconstruct the worked example (Ukraine) at all four levels of analysis from memory; check against text.

- **R3 (Week 1):** Re-attempt the hinge question and one problem-pair task without notes; score against model answer.
- **R4 (Week 2):** Build a one-page map linking the five key ideas to the five perspectives; identify one cross-link to L13 or L15.
- **R5 (Month 1):** Write a 300-word adjudication of "BRICS+ as genuine challenge" using new evidence; compare to earlier memo.

SECTION 10 — COMPLETION CHECKLIST

☐ I can define unipolarity, multipolarity, and multiplexity and distinguish them.
☐ I can state Schweller's, Mearsheimer's, and Acharya's positions and their disagreements.
☐ I can name the five order-projects and steel-man each from within.
☐ I can explain African strategic autonomy and its NAM/AU lineages.
☐ I can describe UNGA Ukraine voting patterns 2022–2024 by region.
☐ I can explain why abstentions are not endorsements.
☐ I can assess BRICS+ expansion as challenge vs forum of convenience.
☐ I can define the "rules-based international order" and state its contestations.
☐ I can explain institutional revisionism via AIIB, NDB, and payment systems.
☐ I can reconstruct all five perspectives on the lesson's central topic.
☐ I can apply the four levels of analysis to the Ukraine worked example.
☐ I can complete the problem-pair tasks and compare to the model answer.
☐ I can write the independent memo with all four required headings.
☐ I can answer the hinge question and diagnose each distractor.
☐ I can interpret the Data Lab tables and state their limitations.
☐ I can fill out the Cornell notes and Feynman compression.
☐ I can score my confidence audit and log errors.
☐ I can place this lesson in the curriculum via cross-links.

16. State-Market Paradigms: Mercantilism, Liberalism, Embedded Liberalism

LESSON METADATA

Field	Value
Lesson number and title	Lesson 15 — State-Market Paradigms: Mercantilism, Liberalism, Embedded Liberalism
Module	Module 3: International Political Economy and Geoeconomics
Prerequisites	L6 (institutionalism), L8 (Marxism), L12 (Cold War), L13 (liberal order)
Interleaved links	Forward to L16 (Bretton Woods), L17 (world-systems), L18 (interdependence), L19 (energy)
Reading load	7-9 hours
Content channels	Text, data tables, hand-drawn visuals, flashcards, worked cases
Bloom ceiling	Evaluate / Create
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

The central puzzle of this lesson is not whether states or markets should govern economic life, but why the boundary between them is repeatedly redrawn and why each redrawing is presented as the discovery of an economic truth rather than as a political choice. From the mercantilist statecraft of the seventeenth century to the neoliberal deregulation of the 1980s and the contemporary revival of industrial policy in Washington, Brussels, and Beijing, the history of international political economy is a history of paradigms that claim universality while resting on contingent power relations. The lesson asks: what mechanisms drive the rise and fall of state-market paradigms, under what scope conditions does each hold, and whose experience is rendered invisible when one paradigm is universalized? The student who masters this lesson will stop treating "free trade" or "state intervention" as self-evident categories and will instead analyze them as institutional settlements produced by specific coalitions, crises, and distributions of power.

This lesson sits at the hinge of Module 3. It presumes the institutionalist toolkit from Lesson 6—how rules, norms, and organizations reduce transaction costs and lock in expectations—and the Marxist analytics from Lesson 8, which treat markets as arenas of accumulation and class power rather than as neutral exchange mechanisms. It also presumes the Cold War narrative of Lesson 12, in which economic policy was subordinated to geopolitical competition, and the liberal-order account of Lesson 13, which credits hegemonic stability with sustaining open markets. The present lesson does not choose among these; it synthesizes them by showing that each state-market paradigm is a historically specific answer to the same underlying problem: how to reconcile the mobility of capital with the territoriality of political authority. The answer has

varied—from List's infant-industry protection to Smith's invisible hand to Polanyi's embedded compromise to the Washington Consensus—and each variation has been defended as the natural order.

The African perspective is primary here because it exposes the false universality of every paradigm. African political economy has lived through colonial extraction justified by mercantilist logic, post-independence state-led development inspired by import-substitution and socialist planning, the structural adjustment programs of the 1980s and 1990s that imposed liberalization as conditionality, and the contemporary turn toward developmental regionalism and resource nationalism embodied in the African Continental Free Trade Area. From this vantage point, the "free market" was never a default state of nature; it was constructed through colonial violence, maintained by Bretton Woods institutions, and enforced through conditionality. Conversely, state intervention in Africa has been both emancipatory and predatory, depending on whether it was accountable to domestic constituencies or captured by ruling elites. The African experience thus reveals what Western and Chinese narratives often occlude: that the state-market boundary is always a site of political contestation over who benefits from economic order, and that no paradigm can be evaluated apart from its distributional consequences for peripheral economies.

By the end of the lesson the student will be able to perform four operations. First, identify the mechanism by which a given paradigm allocates resources and distributes gains—whether through comparative advantage, infant-industry protection, embedded social bargains, or conditionality. Second, specify the scope conditions under which each mechanism is likely to produce its claimed outcomes, and the conditions under which it fails. Third, reconstruct how African, Chinese, Russian, Western, and UN actors would each frame the same case, and adjudicate among them using evidence rather than assertion. Fourth, apply these tools to concrete cases: the 1971 Nixon shock, which ended the Bretton Woods gold-exchange standard and inaugurated floating rates; and the 2022 US CHIPS and Science Act alongside the EU Chips Act, which re-embed liberal markets in national-security frameworks. The student will also be able to distinguish description, explanation, prediction, and prescription—a distinction that is routinely collapsed in policy discourse and that this lesson treats as a core methodological discipline.

The lesson's methodological commitment is that paradigms are not neutral lenses but political projects with distributional consequences. Mercantilism served rising industrial powers; classical liberalism served British hegemony; embedded liberalism served the postwar social-democratic compromise; neoliberalism served mobile capital and creditor interests; the contemporary return of industrial policy serves geopolitical competition and domestic political coalitions. Each paradigm's strongest advocates present it as economic science, yet each rests on assumptions about state capacity, market completeness, and power asymmetries that are empirical, not axiomatic. The task of the analyst is therefore not to choose the "correct" paradigm but to specify the conditions under which each operates, the mechanisms it activates, and the evidence that would falsify its claims. This is the standard of adjudication the lesson demands.

The five key ideas proceed in historical and logical order. Mercantilism and economic nationalism establish the baseline of state-directed accumulation. Classical liberalism supplies the counter-thesis of market coordination through comparative advantage. Polanyi's embedded liberalism reframes the debate by showing that markets are always politically constructed and that liberalization generates a protective counter-movement. The Washington Consensus and post-1980 neoliberalism represent the most recent attempt to disembed markets from social control. The contemporary contest—state capitalism in China, friend-shoring, industrial policy in the CHIPS Act and Inflation Reduction Act, and the broader "return of the state"—shows the cycle turning again. The lesson closes by asking whether we are witnessing a new embedded liberalism, a new mercantilism, or something without historical precedent, and by insisting that the answer depends on which

perspective one occupies.

SECTION 1 — Pre-Class Priming

1.1 Retrieval warm-up

1. From L6: How does institutionalism explain why states cooperate even under anarchy, and what role do international organizations play in reducing uncertainty and locking in expectations?
2. From L8: In Marxist international political economy, what is the relationship between capital accumulation and the territorial state, and how does this challenge liberal accounts of comparative advantage?
3. From L12: How did Cold War geopolitical competition shape the economic policies of both superpowers and their allies, and what does this imply about the "neutrality" of market institutions?
4. From L13: What is hegemonic stability theory, and how does it connect the openness of the post-1945 trading system to the distribution of power, particularly US power?
5. From L6 and L13 combined: What is the difference between a rule-based and a power-based international order, and can the two be separated empirically in practice?
6. From L8: How does dependency theory, as a Marxist-influenced framework, explain persistent underdevelopment in the global South, and what policy implications did it draw for state intervention?

1.2 Orientation questions

1. Why does every state-market paradigm present itself as economic science rather than as a political project, and what evidence would distinguish a scientific claim from an ideological one?
2. Under what conditions does infant-industry protection produce genuine industrialization rather than rent-seeking, capture, and permanent inefficiency?
3. How did the 1971 Nixon shock alter the relationship between monetary policy, state autonomy, and global capital mobility, and what paradigm did it help to discredit or enable?
4. Does the 2022 CHIPS and Science Act represent a return to mercantilism, a new embedded liberalism, or a novel form of security-driven industrial policy—and what evidence would falsify each reading?

1.3 Vocabulary pre-teach

- **Mercantilism**: doctrine that state power is built through accumulation of bullion and favorable trade balances, with markets subordinated to national strength.
- **Economic nationalism**: policy orientation prioritizing domestic industry, employment, and strategic capacity over global efficiency and consumer prices.
- **Infant-industry argument**: List's claim that temporary protection allows nascent industries to achieve scale, learning, and technological capability before facing international competition.
- **Comparative advantage**: Ricardo's principle that countries gain by specializing in goods with lower opportunity cost, even if less efficient in absolute terms.
- **Embedded liberalism**: Polanyi's term for the post-1945 compromise in which markets were liberalized internationally while domestically embedded in social protections and state management.
- **Double movement**: Polanyi's concept of the dialectic between market expansion and the social protective counter-movement it provokes.

- **Washington Consensus**: Williamson's 1990 summary of ten neoliberal policy prescriptions—fiscal discipline, privatization, deregulation, trade liberalization, and others—promoted by Bretton Woods institutions.
- **Structural adjustment program (SAP)**: conditionality-based lending requiring recipient states to implement liberalization, privatization, and austerity.
- **State capitalism**: system in which the state retains significant ownership and strategic direction of capital, as in contemporary China.
- **Friend-shoring**: relocation of supply chains to geopolitically aligned countries, prioritizing security and resilience over cost minimization.
- **Dual circulation**: Chinese strategy emphasizing domestic consumption and innovation while maintaining external trade, reducing vulnerability to external shocks.
- **Resource nationalism**: assertion of state sovereignty over natural resources, including renegotiation of contracts, taxation, and local content requirements.

SECTION 2 — LESSON CORE

2.1 Learning objectives

By the end of this lesson, the student will be able to:

1. **Define** mercantilism, economic nationalism, and the infant-industry argument as historically specific state-market paradigms, distinguishing their zero-sum and dynamic-comparative-advantage logics from both classical liberalism and neoliberalism, and locating each in its theoretical lineage from Mun and Colbert through Hamilton and List to contemporary industrial policy (Bloom: Understand).
2. **Explain** the mechanism by which temporary protection can generate dynamic comparative advantage through learning-by-doing, scale economies, and supplier-network formation, and identify the scope conditions—state capacity, credible sunset clauses, market size, technological gap—under which this mechanism succeeds or degenerates into permanent rent-seeking (Bloom: Analyze).
3. **Compare** the five perspectives (African, Chinese, Russian, Western, UN) on state-market paradigms, steel-manning each from within its own premises and identifying what each reveals about power, development, and security that the others occlude (Bloom: Evaluate).
4. **Apply** the four levels of analysis (individual, state, systemic, transnational) to the 1971 Nixon shock, reconstructing how converging pressures at each level jointly produced the collapse of Bretton Woods and the transition to floating exchange rates (Bloom: Apply).
5. **Critique** the Washington Consensus and post-1980 neoliberalism using Polanyi's double movement, assessing whether contemporary industrial policy (CHIPS Act, IRA, EU Chips Act) represents a genuine re-embedding of markets in society or a securitized, great-power variant of mercantilism that risks fragmenting the trading system (Bloom: Evaluate).

2.2 KEY IDEA 1 — Mercantilism and Economic Nationalism

Bolded Causal Claim: States that strategically restrict imports and subsidize infant industries can, under specifiable conditions, convert temporary protection into durable industrial capacity and dynamic comparative advantage, thereby reshaping the international division of labor in their favor.

Mechanism: Mercantilism as a state-market paradigm rests on a foundational premise that international

trade is a zero-sum contest for national power, and that wealth is best measured by the accumulation of specie and productive capacity rather than by consumer welfare. In its seventeenth- and eighteenth-century European form—articulated by writers such as Thomas Mun and operationalized by Jean-Baptiste Colbert in France and by the English Navigation Acts of 1651—this meant maximizing exports, minimizing imports, capturing colonial markets, and channeling bullion into state coffers. The mechanism was straightforward: a trade surplus generated specie inflows, which financed armies and navies, which in turn secured the trade routes that sustained the surplus. The paradigm treated the economy as an instrument of state power, and the market as a domain to be disciplined rather than trusted.

The infant-industry argument, developed by Alexander Hamilton in his 1791 Report on Manufactures and systematized by Friedrich List in The National System of Political Economy (1841), transformed this zero-sum logic into a dynamic, time-bound mechanism. Hamilton and List accepted that free trade maximizes static efficiency among nations at similar levels of development, but argued that nations at different stages of industrial maturity face asymmetric competitive conditions. A newly industrializing nation cannot compete with an established industrial power whose firms already enjoy scale economies, skilled labor pools, supplier networks, and accumulated technological knowledge. The mechanism proceeds as follows: the state imposes temporary tariffs or subsidies on imported manufactures, raising their domestic price and creating a protected space in which domestic firms can produce, learn, and scale. Through learning-by-doing—later formalized by Kenneth Arrow and Allyn Young's increasing-returns tradition—unit costs fall as cumulative output rises, skills deepen, supplier ecosystems form, and technological capability accumulates. Once the industry achieves international competitiveness, protection is withdrawn and the industry competes on open markets. List termed this "educational protection," distinguishing it from the "consumptive protection" of permanent tariffs that merely enrich rent-seekers. The key analytical move is the shift from static to dynamic comparative advantage: comparative advantage is not given by nature or factor endowments alone, but can be created through deliberate policy and historical time.

The mechanism is therefore conditional on several interacting processes. First, firms must actually learn rather than simply collect rents behind the tariff wall; this requires competitive pressure within the protected market, access to technology, and managerial capability. Second, the state must possess the capacity to select sectors with genuine potential, to monitor performance, and to withdraw support when firms fail to become competitive—the "discipline" that distinguishes developmental states from rentier ones. Third, the protected industry must eventually face international competition, since permanent protection severs the feedback loop between cost reduction and market survival. Fourth, complementary investments in infrastructure, education, and finance must accompany border protection, since tariffs alone cannot generate industrialization.

Scope Conditions: The infant-industry mechanism operates successfully only where a cluster of scope conditions holds. The domestic market must be large enough to sustain scale economies during the protection period, or the state must secure preferential access to regional or imperial markets. State capacity must be sufficient to resist capture by protected interests and to enforce sunset clauses. The technological gap between the infant industry and the frontier must be closable within a politically feasible time horizon; if the gap is too wide, protection becomes permanent subsidy. The industry must exhibit increasing returns to scale or learning externalities that markets alone cannot capture, otherwise free trade remains efficient. Retaliation must be manageable: unilateral protection invites counter-tariffs that can close export markets and trigger trade wars, as the Smoot-Hawley Tariff of 1930 demonstrated. Finally, the macroeconomic environment must be stable enough that firms can plan long-term investment; high inflation or currency volatility undermines the mechanism. Where these conditions fail—small markets, weak states, high capture, no sunset credibility—the same policy instruments produce stagnation, inefficiency, and entrenched rent-

seeking rather than industrial transformation.

Observable Implications: Where the mechanism operates as theorized, one should observe a rising manufacturing share of GDP during the protection period, followed by export diversification away from primary commodities, declining unit costs along learning curves, increasing patent filings and technological upgrading, and the emergence of supplier networks and industrial clusters. Tariff structures should show escalation—higher rates on finished manufactures than on raw materials and intermediates—reflecting the logic of protecting downstream processing. The presence of development banks, industrial parks, and performance-linked subsidies indicates state capacity to discipline firms. Conversely, where protection fails, one observes persistent trade deficits in manufactures despite high tariffs, stagnant or declining manufacturing productivity, concentration of protection in politically connected sectors, and repeated extensions of "temporary" protection. At the systemic level, successful infant-industry industrialization by one country tends to provoke emulation and competitive protectionism among others, altering the structure of world trade.

Perspective Note (five traditions in brief):

African (primary): African economic nationalism is not a derivative of European mercantilism but a response to a specific historical experience: colonial extraction, the deliberate suppression of African manufacturing, and post-independence commodity dependence. The African vantage point begins with Walter Rodney's argument in How Europe Underdeveloped Africa (1972) that colonialism systematically deindustrialized the continent and locked it into primary-commodity export, and with Kwame Nkrumah's analysis of neo-colonialism as the continuation of economic subordination through market mechanisms after formal independence. From this perspective, the infant-industry argument is not an abstract theoretical option but a developmental imperative: without protection and state-led industrialization, African economies remain trapped in unequal exchange, exporting raw materials and importing manufactures at deteriorating terms of trade. Post-independence import-substitution industrialization in Ghana, Nigeria, Kenya, and Egypt attempted this, but often failed because of small national markets, weak state capacity, and elite capture—problems compounded by structural adjustment programs in the 1980s and 1990s that forced premature liberalization. Contemporary African economic nationalism takes several forms. Resource nationalism asserts state sovereignty over extractives, as in Tanzania's 2017 mining legislation and the Democratic Republic of Congo's renegotiation of cobalt and copper contracts. Developmental regionalism pools markets through the African Continental Free Trade Area (AfCFTA), launched in 2018 and operationalized in 2021, creating a continental market of roughly 1.3 billion people that can sustain scale economies for infant industries. Industrial parks and special economic zones in Ethiopia, Rwanda, and Morocco represent attempts to combine protection with export orientation. African scholars such as Thandika Mkandawire have emphasized that developmental states in Africa are possible but require political coalitions that discipline capital rather than merely rent to it, while Ha-Joon Chang's argument that today's rich countries industrialized behind high tariff walls—kicking away the ladder after climbing it—resonates deeply in African policy circles. The African perspective reveals what Western theory often occludes: that free trade among unequals reproduces inequality, that policy space for late developers has been systematically narrowed by WTO rules and bilateral investment treaties, and that regional integration is not merely an economic efficiency measure but a sovereignty project. It also acknowledges its own risks: elite capture, regional inequality within Africa, trade diversion, and the danger that resource nationalism provokes capital flight or sanctions.

Chinese: China's state capitalism is frequently described as a contemporary variant of mercantilism, and from within the Chinese perspective this is partly embraced as a vindication of Listian late development. The

mechanism runs through state-owned enterprises, industrial policy, technology transfer requirements, and strategic protection in sectors deemed critical to national power. Made in China 2025 and the dual-circulation strategy explicitly aim to move China up the value chain from assembly to innovation, using state capacity to discipline firms through party committees, performance targets, and credit allocation. Chinese scholars and policymakers frame this not as mercantilism in the pejorative Western sense but as legitimate development strategy by a latecomer, noting that the United States and Europe industrialized behind protection and now seek to deny China the same tools. The perspective contributes an emphasis on state capacity and long-term planning, and it reveals how industrial policy can be coordinated with infrastructure investment and human-capital formation at scale. It occludes, however, the costs of overcapacity, the inefficiency of politically protected SOEs, the trade friction generated by subsidies, and the debt burdens accumulated by local governments and state banks.

Russian: Russia's post-2014 and especially post-2022 economic strategy represents a defensive, sanctions-driven form of mercantilism: import substitution, parallel imports, state-directed production in defense and energy, and a deliberate reduction of dollar dependence. The mechanism is reactive rather than developmental—sanctions forced diversification, and the state mobilized resources to sustain production in critical sectors. From within, this is framed as sovereignty and resilience: a fortress economy that can withstand external pressure. The perspective reveals how economic interdependence can be weaponized and how states respond by de-risking. It occludes the technological stagnation, brain drain, and isolation that accompany autarky, and the long-term cost of severing access to global innovation networks.

Western: The Western perspective contains an internal tension. Classical liberalism, from Smith through Ricardo, treated mercantilism as a fallacy: trade is positive-sum, specialization by comparative advantage maximizes global and national welfare, and protection enriches producers at consumers' expense. This view dominated post-1945 trade policy and underpinned the GATT/WTO system. Yet the same Western tradition has recently revived industrial policy—evident in the US CHIPS and Science Act, the Inflation Reduction Act, and the EU Chips Act—justified by market failures, supply-chain security, and great-power competition. The Western perspective thus oscillates between liberal openness and strategic protection, and its contemporary variant often frames industrial policy as an exception to liberal rules rather than a repudiation of them. It contributes rigorous analysis of market failures and the costs of protection, but occludes the historical hypocrisy of denying late developers the tools the West itself used, and the risk that securitized industrial policy fragments the trading system.

UN: The UN perspective approaches state-market paradigms through development finance and the Sustainable Development Goals. It treats infant-industry protection as potentially compatible with development if aligned with green industrialization, technology transfer, and inclusive growth, and institutions such as UNCTAD and UNIDO have historically supported policy space for developing countries. The mechanism is framed as global partnership: industrial policy in the South requires concessional finance, technology sharing, and reform of trade rules that constrain policy space. The perspective contributes a normative commitment to equity and a recognition that markets alone do not deliver development. It occludes, however, the limited enforcement power of UN frameworks, the tension between industrial policy and WTO commitments, and the risk that development finance becomes conditional on donor priorities.

SECTION 2.3 KEY IDEA 2 — Classical Liberalism: Smith, Ricardo, Comparative Advantage, and Nineteenth-Century Free Trade

Bolded Causal Claim: Classical liberalism explains nineteenth-century trade expansion and industrial specialization as the unintended result of decentralized exchange under comparative advantage, not as the product of state design; yet its causal force depends on institutional and coercive preconditions—property rights, monetary convertibility, transport infrastructure, and imperial power—that the theory often treats as exogenous background.

Mechanism: Adam Smith's mechanism begins with the division of labor and the extent of the market: as markets widen, producers can specialize, specialization deepens skill and machinery, and productivity rises. The "invisible hand" is not a claim that individuals intend public benefit; it is a claim that competitive price signals can coordinate dispersed self-interest into an unintended order. David Ricardo's mechanism adds comparative advantage: even if one country is less efficient in producing every good, both countries gain when each specializes where its relative efficiency is highest, because opportunity costs differ. Trade then expands the consumption possibilities of both parties beyond their production possibilities. In policy terms, this mechanism was translated into tariff reduction, most-favored-nation treaties, and the gold standard: lower barriers allow relative prices to guide specialization; stable money reduces transaction costs; contract enforcement and property rights make long-distance exchange credible. The nineteenth-century free-trade movement—British repeal of the Corn Laws in 1846, the Cobden-Chevalier treaty of 1860, and subsequent treaty networks—was the political expression of this mechanism. But the mechanism is not merely "remove tariffs"; it is a broader institutional package in which price signals, capital mobility, and monetary convertibility jointly reallocate resources. Where those institutions are absent, liberalization may produce not specialization but deindustrialization, dependency, or rent extraction.

Scope Conditions: The Ricardian mechanism holds under restrictive assumptions: two goods, two countries, labor as the sole factor, constant returns to scale, no transport costs, full employment, no externalities, and capital immobility across borders. These assumptions are not incidental; they define when comparative advantage is a reliable guide to policy. If increasing returns, path dependence, or technological spillovers matter, early specialization can lock in disadvantage rather than efficiency. If capital is mobile, comparative advantage may be endogenous to investment flows rather than to fixed endowments. If security externalities exist, a state may rationally sacrifice efficiency for autonomy. The political scope conditions are equally important: liberalization requires coalitions capable of overcoming protected interests, and it requires states with enough capacity to enforce property rights and maintain monetary stability. In the nineteenth century, Britain's unilateral free trade was compatible with its industrial lead and naval power; for late industrializers such as Germany and the United States, protection often remained the dominant strategy. The mechanism also assumes that aggregate gains can be redistributed, but classical liberalism did not solve the compensation problem: workers and regions displaced by trade may not be compensated, and political backlash can reverse liberalization. Finally, the nineteenth-century "free trade" order was not a universal equilibrium; it coexisted with empire, coerced labor, and unequal treaties, so its scope was historically bounded by power asymmetry.

Observable Implications: If classical liberalism's mechanism is operating, one should observe rising trade as a share of output, specialization by relative cost structure, price convergence for tradable goods, and capital flows toward higher returns under stable money. One should also observe policy convergence toward lower tariffs in hegemonic centers, though not necessarily in peripheral or late-industrializing states. The British case suggests deindustrialization of competitors in some sectors and commodity specialization in regions integrated into imperial markets. The German and American cases suggest that protection can co-

exist with rapid industrialization, which is an observable implication that qualifies, rather than refutes, the theory: comparative advantage predicts gains from trade, but it does not prove that free trade is always the optimal development strategy. Financially, the gold standard and capital mobility imply synchronized business cycles and vulnerability to external shocks. Distributionally, one should observe sectoral displacement, regional inequality, and political contestation over trade policy. The theory's strongest empirical support is the aggregate expansion of trade and output in the long nineteenth century; its strongest empirical challenge is that the same period included rising protection in major economies and deepening global inequality.

Perspective Note (five traditions in brief):

African (primary): From an African vantage point, classical liberalism often appears not as a neutral theory of mutual gain but as the ideology of imperial free trade. African economies were integrated into the world market as suppliers of primary commodities and consumers of manufactured imports, a pattern that Rodney and Nkrumah analyzed as structural subordination rather than voluntary specialization. The mechanism of comparative advantage, when applied to colonial economies, could lock in extraversion: export enclaves, limited industrial linkages, and terms-of-trade vulnerability. Postcolonial African thinkers did not necessarily reject trade; they rejected the assumption that market integration automatically produces development. The African perspective therefore treats classical liberalism as historically powerful but normatively incomplete: it explains price-driven specialization while obscuring coercion, colonial extraction, and the political construction of "free" markets. It contributes a critique of methodological individualism and a demand that trade theory account for historical power. It occludes, however, the genuine productivity gains from specialization and the possibility that regional trade and industrial policy can be designed within, rather than against, comparative advantage.

Chinese: Chinese engagement with classical liberalism has been selective and instrumental. Late Qing self-strengthening and Republican-era reformers studied Western trade theory while seeking to preserve sovereignty and build industrial capacity. The Chinese perspective treats comparative advantage as a description of current specialization, not a prescription for permanent status: a country may accept labor-intensive exports while using state capacity to move up the value chain. This vantage point contributes a developmental reading of trade theory, in which comparative advantage is dynamic and policy can reshape endowments. It occludes the risk that state-led upgrading can produce overcapacity, trade conflict, and allocative inefficiency.

Russian: Russian economic thought has long oscillated between integration and autarky. Late imperial ministers such as Sergei Witte promoted foreign capital and trade to accelerate industrialization, while later Soviet doctrine rejected comparative advantage as capitalist ideology. The Russian perspective highlights vulnerability to external shocks and the strategic value of self-sufficiency, especially in energy and defense. It contributes a security-centered critique of liberal trade optimism. It occludes the costs of autarky and the possibility that interdependence can be managed rather than eliminated.

Western: The Western perspective, especially in its Anglo-American variant, has often treated classical liberalism as both positive theory and normative ideal. It emphasizes consumer welfare, efficiency, and the peace-promoting effects of trade. This vantage point contributes powerful analytical tools and a strong case against crude protectionism. It occludes the historical role of coercion in market expansion and the distributional conflicts that liberalization generates.

UN: The UN perspective has generally supported trade as a development instrument while insisting on policy space, special and differential treatment, and technology transfer. It treats classical liberalism as a useful but

insufficient framework: markets can expand output, but development requires institutional capacity and equity. This perspective contributes a multilateral, normative commitment to inclusive growth. It occludes the difficulty of enforcing development-friendly trade rules and the tension between liberalization commitments and industrial policy.

SECTION 2.4 KEY IDEA 3 — Polanyi's Embedded Liberalism: The Double Movement and the Post-1945 Compromise

Bolded Causal Claim: Polanyi's "double movement" claims that the attempt to create a self-regulating market necessarily provokes social counter-movements that re-embed economic activity in protective institutions; post-1945 embedded liberalism was therefore not a natural equilibrium but a historically specific compromise between international liberalization and domestic social protection.

Mechanism: Polanyi's core mechanism is the fictitious commodification of land, labor, and money. These are not produced for sale in the ordinary sense, yet market society treats them as commodities. When labor is fully commodified, communities lose social protection; when land is fully commodified, nature is subordinated to price; when money is fully commodified, credit becomes detached from productive activity. The result is social dislocation, which generates a counter-movement: labor legislation, welfare provision, central banking, agricultural protection, and democratic demands for security. This is the "double movement"—market expansion and social protection advancing together, often in tension. The post-1945 compromise, which John Ruggie later termed embedded liberalism, institutionalized this tension internationally: states liberalized trade while retaining capital controls, welfare states, and macroeconomic management. The mechanism is not simply "markets fail, therefore states intervene"; it is that market expansion creates the political forces that demand intervention. Bretton Woods, the General Agreement on Tariffs and Trade, and the International Labour Organization can be read as institutional expressions of this compromise: trade liberalization was paired with exceptions for balance-of-payments adjustment, agricultural protection, and domestic welfare. The mechanism also explains reversal: when capital mobility increased and neoliberal ideology gained force after the 1970s, the protective layer was weakened, re-exposing societies to market volatility and provoking new counter-movements.

Scope Conditions: Polanyi's mechanism applies most strongly where democratic politics can translate social dislocation into institutional protection, and where states have the capacity to regulate markets without destroying them. It applies where capital is not fully mobile, because capital mobility constrains the policy space available for welfare states and industrial policy. It also applies where a hegemonic power tolerates or supports the compromise, as the United States did in the early postwar period for strategic and economic reasons. The mechanism is weaker under authoritarian regimes that suppress counter-movements, under financialized economies where capital can exit, and under conditions where social groups are fragmented or lack organizational capacity. It is also historically bounded: Polanyi wrote from the experience of interwar collapse, and his argument is not a universal law of all market societies but a historically grounded theory of European and North Atlantic transformation. The post-1945 compromise was further bounded by colonial exclusion: many non-Western societies were not included in the welfare bargain, and their integration into the liberal order occurred through different, often coercive, mechanisms. Finally, embedded liberalism is not a stable endpoint; it is a contingent settlement that can be renegotiated or dismantled.

Observable Implications: If Polanyi's mechanism is operating, one should observe market expansion followed by protective legislation, welfare-state growth, and institutionalized exceptions to free trade. In the postwar period, this appears as capital controls, fixed but adjustable exchange rates, agricultural subsidies,

labor rights, and social insurance. One should also observe that trade liberalization is accompanied by domestic compensation mechanisms, not by pure laissez-faire. When the protective layer erodes—as in the 1980s and 1990s—one should observe rising inequality, financial instability, and political backlash against globalization. The mechanism implies that attempts to impose self-regulating markets without social protection will generate resistance, whether through populism, nationalism, labor militancy, or demands for industrial policy. It also implies that international institutions will contain internal contradictions: the same order that liberalizes trade must accommodate exceptions for social protection. Observable evidence includes the expansion of welfare states in the 1950s and 1960s, the rollback of capital controls in the 1980s, and the contemporary return of industrial policy and subsidy competition. The theory's strength is its explanation of why market expansion produces political counter-reactions; its weakness is that it can be overextended to explain too many outcomes unless scope conditions are specified.

Perspective Note (five traditions in brief):

African (primary): The African perspective on embedded liberalism is shaped by the fact that the post-1945 compromise was largely a North Atlantic bargain. African societies were integrated into the world economy through colonial extraction and, after independence, through commodity dependence and conditional finance, not through a welfare-state bargain. Polanyi's double movement is nonetheless analytically powerful for Africa: structural adjustment programs in the 1980s and 1990s dismantled protective institutions and re-commodified labor and land, provoking counter-movements in the form of protests, informalization, and demands for policy space. African developmental regionalism and the African Continental Free Trade Area can be read as attempts to re-embed markets in regional institutions that protect development rather than merely liberalize trade. This perspective contributes a critique of the universalization of European social history and a demand that embeddedness be understood in postcolonial terms. It occludes, however, the diversity of African political economies and the risk that regional protection can shelter inefficient elites.

Chinese: China's perspective treats the market as an instrument embedded in state strategy, not as a self-regulating order. The socialist market economy, dual circulation, and state-owned enterprises represent a deliberate re-embedding of markets in party-state institutions. Polanyi's framework helps explain why China resisted full commodification of land and labor and why it maintains capital controls. This vantage point contributes a model of market governance in which development and security precede liberalization. It occludes the costs of state discretion, including allocative inefficiency and the suppression of certain social counter-movements.

Russian: The Russian perspective emphasizes the collapse of Soviet embeddedness and the shock therapy of the 1990s, which rapidly commodified assets and labor with severe social consequences. The subsequent turn toward state capitalism, sanctions resilience, and strategic sectors reflects a counter-movement against unregulated market integration. This perspective contributes a security-driven understanding of re-embedding. It occludes the economic costs of autarky and the possibility that some market integration can be stabilizing.

Western: The Western perspective has treated embedded liberalism as the golden age of the liberal order and neoliberalism as its unraveling. It contributes a rich institutional history of welfare states, Bretton Woods, and the politics of compromise. It occludes the colonial and racial exclusions of the postwar order and the extent to which embedded liberalism depended on American hegemony.

UN: The UN perspective frames embedded liberalism through development decades, social protection floors, and the Sustainable Development Goals. It treats markets as requiring institutional embedding to deliver equity and sustainability. This perspective contributes a normative commitment to social protection and

multilateral development finance. It occludes the limited enforcement capacity of UN frameworks and the tension between industrial policy and trade commitments.

2.5 KEY IDEA 4 — Washington Consensus and post-1980 neoliberalism — conditionality, deregulation, SAPs

Bolded Causal Claim: The Washington Consensus transformed a contingent set of market-liberalizing reforms into a conditionality-backed policy orthodoxy, so that access to finance, debt relief, and institutional legitimacy became dependent on states meeting creditor-defined benchmarks; the result was not the retreat of the state but its reorientation toward compliance, market enforcement, and externally monitored adjustment.

Mechanism: The mechanism begins with John Williamson's 1990 formulation of the Washington Consensus, which distilled a recognizable package of reforms—fiscal discipline, tax reform, interest-rate liberalization, competitive exchange rates, trade liberalization, liberalization of inward foreign direct investment, privatization, deregulation, and property-rights enforcement—into a shared language for policymakers, creditors, and international financial institutions. The operative instrument was conditionality: the International Monetary Fund and the World Bank attached policy requirements to loans, stand-by arrangements, structural adjustment programs, and debt-relief initiatives. Conditionality worked through a financing chokepoint. States facing balance-of-payments crises, debt overhangs, or exclusion from private capital markets needed official liquidity; creditors used that need to require policy changes that would otherwise have faced domestic resistance. Structural adjustment programs (SAPs) in the 1980s and 1990s typically combined fiscal austerity, subsidy removal, currency devaluation, trade liberalization, privatization of state enterprises, and public-sector retrenchment. The theoretical justification drew on public-choice and state-failure arguments: governments were assumed to distort prices, protect rents, and misallocate capital; markets, by contrast, were treated as information-processing mechanisms whose price signals could coordinate investment more efficiently than planning. Deregulation reduced the state's direct allocative role while expanding its enforcement role—protecting property rights, enforcing contracts, maintaining macroeconomic stability, and opening capital accounts. Capital-account liberalization added a disciplinary mechanism: mobile capital could exit when policy deviated from investor expectations, narrowing the space for redistributive or industrial policies. The paradigm therefore did not eliminate state capacity; it redirected it toward market-conforming governance and creditor confidence.

Scope Conditions: This paradigm was most powerful where states faced acute financing constraints, high external debt, weak domestic coalitions for alternative development strategies, and dependence on multilateral or bilateral creditors. It was reinforced by the collapse of Soviet-style planning, the debt crises of the 1980s, and the ideological ascendancy of market liberalism in the United States and United Kingdom. It worked best, or at least was most implementable, where states already possessed basic administrative capacity, legal institutions, and political stability sufficient to execute reforms. It worked poorly or destructively where state capacity was thin, social safety nets were absent, informal economies were large, or reforms were imposed without domestic ownership. In such settings, austerity could compress public investment, privatization could transfer assets to politically connected buyers, and trade liberalization could expose infant industries to competition before they had accumulated productive capability. The paradigm also assumed that market failures were secondary to state failures; where externalities, coordination problems, or strategic industries mattered, liberalization could lock in specialization patterns that were difficult to reverse.

Observable Implications: The observable implications include widespread tariff reductions, privatization

waves, financial deregulation, capital-account opening, and the institutionalization of inflation targeting and fiscal rules in many developing and transition economies. One can also observe the social and political costs associated with adjustment: compressed public spending, removal of food and fuel subsidies, currency crises, unemployment in formerly protected sectors, and in some cases deindustrialization or premature specialization in primary commodities. The period produced growth accelerations in some economies, especially where reforms coincided with favorable global demand, but also recurrent crises—Mexico in 1994, East Asia in 1997, Russia in 1998, Argentina in 2001—that exposed the fragility of capital-account liberalization and the procyclicality of market discipline. Politically, the paradigm generated backlash: anti-austerity movements, resource-nationalist reactions, and later demands for industrial policy. The Washington Consensus also became a contested label; Williamson himself distinguished his original ten points from what critics called the "augmented" or "neoliberal" Washington Consensus, suggesting that the term had hardened into an ideological brand beyond its initial technocratic content.

Perspective Note (five traditions in brief):

African: The African perspective treats the Washington Consensus less as neutral technocracy than as a restructuring of sovereignty under creditor power. Structural adjustment programs are read as episodes in which policy autonomy was traded for liquidity, often with severe consequences for public health, education, food security, and industrial capacity. African scholarship emphasizes that conditionality interacted with colonial legacies, weak state capacity, and commodity dependence, producing adjustment without development. The perspective also notes that African states were not merely passive recipients; they bargained, resisted, and selectively implemented reforms. Its contribution is to center the lived costs of macroeconomic stabilization and the political economy of debt. It occludes, if taken alone, the genuine fiscal crises and inflationary spirals that motivated reform in some cases.

Chinese: The Chinese perspective reads the Washington Consensus as a cautionary example of excessive marketization and external conditionality. China's reform trajectory—gradual, experimental, and state-led—deliberately avoided shock therapy and full capital-account liberalization. The perspective contributes a model in which markets are instruments of state strategy rather than autonomous allocators. It occludes the internal costs of China's state-led model, including financial repression, regional inequality, and the political risks of concentrated state power.

Russian: The Russian perspective associates the Washington Consensus with the 1990s transition experience, including privatization, price liberalization, and external advice. It often frames that period as a loss of state capacity and national wealth, followed by a reassertion of state control over strategic sectors. The perspective contributes an emphasis on sovereignty, strategic industries, and the dangers of rapid liberalization in weak institutional settings. It occludes the inefficiencies and corruption that also characterized state-led alternatives.

Western: The Western perspective is internally divided. One strand treats the Washington Consensus as a necessary correction to state failure and a driver of global growth and poverty reduction. Another strand, especially after the 2008 financial crisis, treats it as an overreach that underestimated market failure, inequality, and the need for regulation. The perspective contributes sophisticated institutional analysis and policy evaluation. It occludes the asymmetry between Western states that retained industrial policy space and developing states that faced stricter conditionality.

UN: The UN perspective frames the Washington Consensus through development decades, poverty reduction, and the Millennium Development Goals. It emphasizes social protection, human development, and

the need for policy space. It contributes a normative commitment to equity and multilateral development finance. It occludes the limited enforcement capacity of UN frameworks and the tension between its social goals and the macroeconomic constraints imposed by creditors.

2.6 KEY IDEA 5 — Contemporary contest — state capitalism (China), friend-shoring, industrial policy (CHIPS Act, IRA), 'return of the state'

Bolded Causal Claim: The contemporary turn toward industrial policy, friend-shoring, and state capitalism does not abolish liberal markets but re-embeds them in security, technological, and geopolitical logics, using subsidies, procurement, export controls, and alliance coordination to reshape comparative advantage around strategic resilience rather than static cost minimization.

Mechanism: The mechanism is a shift in the dominant policy paradigm from efficiency-first globalization to security-conscious geoeconomics. Chinese state capitalism operates through state-owned enterprises, policy banks, directed credit, subsidies, and strategic planning, using markets as instruments of national capability-building rather than as autonomous allocators. Its scale and integration into global supply chains made it both a growth engine and a perceived strategic competitor. The United States and European Union responded not by abandoning markets but by layering security and industrial objectives onto them. The 2022 CHIPS and Science Act provides subsidies, tax credits, and research funding to expand domestic semiconductor manufacturing and reduce dependence on concentrated East Asian supply chains. The 2022 Inflation Reduction Act uses tax credits and domestic-content requirements to accelerate clean-energy manufacturing and electric-vehicle supply chains. The European Chips Act and related industrial strategies similarly combine subsidies, research coordination, and supply-chain monitoring. Friend-shoring, articulated in U.S. Treasury and allied policy discourse, seeks to relocate or diversify production toward politically aligned or trusted partners rather than purely lowest-cost jurisdictions. Export controls—especially on advanced semiconductors, manufacturing equipment, and related technologies—weaponize interdependence by restricting access to chokepoint technologies. The mechanism is therefore not simple protectionism; it is a reconfiguration of market incentives through public finance, regulation, standards, and alliance structures. The state becomes a risk-socializer and market-maker: it absorbs upfront capital costs, coordinates private investment, and defines which sectors are strategic. This "return of the state" is better understood as a change in the state's function—from neutral referee to strategic coordinator—than as a return to mid-twentieth-century planning.

Scope Conditions: This paradigm is most likely where three conditions converge: first, geopolitical rivalry raises the perceived cost of dependence on potential adversaries; second, supply chains are concentrated in technologies with high fixed costs, long lead times, or national-security externalities; third, domestic political coalitions support public investment and are willing to absorb fiscal costs. Semiconductors, batteries, critical minerals, pharmaceuticals, and clean-energy technologies fit these conditions because they combine economic importance with security sensitivity. The paradigm is weaker where fiscal space is limited, institutional capacity for industrial policy is low, or alliance coordination is unreliable. It also depends on the credibility of long-term commitments: private firms will not relocate production unless subsidies, permits, and demand signals are durable. A further scope condition is technological asymmetry. Export controls work best where the controlling state or alliance occupies a chokepoint; they can accelerate indigenous innovation, retaliation, or parallel supply chains if targets have sufficient resources and time. The contemporary contest is therefore not a settled victory of state capitalism over liberalism or vice versa, but an ongoing bargaining process over the boundaries of legitimate intervention.

Observable Implications: Observable implications include new semiconductor fabrication plants in the

United States, Europe, and Japan; battery and electric-vehicle supply-chain investments tied to IRA-style incentives; expanded export-control lists; "de-risking" rather than full decoupling language; and the proliferation of industrial-policy strategies across advanced and emerging economies. One can also observe trade fragmentation, subsidy races, WTO disputes, and retaliatory measures, as well as efforts to build "trusted" supply networks among allies. Market outcomes are increasingly shaped by policy eligibility: firms reorganize production to qualify for subsidies, meet domestic-content rules, or avoid controlled technologies. The paradigm also produces distributional effects: regions and firms that receive subsidies gain, while consumers may face higher costs in the short run; developing countries may be excluded from preferential supply chains unless they align with major powers. The "return of the state" is visible in public spending, but its success remains contingent on implementation quality, technological learning, and geopolitical stability.

Perspective Note (five traditions in brief):

African: The African perspective sees the contemporary contest as both an opportunity and a risk. On one side, resource nationalism, critical-minerals strategies, and the African Continental Free Trade Area (AfCFTA) aim to move Africa from raw-material export to value-added production and regional industrialization. On the other, friend-shoring and great-power competition may reproduce extractive patterns if African states remain suppliers of unprocessed minerals while processing and technology stay elsewhere. The perspective contributes a focus on developmental regionalism, bargaining power, and the need for policy space. It occludes, if overstated, the internal governance and infrastructure constraints that limit industrialization regardless of external demand.

Chinese: The Chinese perspective frames state capitalism as a development strategy and a response to perceived Western containment. Dual circulation—strengthening domestic demand and technological self-reliance while maintaining external engagement—reflects a strategy of reducing vulnerability to sanctions and supply shocks. The perspective contributes an alternative to liberal market orthodoxy and a demonstration that state coordination can accelerate industrial upgrading. It occludes the risks of overcapacity, debt, opacity, and the geopolitical backlash that state-led expansion can provoke.

Russian: The Russian perspective treats sanctions and economic pressure as catalysts for a resilience economy: import substitution, parallel imports, state-directed credit, and reorientation toward non-Western markets. It contributes an emphasis on sovereignty, strategic autonomy, and the limits of financial weaponization. It occludes the efficiency losses, technological gaps, and long-term growth constraints that can result from isolation from advanced markets and technology.

Western: The Western perspective is split between liberal-internationalist commitments and a revived acceptance of industrial policy. One strand argues that targeted intervention is necessary to correct market failures, secure supply chains, and compete with state-capitalist rivals. Another warns that subsidy races, protectionism, and politicized trade can undermine the rules-based order and raise costs. The perspective contributes institutional capacity for policy design and evaluation. It occludes the possibility that Western industrial policy may be judged by the same standards of conditionality and market distortion that were applied to developing countries.

UN: The UN perspective frames the contemporary contest through sustainable development, financing for development, and the Sustainable Development Goals. It emphasizes that industrial policy should support green transition, technology transfer, and inclusive growth rather than zero-sum competition. It contributes a normative commitment to multilateral cooperation and development finance. It occludes the limited enforcement capacity of UN frameworks and the difficulty of reconciling national security industrial policy

with global public goods.

2.7 FIVE PERSPECTIVES IN DEPTH

2.7.1 African Perspective (PRIMARY) The African vantage point on state-market paradigms begins from a position that the other four perspectives systematically understate: the African continent has never experienced the "free market" as a neutral baseline from which deviations—mercantilism, embedded liberalism, neoliberalism—are measured. Rather, African economies have been constituted through successive waves of external market-making that were always already political: slave trades, colonial extraction, post-colonial conditionality, and contemporary resource competition. This is the foundational insight that Walter Rodney (1972) developed in *How Europe Underdeveloped Africa*: underdevelopment was not a pre-existing condition but an active process of market integration on unequal terms. The African perspective therefore does not ask "state versus market" but "whose state, whose market, on what terms, and to whose benefit." This reframing is not a regional variation on a universal debate; it is a challenge to the universality of the debate itself.

The theoretical lineage runs through several distinct but converging traditions, each of which redefines the state-market relationship from within African historical experience. Kwame Nkrumah's (1965) *Neo-Colonialism: The Last Stage of Imperialism* argued that formal political independence masked continued economic subordination through control of trade, finance, and multinational corporations. For Nkrumah, the state-market question was not about efficiency but about sovereignty: a post-colonial state that did not control its productive base remained a neo-colonial state regardless of its constitutional status. This framing inverts the liberal assumption that markets precede and constrain states; for Nkrumah, markets were instruments of imperial power that post-colonial states had to capture or be captured by. The mechanism of neo-colonialism operated through unequal exchange in trade, debt dependency, and the structural power of multinational corporations to determine investment, technology transfer, and pricing. Nkrumah's scope condition was the post-colonial state with formal sovereignty but substantive economic dependence—a condition that described most of Africa in the 1960s and, in modified form, persists today.

Julius Nyerere's (1968) Ujamaa socialism offered a different but complementary critique. Nyerere argued that African societies possessed pre-colonial traditions of communal ownership and mutual obligation that were destroyed by colonial capitalism, and that post-colonial development required rebuilding these solidarities through state-led cooperative production. The Arusha Declaration (1967) explicitly rejected both capitalist and communist models in favor of a specifically African socialism rooted in village-level democracy. Nyerere's contribution was to show that the state-market binary itself was Eurocentric: African political economy had historically operated through kinship, lineage, and communal obligation rather than through the individualized property relations assumed by both Smith and Marx. The mechanism of Ujamaa was the villagization program, which sought to concentrate dispersed rural populations into cooperative settlements where collective production and distribution would replace market exchange. The scope conditions were rural, agrarian societies with strong communal traditions; the program struggled where these conditions were absent or where state coercion replaced voluntary cooperation. Nyerere's legacy is contested—critics point to economic stagnation and forced resettlement—but his theoretical contribution endures: the state-market debate must be grounded in actually existing social relations, not abstract models.

Amílcar Cabral (1973) in *Return to the Source* added a crucial dimension by insisting that national liberation required not merely political independence but economic transformation of the productive base. Cabral's

concept of "class suicide"—the obligation of the petty bourgeoisie to commit class suicide in order to merge with the masses—was a theory of state-market relations in which the state's role was not to regulate markets but to dissolve class distinctions through productive transformation. Cabral's work is particularly important because it linked the state-market question to the epistemological question: whose knowledge counts in development planning? Cabral argued that the colonial bourgeoisie had been replaced by a national bourgeoisie that reproduced the same extractive patterns, and that genuine liberation required the development of a "revolutionary petty bourgeoisie" committed to mass mobilization. The mechanism was the PAIGC's (African Party for the Independence of Guinea and Cape Verde) practice of combining armed struggle with the construction of alternative institutions—schools, clinics, agricultural cooperatives—in liberated zones. Cabral's scope condition was the anti-colonial struggle itself; his framework has been extended by later scholars to analyze post-colonial states that have failed to transform their productive bases.

Frantz Fanon (1961) in *The Wretched of the Earth* provided the psychological and cultural dimension that the other traditions lacked. Fanon argued that colonialism created a "Manichean" world divided into settler and native zones, and that post-colonial elites risked reproducing this division by adopting the consumption patterns and institutional forms of the former colonizers. Fanon's analysis of the "national bourgeoisie" as a class that sought to replace the colonial bourgeoisie rather than transform the productive structure anticipated later critiques of African states as "gatekeeper" regimes that mediated external resource extraction rather than developing domestic productive capacity. The mechanism Fanon identified was the "psychopathology of colonization": the internalization of colonial hierarchies that led post-colonial elites to identify with the colonizer's culture and interests. Fanon's scope condition was the immediate post-independence period, but his analysis of the national bourgeoisie has been extended to explain contemporary patterns of elite capture and extraversion.

Mahmood Mamdani (1996) in *Citizen and Subject: Contemporary Africa and the Legacy of Late Colonialism* provided the institutional analysis that connected these earlier thinkers to contemporary debates. Mamdani argued that colonial rule in Africa created a bifurcated state: "citizens" in urban areas governed by civil law, and "subjects" in rural areas governed by customary law through "decentralized despotism." This institutional inheritance meant that post-colonial African states lacked the unified legal and administrative capacity that Western theories of state-market relations assumed. The African state was not a Weberian monopoly on legitimate violence but a patchwork of direct and indirect rule that shaped how markets functioned. Mamdani's framework explains why African states have historically struggled to implement industrial policy: the institutional capacity for policy design and enforcement was fragmented by colonial inheritance. The mechanism is that bifurcated citizenship creates dual legal regimes that undermine the uniform application of commercial law, property rights, and regulatory standards that market economies require. Mamdani's scope conditions are the former British and French colonies in Africa; his framework has been extended to analyze contemporary challenges of state-building and market development.

Jean-François Bayart (1993) in *The State in Africa: The Politics of the Belly* offered a different but complementary analysis. Bayart argued that African states were not "weak" in the sense of lacking capacity, but rather operated through "extraversion"—the strategic use of external resources to maintain domestic political coalitions. The African state was not a failed version of the Western state but a distinct form of political organization that used international markets, aid, and investment as resources for domestic political management. This reframes the state-market question: rather than asking why African states failed to develop markets, Bayart asks how African states used markets to reproduce themselves. The "politics of the belly" was not corruption in the Western sense but a mode of social reproduction that linked state elites to international capital through patronage networks. The mechanism of extraversion operates through the control

of "gateways"—ports, borders, mineral concessions, aid flows—through which external resources enter the domestic economy. State elites capture these gateways and distribute rents to maintain political coalitions. Bayart's scope condition is the post-colonial African state with limited domestic productive capacity but significant external resource flows; his framework explains why African states often prioritize rent extraction over productive investment.

Achille Mbembe (2001) in *On the Postcolony* extended this analysis by examining the cultural and symbolic dimensions of state-market relations. Mbembe argued that the post-colonial state operated through "commandement"—a mode of authority that combined violence, spectacle, and consumption. The post-colonial economy was not a market in the liberal sense but a "convivial" system in which state power, market exchange, and social obligation were intertwined. Mbembe's concept of "necropolitics" (2003) further argued that sovereign power to decide who lives and who dies was exercised not only through direct violence but through the structuring of economic life—through debt, structural adjustment, and the withdrawal of public services. This connects the African perspective directly to Polanyi's double movement: the "disembedding" of markets in Africa was experienced not as abstract economic liberalization but as the withdrawal of the state's protective function and the exposure of populations to market forces without social protection. The mechanism of necropolitics operates through the differential allocation of life chances: some populations are integrated into circuits of accumulation while others are abandoned to zones of death. Mbembe's scope condition is the post-colonial state with weak legitimacy and high violence; his framework has been applied to analyze everything from structural adjustment to the political economy of pandemics.

Siba Grovogui (2006) in *Beyond Eurocentrism and Anarchy: Memories of International Order and Institutions* provided the international relations theoretical framework. Grovogui argued that the discipline of IR was built on Eurocentric assumptions that treated European state formation as universal, and that African political experience offered alternative conceptions of sovereignty, authority, and international order. Grovogui's critique is essential for the state-market debate because it challenges the premise that "the state" and "the market" are universal categories. In many African contexts, authority is exercised through chiefs, religious leaders, and community elders alongside or instead of state institutions; markets operate through informal networks, kinship obligations, and moral economies that do not conform to either liberal or mercantilist models. Grovogui's work demands that state-market paradigms be evaluated not against an idealized Western state but against the actual institutional diversity of African political economy. The mechanism of Eurocentrism operates through the epistemic violence of treating European categories as universal, which renders African institutional forms invisible or pathological. Grovogui's scope condition is the entire field of international relations theory; his framework has been extended to analyze the construction of global economic governance.

Oyèrónkẹ́ Oyěwùmí (1997) in *The Invention of Women: Making an African Sense of Western Gender Discourses* contributed a gendered critique that is often overlooked in state-market debates. Oyěwùmí argued that the categories of "man" and "woman" as used in Western social science were not universal but were products of specific Yoruba and European social organizations. Applied to political economy, this suggests that the "household" as the unit of economic analysis in liberal theory, and the "worker" as the unit in Marxist theory, both embed gendered assumptions that obscure the actual organization of production and reproduction in African societies. The state-market debate in Africa cannot be understood without examining how women's labor—often informal, unpaid, and unrecognized—subsidizes both state capacity and market exchange. The mechanism operates through the invisibility of reproductive labor in national accounts and policy frameworks, which leads to the systematic underestimation of women's contribution to economic output and the overestimation of state and market capacity. Oyěwùmí's scope condition is the Yoruba social

organization she studied, but her epistemological critique has been extended to other African contexts.

Sylvia Tamale (2020) in *Decolonization and Afro-Feminism* extended this by arguing that decolonization is not merely a political project but an epistemological one: African knowledge systems must be centered in the analysis of African political economy. Tamale's work suggests that the state-market paradigms developed in European intellectual history—mercantilism, liberalism, embedded liberalism—are themselves products of specific historical experiences that may not translate to African contexts. The task is not to apply these paradigms to Africa but to develop African paradigms that can speak back to the global debate. The mechanism of epistemic decolonization operates through the centering of African languages, concepts, and methodologies in the production of knowledge about African political economy. Tamale's scope condition is the contemporary academy, but her framework has implications for policy design and institutional reform.

The contemporary African contribution to the state-market debate centers on three concepts: developmental regionalism, AfCFTA, and resource nationalism. Developmental regionalism, associated with scholars like Carlos Lopes and institutions like the African Union, argues that African development requires regional integration that goes beyond trade liberalization to include industrial policy, infrastructure coordination, and collective bargaining with external partners. The mechanism is that regional integration creates larger markets that can support industrialization, while collective bargaining increases African states' leverage in negotiations with external partners. The African Continental Free Trade Area (AfCFTA), launched in 2021, represents the most ambitious attempt to create a continental market, but its success depends on resolving the tension between liberalization and industrial policy: if AfCFTA merely opens African markets to external competition without building domestic productive capacity, it risks reproducing the neo-colonial pattern that Nkrumah identified. The scope conditions for AfCFTA's success include infrastructure investment, harmonization of standards and regulations, and the development of regional value chains.

Resource nationalism represents the contemporary African assertion that states should control and benefit from their natural resources. From Tanzania's renegotiation of mining contracts under President Magufuli to Zambia's copper nationalization debates to the DRC's cobalt export restrictions, African states are increasingly challenging the liberal assumption that resource extraction should be governed by market contracts. This is not a return to 1970s state socialism but a pragmatic recognition that the terms of trade between resource exporters and industrialized consumers have historically been unfavorable, and that state intervention is necessary to capture value-added. The mechanism operates through the renegotiation of contracts, the imposition of local content requirements, and the development of downstream processing capacity. The scope conditions include the availability of technical expertise, the willingness of investors to accept renegotiated terms, and the capacity of states to manage resource revenues transparently.

What the African perspective contributes that the other four cannot: First, it reveals that the state-market binary is itself a product of European historical experience that does not capture the diversity of institutional forms in Africa. Second, it demonstrates that "market integration" has historically been a mechanism of extraction rather than development, and that the terms of integration matter more than the fact of integration. Third, it provides a theory of the state as a site of extraversion and patronage rather than as a neutral regulator or developmental actor. Fourth, it centers gender and epistemology as dimensions of political economy that Western theories systematically exclude. Fifth, it offers a critique of the universalism of Western categories that is not merely relativist but grounded in alternative institutional practices.

What the African perspective occludes: It can understate the agency of African states in shaping their own trajectories, sometimes reducing African political economy to a story of external domination. It can romanticize pre-colonial communalism without adequately examining its internal hierarchies, including those of

gender, age, and caste. It can treat "Africa" as a unified category, obscuring the enormous variation between, say, South Africa's industrial economy and Chad's pastoral economy, or between Nigeria's oil-dependent state and Kenya's more diversified economy. And it can struggle to generate prescriptive policy frameworks that are both theoretically grounded and practically implementable, sometimes oscillating between radical critique and pragmatic accommodation. The tension between Nkrumah's revolutionary socialism and Nyerere's pragmatic Ujamaa, or between Bayart's extraversion thesis and the developmental state literature, remains unresolved.

2.7.2 Chinese Perspective The Chinese perspective on state-market paradigms is rooted in a distinct theoretical tradition that does not map neatly onto either Western liberalism or Soviet Marxism-Leninism. The concept of "socialism with Chinese characteristics," formalized under Deng Xiaoping, represents a pragmatic synthesis that treats the market as an instrument of socialist development rather than as an end in itself. This framing has deep roots in Chinese political thought, particularly in the tradition of "statecraft" (jingshi) that emphasizes the state's responsibility for economic welfare and social order, and in the Leninist tradition of state-led modernization that the Chinese Communist Party inherited.

The contemporary Chinese perspective is most clearly articulated through the concept of the "socialist market economy," though Western analysts often use the term "state capitalism." Chinese scholars and officials reject the latter as a Cold War category that misrepresents the Chinese model. The key theoretical claim is that the state and the market are not opposites but complements: the state provides strategic direction, infrastructure, and long-term planning, while the market provides efficiency, innovation, and consumer welfare. This is not a temporary deviation from liberal norms but a permanent feature of the Chinese model, grounded in the argument that markets are tools that must be subordinated to political objectives.

The mechanism of Chinese state-market relations operates through several channels. State-owned enterprises (SOEs) account for a significant share of economic output—estimates vary depending on measurement, but SOEs and state-controlled firms represent roughly 30-40% of GDP. These enterprises operate in strategic sectors including energy, telecommunications, finance, and transportation, providing the state with direct control over key inputs to the economy. The state also exercises control through the banking system, where state-owned banks direct credit toward priority sectors and projects. The "dual circulation" strategy, announced in 2020, represents the latest evolution: it emphasizes domestic consumption and innovation as the primary growth driver while maintaining international trade as a secondary circuit. This is a response to perceived vulnerabilities in global supply chains and US technology restrictions, and it reflects a strategic reassessment of China's position in the global economy.

The Chinese perspective contributes an empirical demonstration that rapid economic development can occur without full liberalization. China's growth from 1978 to the present—averaging roughly 9-10% annually for three decades—represents the most significant poverty reduction in human history, lifting approximately 800 million people out of extreme poverty. This empirical record challenges the Washington Consensus assumption that liberalization is necessary for growth. It also challenges the mercantilist assumption that state intervention must be protectionist: China's growth was driven by export-oriented manufacturing that integrated into global markets while maintaining state control over key sectors. The mechanism of Chinese growth combined market incentives at the micro level (household responsibility system in agriculture, township and village enterprises, special economic zones) with state direction at the macro level (five-year plans, infrastructure investment, credit allocation).

The Chinese perspective also contributes the argument that political legitimacy derives from performance

rather than electoral competition. This challenges the Western assumption that liberal democracy is a prerequisite for economic development, and suggests that state capacity for long-term planning may be enhanced by insulation from short-term electoral pressures. The mechanism is that the CCP's monopoly on political power allows it to implement long-term strategies—such as the Belt and Road Initiative or the Made in China 2025 plan—without the policy reversals that electoral cycles can produce.

What the Chinese perspective occludes: It tends to understate the costs of state capitalism, including allocative inefficiency, corruption, and the suppression of private entrepreneurship in sectors where SOEs dominate. It struggles to account for the environmental and social costs of rapid industrialization, including air pollution, labor exploitation, and regional inequality. It presents a unified "Chinese model" that obscures significant regional variation—between coastal and interior provinces, between state and private sectors—and internal debate about the appropriate balance between state and market. And it tends to treat state capacity as given rather than examining how it was built and at what cost, including the human costs of the Great Leap Forward and the Cultural Revolution, which preceded the reform era. The Chinese perspective also struggles to explain why similar state-capitalist models in other countries have not produced comparable growth, suggesting that China's success may depend on factors—scale, timing, geopolitical context—that are not easily replicable.

2.7.3 Russian Perspective The Russian perspective on state-market paradigms is shaped by a distinctive historical trajectory: the collapse of the Soviet planned economy, the chaotic liberalization of the 1990s, and the subsequent reassertion of state control under Putin. This experience has produced a perspective that is deeply skeptical of both liberal market orthodoxy and Soviet-style planning, while embracing a pragmatic statism that prioritizes sovereignty, security, and great-power status.

The theoretical lineage begins with the Soviet experience itself. The Soviet model represented the most thorough attempt to replace market coordination with state planning, and its collapse in 1991 was interpreted in Russia not as a failure of socialism per se but as a failure of a specific bureaucratic model. The 1990s "shock therapy" reforms, associated with Jeffrey Sachs and the IMF, produced hyperinflation, deindustrialization, and the rise of oligarchs who acquired state assets at fire-sale prices. This experience discredited liberal market reforms in Russian political discourse and created a constituency for state reassertion. The mechanism of shock therapy's failure was the rapid removal of price controls and subsidies without the institutional infrastructure—property rights, bankruptcy law, regulatory capacity—needed to support market coordination. The result was not a market economy but a "virtual economy" in which enterprises continued to produce without paying taxes or wages, sustained by barter and non-payment chains.

The contemporary Russian perspective is best understood through the concept of the "power vertical" (vertikal vlasti) and the associated economic model of selective state capitalism. Under Putin, the state reasserted control over strategic sectors—particularly energy—through the renationalization of assets (most notably Yukos in 2003) and the creation of state corporations (Rosneft, Gazprom, Rostec, VEB). The state does not seek to control the entire economy but to dominate strategic sectors while allowing private enterprise in non-strategic areas. This is a selective statism rather than comprehensive planning, and it reflects a pragmatic assessment of where state control is necessary for security and where market coordination is more efficient.

The sanctions-resilience economy represents the most recent evolution. Following the 2014 sanctions and the 2022 escalation, Russia has pursued import substitution, de-dollarization, and the development of alternative payment systems. The National Wealth Fund and the Central Bank's management of reserves have been reoriented toward sanctions resilience. The Russian perspective frames this not as autarky but as

"sovereign development"—the capacity to maintain economic function under external pressure. The mechanism operates through state-directed credit, subsidized domestic production, and the redirection of trade toward non-Western partners, particularly China and India. The "Fortress Russia" strategy, developed after 2014, included the accumulation of foreign exchange reserves, the reduction of dollar-denominated debt, and the development of domestic alternatives to Western technology.

The Russian perspective contributes an empirical demonstration that economies can adapt to severe external pressure through state-directed restructuring. The Russian economy contracted by roughly 2% in 2022 following the invasion of Ukraine and the imposition of unprecedented sanctions, but recovered to grow by approximately 3% in 2023, driven by military spending and import substitution. This resilience challenges the assumption that sanctions can rapidly cripple a large, resource-rich economy. The mechanism of resilience includes the redirection of energy exports to China and India, the development of parallel import channels through third countries, and the fiscal stimulus provided by military spending.

What the Russian perspective occludes: It tends to present state reassertion as a response to external threat rather than as a choice that preceded and contributed to confrontation. It understates the long-term costs of sanctions, including technological stagnation, brain drain, and dependence on Chinese inputs for critical technologies. It treats the 1990s liberalization as a failure without adequately examining the structural conditions—Soviet legacy, institutional weakness, absence of rule of law—that shaped its outcomes. And it struggles to distinguish between genuine state capacity and the personalistic control of a narrow elite, conflating regime survival with national interest. The Russian perspective also tends to obscure the distributional consequences of state capitalism: the concentration of wealth among state-connected elites, the suppression of independent business, and the militarization of the economy at the expense of civilian investment.

2.7.4 Western Perspective The Western perspective on state-market paradigms has undergone a significant evolution over the past century, from classical liberalism through embedded liberalism to neoliberalism and, most recently, to a revival of industrial policy. This evolution reflects changing assessments of the state-market relationship in response to historical crises, and it reveals a pattern of theoretical innovation driven by practical failure.

The classical liberal tradition, rooted in Smith (1776) and Ricardo (1817), treats the market as a spontaneous order that generates efficiency through the division of labor and comparative advantage. The state's role is limited to providing public goods, enforcing contracts, and maintaining order. This tradition dominated 19th-century British policy and shaped the post-1945 liberal international order, though in modified form. The mechanism of comparative advantage operates through specialization: countries export goods in which they have lower opportunity costs and import goods in which they have higher opportunity costs, generating mutual gains from trade. The scope conditions include the absence of externalities, perfect competition, and factor mobility—conditions that are rarely met in practice but that serve as a benchmark for policy evaluation.

The embedded liberalism compromise, articulated by Ruggie (1982) and rooted in Polanyi (1944), represented a modification: markets were to be liberalized internationally while domestically embedded in social welfare systems and regulatory frameworks. This was the Bretton Woods compromise: free trade plus capital controls plus welfare states. The mechanism was that domestic social protection would absorb the dislocations of international market integration, preventing the political backlash that had destroyed the interwar gold standard. Polanyi's (1944) "double movement" provided the theoretical foundation: the expansion of self-regulating markets generates a counter-movement of social protection, and the stability of the system depends on maintaining a balance between the two. The scope conditions for embedded liberalism included

the existence of strong labor movements, social democratic parties, and state capacity for welfare provision—conditions that were present in post-war Western Europe but not in most developing countries.

The neoliberal turn of the 1980s, associated with Williamson's (1990) Washington Consensus, represented a partial disembedding: deregulation, privatization, and liberalization were promoted as universal prescriptions, with conditionality as the enforcement mechanism. The mechanism was that market liberalization would generate efficiency gains that would trickle down to all segments of society. The scope conditions were assumed to be universal: what worked in the US and UK would work everywhere. The Washington Consensus included ten policy prescriptions: fiscal discipline, reordering of public expenditure priorities, tax reform, liberalization of interest rates, competitive exchange rates, trade liberalization, liberalization of inward FDI, privatization, deregulation, and property rights. The mechanism of conditionality operated through the IMF and World Bank, which made loans contingent on the implementation of these reforms.

The contemporary Western perspective is characterized by what might be called "liberalism with industrial policy." The US CHIPS and Science Act (2022), the Inflation Reduction Act (2022), and the EU Chips Act (2023) represent a significant departure from neoliberal orthodoxy. The mechanism is that national security and supply chain resilience require state intervention in strategic sectors, even at the cost of market efficiency. This is not a return to mercantilism—the US and EU remain committed to open trade in non-strategic sectors—but a recognition that the liberal order itself requires protection from geopolitical competition. The scope conditions are the existence of a geopolitical rival (China) and the perceived vulnerability of supply chains (semiconductors, critical minerals, pharmaceuticals).

Rodrik (2011) in *The Globalization Paradox* provides the theoretical framework for this evolution: the "trilemma" of hyperglobalization, democracy, and national sovereignty. Rodrik argues that you can have at most two of the three, and that the post-1990s pursuit of hyperglobalization sacrificed democracy and sovereignty. The contemporary industrial policy revival represents a reassertion of sovereignty and democracy at the expense of hyperglobalization. The mechanism is that democratic polities will not sustain economic policies that produce concentrated losses without compensation, and that national sovereignty requires the capacity to respond to external shocks. Rodrik's scope conditions include the existence of democratic institutions and the political salience of distributional concerns.

What the Western perspective contributes: A rich theoretical tradition that has generated testable hypotheses about the relationship between institutions, markets, and development. A demonstrated capacity for self-correction, as evidenced by the shift from Washington Consensus to industrial policy revival. And institutional capacity for policy design and evaluation that other perspectives lack, including independent central banks, regulatory agencies, and research institutions.

What the Western perspective occludes: It tends to universalize its own historical experience, treating the European and North American path as the template for all development. It can understate the coercive dimensions of its own market-making, from colonialism to structural adjustment. It tends to judge non-Western state intervention by standards that it does not apply to its own industrial policy, creating a double standard that undermines its normative claims. And it can present its own evolution—from liberalism to neoliberalism to industrial policy—as a learning process while treating non-Western alternatives as deviations or failures.

2.7.5 UN Perspective The UN perspective on state-market paradigms is framed through the lens of sustainable development, financing for development, and the Sustainable Development Goals (SDGs). It represents a multilateral, normative approach that seeks to reconcile market efficiency with social equity and environmental sustainability, and it draws on a longer tradition of UN-sponsored development thinking that stretches

back to the 1950s.

The theoretical lineage draws on the development economics tradition that emerged from the UN system itself: the Prebisch-Singer thesis on terms of trade, the UNCTAD conferences on trade and development, and the Brandt Commission reports of the 1980s. These frameworks argued that the global trading system was structurally biased against developing countries and that state intervention was necessary to correct these biases. The UN perspective thus has roots in both liberal internationalism and developmentalism, and it has historically served as a forum for articulating the grievances of developing countries against the liberal international order. The mechanism of the Prebisch-Singer thesis operates through the tendency of primary commodity prices to decline relative to manufactured goods over time, which means that developing countries specializing in primary exports face a structural disadvantage in international trade. This provides a theoretical justification for import-substituting industrialization and state intervention in trade.

The contemporary UN perspective is articulated through the 2030 Agenda for Sustainable Development and the Addis Ababa Action Agenda on financing for development. The mechanism is that industrial policy should support green transition, technology transfer, and inclusive growth rather than zero-sum competition. The UN framework emphasizes that the SDGs require massive investment in infrastructure, education, and health, and that this investment cannot be left to markets alone. The state has a role in directing investment toward public goods, while the market provides efficiency and innovation. The SDGs include 17 goals with 169 targets, covering poverty, hunger, health, education, gender equality, water, energy, economic growth, industry, inequality, cities, consumption, climate, oceans, ecosystems, peace, and partnerships. The mechanism of the SDG framework is to create a common set of goals that all countries can work toward, with the UN providing monitoring, technical assistance, and normative guidance.

The UN perspective contributes a normative commitment to multilateral cooperation and development finance. It provides a framework for evaluating state-market arrangements against criteria of sustainability, equity, and human rights rather than purely economic efficiency. The UN's role in setting standards, monitoring progress, and providing technical assistance gives it a unique position in the state-market debate. The mechanism of UN influence operates through norm-setting (the SDGs, the Paris Agreement), technical assistance (UNCTAD, UNIDO, UNDP), and convening power (conferences, summits, expert groups). The scope conditions for UN effectiveness include the willingness of member states to cooperate, the availability of funding, and the capacity of UN agencies to deliver technical assistance.

What the UN perspective occludes: The limited enforcement capacity of UN frameworks means that its normative commitments often lack teeth. The difficulty of reconciling national security industrial policy with global public goods creates tensions that the UN framework struggles to resolve: when the US and China both pursue semiconductor self-sufficiency, the UN's call for technology transfer and inclusive growth is difficult to operationalize. The UN's own institutional biases—toward Western donors, toward technocratic solutions, toward incremental reform rather than structural transformation—can limit its transformative potential. And the UN's dependence on member state contributions means that its agenda is shaped by the priorities of its largest funders, which may not align with the needs of the poorest countries. The UN perspective also struggles to address the power asymmetries that shape state-market relations: it can call for fair trade and debt relief, but it cannot compel powerful states to comply.

2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Shows state-market paradigms as externally imposed constraints on developmental sovereignty; centers resource nationalism, AfCFTA, and developmental regionalism	May underweight internal governance failures, elite capture, and variation in state capacity within Africa	Developmental sovereignty and structural transformation over market efficiency	AfCFTA (signed 2018, trading 2021); resource nationalism in DRC, Zambia, Nigeria; SAP resistance movements	Western: internal institutional quality, not external paradigms, is the binding constraint on development
Chinese	Demonstrates that state capitalism can deliver rapid industrialization and technological upgrading within global markets	Obscures costs of state direction: capital misallocation, debt accumulation, repression, and negative global spillovers	State-led development and technological sovereignty within managed globalization	SOE share of GDP ~25–30%; Made in China 2025; dual circulation strategy; semiconductor self-sufficiency push	Western: state capitalism distorts competition, creates security externalities, and undermines rules-based trade
Russian	Shows how sanctions can be absorbed through import substitution, parallel trade, and energy pivot, preserving state autonomy	Understates long-run technological stagnation, brain drain, and deepening dependence on China	Sovereign economic resilience and multipolarity against Western hegemony	Ruble stabilization post-2022; parallel imports; energy exports to Asia; de-dollarization rhetoric	Western: resilience is partial and temporary; technological capacity is eroding

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Western	Provides coherent framework for gains from trade, comparative advantage, and institutionalized liberal order	Treats market outcomes as natural; obscures power asymmetries, colonial legacies, and historical coercion	Liberal international order with managed openness and rules-based trade	Bretton Woods institutions; GATT/WTO; postwar growth; CHIPS/IRA as "friend-shoring"	African: liberal order was built on colonial extraction and unequal exchange
UN	Articulates universal development norms and multilateral frameworks (SDGs, Addis Ababa Action Agenda)	Lacks enforcement power; agenda shaped by largest donors; technocratic bias	Inclusive multilateral development and global public goods	SDG 8, 9, 17; UNCTAD reports; Financing for Development conferences	African: UN frameworks are donor-driven and incremental, not structurally transformative

2.8 WORKED EXAMPLE (I do)

Case: The 1971 Nixon Shock — Closing the Gold Window and the Transition from Bretton Woods to Floating Rates

On August 15, 1971, President Richard Nixon announced the suspension of the convertibility of the US dollar into gold at $35 per ounce, imposed a 10 percent surcharge on imports, and froze wages and prices for ninety days. Delivered on a Sunday evening from Camp David, the announcement ended the Bretton Woods system of fixed exchange rates that had governed international monetary relations since 1944. Within two years the major currencies were floating; by 1976 the Jamaica Accords formally ratified a regime of managed flexibility. The Nixon shock is the pivotal moment in which the postwar embedded-liberal compromise gave way to a more market-driven, financially liberalized order, and it remains the canonical case for understanding how state decisions restructure systemic monetary arrangements.

Levels of analysis. At the individual level, the decision was shaped by Nixon's political calculations amid falling approval ratings, Treasury Secretary John Connally's aggressive advocacy for unilateral action, and Federal Reserve Chairman Arthur Burns's reluctant acquiescence; the Camp David meeting deliberately excluded the State Department and the IMF, concentrating authority in a small circle of economic advisors. At the state level, the United States faced a structural balance-of-payments deficit driven by Vietnam War spending, Great Society programs, and an overvalued dollar; the US gold stock had fallen from roughly $22 billion in 1958 to under $11 billion by 1971, while foreign dollar claims exceeded $60 billion. At the systemic level, the Triffin dilemma — identified by Robert Triffin in 1960 — captured the contradiction: the global

economy needed dollar liquidity, which required US deficits, but those same deficits eroded confidence in the dollar's gold backing; the system required a hegemon to supply public goods, yet the hegemon's domestic priorities undermined its capacity to do so. At the transnational level, the Eurodollar market, which had grown from negligible size in the late 1950s to over $50 billion by 1971, allowed capital to move across borders outside national regulatory control, enabling speculative attacks on the dollar and constraining the policy space available to US authorities; multinational corporations and private banks had created a parallel financial infrastructure that made unilateral state action both necessary and, in some respects, already fait accompli.

Mechanism. The mechanism operates through a three-step causal chain. First, the structural contradiction identified by Triffin created a confidence problem: as US liabilities to foreigners grew, the ratio of gold to dollar claims deteriorated, making the fixed rate of $35 per ounce increasingly notional. Second, capital mobility — the Eurodollar market and the growing integration of financial markets — translated this structural vulnerability into an acute crisis by allowing private actors to move funds in anticipation of devaluation, forcing central banks to defend parities through reserve losses or interest-rate hikes that damaged domestic economies. Third, the state-level decision to suspend convertibility was the triggering event that resolved the immediate crisis by removing the gold constraint, but in doing so it transformed the systemic regime: without a nominal anchor, exchange rates floated, monetary policy became domestically oriented, and capital account liberalization accelerated. The December 1971 Smithsonian Agreement briefly attempted to patch the system with a devalued dollar ($38 per ounce) and wider bands, but speculative pressure resumed and by March 1973 the major currencies were floating; the 1976 Jamaica Accords then formally demonetized gold and legitimized floating. The mechanism is therefore not simply "Nixon decided" but rather a structural pressure (Triffin) transmitted through transnational capital mobility (Eurodollars) and resolved by a state decision (suspension) that reconstituted the systemic order. The post-1971 regime of floating rates and financial globalization was not designed but emerged from the interaction of these levels, a point emphasized by Helleiner (1994) and James (1996).

Perspective reconstruction. The African perspective, which is primary here, interprets the Nixon shock as the moment when the developmentalist compromise of the postwar order was abandoned and African economies were exposed to the volatility of unmanaged global finance. African scholars and policymakers had benefited from the relative predictability of fixed rates and from the UNCTAD-led push for commodity stabilization and special drawing rights; the collapse of Bretton Woods removed these anchors and inaugurated the era of petrodollar recycling, debt crises, and structural adjustment. From this vantage, the shock was not a technical monetary adjustment but a redistribution of risk: the costs of dollar instability were exported to commodity-dependent economies that had no voice in the decision, a dynamic that Samir Amin (1976) and Walter Rodney (1972) anticipated in their critiques of unequal exchange. The Chinese perspective, at the time still outside the Bretton Woods system, viewed the collapse with a mixture of vindication and caution: the dollar's loss of gold backing confirmed Maoist critiques of imperialist monetary hegemony, yet China's subsequent integration into the global economy after 1978 meant that the post-1971 floating regime became the environment in which China's export-led growth strategy was constructed; Chinese scholars later emphasized that dollar hegemony persisted despite the gold suspension, and that the post-1971 order, while more flexible, remained asymmetrically favorable to the reserve-currency issuer. The Russian (Soviet) perspective saw the Nixon shock as confirmation of the inherent instability of capitalism: the Soviet bloc's separate monetary system, anchored by the transferable ruble and Comecon trade, appeared insulated from dollar volatility, and Soviet economists argued that the collapse demonstrated the impossibility of reconciling national monetary sovereignty with international capitalist integration; yet the shock also complicated Soviet

trade with the West, as floating rates introduced uncertainty into hard-currency transactions and contributed to the eventual Soviet turn toward Western borrowing in the 1970s. The Western perspective, dominant in the historiography, frames the shock as a necessary adjustment to an unsustainable system: the Triffin dilemma made the gold-dollar standard unworkable, and Nixon's action, while unilateral and disruptive, cleared the way for a more efficient market-based monetary order; Western economists emphasize the gains from floating rates — automatic adjustment, monetary policy autonomy, and the avoidance of deflationary gold-standard discipline — while acknowledging the costs of increased volatility and the eventual need for coordination (Plaza Accord, Louvre Accord), as analyzed by Eichengreen (2011). The UN perspective, articulated through UNCTAD and the Group of 77, treated the shock as a crisis of global economic governance requiring multilateral reform; UNCTAD's 1972 Nairobi conference and subsequent calls for a New International Economic Order demanded commodity price stabilization, debt relief, and a reformed monetary system with greater developing-country voice, holding that the unilateral US decision violated the spirit of Bretton Woods and that the post-1971 order, by privileging market forces over managed development, worsened North-South inequality.

Adjudication. The systemic-level Western structuralist account — the Triffin dilemma transmitted through capital mobility — best explains the mechanism and timing of the Nixon shock: it identifies why the system became unsustainable and why the crisis broke when it did. However, this account underweights the distributional consequences that the African perspective foregrounds: the shock was not merely a technical adjustment but a reallocation of monetary risk toward the global South, and the subsequent debt crises of the 1980s cannot be understood without this lens. The Western account also tends to treat the post-1971 order as an improvement in efficiency, whereas the African and UN perspectives reveal it as a shift in power that disadvantaged commodity exporters and borrowers. The Chinese and Russian perspectives add the important insight that dollar hegemony survived the gold suspension, meaning the shock changed the form but not the substance of US monetary dominance — a point that Western narratives of "the end of Bretton Woods" sometimes obscure. What the Western account misses, the African account captures: the shock's costs were borne asymmetrically. What the African account misses, the Western account captures: the gold-dollar standard was genuinely unsustainable and required adjustment. The best synthesis is therefore: the Triffin mechanism explains the collapse, the African perspective explains who bore its costs, and the Chinese and Russian perspectives explain why US dominance persisted. No single perspective is sufficient; the case requires multi-level, multi-perspective analysis, and the student should treat the Nixon shock not as a closed historical episode but as the origin point of the financialized, dollar-centered order that contemporary industrial policy and de-dollarization debates are now contesting.

SECTION 2.9 PROBLEM PAIR (We do)

1. **Mechanism.** Trace how the 2022 US CHIPS and Science Act and the EU Chips Act alter firm incentives in semiconductor supply chains. Specify at least two policy instruments and one market failure they target.

2. **Levels of analysis.** Explain the same episode at the individual, state, systemic, and transnational levels without conflating them.

3. **Perspective reconstruction.** In 3–4 sentences each, reconstruct how African, Chinese, Russian, Western, and UN vantage points interpret these acts.

4. **Historical analogue.** Compare the acts to one of List's infant-industry argument, Hamilton's Report on Manufactures, or Polanyi's double movement. State one similarity and one difference.

5. **Falsifiers.** Identify two observable developments that would weaken the claim that this is a durable paradigm shift rather than a temporary subsidy.

6. **Adjudication.** Decide whether the acts are better described as mercantilist revival, embedded-liberal re-regulation, or state-capitalist competition, and justify with scope conditions.

Model answer. The CHIPS Act and EU Chips Act are best understood as a re-embedding of liberal semiconductor markets in national-security priorities, not as a return to either nineteenth-century mercantilism or 1990s neoliberalism. The mechanism runs through a recognized market failure: advanced logic and memory production is highly concentrated, capital-intensive, and geopolitically exposed, so private firms underinvest in redundancy and allied capacity. Washington and Brussels respond with subsidies, tax credits, research funding, and export controls that change expected returns for firms such as Intel, TSMC, Samsung, and ASML-linked suppliers. The state does not abolish trade; it prices security into location decisions and restricts technology transfer to rivals. At the individual level, executives optimize subsidy eligibility and compliance; at the state level, governments frame chips as critical infrastructure; at the systemic level, the policy is inseparable from US-China rivalry and alliance management; at the transnational level, the EU's parallel act and firm-level cross-border investment show emulation and interdependence rather than autarky. African observers can read the episode as vindication that industrial policy is a normal tool of development, yet they may also note that African states rarely possess comparable fiscal capacity or bargaining power, and that "friend-shoring" can redirect investment away from non-aligned suppliers. Chinese analysts tend to interpret the acts as technological containment that accelerates dual circulation and domestic substitution, while also revealing the limits of US unilateralism because allied firms remain embedded in Chinese markets. Russian perspectives emphasize sanctions resilience and the weaponization of supply chains, treating chips policy as part of a broader geoeconomic bloc formation that justifies import substitution and parallel trade. Western liberal accounts often describe the acts as a correction to hyper-globalization: markets remain open, but only within a security perimeter, echoing Polanyi's double movement in which the expansion of global markets provokes a protective countermovement. UN development perspectives stress technology access, SDG financing, and the risk that subsidy races divert resources from poorer countries; they may welcome capacity diversification but warn against a two-tier global economy. Historically, the acts resemble List's infant-industry logic and Hamilton's manufacturing promotion in their acceptance of temporary protection for strategic sectors, yet they differ because they target knowledge-intensive, networked production rather than simple tariff walls, and because they depend on alliance coordination rather than national self-sufficiency. They also echo Polanyi's embedded liberalism: the post-1945 compromise subordinated markets to social stability, whereas the new compromise subordinates them to security and resilience. The claim of a durable paradigm shift would be weakened if subsidy programs were repealed after one electoral cycle, if firms accepted funds but failed to reach production milestones, if export controls were relaxed without reciprocal concessions, or if WTO disputes forced a retreat to narrower national-security exceptions. Conversely, durable shift would be supported by multi-administration continuity, allied co-financing, and measurable capacity relocation. On adjudication, "mercantilist revival" captures the zero-sum rhetoric but overstates autarky; "state-capitalist competition" captures Chinese and US emulation but blurs the difference between party-state direction and regulated market incentives; "embedded-liberal re-regulation" best fits the

evidence because liberal trade remains the baseline while security, labor, and climate conditions are layered onto it. The scope condition is sectoral and geopolitical: this is not a general return of the state to all markets, but a targeted re-embedding in technologies deemed systemically critical.

SECTION 2.10 INDEPENDENT MEMO (You do)

(a) Case description. Indonesia's 2020 ban on exports of unprocessed nickel ore, combined with domestic processing requirements, tax incentives for smelters, and downstream investment rules, has repositioned the country from a raw-material exporter to a prospective hub in electric-vehicle battery supply chains. Jakarta defends the policy as industrialization and value capture; several trading partners have challenged aspects of it at the WTO; and Chinese, Korean, European, and US-linked firms have invested in ferronickel, precursor, and battery projects. The case sits at the intersection of resource nationalism, green-transition demand, and great-power competition over critical minerals, while raising questions about environmental costs, local community impacts, and whether downstream gains are durable or subsidy-dependent.

(b) Required memo headings as prompts.

- **Mechanism:** How do export restrictions and downstream mandates alter firm location, technology transfer, and state revenue? Identify the market failure or political objective being corrected.
- **Perspective reconstruction:** Reconstruct African, Chinese, Russian, Western, and UN readings of Indonesia's policy in 3–5 sentences each, noting what each reveals and occludes.
- **Historical analogue:** Compare the policy to one of List's infant-industry argument, Hamilton's manufacturing promotion, or Polanyi's double movement; state one similarity and one difference.
- **Falsifiers:** What evidence would show that the policy is (i) a durable developmental success, (ii) a temporary rent-seeking arrangement, or (iii) a trigger for supply-chain relocation?

(c) Self-check line. Self-check: Did you distinguish description, explanation, prediction, and prescription in your memo?

SECTION 2.11 HINGE QUESTION

Question: The 2022 US CHIPS and Science Act is best classified as:

A. A return to classical liberalism because subsidies reduce production costs.
B. A revival of pure mercantilism because it ends semiconductor trade.
C. An embedded-liberal re-regulation in which market openness is subordinated to security and resilience goals.
D. A continuation of Washington Consensus neoliberalism because it relies on private firms.

Correct answer: C.

Distractor diagnoses.
- **A** mistakes a subsidy for laissez-faire; classical liberalism opposes discretionary state allocation of capital and selective industrial targeting.
- **B** overstates autarky; the act preserves trade and allied supply chains rather than abolishing them.
- **D** misidentifies the era; neoliberal conditionality is replaced by strategic conditionality, security screening, and sector-specific state direction.

SECTION 2A — DATA LAB

Table 1 — Trade Openness (Exports + Imports as % of GDP), Selected Benchmarks, 1870–2023

Period	World average (approx.)	United States	United Kingdom	China	Interpretive label
1870	~12%	~12%	~45%	~5%	First globalization (steam, gold standard)
1913	~21%	~11%	~50%	~8%	Peak of classical liberal order
1938	~15%	~9%	~35%	~7%	Interwar collapse, protectionist turn
1970	~25%	~10%	~40%	~5%	Embedded-liberal Bretton Woods era
1990	~38%	~20%	~50%	~25%	Post-Cold War liberalization
2008	~61%	~28%	~60%	~65%	Peak "hyper-globalization"
2023	~58%	~25%	~65%	~38%	Plateau; "slowbalization"/fragmentation

Sources: World Bank World Development Indicators; Maddison Project Database (Bolt & van Zanden 2020); WTO World Trade Statistical Review. Figures are rounded benchmarks for pedagogical use; country definitions and measurement conventions vary across series.

Table 2 — Average Applied Tariff Rates (Simple Mean, %), Selected Economies

Economy	1990	2000	2010	2023	Notes
United States	~4.5	~3.5	~3.4	~3.4 (MFN); higher effective rates under Section 301 tariffs on China	GATT/WTO rounds; post-2018 bilateral tariffs

Economy	1990	2000	2010	2023	Notes
European Union	~6.0	~4.5	~4.0	~5.1	Common external tariff; agricultural peaks remain
China	~40	~15	~9.5	~7.5	Accession to WTO (2001) drove reduction
India	~80	~30	~12	~12	Post-1991 liberalization; recent selective hikes
Sub-Saharan Africa (unweighted avg.)	~25	~18	~12	~10	AfCFTA (2021) aims at intra-regional reduction

Sources: World Bank WDI (tariff rate, applied, simple mean, all products); WTO Tariff Profiles. "Applied" rates understate bound rates and non-tariff barriers.

Table 3 — State Role in the Economy: SOE Share and Industrial Policy Spending

Indicator	China	European Union	United States
SOE share of GDP (approx.)	25–30%	5–8%	<2% (utilities, postal, Amtrak)
SOE share of listed market cap (approx.)	~40–45%	~8–12%	~1–2%
Flagship industrial policy package	Made in China 2025; semiconductor subsidies; "dual circulation"	EU Chips Act (€43bn); Green Deal Industrial Plan	CHIPS and Science Act ($52.7bn); Inflation Reduction Act (~$369bn over 10 yrs)
Industrial policy spending as % of GDP (recent, approx.)	~1.5–2.0%	~0.5–1.0%	~0.5–1.0% (front-loaded)
Dominant paradigm label	State capitalism / "socialist market economy"	Embedded liberalism revived (green + security)	Liberal order + industrial policy revival

Sources: OECD (2021) "The Size and Sectoral Distribution of State-Owned Enterprises"; IMF (2020) "State-Owned Enterprises: The Other Government"; US Congressional Budget Office scoring of CHIPS Act and IRA; European Commission (2023) EU Chips Act. SOE shares are contested and vary by definition (assets vs. value-added vs. employment).

Five Numbered Analysis Questions

1. Trend. Describe the long-run trajectory of trade openness from 1870 to 2023 using Table 1. Identify the two peaks (1913, 2008) and the two collapses (1930s, 2008–2023 plateau). What does the post-2008 plateau—rather than a sharp collapse—suggest about the state-market paradigm? Is the world experiencing a "deglobalization" or a "reconfiguration" of trade, and what evidence in the table supports your reading?

2. Level of analysis. At which of the four levels (individual, state, systemic, transnational) does a tariff schedule such as the EU's common external tariff primarily operate? Which level is most neglected in standard trade theory, and why does that neglect matter for understanding why tariffs persist even when aggregate welfare models predict free trade? Connect your answer to List's infant-industry argument and to contemporary "friend-shoring."

3. Perspective reconstruction (all five). Read Tables 1–3 through each of the five lenses. For each perspective, state (a) what the data most strongly supports, and (b) what the data most dangerously obscures: - *African* (developmental regionalism, AfCFTA, resource nationalism) - *Chinese* (state capitalism, dual circulation) - *Russian* (sanctions-resilience economy) - *Western* (liberal order plus industrial policy revival) - *UN* (development finance, SDGs)

4. Interpretation. Does the data support a "return of the state" thesis? Construct the strongest affirmative case using Table 3 (SOE share, industrial policy spending) and the strongest negative case using Table 1 (still-high trade openness) and Table 2 (still-low average tariffs). What single additional data series would most decisively adjudicate between these two readings, and why?

5. Limitation. These aggregates conceal as much as they reveal. Identify three specific blind spots: (a) the treatment of services and digital trade in goods-based openness ratios; (b) the gap between applied and bound tariffs and the role of non-tariff barriers (subsidies, standards, export controls); and (c) the quality and governance of SOEs rather than their quantity. For each blind spot, explain how a different measurement choice would change the policy conclusion drawn from the tables.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — "The Paradigm Pendulum": State-Market Regimes, 1800–2025

What to draw. A horizontal timeline from 1800 to 2025 across the bottom of the page. Above it, a vertical axis labeled "Degree of state direction of the market" running from LOW at the bottom to HIGH at the top. Plot a single continuous curve (the "pendulum") that rises and falls across five regimes, each shaded in a different color band:

1. **Mercantilism / Economic Nationalism (pre-1846)** — HIGH; label with "List 1841; Hamilton's Report on Manufactures 1791; Corn Laws."
2. **Classical Liberalism (1846–1914)** — LOW; label with "Corn Laws repealed 1846; Cobden-Chevalier 1860; gold standard."
3. **Embedded Liberalism (1944–1971/73)** — MEDIUM-HIGH; label with "Bretton Woods 1944; GATT; capital controls; welfare state."

4. **Neoliberalism / Washington Consensus (1980–2008)** — LOW and falling; label with "Reagan/Thatcher; SAPs; WTO 1995; China WTO 2001."
5. **State Capitalism / Industrial Policy Revival (2008–present)** — RISING; label with "GFC 2008; COVID; CHIPS Act 2022; IRA 2022; friend-shoring."

Mark three "shocks" as vertical dashed lines: 1914 (WWI), 1971 (Nixon shock), 2008 (GFC). At each shock, draw a small arrow showing the curve's reversal.

Perspective overlay (annotate in the margins). On the left margin, write "African: developmental regionalism re-embeds markets regionally (AfCFTA)"; on the right margin, "Chinese: dual circulation = internal market + controlled external"; at the bottom, "Western: liberal order + industrial policy revival"; top, "UN: SDGs re-embed markets in development"; and a small Russian flag note "sanctions-resilience = autarkic turn."

Why this visual works. It compresses the entire lesson into one image: the paradigm is not a linear march toward free trade but an oscillation driven by crises, with each swing producing a new compromise between state and market.

Visual 2 — "Five Lenses on One Object": Perspective Star

What to draw. A central circle labeled "STATE-MARKET PARADIGM (e.g., CHIPS Act 2022)". From the circle, draw five thick rays to five outer boxes, one per perspective, arranged like a star or pentagon. Each outer box contains:

- **African (PRIMARY, largest box):** "Developmental regionalism; AfCFTA; resource nationalism; asks: who owns the minerals? who captures value?"
- **Chinese:** "State capitalism; dual circulation; SOEs as instruments; asks: does this build sovereign capability?"
- **Russian:** "Sanctions-resilience; import substitution; asks: does this reduce external vulnerability?"
- **Western:** "Liberal order + industrial policy revival; asks: does this preserve rules-based trade?"
- **UN:** "Development finance; SDGs; asks: does this advance inclusive development?"

Draw a dashed inner ring labeled "Shared blind spot: all five under-theorize transnational supply-chain labor." Annotate each ray with a one-word "contribution" (African: *agency*; Chinese: *capability*; Russian: *resilience*; Western: *rules*; UN: *inclusion*) and a one-word "occlusion" (African: *scale*; Chinese: *accountability*; Russian: *efficiency*; Western: *power*; UN: *enforcement*).

Why this visual works. It forces the student to see that no single perspective owns the object; each illuminates one face and darkens another.

Visual 3 — "Four Levels, One Policy": Levels of Analysis Matrix for the CHIPS Act

What to draw. A 2×2 grid (or four stacked horizontal bands) with rows labeled:

- **Individual level:** "Firm lobbying (Intel, TSMC, Samsung); CEO testimony; patent holders; worker skill premiums."
- **State level:** "Congressional coalitions; Commerce Department subsidies; export controls; national security framing."

- **Systemic level:** "WTO subsidy rules; US-China tech competition; alliance coordination (Quad, EU-US TTC)."
- **Transnational level:** "TSMC Arizona fab; ASML lithography (Netherlands); Korean memory; global semiconductor supply chain."

Draw arrows showing feedback: individual → state (lobbying), state → systemic (rule-breaking), systemic → transnational (friend-shoring), transnational → individual (wage effects). In the center, place a small circle "CHIPS Act $52.7bn" with radiating lines to all four bands.

Perspective overlay. Color-code each band by which perspective privileges it: African (transnational, value chains), Chinese (state), Russian (state/systemic), Western (systemic/individual), UN (individual/transnational). Add a legend.

Why this visual works. It operationalizes Lesson 1's four levels of analysis and shows that a single industrial policy is simultaneously four different objects depending on the level at which one looks.

SECTION 4 — CORNELL NOTES

Cue Column (Prompts)

#	Cue (Question / Keyword)
1	Define mercantilism vs. economic nationalism; what is the infant-industry argument?
2	Smith's invisible hand: mechanism and scope conditions?
3	Ricardo's comparative advantage: core assumption that fails in reality?
4	Polanyi's "double movement": the two movements and their collision?
5	Embedded liberalism: what post-1945 compromise?
6	Washington Consensus (Williamson 1990): list the 10 points in 3 words each?
7	SAPs: mechanism by which they harmed developing economies?
8	State capitalism (China): how does it differ from Soviet central planning?
9	Friend-shoring: what problem does it solve, what does it cost?
10	CHIPS Act: mechanism linking subsidy to national security?
11	"Return of the state": strongest evidence and strongest counter?
12	African perspective: what does developmental regionalism add that Western theory misses?

Notes Column (with Source Log)

1. Mercantilism / economic nationalism. Mercantilism treats wealth as zero-sum and the state as the instrument of national power; trade is a means to bullion accumulation and military capacity. Economic nationalism (List 1841, *The National System of Political Economy*) updates this: nations at different stages of development require different policies; the infant-industry argument holds that temporary protection allows domestic manufacturing to reach scale economies before facing British competition. Hamilton's *Report on Manufactures* (1791) is the US precedent. *Mechanism:* protection → learning-by-doing → productivity convergence → eventual competitiveness. *Scope condition:* protection must be time-limited and performance-conditioned; otherwise it produces rent-seeking (Krueger 1974, "rent-seeking society").

2. Classical liberalism. Smith (1776, *Wealth of Nations*): division of labor and the "invisible hand" coordinate self-interest into social benefit under competition and rule of law. Ricardo (1817, *Principles*): comparative advantage—countries gain by specializing in goods where their opportunity cost is lowest, even if absolutely less efficient. *Mechanism:* price signals → specialization → gains from trade. *Scope conditions:* no externalities, no increasing returns, no strategic industries, no power asymmetries. These conditions are systematically violated in development, which is List's point.

3. Polanyi's double movement. Polanyi (1944, *The Great Transformation*): the "double movement" is (a) the push to disembed the economy from society (marketization, commodification of land, labor, money) and (b) the counter-movement to re-embed it (social protection, regulation, planning). The two movements are not sequential but simultaneous and contradictory. *Mechanism:* market expansion → social dislocation → political backlash → re-embedding → new market expansion. Polanyi's scope condition: the "self-regulating market" is a utopian construct; land, labor, and money are "fictitious commodities."

4. Embedded liberalism. Ruggie (1982, "International Regimes, Transactions, and Change"): the post-1945 Bretton Woods order was "embedded liberalism"—multilateralism and free trade at the international level, but with domestic policy space for welfare states, capital controls, and Keynesian demand management. *Mechanism:* international openness + domestic compensation = political sustainability of trade. The compromise collapsed in the 1970s (stagflation, Nixon shock 1971) and was replaced by neoliberalism.

5. Washington Consensus. Williamson (1990): ten policy prescriptions (fiscal discipline, tax reform, interest-rate liberalization, competitive exchange rates, trade liberalization, FDI liberalization, privatization, deregulation, property rights, redirection of public spending). *Mechanism:* price liberalization → efficient allocation → growth. *Critique:* Rodrik (2011, *The Globalization Paradox*): the "trilemma"—deep economic integration, national sovereignty, and democratic politics cannot all be maximized simultaneously; choose two. SAPs (structural adjustment programs) applied these prescriptions via IMF/World Bank conditionality in the 1980s–90s; evidence on growth is mixed, on inequality and poverty negative in many cases (Stiglitz 2002, *Globalization and Its Discontents*).

6. State capitalism / China. China's model: SOEs in strategic sectors, state-directed credit, industrial policy (Made in China 2025), "dual circulation" (internal market + controlled external). Differs from Soviet planning: market prices, profit motives, integration into global trade, party-state steering rather than central planning. *Mechanism:* state capacity + market discipline → targeted capability building. *Critique:* efficiency losses, debt, overcapacity, opacity.

7. Contemporary contest. Friend-shoring (Yellen 2022): relocate supply chains to "trusted" partners. CHIPS Act 2022 ($52.7bn subsidies + export controls); IRA ($369bn green industrial policy). EU Chips Act (€43bn). "Return of the state" (Rodrik 2019; Tooze 2018, *Crashed*): post-2008, state capacity returned

as crisis manager and industrial planner. *Mechanism:* security externalities + supply-chain fragility → state intervention → re-embedding markets in national strategy.

8. African perspective. Developmental regionalism: regional integration (AfCFTA, 2021) as a vehicle for industrialization and value-chain upgrading, not just market access. Resource nationalism: state capture of mineral rents (cobalt, lithium, copper) for domestic processing. *Mechanism:* regional scale → infant-industry protection at continental level → reduced dependence on raw-material exports. *Occlusion:* intra-African trade barriers, infrastructure gaps, elite capture.

9. Russian perspective. Sanctions-resilience economy: import substitution, parallel imports, pivot to Asia, de-dollarization. *Mechanism:* external shock → autarkic adjustment → reduced but not eliminated vulnerability. *Occlusion:* technological dependence, efficiency losses, long-run stagnation risk.

10. Western perspective. Liberal order (rules-based trade, WTO) plus industrial policy revival. Tension: the US now subsidizes and protects while preaching rules. *Mechanism:* hegemonic provision of public goods → under strain → selective protection. *Occlusion:* power asymmetries in rule-making.

11. UN perspective. Development finance, SDGs, "leaving no one behind." Re-embedding markets in development goals. *Mechanism:* normative frameworks → financing → capacity building. *Occlusion:* enforcement weakness, donor conditionality.

12. Adjudication. The paradigms are not mutually exclusive stages but recurring responses to crises; the "return of the state" is real in spending terms but operates within, not against, globalized markets (Rodrik's trilemma).

Source Log: Polanyi (1944); Smith (1776); Ricardo (1817); List (1841); Hamilton (1791); Williamson (1990); Rodrik (2011, 2019); Tooze (2018); Ruggie (1982); Stiglitz (2002); Krueger (1974); Yellen (2022); WTO (2023); World Bank WDI; OECD (2021); IMF (2020).

Summary (3–5 sentences). State-market paradigms oscillate rather than progress: mercantilism, liberalism, embedded liberalism, neoliberalism, and the contemporary industrial-policy revival each re-solve the tension between market efficiency and social/political stability. Polanyi's double movement explains why: market expansion provokes re-embedding. The Washington Consensus applied liberal prescriptions via conditionality with mixed results, while China's state capitalism and the West's post-2008 industrial policy revival show the state returning as planner and crisis manager. The African vantage—developmental regionalism and resource nationalism—reveals that the real question is not state vs. market but who captures value and at what scale. Rodrik's trilemma remains the binding constraint: deep integration, sovereignty, and democracy cannot all be maximized.

SECTION 5 — FEYNMAN COMPRESSION

Step 1 — Explain without jargon. Countries have always disagreed about how much the government should steer the economy. Sometimes governments protect home industries and steer investment (mercantilism, industrial policy). Sometimes they let markets and prices decide (free trade). After World War II, rich countries tried a middle path: open trade abroad, but strong welfare states and controls at home—Polanyi called the back-and-forth a "double movement," because every push to free markets provokes a push to protect people. In the 1980s and 90s, the free-market side won globally through IMF and World Bank conditions. Since 2008, and especially since COVID and the Ukraine war, governments are back in the business

of subsidizing chips, green energy, and "trusted" supply chains. The African view says the real issue is not state versus market but who owns the resources and who captures the value; regional blocs like AfCFTA try to build industry at continental scale. The Chinese view says state direction can build capability; the Western view worries about rules; the UN worries about development; Russia worries about sanctions. Nobody has solved the basic trade-off: you cannot have deep global integration, full national sovereignty, and democratic politics all at once.

Step 2 — Mark gaps. (a) I asserted that SAPs had "mixed to negative" effects but did not specify which countries or metrics; (b) I treated "return of the state" as established without defining the threshold (spending? regulation? ownership?); (c) I did not explain why comparative advantage fails in practice beyond listing assumptions; (d) I conflated mercantilism and economic nationalism, which List distinguished; (e) I did not specify the mechanism by which AfCFTA would overcome the infant-industry problem at continental scale.

Step 3 — Reread verification. Re-check: Polanyi (1944) on fictitious commodities and the double movement; Ricardo (1817) on opportunity cost; List (1841) on stages of development; Williamson (1990) ten points; Rodrik (2011) trilemma; Tooze (2018) on crisis and state capacity. Verify that "embedded liberalism" is Ruggie's (1982) term, not Polanyi's. Verify CHIPS Act figure ($52.7bn) and IRA figure (~$369bn) against CBO scoring. Verify AfCFTA entry into force (2021) and its tariff-reduction commitments.

Step 4 — Analogy with explicit limits. *Analogy:* The state-market paradigm is like a thermostat in a house with two occupants who disagree about temperature—one wants it cold (market efficiency), one wants it warm (social protection). The thermostat swings back and forth; each swing is a "paradigm." *Limits:* The analogy implies a single optimal temperature and a neutral device; in reality there is no neutral "market" baseline (Polanyi), the occupants have unequal power (class, North/South), and the house itself (global institutions) changes shape with each swing. The analogy also hides the African point: the question is not the temperature but who owns the house.

Step 5 — Rewrite. State-market paradigms are recurring, crisis-driven compromises between efficiency and protection, not stages in a linear progression. Polanyi's double movement predicts the oscillation: marketization generates counter-movements that re-embed the economy in society and politics. The post-1945 embedded-liberal compromise (Ruggie) gave way to the Washington Consensus (Williamson 1990), whose conditionality produced contested development outcomes; since 2008, industrial policy and state capitalism have returned, but within—not against—globalized markets. The African lens (developmental regionalism, AfCFTA, resource nationalism) reframes the debate around value capture and scale; the Chinese, Russian, Western, and UN lenses each illuminate one face. Rodrik's trilemma remains the binding constraint: deep integration, sovereignty, and democracy are mutually incompatible in full.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L15	Definition	What is mercantilism in IPE?	Mercantilism treats trade as a zero-sum competition for national power, privileging bullion accumulation, export surpluses, colonies, and state-directed industry. It is not merely "protectionism"; it is a theory of statecraft in which economic capacity serves security.	African resource-nationalist arguments often echo mercantilist premises when they insist that raw-material exports should be converted into domestic industrial capacity.
L15	Definition	What is classical liberalism's core trade claim?	Classical liberalism argues that voluntary exchange under division of labor raises aggregate wealth; Ricardo's comparative advantage shows gains from trade even when one country is less efficient in all goods.	Western liberal order narratives often universalize this claim, while African and post-colonial critics ask who captures the gains and who bears adjustment costs.

Tag	Card Type	Front	Back	Perspective Note
L15	Mechanism	How does the infant-industry argument work?	A temporary tariff or subsidy protects a nascent sector until learning-by-doing, scale economies, and supplier networks make it internationally competitive; the policy is justified only if protection is time-limited and performance-tested.	List's version was developmental, not permanent rent-seeking; African industrial policy debates turn on whether states can credibly withdraw protection.
L15	Definition	What is Polanyi's "double movement"?	Market expansion provokes a protective counter-movement by society; embedded liberalism is the post-1945 attempt to reconcile international openness with domestic social protection.	Polanyi's framework helps explain why African states resist pure liberalization when it threatens land, labor, and food security.
L15	Definition	What was the Washington Consensus?	Williamson's 1990 agenda summarized market-oriented reforms—fiscal discipline, trade liberalization, privatization, deregulation, and secure property rights—often implemented through IMF/World Bank conditionality.	In Africa, SAPs are remembered as externally imposed adjustment that compressed public investment and social spending.

Tag	Card Type	Front	Back	Perspective Note
L15	Mechanism	How does conditionality transmit policy preferences?	Loans and debt relief are made contingent on policy benchmarks; governments trade sovereignty over fiscal, monetary, and regulatory choices for financing and market access.	Conditionality can stabilize macroeconomies but may also narrow democratic deliberation over development strategy.
L15	Application	What did the 1971 Nixon shock change?	Closing the gold window ended dollar-gold convertibility, accelerated the shift from fixed to floating exchange rates, and weakened the Bretton Woods compromise between openness and capital controls.	For developing economies, the shock increased exchange-rate volatility and debt-servicing uncertainty.
L15	Comparison	Mercantilism vs. liberalism: what is the key disagreement?	Mercantilism prioritizes relative gains, state power, and strategic sectors; liberalism prioritizes absolute gains, consumer welfare, and comparative advantage.	African policymakers often seek a hybrid: market access plus industrial policy and resource sovereignty.

Tag	Card Type	Front	Back	Perspective Note
L15	Source	What is Polanyi's central warning in *The Great Transformation*?	Unregulated markets can disembed economy from society, producing social dislocation; therefore market construction requires political and institutional embedding.	This is foundational for critiques of SAPs and for arguments that development is a political project, not just price adjustment.
L15	Debate	Is the Washington Consensus discredited?	Critics cite inequality, deindustrialization, and financial crises; defenders cite growth in some reformers and the absence of a superior universal formula.	Rodrik's argument that "one economics, many recipes" reframes the debate around context-specific institutions.
L15	Reconstruction	How does the African perspective reframe state-market paradigms?	It centers developmental regionalism, AfCFTA, resource nationalism, and the need to convert commodity dependence into productive capacity.	This perspective treats markets as instruments of sovereignty rather than ends in themselves.
L15	Occlusion	What does the Chinese perspective often occlude in Western debates?	State capitalism and dual circulation are sometimes read only as distortions, obscuring their role in technology upgrading, employment, and strategic autonomy.	Western industrial-policy revival now borrows tools China long used, while still framing them as exceptions.

Tag	Card Type	Front	Back	Perspective Note
L15	Adjudication	When is industrial policy defensible?	It is more defensible when tied to measurable capability-building, sunset clauses, competitive discipline, and security externalities; less defensible when it becomes permanent rent protection.	CHIPS/IRA-style policies must be judged by whether they create spillovers or merely subsidize firms.
L15	Visual	What does the trade-as-%-of-GDP series suggest?	Long-run globalization rose sharply after 1945 and especially after 1980, but recent shocks, tariffs, and friend-shoring indicate partial fragmentation rather than full deglobalization.	African economies remain vulnerable to commodity-price and shipping shocks despite aggregate trade growth.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence Audit (0–100)

Skill	Self-rating (0–100)	Evidence from last attempt	Next action
Defining mercantilism, liberalism, embedded liberalism, neoliberalism			Rehearse one-sentence definitions aloud without notes
Tracing causal mechanisms (infant industry, conditionality, double movement)			Draw each mechanism as a causal chain with scope conditions

Skill	Self-rating (0–100)	Evidence from last attempt	Next action
Reconstructing all five perspectives fairly			Write 3–5 sentence steel-man for the perspective you find least intuitive
Applying the framework to the 1971 Nixon shock			Reconstruct levels of analysis and adjudicate competing explanations
Interpreting trade/GDP and industrial-policy data			Label each data point with level of analysis and perspective
Distinguishing description, explanation, prediction, prescription			Annotate your memo with D/E/P/P tags

7.2 Three-Question Debrief

1. Which perspective did you reconstruct most weakly, and what evidence would force you to revise it?
2. Did you confuse a normative preference (e.g., free trade is good) with an empirical claim (e.g., tariff removal raised exports)?
3. Which mechanism in this lesson would you struggle to explain to a skeptical policymaker in two minutes?

7.3 Error-Log

Common Misconception	Correction	Evidence
"Mercantilism is just old-fashioned protectionism."	Mercantilism is a statecraft doctrine linking wealth to power, colonies, and strategic capacity; protection is one instrument among several.	List (1841); Hamilton's Report on Manufactures (1791)
"Comparative advantage proves free trade always benefits everyone."	It proves aggregate gains under assumptions (full employment, no externalities, no strategic dependence); it does not guarantee distribution or security.	Ricardo (1817); Rodrik (2011)

Common Misconception	Correction	Evidence
"Embedded liberalism means markets were heavily planned."	It means markets were politically constructed and socially buffered, not abolished; capital controls and welfare states coexisted with trade openness.	Polanyi (1944); Ruggie (1982)
"The Washington Consensus was uniformly imposed and uniformly failed."	It was a policy agenda with variable implementation; outcomes differed by initial institutions, sequencing, and external shocks.	Williamson (1990); Rodrik (2011)
"Contemporary industrial policy is a return to 1970s state planning."	Modern industrial policy is more targeted, subsidy-based, and security-framed; it often operates inside liberal trade rules rather than replacing them.	CHIPS and Science Act (2022); EU Chips Act (2023)
"State capitalism is only a market distortion."	It can be a development and strategic-autonomy strategy with real capability-building effects, though it also creates opacity and rent risks.	Chinese dual-circulation debates; Rodrik (2011)

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Mercantilism; economic nationalism; infant industry; classical liberalism; comparative advantage; embedded liberalism; double movement; Washington Consensus; neoliberalism; conditionality; state capitalism; friend-shoring; industrial policy	State-directed accumulation; learning-by-doing under protection; market disembedding and social countermovement; policy conditionality; deregulation/privatization; strategic subsidies; supply-chain relocation	List (1841); Hamilton (1791); Smith (1776); Ricardo (1817); Polanyi (1944); Williamson (1990); Rodrik (2011); Tooze (2018)	1971 Nixon shock; Bretton Woods to floating rates; SAPs in Africa; CHIPS and Science Act (2022); EU Chips Act (2023); AfCFTA; Chinese SOE share; trade as % of GDP 1870–2023	Universal free trade vs. strategic protection; market efficiency vs. social embedding; conditionality vs. sovereignty; state capitalism vs. liberal order; deglobalization vs. reconfiguration	Sustained industrial upgrading without protection; no social backlash after liberalization; conditionality producing durable inclusive growth; industrial policy failing to build capabilities; trade fragmentation reversing all gains	L6 institutionalism; L8 Marxism; L12 Cold War; L13 liberal order; L16 Bretton Woods; L17 world-systems; L18 interdependence; L19 energy

SECTION 9 — REVIEW SCHEDULE

- **R1 — 24 hours after first study:** Re-read flashcards 1–7 and recite the five key ideas in order without notes.
- **R2 — 3 days:** Redraw the trade-as-%-of-GDP trend from memory and annotate one African, Chinese, Russian, Western, and UN interpretation.
- **R3 — 1 week:** Reconstruct the 1971 Nixon shock at all four levels of analysis and write a 200-word adjudication.
- **R4 — 2 weeks:** Complete a fresh problem pair on CHIPS/IRA-style industrial policy using the memo headings and compare with your earlier answer.
- **R5 — 1 month:** Teach the lesson's central puzzle to a peer or record a 5-minute explanation, then update the error-log with any remaining gaps.

SECTION 10 — COMPLETION CHECKLIST

☐ I can define mercantilism, classical liberalism, embedded liberalism, neoliberalism, and state capitalism.

☐ I can explain List's infant-industry mechanism and its scope conditions.

☐ I can explain Ricardo's comparative advantage and its main assumptions.
☐ I can explain Polanyi's double movement and why it matters for IPE.
☐ I can explain Williamson's Washington Consensus and its African reception.
☐ I can explain how conditionality works as a mechanism.
☐ I can reconstruct the 1971 Nixon shock at individual, state, systemic, and transnational levels.
☐ I can reconstruct African, Chinese, Russian, Western, and UN perspectives fairly.
☐ I can identify what each perspective contributes and occludes.
☐ I can interpret trade-as-%-of-GDP and industrial-policy data with appropriate caution.
☐ I can distinguish description, explanation, prediction, and prescription.
☐ I can state falsifiers for at least three claims in this lesson.
☐ I can connect this lesson to L6, L8, L12, and L13.
☐ I can connect this lesson forward to L16–L19.
☐ I have completed the confidence audit honestly.
☐ I have updated my error-log with at least one correction.
☐ I can explain the lesson's central puzzle in under two minutes.

FURTHER READING (Optional)

- **Mercantilism and economic nationalism:** List, F. (1841) *The National System of Political Economy*; Hamilton, A. (1791) *Report on Manufactures*; Chang, H.-J. (2002) *Kicking Away the Ladder*.
- **Classical liberalism:** Smith, A. (1776) *The Wealth of Nations*; Ricardo, D. (1817) *On the Principles of Political Economy and Taxation*.
- **Embedded liberalism:** Polanyi, K. (1944) *The Great Transformation*; Ruggie, J. G. (1982) "International Regimes, Transactions, and Change"; Helleiner, E. (1994) *States and the Reemergence of Global Finance*.
- **Washington Consensus and neoliberalism:** Williamson, J. (1990) "What Washington Means by Policy Reform"; Rodrik, D. (2011) *The Globalization Paradox*; Stiglitz, J. E. (2002) *Globalization and Its Discontents*.
- **Contemporary contest and state capitalism:** Tooze, A. (2018) *Crashed*; Naughton, B. (2017) "The Chinese Economy"; Ostry, J. D., Loungani, P., and Furceri, D. (2016) "Neoliberalism: Oversold?"
- **African perspectives:** Mkandawire, T. (2001) "Thinking about Developmental States in Africa"; Adesina, J. O. (2011) "Beyond the Social Protection Paradigm"; UNCTAD (2023) *Economic Development in Africa Report*.

17. Hegemonic Stability and the Bretton Woods System

LESSON METADATA

Field	Value
Lesson number and title	Lesson 16 — Hegemonic Stability and the Bretton Woods System
Module	Module 3: International Political Economy and Geoeconomics
Prerequisites	L6 (institutionalism); L15 (state-market paradigms)
Interleaved links	Forward to L18 (weaponized interdependence); L38 (sanctions); L49 (revisionism)
Reading load	7-9 hours
Content channels	Text core; Data lab; Visual anchor; Cornell notes; Flashcards; Worked example; Problem pair; Memo; Hinge question
Bloom ceiling	Create
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

The central puzzle of this lesson is whether international economic order is something that can be built and sustained by institutions alone, or whether it ultimately depends on the material power and political will of a single dominant state. The Bretton Woods system — the monetary and financial architecture negotiated in 1944 at Bretton Woods, New Hampshire, and anchored by the International Monetary Fund (IMF), the International Bank for Reconstruction and Development (IBRD, now the World Bank Group), fixed but adjustable exchange rates, capital controls, and a dollar-gold standard — is the canonical case through which this puzzle has been debated. For nearly three decades after the Second World War, the system delivered unprecedented growth, trade expansion, and macroeconomic stability across the industrialized North. Yet it collapsed in 1971 when the United States suspended dollar convertibility into gold, and the subsequent half-century has been marked by recurrent financial crises, deepening inequality between North and South, and persistent contestation over who governs global money. Understanding why the system was built, how it functioned, why it broke, and what replaced it is therefore not merely historical reconstruction; it is the foundation for analyzing every contemporary debate about global economic governance, from IMF conditionality in Africa to the BRICS demand for quota reform.

The theoretical stakes are set by Charles Kindleberger's *The World in Depression, 1929–1939* (1973), which argued that the Great Depression was so severe and so prolonged because no single power was willing and able to act as a "lender of last resort" to the international economy — providing liquidity, maintaining open markets, and stabilizing exchange rates. Kindleberger's hegemonic stability theory posits that a liberal international economic order requires a hegemon: a state with sufficient economic size, military capacity, and ideological commitment to supply the public goods that markets cannot provide on their own. The United States, in this reading, deliberately constructed Bretton Woods to avoid a repeat of the 1930s, embedding its own currency at the center of the system and extracting seigniorage and structural privilege in return. The theory is elegant and parsimonious, but it is also deeply contested: Robert Keohane's *After Hegemony* (1984) argued that institutions can sustain cooperation even after the hegemon declines, while Robert Gilpin's *The Political Economy of International Relations* (1987) insisted that hegemonic power and the distribution of

gains remain foundational. The lesson forces you to adjudicate between these positions using evidence rather than assertion.

The African perspective is not an add-on to this debate; it is the lens that reveals what the hegemonic-stability framework systematically occludes. From the vantage point of the global South, and Africa in particular, Bretton Woods was never primarily a stability mechanism. It was a structure of power that locked newly independent states into commodity dependence, subjected them to conditionality designed in Washington, and reproduced colonial hierarchies through the language of development. Walter Rodney's *How Europe Underdeveloped Africa* (1972), Kwame Nkrumah's *Neo-Colonialism: The Last Stage of Imperialism* (1965), and the subsequent structural-adjustment critique — articulated by scholars such as Thandika Mkandawire and by movements from the Lagos Plan of Action (1980) to the Ezulwini Consensus (2005) — frame the system as a mechanism of extraction dressed in technocratic neutrality. The 1997–98 Asian financial crisis and the IMF's response, the 1980s structural adjustment programs (SAPs) imposed across Africa, and the 2020–2022 allocation of $650 billion in Special Drawing Rights (SDRs) — of which Africa received roughly 5 percent despite bearing disproportionate pandemic costs — are not aberrations. They are the system working as designed. This lesson therefore places the African critique at the center of the analysis and asks what it reveals that Western institutionalism, Chinese reformism, Russian anti-dollarism, and UN developmentalism each miss.

The lesson also traces the system's evolution and contestation across five key ideas. First, Kindleberger and the Great Depression establish the hegemonic-stability baseline. Second, the Bretton Woods architecture itself — the IMF, the IBRD, fixed rates, capital controls, and the dollar-gold standard — is unpacked as a deliberate political construction with distributional consequences. Third, the theoretical debate among Gilpin, Keohane, and others is presented with scope conditions and counterarguments, not as settled doctrine. Fourth, the 1971 Nixon shock and the subsequent rise of the dollar as a fiat global reserve currency are analyzed as both a crisis of hegemony and a reconstitution of it. Fifth, contestation — the New International Economic Order (NIEO) of the 1970s, SAPs in the 1980s, the 1997 Asian crisis, and BRICS reform demands from 2009 to the present — is examined as evidence that the system has always been politically disputed, never a neutral technocracy. Each key idea is developed through its theoretical lineage, its mechanism, its scope conditions, its observable implications, and a brief perspective note across all five traditions.

The worked example — the 1997–98 Asian financial crisis and IMF conditionality — applies these ideas at four levels of analysis (individual, state, systemic, transnational) and adjudicates among the five perspectives. The problem pair — the 2020–2022 IMF allocation of $650 billion in SDRs and the debate over rechanneling to African states — asks whether recent reforms reproduce or challenge hierarchy. The data lab supplies quantitative anchors: IMF voting shares, SDR allocations by region, IMF conditionality counts, and the USD share of global reserves from 1999 to 2024. Together, these components train you to move from description to explanation, from explanation to prediction, and from prediction to prescription — while keeping the African vantage point primary rather than decorative.

By the end of this lesson you will be able to: reconstruct the hegemonic-stability debate with its strongest versions on all sides; explain the Bretton Woods architecture and its 1971 collapse as political-economic events, not merely technical adjustments; evaluate IMF crisis management through African, Chinese, Russian, Western, and UN lenses; and produce an evidence-based adjudication of whether contemporary reform demands (SDR rechanneling, quota reform, BRICS alternatives) constitute genuine transformation or managed reproduction of hierarchy. You will also be able to identify the falsifiers that would distinguish these hypotheses — a skill that carries forward to L18 on weaponized interdependence, L38 on sanctions, and L49

on revisionism, where the same questions of power, institutions, and hierarchy recur in different domains.

SECTION 1 — Pre-Class Priming

1.1 Retrieval Warm-Up Answer these from memory before reading further; check your answers against L6 and L15.

1. **Institutionalism (L6):** What is the difference between rationalist (neoliberal) institutionalism and constructivist institutionalism, and which scholar is most closely associated with each?
2. **Institutional functions (L6):** Name two functions that international institutions perform according to Keohane's *After Hegemony*, and explain how each reduces transaction costs.
3. **Embedded liberalism (L15):** How did John Ruggie's concept of "embedded liberalism" describe the post-1945 compromise between free trade and domestic welfare states?
4. **Washington Consensus (L15):** List three of the ten policy prescriptions associated with the Washington Consensus, and identify the institution most closely linked to its diffusion.
5. **Path dependence (L6):** What is path dependence, and how does it explain why international institutions persist even after the power distribution that created them changes?
6. **Polanyi's double movement (L15):** In *The Great Transformation*, what did Karl Polanyi mean by the "double movement," and how does it anticipate contemporary backlash against globalization?

1.2 Orientation Questions Consider these before engaging the core; they frame the lesson's central puzzle.

1. Does international economic order require a hegemon to supply public goods, or can institutions sustain cooperation once hegemonic power declines?
2. How did the 1971 collapse of Bretton Woods fixed exchange rates reshape the global financial system, and did it end or reconstitute dollar hegemony?
3. Whose interests do IMF conditionality, quota-based voting, and SDR allocations serve — and can these instruments be reformed without transforming the underlying power structure?
4. How does the African critique — from structural adjustment to the Ezulwini Consensus — reframe Bretton Woods from a stability mechanism into a hierarchy-reproducing structure, and what does this vantage point reveal that Western institutionalism misses?

1.3 Vocabulary Pre-Teach Provisional definitions to be refined in the lesson core.

- **Hegemonic stability theory:** The argument, associated with Kindleberger, that a liberal international economic order requires a single dominant state willing and able to supply public goods such as liquidity, open markets, and exchange-rate stability.
- **Bretton Woods system:** The monetary and financial architecture established in 1944, comprising the IMF, the IBRD/World Bank, fixed but adjustable exchange rates, capital controls, and a dollar-gold standard.
- **Fixed exchange rate:** A currency peg in which a state commits to maintaining its currency's value relative to another currency or gold, requiring intervention and reserve management.
- **Capital controls:** State restrictions on the cross-border movement of financial capital, used under Bretton Woods to preserve monetary autonomy and prevent speculative attacks.

- **Dollar-gold standard (gold-exchange standard):** The Bretton Woods arrangement in which the US dollar was convertible into gold at $35 per ounce and other currencies pegged to the dollar, making the dollar the central reserve asset. - **Triffin dilemma:** The structural tension identified by Robert Triffin in which the global economy's need for dollar liquidity conflicts with confidence in dollar convertibility into gold. - **Special Drawing Rights (SDRs):** An IMF-created international reserve asset, allocated to member states in proportion to quota shares, used to supplement official reserves. - **Conditionality:** The policy requirements — fiscal austerity, privatization, trade liberalization — that the IMF attaches to its lending, typically negotiated with borrowing governments. - **Structural adjustment programs (SAPs):** IMF/World Bank-mandated economic reforms imposed on developing countries, especially in the 1980s and 1990s, often criticized for social costs and sovereignty erosion. - **New International Economic Order (NIEO):** A 1974 UN General Assembly program demanding restructuring of global trade, finance, and technology transfer to benefit developing countries. - **Embedded liberalism:** Ruggie's term for the post-1945 compromise permitting domestic welfare states alongside international free trade, underwritten by capital controls. - **Nixon shock:** The August 1971 suspension of dollar-gold convertibility by President Nixon, which collapsed the Bretton Woods fixed-rate system and ushered in floating exchange rates. - **Reserve currency:** A currency held in significant quantities by foreign central banks and used for international trade invoicing and debt denomination; the US dollar has been the dominant reserve currency since 1944.

SECTION 2 — LESSON CORE

2.1 Learning Objectives

By the end of this lesson, students will be able to:

1. **Define** hegemonic stability theory and identify the four international public goods that Kindleberger argued were undersupplied during the interwar period, distinguishing a hegemon's provision of public goods from ordinary great-power self-interest. (Bloom: Remember/Understand)
2. **Explain** the causal mechanism through which the absence of a willing hegemon transformed the 1929 Wall Street crash into a global depression, tracing the chain from liquidity contraction through competitive devaluation to trade collapse and banking panics. (Bloom: Analyze)
3. **Evaluate** the scope conditions of hegemonic stability theory, specifying when a hegemon's provision of public goods is likely, when it is not, and which alternative explanations—domestic political coalitions, institutional design, ideological commitment, or multilateral coordination—compete with or complement it. (Bloom: Evaluate)
4. **Reconstruct** how African, Chinese, Russian, Western, and UN perspectives each interpret the claim that international economic order requires a hegemon, identifying what each perspective contributes to our understanding and what it systematically occludes. (Bloom: Analyze)
5. **Apply** Kindleberger's framework to a contemporary episode of international economic instability, distinguishing description of what happened, explanation of why it happened, prediction of what will happen next, and prescription of what should be done. (Bloom: Apply)

These objectives are cumulative. The first two build conceptual and causal literacy; the third introduces critical evaluation of a theory's boundaries; the fourth requires perspective-taking across five distinct intellectual traditions; the fifth demands that the student move from theory to judgment without conflating analytic and

normative registers. Mastery is demonstrated not by reciting Kindleberger's conclusions but by being able to specify the mechanism, its scope conditions, its strongest counterargument, and the vantage point from which each of those is assessed.

2.2 KEY IDEA 1 — Kindleberger and the Great Depression: Absence of a Hegemon Willing to Provide Public Goods

Bolded Causal Claim: The Great Depression became global and prolonged not because of the 1929 crash alone but because no state possessed both the capacity and the willingness to supply the international public goods—countercyclical lending, a market of last resort for distress goods, stable exchange rates, and macroeconomic coordination—that would have arrested the downward spiral; Britain had the willingness but not the capacity after 1914, and the United States had the capacity but not the willingness until 1933, by which time the damage was done.

Mechanism: Kindleberger's argument in *The World in Depression, 1929-1939* (1973) rests on a public-goods logic applied to the international economy. In a closed economy, a central bank can act as lender of last resort, injecting liquidity when private credit contracts; in an open economy with fixed exchange rates, that function must be performed internationally, or at least by a state large enough that its domestic monetary policy has systemic effects. Kindleberger identified four specific public goods whose undersupply turned a severe but potentially containable downturn into a decade-long depression. First, a **lender of last resort** at the international level: someone willing to extend credit to distressed borrowers—banks, firms, and governments—when private capital fled. Second, a **market of last resort**: a large economy willing to keep its import markets open and absorb the exports of distressed countries, providing them with the foreign exchange needed to service debts and maintain employment. Third, **exchange-rate stability**: a credible anchor (in the interwar case, the gold standard) that prevented competitive devaluations from destroying trade volumes. Fourth, **macroeconomic coordination**: leadership in convening conferences, setting agendas, and persuading or coercing other states into cooperative adjustment rather than beggar-thy-neighbor policies.

The mechanism operates through a free-rider problem. Each of these goods is non-excludable and non-rivalrous at the international level: if the United States stabilizes the gold standard, all trading partners benefit whether or not they contribute; if Britain keeps its market open, all exporters gain. Rational states therefore have an incentive to free-ride, waiting for another state to bear the cost. Only a state whose stake in the system is large enough that the cost of non-provision exceeds the cost of provision—a hegemon—will overcome this collective-action failure. Britain performed this role before 1914, when its financial center (the City of London), its colonial trade network, and its gold-standard commitment gave it both the capacity and the incentive to lend countercyclically and absorb distress goods. After 1914, Britain's war debts, industrial decline, and domestic unemployment destroyed its capacity; it could not afford to be the market of last resort. The United States, by contrast, emerged from the war as the world's largest creditor and industrial power, with the Federal Reserve capable of international lending and the American market capable of absorbing imports. But American policymakers—shaped by isolationism, the gold-standard orthodoxy of the Federal Reserve, and a domestic political coalition that prioritized agricultural protection (the Smoot-Hawley Tariff of 1930) over international stability—refused to play the role. The result was a cascade: the 1929 crash triggered credit contraction; without a lender of last resort, banks failed across Europe and the United States; without a market of last resort, distressed countries could not earn foreign exchange; without exchange-rate stability, countries abandoned gold and devalued competitively; without coordination, each state raised tariffs and imposed quotas. World trade fell by roughly two-thirds between 1929 and 1934, and

unemployment reached catastrophic levels in industrial countries. Kindleberger's counterfactual is explicit: had the United States acted as Britain had before 1914—lending to distressed economies, keeping its market open, stabilizing exchange rates—the depression would have been shorter and shallower. The crash was American; the depression was global because no one managed the international consequences.

Scope Conditions: Hegemonic stability theory, in Kindleberger's formulation, applies under specific conditions that must be stated precisely or the theory becomes unfalsifiable. First, the theory assumes a high degree of international economic interdependence: if economies are largely autarkic, the failure to provide international public goods has limited consequences. The interwar period qualified because the gold standard and pre-1914 trade integration had created dense financial and commercial linkages. Second, the theory requires a state with disproportionate economic capacity—large enough that its domestic market can absorb global distress goods and its central bank can lend internationally without exhausting its own reserves. Third, and critically, the theory requires that the hegemon's domestic political economy permit international provision: the state must have a coalition willing to bear the costs (inflation, fiscal outlays, trade adjustment) for benefits that are partly captured by foreigners. This is the theory's most contested scope condition. Kindleberger himself noted that the United States in the 1920s and 1930s was constrained by the gold standard, by the Federal Reserve's misunderstanding of its international role, and by a Congress dominated by agricultural protectionists. The theory therefore does not predict that hegemons always provide public goods; it predicts that order is more likely when a hegemon's domestic interests align with international stability. Fourth, the theory is primarily about short-to-medium-run crisis management, not about long-run structural transformation. It explains why a downturn became a depression; it does not explain why some economies industrialized and others did not, or why the postwar order took the specific form it did. Fifth, the theory is sensitive to the definition of "public good": what Kindleberger treated as public goods (stable exchange rates, open markets) were, from other perspectives, mechanisms of imperial extraction or creditor privilege. This normative ambiguity is not a flaw in the theory's logic but a boundary on its applicability: the theory describes how order is maintained, not whether that order is just.

Observable Implications: If Kindleberger's mechanism is correct, several observable patterns should hold. (a) Periods of hegemonic transition or hegemonic reluctance should correlate with deeper and more prolonged international economic crises, holding other factors constant. (b) The presence of a willing hegemon should be associated with faster recovery from financial crises, as measured by trade recovery, credit flows, and output gaps. (c) In the absence of a hegemon, states should exhibit beggar-thy-neighbor behavior—competitive devaluation, tariff escalation, capital controls—more frequently and more severely. (d) The specific public goods Kindleberger identified should be traceable in the historical record: central-bank swap lines, import-absorption policies, exchange-rate stabilization agreements, and summit diplomacy should appear during hegemonic periods and be absent during hegemonic gaps. (e) Conversely, if crises of comparable severity occur during periods of clear hegemonic dominance, or if non-hegemonic coordination (as in the 1933 London Economic Conference's failure, or conversely in the post-1973 floating-rate era) successfully manages crises, the theory's explanatory power is weakened. The 1997-98 Asian financial crisis, the 2008 global financial crisis, and the 2020 COVID-19 shock each provide test cases: in 2008, the United States and the G20 coordinated massive stimulus and central-bank swap lines, consistent with hegemonic provision; in 2020, the Federal Reserve extended dollar swap lines to fourteen central banks, again consistent; but the 1997-98 crisis, in which the IMF (not the United States directly) imposed conditionality, raises questions about whether the hegemon provided public goods or creditor protection.

Perspective Note (five traditions in brief):

African (primary): The African vantage point on Kindleberger's thesis begins from a position that the theory itself does not occupy: the position of those for whom the "public goods" of the interwar and postwar orders were experienced not as stability but as subordination. Kindleberger's framework is built around North Atlantic powers—Britain, the United States, France, Germany—and treats the rest of the world as the passive terrain on which hegemonic provision or its absence plays out. African economies in the 1920s and 1930s were overwhelmingly colonial, dependent on primary commodity exports (cocoa, coffee, cotton, minerals) whose prices collapsed during the Depression. The colonial fiscal regimes of British, French, and Belgian Africa responded not with countercyclical spending but with forced labor, tax increases, and cuts to social services—policies that deepened rather than cushioned the shock. From this perspective, the "absence of a hegemon" was not the central problem; the central problem was that the existing hegemon (Britain, as colonial power) used its capacity not to provide public goods to African subjects but to extract resources and maintain imperial control. Rodney's *How Europe Underdeveloped Africa* (1972) and Nkrumah's *Neo-Colonialism: The Last Stage of Imperialism* (1965) frame this not as a failure of hegemonic stability but as the normal operation of a system designed for extraction. The African critique therefore inverts Kindleberger's causal logic: the Depression's severity in Africa was not caused by the absence of a hegemon willing to provide public goods but by the presence of a hegemon (imperial Britain) whose "stability" was built on African exploitation. Post-independence African leaders—Nyerere in Tanzania, Nkrumah in Ghana, Touré in Guinea—drew from this experience a deep skepticism toward any theory that treats great-power provision as benign. Nyerere's *ujamaa* and the Arusha Declaration (1967) were, in part, attempts to build economic self-reliance precisely because dependence on external hegemons had proven catastrophic. The Ezulwini Consensus (2005), adopted by the African Union, and subsequent African demands for reform of the IMF and World Bank voting structures reflect this inherited skepticism: African states do not deny that international order requires coordination, but they reject the premise that such coordination must be provided by a single hegemon whose interests are structurally misaligned with African development. Mamdani's analysis of the colonial state in *Citizen and Subject* (1996) adds a further dimension: the "public goods" of the colonial order were distributed along racial and ethnic lines, so that even when a hegemon provided stability, it was stability for settlers and extractors, not for the colonized. Bayart's concept of the "politics of the belly" (*La politique du ventre*, 1989) suggests that African states developed informal, extraverted strategies for surviving in a system where formal public-goods provision was unreliable or predatory. Grovogui's *Beyond Eurocentrism and Anarchy* (2006) argues that the entire framework of hegemonic stability theory is Eurocentric: it assumes that international order is produced by great powers and that non-Western actors are either recipients or disruptors, never co-producers. From the African perspective, the lesson of the 1930s is not that the world needed a better hegemon but that the very structure of hegemony—whether British, American, or multilateral—systematically subordinates African interests, and that genuine stability requires not hegemonic provision but structural transformation of the global economy and democratic reform of its institutions. This is the longest and most developed of the five perspectives because it is the one that most fundamentally challenges the theory's premises rather than merely disputing its application.

Chinese: Chinese international-relations scholarship approaches Kindleberger's thesis with a characteristic ambivalence that reflects China's own trajectory from victim of hegemonic disorder to potential provider of international public goods. Historically, China in the 1930s was itself a victim of the absence of hegemonic stability: the Japanese invasion of Manchuria (1931), the collapse of the silver standard, and the inability of the League of Nations to coordinate a response are read in Chinese historiography as evidence that a weak or absent hegemon produces not freedom but predation by regional powers. This experience supports the Kindlebergerian premise that order requires a provider. At the same time, Chinese scholars—drawing on the

tradition of "tianxia" (all-under-heaven) and on contemporary debates about China's global role—resist the conclusion that hegemony must be unipolar or Western. Yan Xuetong and other Chinese IR theorists have argued that a "humane authority" (wangdao) can provide public goods without the coercive dominance associated with Western hegemony. China's contemporary provision of infrastructure finance through the Belt and Road Initiative, the Asian Infrastructure Investment Bank, and bilateral swap lines is framed by Chinese policymakers as a contribution to international public goods, not as hegemonic domination. Yet Chinese scholars also note that the Kindleberger framework is frequently deployed by Western analysts to pressure China into assuming the costs of a system from which it has historically been excluded—a "hegemonic trap" in which China is asked to subsidize an order it did not design. The Chinese perspective thus accepts the descriptive logic of hegemonic stability (order requires provision) while rejecting its normative implication that the United States or any single Western power is the legitimate or sole provider.

Russian: The Russian and Soviet perspective on Kindleberger's thesis is shaped by a Marxist-Leninist critique of imperialism that treats "hegemonic stability" as an ideology of domination rather than a neutral theory of public goods. From this vantage, the interwar period is not a story of missing public goods but of capitalist crisis: the Depression was an inevitable consequence of overproduction and underconsumption in the capitalist mode of production, and the "hegemon" (Britain, then the United States) was not a failed provider but an exploiter whose system generated the crisis in the first place. The Soviet Union's relative insulation from the Depression—through autarky and state planning—was cited as evidence that capitalist hegemony was neither necessary nor desirable. In the post-Soviet period, Russian IR scholars and policymakers have revived a critique of dollar hegemony, arguing that the United States uses its position as provider of the global reserve currency to extract seigniorage, impose sanctions, and finance deficits at others' expense. Karaganov and others have framed the post-1991 unipolar moment as a period of "hegemonic instability" in which the United States provided not public goods but public bads—wars, financial crises, and institutional capture. The 1998 Russian default and the IMF's role in it are cited as evidence that "stability" in the Bretton Woods system means stability for creditors. The Russian perspective therefore rejects Kindleberger's premise that the problem was the absence of a willing hegemon; the problem, on this view, was and remains the presence of a hegemon whose interests are structurally opposed to those of the periphery.

Western: The Western perspective is the tradition in which Kindleberger's thesis originated and in which it has been most extensively developed. Liberal institutionalists—Keohane in *After Hegemony* (1984), Nye, and others—accepted Kindleberger's premise that hegemony matters but argued that institutions can sustain cooperation after hegemonic decline, a position that directly engages the question of whether order requires a hegemon or merely requires hegemonic creation of institutions. Realists—Gilpin in *The Political Economy of International Relations* (1987)—argued that hegemonic stability is not a choice but a structural feature of the international system: the hegemon provides public goods because its interests are served by an open, stable order, and when its relative power declines, the order decays. The Western tradition also contains a strong self-critical strand: Eichengreen's *Globalizing Capital* (1996) and Stiglitz's *Globalization and Its Discontents* (2002) document how the United States and the Bretton Woods institutions provided "stability" selectively—stabilizing finance for creditors while imposing austerity on debtors. This self-critique does not abandon the hegemonic stability framework but complicates it: the question becomes not whether a hegemon provides public goods but whose interests those goods serve and at what cost to whom. The Western perspective's contribution is the most systematic theoretical development of Kindleberger's insight; its occlusion is the tendency to treat the hegemon's provision as presumptively benign and to understate the distributional consequences of hegemonic order.

UN: The United Nations perspective on Kindleberger's thesis is refracted through the lens of development

finance and the institutional mandate of the UN system. From this vantage, the interwar period is not primarily a story of missing hegemonic public goods but of missing multilateral development finance: the League of Nations' financial committees, the Bank for International Settlements (founded 1930), and later the Bretton Woods institutions were attempts to multilateralize what Kindleberger treated as a hegemonic function. The UN's emphasis—visible in the Financing for Development process, the Monterrey Consensus (2002), and the Addis Ababa Action Agenda (2015)—is on the SDG financing gap and the need for concessional, predictable, long-term finance rather than on the identity of the hegemon. The UN perspective thus accepts that international economic stability requires provision but insists that provision should be institutionalized and democratized, not personalized in a single state. The NIEO demands of the 1970s, advanced through the UN General Assembly, were in part a rejection of the premise that the existing hegemon (the United States) could be trusted to provide public goods equitably. The UN perspective's contribution is to shift the question from "who is the hegemon?" to "how are public goods financed, governed, and distributed?"; its occlusion is a tendency toward institutional optimism that may underestimate the power asymmetries that shape even multilateral provision.

2.3 KEY IDEA 2 — Bretton Woods Architecture: IMF, IBRD, Fixed Rates, Capital Controls, and the Dollar-Gold Standard

Bolded Causal Claim: The Bretton Woods system was not merely a set of institutions but a *causal architecture* in which fixed exchange rates, capital controls, a dollar-gold anchor, and two multilateral institutions (the IMF and the IBRD) jointly produced a postwar order in which trade liberalization became compatible with macroeconomic stabilization and domestic welfare commitments—a compatibility that had collapsed in the interwar period.

Mechanism: The mechanism operates through four interlocking components. First, the *adjustable peg*: member states fixed their currencies to the dollar within a narrow band (±1 percent, later widened to ±2.25 percent under the Smithsonian Agreement of 1971, though that came later), with the dollar itself convertible to gold at $35 per ounce. This eliminated the competitive devaluations and exchange-rate volatility that had devastated interwar trade. Second, *capital controls*: the Bretton Woods Articles of Agreement explicitly permitted (indeed encouraged) restrictions on capital movements, which insulated domestic monetary policy from speculative flows and allowed governments to pursue full employment without fear of capital flight. As Eichengreen (1996) emphasizes, this was the "impossible trinity" resolved in favor of fixed rates and monetary autonomy at the expense of capital mobility. Third, the *IMF*: a quota-based lending facility that provided short-term balance-of-payments financing to members facing temporary deficits, conditional on adjustment programs, thereby substituting multilateral liquidity for the destabilizing gold-standard adjustment of the 1920s–30s. Fourth, the *IBRD (World Bank)*: long-term development and reconstruction lending, initially focused on European reconstruction and later on development finance. The causal chain runs: fixed rates reduce trade uncertainty → capital controls preserve policy space → IMF liquidity prevents forced deflation → IBRD finance rebuilds productive capacity → trade expands under stable rules. The dollar-gold standard at the center meant that the United States, as the reserve-currency issuer, had to run balance-of-payments deficits to supply global liquidity—the Triffin dilemma—while other states accumulated dollar reserves. The system thus required US willingness to subordinate domestic monetary autonomy to global liquidity provision, a willingness that eroded by the late 1960s.

Scope Conditions: The architecture functioned only under specific conditions: (a) US hegemony sufficient

to underwrite the dollar-gold peg and absorb adjustment costs; (b) capital controls enforceable by states with administrative capacity; (c) a shared memory of interwar collapse generating political support for multilateralism; (d) limited capital mobility, which made the adjustable peg credible; and (e) European and Japanese reconstruction demand that absorbed US exports. Where these conditions failed—where capital mobility rose, where US deficits became unsustainable, where domestic inflation diverged—the system broke down, as it did in 1971–73. The architecture was thus historically contingent, not a universal template.

Observable Implications: If the Bretton Woods architecture causally produced postwar stability, we should observe: (i) rising trade volumes and declining exchange-rate volatility 1945–1971; (ii) widespread use of capital controls throughout the period; (iii) IMF lending concentrated in short-term balance-of-payments support rather than structural transformation; (iv) US current-account deficits growing as global liquidity provision; (v) eventual collapse when US inflation and deficits undermined gold convertibility. The data confirm these: world trade grew roughly 8 percent annually 1950–1973, exchange-rate volatility was minimal, and capital controls were near-universal. The Nixon shock of August 1971—suspending dollar-gold convertibility—marks the empirical endpoint of the architecture's viability, not of its influence, since IMF and World Bank structures persisted and adapted.

Perspective Note (five traditions in brief):

African (primary): The Bretton Woods architecture is read from the African vantage as a system designed for the reconstruction of Europe and the management of advanced-capitalist macroeconomics, with Africa incorporated only as a source of primary commodities and a recipient of development finance on terms set by others. The IBRD's early lending prioritized European reconstruction; African states, entering independence in the 1960s, found themselves subject to an architecture they had not designed. The dollar-gold standard meant that African export earnings fluctuated with commodity prices denominated in dollars, while African states lacked the policy space that capital controls theoretically provided because their economies were structurally dependent on a few exports. The African perspective emphasizes that the "stability" Bretton Woods produced was stability for the core, not for the periphery: African states experienced the system as a set of constraints (conditionality, commodity dependence, limited voice in IMF/World Bank governance) rather than as a framework of managed stability. The Ezulwini Consensus and subsequent reform demands reflect this reading: the architecture's legitimacy deficit in Africa stems from its origins in a moment when African states were colonies, not members. The African contribution is to show that institutional design reflects power at the moment of creation, and that formal membership does not equal substantive voice.

Chinese: China's perspective treats Bretton Woods as a historically specific arrangement that served US hegemony and European recovery, not as a neutral public good. Chinese scholarship emphasizes that the system's collapse in 1971 demonstrated the unsustainability of dollar-gold anchoring and the Triffin dilemma, lessons that inform contemporary Chinese advocacy for a multipolar reserve system. China's own integration into Bretton Woods institutions (IMF membership 1980, World Bank borrowing, eventual WTO accession 2001) is understood as strategic engagement with an inherited architecture rather than endorsement of its design. The Chinese view contributes the insight that institutional persistence does not imply institutional legitimacy: the IMF and World Bank survived 1971 because they adapted, but their governance structures remained anchored in mid-twentieth-century power distributions. The occlusion is a tendency to understate the genuine developmental finance that IBRD lending provided to China and others.

Russian: The Russian/Soviet perspective historically rejected Bretton Woods as a capitalist instrument of US hegemony, with the USSR refusing to join and establishing alternative institutions (Comecon, the International Bank for Economic Cooperation). Post-Soviet Russian scholarship has shifted toward a more

analytical critique: the system's dollar-gold anchor created structural dependence on US monetary policy, and the IMF's conditionality represented an infringement on sovereignty that Russia experienced directly during the 1998 crisis. The Russian contribution is to highlight the sovereignty costs of embedded liberalism: the same capital controls and fixed rates that enabled European recovery constrained policy autonomy elsewhere. The occlusion is a nostalgic overstatement of Soviet-era alternatives, which were themselves hierarchical.

Western: Western scholarship (Eichengreen 1996; Kindleberger 1973) treats Bretton Woods as a successful, if temporary, solution to the interwar problem of reconciling trade openness with domestic stability—the "embedded liberalism" of Ruggie (1982). The Western perspective emphasizes the genuine public goods provided: exchange-rate stability, liquidity, reconstruction finance. Its self-critique, developed in Stiglitz (2002) and others, acknowledges that the system's benefits were unevenly distributed and that its governance structures became anachronistic. The occlusion is a tendency to treat the system's success as evidence of its design wisdom rather than of US hegemonic capacity.

UN: The UN perspective, particularly through UNCTAD and the development-finance agenda, treats Bretton Woods as an incomplete project: the IMF and World Bank were created to manage stability and reconstruction, but the development dimension (trade, commodities, technology transfer) was underprovided. The NIEO demands of the 1970s were in part a response to the perception that Bretton Woods institutions served creditor interests. The UN contribution is to insist that architecture must include development finance and commodity stabilization, not just macroeconomic management. The occlusion is institutional optimism about reforming inherited structures.

2.4 KEY IDEA 3 — Gilpin, Keohane, and Hegemonic Stability: Does Order Require a Hegemon, and Can It Persist After Hegemony?

Bolded Causal Claim: Hegemonic stability theory (HST) posits that international economic order requires a single dominant state willing and able to provide public goods—open markets, stable money, security of property rights—and that such order decays when hegemonic capacity or willingness declines; yet Keohane's (1984) institutionalist challenge demonstrates that institutions can sustain cooperation after hegemony by reducing transaction costs and locking in expectations, provided that the costs of defection exceed the benefits.

Mechanism: The mechanism has two competing variants. *Gilpin's (1987) realist variant*: hegemony creates order because the hegemon has both the interest (gains from trade exceed costs of provision) and the capacity (economic and military dominance) to enforce rules, absorb adjustment costs, and punish defectors. The hegemon's decline—relative economic decline, overextension, or domestic political shifts—removes the enforcement mechanism, and order fragments into protectionism and conflict. The causal chain: hegemonic dominance → rule-setting and enforcement → predictable expectations → investment and trade → hegemonic decline → enforcement gap → order erosion. *Keohane's (1984) institutionalist variant*: institutions created during hegemony (IMF, GATT/WTO, World Bank) develop independent causal force by (a) reducing information asymmetries, (b) lowering transaction costs of cooperation, (c) creating sunk costs in compliance, and (d) generating reputational stakes. The mechanism: hegemony → institution creation → institutionalization of rules and expectations → post-hegemonic persistence of cooperation because defection costs exceed gains. The two theories share the premise that hegemony originates order but diverge on whether institutions can substitute for hegemonic enforcement. Keohane's "after hegemony" argument is not that institutions replace power but that they transform the strategic environment so that cooperation becomes

self-sustaining among states with convergent interests. The scope conditions for institutional persistence include: low number of major actors, high issue density creating iterated interaction, and roughly symmetrical vulnerability to defection.

Scope Conditions: HST applies most strongly when (a) public goods are non-excludable and non-rivalrous (security of sea lanes, monetary stability), (b) the hegemon's relative decline is rapid, (c) no alternative provider emerges, and (d) institutions are weak or absent. Institutional persistence applies when (a) institutions have acquired independent legitimacy, (b) exit costs are high, (c) states share an interest in continued cooperation, and (d) the hegemon's decline is gradual enough for adaptation. The theories are not mutually exclusive: HST explains origins and crises; institutionalism explains persistence and adaptation. The 1970s–80s transition—US relative decline, institutional adaptation (floating rates, G7 coordination, expanded IMF)—tests both: HST predicts disorder; institutionalism predicts managed adaptation. The evidence is mixed: trade volumes continued growing, but monetary instability increased and protectionist pressures rose.

Observable Implications: If HST is correct, we should observe: (i) economic order correlating with hegemonic concentration of power; (ii) order erosion during hegemonic decline; (iii) weaker states free-riding on hegemonic provision; (iv) hegemonic withdrawal producing protectionism. If institutionalism is correct, we should observe: (i) institutional persistence after hegemonic decline; (ii) cooperation continuing among non-hegemonic states; (iii) institutional adaptation rather than collapse; (iv) compliance driven by reputational and transaction-cost considerations. The post-1971 record supports institutionalism partially: IMF, World Bank, and GATT/WTO persisted and expanded, but the monetary order became more volatile and US unilateralism (e.g., Volcker shock, Plaza Accord) remained decisive. The 2008 financial crisis tested both: HST would predict US-led rescue; institutionalism would predict multilateral coordination. Both occurred, suggesting complementarity rather than competition.

Perspective Note (five traditions in brief):

African (primary): The African perspective on hegemonic stability is distinctive because it questions the premise that hegemony—whether US or any other—produces order for Africa. From the African vantage, the "order" HST describes is an order of extraction: the hegemon provides public goods (security of sea lanes, monetary stability) primarily to secure its own trade and investment, while African states bear the costs (commodity price volatility, conditionality, limited policy space) without commensurate voice. Gilpin's framework, read from Africa, naturalizes a hierarchy in which the hegemon's interests are conflated with global interests. The African contribution is to ask: stability for whom? The Bretton Woods institutions' persistence "after hegemony" (Keohane) is read not as institutional success but as the institutionalization of asymmetric power: the IMF and World Bank survived US relative decline because they served creditor interests regardless of hegemon. The African perspective thus inverts HST: order does not require a hegemon; it requires *legitimacy*, and legitimacy requires voice. The Ezulwini Consensus and African Union reform demands reflect this: African states do not seek a new hegemon but a reformed architecture in which provision is decoupled from domination. The occlusion in African scholarship is a tendency to treat all institutional persistence as reproduction of hierarchy, which may understate genuine institutional learning (e.g., IMF's post-2008 flexibility, SDR allocations).

Chinese: China's perspective engages HST through the lens of its own rise: if order requires a hegemon, and the US is declining, does China's rise produce a new hegemony or a multipolar order? Chinese scholarship (e.g., Yan Xuetong's moral realism, though not a canonical source here) generally rejects the premise that China seeks hegemony, framing its rise as producing a "community of shared future" rather than a new

dominant state. The Chinese contribution to the HST debate is to question whether the public goods the US provided were genuinely global or selectively beneficial, and whether China's provision (Belt and Road, AIIB, BRICS institutions) constitutes an alternative or a complement. The occlusion is a tendency to understate the coercive dimensions of Chinese economic statecraft and to overstate the novelty of its institutional alternatives.

Russian: The Russian perspective treats HST as a legitimizing discourse for US dominance: the claim that order requires a hegemon is read as an ideological justification for unilateralism. Russian scholarship emphasizes that the Soviet Union provided an alternative order (however flawed) and that the post-Cold War "unipolar moment" produced not stability but interventionism and disorder. The Russian contribution is to highlight the *coercive* dimension of hegemonic provision: the same institutions that HST treats as public goods are experienced by weaker states as instruments of control. The occlusion is a tendency to romanticize multipolarity and to understate the transaction-cost benefits of institutionalized cooperation.

Western: Western scholarship is the home of both HST (Kindleberger, Gilpin) and its institutionalist critique (Keohane). The Western perspective's strength is its theoretical self-reflection: it generated the debate and has tested it against evidence. The Western contribution is to have identified the public-goods problem at the core of international order and to have developed both realist and institutionalist solutions. Its self-critique (Stiglitz 2002; Grabel 2018) acknowledges that HST can legitimate hegemonic overreach and that institutionalism can obscure power asymmetries. The occlusion is a tendency to treat Western theoretical frameworks as universal, when they may reflect the specific experience of advanced capitalist states.

UN: The UN perspective approaches HST through the lens of collective security and development: if order requires a hegemon, then the UN system (which presupposes collective rather than hegemonic provision) is structurally disadvantaged. The UN contribution is to insist that public goods can be provided multilaterally through institutionalized burden-sharing, as in peacekeeping or development finance. The NIEO and SDG agendas reflect this: the demand is for institutionalized provision, not hegemonic charity. The occlusion is institutional optimism: the UN's own record of providing public goods (e.g., in conflict zones) is mixed, and its effectiveness depends on member-state willingness that resembles hegemonic provision in practice.

2.5 KEY IDEA 4 — The 1971 Nixon Shock, Floating Rates, and the Rise of the Dollar as Global Reserve Currency

Bolded Causal Claim: The suspension of dollar-gold convertibility in 1971 and the subsequent move to floating exchange rates did not terminate American monetary hegemony; instead, by removing the gold constraint while preserving dollar invoicing, settlement, and reserve functions, the Nixon shock converted the dollar from a gold-backed reserve currency into a fiat reserve currency whose persistence depends on US financial-market depth, geopolitical demand, and network externalities rather than on metallic convertibility.

Mechanism: The mechanism begins with the Triffin dilemma: the Bretton Woods system required the United States to supply dollar liquidity to the world through current-account deficits, yet those same deficits eroded confidence in the dollar's convertibility into gold at $35 per ounce. As US inflation accelerated in the late 1960s—driven by Vietnam War spending and Great Society programs—the gap between outstanding dollar claims and US gold reserves widened. Speculative attacks on the dollar forced Nixon's August 1971 suspension of convertibility, followed by the Smithsonian Agreement's failed attempt to realign parities and, ultimately, the Jamaica Accords of 1976, which legalized floating rates and demonetized gold.

The crucial point is that the collapse of the gold anchor did not collapse dollar demand. Three reinforcing mechanisms replaced convertibility. First, the Eurodollar market and, after 1973, petrodollar recycling created offshore dollar liquidity outside US regulatory control, deepening dollar use in trade and finance. Second, the US Treasury market became the world's premier safe asset: foreign central banks and private investors held dollars not because they could be converted into gold, but because they could be converted into liquid, default-remote US government debt. Third, network externalities and path dependence locked in dollar invoicing: commodity markets, especially oil, were priced in dollars; trade contracts, derivatives, and clearing systems were built around dollar settlement; and the cost of switching to an alternative currency rose with each additional user. The result was a fiat reserve system in which the United States could finance external deficits at lower cost—the "exorbitant privilege" of seigniorage and lower borrowing costs—while adjustment pressures fell disproportionately on deficit countries in the periphery, which faced IMF programs, reserve depletion, or currency crises. Floating rates also increased exchange-rate volatility, encouraging hedging, derivatives markets, and capital mobility, thereby financializing international monetary relations. In this sense, the Nixon shock was not the end of hegemonic monetary order but its mutation: from a gold-exchange standard to a dollar standard sustained by market depth and institutional habit.

Scope Conditions: The mechanism operates only where several conditions hold. The United States must maintain deep, liquid, and relatively open financial markets, especially in government debt, so that foreign holders can enter and exit without large price effects. US monetary policy must remain sufficiently credible that inflation does not destroy the store-of-value function, even if short-run inflation occurs. There must be no rival currency with comparable market depth, convertibility, and geopolitical backing; the euro and, more recently, the renminbi have challenged the dollar at the margins but have not replicated the full bundle of liquidity, rule of law, and security guarantees. Demand for dollars must be reinforced by structural factors such as commodity invoicing, offshore dollar debt, and security alliances. The mechanism also assumes that the US is willing to run the deficits necessary to supply global liquidity and that foreign actors are willing to absorb dollar assets; if the US pursued sustained fiscal consolidation or if foreign states coordinated a rapid diversification, the equilibrium would weaken. Finally, the mechanism is historically contingent: it was reinforced by the Volcker shock of the early 1980s, which restored dollar credibility after 1970s inflation, and by the absence of a credible alternative after the collapse of the Bretton Woods fixed-rate system.

Observable Implications: The observable implications include the persistence of the dollar's share of global foreign-exchange reserves at roughly two-thirds in the early 2000s and still above 55 percent in the mid-2020s, despite decades of US current-account deficits. They include the dominance of the dollar in trade invoicing, cross-border banking, and international debt issuance, as well as the recurring pattern in which emerging-market crises—such as the 1997 Asian financial crisis or the 2008 global financial crisis—manifest as dollar shortages requiring Federal Reserve swap lines. They include the accumulation of dollar reserves by developing countries as self-insurance, which diverts fiscal resources from domestic investment, and the asymmetric adjustment pattern in which peripheral economies raise interest rates or seek IMF support while the United States adjusts through exchange-rate and monetary channels. They also include the geopolitical implication that dollar centrality gives the United States leverage through financial sanctions and control over clearing infrastructure, although overuse of that leverage can accelerate diversification without immediately displacing the dollar.

Perspective Note (five traditions in brief):

African (primary): From an African vantage point, the Nixon shock and floating-rate order are not merely technical monetary events but a reorganization of global hierarchy that exposed postcolonial economies to

dollar volatility, commodity-price swings, and foreign-currency debt. African states that had gained independence under fixed or managed rates found their export revenues, import costs, and debt burdens increasingly determined by US monetary policy and by exchange-rate movements they did not control. The shift to fiat dollar hegemony meant that African central banks had to hold dollar reserves as self-insurance, diverting scarce resources from development, while their currencies became more vulnerable to sudden stops. African political economists have long read this as a monetary dimension of neo-colonial dependence: Nkrumah's analysis of neo-colonialism and Rodney's account of underdevelopment provide the lineage for understanding how formal sovereignty coexists with monetary subordination. The African perspective reveals that what Western accounts call "stability" often means predictability for core creditors and volatility for peripheral debtors; it also shows that reserve-currency status is not a neutral market outcome but a structure of power that shapes who bears adjustment costs. Contemporary African demands for SDR rechanneling, local-currency trade settlement, and institutional reform are therefore not technical preferences but claims against a monetary order whose rules were set without African consent.

Chinese: China's perspective is reformist rather than revolutionary. Beijing benefited enormously from dollar-based globalization: export-led growth, foreign direct investment, and reserve accumulation were all enabled by a stable dollar anchor and US consumer demand. At the same time, Chinese policymakers have criticized the "exorbitant privilege" and the risks of dollar dependence, promoting renminbi internationalization through bilateral swap lines, the Cross-Border Interbank Payment System, and inclusion of the renminbi in the IMF's Special Drawing Rights basket. Yet China has not sought an immediate displacement of the dollar, recognizing that its own capital controls, shallow offshore markets, and institutional trust deficits limit renminbi reserve status. The Chinese occlusion is a tendency to treat dollar dominance as a policy choice that can be incrementally adjusted without confronting the deeper network effects and geopolitical bargains that sustain it.

Russian: Russia's perspective treats dollar hegemony as a strategic vulnerability, especially after sanctions and the freezing of reserves. Moscow has promoted de-dollarization in trade with partners, alternative payment messaging, and gold accumulation. The Russian critique correctly identifies the coercive potential of reserve-currency status, but it often overstates the feasibility of rapid alternatives and understates the institutional trust, liquidity, and legal predictability required for reserve-currency status. Its occlusion is the conflation of geopolitical opposition to the United States with a viable monetary alternative.

Western: The Western perspective, particularly in US and European scholarship, defends the dollar system as a provider of global public goods—liquidity, safe assets, and a nominal anchor—while acknowledging the Triffin dilemma and "exorbitant privilege." Eichengreen's historical work on international monetary systems emphasizes that reserve-currency transitions are rare and path-dependent, implying that dollar dominance is durable but not eternal. Western self-critique focuses on US fiscal deficits, inflation risks, and the geopolitical overuse of financial sanctions. The occlusion is a tendency to equate US interests with global interests and to treat the costs of dollar volatility as transitional or manageable.

UN: The UN perspective approaches the post-1971 monetary order through development finance and liquidity provision. It highlights how floating rates and dollar dominance create debt vulnerabilities, reserve accumulation burdens, and procyclical capital flows for developing countries. UN agencies and the Financing for Development process have called for SDR reform, debt relief, and multilateral liquidity mechanisms. The occlusion is institutional optimism: the UN can diagnose monetary hierarchy but lacks the power to restructure the reserve system, which depends on the consent of major shareholders and central banks.

2.6 KEY IDEA 5 — Contestation: NIEO, Structural Adjustment, the Asian Crisis, and BRICS Reform Demands

Bolded Causal Claim: The Bretton Woods order has survived not because it is uncontested but because contestation has been absorbed through partial reform, crisis management, and institutional adaptation; from the NIEO through structural adjustment, the 1997 Asian crisis, and BRICS demands, challengers have exposed legitimacy deficits and forced changes in conditionality and governance, yet the core hierarchy of dollar centrality and shareholder power has remained intact.

Mechanism: The mechanism is a cycle of challenge, crisis, adaptation, and re-legitimation. In the 1970s, the New International Economic Order (NIEO) demanded commodity price stabilization, technology transfer, debt relief, and greater voice for developing countries in international institutions. The oil shocks and stagflation of the 1970s gave commodity exporters temporary leverage, but the NIEO's institutional demands were largely blocked by advanced capitalist states; the UN Conference on Trade and Development (UNCTAD) became a forum for grievance rather than redistribution. The 1980s debt crisis shifted the terrain: IMF and World Bank structural adjustment programs (SAPs) offered financing in exchange for liberalization, privatization, fiscal austerity, and trade opening. SAPs were not merely technical stabilization; they were a political project to restructure state-market relations in the Global South, often with severe social costs. Contestation here took the form of riots, electoral backlash, and scholarly critique, including Stiglitz's argument that IMF conditionality was often procyclical and ideologically driven. The 1997 Asian financial crisis revealed another dimension: IMF programs initially demanded high interest rates and fiscal austerity in economies suffering from capital-account liberalization and currency mismatches, prompting accusations of misdiagnosis and double standards. The crisis generated institutional learning—greater emphasis on financial-sector surveillance, reserve adequacy, and, eventually, more flexible conditionality—but also accelerated self-insurance through reserve accumulation in Asia. The 2008 global financial crisis and its aftermath shifted power further: the G20 displaced the G7 as the premier economic forum, BRICS states demanded quota and voice reform, and new institutions such as the New Development Bank and the Asian Infrastructure Investment Bank emerged. Yet reform has been partial. The 2010 IMF quota reform, which increased emerging-market shares, was delayed for years by US congressional politics; the 2021 allocation of $650 billion in Special Drawing Rights distributed according to quota, giving low-income countries a small share relative to need; and debates over rechanneling SDRs to African states have exposed the gap between liquidity provision and structural inequality. Thus contestation operates through multiple channels—diplomatic demands, crisis backlash, institutional entrepreneurship, and scholarly critique—but incumbent institutions retain agenda-setting power through voting structures, conditionality design, and control over liquidity.

Scope Conditions: Contestation is most effective when challengers possess market power, regional coordination, or crisis leverage. China's rise and the BRICS' collective weight have made quota reform and alternative institutions possible in ways that were unavailable to African or Latin American states in the 1980s. Regional mechanisms such as the Chiang Mai Initiative Multilateralization demonstrate that contestation can produce parallel liquidity arrangements, though these often remain linked to IMF frameworks. Contestation is weaker where states are heavily indebted, dependent on concessional finance, or fragmented; in such cases, IMF programs remain the only available source of balance-of-payments support. The mechanism also depends on the willingness of incumbent powers to accommodate: the United States and Europe have accepted incremental reforms that do not threaten core privileges, such as dollar centrality or European overrepresentation, while resisting changes that would. Finally, contestation requires ideational resources; the shift from Washington Consensus to "country ownership" and "social spending floors" in IMF programs reflects not only power but also the legitimation strategies of institutions under pressure.

Observable Implications: Observable implications include the changing composition and number of IMF conditions over time, with a shift from broad structural conditions in the 1980s and 1990s toward more targeted macro-critical conditions and, in some programs, social spending floors. They include the creation of new institutions such as the NDB and AIIB, which both complement and compete with the World Bank. They include persistent disparities in IMF voting shares, with the United States retaining a veto-level share and Europe overrepresented relative to emerging markets. They include the 2021 SDR allocation's distribution by quota, which gave Africa a small share relative to pandemic financing needs, and the subsequent debate over rechanneling SDRs through multilateral development banks or the IMF's Poverty Reduction and Growth Trust. They also include BRICS expansion and de-dollarization rhetoric, which signal dissatisfaction but have not yet produced a reserve alternative. Finally, they include the continued use of IMF programs in Africa and Latin America, indicating that contestation has altered the terms of engagement without ending dependence.

Perspective Note (five traditions in brief):

African (primary): The African perspective places NIEO and SAPs at the center of the story, not as footnotes to Western institutional history. African states experienced structural adjustment as externally imposed austerity that cut public services, liberalized trade, and often undermined industrialization, while debt burdens persisted. The Ezulwini Consensus of 2005, adopted by the African Union, crystallized demands for UN Security Council reform and greater African voice in international financial institutions. More recently, the 2021 SDR allocation and rechanneling debate have been read in Africa as a test of whether global liquidity provision can be decoupled from quota-based hierarchy. African scholars such as Grovogui, Mbembe, Bayart, and Mamdani provide the analytical vocabulary: Grovogui's critique of international legal and institutional orders as systems of domination; Mbembe's analysis of necropolitics and the unequal valuation of life; Bayart's concept of extraversion, by which African elites navigate external power; and Mamdani's insistence on the political construction of state and civil society. The African perspective reveals that contestation is not an abstract debate over governance reform but a lived experience of austerity, debt, and conditional sovereignty. It also warns that BRICS or new institutions may reproduce hierarchy in new forms if they do not alter decision-making power and if African states remain rule-takers. The strongest African claim is that reform must be measured not by institutional creation but by whether it changes who decides, who pays, and who benefits.

Chinese: China's perspective is reformist: it seeks greater voice in the IMF and World Bank, supports SDR expansion, and has created parallel institutions, but it does not advocate abolishing the Bretton Woods system. Beijing's strategy is to increase optionality—AIIB, NDB, bilateral swaps—while remaining embedded in global markets. The occlusion is that China's creditor power in new institutions can reproduce the very asymmetries it criticizes, and its support for multilateralism is tempered by geopolitical competition with the United States.

Russian: Russia frames contestation in geopolitical terms, emphasizing multipolarity, de-dollarization, and resistance to Western-dominated institutions. Its critique of IMF conditionality and dollar hegemony resonates with Global South grievances, but Russia's institutional alternatives remain limited by sanctions, shallow financial markets, and trust deficits. The occlusion is the instrumentalization of anti-hegemonic rhetoric for state interests rather than systemic reform.

Western: The Western perspective combines institutional defense with self-critique. Stiglitz's critique of IMF conditionality, the IMF Independent Evaluation Office's assessments, and academic work on "augmented Washington Consensus" reforms show that Western scholars and officials have acknowledged failures. Yet

the dominant Western view treats institutions as reformable and preferable to fragmented alternatives. The occlusion is a tendency to measure reform by procedural changes—conditionality counts, transparency—rather than by shifts in power.

UN: The UN perspective emphasizes development finance, debt sustainability, and the SDG financing gap. It has supported the NIEO legacy through UNCTAD, Financing for Development conferences, and calls for SDR rechanneling and debt relief. The UN's contribution is to keep distributional questions on the agenda. Its occlusion is the lack of enforcement power: UN resolutions can frame demands but cannot compel quota reform or debt cancellation without the consent of major shareholders.

2.7.1 African Perspective (PRIMARY)

From an African vantage point, the Bretton Woods system is not first and foremost a technical solution to the problem of hegemonic public goods; it is a historically specific arrangement through which economic sovereignty has been stratified, deferred, and, in many periods, hollowed out. The central puzzle is therefore not whether a hegemon can supply liquidity, stable exchange rates, and crisis lending, but whether an international order built on unequal sovereignty can ever be neutral, even when it is efficient by the standards of its most powerful shareholders. African scholarship reconstructs this order from the experience of states that entered it not as architects but as latecomers, often through colonial subordination, and that have repeatedly encountered its institutions as sites where political independence is separated from economic self-determination. Nkrumah's concept of neo-colonialism captures the foundational suspicion: formal sovereignty can coexist with continued external control over finance, trade, currency, and development strategy, so that the flag changes while the structure of dependence remains. Rodney's analysis of underdevelopment as an active historical process rather than a natural condition sharpens the point; Bretton Woods institutions are not merely responding to African backwardness but are embedded in a longer chain of extraction, unequal exchange, and constrained industrialization. Fanon's insistence that decolonization must be a total transformation, not only a transfer of political office, gives the critique its existential dimension: an order that leaves the colonized dependent on externally determined prices, credit, and policy templates reproduces the colonial relation in economic form. Cabral's emphasis on returning to the source implies that liberation requires control over the material conditions of production and social reproduction, not simply participation in institutions designed elsewhere. Nyerere's ujamaa and self-reliance tradition adds a normative alternative: development should be measured by collective dignity and autonomous capacity, not by integration into a hierarchy whose rules are set by creditors. Taken together, these thinkers frame Bretton Woods not as a neutral framework but as one of the principal arenas in which neo-colonialism has been institutionalized.

The mechanism is not only ideological; it is concrete and institutional. The IMF and World Bank allocate voice through quota formulas that reflect economic weight at particular historical moments, which means that African states, individually small in GDP and trade shares, possess limited formal influence even when their collective needs are large. Conditionality converts liquidity into policy leverage: loans are accompanied by requirements concerning fiscal consolidation, privatization, trade liberalization, exchange-rate adjustment, and public-sector reform. The dollar's role as global reserve currency, consolidated after the 1971 collapse of Bretton Woods fixed rates, means that African states must earn or borrow dollars to import, service debt, and stabilize currencies, while the United States can finance deficits in its own currency. Special Drawing Rights are allocated according to quota, so a global liquidity injection such as the 2021 allocation of roughly $650 billion delivers proportionally more to already wealthy economies, leaving African states with a small

share relative to need and forcing debates about rechanneling that reproduce donor-recipient hierarchies. Structural adjustment programs in the 1980s and 1990s are remembered in much African scholarship not as technocratic stabilization but as a contraction of developmental state capacity, with cuts to health, education, and public employment, and with long-term effects on industrial policy and social protection. The 1997 Asian financial crisis, though geographically outside Africa, reinforced African suspicions because IMF conditionality appeared to prioritize creditor confidence and rapid liberalization over domestic stability, suggesting that crisis management is also a mechanism for disciplining states into market conformity. The NIEO demands of the 1970s, including commodity price stabilization, technology transfer, debt relief, and voting reform, represented an African and broader Global South attempt to renegotiate this hierarchy; their partial defeat is read as evidence that Bretton Woods institutions are responsive to power, not merely to need. More recent BRICS reform demands, in which South Africa participates, continue this tradition but also expose its tensions: African states seek greater voice within existing institutions while also experimenting with alternative forums, yet those forums may reproduce new dependencies rather than end old ones.

Bayart's concept of extraversion is crucial for avoiding a simplistic victim narrative. African political elites have not merely suffered Bretton Woods; they have also used external resources, aid, debt, and institutional relationships to build domestic power. This means the African perspective must include internal agency and complicity: conditionality can be resisted, negotiated, instrumentalized, or welcomed by factions within states. Mamdani's analysis of the bifurcated postcolonial state helps explain why adjustment often landed unevenly, reinforcing distinctions between citizens with rights and subjects governed through custom and coercion, and why reforms that weakened public institutions could strengthen authoritarian or patrimonial rule. Mbembe's work on the postcolony and on necropolitics suggests that debt and austerity are not just economic constraints but modes of governing life, in which some populations are rendered disposable in the name of fiscal credibility. Grovogui's reconstruction of sovereignty in international law shows that African sovereignty has often been treated as quasi-sovereignty, contingent on recognition by powerful states and institutions; Bretton Woods governance is one of the sites where that contingency is reproduced. Oyěwùmí and Tamale add an epistemic and gendered dimension: development categories, household models, and policy metrics often universalize Western social arrangements, obscuring African gender systems and local knowledge. From this angle, Bretton Woods is not only a financial architecture but a knowledge regime that defines what counts as development, rationality, and reform.

The African perspective contributes what the other four largely cannot: a view of international order in which stability and hierarchy are not separable. Western hegemonic stability theory tends to treat public goods as potentially welfare-enhancing for all; the African vantage insists that the same institutions can stabilize an unequal structure. It reveals the racialized and colonial genealogy of sovereignty, the epistemic violence of conditionality, and the way liquidity provision can become a technology of discipline. It also centers African agency, showing that African states and movements have repeatedly proposed alternatives, from the Lagos Plan of Action to the NIEO, from self-reliance doctrines to contemporary demands for SDR rechanneling and quota reform. The Ezulwini Consensus, though most often discussed in relation to UN Security Council reform, expresses a broader African claim: global governance must be restructured to reflect equitable representation, not merely the economic weight of the powerful. In financial terms, that claim translates into demands for quota reform, voice, debt cancellation, and conditionality-free liquidity. The perspective also highlights that reform debates are not only about efficiency but about recognition: who is treated as a full sovereign, whose knowledge counts, and whose suffering is legible in policy design.

Its occlusions must be acknowledged if it is to be steel-manned rather than romanticized. It can homogenize a continent of fifty-four states with divergent interests, resource endowments, and institutional capacities; not

all African states experience Bretton Woods in the same way, and some have benefited from market access, debt relief, and crisis support. It can understate the genuine public-goods problem identified by Kindleberger: the absence of a hegemon willing to provide liquidity during the Great Depression was catastrophic, and some form of coordinated stabilization may be preferable to fragmentation. It can also understate the agency of African elites in extraversion, as Bayart reminds us, and can risk idealizing autarkic or state-led alternatives that have their own records of failure. It may not fully account for the interests of other non-Western powers, including China and Russia, whose critiques of dollar hegemony are not identical to African demands for structural transformation. Finally, it can sometimes treat Western self-critique as merely cosmetic, underestimating the extent to which scholars such as Stiglitz, Eichengreen, and Grabel have documented institutional failures and pushed for reform. The strongest version of the African perspective therefore does not deny that Bretton Woods institutions can provide liquidity or that reform is possible; it insists that reform must be measured by shifts in power, sovereignty, and distribution, not only by procedural transparency or reduced conditionality counts. On that standard, the 2021 SDR allocation and subsequent rechanneling debates are not simply technical adjustments but tests of whether the system can move from hierarchy toward genuine multilateralism.

2.7.2 Chinese Perspective

The Chinese perspective on hegemonic stability and Bretton Woods is reformist rather than revolutionary. It does not seek the abolition of the IMF, the World Bank, or the dollar-based trading system in the short term; rather, it argues that these institutions were built for a mid-twentieth-century distribution of power and must be adapted to a multipolar economy. This position follows from China's own trajectory: it benefited from export-led growth, foreign direct investment, and access to global markets under a relatively open trading order, while also experiencing the vulnerabilities of dollar dependence and external conditionality. Chinese officials and scholars typically acknowledge that Bretton Woods provided a framework for postwar reconstruction and trade expansion, but they criticize the concentration of voting power, the asymmetry of crisis lending, and the use of conditionality as an instrument of political influence. The 1971 Nixon shock is read less as a technical regime change than as evidence that the United States can unilaterally alter the rules of the monetary system when its domestic interests require it, exposing the exorbitant privilege of dollar issuance. The 1997 Asian financial crisis reinforced Chinese skepticism toward rapid capital-account liberalization and IMF-prescribed austerity, contributing to China's insistence on gradual financial opening and strong capital controls. The 2008 global financial crisis further strengthened the argument that Western financial governance had failed and that emerging economies deserved greater voice.

China's preferred response is institutional pluralism within a broadly multilateral framework. It has pushed for quota and voting reform in the IMF, supported the inclusion of the renminbi in the SDR basket in 2016, and promoted the Asian Infrastructure Investment Bank and the New Development Bank as complements rather than replacements for Bretton Woods institutions. The BRICS agenda, including demands for reform of global financial governance, is framed as democratization rather than secession. Chinese discourse emphasizes "win-win" development, non-interference, and infrastructure finance, contrasting its approach with the policy conditionality associated with Western-led institutions. At the same time, China's position is constrained by its own interests: it holds large dollar reserves, depends on export markets, and benefits from the stability of the current system even as it criticizes its asymmetries. This creates a reformist posture that wants more influence without assuming the full burdens of hegemonic provision. The perspective contributes an important corrective to Western hegemonic stability theory by showing that order can be maintained through institutional diversification and that legitimacy requires voice, not only efficiency. It also highlights that the Bretton Woods system is not static; it has been repeatedly renegotiated, and its future may involve layered

governance rather than a single hegemon. Its occlusions are equally significant. Chinese rhetoric of multipolarity can obscure the ways in which its own lending, infrastructure projects, and bilateral arrangements create new dependencies and asymmetries. It tends to understate concerns about transparency, debt sustainability, and political conditionality in its own development finance. It also frames reform in terms that often align with Chinese strategic interests, making it difficult to distinguish universalist claims from great-power ambition. The strongest objection to the Chinese perspective is that its reformism may be less a challenge to hierarchy than a demand for a larger share of it, leaving the underlying structure of dollar dominance and creditor power largely intact.

2.7.3 Russian Perspective

The Russian perspective treats Bretton Woods and dollar hegemony as instruments of American power rather than as neutral public goods. From this vantage, the system's central feature is not liquidity provision but the capacity of the United States to convert monetary dominance into geopolitical leverage. The 1971 Nixon shock is interpreted as the moment when the dollar's link to gold was severed, freeing the United States to finance deficits and project power without external constraint. The IMF is seen not as an impartial crisis manager but as an institution whose conditionality and surveillance reinforce Western preferences, particularly when applied to states outside the Western core. Russian discourse emphasizes that the post-1944 order was designed by and for the victors of the Second World War, and that its persistence after the Cold War reflected unipolar dominance rather than universal consent. Sanctions, especially financial sanctions and exclusion from payment systems, are treated as proof that interdependence has been weaponized; this connects the Bretton Woods legacy to contemporary conflicts and to the broader argument that dollar centrality is a security threat. The Russian perspective therefore aligns with demands for de-dollarization, alternative payment mechanisms, and BRICS-led financial cooperation, while also invoking a language of multipolarity and sovereign equality.

This perspective contributes a sharp awareness that financial order is never merely economic. It highlights the coercive potential of reserve-currency status, the political uses of conditionality, and the vulnerability of states that depend on dollar liquidity. It also draws attention to the ways in which crisis management can serve creditor interests, a point that resonates with African and other Global South critiques. In the context of the 1997 Asian crisis, Russian analysts would likely emphasize that IMF programs protected international creditors and imposed adjustment on domestic populations, reinforcing the view that Bretton Woods institutions manage crises in ways that preserve the hierarchy of global finance. The perspective is further strengthened by its insistence that reform cannot be limited to quota shares; it must address the structural privilege of the reserve-issuing state. However, the Russian position is heavily shaped by its own geopolitical conflicts and by a desire to escape Western sanctions, which means its universalist claims are entangled with particular strategic interests. It occludes the extent to which Russia's own economy remains dependent on commodity exports and on access to global markets, and it offers few fully developed institutional alternatives capable of replacing the liquidity, depth, and credibility of the dollar system. Its critique of Western hegemony is often coupled with a defense of state sovereignty that can be selectively applied, particularly when Russian actions are at issue. The strongest objection is that anti-hegemonic rhetoric may mask an attempt to build a parallel sphere of influence rather than a genuinely equitable order. Even so, the Russian perspective remains important because it forces attention onto the security dimension of monetary power, a dimension that Western institutionalism often treats as secondary.

2.7.4 Western Perspective

The Western perspective is anchored in hegemonic stability theory and institutionalist analysis. It begins

from the Kindleberger problem: the Great Depression was deepened by the absence of a hegemon willing and able to provide liquidity, maintain open markets, and coordinate adjustment. On this view, Bretton Woods was a successful response to that failure, creating institutions that supplied public goods—stable exchange rates, crisis lending, development finance, and trade liberalization—under American hegemony. Keohane's argument that institutions can persist after hegemony by reducing transaction costs and information asymmetries provides the theoretical basis for believing that the order can survive relative decline. Gilpin's political economy adds that international economic order reflects the distribution of power but also requires ideological legitimacy and institutionalized rules. From this perspective, the 1971 Nixon shock did not destroy the system; it transformed it into a dollar-centered order in which floating rates, deep financial markets, and IMF surveillance continued to provide coordination. The rise of the dollar as global reserve currency is treated as a source of stability and efficiency, even if it confers privilege on the United States. Western scholars and officials generally defend the IMF and World Bank as reformable institutions that have adapted to new challenges, including the NIEO critique, structural adjustment controversies, the 1997 Asian crisis, and contemporary demands for SDR rechanneling.

This perspective is not uncritical. Stiglitz's critique of IMF conditionality and of market fundamentalism represents an important internal challenge, arguing that the Fund imposed inappropriate policies and worsened crises in East Asia and elsewhere. Eichengreen's historical work on Bretton Woods emphasizes that the system was always politically constructed and that its collapse reflected tensions between domestic and international objectives. Grabel's more recent analysis of global financial governance after 2008 suggests that institutions have become more fragmented and experimental, with space for capital controls and alternative arrangements. These self-critical strands acknowledge that conditionality has often been excessive, that surveillance has been asymmetric, and that the institutions have sometimes served creditor interests. Nevertheless, the dominant Western view holds that the alternatives—fragmented liquidity, bilateral dependence, or politicized finance—are worse. It measures progress through procedural reform: more transparent conditionality, better debt-sustainability frameworks, increased but still limited quota adjustments, and targeted SDR rechanneling. The contribution of this perspective is its attention to systemic stability, institutional learning, and the genuine public-goods problem. It reminds critics that liquidity crises can be devastating and that coordination requires credible institutions. Its occlusion is a tendency to treat power as a background condition rather than a constitutive feature of order. It often measures reform by institutional procedure rather than by shifts in substantive control, and it can underestimate the extent to which African, Chinese, Russian, and UN critiques identify not merely policy errors but structural hierarchy. The strongest objection is that Western institutionalism risks conflating the survival of institutions with their legitimacy, assuming that because Bretton Woods institutions are useful, their current distribution of power is acceptable.

2.7.5 UN Perspective

The UN perspective centers development finance, debt sustainability, and the gap between global resources and the Sustainable Development Goals. It does not treat Bretton Woods primarily as a problem of hegemonic stability; rather, it treats the international financial architecture as one component of a broader development system that must be aligned with human rights, poverty reduction, and sustainable development. UNCTAD has long carried the legacy of the NIEO, documenting commodity dependence, unequal exchange, and the constraints imposed by debt and conditionality. Financing for Development conferences have repeatedly called for debt relief, increased official development assistance, SDR rechanneling, and reform of international financial institutions. The UN's contribution is to keep distributional questions on the agenda and to frame global finance in terms of obligations to the most vulnerable. It has supported calls for the 2021 SDR allocation and for rechanneling unused SDRs to countries with the greatest need, while also emphasizing

that liquidity provision should not be accompanied by harmful conditionality. In this sense, the UN perspective bridges African demands for sovereignty and Western institutional reform by insisting that financial governance must be evaluated against development outcomes.

The UN perspective also highlights the temporal dimension of Bretton Woods contestation. From the NIEO in the 1970s through structural adjustment in the 1980s and 1990s, the Asian crisis in 1997, and BRICS reform demands after 2009, the UN has provided forums in which Global South grievances are articulated, even when they are not fully resolved. It treats the 1997 Asian crisis as a warning that financial liberalization without adequate safeguards can devastate development gains, and it treats the 2021 SDR allocation as evidence that the system can mobilize resources at scale but also as a reminder that allocation rules reproduce inequality. Its normative stance is reformist and solidaristic: it seeks a more equitable financial architecture within a multilateral framework, not the dismantling of global institutions. The perspective contributes a development-centered metric for evaluating hegemonic stability: an order is not stable if it produces recurrent debt crises, austerity, and unmet SDGs. Its occlusion is the lack of enforcement power. UN resolutions can frame demands and create norms, but they cannot compel quota reform, debt cancellation, or SDR rechanneling without the consent of major shareholders. This means the UN often functions as a moral and analytical counterweight rather than as a decision-maker. The strongest objection to the UN perspective is that its normative authority can create the appearance of action without altering power relations, allowing states to endorse development goals while resisting the financial transfers and institutional reforms required to achieve them. Even so, it remains indispensable because it prevents the debate over Bretton Woods from being reduced to either hegemonic efficiency or great-power rivalry, insisting that the ultimate test of international financial order is whether it enables inclusive and sustainable development.

SECTION 2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Exposes the distributional asymmetry of Bretton Woods governance; centers the experience of conditionality and debt; articulates reform demands from the NIEO through the Ezulwini Consensus	May understate the role of domestic policy choices and institutional weakness in crises; can treat all conditionality as illegitimate	Sovereign equality and developmental autonomy; international financial order must be accountable to those it affects	Structural adjustment programs in Africa (1980s–90s); SDR allocation disparities 2020–2022; African Union reform demands	Western: that governance reform without capacity-building risks institutional decay and that domestic institutional failure is a genuine causal factor
Chinese	Demonstrates that state-led development within Bretton Woods is possible; provides a model of gradual, sequenced integration; highlights double standards in IMF prescriptions	Understates the costs of its own mercantilist practices and opacity in lending; ambiguous on whether it seeks reform or replacement of the system	Multipolar stability; reform from within; non-interference in domestic affairs; strategic autonomy	China's rise within IMF quota system; maintenance of capital controls through 1997; AIIB creation as parallel institution	Western: that Chinese lending lacks transparency and conditionality standards, creating a race to the bottom in governance

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Russian	Highlights the weaponization of dollar hegemony and financial sanctions; questions the legitimacy of unilateral US power over global finance	Ignores Russia's own use of economic coercion; offers no constructive alternative architecture; conflates critique with great-power rivalry	Sovereign equality; opposition to unipolar financial order; multipolarity as an end in itself	De-dollarization rhetoric; BRICS expansion; sanctions on Russia 2022; 1998 ruble crisis experience	African: that Russian critique serves great-power rivalry rather than developmental justice and does not address the needs of the global South
Western	Provides the theoretical and institutional framework for hegemonic stability; acknowledges need for reform; self-critique (Stiglitz) on conditionality	Treats US interests as global public goods; underestimates the legitimacy deficit; applies double standards in crisis response	Rules-based order with US leadership; efficiency, stability, and market discipline as foundations of prosperity	Post-WWII growth; IMF crisis lending; G20 coordination 2008; Stiglitz's critique of IMF overreach	African: that "rules-based" order is selectively enforced and that the rules are written by and for the powerful
UN	Maintains development finance agenda; quantifies SDG financing gap; provides normative counterweight to power politics	Lacks enforcement power; dependent on member state contributions; can create appearance of action without altering power relations	Inclusive development; human rights-based approach to finance; financial stability as means to human development	Monterrey Consensus; Addis Ababa Action Agenda; SDG financing gap reports; SDR rechanneling debates	Western: that normative authority without power creates illusion of action and that UN agencies lack the technical capacity to manage financial crises

SECTION 2.8 WORKED EXAMPLE (I do)

Case: The 1997–98 Asian Financial Crisis and IMF Conditionality

Levels of analysis

At the individual level, the crisis was shaped by the decisions of specific actors operating under radical uncertainty. IMF staff economists, drawing on the Washington Consensus playbook, prescribed fiscal austerity and high interest rates to Thailand, Indonesia, and South Korea. Finance ministers and central bankers in these countries faced impossible choices between defending pegged exchange rates and preserving domestic output. Hedge fund managers and currency speculators, operating with leverage and short time horizons, accelerated the collapse of the Thai baht in July 1997. The individual-level analysis reveals that the crisis was not merely a structural inevitability but was mediated by human judgment, cognitive frameworks, and incentive structures — including the moral hazard created by implicit guarantees to domestic banks and the IMF's own lending practices, which may have encouraged risk-taking by signaling that crises would be managed.

At the state level, the crisis originated in the domestic political economies of the affected countries. Thailand, Indonesia, South Korea, and Malaysia had pursued rapid growth through export-led industrialization, but their financial sectors were characterized by weak regulation, connected lending, and implicit government guarantees. Capital account liberalization, often undertaken under pressure from the US Treasury and the IMF, allowed short-term foreign borrowing to flood in. When confidence evaporated, the sudden stop of capital flows forced abrupt adjustments. The state-level analysis shows that the crisis was endogenous to domestic institutional weaknesses, but that these weaknesses were amplified by the policy advice and market access conditions promoted by external actors.

At the systemic level, the crisis exposed the fragility of the post-Bretton Woods dollar standard and the absence of a genuine international lender of last resort. The United States, as hegemon, had an interest in preventing contagion that might threaten global financial stability, but its response was shaped by domestic political constraints and by the ideological preferences of the Clinton administration's Treasury. The IMF, as the systemic institution, lacked the resources and the mandate to act as a true lender of last resort; its conditionality reflected the preferences of its major shareholders rather than the needs of the borrowing countries. The systemic analysis reveals that the crisis was not just a series of national failures but a failure of the international financial architecture to manage capital mobility.

At the transnational level, the crisis propagated through channels that transcended national borders. Cross-border bank lending, portfolio investment, and derivative positions linked the fates of East Asian economies to global financial markets. Rating agencies downgraded sovereign debt, triggering forced selling by institutional investors with mandate constraints. Contagion spread from Thailand to Indonesia, South Korea, Malaysia, and beyond, reaching Russia and Brazil in 1998. The transnational analysis demonstrates that the crisis was a product of financial globalization itself, and that the IMF's country-by-country approach was structurally inadequate to address a systemic phenomenon.

Mechanism

The mechanism of the Asian financial crisis can be decomposed into three linked stages. First, the buildup: capital account liberalization in the 1990s allowed short-term foreign capital to flow into East Asian economies, where it was intermediated by weakly regulated domestic banks into speculative real estate and equity investments. Exchange rates were pegged to the dollar, creating an implicit guarantee that encouraged

unhedged foreign borrowing. Second, the trigger: the collapse of the Thai baht in July 1997, following the exhaustion of foreign reserves, initiated a sudden stop. Capital flight accelerated as investors reassessed risk, and the pegs became unsustainable. Third, the IMF intervention: the Fund provided emergency financing conditioned on fiscal austerity, monetary tightening, and structural reforms including financial sector restructuring and corporate governance changes. The mechanism of conditionality operated through the leverage of financing: countries in crisis had no alternative source of liquidity, and the IMF's terms were non-negotiable. The result was a deepening of the recession in the short run, as austerity contracted domestic demand, followed by recovery driven by export competitiveness gained through currency depreciation and by the eventual restructuring of debt. The mechanism thus combined market-driven contagion with institutionally mediated adjustment, and the distributional consequences fell disproportionately on workers, small businesses, and the poor, while creditors and large corporations were largely protected.

Perspective reconstruction

African perspective: The Asian crisis and IMF conditionality confirmed what African states had experienced during the structural adjustment era of the 1980s and 1990s: that Bretton Woods institutions impose uniform policy prescriptions that ignore local institutional contexts and social costs. African scholars and policymakers noted that the same Fund that demanded austerity from Thailand and Indonesia had demanded it from Ghana, Nigeria, and Zambia a decade earlier, with similarly devastating effects on public services and employment. The African vantage point reveals that the Asian crisis was not an anomaly but a systemic feature of a financial architecture that socializes losses while privatizing gains, and that the IMF's claim to technocratic neutrality masks a political project of enforcing market discipline on the global South. From this perspective, the Ezulwini Consensus and subsequent African Union demands for quota reform and SDR rechanneling are not requests for charity but claims for sovereign equality in global economic governance. The African perspective also highlights that the recovery of East Asian economies owed more to capital controls and state intervention — Malaysia's rejection of IMF conditionality being the clearest case — than to the Fund's prescriptions, a lesson that African policymakers have drawn in their own debates over debt and development finance.

Chinese perspective: China observed the Asian crisis with alarm and drew the lesson that capital account liberalization without adequate institutional safeguards is dangerous. Beijing's response was to maintain capital controls, accumulate foreign exchange reserves, and pursue gradual financial reform on its own terms — a strategy that insulated China from the 1997 contagion and that has shaped its approach to global financial integration ever since. From the Chinese vantage point, the crisis demonstrated both the risks of premature liberalization and the value of state capacity in managing financial flows. China also noted that the IMF's prescriptions for its neighbors were not applied to Western economies facing similar crises, reinforcing the perception of double standards. The Chinese perspective contributes the insight that development within the Bretton Woods system is possible but requires strategic autonomy, and that the Fund's legitimacy depends on its willingness to accommodate diverse development models.

Russian perspective: Russia experienced its own financial crisis in 1998, partly triggered by contagion from Asia, and its perspective on the IMF is shaped by the experience of conditionality during the Yeltsin era. From Moscow's vantage point, the Fund's prescriptions — privatization, fiscal austerity, and market liberalization — facilitated the transfer of state assets to oligarchs and contributed to the collapse of the ruble. The Russian perspective frames the IMF as an instrument of Western geopolitical influence, using financial conditionality to reshape the domestic political economies of non-Western states. The 1997–98 crisis reinforced Russian skepticism toward dollar hegemony and contributed to the long-term project of de-dollarization and the

construction of alternative financial institutions. The Russian perspective's contribution is its insistence that financial institutions are never neutral but are embedded in power relations, though it occludes Russia's own use of economic coercion and its lack of a constructive alternative architecture.

Western perspective: The Western perspective, particularly as articulated by the US Treasury and the IMF, framed the Asian crisis as a consequence of crony capitalism, weak financial regulation, and premature capital account liberalization. The Fund's conditionality was defended as necessary to restore market confidence, restructure insolvent financial systems, and prevent moral hazard. Western scholars such as Eichengreen and Stiglitz debated whether the IMF's prescriptions were appropriate — Stiglitz famously criticized the Fund for applying inappropriate templates and deepening the recession — but the mainstream Western view held that the crisis validated the need for stronger domestic institutions and greater transparency. The Western perspective's contribution is its attention to the role of domestic governance failures and its acknowledgment, post-crisis, that capital account liberalization should be sequenced carefully. Its occlusion is the tendency to treat Western financial practices as the benchmark and to underestimate the systemic role of dollar hegemony and capital mobility in generating crises.

UN perspective: The UN perspective on the Asian crisis emphasized the human costs of IMF conditionality and the need for a more development-centered approach to crisis management. UN agencies documented the rise in poverty, unemployment, and inequality that followed austerity programs, and called for social safety nets, debt relief, and greater attention to the Millennium Development Goals. The UN's contribution is its insistence that financial stability is a means to human development, not an end in itself, and that crisis management must be accountable to affected populations. The UN perspective also highlights the gap between the resources available to the IMF and the scale of financing needed for sustainable development, a theme that has persisted through the 2020 SDR allocation debates. Its limitation is that it lacks the institutional power to alter IMF conditionality or to compel quota reform.

Adjudication

The African perspective best explains the 1997–98 Asian crisis as a systemic phenomenon rather than a series of national failures, because it correctly identifies the pattern of conditionality as a recurring feature of Bretton Woods governance that predates and postdates the Asian episode. The African vantage point reveals that the IMF's prescriptions were not tailored to Asian conditions but drawn from a standard template applied across the global South, and that the distributional consequences — borne by workers and the poor while creditors were protected — were structurally predictable. However, the African perspective risks underweighting the genuine domestic institutional weaknesses in the affected countries, including connected lending, weak supervision, and implicit guarantees, which created the vulnerabilities that capital flows exploited. The Western self-critique, particularly Stiglitz's intervention, partially addresses this by acknowledging that the IMF's prescriptions were inappropriate, but it stops short of questioning the legitimacy of the Fund's governance structure. The Chinese perspective adds the crucial insight that capital controls and state capacity can provide insulation, but it does not fully account for the contagion dynamics that affected even well-regulated economies. The Russian perspective correctly identifies the geopolitical dimension of financial institutions but offers no constructive alternative. The UN perspective captures the human costs but lacks analytical leverage on the mechanism. The most complete explanation combines the African perspective's structural critique with the Western self-critique's attention to domestic institutional failure, yielding a verdict that the crisis was produced by the interaction of domestic vulnerabilities with a global financial architecture that amplified risk and distributed losses asymmetrically.

SECTION 2.9 PROBLEM PAIR (We do)

1. Define the mechanism by which the 2021 SDR allocation was distributed and explain why quota-based allocation is not need-based.

2. Reconstruct the African, Chinese, Russian, Western, and UN perspectives on rechanneling, steel-manning each.

3. Identify the level of analysis at which the SDR debate is most coherently explained and justify excluding at least one alternative level.

4. Compare the SDR case with one historical analogue and state what is similar and what differs.

5. Use the data on IMF voting shares, regional SDR shares, conditionality counts, and USD reserve share to evaluate whether the case shows reform or reproduction.

6. Specify two falsifiers: one that would support "reform" and one that would support "reproduction."

Model answer (continuous prose): The 2021 allocation of $650 billion in Special Drawing Rights is best understood as a liquidity operation conducted through an institution whose governance still reflects the power distribution of 1944 rather than the distribution of contemporary need. SDRs are reserve assets created by the IMF and allocated according to quota shares, which are tied to relative economic size and to bargaining power at Bretton Woods and in subsequent reviews. Consequently, the largest shares accrue to the United States, the euro area, Japan, and China, while African states receive a small fraction despite facing acute foreign-exchange and debt-servicing constraints. The mechanism is not simply market failure; it is institutionalized hierarchy. The IMF can create global liquidity, but the rules of creation allocate voice and resources together, so that the states most able to self-insure receive the largest automatic claims. Rechanneling proposals through the Poverty Reduction and Growth Trust and the Resilience and Sustainability Trust do not remove this hierarchy; they relocate it. Rechanneling converts an automatic, quota-based entitlement into a discretionary, donor-influenced flow. African governments and the African Union have argued, consistent with the Ezulwini Consensus and broader demands for UN Security Council and Bretton Woods reform, that liquidity should be allocated by need and that conditionality should not reproduce the structural-adjustment logic of the 1980s and 1990s. From this vantage point, rechanneling is a palliative: it may finance imports or climate adaptation, but it leaves quota shares, voting weights, and the US veto over major decisions intact. The African perspective thus treats the SDR episode as evidence that hegemonic stability without hegemonic reform produces managed dependency. Other perspectives qualify this judgment without refuting it. A Chinese perspective is typically reformist rather than revolutionary: Beijing has sought greater quota share and influence commensurate with its economic weight, supports multilateral liquidity provision, and has used bilateral swap lines and the Asian Infrastructure Investment Bank to diversify channels without dismantling the IMF. A Russian perspective emphasizes dollar hegemony and the weaponization of finance, arguing that SDRs and IMF programs are instruments of Western power; yet this critique often understates the extent to which non-Western states also benefit from dollar liquidity and IMF crisis lending. A Western perspective defends the 2021 allocation as a rapid, large-scale public good provided under US leadership, while acknowledging governance anachronisms; self-critique focuses on delayed quota reform and congressional constraints on US participation. The UN perspective frames the issue through development finance and the SDG financing gap, treating rechanneling as necessary but insufficient because it does not close structural

gaps in concessional finance or debt sustainability. The most useful historical analogue is the 1997-98 Asian financial crisis. In both cases, the IMF appeared as crisis manager under Western leadership, and conditionality became the terrain on which sovereignty and adjustment were contested. The difference is that in 1997 the IMF imposed austerity and structural conditions on affected states, whereas in 2021 the allocation itself was unconditional; conditionality enters only at the rechanneling stage. This difference matters because it shows institutional learning and a partial move away from the Washington Consensus, but it also shows that hierarchy persists in the gatekeeping function. The 1970s New International Economic Order demanded a more fundamental restructuring of trade, finance, and voting power; the SDR debate is narrower, focused on liquidity rather than production or terms of trade. Thus the case is less a replay of NIEO than a technocratic contest over who controls the spigot. At the systemic level, the episode supports the claim that hegemonic stability can outlast relative hegemonic decline through institutional inertia: the dollar remains central, IMF liquidity is dollar-denominated in effect, and US voting power remains decisive. Yet the same episode shows that inertia is not legitimacy. African states, middle powers, and UN agencies increasingly treat quota reform as a condition for institutional credibility. The data pattern is consistent with reproduction: voting shares change slowly, regional SDR shares track quotas rather than need, conditionality counts remain significant in IMF programs, and the dollar's share of reserves, though gradually declining, remains dominant. Evidence of genuine reform would include a quota realignment that raises African and low-income shares, an expansion of unconditional liquidity, and African representation in IMF decision-making beyond advisory roles. Evidence of reproduction would include stalled quota reviews, donor-controlled rechanneling, and continued reliance on conditionality. On current evidence, the 2021-2022 SDR episode is better described as a managed adaptation of hierarchy than as a transformation of it: it expanded liquidity without redistributing power, and it invited contestation without resolving it.

SECTION 2.10 INDEPENDENT MEMO (You do)

(a) Case description: In 2022-2024, policymakers debated whether to rechannel part of the 2021 $650 billion SDR allocation through the IMF's Resilience and Sustainability Trust and Poverty Reduction and Growth Trust to African and other vulnerable states. African governments, the African Union, and civil-society groups argued that quota-based allocation had given them too little liquidity relative to debt and climate needs, and that rechanneling should be large, predictable, and free of structural conditions. Donor governments and IMF management emphasized fiduciary safeguards, debt sustainability, and program conditionality. The debate occurred alongside stalled IMF quota reviews, continued dollar dominance in reserves, and UN warnings about an SDG financing gap. Assess whether this episode represents institutional reform of Bretton Woods hierarchy or its reproduction under new instruments.

(b) Required memo headings as prompts:

Mechanism: Explain how SDR allocation, quota shares, and rechanneling convert liquidity provision into hierarchical control; specify the causal chain from rule to distributional outcome.

Perspective reconstruction: Steel-man African, Chinese, Russian, Western, and UN views on whether rechanneling is reform or reproduction.

Historical analogue: Compare with one earlier episode (1997-98 Asian crisis, 1970s NIEO, or 1980s SAPs) and identify one similarity and one difference.

Falsifiers: State one observable development that would falsify "reform" and one that would falsify "reproduction."

(c) Self-check: Does your memo clearly separate description of the SDR debate from explanation of its causes, prediction of likely outcomes, and prescription for institutional change?

SECTION 2.11 HINGE QUESTION

The 2021 $650 billion SDR allocation most clearly illustrates which proposition about hegemonic stability and Bretton Woods institutions?

A. Quota-based liquidity provision automatically corrects global imbalances by directing resources to greatest need.
B. Hegemonic stability can persist through institutional inertia even when the hegemon's relative power declines, because rules and dollar centrality lock in hierarchy.
C. The absence of a hegemon in 2021 caused the IMF to fail to provide any public goods.
D. SDR rechanneling proves that African states now hold decisive influence over IMF governance.

Correct answer: B.

Distractor diagnoses:

- Option A conflates liquidity provision with need-based redistribution; SDR quotas reflect relative economic and bargaining power, not financing need.
- Option C misreads Kindleberger's hegemonic-stability argument: in 2021 the United States remained the decisive hegemon and the IMF did provide a large liquidity public good.
- Option D overstates reform; rechanneling remains donor-controlled and quota shares, voting weights, and US veto power were not transformed.

SECTION 2A — DATA LAB

Table 1 — IMF Quota and Voting Shares (post-2016 reform, selected members)

Member	Quota (SDR bn)	Voting share (%)	Rank
United States	82.99	16.52	1
Japan	30.82	6.15	2
China	30.48	6.08	3
Germany	26.63	5.32	4
France	20.14	4.03	5
United Kingdom	20.14	4.03	6
Italy	15.07	3.02	7
India	13.11	2.63	8
Russia	12.93	2.59	9
Brazil	11.02	2.22	10
South Africa	3.05	0.64	24
Nigeria	2.45	0.51	29
Sub-Saharan Africa (all 46 members)	~11.5	~2.3	—

Member	Quota (SDR bn)	Voting share (%)	Rank
European Union (aggregate)	~130	~26	—

Source: IMF, "IMF Members' Quotas and Voting Power, and IMF Board of Governors" (2024). The United States retains an effective veto over amendments requiring an 85% supermajority; no other single member approaches the 15% blocking threshold.

Table 2 — 2021 Special Drawing Rights Allocation of USD 650 billion, by income group

Group	Share of allocation (%)	Approx. amount (USD bn)	Share of global GDP (%)
Advanced economies	58.1	377.6	~42
Emerging market and developing economies (excl. LIDCs)	32.6	212.0	~45
Low-income developing countries (LIDCs)	3.2	20.8	~3
Africa (all)	5.1	33.2	~3
— of which Sub-Saharan Africa	3.6	23.4	~2

Source: IMF (2021) allocation data; ONE Campaign (2021) rechanneling analysis; World Bank GDP shares (2021). The allocation was made in proportion to existing IMF quotas, not to pandemic need or income level.

Table 3 — USD Share of Global Foreign-Exchange Reserves, 1999–2024 (IMF COFER)

Year	USD (%)	EUR (%)	JPY (%)	GBP (%)	CNY (%)	Other (%)
1999	71.0	18.0	6.4	2.9	—	1.7
2005	66.5	24.0	3.8	3.6	—	2.1
2010	61.8	26.0	3.7	4.0	—	4.5
2015	65.7	19.1	3.8	4.7	1.1	5.6
2020	59.0	21.2	5.8	4.7	2.3	7.0
2024	58.4	20.0	5.5	4.9	2.8	8.4

Source: IMF Currency Composition of Official Foreign Exchange Reserves (COFER), quarterly releases, 1999–2024. Percentages are shares of allocated reserves; "Other" includes AUD, CAD, CHF, and smaller currencies.

Table 4 — Average Number of Conditions per IMF Program, by Decade

Period	Avg. conditions per program	Dominant conditionality type
1980–1989	~2.5	Macroeconomic (fiscal, monetary)
1990–1999	~6.5	Structural (privatization, trade liberalization)
2000–2009	~10.5	Deep structural (labor markets, pension reform)
2010–2019	~7.0	Fiscal consolidation + targeted social spending
2020–2023	~5.5	Emergency liquidity + debt sustainability

Source: Kentikelenis, Stubbs, and King (2016), "IMF Conditionality and Development Policy Space, 1985–2014," Review of International Political Economy*; IMF Independent Evaluation Office (IEO) reviews (2014, 2020). Counts reflect legally binding prior actions and performance criteria, not indicative targets.*

Analysis Questions

Q1 (Trend). The COFER series shows the USD share of global reserves falling from roughly 71% in 1999 to roughly 58% in 2024, a decline of about thirteen percentage points over twenty-five years, while the "Other" category (AUD, CAD, CHF, and smaller currencies) rose from 1.7% to 8.4% and the CNY share rose from zero to 2.8%. Does this trend falsify the hegemonic-stability thesis, or does it illustrate a distinction between *structural* hegemony (the dollar's role in invoicing, clearing, and safe-asset provision) and *compositional* hegemony (the share of reserves held in dollars)? Specify the mechanism by which a hegemon can lose reserve share without losing systemic dominance, and identify the threshold or indicator that would genuinely challenge the thesis.

Q2 (Level of analysis). The 2021 SDR allocation can be analyzed at four levels. At the *individual* level, which households and firms in African states gained purchasing power from the roughly USD 33 billion that reached the continent? At the *state* level, how did finance ministries use SDRs to service external debt or finance imports? At the *systemic* level, what does the allocation reveal about the distribution of liquidity creation in the international monetary system? At the *transnational* level, how did private creditors, rating agencies, and the IMF's own surveillance apparatus interact with the allocation? Which level is most analytically productive for explaining why Africa received 5.1% of an allocation justified by pandemic need, and which level is most productive for explaining what would have to change for the next allocation to differ?

Q3 (Perspective reconstruction — all five). Reconstruct how each perspective reads Table 2 (the 2021 SDR allocation). The African perspective must be developed first and at greatest length: how does the Ezulwini Consensus frame the allocation as a reproduction of quota-based hierarchy, and what does it demand instead? The Chinese perspective: does Beijing treat the allocation as a reformist opportunity or a confirmation of dollar dependency? The Russian perspective: how does Moscow read the allocation through the lens of sanctions vulnerability and de-dollarization? The Western perspective: how do US and European officials defend the quota-proportional formula, and what self-critique exists within that camp (Stiglitz, Grabel)? The UN perspective: how does the SDG financing gap frame the allocation as insufficient, and what institutional alternatives does it propose (the Liquidity and Sustainability Facility, the G20 Common Framework)?

Q4 (Interpretation). Table 4 shows average conditionality counts peaking at roughly 10.5 per program in the 2000s and declining to roughly 5.5 in 2020–2023. Two competing interpretations exist. Interpretation A (institutional learning): the IMF genuinely reduced conditionality after the 2008 crisis and the 2010s reviews, shifting toward "ownership" and "streamlining." Interpretation B (modality shift): the *number* of conditions

fell but their *depth* increased, with fiscal consolidation targets and debt-sustainability frameworks replacing structural conditions, and with conditionality migrating from program documents to surveillance reports and debt-sustainability analyses. Adjudicate between these interpretations using the evidence in Table 4 and the canonical sources (Stiglitz 2002; Grabel 2018; Kentikelenis et al. 2016). What observable implication would distinguish them?

Q5 (Limitation). What do these four tables systematically fail to capture about power in the Bretton Woods system? Consider at least three of the following: (a) the informal power of the US Treasury and the New York Fed in dollar swap lines; (b) the role of private credit-rating agencies in determining which states can access SDR rechanneling; (c) the epistemic power of IMF staff in defining "debt sustainability" and "macroeconomic stability"; (d) the absence of African representation in the IMF's executive board decision-making on conditionality design. For each, explain why its omission from the tables matters for the hegemonic-stability thesis.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — "The Bretton Woods Triangle"

What to draw. A large equilateral triangle on a single page, oriented with one vertex at the top. At the top vertex, write "Fixed Exchange Rates (par values, ±1% band)." At the bottom-left vertex, write "Capital Controls (Bretton Woods Agreement, Article VI)." At the bottom-right vertex, write "Dollar-Gold Convertibility (USD 35/oz, US Treasury guarantee)." In the center of the triangle, draw a small circle labeled "US Hegemony (lender of last resort, market of last resort, reserve currency)." Draw three arrows from the center circle to each vertex, labeled respectively "enforces," "permits," and "guarantees." Outside the triangle, on the left side, draw a dashed arrow pointing inward labeled "Kindleberger's public goods (1973)." On the right side, draw a dashed arrow pointing outward labeled "Nixon shock (1971) — vertex removed."

How to label it. Use a bold title at the top: "The Bretton Woods Triangle, 1944–1971." Below the triangle, add a legend: solid lines = institutional commitments; dashed lines = external shocks or theoretical claims. In the bottom margin, write: "The triangle collapses when any vertex is removed; the Nixon shock removed dollar-gold convertibility, leaving floating rates and capital mobility to reconstitute the system around dollar hegemony without gold."

Perspective overlay. Annotate the top vertex in red ink: "African view: fixed rates stabilized import prices but locked in commodity-export dependence." Annotate the bottom-left vertex in blue ink: "Chinese view: capital controls preserved policy space; their removal in the 1990s enabled crisis." Annotate the bottom-right vertex in green ink: "Western view: convertibility anchored expectations; its end was regrettable but necessary." Annotate the center circle in purple ink: "UN view: the center should be multilateral, not unilateral."

Visual 2 — "Kindleberger's Public-Goods Provision (Hub and Spoke)"

What to draw. A central hub circle labeled "Hegemon (United States, 1945–1971)." Four spokes radiate outward to four rectangular boxes. Spoke 1 (top): "Lender of Last Resort — discount window, swap lines, IMF quota." Spoke 2 (right): "Market of Last Resort — countercyclical import demand, Marshall Plan, commodity purchases." Spoke 3 (bottom): "Stable Reserve Currency — dollar-gold, deep Treasury market, convertibility." Spoke 4 (left): "Countercyclical Lending — IBRD, Ex-Im Bank, bilateral aid." Each box

has a small icon: a bank for spoke 1, a shopping cart for spoke 2, a coin for spoke 3, a handshake for spoke 4. Below the hub, draw a dashed circle labeled "Absence of Hegemon (1929–1933)" with a red X through it, and an arrow pointing to a small box labeled "Great Depression — competitive devaluations, tariff wars, liquidity collapse."

How to label it. Title: "Kindleberger (1973): The Hegemon as Public-Goods Provider." Subtitle: "Order requires a single state willing to bear the costs of stability." In the bottom margin, write the causal chain: "No hegemon → no lender of last resort → liquidity collapse → competitive devaluation → trade contraction → depression."

Perspective overlay. Annotate the hub in red ink: "African view: the hegemon's 'public goods' were provided to Europe; Africa received extractive terms." Annotate spoke 2 in blue ink: "Chinese view: market of last resort became a tool of leverage, not stability." Annotate spoke 3 in green ink: "Western view: the dollar's reserve role is a service, not exploitation." Annotate the dashed circle in purple ink: "UN view: multilateral institutions can substitute for a single hegemon."

Visual 3 — "SDR Allocation as Mirror of Quota (Bar Chart Sketch)"

What to draw. A hand-drawn grouped bar chart with five regions on the x-axis: "Advanced Economies," "Emerging Markets (excl. LIDCs)," "Low-Income Developing," "Africa (all)," "Sub-Saharan Africa." For each region, draw two adjacent bars: a taller bar in dark blue labeled "Share of global GDP (%)" and a shorter or taller bar in red labeled "Share of 2021 SDR allocation (%)." The advanced-economies bar pair should show GDP ~42% and SDR ~58%; emerging markets ~45% GDP and ~33% SDR; LIDCs ~3% GDP and ~3% SDR; Africa ~3% GDP and ~5% SDR; Sub-Saharan Africa ~2% GDP and ~3.6% SDR. Draw a horizontal dashed line at 5% labeled "Proportional-to-need benchmark (illustrative)." Add error bars or brackets on the Africa bars labeled "Rechanneling gap: ~USD 30 bn pledged, ~USD 15 bn delivered (2024)."

How to label it. Title: "The 2021 SDR Allocation: Quota Logic vs. Need Logic." X-axis: "Region / income group." Y-axis: "Share (%) of global total." Legend: blue = GDP share; red = SDR share. Below the chart, write: "The allocation reproduced quota weights; advanced economies received ~58% of new liquidity despite ~42% of global GDP, while Africa received ~5% despite ~3% of GDP — a modest pro-poor tilt that rechanneling was meant to correct but has not."

Perspective overlay. Annotate the advanced-economies bars in green ink: "Western view: quota reflects contribution to IMF resources and risk-bearing." Annotate the Africa bars in red ink: "African view: quota reflects colonial-era voting weights, not contemporary need." Annotate the rechanneling gap bracket in blue ink: "Chinese view: rechanneling is a partial fix that leaves the quota structure intact." Annotate the dashed benchmark line in purple ink: "UN view: need-based allocation is the SDG-consistent standard."

SECTION 4 — CORNELL NOTES

Cue Column (prompts)

Cue	Notes
What is hegemonic stability theory?	Kindleberger (1973): order in the international economy requires a single hegemon willing to provide public goods — lender of last resort, market of last resort, stable reserve currency, countercyclical lending. The Great Depression resulted from the absence of such a hegemon after British decline and before US willingness. Scope condition: the hegemon must internalize the costs of stability; free-riding by others is assumed.
What is the Bretton Woods architecture?	IMF (exchange-rate surveillance, short-term liquidity), IBRD (long-term development lending), fixed par values (±1%), capital controls (Article VI), dollar-gold convertibility at USD 35/oz. Designed at Bretton Woods, NH, July 1944. Premise: avoid 1930s competitive devaluations and beggar-thy-neighbor tariffs.
Gilpin vs. Keohane	Gilpin (1987): hegemonic stability is structural; order decays as hegemon declines; transition periods are conflict-prone. Keohane (1984): institutions persist after hegemony through "after hegemony" — sunk costs, information, and reduced transaction costs create path dependence. Adjudication: institutions persist but lose enforcement capacity; hegemony matters for creation, less for maintenance.
1971 Nixon shock	Suspension of dollar-gold convertibility (August 15, 1971); Smithsonian Agreement (December 1971) attempted realignment; collapse of fixed rates by 1973. Result: floating rates, capital mobility, and dollar hegemony without gold — "exorbitant privilege" (Giscard d'Estaing) plus seigniorage.
NIEO and SAPs	NIEO (1974 UN General Assembly Resolution 3201): demands for commodity price stabilization, technology transfer, debt relief. Rejected by West. SAPs (1980s): IMF/World Bank conditionality — privatization, trade liberalization, fiscal austerity. Critiqued by Stiglitz (2002) and African scholars as undermining development sovereignty.

Cue	Notes
Asian crisis 1997–98	Thailand float (July 1997); contagion to Indonesia, Korea, Malaysia. IMF programs: high interest rates, fiscal austerity, structural conditions. Critique: procyclical policy deepened recession; Malaysia's capital controls (Mahathir) recovered faster. Stiglitz (2002) argues IMF misdiagnosed liquidity crisis as solvency crisis.
2021 SDR allocation	USD 650 bn allocated August 2021, largest in IMF history. Distributed by quota: advanced economies ~58%, Africa ~5%. Rechanneling pledges (~USD 100 bn target, ~USD 50 bn pledged by 2024) partially delivered. African states demand quota reform and need-based allocation (Ezulwini Consensus, 2005).
USD reserve share trend	COFER: 71% (1999) → 58.4% (2024). Decline is gradual, not collapse. Mechanism: diversification into smaller currencies and gold; sanctions (Russia 2022) accelerated de-dollarization rhetoric but not yet practice. Structural dominance (invoicing, clearing, safe assets) persists.
Conditionality counts	Peak ~10.5 conditions/program (2000s); decline to ~5.5 (2020–23). Debate: institutional learning (streamlining) vs. modality shift (fiscal targets replace structural conditions; conditionality migrates to surveillance). Kentikelenis et al. (2016) document persistence of intrusive conditions.
African perspective (primary)	Structural adjustment critique: SAPs undermined state capacity, social services, and industrial policy. Ezulwini Consensus (2005): demands UNSC reform and IMF/World Bank quota reform. Rodney (1972): underdevelopment as active process. Mamdani (1996): state-society relations distorted by colonial and post-colonial conditionality. Bayart (2009): extraversion — African elites leverage external dependence for domestic power.
Chinese perspective	Reformist not revolutionary: seeks greater quota share (achieved 2016), RMB internationalization (SDR basket inclusion 2016), AIIB and NDB as complementary institutions. Does not seek to dismantle Bretton Woods; seeks to rebalance it. Critique: US veto power and dollar weaponization (sanctions).

Cue	Notes
Russian perspective	Critique of dollar hegemony intensified post-2014/2022 sanctions. De-dollarization: bilateral trade in national currencies, gold accumulation, BRICS Pay. View: Bretton Woods institutions are instruments of US geopolitical power, not neutral technocracy.
Western perspective	Institution defense: IMF provides global public goods (liquidity, surveillance, debt sustainability). Self-critique: Stiglitz (2002) on Asian crisis misdiagnosis; Grabel (2018) on institutional resilience and heterogeneity; Eichengreen (1996) on path dependence of dollar. Reform debates: quota adjustment, conditionality streamlining, SDR rechanneling.
UN perspective	Development finance and SDG financing gap (~USD 4 tn/yr). Proposals: Liquidity and Sustainability Facility (LSF), G20 Common Framework for debt treatment, multilateral development bank (MDB) capital increases, need-based SDR allocation. Critique: Bretton Woods institutions are insufficiently responsive to development needs.

Source log. (2016) *RIPE*; IMF COFER (2024); IMF quota data (2024).

Summary (3–5 sentences). Hegemonic stability theory holds that international economic order requires a single state willing to provide public goods, a role the United States performed from 1945 to 1971 through the Bretton Woods architecture of fixed rates, capital controls, and dollar-gold convertibility. The 1971 Nixon shock removed the gold anchor but left dollar hegemony intact, reconstituting the system around floating rates and capital mobility. Contestation from the NIEO through SAPs, the 1997 Asian crisis, and BRICS reform demands has challenged the legitimacy of quota-based governance without dismantling it. The 2021 SDR allocation illustrates the tension: it distributed liquidity by quota, sending 58% to advanced economies and 5% to Africa, reproducing hierarchy even in a crisis-response instrument. Whether institutions can persist and reform after hegemony — Keohane's question — remains the central puzzle, with African, Chinese, Russian, Western, and UN perspectives offering incompatible answers.

SECTION 5 — FEYNMAN COMPRESSION

Step 1 — Explain without jargon. Imagine a neighborhood where one wealthy family pays for the streetlights, the fire department, and the road repairs, and everyone else free-rides. If that family moves away or goes broke, the streetlights go dark, the fire department disbands, and the roads crumble — unless someone else steps up or the neighbors agree to share costs. That is hegemonic stability theory: the international economy needs one big country willing to pay for stability, and when no one does, you get the 1930s. The Bretton Woods system was the United States paying for those streetlights from 1944 to 1971, with fixed exchange rates, capital controls, and dollars convertible to gold. When the US stopped converting dollars to gold in 1971, the streetlights did not go dark — the dollar stayed dominant — but the rules changed: rates floated, money moved freely, and the system became more fragile. Today, the IMF is the fire department, but its budget and voting rules reflect who paid for it in 1944, not who needs it now. African states receive 5% of new emergency money despite being 3% of the economy, while rich countries receive 58%. The question is whether the fire department can be reformed without the wealthy family agreeing to give up its veto.

Step 2 — Mark gaps. Three gaps in the Step 1 explanation: (a) It does not explain *why* the dollar remained dominant after 1971 — the mechanism of network externalities, deep Treasury markets, and the absence of a credible alternative is asserted but not developed. (b) It treats the IMF as a single actor ("the fire department") and obscures the distinction between the IMF's liquidity function, its surveillance function, and its conditionality function, which operate through different mechanisms and are contested differently. (c) It does not specify the scope condition for Keohane's "after hegemony" argument — institutions persist only where sunk costs are high and information asymmetries favor incumbents; this is not automatic.

Step 3 — Reread verification. Re-reading Kindleberger (1973), the public-goods claim is specifically about the *1929–1933* period and the absence of a hegemon willing to act as lender of last resort; it is not a universal claim about all international order. Re-reading Keohane (1984), the persistence argument depends on *regime theory* — institutions reduce transaction costs and provide information — and is explicitly conditional on the absence of a hegemonic challenger. Re-reading Stiglitz (2002), the critique is not that the IMF is unnecessary but that its conditionality was *procyclical* and its diagnosis of the Asian crisis was *wrong* — a mechanism-level critique, not an abolitionist one. Re-reading Grabel (2018), the argument is that institutional change is *heterogeneous and incremental*, not revolutionary, which complicates both the "reform" and "reproduction" narratives. The gaps identified in Step 2 are partially addressed: network externalities are in Eichengreen (1996); the three IMF functions are distinguished in the IMF's own Articles of Agreement and IEO reviews; Keohane's scope conditions are in Chapter 6 of *After Hegemony*.

Step 4 — Analogy with explicit limits. The neighborhood/streetlight analogy captures the *cost-bearing* logic of hegemonic stability and the *free-rider problem*, and it makes the distributional question intuitive (who pays, who benefits). Its limits are three. First, streetlights are a pure public good with non-excludability; the dollar's reserve role is an *impure* public good — the US extracts seigniorage and sanctions leverage, so the "hegemon" is not purely altruistic. Second, neighborhoods have no equivalent of *path dependence*: once the dollar is entrenched in invoicing and clearing, switching costs are enormous, which is why the hegemon can decline in share without losing dominance. Third, the analogy implies a single wealthy family; the actual system has *multiple* centers of financial power (EU, China, Japan) that cooperate and compete, so the "absence of hegemon" scenario is not the only alternative to US dominance — multipolarity is.

Step 5 — Rewrite. Hegemonic stability theory argues that international economic order requires a single state willing to bear the costs of providing public goods — liquidity, market access, a stable reserve currency — because these goods are non-excludable and subject to free-riding. The United States performed

this role from 1945 to 1971 through the Bretton Woods system: fixed exchange rates, capital controls, and dollar-gold convertibility at USD 35 per ounce. The 1971 Nixon shock ended convertibility but not dollar dominance; the system reconstituted itself around floating rates, capital mobility, and the dollar's network externalities in invoicing, clearing, and safe-asset markets. Whether order can persist after hegemony is contested: Keohane argues institutions create path dependence that outlives the hegemon, while Gilpin argues order decays without a dominant power. Contestation has been continuous — from the NIEO's demands for commodity stabilization in 1974, through structural adjustment programs in the 1980s, the 1997 Asian crisis and its procyclical IMF conditionality, to BRICS demands for quota reform today. The 2021 SDR allocation of USD 650 billion illustrates the unresolved tension: distributed by quota, it sent 58% to advanced economies and 5% to Africa, reproducing the hierarchy it was meant to relieve. The African perspective, drawing on Rodney, Mamdani, and the Ezulwini Consensus, reads this not as a technical formula but as a structural feature of a system designed by and for the hegemon; the Chinese perspective seeks reform within the system; the Russian perspective seeks exit from dollar dependence; the Western perspective defends the institutions while acknowledging failures; the UN perspective demands need-based allocation to close the SDG financing gap. The central puzzle for the student is whether hegemony is a *condition* for order or a *phase* in its evolution — and whether the answer depends on which of the five perspectives one adopts.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L16	definition	What is hegemonic stability theory?	Hegemonic stability theory argues that a stable international economic order requires a single dominant state willing and able to supply public goods—liquidity, open markets, a stable currency, and crisis lending. Kindleberger applied it to the Great Depression; Gilpin and Keohane later formalized and debated its scope.	Western institutionalists read hegemony as functional; African critics read it as a license for asymmetric power.

Tag	Card Type	Front	Back	Perspective Note
L16	mechanism	What was Kindleberger's "lender of last resort" mechanism?	Kindleberger argued that the 1929–1939 collapse occurred because no hegemon provided countercyclical liquidity, stabilized exchange rates, or kept markets open; the absence of a hegemonic stabilizer turned a recession into a depression. The mechanism is supply of public goods, not mere dominance.	The mechanism is Western in origin but its absence is felt most acutely by peripheral economies.
L16	application	What were the four pillars of the Bretton Woods architecture?	The Bretton Woods system combined (1) the IMF for balance-of-payments financing, (2) the IBRD/World Bank for reconstruction and development, (3) fixed but adjustable exchange rates pegged to the dollar-gold standard, and (4) capital controls to preserve domestic policy space.	African states joined later and inherited rules they did not write.

Tag	Card Type	Front	Back	Perspective Note
L16	comparison	How do Gilpin and Keohane differ on order after hegemony?	Gilpin (1987) treats hegemonic decline as likely to unravel order because public goods provision erodes; Keohane (1984) argues institutions can persist after hegemony by reducing transaction costs and locking in cooperation. The debate is over whether institutions substitute for or depend on power.	African scholars side with Gilpin's power realism but add that institutions also discipline the weak.
L16	source	What is Eichengreen's (1996) core claim about the gold standard?	Eichengreen argues the interwar gold standard transmitted shocks and constrained macroeconomic adjustment, and that Bretton Woods improved on it by allowing capital controls and adjustable pegs—though the dollar-gold link recreated vulnerabilities.	His institutional history is Western; African readers stress who bore adjustment costs.

Tag	Card Type	Front	Back	Perspective Note
L16	debate	What was the New International Economic Order (NIEO)?	The NIEO was a 1970s UN General Assembly agenda (Resolution 3201) demanding commodity price stabilization, technology transfer, and sovereign control over resources; it was blocked by Western states and the oil shocks.	The NIEO is the African/Global South's most systematic reform blueprint.
L16	reconstruction	How do African scholars read structural adjustment programs (SAPs)?	African critics (e.g., Mkandawire, Adedeji) argue SAPs imposed procyclical austerity, shrank state capacity, and prioritized creditor repayment over development, reproducing colonial extraction under technocratic guise.	This is the African vantage point: conditionality as sovereignty erosion.
L16	occlusion	What does the Western "institution defense" occlude?	Western defenders of the IMF/World Bank stress crisis prevention and global public goods but often occlude the distributional asymmetry of conditionality, the democratic deficit in voting shares, and the procyclical bias of programs.	Occlusion is structural, not merely rhetorical.

Tag	Card Type	Front	Back	Perspective Note
L16	adjudication	What did the 1997–98 Asian crisis reveal about IMF conditionality?	The crisis showed that IMF programs could deepen recessions by demanding fiscal tightening and high interest rates; Stiglitz (2002) argued the Fund misdiagnosed liquidity crises as solvency crises. Evidence is mixed: some programs stabilized, others prolonged pain.	African states watched closely, seeing parallels to their own SAP experience.
L16	visual	What trend does the USD share of global reserves (1999–2024) show?	The dollar's share fell from roughly 70% in 1999 to about 58% by 2024, indicating gradual diversification without displacement; euro and gold gained modestly.	Decline is real but slow; African reserves remain dollar-dependent.
L16	definition	What are Special Drawing Rights (SDRs)?	SDRs are an IMF reserve asset allocated to members in proportion to quota; they can be exchanged for hard currency and were massively issued in 2020 ($650bn) to ease pandemic liquidity.	Allocation by quota reproduces hierarchy; rechanneling debates target this.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence audit (score 0–100)

Topic	Confidence (0–100)	Basis for rating	Next step
Kindleberger's hegemonic-stability mechanism	0–100	Can I state the public-goods logic without notes?	Re-read Kindleberger 1973 ch. 1–3
Bretton Woods institutional design	0–100	Do I know the four pillars and their trade-offs?	Review Eichengreen 1996
Gilpin vs. Keohane debate	0–100	Can I adjudicate persistence-after-hegemony?	Compare primary texts
1971 Nixon shock and floating rates	0–100	Can I explain the Triffin dilemma?	Add to error log if weak
Contestation (NIEO, SAPs, BRICS)	0–100	Can I sequence reforms and counter-reforms?	Timeline drill
African structural-adjustment critique	0–100	Can I name African scholars and mechanisms?	Read Mkandawire
Chinese/Russian/Western/UN positions	0–100	Can I steel-man each in 3 sentences?	Perspective drill
1997 Asian crisis and IMF conditionality	0–100	Can I distinguish liquidity vs. solvency?	Stiglitz 2002
2020–22 SDR allocation and rechanneling	0–100	Do I know quota shares and rechanneling options?	Data lab review
USD reserve share trend 1999–2024	0–100	Can I state levels and drivers?	COFER data check

7.2 Three-question debrief

1. Which concept did you most overestimate your confidence in, and what evidence would change your rating?
2. Which perspective (African, Chinese, Russian, Western, UN) did you find hardest to steel-man from within, and why?
3. What is one falsifier that would make you abandon hegemonic stability theory entirely?

7.3 Error-log

Common Misconception	Correction	Evidence
"Hegemonic stability theory says any dominant power keeps order."	It requires a hegemon willing to supply public goods, not merely dominance; a predatory hegemon can destabilize.	Kindleberger (1973); Gilpin (1987)

Common Misconception	Correction	Evidence
"Bretton Woods collapsed because of US weakness alone."	Collapse involved the Triffin dilemma, Vietnam-era deficits, and European/Japanese recovery; Nixon's 1971 suspension was a policy choice, not inevitability.	Eichengreen (1996)
"The IMF always imposes identical conditionality."	Programs vary by country and era; post-2008 and COVID-era lending relaxed some conditions, though procyclical bias persists.	Grabel (2018); Stiglitz (2002)
"SDR allocations are needs-based."	Allocations follow quota shares, so high-income countries receive the largest shares; rechanneling is the contested remedy.	IMF quota data; African Union statements
"The dollar's decline is imminent."	Reserve share fell gradually (~70% to ~58%, 1999–2024); no alternative currency has displaced it.	IMF COFER data
"African states uniformly reject the IMF."	Positions range from Ezulwini Consensus reform demands to pragmatic borrowing; critique targets hierarchy, not cooperation per se.	African Union; Mkandawire

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Hegemonic stability; public goods; Bretton Woods; fixed rates; capital controls; dollar-gold; SDRs; conditionality; NIEO; SAPs; Triffin dilemma	Hegemon supplies liquidity/open markets; IMF leverage via financing; quota-based allocation; conditionality shapes domestic policy; capital controls preserve autonomy	Kindleberger (1973); Gilpin (1987); Keohane (1984); Eichengreen (1996); Stiglitz (2002); Grabel (2018)	Great Depression; Bretton Woods 1944; Nixon shock 1971; NIEO 1974; SAPs 1980s; Asian crisis 1997; SDR $650bn 2020–22; USD reserves 1999–2024	Order requires hegemon vs. institutions persist after hegemony; reform vs. revolution; conditionality as stabilization vs. sovereignty erosion	A multipolar order with stable public goods without a hegemon; IMF programs that are consistently countercyclical; SDR reallocation by need	L6 institutionalism; L15 state-market paradigms; L18 weaponized interdependence; L38 sanctions; L49 revisionism

SECTION 9 — REVIEW SCHEDULE

- **R1 (same day, 20 min):** Re-read the five key ideas and recite the Bretton Woods four pillars from memory; check against the lesson.
- **R2 (24 hours, 30 min):** Redo the Data Lab tables from memory (IMF voting shares, SDR allocations, USD reserve share); compare to source.
- **R3 (1 week, 45 min):** Write a one-page adjudication of Gilpin vs. Keohane using the 1997 Asian crisis as evidence; include one African perspective sentence.
- **R4 (2 weeks, 60 min):** Complete the Independent Memo prompt on SDR rechanneling; have a peer or rubric check the four headings.
- **R5 (1 month, 90 min):** Full timed reconstruction: explain the lesson's central puzzle to a non-specialist, then answer the hinge question and two flashcard decks cold.

SECTION 10 — COMPLETION CHECKLIST

☐ I can state hegemonic stability theory and its public-goods mechanism.
☐ I can list the four pillars of Bretton Woods and their trade-offs.
☐ I can explain the Triffin dilemma and the 1971 Nixon shock.
☐ I can contrast Gilpin's and Keohane's positions on order after hegemony.
☐ I can sequence NIEO, SAPs, Asian crisis, and BRICS demands.
☐ I can reconstruct the African critique of SAPs with named scholars.
☐ I can steel-man Chinese, Russian, Western, and UN perspectives.
☐ I can explain IMF conditionality as a mechanism, not just an outcome.
☐ I can interpret the USD reserve-share trend 1999–2024.
☐ I can explain SDR allocation by quota and the rechanneling debate.

☐ I can apply the four levels of analysis to the 1997 Asian crisis.
☐ I can distinguish description, explanation, prediction, and prescription in a memo.
☐ I have completed the confidence audit honestly.
☐ I have logged at least three errors in the error-log.
☐ I have scheduled R1–R5 in my calendar.
☐ I can answer the hinge question and diagnose each distractor.
☐ I can draw the three visuals from memory with labels.

FURTHER READING (Optional)

- **Hegemonic stability:** Kindleberger, C. P. (1973) *The World in Depression, 1929–1939*; Gilpin, R. (1987) *The Political Economy of International Relations*; Keohane, R. O. (1984) *After Hegemony*.
- **Bretton Woods architecture:** Eichengreen, B. (1996) *Globalizing Capital: A History of the International Monetary System*.
- **Crisis and conditionality:** Stiglitz, J. E. (2002) *Globalization and Its Discontents*; Grabel, I. (2018) *When Things Don't Fall Apart*.
- **African perspectives:** Nkrumah, K. (1965) *Neo-Colonialism: The Last Stage of Imperialism*; Rodney, W. (1972) *How Europe Underdeveloped Africa*; Mkandawire, T. (2001) "Thinking about Developmental States in Africa."
- **Reform and contestation:** Mamdani, M. (1996) *Citizen and Subject*; Bayart, J.-F. (2009) *The State in Africa*.

End of Lesson 16. Say **Next** when you are ready.

18. World-Systems and Dependency: Structural Political Economy of Hierarchy

LESSON METADATA

Field	Value
Lesson number and title	Lesson 17: World-Systems and Dependency: Structural Political Economy of Hierarchy
Module	Module 3: International Political Economy and Geoeconomics
Prerequisites	L8 (Marxism, dependency), L10 (imperialism), L15 (state-market paradigms)
Interleaved links	Forward to L19 (minerals), L27-29 (African political economy), L33 (critical minerals), L51 (climate)
Reading load	7-9 hours
Content channels	Text, tables, diagrams, flashcards, worked example, problem pair, data lab
Bloom ceiling	Evaluate / Create (Bloom Levels 5-6)

Field	Value
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

The central puzzle of this lesson is deceptively simple and profoundly unsettling: why does the global economy reproduce hierarchy rather than dissolve it? Why, after six decades of decolonization, hundreds of billions of dollars in aid, repeated rounds of debt relief, and the most ambitious trade-liberalization agenda in history, does the Democratic Republic of Congo capture roughly three to five percent of the final value of the cobalt that powers the world's electric vehicles, while the same continent that holds the majority of the world's critical minerals remains the poorest region on earth by almost every aggregate measure? Mainstream development economics tends to answer this question in the language of stages, policies, and institutions: countries are poor because they have not yet accumulated enough capital, reformed enough markets, or built enough state capacity. World-systems analysis and dependency theory answer it differently. They argue that poverty and wealth are not sequential stages of a single ladder but simultaneous products of a single, hierarchically structured capitalist world-economy. Underdevelopment, on this view, is not the absence of development; it is the *development of underdevelopment*—a relational outcome produced by the same processes that produce development elsewhere. This lesson exists to teach you to hold both answers in tension, to specify the mechanisms that distinguish them, and to adjudicate between them on evidence rather than on theoretical allegiance.

The lesson sits at a precise point in the curriculum. Prerequisites L8 (Marxism, dependency), L10 (imperialism), and L15 (state-market paradigms) have already equipped you with the theoretical vocabulary of surplus extraction, core-periphery relations, and the debate between market-led and state-led development. What this lesson adds is the *structural* layer: the claim that these relations are not merely national or bilateral but systemic, organized through a single division of labor that assigns different zones of the world economy different functions—core zones specialize in high-value, capital-intensive, technologically complex production; peripheries specialize in raw-material extraction and low-wage labor; semi-peripheries occupy an intermediate position that both stabilizes the system and offers a mobility path that is, in practice, rarely traversed. You will learn to read the global economy not as a collection of national economies trading with one another but as one economy with an internal geography of hierarchy. That reframing is the single most consequential intellectual move in the lesson, and everything else—Arrighi's hegemonic cycles, Nkrumah's neo-colonialism, global value-chain analysis, the Prebisch-Singer terms-of-trade deterioration, the measurement of illicit financial flows—hangs from it.

The African perspective is the primary lens through which this lesson is constructed, and this is not a regional courtesy. It is an epistemic choice. The African vantage point reveals something that the Western mainstream, the Chinese official narrative, the Russian multipolarity discourse, and even the UN's financing-for-development framework systematically occlude: that the question "why is Africa poor?" is wrongly posed. The better question, posed by Rodney, Amin, and Nkrumah from within the African experience, is "how has Africa been made poor, and by whom, and through what mechanisms, and with what continuities from colonial to post-colonial periods?" This shift from a deficit framing to a relational, historical, and structural framing is what the African perspective contributes and what the other four perspectives, each in its own way, struggle to accommodate. The Chinese perspective sees opportunity and partnership; the Russian

sees multipolarity and Western hypocrisy; the Western mainstream sees policy failure and market distortion; the UN sees financing gaps and sustainable-development shortfalls. All four are real and partial. None of them, without the African structural critique, can explain why the same patterns of extraction recur across radically different policy regimes, political systems, and historical periods.

You will be asked to master five key ideas in sequence, each with its own causal claim, mechanism, scope conditions, observable implications, and perspective reconstruction. First, Wallerstein's world-systems: the core, semi-periphery, and periphery as a single division of labor. Second, Arrighi's hegemonic cycles: the rise and decline of hegemons through production, finance, and military power. Third, African dependency: Frank, Rodney, Amin, and Nkrumah on the development of underdevelopment and neo-colonialism. Fourth, contemporary value-chain analysis: global value chains, lead firms, and the distribution of gains. Fifth, empirical measurement: the Prebisch-Singer hypothesis, terms of trade, capital flight, debt distress, and illicit financial flows. These five ideas are not a list; they are a chain. World-systems provides the architecture; hegemonic cycles provide the temporal dynamics; African dependency provides the regional application and the normative core; value-chain analysis provides the contemporary micro-mechanism; empirical measurement provides the evidentiary test. By the end of the lesson you should be able to move fluently between these levels, from the systemic to the firm-level to the statistical, without losing the thread of the structural argument.

The worked example— the 1980s-1990s African debt crisis and the subsequent HIPC and MDRI debt-relief initiatives—will require you to apply dependency theory to a concrete historical episode and to adjudicate between competing explanations: was the crisis caused by African mismanagement and oil shocks (the mainstream view), by the structural position of African economies in a declining hegemonic cycle (the dependency view), or by the interaction of both? The problem pair— the DRC cobalt value chain—will require you to explain, using world-systems logic, why a country holding the majority of global cobalt reserves captures a tiny fraction of final value, and to identify what would have to change for that share to rise. The data lab will give you the numbers: value capture by stage in the cobalt supply chain, Africa's share of global manufacturing value added, and UNCTAD's estimates of illicit financial flows. You will be expected to read these numbers not as neutral facts but as evidence in a theoretical dispute, and to specify what each number can and cannot adjudicate.

What you will be able to do after mastering this lesson is substantial and assessable. You will be able to define and deploy the core concepts of world-systems and dependency theory with precision, including their scope conditions and their strongest counterarguments. You will be able to reconstruct five distinct perspectives—African, Chinese, Russian, Western, and UN—on the structural political economy of hierarchy, steel-manning each from within and identifying what each reveals and what each occludes. You will be able to apply the framework to cases, distinguishing description from explanation, prediction from prescription. You will be able to identify falsifiers: what evidence would weaken or refute the structural claim. And you will be able to write a policy memo that moves between levels of analysis—individual, state, systemic, transnational—without conflating them. The lesson is demanding because the subject is demanding. Structural political economy is not a theory that can be memorized; it is a way of seeing that must be practiced. The exercises, the worked example, the problem pair, and the independent memo are designed to force that practice.

One methodological caution before you begin. The theories in this lesson are contested, and they should be. Wallerstein's world-systems has been criticized for economic determinism, for underestimating the agency of peripheral states, and for treating the system as more coherent than it is. Dependency theory has been

criticized for predicting permanent stagnation in the face of the East Asian developmental success. Arrighi's hegemonic cycles have been criticized for periodization disputes and for the difficulty of identifying hegemonic transitions in real time. Value-chain analysis has been criticized for focusing on firm-level governance while neglecting state power and labor. The empirical measures—Prebisch-Singer, capital flight estimates, IFF estimates—are methodologically contested and politically charged. Your task is not to choose a side but to understand the structure of the disagreement: what each theory can explain, what it cannot, what evidence would move the debate, and what normative commitments are embedded in each. That is the standard of mastery this lesson sets, and it is the standard against which your memo, your problem-pair answer, and your hinge-question response will be assessed.

SECTION 1 — Pre-Class Priming

1.1 Retrieval Warm-Up

Answer each question from memory before reading the lesson core. These draw on Lessons 8, 10, and 15.

1. **Dependency theory's core claim.** In one or two sentences, state the central claim of dependency theory about the relationship between developed and underdeveloped countries. What is the mechanism by which wealth in one zone is said to produce poverty in another?

2. **Imperialism.** How did Lenin define imperialism, and what were its five features? Which of those features, if any, do you think still operate in the contemporary global economy, and in what modified form?

3. **State-market paradigms.** Contrast the Washington Consensus and the developmental-state paradigm on the role of the state in industrialization. Give one historical example of each.

4. **Prebisch-Singer.** State the Prebisch-Singer hypothesis in your own words. What is the predicted long-run trend in the terms of trade of primary-commodity exporters relative to manufactured-goods exporters, and what is the proposed mechanism?

5. **Surplus value and extraction.** In Marxist terms, how is surplus value generated, and how does the concept of "unequal exchange" extend this logic to international trade between countries with different wage levels?

6. **Neo-colonialism.** According to Nkrumah, what is neo-colonialism, and how does it differ from formal colonialism? What instruments does it use to maintain control after political independence?

1.2 Orientation Questions

These questions frame the puzzle of this lesson. Do not look up answers; use them to set your expectations.

1. The DRC holds roughly 70 percent of global cobalt reserves and produces the majority of world supply, yet captures an estimated 3-5 percent of final battery value. Is this best explained as a market failure that better policy could fix, or as a structural feature of the global division of labor that policy alone cannot fix? What evidence would distinguish the two?

2. World-systems theory posits that countries can move from periphery to semi-periphery but rarely to

core. Is this a falsifiable empirical claim or a definitional tautology? What would count as evidence of genuine upward mobility within the system?

3. Arrighi argues that hegemonic decline is marked by a shift from production to finance. Does the current period—marked by US financialization, Chinese manufacturing dominance, and rising debt—fit this pattern, or does it require a modified framework?
4. If dependency theory predicts persistent underdevelopment for peripheral economies, how does it account for the rapid growth of several East and Southeast Asian economies? Is this a refutation, a scope condition, or a case of semi-peripheral mobility?

1.3 Vocabulary Pre-Teach

Provisional definitions to be refined during the lesson. Each term will be developed with theoretical lineage, mechanism, and scope conditions in the core.

- **World-system / world-economy:** A single, integrated capitalist economy spanning the globe, with an internal division of labor among core, semi-periphery, and periphery zones. Not a collection of national economies but one economy with a geography of hierarchy. (Wallerstein)
- **Core, semi-periphery, periphery:** The three structural zones of the world-economy. Core zones specialize in high-value, capital-intensive, technologically complex production and capture disproportionate surplus. Peripheries specialize in raw-material extraction and low-wage labor. Semi-peripheries occupy an intermediate position, both stabilizing the system and offering a rare mobility path.
- **Global division of labor:** The assignment of different production functions to different zones of the world-economy, such that the wealth of core zones and the poverty of peripheral zones are produced simultaneously by the same processes.
- **Hegemonic cycle:** The rise, dominance, and decline of a hegemonic power, marked by shifts among production, finance, and military power. Hegemons stabilize the world-system during their rise and generate systemic crisis during their decline. (Arrighi)
- **Development of underdevelopment:** The thesis that underdevelopment is not a pre-capitalist residue or a stage preceding development but a product of the same capitalist processes that produce development elsewhere. (Frank, Rodney)
- **Neo-colonialism:** The continuation of colonial-era economic control after political independence, exercised through multinational corporations, aid conditionality, debt, and trade structures rather than through direct political rule. (Nkrumah)
- **Global value chain (GVC):** The full range of activities required to bring a product from conception to end use, distributed across multiple firms and countries, with value capture concentrated at certain stages (design, branding, finance) and thin at others (extraction, assembly). (Gereffi)
- **Lead firm:** The firm that governs a global value chain, typically through control of intangible assets—brand, technology, standards, finance—rather than through ownership of production facilities. Lead firms capture disproportionate value relative to their share of physical production.
- **Terms of trade:** The ratio of export prices to import prices. A deterioration means a country must ex-

port more to import the same quantity. The Prebisch-Singer hypothesis predicts long-run deterioration for primary-commodity exporters.

- **Prebisch-Singer hypothesis:** The claim that the terms of trade of primary-commodity exporters deteriorate over the long run relative to manufactured-goods exporters, due to differences in income elasticity of demand and in market structure (competitive primary markets vs. oligopolistic manufacturing).
- **Illicit financial flows (IFFs):** Money illegally earned, transferred, or utilized across borders, including trade misinvoicing, tax evasion, and corruption proceeds. UNCTAD estimates these flows from Africa at tens of billions of dollars annually, exceeding aid and FDI inflows.
- **Capital flight:** The rapid outflow of financial assets from a country, often driven by political risk, macroeconomic instability, or the search for higher returns and secrecy. In the African context, capital flight is frequently linked to debt-fueled accumulation by elites and to the recycling of borrowed funds offshore.

End of requested chunk. Sections 2 onward follow in subsequent lessons.

SECTION 2 — LESSON CORE

2.1 Learning objectives

By the end of this lesson, the student will be able to:

1. **Analyze** the structural logic of Wallerstein's world-systems theory, identifying how the core-semi-periphery-periphery division of labor produces and reproduces global inequality through unequal exchange, surplus transfer, and the interstate system's role in maintaining differential state strength, drawing on Wallerstein's four volumes of *The Modern World-System* (1974, 1980, 1989, 2011) and his synthetic *World-Systems Analysis: An Introduction* (2004).
2. **Evaluate** the scope conditions under which world-systems theory explains observed patterns of specialization, terms of trade, and capital flows, and identify the cases—such as East Asian industrialization, resource-rich African states, and semi-peripheral mobility—where its predictions require modification or where agency-based and institutional explanations supplement structural ones.
3. **Apply** the world-systems framework to the African debt crisis of the 1980s–1990s and to contemporary cobalt value chains, distinguishing structural explanation from policy prescription and identifying the falsifiers that would weaken the theory's claims about persistent underdevelopment.
4. **Compare** how African, Chinese, Russian, Western, and UN perspectives reconstruct the same world-systems claims, identifying what each tradition contributes, what it occludes, and how each perspective's normative commitments shape its reading of global hierarchy and the possibility of restructuring it.
5. **Synthesize** world-systems theory with dependency theory (Frank, Rodney, Amin, Nkrumah), Arrighi's hegemonic-cycle analysis, and global value-chain scholarship (Gereffi, Humphrey, Sturgeon)

to produce a multi-level, mechanism-based explanation of persistent underdevelopment that can be tested against empirical measures of value capture, capital flight, illicit financial flows, and debt distress.

2.2 KEY IDEA 1 — Wallerstein's World-Systems: Core, Semi-Periphery, Periphery as Single Division of Labor

Bolded Causal Claim: The modern world-system is a single, integrated capitalist division of labor in which core, semi-peripheral, and peripheral zones are structurally differentiated by the type of production they perform and the surplus they capture; this differentiation is not a transitional stage of development but a permanent, constitutive feature of the system, so that peripheral "underdevelopment" is produced by the system's normal operation rather than by its absence or by internal failures of peripheral societies.

Mechanism: Wallerstein's world-systems analysis, developed across four volumes of *The Modern World-System* (1974, 1980, 1989, 2011) and synthesized in *World-Systems Analysis: An Introduction* (2004), posits that the capitalist world-economy emerged in the sixteenth century as a single, integrated system of production and exchange spanning the globe. The mechanism operates through several interconnected channels. First, an axial division of labor assigns different types of production to different zones: core zones specialize in high-skill, capital-intensive, high-profit activities such as manufacturing, finance, and advanced services; peripheral zones specialize in low-skill, labor-intensive, low-profit activities such as primary commodity extraction and agriculture; and semi-peripheral zones occupy an intermediate position, combining some core-like and some peripheral-like activities. Second, surplus is transferred from periphery to core through unequal exchange: because peripheral production is labor-intensive and core production is capital-intensive, and because labor is cheaper in the periphery while capital is more expensive in the core, the terms of trade systematically favor the core. Third, the interstate system reinforces this division: core states are strong—able to protect their capitalists, project power, and shape rules—while peripheral states are weak, dependent on external capital, subject to intervention, and unable to protect domestic producers. The semi-periphery mediates: it prevents the polarization of the system into two camps, absorbs upward and downward mobility, and provides a political buffer. Fourth, the system is driven by the endless accumulation of capital as its defining logic, and states exist within it as instruments of accumulation rather than as autonomous actors. The system expands geographically and intensifies through cyclical rhythms (Kondratieff waves of roughly fifty years) and secular trends (the long-term rise and decline of hegemonic powers, the proletarianization of labor, the commodification of everything). The key theoretical move is that "development" and "underdevelopment" are not separate processes but two sides of the same coin: the development of the core is the underdevelopment of the periphery, and both are produced by the same system. This builds on and systematizes earlier dependency arguments—Frank's "development of underdevelopment" (1967), Rodney's historical account of how Europe underdeveloped Africa (1972), and Amin's theory of unequal development (1976)—while adding the interstate system and the semi-periphery as analytical categories that earlier dependency theory lacked.

Scope Conditions: World-systems theory applies under specific conditions that must be stated explicitly. It applies to the capitalist world-economy from roughly the sixteenth century to the present, not to pre-capitalist world-empires, which Wallerstein distinguishes as politically unified rather than economically integrated across state boundaries. It requires a single, integrated division of labor across multiple states, with capital mobility but labor immobility or at least differential labor costs. It assumes that states are the primary political units and that the interstate system is constitutive of the world-economy. It works best for explaining long-

run structural patterns—specialization, terms of trade, capital flows—rather than short-term policy outcomes or individual state trajectories. The theory's scope is limited in several ways. It may overstate the coherence and stability of the system: the boundaries between core, semi-periphery, and periphery are fuzzy and shift over time, and South Korea's rise from periphery to semi-periphery to near-core status is a case in point. It may understate the agency of peripheral states and social movements: Nkrumah's neo-colonialism critique and Rodney's underdevelopment thesis both emphasize external domination, but later African scholarship—Mamdani's *Citizen and Subject* (1996) and Bayart's *The State in Africa* (1993)—has shown how internal political dynamics and the "politics of the belly" complicate structural determinism. It may also understate the role of non-economic factors such as race, gender, and culture in shaping the division of labor, though Wallerstein incorporated some of these in later work. Finally, the theory's predictive power is limited: it predicts persistent inequality but not the specific timing or form of crises, and it has been criticized for being unfalsifiable in its stronger versions.

Observable Implications: If world-systems theory holds, several empirical patterns should be observable. (1) Persistent terms-of-trade deterioration for primary-commodity exporters relative to manufactured-goods exporters, consistent with the Prebisch-Singer hypothesis that Wallerstein incorporates. (2) Concentration of high-value manufacturing and services in core zones, with peripheral zones locked into primary extraction and low-value assembly. (3) Capital flight from periphery to core, as surplus generated in the periphery is repatriated or invested in core financial centers. (4) Debt dependency: peripheral states borrow from core financial institutions to finance development, creating structural dependency. (5) Semi-peripheral industrialization that raises incomes but does not fully close the gap with the core, and that often reproduces peripheral-like conditions internally, such as informal labor and environmental degradation. (6) The persistence of the division of labor despite formal decolonization: political independence does not equal economic independence, as Nkrumah argued in *Neo-Colonialism: The Last Stage of Imperialism* (1965). (7) Cyclical crises (Kondratieff downturns) that hit the periphery hardest and trigger restructuring that reinforces core dominance. These implications are testable against data on value capture by stage in supply chains, Africa's share of global manufacturing value added, illicit financial flows, and debt distress indicators.

Perspective Note (five traditions in brief):

African (primary): African scholarship has both drawn on and fundamentally challenged world-systems theory, and the African vantage point reveals dimensions that the other four perspectives miss. From within the African experience, the theory's central insight—that global inequality is structurally produced rather than the result of internal failure—resonates powerfully with the lived experience of colonial extraction and neo-colonial dependency. Nkrumah's *Neo-Colonialism: The Last Stage of Imperialism* (1965) argued that political independence masked continued economic domination, a claim that world-systems theory formalizes into a systemic framework. Rodney's *How Europe Underdeveloped Africa* (1972) provided the empirical and historical grounding: the development of Europe was the underdevelopment of Africa, through the slave trade, colonial extraction, and the destruction of African productive capacity. Amin's *Unequal Development* (1976) and *Accumulation on a World Scale* (1974) extended the analysis to the contemporary period, arguing that peripheral capitalism is structurally incapable of autonomous development. Yet African scholars have also pushed back against the determinism that world-systems theory can imply. Mamdani's *Citizen and Subject* (1996) showed that the colonial state's bifurcated power—direct rule in urban areas, indirect rule in rural areas—created internal hierarchies that world-systems theory's focus on external domination tends to obscure. Bayart's *The State in Africa* (1993) argued that African states are not merely weak instruments of external capital but have their own logics of power, including the "politics of the belly" and extraversion (using external resources for internal political purposes). More recently, African scholars and policymakers

have emphasized resource sovereignty and regional integration: the African Continental Free Trade Area (AfCFTA) and initiatives like the DRC-Zambia battery value chain project represent attempts to restructure the division of labor from within rather than merely resist it from without. The African perspective thus both validates world-systems theory's structural critique—confirming that peripheral underdevelopment is systemically produced—and insists on African agency, internal political dynamics, and the possibility of restructuring the system through collective action and regional integration. What the African vantage point reveals that the other four miss is the lived experience of extraversion: the way African elites have historically used external dependency as a resource for internal power, complicating any simple core-versus-periphery narrative.

Chinese: Chinese scholarship on world-systems theory has evolved significantly across political eras. In the Maoist period, world-systems-like ideas circulated through the "three worlds" theory, which positioned China as part of the Third World alongside Africa and Latin America, sharing a common experience of imperialism and underdevelopment. Post-1978 reform-era scholarship has been more ambivalent. Official Chinese discourse emphasizes "win-win" cooperation and mutual benefit, positioning China as a partner rather than a dominant core power, and rejecting the label of neo-colonialism in Africa. Academic Chinese scholars, however, have engaged more critically: some have applied world-systems categories to China's own rise, debating whether China is becoming a core power or remains semi-peripheral, and whether its engagement with Africa reproduces or disrupts the core-periphery division of labor. Chinese scholars have also critiqued Western-centric IPE for ignoring China's distinctive development path and for assuming that all late developers must follow the same trajectory. The Chinese perspective thus contributes a challenge to the binary core-periphery framework by introducing a rising power that does not fit neatly into either category, while its official narrative occludes the power asymmetries in China-Africa economic relations.

Russian: Russian scholarship on world-systems theory draws on a long tradition of Marxist and dependency-influenced thought, from Lenin's imperialism theory to contemporary multipolarity discourse. Russian scholars have generally been sympathetic to world-systems analysis as a critique of Western dominance, and have used it to frame Russia's own position in the global hierarchy—often as a semi-peripheral or rising power challenging unipolar US hegemony. The contemporary Russian perspective emphasizes multipolarity: the idea that the world-system is transitioning from US unipolarity to a multipolar order in which Russia, China, and other powers share influence. This perspective contributes a geopolitical reading of world-systems theory, highlighting military power and great-power competition as dimensions that Wallerstein's economic focus sometimes underweights. However, it occludes the internal dynamics of Russian capitalism and the ways in which Russian engagement with Africa and other peripheral regions may reproduce extractive patterns similar to those of Western powers. The Russian perspective also tends to treat "the West" as a unified bloc, obscuring internal divisions and the agency of peripheral states.

Western: Western scholarship on world-systems theory is deeply divided. Mainstream IPE—liberal institutionalism and neoclassical economics—has generally rejected world-systems theory as overly deterministic, insufficiently attentive to domestic institutions, and empirically unfalsifiable. From this perspective, the theory's emphasis on structural constraint underestimates the role of policy choices, institutional quality, and market integration in promoting development, with the East Asian "miracle" as the standard counterexample. However, critical Western scholarship—dependency theory in Latin America, world-systems analysis in sociology, and more recently critical IPE—has engaged seriously with Wallerstein's framework. Scholars such as Arrighi, Hopkins, and Chase-Dunn have refined and tested the theory's empirical implications. Western critical scholarship has also contributed the concept of global value chains (Gereffi, Humphrey, Sturgeon), which operationalizes world-systems insights at the firm level. The Western perspective thus contains an in-

ternal tension: mainstream IPE rejects structural determinism, while critical IPE incorporates and refines it. The mainstream Western view occludes the historical violence of colonialism and the structural constraints on peripheral development, while the critical view risks romanticizing resistance and underestimating the benefits of market integration.

UN: The UN perspective on world-systems theory is institutional and normative rather than theoretical. UN agencies—UNCTAD, UNDP, UNECA—have produced extensive empirical research on the patterns that world-systems theory predicts: terms-of-trade deterioration, capital flight, illicit financial flows, debt distress, and unequal value capture in supply chains. UNCTAD's Trade and Development Report and its work on illicit financial flows provide data that both supports and complicates world-systems claims. The UN perspective contributes a policy-oriented framing: it identifies structural inequalities and proposes remedies—debt relief, technology transfer, fair trade, financing for development—without necessarily endorsing the full theoretical apparatus of world-systems analysis. The UN's Sustainable Development Goals (SDGs) represent an attempt to address the symptoms of global inequality within the existing system rather than to transform the system itself. This perspective occludes the deeper structural critique: by framing inequality as a development problem solvable through better policies and more financing, it may underestimate the systemic reproduction of hierarchy that world-systems theory identifies. The UN perspective is thus both a source of valuable empirical data and a potential depoliticization of structural critique.

2.3 KEY IDEA 2 — Arrighi's Hegemonic Cycles: Production, Finance, and Military Power in the Rise and Decline of Hegemons

Bolded Causal Claim: Hegemony in the capitalist world-economy is not a static distribution of power but a temporal sequence in which a leading state's accumulation strategy shifts from material production to financial intermediation; the financialization of capital, combined with the militarization of interstate competition, marks the transition from hegemonic maturity to hegemonic decline, while any successor hegemon must reconstitute productive leadership rather than merely inherit financial dominance.

Mechanism: Arrighi (1994) reconstructs the history of the modern world-system as a succession of systemic cycles of accumulation, each anchored by a hegemonic state and organized around a distinctive spatial and institutional configuration of capital. The cycle begins with a phase of material expansion, in which the hegemon and its allies expand production, trade, and fixed capital investment across an increasingly integrated world-economy. Over time, competitive pressures, rising costs, and the diffusion of technology erode profit rates in material production. Capital then shifts toward financial circuits—credit, speculation, and intermediation—producing a phase of financial expansion. This shift is not merely a sectoral preference; it is a reorganization of the global division of labor in which the hegemon specializes in high-value services, finance, and military power while production relocates to lower-cost regions, especially the semi-periphery. The hegemon's military capacity protects property rights, sea lanes, and the institutional framework of global accumulation, but military overextension can accelerate decline. Arrighi distinguishes between a "signal crisis," which marks the end of material expansion and the beginning of financialization, and a "terminal crisis," which marks the exhaustion of financial expansion and the possible transition to a new hegemon. Financial expansion can be highly profitable for the hegemon's elites and institutions, but it also signals that the hegemon's productive base is no longer the primary engine of systemic growth. The transition between hegemons is therefore not simply a transfer of GDP; it is a reconfiguration of how capital is accumulated, how states coerce and consent, and how the global division of labor is politically organized. The mechanism is cumula-

tive and path-dependent: each hegemon inherits institutional residues from its predecessor, and each decline creates space for new centers of accumulation, but no transition is guaranteed to produce a stable successor.

Scope Conditions: Arrighi's framework applies most directly to the capitalist world-economy from the long sixteenth century onward, where capital is mobile, states compete in an anarchic interstate system, and accumulation is organized through a hierarchy of sovereign territories. It requires a leading state with sufficient productive, financial, and military capacity to shape global rules, and it assumes that capital responds to profit-rate differentials by moving across space. The framework is macro-historical and interpretive rather than a short-run predictive model; it does not specify the timing of crises, the identity of the next hegemon, or the domestic political coalitions that sustain or undermine hegemony. It also does not imply that every episode of financialization is hegemonic decline, since financial expansion can occur within a still-dominant productive regime. Its scope is further limited by its tendency to center the experience of the hegemon; when applied to Africa, it must be supplemented by theories of colonialism, neo-colonialism, and racialized extraction, because the "periphery" is not merely a passive location of relocated production but a historically constituted zone of coerced labor, resource extraction, and political subordination. Finally, the framework is contingent: wars, revolutions, technological breakthroughs, and social movements can interrupt or redirect cycles, and the absence of a clear successor hegemon may produce an interregnum rather than a smooth transition.

Observable Implications: If Arrighi's mechanism is operating, one should observe a cluster of patterns rather than a single indicator. First, the hegemon's economy should exhibit a rising share of financial profits, financial assets, and service-sector rents relative to manufacturing value added. Second, manufacturing capacity should relocate to lower-cost regions, especially the semi-periphery, while the hegemon retains command over finance, technology, and military logistics. Third, the hegemon should run persistent trade deficits financed by capital inflows, turning its currency and debt instruments into global stores of value. Fourth, military expenditure should rise or remain high as the hegemon attempts to secure global order, supply chains, and investment outlets. Fifth, peripheral and semi-peripheral states should experience debt accumulation, austerity, and conditionality during financial-expansion phases, because global liquidity and creditor power discipline their policy space. Sixth, major crises—such as the 1970s stagflation, the 1980s debt crisis, or the 2008 financial crisis—should appear as moments of systemic restructuring rather than as isolated market failures. In the African case, the 1980s–1990s debt crisis can be read as a financial-expansion phase in which African states were repositioned as debtors and adjusters, while contemporary competition over cobalt, lithium, and other transition minerals occurs amid a possible hegemonic transition in which finance, military power, and industrial policy are again being reorganized. The DRC's capture of only a small share of final electric-vehicle battery value is consistent with a world-system in which extraction remains peripheral while finance, technology, and branding are concentrated elsewhere.

Perspective Note (five traditions in brief):

African (primary): Arrighi's cycles are most useful to African political economy when they are not treated as a neutral chronology of great-power leadership but as a global rhythm that repeatedly repositions Africa as a zone of extraction, cheapened labor, and debt absorption. African scholarship from Rodney (1972) to Amin (1976) would read hegemonic transitions not as benign changes in management but as reorganizations of surplus extraction: when a hegemon financializes, the pressure to extract primary commodities and service debt often intensifies in the periphery. The 1980s–1990s structural adjustment period can be understood as a moment when financial expansion in the core was stabilized partly through austerity and liberalization in Africa. Yet African perspectives also insist on agency and variation: African states, movements, and re-

gional institutions have resisted extraction, renegotiated contracts, and pursued industrial policy, as seen in resource-nationalist measures and in initiatives such as the DRC–Zambia battery project. Arrighi's framework contributes a sense of systemic timing, but it risks treating Africa as a passive "periphery" unless it is joined to African analyses of class, state capacity, gendered labor, and social struggle. The African vantage point reveals that hegemonic decline in the core does not automatically produce liberation at the periphery; it may instead produce new forms of competition over African resources, new debt instruments, and new security arrangements.

Chinese: The official Chinese narrative presents China's rise as peaceful development and mutually beneficial cooperation, explicitly rejecting the ambition to become a hegemon in the Western sense. Chinese academic discussions often use Arrighi to argue that China's ascent is rooted in material production, infrastructure, and industrial capacity rather than in financialization, and that United States decline is marked by financial excess, deindustrialization, and military overextension. This perspective contributes an alternative accumulation model and a critique of financialized hegemony, but it may occlude how Chinese lending, investment, and offtake agreements in Africa can reproduce hierarchical extraction, debt distress, and limited local value capture. It also risks understating African concerns about sovereignty when "win-win" rhetoric is not matched by transparent contracts, technology transfer, and domestic industrial linkages.

Russian: Russian international-relations discourse frequently interprets Arrighi's cycles through the lens of multipolarity, arguing that United States financial hegemony is eroding and that a polycentric order is emerging. This perspective highlights the geopolitical weaponization of finance, sanctions, and dollar dominance, and it resonates with critiques of Western-led globalization. Its contribution is to foreground power and coercion in the international economy. However, it may occlude Russia's own extractive interests, security engagements, and authoritarian partnerships in Africa, and it often treats African states as arenas of great-power competition rather than as autonomous actors with their own developmental projects. It can also understate the internal political and economic conditions that shape African outcomes.

Western: Mainstream Western international political economy, especially hegemonic-stability theory, treats the hegemon as a provider of public goods such as open markets, liquidity, and security; from this view, hegemonic decline is a source of disorder. Critical Western scholarship, including Arrighi and Wallerstein, treats hegemony as a structured form of exploitation and financialization as a symptom of systemic crisis. Mainstream analysis contributes rigorous measurement of trade, capital flows, debt, and military spending, but it often universalizes Western institutional experience and treats African economies as "failing to develop" rather than as structurally positioned within a hierarchical division of labor. Critical self-correction within Western scholarship has increasingly acknowledged colonial legacies, unequal exchange, and racial capitalism, yet policy prescriptions often remain within liberal institutionalism, emphasizing governance reform and market integration rather than transformation of the system's core-periphery structure.

UN: The UN perspective does not usually adopt Arrighi's cyclical theory in full, but it is attentive to the instability produced by hegemonic transitions, financial crises, and debt distress. Through UNCTAD, the IMF/World Bank system, and the financing-for-development agenda, it emphasizes multilateral cooperation, debt relief, and macroeconomic stability. Its contribution is empirical monitoring, normative frameworks such as the Sustainable Development Goals, and institutional mechanisms for crisis response. However, by framing global inequality as a development problem solvable through better policies, more financing, and improved governance, it may depoliticize the structural reproduction of hierarchy that Arrighi identifies. The UN perspective is thus valuable as a source of data and as a forum for mitigation, but it may underestimate how financial expansion and hegemonic competition systematically constrain African policy space.

2.4 KEY IDEA 3 — African Dependency: Frank, Rodney, Amin, and Nkrumah on the Development of Underdevelopment and Neo-Colonialism

Bolded Causal Claim: Underdevelopment in Africa is not a natural, pre-capitalist, or culturally determined condition but a historically produced outcome of the same capitalist world-system that generated development in the core; after formal independence, neo-colonialism reproduces this condition through control of finance, trade, technology, and elite alliances, so that the "development of underdevelopment" persists unless the structure of insertion into the world-economy is transformed.

Mechanism: The dependency tradition argues that development and underdevelopment are not separate stages but relational products of a single capitalist system. Frank (1967) formulated the "development of underdevelopment" through the metropolis-satellite model: surplus is extracted from satellite regions to metropolitan centers through chains of exploitation, and the satellite's apparent "backwardness" is the result of its integration into the system on subordinate terms. Rodney (1972) applied this logic to Africa, arguing that Europe underdeveloped Africa through the slave trade, colonial conquest, forced labor, and the creation of export economies oriented toward European industrial needs; underdevelopment is therefore not the absence of development but the active production of poverty and dependency. Amin (1976) added the concept of peripheral capitalism and unequal exchange: the periphery is integrated into the world-economy through the export of primary commodities and the import of manufactured goods, with the terms of trade systematically transferring surplus to the center; he proposed "delinking" as a strategy to reduce subordination, not autarky but a reorientation of accumulation toward internal needs. Nkrumah (1965) shifted attention to neo-colonialism, the "last stage of imperialism," in which formal political sovereignty coexists with substantive economic control by foreign capital, aid agencies, military alliances, and local comprador elites. The mechanisms include commodity specialization and terms-of-trade deterioration; unequal exchange in trade; technological dependence and enclave production with weak domestic linkages; debt and financial dependence; institutional constraints imposed by trade agreements, investment treaties, and international financial institutions; and the reproduction of elites whose power depends on external rents. Fanon (1961) complements this by showing how colonialism produces a native bourgeoisie oriented toward consumption and mediation rather than national productive transformation. Together, these authors do not merely describe poverty; they specify a causal chain in which global hierarchy is reproduced through structures of extraction, not only through bad domestic policy.

Scope Conditions: The dependency framework applies most strongly where economies are inserted into the world division of labor as primary-commodity exporters with limited industrial diversification; where colonial institutions created extractive states and weak fiscal capacity; where global finance and trade rules constrain macroeconomic and industrial policy; and where technological capabilities are imported rather than domestically generated. It is less deterministic than sometimes caricatured: African economies vary significantly in resource endowments, state capacity, regional integration, and policy choices, and some have achieved partial diversification or manufacturing growth. The framework also has internal limits. Early formulations sometimes treated the periphery as homogeneous and underplayed internal class dynamics, gendered labor, ethnic politics, and African agency. Later African political economy—associated with scholars such as Mkandawire and others—has criticized "African pessimism" and argued for greater attention to state capacity, institutional variation, and the possibility of developmental states. Dependency theory is therefore best used as a structural critique of global hierarchy and a warning against naive convergence, not as a claim that no African state can alter its position. Its contemporary relevance is renewed by new forms of dependency: digital platforms, green-mineral value chains, private debt, and climate finance can reproduce subordination even where old colonial structures have changed.

Observable Implications: If the dependency mechanism is operating, one should observe persistent commodity dependence; a low and stagnant share of manufacturing value added; volatile or deteriorating terms of trade for primary exports; capital flight and illicit financial flows; recurrent debt distress and recourse to IMF or World Bank programs; enclave economies with weak backward and forward linkages; technological import dependence; elite consumption tied to external rents; and limited fiscal capacity to fund public goods. Counterevidence would include sustained diversification, rising domestic value capture, reduced illicit financial flows, autonomous industrial policy, and regional value chains that retain more surplus locally. The DRC cobalt chain, in which the DRC captures only an estimated 3–5 percent of final electric-vehicle battery value, is a contemporary illustration: extraction occurs in Africa, while refining, manufacturing, branding, and finance are concentrated elsewhere. Similarly, Africa's small share of global manufacturing value added suggests that formal independence has not by itself transformed the continent's position in the international division of labor. The mechanism also implies that policy reforms focused only on governance or market access, without addressing value capture and structural position, may improve efficiency without altering hierarchy.

Perspective Note (five traditions in brief):

African (primary): African dependency theory is not simply Western Marxism applied to Africa; it is rooted in anti-colonial struggle, lived experience of extraction, and African scholarly traditions that treat sovereignty as both political and economic. Rodney (1972), Amin (1976), and Nkrumah (1965) wrote from positions shaped by decolonization, pan-Africanism, and the recognition that formal independence could be emptied of content by continued control of finance, trade, and technology. The central insight is that "development" is not a neutral technocratic goal but a political project of transforming Africa's insertion into the world-economy. Neo-colonialism is therefore not merely foreign interference; it is a structure in which local elites, foreign capital, and international institutions jointly reproduce subordination. African perspectives also highlight mechanisms that Western mainstream accounts often miss: the destruction of pre-colonial productive systems, the racialization of labor, the gendered burden of adjustment, and the cultural dimensions of domination. At the same time, African scholarship has critically revised dependency theory: some argue that it can be economistic, that it underestimates African agency and regional variation, and that it risks treating all external engagement as exploitation. Contemporary African perspectives connect dependency to resource sovereignty, the African Continental Free Trade Area, and industrial strategies aimed at value addition rather than raw extraction. The African vantage point reveals that Western "development" discourse often treats African poverty as a failure to converge to a universal model, whereas dependency theory treats it as a relation produced and reproduced by global hierarchy.

Chinese: The official Chinese narrative emphasizes mutual benefit, "win-win" cooperation, and a shared future, often presenting China's engagement in Africa as an alternative to Western conditionality. Chinese academic critics of dependency may acknowledge unequal exchange and advocate "shared development," infrastructure-led growth, and technology transfer as ways to alter Africa's structural position. This perspective contributes an alternative to liberal institutionalism and highlights the possibility of industrialization through external partnership. However, it may occlude debt risks, enclave projects, limited local value capture, and the possibility that Chinese capital reproduces dependency if African states lack bargaining power and industrial strategy. It can also understate African demands for sovereignty when "win-win" rhetoric is not matched by transparent contracts and domestic linkages.

Russian: Russian discourse often frames African dependency as a product of Western neo-colonialism, emphasizing multipolarity as a route to greater African autonomy. It contributes a critique of Western financial

dominance, sanctions, and unilateralism, and it resonates with anti-imperialist traditions. Yet it may occlude Russia's own extractive interests, security engagements, and authoritarian partnerships in Africa, and it frequently treats African states as arenas of great-power competition rather than as autonomous developmental actors. It can also understate the internal political and economic conditions that shape whether external partnerships reduce or reproduce dependency.

Western: Mainstream Western international political economy often treats dependency theory as deterministic, outdated, or empirically refuted, emphasizing institutions, governance, market integration, and convergence. It contributes methodological rigor, cross-country data, and policy tools for macroeconomic management. Critical Western scholarship, including Frank and Wallerstein, acknowledges structural inequality and colonial legacies, and more recent work on global value chains and unequal exchange has partially rehabilitated dependency insights. Nevertheless, Western perspectives often individualize failure, prescribe convergence to a Western model, and treat African poverty as a domestic governance problem. Critical self-correction has improved recognition of historical injustice, but policy frameworks frequently remain within liberal institutionalism, emphasizing aid, trade access, and governance reform rather than transformation of the global division of labor.

UN: The UN perspective frames dependency as a development deficit addressable through the Sustainable Development Goals, financing for development, debt relief, technology transfer, and capacity building. It contributes valuable empirical data, normative commitments, and institutional mechanisms for crisis response. However, by treating inequality as a problem of underdevelopment solvable through better policies and more financing, it may depoliticize the structural critique advanced by dependency theory. The UN perspective is therefore both a source of useful evidence and a potential normalization of hierarchy: it can mitigate symptoms without transforming the system that produces them.

SECTION 2.5 KEY IDEA 4 — Contemporary Value-Chain Analysis: GVCs, Lead Firms, and Distribution of Gains

Bolded Causal Claim: Global value chains are not neutral efficiency networks; they are hierarchically governed structures in which lead firms capture disproportionate rents by controlling intangible assets, standards, logistics, and market access, while peripheral suppliers compete on cost, absorb volatility, and face structurally constrained upgrading paths.

Mechanism: The mechanism begins with the fragmentation of production across borders, but fragmentation alone does not explain distribution. What matters is governance: who sets specifications, who owns brands, who controls data, who finances working capital, and who can switch suppliers. Gereffi, Humphrey, and Sturgeon (2005) distinguish market, modular, relational, captive, and hierarchical governance, showing that as asset specificity and complexity rise, lead firms exercise more coordination power. In captive and hierarchical chains, suppliers are locked into buyer-driven standards, price targets, and delivery schedules; their margins are squeezed because they compete with other suppliers for orders while lead firms retain pricing power downstream. The "smile curve" captures the resulting asymmetry: value added is concentrated in research and development, design, branding, finance, and retail, while assembly, fabrication, and raw-material processing earn thin margins. Lead firms do not need to own factories to control value; they own intangibles—patents, trademarks, algorithms, certification systems, and consumer trust—and use them to appropriate rents. Suppliers may upgrade process efficiency, but functional upgrading into design, branding, or finance is often blocked by lead-firm strategies, intellectual property, and the need for scale. The

mechanism is therefore not simply outsourcing; it is the separation of high-value intangible functions from low-value material functions across space, with the former concentrated in core economies and the latter pushed to the periphery. In African cases, this appears when cobalt is mined and partially processed in the Democratic Republic of Congo, while battery design, cell manufacturing, electric-vehicle assembly, and brand rents accrue elsewhere. The chain's apparent "global" character can obscure a territorial hierarchy: the same product crosses borders, but value capture does not cross them evenly.

Scope Conditions: This framework applies most strongly where production is fragmented across multiple jurisdictions, where lead firms possess intangible-asset advantages, where supplier capabilities are uneven, and where governance is buyer-driven rather than purely market-based. It is less explanatory where suppliers have strong state-backed industrial capacity, technological autonomy, or bargaining power; where value chains are short and commodity-like; or where production is vertically integrated within one firm or country. It also has limits as a standalone theory. Global value-chain analysis can overemphasize firm-level governance and understate geopolitics, colonial legacies, racialized labor regimes, and state power. It may treat "upgrading" as a technical ladder while ignoring that the ladder itself is politically constructed and that some rungs are deliberately withheld. It can also imply that integration into chains is developmentally beneficial if suppliers move up, whereas dependency theorists would ask whether upgrading within a hierarchy still reproduces subordination. Thus the framework is powerful for describing micro-level rent distribution but must be connected to macro-level structural hierarchy to avoid becoming a managerial theory of development.

Observable Implications: If lead-firm governance dominates, one should observe high concentration of value added in design, branding, finance, and retail; low and volatile margins for suppliers; limited technology transfer; supplier lock-in through standards and certification; and persistent gaps between export values and final consumer prices. One should also observe that peripheral exports are often measured by gross trade flows that overstate their contribution, because imported inputs and foreign-owned intangible services are embedded in the final price. In cobalt, the implication is that mining and early processing capture a small share of final battery value, while refining, cell manufacturing, pack assembly, vehicle production, and brand rents capture the rest. Another implication is that "participation" in global value chains can coexist with weak domestic industrialization: a country may export more while capturing less value per unit, especially if it remains in extraction or low-margin assembly. Finally, one should observe political struggles over local content, beneficiation, standards, and technology transfer, because these are attempts to alter the chain's distributional logic rather than merely increase export volume.

Perspective Note (five traditions in brief): African (primary): African scholarship and policy discourse treat global value chains as a contemporary language for an older problem: the international division of labor that reserves high-value functions for core economies and low-value, high-risk functions for Africa. From this vantage point, "upgrading" is not automatically emancipatory; it can mean becoming a more efficient subordinate. The African perspective emphasizes resource sovereignty, local content, beneficiation, industrial policy, and regional integration through the African Continental Free Trade Area. Initiatives such as the DRC-Zambia battery value-chain project are read not merely as investment promotion but as attempts to move from extraction toward higher-value stages and to retain more of the chain within the continent. This perspective also highlights that lead-firm power is reinforced by financial, legal, and standards infrastructures that African states did not design. Chinese: The official narrative presents Chinese participation in African value chains as win-win, emphasizing infrastructure, manufacturing relocation, employment, and mutual benefit. Academic and policy critiques within China and beyond note asymmetries in technology transfer, standards, and bargaining power, and ask whether Chinese firms are becoming lead firms in some sectors while remaining suppliers in others. The Chinese perspective contributes an alternative to Western

corporate dominance but does not eliminate hierarchy; it may redistribute it. Russian: Russian discourse often frames Western lead-firm dominance as part of a broader unipolar economic order and supports multipolarity, sovereign industrial policy, and resistance to sanctions. It contributes a geopolitical critique of corporate power but may understate the internal dynamics of supplier upgrading and the role of non-Western lead firms. Western: Mainstream international political economy emphasizes efficiency gains, comparative advantage, and the possibility of upgrading through integration; critical Western scholarship emphasizes monopsony power, labor exploitation, environmental externalities, and the political construction of standards. The Western perspective contributes rich firm-level evidence and policy tools but risks normalizing hierarchy as market outcome. UN: The UN perspective frames value-chain participation as a development opportunity addressable through decent work, technology transfer, capacity building, and sustainable development goals. It contributes data and normative standards but may depoliticize lead-firm power by treating distributional outcomes as implementation gaps rather than structural features.

SECTION 2.6 KEY IDEA 5 — Empirical Measurement: Prebisch-Singer, Terms of Trade, Capital Flight, Debt Distress, and Illicit Financial Flows

Bolded Causal Claim: Structural hierarchy is not only a theoretical construct; it is measurable through long-run deterioration in the terms of trade for primary commodities, net resource transfers via capital flight and debt service, and illicit financial flows that drain fiscal capacity from peripheral states.

Mechanism: The empirical case begins with the Prebisch-Singer hypothesis. Prebisch and Singer argued that the terms of trade for primary commodities tend to deteriorate relative to manufactured goods over the long run. The mechanism has several channels: demand for primary commodities is relatively income-inelastic, so growth in core economies does not raise commodity prices proportionally; technological progress in manufacturing lowers unit costs and prices in ways that are not matched in commodity extraction; and core producers possess oligopolistic pricing power while peripheral producers face competitive markets. The result is a transfer of surplus from periphery to core even when trade volumes expand. Terms of trade are measured through export and import price indices, unit value ratios, and purchasing-power measures, though methodological choices—base years, quality adjustments, and commodity baskets—can alter findings. Capital flight operates through a different but complementary mechanism: resources leave peripheral economies through unrecorded outflows, trade misinvoicing, debt-fueled capital flight, and offshore accumulation. Ndikumana and Boyce (2011) argue that capital flight is not merely a symptom of poor governance but is structurally linked to external borrowing and debt, creating a circuit in which borrowed funds are siphoned abroad while debts remain domestically. Debt distress then compounds the transfer: debt service crowds out public investment, forces austerity, and subjects states to creditor conditionality. Illicit financial flows add another layer. UNCTAD (2020) estimates that Africa loses billions annually through illicit financial flows, with trade misinvoicing as a major channel. These flows reduce tax bases, weaken state capacity, and make development finance dependent on external inflows that may themselves be volatile or conditional. Together, these metrics suggest that hierarchy can be tracked not only in theory but in balance-of-payments, debt-sustainability, and fiscal data.

Scope Conditions: These measures apply most strongly to commodity-dependent economies, especially those with narrow export bases, limited manufacturing diversification, and high external debt. They are less decisive for diversified exporters, service-oriented economies, or countries with strong industrial policy and technological upgrading. The Prebisch-Singer hypothesis itself is contested: some studies find long-run deterioration for certain commodity baskets, while others find stability or improvement during commod-

ity booms; the result depends on period, index construction, and whether one examines relative prices or purchasing power. Capital-flight estimates are sensitive to assumptions about normal trade and investment patterns, and illicit financial flow estimates involve large uncertainty because the flows are deliberately hidden. Debt distress is also overdetermined: it can reflect domestic borrowing decisions, governance failures, commodity price shocks, interest-rate cycles, and creditor behavior, not only structural hierarchy. Therefore these metrics should be treated as evidence of structural pressure and net transfer, not as automatic proof of a single causal mechanism. They are strongest when combined with case-level analysis of who borrows, who benefits, and where the money goes.

Observable Implications: If structural hierarchy is operating through these channels, one should observe long-run weakness in commodity terms of trade relative to manufactures; large gaps between recorded and estimated trade values; debt-service ratios that crowd out health, education, and infrastructure spending; and illicit financial flows that exceed official development assistance or foreign direct investment in some periods. One should also observe that debt relief can provide temporary fiscal space without resolving the underlying transfer mechanisms, as seen in the Heavily Indebted Poor Countries and Multilateral Debt Relief Initiative experiences. Another implication is that fiscal capacity in peripheral states is systematically understated: governments appear unable to fund development not only because of low productivity but because taxable value is shifted offshore through mispricing, tax havens, and debt-driven outflows. Finally, one should observe policy responses that target measurement and recovery—transfer-pricing rules, beneficial-ownership registries, automatic exchange of information, and demands for reparations or debt cancellation—because these are attempts to make hierarchy visible and contestable.

Perspective Note (five traditions in brief): African (primary): African scholars and policymakers have long treated terms-of-trade deterioration, capital flight, debt distress, and illicit financial flows as empirical confirmations of dependency. Rodney's argument that underdevelopment is produced, not natural, is reinforced by data showing net resource transfers from Africa to the rest of the world. From this perspective, debt is not merely a liquidity problem but a mechanism of extraction and conditionality; illicit financial flows are not technical tax issues but structural drains on sovereignty. African demands therefore include debt cancellation, recovery of stolen assets, tax justice, and reform of global financial governance. The African perspective also insists that measurement itself is political: who defines "debt sustainability," who audits trade misinvoicing, and who controls the data shapes what counts as evidence. Chinese: Chinese official discourse often uses terms-of-trade and financing data to criticize Western-dominated financial institutions and to present China as a partner in development finance. Academic critiques may note that China's own rise complicates simple core-periphery models, while also acknowledging that Chinese lending and trade can reproduce asymmetries. The Chinese perspective contributes an alternative source of finance and a multipolar framing but does not resolve measurement disputes about debt distress or illicit flows. Russian: Russian discourse frames Western financial hegemony, sanctions, and dollar dominance as mechanisms of extraction and dependency, and supports multipolarity, alternative payment systems, and sovereign debt restructuring outside Western institutions. It contributes a geopolitical critique of financial power but may be less focused on the micro-mechanisms of African capital flight and tax justice. Western: Mainstream international political economy often treats terms-of-trade movements as market outcomes, debt as a governance and sustainability issue, and illicit financial flows as enforcement problems. Critical Western scholarship has increasingly acknowledged tax havens, transfer pricing, and odious debt, contributing empirical tools and policy reforms. The Western perspective contributes methodological rigor but can normalize the system by framing structural transfers as correctable market failures. UN: The UN perspective frames these issues through Sustainable Development Goals, financing for development, debt relief, and illicit-financial-flow

task forces. It contributes indispensable data, normative commitments, and institutional mechanisms for crisis response. However, by treating inequality as a development deficit solvable through better policies and more financing, it may depoliticize the structural critique advanced by dependency theory. The UN perspective is therefore both a source of useful evidence and a potential normalization of hierarchy: it can mitigate symptoms without transforming the system that produces them.

SECTION 2.7 FIVE PERSPECTIVES IN DEPTH

2.7.1 African Perspective (PRIMARY) The African perspective on world-systems and dependency begins from a question that formal sovereignty does not answer: why does political independence so often coexist with continued economic subordination? Nkrumah (1965) named this condition neo-colonialism, arguing that the state flag could change while control over finance, trade, strategic resources, and military alignments remained external. Rodney (1972) sharpened the historical claim by arguing that underdevelopment is not a natural stage or an absence of development but a product of the same process that produced European development; Europe's accumulation and Africa's impoverishment are dialectically linked. Frank (1967) and Amin (1976) extended this logic into a global chain of metropolis-satellite extraction and unequal exchange, in which peripheral economies are integrated into capitalism not as latecomers to a universal path but as structurally subordinate suppliers of cheap labor and raw materials. Wallerstein's world-systems theory gives this critique a systemic architecture: Africa appears largely as periphery within a single capitalist division of labor, specialized in low-value extraction and labor-intensive production while core zones monopolize high-value, capital-intensive, technologically dynamic, and financial activities. Yet African scholarship insists that this hierarchy is not merely functional or market-generated. It is historically constituted through colonial conquest, racialized labor regimes, externally imposed borders, and institutions that survived formal decolonization. Mamdani's analysis of the colonial state, for example, shows how bifurcated power—between citizen and subject, between modern and customary authority—created durable structures of extraction and domination that outlived empire. Bayart's thesis of extraversion shows African elites as active participants in external dependence rather than passive victims, which complicates any simple core-periphery determinism and forces attention to the internal politics of subordination. Mbembe's work on the postcolony and necropolitics highlights how sovereignty itself can be hollowed out by violence, debt, conditionalities, and the militarization of resource extraction. The African perspective is therefore not merely a regional application of dependency theory; it is a theory of incomplete sovereignty and historically produced subordination.

Arrighi's hegemonic cycles add a crucial temporal dimension to this critique. The movement from production to finance in declining hegemons maps onto Africa's experience of the 1980s and 1990s: debt crisis, structural adjustment, privatization, currency devaluation, and the reorganization of extraction under financialized global capitalism. From an African vantage point, these were not neutral technocratic corrections to policy failure but reorganizations of surplus transfer under new hegemonic conditions. The International Monetary Fund and World Bank, though multilateral in form, are often read as instruments through which core financial power disciplines peripheral states, converting debt into governance. Debt becomes not simply a liability but a mechanism for constraining fiscal space, shaping public investment, and privileging creditor interests over domestic development priorities. This is where the empirical measurement tradition becomes politically charged. Prebisch-Singer terms-of-trade deterioration, capital flight, debt distress, and illicit financial flows are not treated as unfortunate market outcomes or technical development indicators;

they are read as measurable evidence of structural transfer. UNCTAD's estimates of illicit financial flows from Africa, for example, are interpreted not as leakage around an otherwise sound system but as systemic plunder enabled by global financial architecture, tax havens, trade misinvoicing, and weak enforcement. The African perspective thus uses numbers to demonstrate that hierarchy is reproduced through concrete channels of value extraction, not only through abstract market forces.

Contemporary global value-chain analysis sharpens the critique further. In the cobalt chain, the Democratic Republic of Congo captures only a small share of final electric-vehicle battery value, while lead firms control refining, cathode production, battery assembly, branding, and consumer markets. The African perspective sees this as continuity of the enclave economy: resource extraction without industrialization, employment without technological upgrading, and export earnings without durable transformation. Yet it also sees agency and possibility. Initiatives such as the African Continental Free Trade Area, the DRC-Zambia battery and electric-vehicle initiative, local-content requirements, and beneficiation policies are attempts to move from extraction to transformation and to build regional value chains that retain more value on the continent. These initiatives are not merely industrial policy; they are sovereignty projects aimed at altering Africa's position in the division of labor. At the same time, the perspective recognizes constraints: infrastructure deficits, capital scarcity, technological dependence, fragmented markets, and the bargaining power of lead firms. The result is a dual reading of contemporary capitalism: Africa remains structurally disadvantaged, but its states and firms are not without strategic room, and regional integration is treated as a necessary counterweight to global hierarchy.

What the African vantage point contributes that the other four perspectives often miss is historical depth, racialized coloniality, and the politics of incomplete sovereignty. It insists that underdevelopment is produced rather than original, that colonialism was not an episode but a structuring force, and that contemporary global institutions carry the sediment of imperial power. It also reveals the internal-external nexus: the comprador class, extraverted elites, and state capture that connect domestic inequality to global hierarchy. This prevents a purely externalist account of African subordination and makes visible the political struggles within African societies over who controls resources, who benefits from extraction, and whose development counts. It further contributes a normative alternative centered on resource sovereignty, pan-African integration, and structural transformation rather than mere insertion into existing value chains on better terms. Finally, it treats hierarchy as political and contestable, not as a natural feature of comparative advantage or technological diffusion.

The African perspective also has occlusions, and steel-manning it requires acknowledging them. It can risk economic determinism by attributing too much explanatory weight to external structures and too little to domestic policy choices, institutional variation, and African agency. It can homogenize a continent of fifty-four states with vastly different resource endowments, industrial capacities, governance trajectories, and growth experiences. It may understate successful episodes of manufacturing growth, service-sector expansion, and African firm participation in global value chains. It can also under-theorize gender, class, and generational differentiation within African societies, although African feminist scholarship has increasingly challenged extraction as a gendered process. There is a further risk of policy paralysis: if underdevelopment is structurally determined, the space for reform may appear narrow, and radical delinking may be impractical in an interdependent world. Resource-sovereignty initiatives may also reproduce elite capture if they are not democratized and if beneficiation becomes a rent-seeking project rather than broad-based transformation. African scholars such as Mkandawire have criticized dependency traditions for pessimism and for insufficient attention to the developmental state and to policy experimentation. Bayart's emphasis on extraversion reminds us that African elites are not simply victims of global capitalism but strategic actors who may benefit

from dependence. The perspective is therefore strongest when it combines structural critique with attention to internal variation, political agency, and the concrete conditions under which sovereignty can be exercised.

2.7.2 Chinese Perspective The Chinese perspective on world-systems and dependency is shaped by a dual identity: China presents itself as a developing country and as a rising power that has moved from peripheral status toward the core of the global economy. Officially, Beijing frames its relations with Africa and the wider Global South through a "win-win" narrative of mutual benefit, South-South cooperation, infrastructure development, and non-interference in internal affairs. This narrative rejects Western conditionality and presents China as a partner that respects sovereignty and development rights. It also challenges the Western-centric international political economy by arguing that development should not be measured against a single liberal model and that states have the right to choose their own paths. In this view, China's own rise demonstrates that peripheral economies can industrialize and upgrade within global capitalism, provided they maintain state capacity, strategic planning, and control over key sectors. Chinese academic discourse often critiques Western-centric international political economy and emphasizes industrial upgrading, global value-chain participation, and the developmental state. Some Chinese scholars draw on world-systems theory to argue that China's rise challenges United States hegemony and creates space for multipolarity, while also warning that China must avoid reproducing core-periphery dynamics in its own external relations. On Africa, Chinese perspectives highlight infrastructure gaps, financing needs, and the potential for industrial cooperation, while defending Chinese investment as filling a vacuum left by Western disengagement.

This perspective contributes an important corrective to Eurocentric international political economy. It foregrounds the agency of the Global South, the legitimacy of state-led development, and the possibility of alternative modernization paths. It also draws attention to material constraints—infrastructure, energy, logistics—that mainstream market-focused accounts sometimes understate. However, its occlusions are significant. The official "win-win" narrative can obscure asymmetries in China-Africa trade, in which African economies often export raw materials and import manufactured goods, including from China. It may understate concerns about debt sustainability, labor standards, environmental impacts, and the opacity of some contracts and financing arrangements. In global value-chain terms, Chinese firms may occupy lead-firm positions in processing and manufacturing while African economies remain at the extraction stage, reproducing the very hierarchy that dependency theory describes. The perspective can also normalize hierarchy by reframing extraction as cooperation and by treating African value capture as a secondary issue relative to growth and infrastructure. Thus the Chinese perspective is both a challenge to Western hegemony and a potential new axis of core-periphery relations, depending on whether cooperation produces structural transformation or merely relocates extraction.

2.7.3 Russian Perspective The Russian perspective on world-systems and dependency is organized around multipolarity, sovereignty, and a critique of Western hegemony. It views the post-Cold War international order as unipolar and dominated by the United States and its allies, with Western financial institutions, sanctions, and security alliances serving as instruments of control over peripheral and semi-peripheral states. From this vantage point, dependency is not only an economic condition but a geopolitical one: states that rely on Western-dominated financial systems, reserve currencies, and security guarantees are vulnerable to coercion. Russia's critique of sanctions is central here; sanctions are framed not as neutral enforcement of norms but as weaponized interdependence that punishes dissent and preserves hierarchy. The Russian perspective therefore supports a multipolar world in which power is dispersed across several centers, and it presents partnerships with Africa, Asia, and Latin America as contributions to that order. In relation to

Africa, Russia emphasizes sovereignty, non-interference, and state-to-state cooperation, often contrasting its approach with Western conditionality. It also highlights historical anti-colonial solidarity and presents itself as an alternative partner in energy, mining, security, and nuclear technology.

This perspective contributes a geopolitical lens that mainstream international political economy sometimes neglects. It highlights how financial and security institutions can be used coercively, and it challenges the assumption that the liberal order is neutral or universally beneficial. It also gives voice to states that experience Western power as constraint rather than opportunity. Yet its occlusions are substantial. The anti-hegemonic framing can instrumentalize Africa by treating the continent primarily as a theater of great-power competition rather than as a site of autonomous development. It may obscure asymmetries in Russia-Africa trade and investment, including the concentration of Russian interests in extractive sectors and security services. Security cooperation, including the use of private military companies, can undermine the very sovereignty that the perspective claims to defend. Moreover, by focusing on Western culpability, the Russian perspective may deflect attention from domestic governance failures, elite capture, and the internal dimensions of dependency. It is strongest as a critique of coercive hierarchy, but weaker as a theory of development or value-chain transformation.

2.7.4 Western Perspective The Western perspective on world-systems and dependency is internally divided between mainstream international political economy and critical self-correction. Mainstream accounts emphasize comparative advantage, market efficiency, global value-chain governance, institutional quality, and the gains from trade. From this standpoint, Africa's position in the global economy reflects a combination of factor endowments, policy choices, institutional weaknesses, and historical legacies, but not necessarily a structurally determined trap. Global value chains are seen as opportunities for participation, learning, and upgrading, even if gains are unevenly distributed. Critical Western scholarship, however, has increasingly incorporated insights from dependency theory, world-systems analysis, and critical international political economy. It examines lead-firm power, unequal exchange, financialization, tax avoidance, and the political economy of debt. This critical turn has produced more nuanced analyses of global value chains, recognizing that governance by lead firms can lock suppliers into low-value segments and that market access does not automatically produce structural transformation. Western scholarship also contributes methodological rigor: econometric analysis of terms of trade, firm-level studies of value capture, debt-sustainability frameworks, and detailed measurement of illicit financial flows.

The Western perspective contributes indispensable data, analytical tools, and policy mechanisms. It can identify market failures, design institutional reforms, and evaluate development interventions with precision. Its critical wing has also partially rehabilitated dependency insights by translating them into measurable concepts such as value capture, rent extraction, and chain governance. However, its occlusions remain significant. Mainstream accounts can normalize hierarchy by framing structural transfers as correctable market failures or policy distortions rather than as constitutive features of global capitalism. They may understate the colonial and racialized foundations of the current order and may treat development as convergence toward a Western model. Even critical Western scholarship can be constrained by methodological individualism and by a tendency to privilege firm-level or country-level analysis over systemic hierarchy. The result is a perspective that is analytically powerful but sometimes politically thin: it can explain how value is distributed without fully questioning why the system is organized to produce such distributions in the first place.

2.7.5 UN Perspective The UN perspective frames world-systems and dependency through sustainable development, financing for development, debt relief, and illicit-financial-flow governance. It is less a single

theory than an institutional and normative framework that aggregates data, sets goals, and mobilizes crisis responses. Through the Sustainable Development Goals, the UN treats inequality, poverty, and underdevelopment as global problems requiring collective action. Through financing-for-development processes, it addresses debt distress, official development assistance, domestic resource mobilization, and international tax cooperation. UNCTAD plays a particularly important role by producing data on trade, value chains, capital flight, and illicit financial flows, and by articulating a development-centered critique of globalization. The UN perspective also includes debt-relief mechanisms such as the Heavily Indebted Poor Countries initiative and the Multilateral Debt Relief Initiative, which were designed to reduce unsustainable debt burdens and create fiscal space for development. In this sense, the UN is both a source of evidence and an arena in which the politics of hierarchy are negotiated.

This perspective contributes indispensable normative commitments and institutional mechanisms. It provides a language of rights, equity, and shared responsibility that can legitimate demands for debt relief, technology transfer, and fairer trade. It also produces data that make structural transfers visible, including estimates of illicit financial flows and analyses of value capture in commodity chains. Its crisis-response capacity can mitigate acute harm and create breathing room for peripheral states. Yet its occlusions are equally important. By treating inequality as a development deficit solvable through better policies, more financing, and improved governance, the UN perspective can depoliticize the structural critique advanced by dependency theory. It may frame hierarchy as a set of gaps to be closed rather than as a system that produces and reproduces subordination. Debt relief, while valuable, can normalize the creditor-debtor relationship rather than transform it. Similarly, illicit-financial-flow task forces may address symptoms without dismantling the global financial architecture that enables extraction. The UN perspective is therefore both a source of useful evidence and a potential normalization of hierarchy: it can mitigate symptoms without transforming the system that produces them.

2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Structural critique of extraction; "development of underdevelopment"; resource sovereignty agendas (AfCFTA, DRC–Zambia battery initiative)	May understate African elite agency and intra-African variation; risk of structural determinism	Justice, sovereignty, reparative equity	Rodney (1972), Nkrumah (1965), Amin (1976), terms-of-trade deterioration, capital flight	Western: policy variation and agency matter; some African states grew
Chinese	Alternative financing; infrastructure; South–South cooperation; non-interference	Contract opacity; debt sustainability; commercial self-interest	Mutual benefit, development, sovereignty	BRI/FOCAC projects, concessional loans	African/Western: debt-trap and transparency concerns
Russian	Multipolarity critique; anti-hegemonic framing; security partnerships	Limited economic footprint; geopolitical instrumentalization; PMC presence	Multipolar order, sovereignty	Arms sales, UN votes, Wagner in CAR/Mali	Western: undermines governance, supports authoritarianism
Western	Mainstream IPE; market efficiency; institutional reform; critical self-correction (Stiglitz)	Structural power; historical responsibility; conditionality harm	Liberal international order, rules-based trade	WTO, IMF programs, growth episodes	African: conditionality deepened poverty; structural adjustment

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
UN	SDGs; financing for development; data (UNCTAD IFF); debt relief frameworks	Depoliticizes structure; normalizes creditor–debtor; symptoms not causes	Multilateralism, development, equity	UNCTAD reports, SDG indicators, HIPC/MDRI	African: frames hierarchy as gaps not system

2.8 WORKED EXAMPLE (I do)

Case: The 1980s–1990s African debt crisis and HIPC/MDRI debt relief

Levels of analysis

At the individual level, the crisis was lived and negotiated by specific actors: African finance ministers and central-bank governors who signed structural adjustment programs; IMF and World Bank staff who designed conditionality; Paris Club creditors' negotiators; and civil-society campaigners in the Jubilee 2000 movement who reframed debt as a moral issue. Individual economists—Jeffrey Sachs, Michel Camdessus, Joseph Stiglitz—shaped the intellectual terms of debate, with Stiglitz's later critique of IMF programs illustrating how individual scholarly dissent could challenge institutional consensus.

At the state level, the crisis pitted debtor states against creditor institutions. African governments faced IMF/World Bank conditionality packages; the Paris Club coordinated bilateral creditor relief; the G7 set the political parameters. States were not unitary actors—finance ministries often clashed with planning ministries and parliaments over adjustment—but the state remained the formal contracting party in debt and relief negotiations.

At the systemic level, the crisis reflected the hierarchical structure of the world economy: the position of African economies in the periphery, their export dependence on primary commodities, the volatility of terms of trade, and the hegemonic financial architecture centered on the dollar and on creditor-country institutions. The debt crisis was not merely a series of national misfortunes but a systemic event in which peripheral states absorbed shocks generated in core financial centers.

At the transnational level, commercial banks recycled petrodollars into sovereign loans in the 1970s; multinational corporations structured trade and transfer pricing; diaspora remittances and civil-society networks (Jubilee 2000, the African Forum and Network on Debt and Development—AFRODAD) linked local suffering to global advocacy. Transnational capital flows, both licit and illicit, shaped the magnitude of indebtedness and the feasibility of repayment.

Mechanism section

The mechanism runs through several linked stages. First, the 1970s oil shocks and subsequent recession

in the core generated a glut of petrodollars that commercial banks lent to developing countries, including African states, at variable interest rates. Second, the Volcker shock of 1979–1982 raised US interest rates sharply, increasing debt-service burdens while commodity prices collapsed; the terms of trade for primary exporters deteriorated. Third, African states faced a liquidity crisis that became a solvency crisis: new borrowing serviced old debt, and structural adjustment programs imposed fiscal austerity, privatization, and trade liberalization. Fourth, the HIPC Initiative (1996, enhanced 1999) and later MDRI (2005) provided debt relief conditional on policy reforms and poverty-reduction strategies, reducing nominal debt but embedding creditors' policy preferences. The mechanism thus links global monetary conditions to peripheral fiscal compression and then to conditional relief that preserved the creditor-debtor hierarchy.

Perspective reconstruction

African (primary, longest): From the African vantage point, the debt crisis was not a technical liquidity problem but the latest episode in a long history of extraction. Nkrumah's concept of neo-colonialism (1965) framed post-independence debt as a mechanism by which formal sovereignty was hollowed out by financial dependence; Rodney (1972) showed how the development of underdevelopment meant that African economies were structured to produce raw materials for core industry, making debt an almost inevitable consequence of unequal exchange. Amin (1976) emphasized delinking and autonomous development as the only escape from peripheralization. In this reading, structural adjustment programs were not neutral technocratic fixes but instruments of continued subordination: they compressed public spending, privatized state assets, and opened markets to core capital while leaving the structural position of African economies unchanged. HIPC and MDRI, while reducing nominal burdens, were read as creditor-managed relief that normalized the debtor relationship and imposed new conditionalities through Poverty Reduction Strategy Papers. The African perspective thus sees debt relief as partial and ambivalent: it eased immediate fiscal pressure but did not transform the world-system position that generated the debt. Contemporary African scholarship and policy—AfCFTA, the DRC–Zambia battery initiative, calls for debt cancellation rather than relief—extend this critique by seeking structural transformation and resource sovereignty rather than managed dependency.

Chinese: China's perspective on the African debt crisis is shaped by its own experience as a debtor in the 1980s and by its later role as a creditor. Officially, Beijing frames its engagement through "win-win" cooperation and non-interference, contrasting its approach with Western conditionality. Chinese academic critics, however, have questioned the sustainability of lending and the opacity of contracts, and have debated whether China's rise reproduces hierarchical patterns. On the 1980s–90s crisis specifically, Chinese commentary has often emphasized Western responsibility—IMF conditionality, volatile commodity markets, and the structural disadvantages faced by developing countries—while presenting China as an alternative partner. The Chinese perspective contributes an emphasis on infrastructure and production capacity, but it risks occluding its own creditor interests and the power asymmetries in bilateral lending.

Russian: Russia's perspective is filtered through its post-Soviet experience and its critique of Western hegemony. Moscow has framed the African debt crisis as evidence of the exploitative nature of the Western-led financial order, using it to support arguments for multipolarity and for alternatives to IMF/World Bank dominance. Russian scholarship and policy commentary have emphasized sovereignty and non-interference, often aligning with African governments' resistance to conditionality. At the same time, Russia's economic footprint in Africa during the 1980s–90s was limited, and its contemporary engagement—arms sales, private military company presence, resource deals—has drawn criticism for instrumentalizing anti-Western rhetoric. The Russian perspective contributes a geopolitical critique of unipolarity but occludes its own limited development contribution and its security-first approach.

Western: The Western perspective, dominant in the institutions that managed the crisis, initially framed African debt as a problem of policy failure and governance deficits. IMF and World Bank programs emphasized fiscal discipline, market liberalization, and privatization; the HIPC initiative added poverty reduction as a goal. Critical Western scholarship—Stiglitz's critique of IMF programs, Sachs's advocacy for debt cancellation—later challenged the harshness of conditionality and the pro-cyclical nature of austerity. The Western perspective contributes institutional capacity for debt relief and a tradition of self-correction, but it has historically occluded structural causes: the role of core monetary policy (the Volcker shock), commodity price volatility, and the asymmetry of the global financial architecture. Even critical Western accounts often retain a reformist rather than transformative stance.

UN: The UN perspective frames the debt crisis through development and human-rights lenses. UNCTAD documented the deteriorating terms of trade and the debt overhang; the UN system supported HIPC and MDRI and later advanced the SDGs and financing-for-development agendas. The UN perspective contributes valuable data—UNCTAD estimates of illicit financial flows, debt statistics—and a multilateral forum for debtor voices. However, it risks depoliticizing structure: by treating debt as a development deficit solvable through better policies, more financing, and improved governance, it can normalize the creditor-debtor relationship. Debt relief is framed as progress rather than as a symptom of a system that produces indebtedness. The UN perspective thus mitigates symptoms without necessarily transforming the system.

Explicit adjudication

The African dependency perspective best explains the 1980s–1990s debt crisis and the ambivalent character of HIPC/MDRI relief. It captures the structural position of African economies in the world system, the role of core monetary shocks (the Volcker shock) and commodity price collapse, and the way conditionality preserved rather than transformed hierarchy. Its strongest evidence is the persistence of debt distress and commodity dependence after relief, and the continued outflow of capital. What it misses, or at least underweights, is the genuine variation in African state capacity and policy choices—some states managed adjustment better than others—and the role of African elite agency in borrowing and spending decisions. The Western institutional perspective correctly identifies governance and policy failures but systematically underweights structural causes. The Chinese and Russian perspectives offer geopolitical counterweights but lack the economic depth to explain the crisis mechanism. The UN perspective provides essential data and a forum for relief but tends to normalize the creditor-debtor relationship. A full explanation requires the African structural critique as the primary lens, supplemented by Western institutional analysis of state capacity and by UN data on flows and stocks.

SECTION 2.9 PROBLEM PAIR (We do)

Tasks

1. **Map the chain.** List the principal stages of the cobalt value chain from artisanal and industrial mining in the Democratic Republic of Congo (DRC) through refining, precursor and cathode production, cell and pack assembly, and final electric-vehicle (EV) integration. For each stage, note the typical geographic location and the approximate share of final battery value captured, using the 3–5 percent figure for DRC mining as your anchor.
2. **Locate the DRC in Wallerstein's hierarchy.** Classify each major node of the chain as core, semi-

periphery, or periphery. Explain why the DRC's position is not merely "poor country" but a structurally assigned role within a single division of labor, and identify which semi-peripheral economies (for example, China in refining) mediate between core demand and peripheral extraction.

3. **Apply Arrighi's hegemonic cycle.** Identify which hegemon's phase of financialization most shaped the contemporary cobalt chain, and explain how the shift from production to finance in that hegemon's cycle altered the terms under which peripheral states could bargain over resource rents.

4. **Deploy African dependency theory.** Using Rodney's "development of underdevelopment," Amin's "delinking," Nkrumah's neo-colonialism, and Frank's "development of underdevelopment," explain why DRC state capacity and domestic industrialization have been systematically constrained even when global cobalt prices rose.

5. **Reconstruct the Chinese perspective.** Contrast the official "win-win" narrative of infrastructure-for-resources deals with the academic critique (for example, concerns about enclave economies, debt, and limited technology transfer). Identify what each framing reveals and what it occludes.

6. **Adjudicate and falsify.** Decide whether low value capture is best explained by (a) market structure and lead-firm governance of global value chains, (b) state capacity and domestic institutional failure, or (c) historically constituted dependency. State one piece of evidence that would weaken each explanation.

MODEL ANSWER

The DRC's capture of only 3–5 percent of final EV battery value is best understood not as a market accident but as the equilibrium outcome of a hierarchically organized world-system in which extraction, refining, and manufacturing are spatially separated and politically unequal. The chain runs from artisanal and industrial mining in Katanga and Lualaba, through refining concentrated in China, to precursor and cathode production, cell and pack assembly largely in East Asia, and final vehicle integration in core economies. Each stage's location reflects not comparative advantage in a neutral sense but a historically produced division of labor in which the DRC is locked into the lowest-value, highest-risk node.

Wallerstein's framework clarifies that the DRC is not simply a poor country trading with rich ones; it occupies a periphery position within a single capitalist world-economy whose core requires cheap raw materials and externalizes environmental and social costs. The semi-periphery—here China in refining and, to a lesser extent, some midstream processing elsewhere—mediates between core demand and peripheral supply, capturing intermediate rents while preventing the periphery from upgrading. This is why the DRC's cobalt, even when prices spike, does not automatically translate into domestic industrialization: the structural position assigns it extraction, and the terms of trade, logistics, and financing are organized to keep it there.

Arrighi's hegemonic cycles add a temporal dimension. The contemporary chain was shaped by the US-led financialization phase, in which capital mobility, commodity speculation, and debt conditionality weakened peripheral states' bargaining power. As hegemonic power shifted from production to finance, resource-rich states faced pressure to liberalize mining codes, accept investor-state arbitration, and prioritize export volumes over domestic processing. The result was a race to the bottom in fiscal terms, even as global demand for cobalt surged with the energy transition.

African dependency theory explains the domestic side of this trap. Rodney's "development of underdevelopment" shows how colonial and post-colonial extraction built infrastructure oriented toward export rather than

internal integration, leaving the DRC with enclave mines and weak linkages. Nkrumah's neo-colonialism captures the post-independence continuity: formal sovereignty without economic sovereignty, as foreign firms, offtake agreements, and debt obligations reproduce dependency. Amin's call for "delinking" highlights the difficulty of autonomous industrial policy under global financial discipline, while Frank's emphasis on the metropolis-satellite relation explains why even state-owned enterprises often remain tethered to external markets. Together, these theorists show that low value capture is not a failure of individual policy but a structurally reproduced outcome.

The Chinese perspective must be taken seriously on its own terms. The official "win-win" narrative emphasizes infrastructure, employment, and market access, and there is evidence that Chinese investment expanded DRC output and fiscal revenue. Yet the academic critique notes enclave dynamics, limited technology transfer, and debt vulnerabilities, suggesting that the relationship, while different in form from Western colonialism, still concentrates high-value stages in China. The Western mainstream IPE view often attributes low capture to governance failures and market efficiency, with critical self-correction acknowledging corporate power and unfair trade rules. The UN perspective frames the issue through SDG financing and illicit financial flows, emphasizing transparency and domestic resource mobilization.

Adjudicating among explanations, market structure and lead-firm governance best account for the 3–5 percent figure at the level of chain organization, while state capacity and dependency explain why the DRC has not escaped that structure. The strongest evidence for market structure is the concentration of refining and cathode production in a few firms and countries; for state capacity, the weakness of domestic processing and tax administration; for dependency, the historical pattern of export-oriented enclaves and debt conditionality. Falsifying evidence would include: sustained DRC capture rising above 15 percent through domestic refining without a change in global lead-firm structure (weakening market-structure claims); or DRC capture remaining at 3–5 percent despite strong institutions and industrial policy (weakening state-capacity claims); or capture rising rapidly under continued dependency (weakening dependency claims). The most plausible synthesis is that market structure sets the ceiling, state capacity determines movement within it, and dependency explains why the ceiling has historically been so low.

SECTION 2.10 INDEPENDENT MEMO (You do)

(a) Case description (150–200 words)

Consider the 2022 DRC–Zambia memorandum of understanding to establish a transboundary battery and EV value chain, alongside the African Continental Free Trade Area (AfCFTA) protocols on rules of origin and digital trade. The initiative proposes to move cobalt and copper from extraction through precursor production and battery assembly within Africa, rather than exporting raw ore. Global demand for EV batteries is projected to grow sharply through 2035, and the DRC holds roughly 70 percent of global cobalt reserves. Yet current capture remains at 3–5 percent of final value, refining is concentrated in China, and African manufacturing value added as a share of GDP has stagnated. The memo asks you to evaluate whether this initiative can restructure the chain or whether it will reproduce enclave dynamics under new institutional branding. Use world-systems, dependency, and value-chain theory, and draw on the five perspectives.

(b) Required memo headings (prompts)

- **Mechanism:** Identify the causal mechanism linking the initiative's design to expected value-capture outcomes. Specify scope conditions and what would have to be true for the mechanism to operate.
- **Perspective reconstruction:** Reconstruct the African, Chinese, Russian, Western, and UN perspec-

tives on this initiative, steel-manning each. Note what each reveals and what it occludes.
- **Historical analogue:** Identify one historical case (for example, 1970s import-substitution industrialization, or 1990s HIPC-era mining code reforms) and explain what it suggests about the initiative's prospects.
- **Falsifiers:** List three observable outcomes that would weaken your central claim, and specify the time horizon and metric for each.

(c) Self-check

Before submitting, verify that you have distinguished description (what the initiative contains), explanation (why value capture is currently low), prediction (what will happen under stated conditions), and prescription (what should be done), and that no single paragraph conflates two of these.

SECTION 2.11 HINGE QUESTION

Question: Which of the following best explains why the DRC captures only 3–5 percent of final EV battery value, according to the structural political-economy framework developed in this lesson?

A) The DRC's low capture is primarily a consequence of weak domestic institutions and corruption, which better governance and transparency reforms would largely resolve.

B) The DRC's low capture reflects its structurally assigned periphery position within a single capitalist world-economy, where core demand, semi-peripheral refining, and lead-firm governance jointly reproduce extraction at the lowest-value node.

C) The DRC's low capture is best explained by Chinese "win-win" investment, which has deliberately prevented African industrialization to maintain a monopoly on refining.

D) The DRC's low capture is an artifact of measurement error in UNCTAD illicit financial flow estimates, and actual capture is substantially higher.

Correct answer: B

Distractor diagnosis:

- **A** attributes low capture solely to domestic institutional failure. This is the Western mainstream IPE view in its uncorrected form; it occludes the historically constituted division of labor, debt conditionality, and lead-firm governance that constrain state capacity in the first place. It is partially true but insufficient as a primary explanation.
- **C** overstates Chinese agency and intent. The Chinese perspective includes both official "win-win" claims and academic critiques of enclave dynamics, but neither supports a deliberate monopoly strategy as the primary cause; this option conflates structural outcome with intentional design.
- **D** misreads the data. UNCTAD estimates of illicit financial flows indicate leakage that worsens, not improves, capture; they are not a measurement artifact that would raise the 3–5 percent figure.

SECTION 2A — DATA LAB

Stage in cobalt-for-EV value chain (illustrative)	Typical location	Approx. share of final EV battery value	Mechanism of capture
Mining / extraction	DRC (dominant global source)	3–5%	Low bargaining power, rent capture, weak fiscal/contract terms, artisanal and industrial extraction
Refining / processing	China dominant	10–20% (illustrative)	Technical capacity, scale, standards, infrastructure, state-industrial coordination
Cathode / precursor manufacturing	East Asia, Europe	20–30% (illustrative)	Process engineering, intellectual property, quality certification
Cell / pack assembly	Asia, Europe, North America	25–35% (illustrative)	Capital intensity, automation, supplier finance, logistics
Vehicle integration, branding, retail, finance	OEMs and global consumer markets	Remainder	Brand rents, consumer markets, credit, after-sales services

Note: shares are illustrative ranges, not audited national accounts; they vary by battery chemistry, cobalt price cycle, contract structure, and accounting boundary. The 3–5% figure for DRC extraction is the anchor claim supplied for this lesson; downstream ranges are pedagogical approximations and should be treated as orders of magnitude.

Indicator	Approximate level / trend	Interpretation
Africa's share of global manufacturing value added	Roughly 2% or less; low and broadly stagnant over decades	Late industrialization, deindustrialization pressures, and concentration of manufacturing in East Asia and advanced economies
Manufacturing value added as share of GDP in many African economies	Often around 10–12%, with wide variation	Manufacturing is not absent, but it is small relative to population, employment needs, and historical industrialization benchmarks
Global manufacturing concentration	East Asia and advanced economies dominate	The international division of labor remains spatially hierarchical

Note: manufacturing shares vary by source, year, and whether North Africa is included; treat these as

approximate structural indicators rather than precise point estimates.

Measure	Estimate	Comparison / implication
Annual illicit financial flows from Africa	About $88.6 billion (UNCTAD 2020)	Larger than many annual inflows of official development assistance and foreign direct investment in comparable periods

Note: IFF estimates depend on mirror-trade data, price benchmarks, and assumptions about normal trade; they measure discrepancies, not adjudicated crimes.

Five numbered analysis questions

1. **Trend.** Taken together, what structural trend do the three tables suggest about Africa's position in the global economy: is the pattern cyclical (driven by commodity prices) or structural (driven by position in the division of labor)? Justify with at least two data points.
2. **Level of analysis.** Which of the four levels of analysis—individual, state, systemic, transnational—best explains (a) the DRC's 3–5% capture, (b) Africa's low manufacturing share, and (c) large IFFs? Where do the levels conflict or reinforce one another?
3. **Perspective reconstruction (all five).** How would each perspective read the same three tables: African structural critique; Chinese official "win-win" plus academic critique; Russian multipolarity/dependency critique; Western mainstream IPE plus critical self-correction; UN SDG/financing-for-development? Identify one datum each perspective would emphasize and one it would downplay.
4. **Interpretation.** What mechanism links low value capture, low manufacturing share, and IFFs? Distinguish (a) unequal exchange / terms-of-trade mechanisms, (b) global value-chain governance by lead firms, and (c) financialization / tax-avoidance mechanisms. Which is most directly supported by which table?
5. **Limitation.** What are the most serious data and inference limitations? Address informal/artisanal mining, transfer-pricing opacity, price volatility, aggregation across 54 states, and the gap between measured discrepancies and proven illicit intent.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1: World-Systems Concentric Division of Labor

- **What to draw:** Draw three nested, slightly irregular zones on a simplified world outline or as concentric circles if a map is too complex. Label the innermost zone **CORE** (North America, Western Europe, Japan, and other advanced industrial economies). Label the middle ring **SEMI-PERIPHERY** (large emerging economies such as China, India, Brazil, Mexico, Turkey, South Africa). Label the outer ring **PERIPHERY** (much of sub-Saharan Africa, parts of Latin America, and parts of Asia). Draw thick arrows from periphery to core labeled **raw materials, cheap labor, ecological extraction**; draw thinner arrows from core to periphery labeled **manufactured goods, finance, technology, conditional credit**. Add a small "buffer" arrow between semi-periphery and periphery labeled **intermediate manufacturing / subcontracting**.

- **Labels to place:** "Single division of labor (Wallerstein)"; "Core: high wages, capital-intensive production, financial command"; "Semi-periphery: mixed production, upward mobility pressure, downward vulnerability"; "Periphery: labor-intensive extraction, low value capture"; "Unequal exchange."
- **Perspective overlay to annotate:** African view: the outer ring is not "backward" but structurally positioned for extraction; Chinese view: semi-peripheral ascent is possible through state-led industrial policy; Russian view: core monopoly is a Western-centric order now contested; Western view: zones reflect comparative advantage and institutional quality; UN view: zones map onto SDG financing gaps and capacity needs.

Visual 2: Cobalt Value Capture Waterfall / Staircase

- **What to draw:** Draw a horizontal staircase or waterfall from left to right with five steps: **Mine (DRC)**, **Refine (China)**, **Cathode/Precursor**, **Cell/Pack**, **EV/OEM/Retail**. Make the first step very short (3–5% of final value) and each subsequent step taller, so the visual immediately shows where value accumulates. Use bar height or step height to represent approximate value capture. Add a small "leakage" arrow downward from the first step labeled **IFFs / tax avoidance / underpricing**. Add a second downward arrow from the refining step labeled **technology rent**. Add a final upward arrow at the retail step labeled **brand and finance rent**.
- **Labels to place:** "DRC capture: 3–5%"; "Downstream capture: refining, materials, cells, vehicles"; "Value is not created only at extraction"; "Lead-firm governance"; "Contract, tax, and transfer-pricing leakage."
- **Perspective overlay to annotate:** African view: the staircase is a map of dispossession and a target for resource sovereignty; Chinese view: refining dominance is industrial upgrading and supply-chain security; Russian view: Western OEMs and financial centers still capture final rents; Western view: efficiency, scale, and innovation explain downstream capture; UN view: the staircase identifies where domestic value addition and fiscal capacity can be strengthened.

Visual 3: Dependency Spiral Linked to Hegemonic Cycle

- **What to draw:** Draw two linked loops. The upper loop is an **Arrighi-style hegemonic cycle**: three boxes labeled **Production**, **Finance**, **Military/Geopolitical Power**, connected by arrows in a rising-and-declining spiral. The lower loop is a **dependency spiral**: boxes labeled **Raw-material export**, **Low manufacturing value added**, **Debt / IFF drain**, **Austerity / import dependence**, connected back to **Raw-material export**. Draw a vertical arrow from the lower loop to the upper loop labeled **surplus transfer to hegemon / core**. Draw a smaller counter-arrow labeled **conditional credit / technology**.
- **Labels to place:** "Hegemon rises through production, shifts to finance, relies on military power (Arrighi)"; "Periphery remains locked into extraction"; "Debt distress and HIPC/MDRI as crisis moments"; "Resource sovereignty as attempted break in the loop."
- **Perspective overlay to annotate:** African view: the loop is neo-colonial continuity, not development failure; Chinese view: infrastructure and industrial parks can insert periphery into higher-value stages; Russian view: multipolarity can fracture the loop; Western view: institutions, governance, and market access determine loop intensity; UN view: debt relief, FfD, and SDG investment are loop-interruption tools.

SECTION 4 — CORNELL NOTES

Cue	Notes (with source log)
What is a world-system?	A single capitalist division of labor spanning core, semi-periphery, and periphery; not a set of separate national economies. Source: Wallerstein, *The Modern World-System* (1974–2011).
Core / semi-periphery / periphery	Core: high-skill, capital-intensive, high-wage production and financial command. Semi-periphery: mixed production, mobility and vulnerability. Periphery: labor-intensive extraction and low value capture. Source: Wallerstein.
Hegemonic cycles	Hegemons rise through production, shift toward finance, and sustain position through military/geopolitical power; decline opens space for rivals. Source: Arrighi, *The Long Twentieth Century* (1994).
Development of underdevelopment	Underdevelopment is produced by integration into the capitalist world economy, not by isolation or traditional backwardness. Sources: Frank (1967); Rodney, *How Europe Underdeveloped Africa* (1972).
Neo-colonialism	Political independence without economic sovereignty; control through finance, trade, aid, and multinational corporations. Source: Nkrumah, *Neo-Colonialism* (1965).
Delinking / unequal exchange	Peripheral economies may need to reduce subordination to unequal exchange; terms of trade systematically disadvantage primary exporters. Sources: Amin (1976); Prebisch; Singer.
Global value chains	Production is fragmented across borders; lead firms govern standards, sourcing, and rents; value capture depends on position in the chain. Sources: GVC literature; UNCTAD trade and development reports.
Prebisch-Singer hypothesis	Long-run terms of trade for primary commodities tend to deteriorate relative to manufactures. Sources: Prebisch; Singer.
Capital flight and IFFs	Unrecorded or illicit outflows drain investable resources; trade misinvoicing is a major channel. Source: UNCTAD (2020) IFF report.
Debt distress and relief	1980s–1990s African debt crisis; HIPC and MDRI reduced debt but raised conditionality and sovereignty questions. Sources: World Bank/IMF HIPC documentation; critical IPE literature.

Cue	Notes (with source log)
Resource sovereignty	African policy responses include AfCFTA, local content, and DRC-Zambia battery initiatives; aim is to move from extraction to processing and manufacturing. Sources: AU/AfCFTA materials; DRC-Zambia initiative.
Measurement limits	IFFs are estimated from discrepancies; manufacturing shares vary by source; value-chain shares are accounting constructs, not causal proof. Source: UNCTAD (2020); UNIDO manufacturing data.

Summary (3–5 sentences): World-systems and dependency theories argue that global hierarchy is produced by a single division of labor, not by separate national failures. Arrighi adds that hegemonic power moves from production to finance to military dominance, while African dependency theorists show how extraction, neo-colonial control, and unequal exchange generate "development of underdevelopment." Contemporary value-chain and IFF data suggest that low capture at the extraction stage, low manufacturing share, and large financial outflows are mutually reinforcing. The theories are strongest as structural diagnostics and weakest when treated as deterministic predictions; empirical measurement is necessary but remains uncertain.

SECTION 5 — FEYNMAN COMPRESSION

1. **Explain without jargon:** The world economy is like one big factory spread across countries. Some places dig up raw materials, some refine them, some build batteries and cars, and some sell the final product. The money and power mostly pile up at the later steps, while the places that dig often stay poor. Debt and hidden money outflows make the gap worse.

2. **Mark gaps:** I am not yet clear on how much of Africa's low manufacturing share is caused by global structure versus domestic policy, conflict, infrastructure, or geography. I also need to separate correlation from causation in the cobalt value-capture table, and I need to know how UNCTAD's IFF estimates handle informal trade and price volatility.

3. **Reread verification:** Recheck the definitions of core, semi-periphery, and periphery; recheck Arrighi's sequence of production, finance, and military power; recheck UNCTAD's IFF estimate and its comparison to ODA/FDI; recheck whether the DRC's 3–5% figure refers to extraction value, export value, or final battery value.

4. **Analogy with explicit limits:** The global economy resembles a company town: the mine owner controls credit, stores, and wages, so workers never accumulate capital. **Limits:** states are not workers, they have agency, institutions, and policy choices; the analogy hides colonial history, racialized labor regimes, and the possibility of industrial upgrading; it also risks treating all African economies as identical.

5. **Rewrite:** World-systems theory says global inequality is organized through a hierarchical division of labor; dependency theory says peripheral integration can produce underdevelopment; Arrighi says hegemonic power shifts from production to finance; value-chain and IFF data show where value and money leak out of Africa. The theories explain structure well but must be tested against data, policy variation, and historical change.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L17	Definition	What is Wallerstein's world-system?	A single capitalist world-economy divided into core, semi-periphery, and periphery through an international division of labor; the unit of analysis is the world-system, not the nation-state.	African structural critique treats periphery status as historically produced by colonial extraction, not a natural stage.
L17	Mechanism	How does core-periphery exploitation operate in world-systems theory?	Through unequal exchange: surplus is transferred from peripheral producers of low-value or raw commodities to core firms and states that control high-value processing, finance, and technology.	Scope conditions include a capitalist world-economy and state-backed property rights; African dependency theorists add colonial institutional legacies.

Tag	Card Type	Front	Back	Perspective Note
L17	Application	Why does the DRC capture only 3–5% of final EV battery value?	Because cobalt extraction occurs in a peripheral node while refining, cathode production, cell manufacturing, and branding are concentrated in core and semi-peripheral lead-firm networks.	Chinese processing dominance and Western lead-firm governance are visible; African resource-sovereignty initiatives seek to move nodes upstream.
L17	Comparison	How does dependency theory differ from world-systems theory?	Dependency theory centers national and colonial underdevelopment and neo-colonial control; world-systems theory centers the global division of labor and systemic hierarchy.	Both share core-periphery logic; African scholars often combine them to explain state weakness and external control.
L17	Source	What is Arrighi's hegemonic cycle?	Each hegemon moves from material expansion in production and trade toward financial expansion in credit and speculation as profitability declines, followed by hegemonic transition.	Western IPE often reads this as cyclical power shift; African and Russian perspectives often read financialization as extraction from the periphery.

Tag	Card Type	Front	Back	Perspective Note
L17	Debate	What does the Prebisch-Singer hypothesis claim?	Primary-commodity exporters face long-term deterioration in terms of trade relative to manufactured goods, so growth requires industrialization or value addition.	It underpins African demands for beneficiation; critics note commodity booms and quality upgrading can modify the trend.
L17	Reconstruction	How did African dependency theorists explain the debt crisis?	Rodney, Nkrumah, Amin, and Frank framed debt as neo-colonial leverage: borrowing financed import dependence and adjustment transferred costs to workers and peasants.	HIPC/MDRI relief reduced nominal debt, but conditionality often preserved liberalization; African critics demand policy space.
L17	Occlusion	What does mainstream Western IPE often occlude?	It can treat states as unitary rational actors and markets as neutral, understating structural power, colonial history, and lead-firm governance.	African political economy insists on historical structure and racialized extraction; Western critical IPE partially corrects this.
L17	Adjudication	Does HIPC/MDRI debt relief refute dependency theory?	No single outcome settles it: debt stocks fell, but conditionality, new borrowing, and commodity dependence often reproduced vulnerability.	Adjudication requires comparing counterfactual debt paths, fiscal space, and distributional outcomes.

Tag	Card Type	Front	Back	Perspective Note
L17	Visual	What does a hegemonic-cycle diagram show?	A wave or spiral in which material expansion in production, trade, and infrastructure gives way to financial expansion in credit, speculation, and military overstretch before transition.	Label nodes as Genoese/Spanish, Dutch, British, and American; annotate African extraction as an input to each cycle.
L17	Mechanism	How do illicit financial flows work?	Through trade misinvoicing, transfer pricing, tax-haven routing, and corruption; UNCTAD estimates Africa loses about $88.6 billion annually.	IFFs are a mechanism of value extraction; African revenue authorities and UN agencies frame them as development-finance losses.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence Audit

Competency	Self-score (0-100)	Evidence you can produce	Next action
Define world-systems and name core, semi-periphery, and periphery		A one-paragraph definition with the unit of analysis	Re-read Wallerstein flashcards
Explain Arrighi's material-to-financial expansion		A labeled diagram of one hegemonic cycle	Draw the visual anchor from memory
Reconstruct African dependency arguments		A 200-word steel-man of Rodney or Nkrumah	Compare with error log
Apply value-chain analysis to DRC cobalt		A stage-by-stage value-capture table	Re-run the Data Lab

Competency	Self-score (0-100)	Evidence you can produce	Next action
Interpret Prebisch-Singer and terms of trade		A statement of scope conditions and exceptions	Review commodity-cycle evidence
Identify IFF mechanisms and UNCTAD estimate		A list of four mechanisms and one number	Re-read UNCTAD 2020
Reconstruct all five perspectives		Five 3-sentence summaries	Practice aloud
Adjudicate HIPC/MDRI against dependency		A falsifier and a counterfactual	Re-read worked example

7.2 Three-Question Debrief

1. Which concept did you initially treat as a country-level story rather than a system-level structure?
2. Which perspective did you find hardest to steel-man without caricature?
3. What evidence would change your view on whether debt relief altered dependency?

7.3 Error Log

Common Misconception	Correction	Evidence
Dependency theory says poor countries cannot develop at all.	It says development is constrained and structured by global hierarchy; semi-peripheral mobility is possible.	Wallerstein's semi-periphery category; Amin's unequal development.
World-systems is just Marxism with countries.	It is a distinct historical social science with the world-economy as its unit of analysis.	Wallerstein (1974).
The DRC's low value capture is only due to corruption.	Governance matters, but structural position in GVCs—processing location, standards, finance—explains much of the gap.	Lead-firm concentration in cobalt refining and battery manufacturing.
HIPC/MDRI ended African debt problems.	Relief reduced stocks, but conditionality, new borrowing, and commodity dependence often reproduced vulnerability.	Post-2010 debt distress in several African economies.
Chinese engagement is uniformly a debt trap.	The record is mixed; official win-win narratives and academic critiques both require case-specific assessment.	DRC-Zambia battery initiative and varied project outcomes.

Common Misconception	Correction	Evidence
Prebisch-Singer is an iron law.	It is an empirical tendency with exceptions; commodity cycles and quality upgrading can modify the trend.	Terms-of-trade debates and upgrading cases.

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
World-systems: core, semi-periphery, periphery	Unequal exchange through international division of labor	Wallerstein (1974-2011)	Africa's low share of global manufacturing value added	Systemic vs. state-centric IPE	Peripheral economies capture rising value without changing structural position	L19, L27-29
Hegemonic cycles	Material expansion shifts to financial expansion; hegemonic transition	Arrighi (1994)	Power shifts among hegemons; African extraction as input	Cyclical vs. linear power	Hegemon sustains material dominance without financialization	L33
African dependency	Development of underdevelopment; neo-colonial control	Frank (1967); Rodney (1972); Amin (1976); Nkrumah (1965)	1980s-1990s debt crisis; HIPC/MDRI	Structural vs. policy failure	Policy autonomy alone eliminates hierarchy	L27-29
GVC analysis	Lead firms govern standards, finance, upgrading, and value distribution	GVC scholarship on lead-firm governance	DRC cobalt captures 3-5% of final EV battery value	Upgrading vs. dependency	Rising local value capture and technology transfer	L19, L33

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Empirical measurement	Prebisch-Singer; IFFs; capital flight; debt distress	UNCTAD (2020)	$88.6 billion annual IFFs from Africa; terms of trade	Measurement vs. theory	Sustained terms-of-trade improvement and low IFFs	L51

SECTION 9 — REVIEW SCHEDULE

Interval	Action	Output
R1 — 24 hours	Re-read flashcards and define the five key ideas aloud	Five 30-second definitions
R2 — 3 days	Reconstruct the African perspective from memory, then compare with Chinese, Russian, Western, and UN perspectives	Perspective comparison notes
R3 — 7 days	Re-run the DRC cobalt problem pair and draft memo headings	Mechanism, perspective reconstruction, analogue, falsifiers
R4 — 14 days	Re-run Data Lab tables and identify one falsifier for each key idea	Annotated tables
R5 — 30 days	Complete Feynman compression and teach the lesson to a peer or recorder	Compressed explanation plus error-log update

SECTION 10 — COMPLETION CHECKLIST

- ☐ I can define world-systems theory and its three zones.
- ☐ I can explain unequal exchange as a mechanism.
- ☐ I can describe Arrighi's hegemonic cycle.
- ☐ I can reconstruct African dependency arguments from Frank, Rodney, Amin, and Nkrumah.
- ☐ I can explain neo-colonialism in the debt-crisis context.
- ☐ I can apply GVC analysis to the DRC cobalt chain.
- ☐ I can state the Prebisch-Singer hypothesis and its scope conditions.
- ☐ I can identify IFF mechanisms and the UNCTAD estimate.
- ☐ I can reconstruct all five perspectives without caricature.
- ☐ I can explain what each perspective occludes.
- ☐ I can adjudicate HIPC/MDRI against dependency theory.
- ☐ I can propose a falsifier for each key idea.
- ☐ I can use the four levels of analysis from Lesson 1.

☐ I can distinguish description, explanation, prediction, and prescription.
☐ I can complete the Data Lab tables.
☐ I can update my error log after review.

19. Weaponized Interdependence and Financial Statecraft

LESSON METADATA

Lesson number and title	Module	Prerequisites	Interleaved links	Reading load	Estimated study time	Content channels	Bloom ceiling
L18: Weaponized Interdependence and Financial Statecraft	Module 3: International Political Economy and Geoeconomics	L6 (institutionalism), L15-17 (IPE), L16 (Bretton Woods)	Forward to L19 (energy), L38 (sanctions), L52-53 (semiconductors, minerals), L48 (chokepoints)	7-9 hours	7-9 hours	Text, Data Lab, Visuals	Analyze and Evaluate

SECTION 0 — Why This Lesson Exists

The transition from the post-war institutional order to the contemporary era of financial statecraft represents a fundamental rupture in International Relations theory. For decades, the prevailing paradigm suggested that economic interdependence would act as a pacifying force, reducing the likelihood of conflict through mutual vulnerability. However, the architecture built at Bretton Woods evolved not into a system of shared security, but into a network topology where centrality conferred coercive capability rather than protection. This lesson confronts the central puzzle: how does the very connectivity that enables global trade become the mechanism for geopolitical coercion? Understanding this requires moving beyond traditional state-centric realism to analyze the networked nature of finance itself. The student will learn that financial power is not merely a function of GDP or reserve holdings, but a structural advantage derived from occupying key nodes in the global payment system. This distinction is critical for analyzing contemporary conflicts where economic warfare substitutes for kinetic force.

The theoretical lineage of this lesson traces from the institutionalism of L6 through to the network theory articulated by Farrell and Newman (2019). Early scholarship, such as Drezner (1999), treated sanctions as blunt instruments of state coercion, assuming rational actors who could calculate compliance costs. However, contemporary analysis reveals that the efficacy of sanctions depends on the structural position of the target within a network. The US dollar's dominance in clearing and settlement is not an accident of history but a maintained position of structural power. This lesson interrogates how this centrality is weaponized, moving beyond the simple binary of "sanctions work" or "sanctions fail." It asks instead *how* they function through specific mechanisms like secondary sanctions and SWIFT exclusions. The curriculum placement here follows L16 (Bretton Woods) to show how the original institutional design inadvertently created the vulnerabilities exploited today.

The African perspective is not merely a case study but the primary lens through which this structural violence must be understood. For the continent, financial statecraft is not abstract theory; it is the reality of debt distress, fuel insecurity, and fertilizer price volatility. When Western powers weaponize interdependence, the Global South faces the brunt of these shocks without political recourse. African scholarship, from Fanon to contemporary analyses by Grovogui and Mamdani, highlights how colonial-era financial structures persist in modern sanctions regimes. This lesson reconstructs that vantage point, showing how debt traps and currency volatility are not market outcomes but geopolitical choices. The student will recognize that "financial sovereignty" is the specific vocabulary African states use to describe their struggle against external coercion.

Furthermore, this lesson must address the distributional question: who bears the cost? Western perspectives often focus on compliance rates or target state behavior. However, an African vantage point reveals that the costs are distributed unevenly across the Global South. The impact of sanctions on food security, specifically through fertilizer imports priced in dollars, demonstrates a mechanism of indirect coercion. This lesson integrates these perspectives to show that the network is not neutral; it reflects historical power asymmetries. By mastering this material, students will be able to critique the normative claims of "smart sanctions" and understand why humanitarian carve-outs often fail to reach intended beneficiaries. The analysis extends beyond US policy to include Chinese parallel systems and UN resolutions on unilateral coercive measures.

The central capability developed here is the ability to distinguish between liquidity constraints and network topology constraints. A state may have reserves but still be cut off from the global system if its banks are disconnected from SWIFT. This distinction is vital for analyzing cases like Russia in 2022 or Iran in 2019. The lesson prepares the student for L19 (energy) and L48 (chokepoints), where physical infrastructure intersects with financial control. Without understanding the financial architecture, one cannot analyze energy

geopolitics correctly. Therefore, this module serves as the foundational layer for geoeconomic analysis.

Finally, mastering this lesson allows the student to evaluate policy interventions critically. They will be able to predict how states adapt through parallel banking systems like CIPS or SPFS. They will understand the limitations of "de-dollarization" campaigns and why they are often defensive reactions rather than offensive strategies. The learning outcomes include the ability to map a sanctions regime, identify its network vulnerabilities, and assess the distributional impacts on third parties. This prepares the student for the complex reality where financial warfare is the new battlefield, requiring a sophisticated understanding of both economic mechanisms and political power dynamics.

SECTION 1 — Pre-Class Priming

1.1 Retrieval warm-up

1. According to L6 institutionalism, what is the primary function of international organizations like the IMF in managing state behavior?
2. In Lesson 16 (Bretton Woods), what specific currency was designated as the anchor for the global monetary system?
3. How did the neoliberal shift described in L15 alter the relationship between national sovereignty and market integration?
4. From L17, recall the distinction made between economic sanctions and trade embargoes regarding their legal mechanisms.
5. What is the definition of "interdependence" as used in the IPE framework covered previously?

1.2 Orientation questions

1. How does the concept of "network centrality" differ from traditional measures of state power like GDP or military size?
2. Why is the US dollar considered a "global public good" by some economists, and how can that status be weaponized?
3. What is a "secondary sanction," and why do they create friction between the target state and third-party trading partners?
4. How does the African experience with debt crises inform the theoretical understanding of financial coercion in this lesson?

1.3 Vocabulary pre-teach

1. **Weaponized Interdependence:** The strategic exploitation of economic network vulnerabilities to coerce other states; coined by Farrell and Newman (2019).
2. **Chokepoint:** A critical node or link within a network whose disruption disproportionately affects the whole system.
3. **Secondary Sanctions:** Legal penalties imposed on third-party entities for doing business with a primary sanction target, extending extraterritorial reach.
4. **De-dollarization:** Policy efforts to reduce reliance on US dollars in international trade and reserve holdings.
5. **SWIFT:** The Society for Worldwide Interbank Financial Telecommunication; the messaging system used for cross-border payments.

6. **Parallel Banking System:** Alternative financial infrastructure created by states to bypass primary sanctions (e.g., CIPS, SPFS).
7. **Financial Sovereignty:** A concept emphasizing a state's right to control its own monetary and financial policies without external interference.
8. **Extraterritoriality:** The application of a nation's domestic laws beyond its borders, often used in US sanctions regimes.
9. **Humanitarian Carve-out:** Provisions within sanctions designed to exempt essential goods like food and medicine from restrictions.
10. **Global South:** A geopolitical term referring to nations primarily in Africa, Asia, Latin America, and Oceania, distinct from the Global North/West.
11. **Dollar Hegemony:** The dominance of the US dollar in global trade settlement, reserves, and financial markets.
12. **Coercive Diplomacy:** The use of economic pressure to force a change in an adversary's behavior without direct military engagement.

SECTION 2 — LESSON CORE

SECTION 2.1 Learning objectives

By the end of this lesson, students will be able to:

1. **Analyze** the structural shift in international political economy from a state-centric realist framework to a network-theoretic understanding where centrality constitutes power rather than mere possession of resources.
2. **Evaluate** the causal mechanisms by which financial interdependence creates vulnerabilities that can be weaponized, specifically distinguishing between panopticon effects and chokepoint dynamics as identified in Farrell and Newman's framework.
3. **Construct** arguments regarding the scope conditions under which sanctions succeed or fail, accounting for network density, trust levels, and the presence of alternative clearing mechanisms.
4. **Apply** theoretical insights to historical cases such as the 2018-2019 maximum pressure campaign on Iran versus the 2022 sanctions on Russia, adjudicating between competing explanations for efficacy based on network topology.
5. **Critique** the normative implications of weaponized interdependence regarding distributive justice, specifically assessing how the Global South bears disproportionate costs and reconstructing these dynamics through African scholarship on sovereignty and development.

SECTION 2.2 KEY IDEA 1 — Network Theory and the Structural Basis of Coercion

Bolded Causal Claim: The fundamental causal claim advanced by Farrell and Newman (2019) is that power in the contemporary international system derives not from material capabilities alone, but from the positionality within a network of interdependence. Specifically, centrality confers power because it allows the controller to influence the flow of goods, capital, and information. This relationship is asymmetric: A can punish B for non-compliance by cutting off access to the network, whereas B cannot reciprocate without suffering catastrophic systemic costs. The claim posits that "interdependence is a form of vulnerability," meaning that the very integration that generates prosperity simultaneously creates the leverage points neces-

sary for coercion. In the context of financial statecraft, this manifests as the ability to exclude non-compliant actors from the global payment system. This structural power operates independently of political will; it exists because the architecture itself relies on a few critical nodes (e.g., US dollar clearing) that process the majority of global transactions. Consequently, sanctions are effective not merely because of the threat of retaliation, but because the target is structurally dependent on the network for basic economic functionality. The claim implies that power is endogenous to the network design, not exogenous to state military or economic size.

Mechanism: The mechanism through which this causal claim operates involves two distinct but related topological features: the panopticon and the chokepoint. The panopticon effect occurs when a central node (like the US financial system) can observe and regulate all transactions passing through it, effectively creating an informational advantage that translates into coercive capability. When a state attempts to bypass this node, the system detects it because the flow of information is centralized. The chokepoint mechanism refers to specific nodes where the volume of traffic is so high that removing them causes systemic disruption for third parties. In financial terms, the US dollar clearing system serves as a chokepoint because nearly all international trade requires settlement in dollars or through correspondent banks domiciled in the United States. When the US freezes assets or excludes a bank from SWIFT, it does not just harm the target state; it threatens the liquidity of the entire global banking system if too many chokepoints are removed simultaneously. This creates a feedback loop where the defender of the network (the US) gains power by maintaining the system's integrity, while challengers must choose between isolation or adaptation. The mechanism relies on trust: banks participate in the dollar system because they expect reciprocity and safety. Weaponization breaks this trust, forcing participants to weigh the cost of compliance against the risk of being cut off.

Scope Conditions: The efficacy of weaponized interdependence is contingent upon specific scope conditions that often limit its universal application. First, network density matters; if a target state has diversified its trade and financial partners sufficiently, the chokepoint effect diminishes. This explains why comprehensive sanctions against Iran were less successful than those against Russia in terms of regime change, though both faced severe economic pain. Second, the level of trust within the network is critical. If participants believe the hegemon will use the system for arbitrary coercion, they will seek alternatives (de-dollarization), which erodes the mechanism over time. Third, the legal and regulatory framework must support extraterritorial reach; US laws like the Helms-Burton Act or secondary sanctions rely on the assumption that foreign banks will comply with domestic US law to avoid reputational risk. If these laws are perceived as overly aggressive, they trigger resistance rather than compliance. Finally, the technological capacity of the target matters. A state without a sophisticated financial bureaucracy cannot easily build alternative systems (like SPFS) quickly enough to offset exclusion from the primary network. These conditions suggest that weaponized interdependence is most potent against states that are deeply integrated into the Western-led architecture but lack the resources to pivot rapidly toward alternative networks.

Observable Implications: The observable implications of this theory are found in the varying outcomes of sanctions regimes across different historical contexts. When a chokepoint is successfully weaponized, we observe a rapid contraction in the target's access to global markets, often accompanied by capital flight and currency devaluation among trading partners fearing secondary liability. We also observe the emergence of parallel architectures, such as the creation of new clearinghouses or the shift toward commodity-backed currencies, indicating the network is fracturing under pressure. In cases where the panopticon effect dominates, we see increased surveillance and compliance monitoring by private banks to avoid sanctions violations, effectively privatizing enforcement. A critical implication is the emergence of "sanctions fatigue" among third-party states; as the cost of complying with US demands rises, they begin to seek alternatives, leading

to a gradual erosion of the hegemon's centrality. Empirical evidence from the Atlantic Council sanctions tracker shows that while comprehensive sanctions often cause humanitarian distress, targeted financial exclusions (like SWIFT bans) have higher success rates in altering behavior if the target lacks deep ties with non-aligned partners. However, we also observe resilience where targets rebuild capacity through regional partnerships, suggesting that network power is not permanent but must be constantly renewed.

Perspective Note (five traditions in brief): The African perspective views weaponized interdependence primarily through the lens of historical coloniality and the structural inequalities embedded in the global financial architecture. Scholars like Achille Mbembe and Amina Wadud argue that the current network topology is not neutral but reflects a post-colonial order where the Global South remains structurally dependent on Western nodes for liquidity and trade settlement. From this vantage point, sanctions are often viewed as a continuation of economic warfare that prioritizes geopolitical objectives over human rights and development needs in Africa. The African perspective emphasizes that while network theory explains the mechanics of exclusion, it obscures the historical context of why African economies were integrated into these networks on unequal terms. This is critical because it reveals that "interdependence" often masks dependency relationships established during the Cold War era, where infrastructure was built to serve Western interests rather than local development. Consequently, the African critique focuses on the distributive consequences: when sanctions are weaponized against a state with which Africa trades, African economies bear the brunt of inflation and food insecurity because they lack alternative payment channels. This perspective challenges the neutrality of the panopticon concept by arguing that the "view" is not equal; Western states see the network clearly, while African states often operate in the blind spots of surveillance and compliance regimes designed to protect their own citizens from liability.

The Chinese perspective interprets weaponized interdependence as a challenge to financial sovereignty and a driver of de-dollarization strategies. Beijing views US-centric financial networks as tools of containment rather than neutral infrastructure, leading to investments in alternative systems like CIPS (Cross-Border Interbank Payment System). The Chinese stance emphasizes the need for multipolarity where no single state can dictate the rules of global finance, advocating for local currency settlement to reduce vulnerability to unilateral coercive measures.

The Russian perspective frames sanctions as a form of economic warfare that threatens national survival and seeks to build a parallel financial architecture insulated from Western influence. Moscow argues that the US weaponization of its dollar hegemony violates international law and necessitates a defensive response through gold-backed settlements and bilateral trade agreements, viewing centrality not as power but as an existential threat.

The Western perspective generally defends sanctions as a tool of coercive diplomacy within a rules-based order, arguing that they are necessary to enforce international norms while minimizing humanitarian impact. However, internal critiques acknowledge the collateral damage and the risk of undermining the legitimacy of the financial system itself, leading to debates over proportionality and the effectiveness of secondary sanctions on third-party states.

The UN perspective focuses on humanitarian carve-outs and the Special Rapporteur's role in monitoring unilateral coercive measures, emphasizing that financial restrictions must not violate international human rights law or impede the delivery of essential goods like food and medicine. The UN seeks to balance security concerns with the obligation to protect vulnerable populations from the fallout of geopolitical conflicts played out in financial markets.

SECTION 2.3 KEY IDEA 2 — SWIFT and Dollar Clearing: How the US Converts Financial Centrality into Coercive Power

Bolded Causal Claim: The United States converts its structural centrality in global financial networks into coercive power by leveraging the U.S. dollar as the primary medium of exchange and clearing currency, allowing it to exclude non-compliant states from the international payment system via SWIFT (Society for Worldwide Interbank Financial Telecommunication) membership termination or freezing assets held in U.S. jurisdictions.

Mechanism: This coercion operates through a network theory framework articulated by Farrell and Newman (2019), where the "panopticon" of global finance relies on intermediary banks that must choose between their own commercial interests and alignment with U.S. security priorities. The mechanism functions because the majority of global transactions are denominated in USD, processed through New York clearing houses, or routed through correspondent accounts held at U.S. banks (e.g., JP Morgan Chase, Citibank). When a state like Iran is targeted, the U.S. does not need to physically block funds; it instructs intermediary banks to cease processing transactions involving that target. The cost of compliance for these banks—loss of access to the dollar liquidity pool—is so high that they self-regulate before explicit orders are given. This creates a "chokepoint" effect where the network architecture itself becomes the weapon. In the 2012 case against Iran, the U.S. utilized this mechanism to restrict oil exports by freezing Iranian Central Bank assets and threatening correspondent banks. Similarly, in February 2022, following Russia's invasion of Ukraine, the U.S. Treasury Department moved to cut off Russian state-owned enterprises from SWIFT. This action severed the ability of the Russian state to receive international payments for gas or trade goods, effectively weaponizing the network's topology. The mechanism relies on the assumption that no viable alternative payment system exists with sufficient liquidity depth to replace the dollar clearing infrastructure.

Scope Conditions: The efficacy of this mechanism is contingent upon three specific conditions: first, the global dominance of the U.S. dollar in foreign exchange reserves and trade invoicing; second, the lack of a credible alternative interbank messaging or clearing system that has achieved universal adoption (prior to 2022); and third, the legal jurisdiction of U.S. courts over non-U.S. entities that interact with the U.S. financial system. If a target state possesses significant hard currency reserves denominated in non-dollar assets (e.g., gold or yuan) and can access a parallel network like China's CIPS without friction, the mechanism weakens. Furthermore, this power is asymmetric; it cannot be reciprocated by smaller states because they lack the network centrality to impose comparable costs on others. The scope condition also depends on the willingness of Western banks to comply with U.S. secondary sanctions, a factor that fluctuates based on political pressure from Washington and the risk of losing access to New York markets.

Observable Implications: Empirically, the weaponization of financial networks manifests as immediate liquidity shocks for targeted states. Following the 2012 sanctions on Iran, oil exports dropped significantly not because of a physical blockade but because buyers could not settle payments in dollars without risking U.S. asset freezes. In 2022, Russia's exclusion from SWIFT for major banks led to a fragmentation of its payment system, forcing Moscow to rely on barter trade and the CIPS platform for settlement. The observable outcome is a bifurcation of the global financial system: a "compliant" dollar network and an emerging "non-compliant" parallel architecture. This also triggers secondary effects such as inflation in targeted economies due to supply chain disruptions, capital flight, and devaluation of local currencies. In 2023, analysts noted that while Russia's economy remained resilient in the short term, the long-term cost was

reduced access to Western technology and insurance markets, compounding the financial isolation initiated by SWIFT cuts.

Perspective Note (five traditions in brief): African Perspective: For African states, the weaponization of dollar clearing represents a continuation of colonial-era financial dependency where sovereignty is subordinated to the security interests of a distant hegemon. Scholars like Amina Mama and Mahmood Mamdani argue that this architecture reproduces neo-colonial hierarchies where Global South nations are treated as subjects rather than equals, unable to participate in global finance without U.S. permission. This impacts food security directly; when fuel or fertilizer payments are blocked via dollar clearing, rural livelihoods collapse regardless of the geopolitical justification. **Chinese Perspective:** Beijing views this mechanism as a demonstration of American hegemony that threatens the multipolar order. China interprets SWIFT exclusions not merely as legal enforcement but as political coercion that undermines the principle of non-interference in domestic affairs. Consequently, China advocates for de-dollarization and alternative settlement systems to protect its Belt and Road Initiative partners from similar vulnerability. **Russian Perspective:** Moscow frames this power as "economic warfare" designed to strangle a sovereign state's ability to govern. Russian analysts emphasize that SWIFT cuts are an illegal use of force under international law, violating the principle of economic sovereignty. They view the mechanism as a tool for regime change rather than legitimate statecraft, arguing that it destabilizes global markets by creating artificial scarcity in energy trade. **Western Perspective:** Washington justifies these actions as necessary to enforce international norms and protect national security interests against malign actors. Western analysts emphasize the distinction between targeted sanctions and comprehensive embargoes, arguing that cutting off specific entities minimizes humanitarian harm while maximizing pressure on regimes violating human rights or international law. However, critics within the West acknowledge the collateral damage to innocent populations and the risk of eroding trust in the financial system itself. **UN Perspective:** The United Nations emphasizes the need for humanitarian carve-outs and adherence to international human rights law when implementing financial restrictions. UN Special Rapporteurs monitor unilateral coercive measures to ensure they do not impede the delivery of essential goods like food and medicine. The UN seeks to balance security concerns with the obligation to protect vulnerable populations, often calling for a moratorium on sanctions that violate the sovereignty of non-targeted states or disrupt global supply chains necessary for basic survival.

SECTION 2.4 KEY IDEA 3 — Sanctions Design: Smart vs Comprehensive, Secondary Sanctions, and Extraterritorial Reach

Bolded Causal Claim: The design of sanctions—specifically the use of secondary sanctions and extraterritorial jurisdiction—significantly increases coercive leverage by penalizing third-party entities that engage with a targeted state, thereby expanding the reach of U.S. law beyond its borders to coerce non-targeted nations into compliance.

Mechanism: This mechanism relies on "long-arm" jurisdiction where U.S. laws (such as those enforced by the Office of Foreign Assets Control) assert authority over foreign entities that interact with the U.S. financial system or use U.S.-origin technology. Secondary sanctions threaten to cut off these third parties from dollar access if they trade with a sanctioned target, like Russia or Iran. The mechanism functions through "compliance costs": banks and corporations calculate that the cost of violating U.S. law (asset freezes, reputational damage) exceeds the profit gained from trading with the target. In the case of maximum pressure on Iran (2018-2019), the U.S. threatened secondary sanctions on Indian oil importers who bought discounted Iranian crude. The mechanism works by creating a "compliance cascade" where intermediaries self-censor

to avoid risk, effectively extending the reach of U.S. policy without direct military or physical intervention.

Scope Conditions: This design is effective only when the target state lacks sufficient trade alternatives and when third-party states fear retaliation from the U.S. more than they value their economic ties to the target. The mechanism weakens if the target state develops parallel financial channels (e.g., Russia's SPFS) that bypass SWIFT, or if third parties are willing to accept the risk of sanctions evasion. Additionally, the scope condition depends on the global demand for specific commodities; if a target state offers unique resources (like rare earth minerals or discounted energy), third parties may ignore secondary sanctions despite the risks. The mechanism also has limits regarding humanitarian exemptions; if food and medicine trade is legally protected, the coercive pressure on the target regime diminishes because the economic pain cannot be fully transmitted to the population without violating international norms.

Observable Implications: In practice, secondary sanctions lead to observable shifts in trade patterns and corporate behavior. During the 2018-2019 Iran sanctions, India significantly reduced its oil imports from Tehran due to fears of being cut off from dollar clearing, even though the U.S. did not formally sanction Indian banks directly. Similarly, Iraq faced difficulties paying for electricity imports because Western suppliers feared secondary sanctions liability. The observable outcome is often a "de-risking" phenomenon where banks close accounts in sanctioned countries entirely, rather than just restricting specific transactions. This leads to market fragmentation and higher transaction costs globally. Over time, this design can backfire by incentivizing the creation of non-dollar payment systems, thereby accelerating the very de-dollarization that Western policymakers seek to prevent.

Perspective Note (five traditions in brief): African Perspective: African scholars and policymakers view secondary sanctions as a violation of the principle of non-interference and a threat to food security. For nations like Ethiopia or Kenya, which rely on imported fuel and fertilizer, U.S. pressure on third parties disrupts essential imports without targeting the specific regime responsible for instability. This perspective highlights how financial coercion disproportionately affects the Global South, where states lack the diplomatic leverage to negotiate exemptions and suffer collateral damage in terms of debt distress and inflation. **Chinese Perspective:** China critiques secondary sanctions as a violation of international law and an infringement on national sovereignty. Beijing argues that such measures undermine the multilateral trading system by allowing one nation to unilaterally dictate trade rules for others. Consequently, China promotes alternative payment systems like CIPS to provide a sovereign-safe haven for nations unwilling to submit to U.S. extraterritorial jurisdiction, framing this as a defense of the multipolar order. **Russian Perspective:** Moscow characterizes secondary sanctions as "economic warfare" and an illegal extension of military force. Russian analysts argue that these measures violate the UN Charter by imposing unilateral coercive measures without Security Council authorization. They view the threat of asset freezes against third parties as a tool to destabilize global markets and punish states for maintaining diplomatic ties with Russia, framing it as a breach of fundamental international norms. **Western Perspective:** Washington defends secondary sanctions as a necessary tool for enforcing compliance and protecting national security interests. Western policymakers argue that these measures are proportional and targeted, distinguishing them from comprehensive embargoes that harm civilian populations. However, internal critiques within the West acknowledge that extraterritorial reach can damage U.S. reputation and lead to trade wars with allies who feel coerced into violating their own economic interests for American security goals. **UN Perspective:** The United Nations advocates for a strict adherence to international human rights law when designing sanctions regimes, emphasizing the need for humanitarian carve-outs. UN bodies monitor the impact of secondary sanctions on third-party states, warning against measures that violate the sovereignty of non-targeted nations or impede essential trade in food and medicine. The Special Rapporteur on unilateral coercive measures calls for a moratorium on such practices

unless they are approved by the Security Council, ensuring that financial restrictions do not become tools of regime change rather than instruments of peace enforcement.

SECTION 2.5 — KEY IDEA 4: Evasion and Adaptation in Financial Architecture

Bolded Causal Claim: When hegemonic financial coercion targets a state's access to the global payment system, target states will not remain passive; they will actively construct parallel architectures or utilize alternative settlement mechanisms, though the efficacy of these adaptations is strictly bounded by liquidity constraints and network depth.

Mechanism: The mechanism operates through institutional bifurcation. Following Farrell and Newman's (2019) framework of weaponized interdependence, states seek to decouple from the "panopticon" of U.S.-centric financial governance. Russia's creation of the System for Transfer of Financial Messages (SPFS) following its 2022 exclusion from SWIFT demonstrates this adaptive capacity. SPFS functions not merely as a messaging tool but as a signaling device to partner states that they may transact without relying on correspondent banks vulnerable to U.S. secondary sanctions. Similarly, China's Cross-Border Interbank Payment System (CIPS) offers an alternative clearing channel, though it remains smaller than SWIFT and lacks the deep liquidity of the U.S. dollar market. The European Union attempted this through INSTEX in 2019 to trade with Iran without dollars, but its limited scope revealed that adaptation is often a defensive posture rather than a strategic offensive one. Furthermore, non-architectural adaptations include the use of commodity-backed currencies (gold) and decentralized finance (crypto), which bypass traditional banking rails entirely. However, these methods carry high transaction costs and volatility risks. The mechanism relies on "networked sovereignty," where states leverage existing bilateral trade relationships to create a new web of payment settlements that do not rely on the hegemon's central bank or clearinghouses.

Scope Conditions: This adaptation is viable only when three conditions are met: first, the target state must have sufficient foreign exchange reserves in non-dollar assets (euros, yuan, gold) to facilitate bilateral settlement; second, there must be a critical mass of trading partners willing to accept parallel systems without fear of secondary sanctions; third, the global network topology must contain enough "weak links" or chokepoints that can be bypassed. If the hegemon controls the majority of global reserves (as with the USD's ~60% share in M2 money stock per COFER data), adaptation is limited to niche markets rather than broad systemic replacement. The scope condition also depends on the political will of intermediaries; for instance, Indian banks may process transactions for Russia via SPFS but may avoid doing so if U.S. regulators threaten their correspondent accounts. Consequently, adaptation is often partial and fragmented rather than total systemic replacement.

Observable Implications: Observable indicators of this dynamic include a measurable increase in bilateral trade settlement agreements excluding the dollar, such as China-Russia oil trades settled in yuan or rubles post-2022. Another indicator is the volatility of alternative currencies; when CIPS usage spikes, it often correlates with a decline in SWIFT transaction volume for specific corridors. Furthermore, the emergence of crypto-assets as a settlement layer creates new regulatory challenges, observable through the rise of stablecoins pegged to non-dollar reserves in sanctioned jurisdictions. The fragmentation of the financial system is also visible in the "shadow banking" sector, where states use private blockchain networks or messaging apps (like Telegram-based payment systems) to move value. These implications suggest a trend toward a multipolar financial architecture, though one that remains deeply hierarchical with the U.S. dollar still at the apex of liquidity.

Perspective Note (five traditions in brief): African Perspective: African scholars like Jean-Loup Amselle and Achille Mbembe argue that this adaptation is not merely technical but a matter of survival against structural violence. Bayart's concept of "politics of the belly" suggests that for Global South states, financial sovereignty is not an abstract legal right but a prerequisite for feeding populations; therefore, reliance on Western payment systems is seen as a form of colonial dependency that must be severed through whatever means necessary, even if it fragments global liquidity. The African Union's stance prioritizes food security over financial orthodoxy, viewing parallel systems as essential to prevent the weaponization of food imports (fertilizer, fuel) which are cleared via these networks. **Chinese Perspective:** Beijing views CIPS and SPFS partnerships as legitimate exercises in "financial sovereignty" rather than geopolitical aggression. The narrative emphasizes that no state should be forced to choose between economic development and national security, framing parallel architecture as a defensive measure against unilateral coercion. **Russian Perspective:** Moscow frames the creation of SPFS as a necessary response to Western hostility, justifying the bifurcation of financial infrastructure as a legitimate exercise of sovereign rights under international law. They argue that the West's refusal to grant equal access constitutes an illegal embargo rather than a standard sanction. **Western Perspective:** U.S. policymakers and think tanks (e.g., Atlantic Council) often describe parallel systems as inefficient and risky, arguing they fragment global liquidity and increase transaction costs for everyone. The Western view prioritizes the integrity of SWIFT and the rule-based order, viewing fragmentation as a threat to financial stability rather than an acceptable adaptation. **UN Perspective:** UN agencies emphasize that while sovereignty is respected, fragmentation must not violate humanitarian obligations. The Special Rapporteur on unilateral coercive measures notes that parallel systems should not be used to circumvent sanctions regimes that target individuals or groups involved in human rights abuses, balancing the right to financial autonomy with the imperative of preventing illicit finance and funding terrorism.

SECTION 2.6 — KEY IDEA 5: The Distributional Question of Coercion

Bolded Causal Claim: Weaponized interdependence imposes asymmetric costs on third-party states, particularly those in the Global South, where the economic fallout from financial coercion against a primary target is redistributed through global supply chains and financial markets, disproportionately affecting food security and debt stability.

Mechanism: The distributional mechanism operates through price transmission and liquidity shock. When a major economy like Russia or Iran is sanctioned, its exports (oil, gas, wheat) are priced in dollars but paid for with non-dollar currencies that may be scarce elsewhere. This forces importing nations to pay premiums to secure supply, effectively transferring wealth from the Global South to the sanctioning hegemon or neutral intermediaries. For example, when U.S. sanctions restricted Russian oil sales after 2022, global prices shifted; while some states secured discounts, others faced higher costs due to insurance and shipping risks (the "Arctic route" premium). This is compounded by debt distress: African nations holding bonds in dollars face higher borrowing costs as investors flee riskier assets. The mechanism also involves "secondary sanctions," where non-targeted firms are penalized for transacting with the target, forcing them to exit markets regardless of their own compliance posture. This creates a "spillover effect" where the cost is borne by citizens in countries that never sanctioned the primary target but rely on global markets.

Scope Conditions: The severity of distributional costs depends on the degree of dependency on the sanctioned commodity or currency. States heavily reliant on Russian energy (like Turkey or Egypt) face higher inflationary pressure than those with diversified suppliers. Additionally, the scope is conditioned by the depth of the global financial system; if a large portion of trade is dollar-denominated, any disruption causes

systemic volatility affecting all non-dollar economies. The mechanism also depends on the political economy of the importing state; authoritarian regimes may absorb costs through subsidies (like Egypt's fuel subsidies) while democracies face electoral backlash from inflation. Furthermore, the condition of "humanitarian carve-outs" matters; if food and medicine are exempted from sanctions, distributional harm is mitigated. However, enforcement gaps often mean that essential goods are still blocked or delayed, exacerbating the cost for the vulnerable.

Observable Implications: Empirical evidence includes rising inflation rates in African nations post-2022, correlating with global energy price shocks and dollar volatility. The volume of local currency settlements (LCS) in BRICS+ countries has expanded, indicating a shift away from dollar dependency as a response to distributional harm. Another observable metric is the increase in debt restructuring requests by low-income countries facing higher interest rates due to U.S. Treasury bond issuance dominance. Furthermore, the "cost of compliance" for multinational corporations is visible through reduced market access in sanctioned regions, leading to layoffs and wage stagnation in third-party countries. The distributional question also reveals a divergence in wealth accumulation: while the sanctioning state may achieve security goals, its allies often face higher prices, creating internal friction within alliances.

Perspective Note (five traditions in brief): African Perspective: Drawing on Mamdani and Grovogui, African scholars argue that the distributional costs of sanctions are a form of "structural violence" that disproportionately impacts the poor. The African Development Bank (AfDB) data highlights how fertilizer shortages from sanctioned Russian exports directly threaten food security, leading to malnutrition rates that cannot be offset by diplomatic rhetoric. For Africa, the question is not about abstract financial sovereignty but about the right to survival; sanctions that disrupt global fertilizer markets are viewed as an existential threat that overrides geopolitical calculations. **Chinese Perspective:** Beijing frames distributional costs as a consequence of Western hegemony and advocates for "de-dollarization" to mitigate these harms. The narrative suggests that a multipolar currency system would distribute risks more evenly, preventing any single state from imposing economic warfare on others. **Russian Perspective:** Moscow attributes the distributional harm to Western monopoly power over global finance, arguing that their sanctions regime transfers wealth from the Global South to the U.S. Treasury. They posit that breaking this dependency is necessary to restore a fairer global order where costs are not externalized onto peripheral states. **Western Perspective:** The United States and EU typically argue that sanctions are targeted and that distributional costs are unintended side effects they seek to minimize through humanitarian exemptions. However, critics within the West note that "smart sanctions" often fail due to network effects, meaning that civilian populations in third countries still suffer from supply chain disruptions, challenging the claim of minimal collateral damage. **UN Perspective:** The UN Special Rapporteur on unilateral coercive measures emphasizes that distributional harms violate the right to food and health under international law. The UN argues that sanctions regimes must include rigorous human rights impact assessments before implementation to ensure that the costs do not fall disproportionately on vulnerable populations in non-targeted states.

SECTION 2.7 — FIVE PERSPECTIVES IN DEPTH

2.7.1 African Perspective (PRIMARY) The African perspective on weaponized interdependence does not merely accept the premise that financial networks are neutral infrastructure; rather, it reconstructs them as a continuation of colonial extraction mechanisms. This vantage point contributes a critical epistemological correction: sovereignty is not an abstract legal status but a material capacity to control economic flows, which

has been systematically eroded by the architecture of the US dollar and SWIFT. Where Western theories often treat sanctions as tools of "coercive diplomacy," African scholarship frames them as instruments of "necro-economics" that determine who can access life-sustaining resources (Mbembe 2003; Grovogui 1995). This perspective reveals that the distributional costs borne by the Global South are not "collateral damage" but intentional features of a system designed to maintain hegemony.

Achille Mbembe's concept of necropolitics provides the foundational theoretical lens for understanding financial exclusion in Africa. Necropolitics describes the power to dictate who may live and who must die, extending beyond physical violence to economic suffocation. When a state is excluded from SWIFT or frozen by asset freezes, its population enters a state of suspended animation where food security becomes a matter of survival rather than policy (Mbembe 2013). This perspective occludes the Western claim that sanctions are "smart" and targeted; instead, it argues that in an interdependent world, targeting a central bank inevitably targets the population's access to fertilizer, fuel, and medicine. The African contribution is the insistence on "food sovereignty" rather than "food security." Food security implies receiving aid or market goods from outside; food sovereignty implies control over local production and distribution (Nkrumah 1970). Weaponized interdependence undermines sovereignty by making African economies dependent on US-controlled payment rails, rendering them vulnerable to external coercion.

The theoretical lineage here draws heavily from dependency theory and structuralism, updated for the digital age. Walter Rodney's analysis of how capital accumulation in the metropole requires underdevelopment in the periphery (Rodney 1972) finds its modern expression in financial sanctions. When the US freezes assets or restricts dollar clearing, it effectively weaponizes the historical asymmetry of trade relations. This is not a neutral enforcement of rules but an application of power through infrastructure. Francis Ng'etich and others argue that this dynamic reproduces colonial hierarchies where the Global North sets the terms of engagement (Bayart 2013). Bayart's work on the "political economy of aid" suggests that sanctions are merely a more aggressive form of structural adjustment, imposing austerity through exclusion rather than conditionality.

A critical distinction emerges when analyzing evasion and adaptation. Western observers often view parallel systems like CIPS or SPFS as purely strategic alternatives. The African perspective views them as necessary acts of resistance to maintain sovereignty against external coercion (Mamdani 2016). For African scholars, the choice between the dollar and local currency is not just economic but political: it is a choice between subordination and autonomy. The creation of BRICS+ payment mechanisms is not merely trade diversification; it is an assertion of the right to define one's own financial destiny. This aligns with Amílcar Cabral's argument that liberation requires the construction of new institutions, not just the rejection of old ones (Cabral 1973).

The distributional question is central to this perspective. The cost of sanctions falls disproportionately on the most vulnerable: smallholder farmers who cannot access fertilizer due to frozen supply chains, and consumers facing inflation spikes from fuel shortages. This is analyzed through the lens of human rights law as interpreted in African contexts (Tamale 2018). The Special Rapporteur on unilateral coercive measures highlights this, but African scholarship goes further by questioning the legitimacy of the sanctions regime itself. If a sanction regime violates the right to food and health under international law, then participation in it is complicit in human rights violations (Aning 2020). This perspective challenges the Western notion that economic pressure is a legitimate tool of statecraft when it results in civilian suffering.

Furthermore, the African vantage point reveals what the other four perspectives miss: the internal dynamics of the Global South. The West focuses on US interests; China on strategic autonomy; Russia on survival; the UN on humanitarian carve-outs. Africa focuses on *interdependence itself* as a trap. The "network theory"

proposed by Farrell and Newman (2019) describes how centrality creates power, but African scholars argue that this centrality was never built for equality; it was built for extraction. The network is designed to keep the periphery dependent. When a state like Iran or Russia is sanctioned, the West claims to punish them, but in reality, the system punishes the entire network of developing nations that rely on those states for trade. This "third-country effect" is not an accident; it is a structural feature of the dollar hegemony (Grovogui 2018).

Finally, this perspective offers a normative alternative: the right to self-determination in economic affairs. The African Union's push for local currency settlement and the expansion of AfCFTA are not just trade agreements but constitutional attempts to build sovereignty outside the Western-dominated financial order. This is distinct from the Chinese narrative of "non-interference" because it explicitly links sovereignty to human survival and development rights. It challenges the UN to move beyond humanitarian exemptions toward a fundamental restructuring of global financial governance. The African perspective concludes that weaponized interdependence is not a bug of the system but its operating feature, and that true security requires breaking the dependency on the dollar, not just managing it.

2.7.2 Chinese Perspective The Chinese perspective treats weaponized interdependence as a strategic vulnerability to be neutralized through financial sovereignty and multipolarity. Beijing views the US-dominated financial architecture, particularly SWIFT and USD clearing, not merely as a network but as a tool of geopolitical containment. This view is rooted in the principle of "non-interference" and the defense of national sovereignty against external coercion (Drezner 1999). For China, sanctions are not legitimate diplomatic tools but acts of economic warfare that violate the norms of international trade. Consequently, the Chinese response focuses on building parallel infrastructure to ensure resilience.

Key mechanisms in this perspective include the development of CIPS (Cross-Border Interbank Payment System) and local currency settlement agreements within BRICS+. The logic is straightforward: if the US can weaponize the dollar, China must build a system that cannot be weaponized against it. This is not merely about trade; it is about ensuring that China's economic integration does not expose it to unilateral coercion. The Chinese perspective contributes the concept of "financial sovereignty" as a prerequisite for national security. It argues that interdependence should be based on mutual benefit rather than hierarchy, though in practice, this often means building alternative systems to avoid US reach.

However, this perspective occludes the distributional costs borne by third parties. While China advocates for local currency settlement, it does not explicitly address how this shifts risks to non-aligned states or smaller economies that lack the capacity to manage multi-currency clearing. The Chinese narrative focuses on strategic autonomy and resilience, often framing sanctions as a breach of international law rather than a systemic issue requiring structural reform. This occlusion is evident in the reluctance to acknowledge the humanitarian impact of sanctions regimes unless directly threatened themselves.

The evidence for this perspective includes China's rapid expansion of trade in local currencies with Russia, Iran, and African nations following 2022. The creation of CIPS demonstrates a commitment to reducing reliance on US clearing houses. However, strong objections exist: critics argue that building parallel systems creates fragmentation that reduces overall global efficiency. Furthermore, while China promotes "win-win" cooperation, its own trade practices have been accused by Western observers of state-led industrial policy that distorts markets (Atlantic Council sanctions tracker). The Chinese perspective thus contributes a model of resilience but occludes the potential for reduced global liquidity and increased transaction costs in a fragmented world.

2.7.3 Russian Perspective The Russian perspective frames weaponized interdependence as "economic warfare" and a direct attack on national sovereignty. Following the 2022 sanctions, Moscow views the exclusion from SWIFT and asset freezes not as diplomatic pressure but as an existential threat requiring total mobilization of domestic industry and alternative financial channels (Nephew 2018). This view is rooted in a realist understanding of international politics where power dictates security. For Russia, the US dollar is not a neutral medium of exchange but a weaponized asset that can be used to strangle an adversary.

The mechanism of adaptation here is the creation of parallel financial architecture: SPFS (System for Financial Messages) and the use of gold or crypto as settlement mediums. The Russian argument is that reliance on Western finance was always a vulnerability, and true security requires autarky in critical sectors. This perspective occludes the long-term economic costs of isolationism, such as technology stagnation and inflation, framing them as necessary sacrifices for survival. It also occludes the suffering of Russian civilians under price controls and rationing, prioritizing regime stability over domestic welfare in the short term.

The evidence includes Russia's pivot to trading with China, India, and Central Asia using non-dollar currencies. This demonstrates a successful evasion strategy but highlights the limits of adaptation: without access to advanced Western technology (semiconductors, chips), industrial growth is constrained regardless of currency choice. Strong objections include the risk that this fragmentation creates a "two-tier" global economy where only major powers can afford isolationist strategies. The Russian perspective contributes a stark warning about the dangers of financial hegemony but occludes the moral imperative to protect human rights from economic coercion.

2.7.4 Western Perspective The Western perspective, primarily US and EU, views sanctions as a legitimate tool of "coercive diplomacy" within the rule-based international order. The core claim is that weaponized interdependence can be managed through "smart sanctions" that target elites rather than populations (Farrell & Newman 2019). This view relies on the premise that financial networks are neutral infrastructure that can be regulated to serve democratic values. The mechanism is secondary sanctions: using US law to penalize third parties who trade with sanctioned entities, thereby extending reach beyond territorial borders (Drezner 1999).

However, this perspective increasingly acknowledges its own failures. Critics within the West note that "smart sanctions" often fail due to network effects; cutting off a bank in Iran or Russia inevitably disrupts supply chains for food and fuel in third countries like India or Iraq. The Atlantic Council sanctions tracker documents these unintended consequences, leading to self-critique on collateral damage. The Western view also emphasizes humanitarian carve-outs, arguing that exemptions are necessary to protect civilians. This occludes the fact that exemptions are often bureaucratic hurdles that still result in delays and shortages for vulnerable populations.

The evidence includes the 2018-19 maximum pressure campaign on Iran and its effects on third countries like India (oil imports) and Iraq (electricity payments). Western policymakers argue these are unintended side effects, but critics point out they were foreseeable given the centrality of the dollar clearing system. Strong objections include the claim that unilateral sanctions violate international law and undermine multilateralism. The Western perspective contributes a framework for humanitarian protection but occludes the structural reality that the financial architecture itself is inherently coercive when one currency dominates global trade.

2.7.5 UN Perspective The UN perspective, articulated through the Special Rapporteur on unilateral coercive measures, emphasizes that distributional harms violate fundamental human rights under international

law. The core claim is that sanctions regimes must include rigorous human rights impact assessments before implementation to ensure costs do not fall disproportionately on vulnerable populations in non-targeted states. This view treats financial coercion as a potential violation of the right to food and health (UN Human Rights Council).

The mechanism here is legal: the UN General Assembly resolutions calling for an end to unilateral coercive measures that violate international law. The perspective argues that sovereignty includes the right to economic development without external interference, provided human rights are respected. This occludes the political reality that major powers often ignore these resolutions when it suits their strategic interests. The evidence includes reports from the UN Office on Drugs and Crime (UNODC) tracking the impact of sanctions on civilian populations in Syria, Iran, and Venezuela.

Strong objections include the argument that the UN lacks enforcement power; without compliance from major financial centers like New York or London, resolutions remain symbolic. The UN perspective contributes a normative framework for human rights protection in finance but occludes the structural limitations of international law against state power. It calls for a shift from "smart sanctions" to "humanitarian-first" regimes, arguing that security cannot come at the cost of basic survival rights.

2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Shows sanctions as transnational terms-of-trade, food, fuel, fertilizer, and debt shocks that constrain Southern sovereignty	Can underweight the security aims of sanctioning states and the agency of targeted regimes	Non-alignment, developmental sovereignty, humanitarian priority, and resistance to external economic coercion	AfDB analyses of food, fuel, fertilizer, and debt pressures; African diplomatic hedging and abstentions under material constraint	Western: spillovers are not the intent of sanctions, and aggression must be deterred

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Chinese	Identifies financial centrality as structural power and explains incentives for de-dollarization and parallel payment rails	Downplays China's own reliance on dollar liquidity and its selective use of economic leverage	Financial sovereignty, multipolarity, non-interference, and incremental institutional alternatives	CIPS expansion, yuan settlement growth, BRICS local-currency initiatives, cautious avoidance of secondary-sanctions exposure	Western: de-dollarization remains partial and the dollar still dominates reserves and trade
Russian	Documents adaptation, capital controls, SPFS, CIPS linkage, and shadow-economy workarounds under pressure	Obscures the causal role of the invasion and the domestic costs of militarization and repression	Sovereign equality, anti-unilateralism, retaliation legitimacy, and state resilience	Post-2022 Russian payment-system adaptations and trade rerouting	African/UN: adaptation does not justify aggression, and global spillovers harm civilians
Western	Explains coercive mechanism, targeting logic, alliance coordination, and policy intent; includes self-critique on overuse	Underestimates third-country costs, overcompliance, and long-term fragmentation of financial governance	Coercive diplomacy, rule of law, targeted sanctions, human-rights conditionality	OFAC designations, SWIFT exclusions, central-bank asset freezes, sanctions-tracker data	African/UN: extraterritorial enforcement coerces non-targeted actors and weakens legitimacy

UN	Provides humanitarian carve-outs, proportionality standards, civilian protection, and legal framing for unilateral measures	Lacks enforcement power against major financial centers; resolutions often remain symbolic	Multilateral legality, human rights, humanitarian priority, and limits on civilian harm	Special Rapporteur on unilateral coercive measures; UNODC reports on civilian impacts	Western: without compliance from New York and London, norms cannot constrain state power

2.8 WORKED EXAMPLE (I do)

The 2022 sanctions against Russia following its full-scale invasion of Ukraine illustrate how financial centrality is converted into coercive power and how a targeted state adapts. Within days, G7 and EU actors froze a large share of Russia's central-bank reserves and excluded selected Russian banks from SWIFT, while also restricting technology and energy-related finance. The case is analytically useful because it combines a classic chokepoint intervention with an unusually rapid attempt to build parallel financial infrastructure.

Levels of analysis. At the individual level, the sanctions worked through compliance incentives: risk-averse bankers, lawyers, and corporate officers de-risked Russian counterparties beyond the legal minimum, while Russian citizens faced inflation, capital controls, and restricted access to foreign currency. At the state level, the Central Bank of Russia, the Finance Ministry, state energy firms, and Western treasuries and central banks were the principal actors; Russia raised interest rates, imposed capital controls, and redirected trade, while the United States and European Union coordinated designations and exemptions. At the systemic level, the episode tested dollar hegemony, SWIFT's role as a network hub, and the post-Cold War security order; it accelerated debates about multipolarity without immediately displacing the dollar. At the transnational level, correspondent banking chains, multinational firms, commodity traders, diaspora remittances, and humanitarian organizations transmitted both coercion and spillover costs across borders.

Mechanism. The mechanism is Farrell and Newman's chokepoint effect amplified by secondary sanctions. SWIFT is not itself a payment system, but its messaging standard and network position make it a coordination device for correspondent banking; exclusion raises transaction costs and uncertainty. Dollar clearing through New York adds a second chokepoint because most global trade and reserve management still depends on access to US financial infrastructure. The freeze of central-bank assets attacked Russia's macroeconomic buffer, while export controls and financial sanctions aimed to degrade military-industrial capacity. The panopticon effect mattered too: because transactions are visible through compliance systems, private actors over-complied, extending state coercion through market discipline. Russia's countermeasures—SPFS messaging, CIPS linkage, yuan invoicing, gold accumulation, crypto channels, and shadow-fleet logistics—were attempts to reroute around these chokepoints. The result was not immediate collapse but a bifurcated adaptation: Russia retained energy revenues during the initial price spike, yet faced long-term constraints in aviation, semiconductors, and advanced manufacturing.

Perspective reconstruction. From an African vantage, the 2022 sanctions are legible as another instance in which financial decisions taken in the North become terms-of-trade and debt shocks in the South. African economies dependent on imported wheat, fuel, and fertilizer faced price spikes and tighter dollar liquidity, while AfDB analyses documented rising food insecurity and fiscal pressure; many African governments

therefore treated non-alignment as a material necessity rather than mere diplomatic hedging. The case also resonates with longer African critiques of external economic coercion, from Nkrumah's neo-colonialism to Rodney's underdevelopment thesis, because it shows how control over payment rails can discipline states without formal colonial rule. At the same time, African perspectives must acknowledge that Russia's invasion itself disrupted Black Sea grain exports, so not all cost can be attributed to sanctions. The African view contributes a distributional lens that the other four often underweight, but it can understate the security aims of Ukraine's partners.

From a Chinese perspective, the case confirms that financial centrality is a strategic weapon and that dependence on dollar clearing creates vulnerability. Beijing's response has been cautious: it has expanded CIPS and yuan settlement while avoiding full exposure to secondary sanctions, suggesting that de-dollarization is incremental and interest-driven rather than revolutionary. Chinese analysts often frame the sanctions as accelerating multipolarity, but the continued dominance of the dollar in reserves and trade shows that alternatives remain partial.

From a Russian perspective, the sanctions are economic warfare waged by an adversarial coalition, and adaptation is presented as evidence of sovereign resilience. Moscow's creation of parallel payment channels, capital controls, and import-substitution programs demonstrates state capacity under pressure, while its rhetoric blames Western measures for global inflation and food insecurity. This perspective explains the mechanics of evasion but often obscures the causal role of the invasion and the domestic costs of militarization.

From a Western perspective, the sanctions are coercive diplomacy designed to raise the cost of aggression, degrade Russia's war capacity, and signal commitment to Ukraine. Policymakers emphasize targeted design, humanitarian exemptions, and coordination among allies, while self-critique focuses on overcompliance, third-country spillovers, and the risk of overusing financial tools. This perspective best captures intent and institutional design, but it can understate how extraterritorial enforcement coerces non-targeted actors.

From a UN perspective, the case raises questions of proportionality, civilian protection, and the legality of unilateral coercive measures. UN actors have emphasized humanitarian carve-outs, food and energy access, and the need to prevent sanctions from undermining basic rights, while noting that major powers often ignore resolutions when strategic interests are at stake. The UN perspective supplies normative guardrails but lacks enforcement against dominant financial centers.

Adjudication. The Western perspective best explains the immediate coercive mechanism: it accurately identifies how SWIFT exclusion, reserve freezes, and secondary sanctions were designed to constrain Russia's fiscal and military capacity. However, it misses the transnational distributional costs and the long-term incentive structure for parallel financial architecture, which the African and Chinese perspectives foreground. The African perspective best explains who bears the cost and why Global South states resist alignment, but it can underweight Russian agency and the security rationale of Ukraine's supporters. The Chinese perspective best explains systemic incentives for de-dollarization, yet it risks overstating the pace of change and understating China's own stake in dollar liquidity. The Russian perspective explains adaptation but functions partly as legitimation of aggression. The UN perspective is indispensable for humanitarian limits but cannot by itself explain power. On balance, the case is best explained by a synthesis in which Western mechanism analysis is retained, African distributional analysis is added, and Chinese systemic analysis is used to qualify claims about durability; no single perspective is sufficient.

SECTION 2.9 PROBLEM PAIR (We do)

Tasks

1. Distinguish primary, secondary, and extraterritorial sanctions in the 2018-19 Iran maximum-pressure case, and identify whether US power in this episode operated mainly through law, markets, or military threat.

2. Trace the causal chain from US withdrawal from the JCPOA to India's cessation of Iranian oil imports and Iraq's electricity-payment arrears; identify the chokepoint and the point at which private actors, not states, became the effective enforcers.

3. Apply the four levels of analysis—individual, state, systemic, and transnational—to explain why the same US policy produced different outcomes in India and Iraq.

4. Reconstruct how the African/Global South, Chinese, Russian, Western, and UN perspectives would each evaluate the case, including what each perspective reveals and what it occludes.

5. Compare India and Iraq as cases of differential vulnerability: why was coercion more complete in Indian oil imports and more destabilizing in Iraqi electricity supply?

6. Specify scope conditions and falsifiers: under what conditions would secondary sanctions fail to coerce third countries, and what evidence would show that they did fail?

MODEL ANSWER

The 2018-19 maximum-pressure campaign against Iran is a canonical case of weaponized interdependence because the coercive effect on third countries was produced less by direct US-Iran bilateral measures than by the extraterritorial reach of US financial law. After the United States withdrew from the JCPOA and reimposed sanctions, secondary sanctions threatened foreign persons and firms with exclusion from US markets and the dollar-based financial system if they continued to transact with Iran. This converts US centrality in clearing, correspondent banking, and dollar liquidity into coercive power: the chokepoint is not a physical strait but the institutional architecture through which most international payments are cleared and most trade is financed. Farrell and Newman's framework helps explain why the threat need not be executed to be effective; the panopticon effect means that private actors, uncertain about enforcement but aware of catastrophic downside risk, self-censor and de-risk. Nephew's analysis of sanctions design underscores that modern sanctions are calibrated to exploit this anticipatory behavior, while Drezner's earlier work reminds us that sanctions effectiveness depends on target vulnerability and sender credibility, not merely on legal authority.

India's oil imports illustrate the mechanism. New Delhi had strategic and commercial reasons to maintain Iranian crude purchases, and it initially benefited from temporary waivers. Yet after waivers expired in 2019, Indian refiners and banks faced the prospect that any Iran-related transaction could trigger US penalties, loss of dollar access, or exclusion from US markets. The result was not simply a negotiated bilateral concession by India to Washington, but a compliance cascade through refiners, insurers, shippers, and state-owned banks. India diversified toward other suppliers because the cost of maintaining the Iran channel exceeded the benefit once private financial intermediaries withdrew. Iraq presents a harder case: Iranian electricity and

gas imports were embedded in Iraq's power system, and payment channels were constrained by sanctions-related restrictions and banking de-risking. Arrears and supply interruptions followed, translating a financial dispute into domestic electricity shortages and political instability. The contrast matters: coercion was more complete where substitutes existed, as in Indian crude sourcing, and more destabilizing where infrastructure dependence was high, as in Iraqi power.

The levels of analysis clarify why the same policy had different effects. At the individual level, compliance officers, bank risk committees, and corporate counsel became the operational enforcers of US policy; their incentives favored over-compliance because the cost of a false negative, a sanctions violation, far exceeded the cost of a false positive, lost business. At the state level, India and Iraq made different calculations: India could absorb diversification costs and preserve broader US ties, while Iraq faced immediate energy-security and fiscal constraints. At the systemic level, dollar centrality and payment messaging created the coercive architecture; even where alternative currencies existed, the marginal cost of exiting the dollar channel was high. At the transnational level, shipping, insurance, marine finance, and commodity trading transmitted pressure across jurisdictions, so that a US legal threat became a global market signal.

Perspective reconstruction shows why the case is contested. The Western perspective frames maximum pressure as coercive diplomacy intended to change Iranian nuclear and regional behavior, while also generating self-critique about humanitarian costs, overreach, and the erosion of trust in diplomatic agreements. The Russian perspective interprets such measures as economic warfare and uses them to justify building parallel payment systems and closer ties with sanctioned states. The Chinese perspective treats extraterritorial sanctions as an infringement on financial sovereignty and a reason to accelerate de-dollarization, local-currency settlement, and alternative clearing arrangements. The African and broader Global South perspective emphasizes distributional asymmetry: states not party to the US-Iran dispute bear costs through fuel prices, fertilizer markets, food insecurity, debt stress, and constrained development finance. The UN perspective, including the work of special procedures on unilateral coercive measures, stresses that humanitarian carve-outs for food, medicine, and essential services often fail in practice because banks over-comply and payment channels collapse, so legal exemptions do not guarantee access.

Adjudication requires separating effectiveness from legitimacy. On effectiveness, the evidence supports a conditional conclusion: secondary sanctions coerced third-country behavior in 2018-19, especially where private actors faced high US market exposure and where substitutes were available. On legitimacy, the same mechanism is more contested because it imposes costs on non-targeted populations and undermines the principle that sanctions should be targeted, proportionate, and subject to humanitarian safeguards. Early's work on third-party sanctions suggests that coercion of bystanders is not an accidental byproduct but a structural feature of financial statecraft. The strongest counterargument to the effectiveness claim is that coercion may be temporary and self-undermining: as targeted and third countries invest in alternative payment systems, non-dollar settlement, and barter or gold workarounds, the sender's network advantage erodes. Falsifiers would include sustained India-Iran trade despite US threats, functioning humanitarian payment channels with minimal arrears, or evidence that maximum pressure accelerated rather than constrained Iran's nuclear program. The case therefore supports the narrower theoretical claim that weaponized interdependence is powerful but path-dependent: it works through network centrality and private anticipation, and its durability depends on whether the targeted network remains indispensable.

SECTION 2.10 INDEPENDENT MEMO (You do)

(a) Case description

In 2023, the United States expanded secondary sanctions against non-Russian entities accused of facilitating Russia's war economy, including banks, shipping intermediaries, and commodity traders in third countries. Several Global South economies that had increased trade with Russia after 2022 faced heightened compliance costs, delayed payments, and de-risking by correspondent banks. Some governments argued that the measures were necessary to close sanctions loopholes; others argued that they imposed extraterritorial obligations on states not party to the Russia-Ukraine conflict and disrupted legitimate trade, energy imports, and development finance. The case is analytically useful because it separates the question of whether secondary sanctions change behavior from the question of who bears their costs, and because it tests whether alternative payment systems and non-dollar settlement can reduce US leverage over time. It also raises the problem of over-compliance: private banks may refuse even legally permitted transactions, producing humanitarian and commercial effects that exceed the stated scope of sanctions. Analysts disagree over whether such measures strengthen coercive diplomacy or accelerate the fragmentation of global finance.

(b) Required memo headings as prompts

- **Mechanism:** Identify the specific channel through which US sanctions threats alter third-country behavior—legal, financial, or market—and specify the scope conditions under which that mechanism fails.

- **Perspective reconstruction:** Reconstruct how the African/Global South, Chinese, Russian, Western, and UN perspectives would each evaluate the 2023 expansion, stating what each perspective contributes and what it occludes.

- **Historical analogue:** Compare this case to a prior episode of secondary sanctions or financial coercion, such as the 2018-19 Iran maximum-pressure campaign or the 2014 Russia sanctions, and state what is similar, what differs, and what the analogy cannot explain.

- **Falsifiers:** List two observable developments that would weaken your explanation and two that would strengthen it.

(c) Self-check

Self-check: Did you distinguish description of the 2023 sanctions expansion from explanation of its effects, prediction about future de-dollarization, and prescription about whether the policy should continue?

SECTION 2.11 HINGE QUESTION

Question: In the 2018-19 Iran maximum-pressure case, what best explains why India halted Iranian oil imports after waivers expired?

A. The United States threatened direct military action against Indian refineries.
B. Secondary sanctions threatened foreign firms with loss of US market access and dollar-clearing privileges, producing anticipatory compliance by private actors.
C. Iran refused to continue selling oil to India at discounted prices.
D. UN Security Council sanctions made all Iranian oil purchases illegal for UN member states.

Correct answer: B.

Distractor diagnoses

- **A:** This option conflates financial coercion with military coercion. The mechanism in the case was not a threat of force against Indian infrastructure but the extraterritorial reach of US financial law and the risk of exclusion from dollar markets.

- **C:** This option reverses causality. Iran sought buyers for its oil; Indian refiners and banks withdrew because compliance risk and loss of dollar access made the Iran channel unsustainable, not because Iran refused to sell.

- **D:** This option misstates the legal basis. The 2018-19 measures were primarily US sanctions reimposed after withdrawal from the JCPOA, not a new UN Security Council prohibition binding all member states; it overstates multilateral authority and understates unilateral financial leverage.

SECTION 2A — DATA LAB

Table 1 — SWIFT message traffic by currency (approximate share of value)

Currency	~2015	~2020	~2023	Reading
USD	~45%	~40%	~42%	Stable-high; the clearing currency of first resort
EUR	~29%	~37%	~36%	Rose with euro-area integration, then plateaued
GBP	~8%	~6%	~7%	Stable minor share
JPY	~3%	~3%	~3%	Stable minor share
CNY	~2%	~2%	~3%	Modest rise despite RMB internationalization push
Other	~13%	~12%	~9%	Compressed by USD/EUR dominance

Source: SWIFT RMB Tracker and BIS Triennial Survey (approximate; SWIFT does not publish a complete, consistent currency breakdown, so treat these as indicative orders of magnitude, not precise series).

Table 2 — USD share of global foreign-exchange reserves (IMF COFER, %)

Year	USD	EUR	CNY	Other (JPY, GBP, gold, etc.)
2000	~71	~18	~0	~11
2010	~62	~26	~0	~12

Year	USD	EUR	CNY	Other (JPY, GBP, gold, etc.)
2015	~66	~20	~1	~13
2020	~60	~21	~2	~17
2023	~58	~20	~2.5	~19.5

Source: IMF Currency Composition of Official Foreign Exchange Reserves (COFER). Shares sum to ~100% of allocated reserves; unallocated reserves are excluded.

Table 3 — Estimated impacts of selected sanctions episodes

Case	Metric	Estimate	Source / caveat
Russia 2022	GDP growth	−2.1% (2022)	IMF; confounded by energy-price windfall and import compression
Russia 2022	Frozen central-bank assets	~USD 300 billion	G7/EU statements; legal status of seizure still contested
Iran 2018–19 (maximum pressure)	Crude oil exports	~2.5 mb/d → ~0.5 mb/d	EIA; partial recovery via shadow fleet
Iran 2018–19	GDP contraction	~−6% to −7%	IMF/World Bank estimates
Global South 2022	Wheat price peak	+~40% vs. pre-war	FAO; driven by Black Sea disruption plus sanctions uncertainty
Africa 2022–23	Fertilizer import cost	Sharp increase; several states faced 2–3× price spikes	AfDB analyses

Table 4 — Parallel and local-currency financial architecture (status, approximate)

Initiative	Sponsor	Status	Volume / reach
CIPS (Cross-Border Interbank Payment System)	China	Operational since 2015	Handles a growing share of China's cross-border RMB payments; still small vs. SWIFT
SPFS (System for Transfer of Financial Messages)	Russia	Operational, limited	Mostly domestic Russian banks; limited foreign participation
INSTEX	EU (France/Germany/UK)	Defunct (2019–2023)	Negligible transaction volume; failed to bypass US secondary sanctions

Initiative	Sponsor	Status	Volume / reach
India–Russia oil trade settlement	India/Russia	Operational 2022–23	Rupee/dirham/other non-dollar settlement; large imbalances, rupee accumulation problem
BRICS Pay / proposed common settlement	BRICS	Under discussion	Not operational; no agreed unit of account
Gold and crypto workarounds	Various actors	Episodic	Used for evasion; high friction, traceability varies

Five numbered analysis questions

1. **Trend.** Looking at Tables 1 and 2 together, describe the trajectory of USD dominance in global finance from 2000 to 2023. Is the evidence more consistent with (a) a structural collapse of dollar hegemony, (b) a slow, contested diversification, or (c) stability with marginal erosion? Justify with two specific data points and note what the data cannot show.

2. **Level of analysis.** Weaponized interdependence is sometimes described as a "systemic" phenomenon and sometimes as a "state" phenomenon. Using the tables, identify at least two levels of analysis at which the data operate (individual/bank, state, systemic, transnational), and explain why the COFER series is a systemic-level indicator while the India–Russia rupee settlement is a state-level adaptation.

3. **Perspective reconstruction (all five).** Reconstruct how each of the five perspectives would read Tables 3 and 4: (a) African — cost-bearing and food/fuel/fertilizer shocks; (b) Chinese — de-dollarization opportunity and CIPS growth; (c) Russian — sanctions as economic warfare and SPFS; (d) Western — coercive diplomacy plus self-critique; (e) UN — humanitarian carve-outs and the Special Rapporteur on unilateral coercive measures. Which perspective best explains the wheat-price and fertilizer rows, and why?

4. **Interpretation.** Does the BRICS/local-currency data in Table 4 support the claim that sanctions on Russia in 2022 "broke" dollar dominance? Adjudicate between the "acceleration" thesis (sanctions sped up pre-existing diversification) and the "rupture" thesis (sanctions created a new non-dollar order), citing the CIPS, SPFS, and INSTEX rows.

5. **Limitation.** Identify three specific limitations of these data for testing claims about weaponized interdependence: one concerning measurement (what SWIFT/COFER do not capture), one concerning causal identification (why the Russia GDP figure does not isolate sanctions), and one concerning perspective bias (whose costs are and are not counted in Table 3).

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — "The Chokepoint Network" (hand-drawn graph)

What to draw. A hub-and-spoke network on an A4 page. Draw one large central circle (≈6 cm diameter) labeled **"SWIFT / CHIPS / USD clearing"**. Around it, draw eight to ten smaller circles (≈2 cm) representing

peripheral nodes: label them **US Treasury**, **Federal Reserve**, **Major US banks**, **EU banks**, **Asian banks**, **Iran (2012)**, **Russia (2022)**, **Global South importer**, **Commodity trader**, **Correspondent bank**. Draw straight lines from each peripheral node to the central hub. Thicken the lines into the hub to suggest traffic concentration.

Labels to place. On the central hub, write **"CHOKEPOINT"** in red. Above the hub, draw a stylized eye (an oval with a pupil) labeled **"PANOPTICON: transaction visibility"**. On two peripheral nodes (Iran, Russia), draw a red "X" or a broken line to indicate exclusion. Add a small legend box: solid line = normal traffic; broken line = sanctioned/excluded.

Perspective overlay to annotate. In the margin, write two short annotations: (Western) "Efficiency + compliance leverage: the hub lowers transaction costs and enforces rules." (African) "Vulnerability: peripheral nodes cannot route around the hub; exclusion is collective punishment of non-targets." Draw a dashed arrow from the African annotation to the Global South importer node.

Visual 2 — "Sanctions Escalation Ladder" (hand-drawn vertical ladder)

What to draw. A vertical ladder with six rungs, bottom to top, drawn as horizontal bars connected by two vertical rails. Label each rung from bottom to top: (1) **Diplomatic protest**, (2) **Targeted / "smart" sanctions** (individuals, entities), (3) **Sectoral sanctions** (energy, finance, defense), (4) **Comprehensive sanctions** (trade embargo), (5) **Secondary sanctions** (extraterritorial reach), (6) **Financial exclusion** (SWIFT cutoff, central-bank asset freeze). Draw an arrow on the left rail pointing upward labeled "Escalation."

Labels to place. On the right side, place two timeline markers with leader lines: a dot on rung 2–3 labeled **"Iran 2012 (EU oil embargo + SWIFT)"** and a dot on rung 6 labeled **"Russia 2022 (SWIFT + ~$300bn freeze)"**. At the top, write **"Ceiling: military force"** in grey. At the bottom, write **"Floor: diplomacy"**.

Perspective overlay to annotate. Annotate rung 5 (secondary sanctions) with a bracket and the note: **"Coerces third countries (India, Iraq) without their consent — the extraterritorial mechanism."** Annotate rung 6 with: **"UN perspective: humanitarian carve-outs required; Special Rapporteur on unilateral coercive measures."** Add a small African-perspective note at the bottom: **"Costs fall on food/fuel/fertilizer importers not on the ladder."**

Visual 3 — "Distributional Cost Map" (hand-drawn world map)

What to draw. A simplified world map (continents as rough outlines). Shade the Global South (Africa, parts of Latin America, South/Southeast Asia, Middle East) in a gradient: light yellow = low cost exposure, deep orange/red = high cost exposure (food, fuel, fertilizer). Shade the US and EU in light blue (sanctioning states). Shade Russia in grey (target). Draw thick arrows from Russia/Ukraine grain regions and from Gulf fertilizer regions toward Africa and South Asia, with a red "X" or break symbol on the arrows to indicate disrupted flows. Draw a separate thin arrow from the US/EU toward the Global South labeled "humanitarian carve-outs (partial)."

Labels to place. Legend: **Red/Orange = cost-bearing (food, fuel, fertilizer, debt)**; **Blue = sanctioning states**; **Grey = target state**. Title: **"Who bears the cost of weaponized interdependence?"** Add three callout boxes: (Africa) "AfDB: fertilizer 2–3× price spikes"; (South Asia) "India: oil import disruption, rupee settlement"; (Middle East) "Iraq: electricity payments blocked."

Perspective overlay to annotate. In the margin, write the five perspective one-liners: African — "Costs are

externalized to non-targets"; Chinese — "Opportunity for de-dollarization"; Russian — "Economic warfare"; Western — "Coercive diplomacy with self-critique"; UN — "Humanitarian carve-outs and due process." Draw a bracket grouping the African and UN notes as "cost-bearing / protective" perspectives.

SECTION 4 — CORNELL NOTES

Cue column (prompts)

Cue (question / keyword)	Notes (answer + source log)
What is weaponized interdependence?	The use of economic networks (trade, finance, data) as instruments of coercion by states that occupy central (hub) positions. Farrell & Newman (2019, *International Security*; 2023, *Underground Empire*).
Panopticon effect	Central nodes gain visibility into transactions across the network; information asymmetry favors the hub. Scope: financial messaging, clearing.
Chokepoint effect	Central nodes can deny access to the network; exclusion is the coercive tool. Scope: SWIFT, CHIPS, correspondent banking.
SWIFT's role	Messaging network, not payment settlement; but exclusion from SWIFT raises transaction costs and signals risk. Iran 2012, Russia 2022.
Dollar clearing / CHIPS	Actual settlement in USD requires access to US correspondent banks and Fedwire; this is the deeper chokepoint than SWIFT messaging.
Smart vs. comprehensive sanctions	Smart: targeted individuals/entities/sectors; comprehensive: broad trade/financial embargo. Drezner (1999) on sanctions paradox; Nephew (2018) on design.
Secondary sanctions	Extraterritorial application of US law to non-US persons; coerces third countries (India oil, Iraq electricity). Early (2015) on evasion/busting.
Extraterritorial reach	US law (IEEPA, CAATSA) + dollar clearing nexus = jurisdiction over global transactions.
Evasion: SPFS / CIPS / INSTEX	Russia's SPFS (limited), China's CIPS (growing), EU's INSTEX (failed). Gold, crypto as workarounds.
Distributional costs	Food, fuel, fertilizer, debt in Global South; AfDB analyses; wheat +~40% peak 2022.
African perspective	Sanctions externalize costs to non-targets; food/fuel/fertilizer/debt; demands carve-outs and voice.

Cue (question / keyword)	Notes (answer + source log)
Chinese perspective	De-dollarization, financial sovereignty, CIPS, bilateral local-currency settlement.
Russian perspective	Sanctions as economic warfare; SPFS; parallel architecture; "fortress Russia."
Western perspective	Coercive diplomacy; self-critique on overuse, humanitarian harm, dollar-erosion risk.
UN perspective	Humanitarian carve-outs; Special Rapporteur on unilateral coercive measures; due process.
Falsifiers	USD reserve share collapse; successful large-scale non-dollar settlement; sanctions with zero third-country spillover; humanitarian carve-outs fully effective.

Summary (3–5 sentences)

Weaponized interdependence describes how states occupying central positions in economic networks—especially the US in dollar clearing and SWIFT—convert structural centrality into coercive power through panopticon (visibility) and chokepoint (exclusion) effects. The 2012 Iran and 2022 Russia cases show escalation from targeted sanctions to financial exclusion, with secondary sanctions extending US reach to third countries such as India and Iraq. Evasion efforts (CIPS, SPFS, INSTEX, gold, crypto) have produced parallel architecture but not yet a systemic alternative, as COFER data show slow USD erosion rather than collapse. The distributional costs fall disproportionately on the Global South through food, fuel, fertilizer, and debt channels, generating African, Chinese, Russian, Western, and UN perspectives that disagree on legitimacy, efficacy, and remedy. The data support a "slow diversification" reading, not a "dollar collapse" reading, but measurement and causal-identification limits remain severe.

SECTION 5 — FEYNMAN COMPRESSION

Step 1 — Explain without jargon. Imagine a town where every shop, bank, and household must use one central switchboard to make payments. The switchboard operator can see every transaction (that is the

panopticon) and can cut off anyone's line (that is the chokepoint). If the operator is a powerful country, it can punish a rival by cutting its line—and because everyone else also needs the switchboard, the operator can threaten them too if they keep trading with the rival. That is weaponized interdependence: power comes not from owning the goods but from sitting at the center of the network everyone must use. The 2022 Russia case is the clearest example: Russia was cut off from SWIFT and had roughly $300 billion of central-bank reserves frozen, and other countries felt pressure to stop buying Russian oil or face US penalties.

Step 2 — Mark gaps. (a) I initially conflated SWIFT (messaging) with CHIPS/Fedwire (settlement); the lesson distinguishes them—SWIFT exclusion raises costs and signals risk, but dollar clearing is the deeper chokepoint. (b) I under-specified the African perspective: it is not merely "costs exist" but a claim about externalization and voice, grounded in AfDB food/fuel/fertilizer/debt analyses. (c) I treated "de-dollarization" as a single trend; the data show it is fragmented—CIPS grows, SPFS stalls, INSTEX failed, BRICS Pay is not operational. (d) I did not yet specify the falsifiers that would change the conclusion.

Step 3 — Reread verification. Re-reading Farrell and Newman (2019, 2023): confirmed that panopticon and chokepoint are network-structural effects, not just policy choices, and that they depend on hub centrality and the absence of ready substitutes. Re-reading Drezner (1999) and Nephew (2018): confirmed that "smart" sanctions are designed to reduce humanitarian harm but that comprehensiveness and secondary reach often reintroduce broad costs. Re-reading Early (2015): confirmed that evasion is systematic and that sanctions-busting networks (front companies, re-flagging, alternative messaging) are a predictable adaptation. Re-reading the AfDB analyses and FAO data: confirmed the food/fuel/fertilizer/debt channel as the primary African cost vector. The COFER and SWIFT figures support "slow diversification, not collapse."

Step 4 — Analogy with explicit limits. Analogy: a single dominant railway hub through which all freight must pass; the hub owner can inspect cargo (panopticon) and close the yard (chokepoint), and can threaten shippers who route to a rival. Limits: (i) railways are physical and slow to reroute, whereas financial networks can in principle be re-wired faster—yet in practice network effects and trust make rerouting hard; (ii) the analogy implies a single owner, whereas financial centrality is a public-private hybrid (US state + private banks + SWIFT cooperative); (iii) the analogy omits the legal dimension—extraterritorial US law, not just network position, does much of the coercive work; (iv) the analogy cannot capture the distributional asymmetry: railway closure hurts the hub's customers, but financial exclusion's worst costs fall on third parties (Global South importers) who are not parties to the dispute.

Step 5 — Rewrite. Weaponized interdependence is the conversion of structural centrality in economic networks into coercive power, operating through two mechanisms: the panopticon effect (visibility into transactions) and the chokepoint effect (the ability to deny access). The US occupies the central hub in dollar clearing and SWIFT, which it used against Iran (2012) and Russia (2022), escalating from targeted sanctions to financial exclusion and secondary sanctions that coerce non-targeted states such as India and Iraq. Evasion has produced partial alternatives—CIPS grows, SPFS and INSTEX faltered, BRICS Pay is not operational—so the data show slow diversification of reserves and settlement, not a collapse of dollar dominance. The costs are distributed asymmetrically: food, fuel, fertilizer, and debt burdens fall on the Global South, which is why African, Chinese, Russian, Western, and UN perspectives diverge on legitimacy, efficacy, and remedy. The conclusion is falsifiable: a sustained collapse of the USD reserve share, a functioning large-scale non-dollar settlement system, or sanctions with no third-country spillover would each overturn it.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L18	Definition	What is weaponized interdependence?	Farrell and Newman (2019) argue that states can convert positions of centrality in global economic networks into coercive leverage; the effect depends on network asymmetry and the target's difficulty in finding substitutes. It is a structural power argument, not merely a sanctions list.	The African perspective stresses that network coercion is often experienced downstream as food, fuel, fertilizer, and debt shocks rather than as a bilateral diplomatic dispute.
L18	Mechanism	How does the panopticon effect operate?	A central node can observe, record, and condition access to transactional flows, turning information visibility into enforcement capacity; the coercion lies partly in surveillance and compliance anticipation. Its strength depends on data concentration and legal reach.	Western security discourse often treats visibility as risk management, while many Global South actors read it as extraterritorial surveillance.

Tag	Card Type	Front	Back	Perspective Note
L18	Mechanism	What is the chokepoint effect?	Control over a critical node allows a sender to deny or condition access to an entire network, as when financial messaging or clearing access is restricted. The effect weakens if the target can reroute through substitutes.	Russian discourse frames chokepoints as economic warfare; Chinese discourse frames them as arguments for financial sovereignty.
L18	Application	What happened in the 2012 Iran SWIFT episode?	Under US and EU pressure, SWIFT disconnected designated Iranian banks, disrupting oil payments and trade finance; Iran adapted through barter, gold, and intermediary channels, so exclusion was costly but not total.	The episode illustrates how financial centrality becomes coercive power while also generating incentives for alternative payment systems.

Tag	Card Type	Front	Back	Perspective Note
L18	Application	What was central to the 2022 Russia sanctions package?	G7 and EU measures immobilized a large share of Russia's foreign-exchange reserves and excluded selected Russian banks from SWIFT, while Russia responded with capital controls, ruble-support measures, and accelerated parallel financial planning.	Russian framing treats reserve immobilization as confiscation; Western framing treats it as lawful coercive diplomacy.
L18	Comparison	How do smart and comprehensive sanctions differ?	Smart sanctions target elites, assets, sectors, or transactions; comprehensive sanctions restrict broad trade and financial flows. Drezner (1999) warns that sanctions often fail to change target behavior even when they impose substantial costs.	UN and humanitarian actors prefer narrowly scoped measures with carve-outs, while critics note that even targeted measures can spill over to civilians.

Tag	Card Type	Front	Back	Perspective Note
L18	Mechanism	How do secondary sanctions coerce non-targeted states?	US law and market access threats penalize third parties that transact with sanctioned actors, so firms and banks in non-targeted states often over-comply to protect dollar access. The mechanism is extraterritorial leverage, not direct bilateral pressure.	India's oil-import adjustments and Iraq's electricity-payment difficulties show how third countries bear compliance costs despite not being the primary target.
L18	Evasion	What are SPFS, CIPS, and INSTEX?	Russia's SPFS, China's CIPS, and the EU's INSTEX were attempts to reduce dependence on US-centered financial infrastructure; their impact has been limited by liquidity, trust, network effects, and counterpart willingness.	Chinese and Russian perspectives treat them as sovereignty projects; Western analysts often treat them as partial and costly workarounds.
L18	Evasion	How do gold and crypto workarounds function?	Targets and intermediaries use gold, barter, cryptocurrency, and third-country routing to bypass restrictions; these methods raise transaction costs, reduce transparency, and can increase compliance risk.	African and UN perspectives highlight concerns about illicit financial flows, informalization, and humanitarian payment frictions.

Tag	Card Type	Front	Back	Perspective Note
L18	Distributional	Who bears the costs of weaponized interdependence?	Costs often fall on civilians, import-dependent economies, remittance recipients, and third-country firms, while elites and state institutions may adapt through alternative channels. The distribution is therefore not identical to the target list.	AfDB analyses emphasize food, fuel, fertilizer, and debt pressures in African economies; UN actors emphasize civilian protection.
L18	Source	What is Farrell and Newman's core contribution?	Farrell and Newman (2019, 2023) theorize global economic networks as sites of coercive power, distinguishing information advantages (panopticon) from access denial (chokepoint). Their work links market structure to state power.	The theory is often read in the West as strategic analysis, but African and Global South scholars ask whose costs are rendered invisible by network-centric framing.

Tag	Card Type	Front	Back	Perspective Note
L18	Source	What is Drezner's sanctions paradox?	Drezner (1999) argues that sanctions are frequently imposed for political signaling and domestic reasons, yet often fail to compel target policy change while still generating economic and humanitarian costs.	The paradox supports Global South critiques that sanctions can be performative coercion with unevenly distributed harm.
L18	Debate	Is de-dollarization imminent?	Sanctions have increased interest in local-currency settlement and alternative payment systems, but dollar dominance persists because of liquidity, depth, trust, and network effects; change is gradual and contested.	Chinese and Russian actors push de-dollarization; African actors often hedge rather than fully exit dollar markets.

Tag	Card Type	Front	Back	Perspective Note
L18	Reconstruction	How does the UN perspective frame unilateral sanctions?	The UN perspective emphasizes humanitarian carve-outs, proportionality, civilian protection, and the work of the Special Rapporteur on unilateral coercive measures, warning that broad sanctions can harm non-target populations.	This perspective centers human rights and humanitarian law rather than sender-state strategic goals.
L18	Occlusion	What does Western self-critique acknowledge?	Western analysts increasingly acknowledge that sanctions can strengthen target regimes, fragment global economic governance, impose costs on allies, and accelerate alternative financial architectures.	This self-critique partially overlaps with Russian, Chinese, and African critiques but usually retains coercive diplomacy as a legitimate tool.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence Audit (score 0–100)

Skill or Concept	Confidence (0–100)	Evidence of Mastery	Next Action
Define weaponized interdependence and distinguish panopticon from chokepoint effects		Can state both mechanisms without conflating information advantage with access denial	Re-read Farrell and Newman (2019) and redraw the network diagram

Skill or Concept	Confidence (0–100)	Evidence of Mastery	Next Action
Explain SWIFT/dollar clearing as coercive infrastructure		Can trace how messaging, correspondent banking, and legal jurisdiction combine	Reconstruct the Iran 2012 and Russia 2022 sequences from memory
Distinguish smart, comprehensive, and secondary sanctions		Can identify target, scope, and extraterritorial mechanism in a case	Apply the distinction to the Iran maximum-pressure case
Analyze evasion and adaptation strategies		Can evaluate SPFS, CIPS, INSTEX, gold, and crypto by liquidity and trust	Compare one alternative system with SWIFT on three criteria
Reconstruct all five perspectives		Can state each perspective's contribution and occlusion in 3–5 sentences	Write a one-paragraph reconstruction for the African perspective first
Interpret sanctions data without overclaiming		Can separate trend, level of analysis, and causal attribution	Revisit the Data Lab tables and mark unsupported inferences

7.2 Three-Question Debrief

1. Which mechanism in this lesson did you initially treat as an outcome rather than a process, and how would you now describe its causal chain?
2. Which perspective did you find most difficult to steel-man, and what evidence would be needed to make that reconstruction more credible?
3. What is one falsifier that would weaken your current conclusion about whether sanctions are coercively effective in a given case?

7.3 Error-Log

Common Misconception	Correction	Evidence
Sanctions reliably change target-state behavior.	Sanctions often fail to compel policy change even when they impose high costs; success depends on target vulnerability, sender resolve, and available alternatives.	Drezner (1999); adaptation in Iran and Russia cases.

Common Misconception	Correction	Evidence
SWIFT exclusion equals total financial isolation.	Exclusion raises costs and delays payments but does not eliminate all channels; targets use correspondent workarounds, barter, gold, and alternative systems.	SPFS, CIPS, INSTEX, and gold/crypto workarounds.
Smart sanctions avoid civilian harm.	Targeted measures reduce but do not eliminate spillovers, especially in import-dependent economies and humanitarian payment systems.	UN Special Rapporteur on unilateral coercive measures; AfDB food, fuel, fertilizer, and debt analyses.
De-dollarization is imminent.	Interest in alternatives has grown, but dollar dominance remains strong due to liquidity, depth, trust, and network effects.	COFER reserve-share trends and limited BRICS local-currency settlement volumes.
Secondary sanctions affect only the targeted state.	Extraterritorial penalties coerce third-country firms and governments, producing compliance costs and policy distortions in non-targeted states.	India oil imports and Iraq electricity payments under Iran maximum pressure.

SECTION 8 — CHEATSHEET

Core Concepts	Key Mechanisms	Theories and Authors	Cases and Evidence	Debates	Falsifiers	Cross-links
Weaponized interdependence	Network centrality converted into coercive leverage	Farrell and Newman (2019, 2023)	Iran 2012; Russia 2022	Security efficiency vs. Global South costs	Target has viable substitutes or alternative networks	L6, L15–L17, L38
Panopticon effect	Information extraction and compliance anticipation from central nodes	Farrell and Newman (2019)	SWIFT messaging visibility	Surveillance/risk management vs. sovereignty	Data fragmentation or legal limits on access	L48

Core Concepts	Key Mechanisms	Theories and Authors	Cases and Evidence	Debates	Falsifiers	Cross-links
Chokepoint effect	Denial or conditioning of access at critical network nodes	Farrell and Newman (2019)	SWIFT exclusions	Coercive diplomacy vs. economic warfare	Substitutability rises; chokepoint loses force	L19
Secondary sanctions	Extraterritorial penalties coercing third-party actors	Nephew (2018); Early (2015)	India oil imports; Iraq electricity payments	US legal reach vs. state sovereignty	Third parties can bypass US market without unacceptable cost	L38
Smart vs. comprehensive sanctions	Targeted restrictions vs. broad trade/finance embargoes	Drezner (1999)	Iran maximum pressure	Effectiveness vs. humanitarian harm	Target elite insulated; civilian costs dominate	L38
Evasion architectures	SPFS, CIPS, INSTEX, gold, crypto, third-country routing	Farrell and Newman (2023)	Russia, China, EU, Iran adaptations	Financial sovereignty vs. fragmentation	Low liquidity/trust stalls alternatives	L52–L53
Distributional costs	Food, fuel, fertilizer, debt, remittance, and firm-level spillovers	AfDB analyses; UN Special Rapporteur on unilateral coercive measures	Global South importers	Coercive diplomacy vs. humanitarian protection	Robust carve-outs and payment channels reduce civilian harm	L19, L48

SECTION 9 — REVIEW SCHEDULE

Interval	Action	Timing
R1	Reconstruct the five key ideas from memory, then redraw the panopticon/chokepoint network diagram and label Iran 2012 and Russia 2022.	Same day, 20 minutes

Interval	Action	Timing
R2	Re-read Section 2.7 and write one steel-manned paragraph for each of the five perspectives, beginning with the African perspective.	24 hours, 45 minutes
R3	Work through the 2022 Russia sanctions worked example by levels of analysis: individual, state, systemic, and transnational.	72 hours, 60 minutes
R4	Complete the Iran maximum-pressure problem pair, comparing how secondary sanctions coerce non-targeted states such as India and Iraq.	1 week, 60 minutes
R5	Write the independent memo, run the description/explanation/prediction/prescription self-check, and revisit the Data Lab tables.	2 weeks, 90 minutes

SECTION 10 — COMPLETION CHECKLIST

- ☐ I can define weaponized interdependence and distinguish it from ordinary sanctions.
- ☐ I can explain the panopticon effect as an information-and-compliance mechanism.
- ☐ I can explain the chokepoint effect as an access-denial mechanism.
- ☐ I can trace how SWIFT and dollar clearing convert financial centrality into coercive power.
- ☐ I can compare the Iran 2012 and Russia 2022 cases without conflating them.
- ☐ I can distinguish smart, comprehensive, and secondary sanctions.
- ☐ I can explain the extraterritorial reach of US law in secondary sanctions.
- ☐ I can evaluate SPFS, CIPS, INSTEX, gold, and crypto as evasion strategies.
- ☐ I can identify who bears the costs of weaponized interdependence.
- ☐ I can reconstruct the African perspective as primary, not as a regional add-on.
- ☐ I can reconstruct the Chinese, Russian, Western, and UN perspectives fairly.
- ☐ I can use the comparison matrix to identify each perspective's contribution and occlusion.
- ☐ I can apply the four levels of analysis to the Russia 2022 worked example.
- ☐ I can complete the Iran problem pair and model answer.
- ☐ I can interpret the Data Lab tables without overclaiming causality.
- ☐ I can state at least two falsifiers for a sanctions-effectiveness claim.
- ☐ I can complete the independent memo with all four required headings.
- ☐ I can pass the hinge question and explain each distractor.

20. Energy, Critical Minerals, and Resource Geopolitics

LESSON METADATA

Field	Value
Lesson number and title	Lesson 19: Energy, Critical Minerals, and Resource Geopolitics
Module	Module 3: International Political Economy and Geoeconomics
Prerequisites	L15–L18 (IPE), L10 (Imperialism), L17 (World-Systems)
Interleaved links	Forward to L33 (Minerals in Africa), L38 (Energy Coercion), L46 (Hydrocarbons), L51 (Climate), L52–53
Reading load	7-9 hours
Content channels	Text, tables, worked example, problem pair, data lab, visuals, flashcards
Bloom ceiling	Evaluate / Create
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

The central puzzle of this lesson is whether the global energy transition restructures or merely relocates the material basis of international power. For roughly a century, hydrocarbons—above all petroleum—

constituted the foundational commodity of industrial civilization, military capability, and great-power rivalry. The 1973 OPEC embargo demonstrated that control over a single commodity could reconfigure alliances, trigger recessions, and force diplomatic realignments across the entire international system. The transition now underway—toward electrification, renewable generation, and battery storage—does not abolish this logic of material power; it translates it. Where the twentieth-century energy system concentrated leverage in a handful of producer states and consumed resources in industrial cores, the emerging system disperses geological endowment across many territories while hyper-concentrating the processing, refining, and manufacturing stages in a few—most notably China. The question that organizes this lesson is therefore not whether resources still matter, but which resources matter, at which stage of the value chain leverage actually resides, and whether the transition opens space for developmental autonomy or reproduces dependency under the sign of "green" modernity.

This puzzle sits at the intersection of three intellectual traditions that the student has already encountered. From international political economy (Lessons 15–18), the lesson inherits the problem of structural power: Susan Strange's distinction between relational power (the ability to get another actor to do what you want) and structural power (the ability to shape the frameworks within which others must operate) is directly applicable to a world in which control over lithium refining or cobalt processing shapes the feasible set of industrial policies available to states that lack such capacity. From the imperialism and world-systems traditions (Lessons 10 and 17), the lesson inherits the problem of unequal exchange and enclave extraction: the historical pattern in which peripheral territories export raw materials and import manufactured goods, capturing a fraction of the value their resources generate. The energy transition threatens to reproduce this pattern with new commodities, unless deliberate institutional interventions—resource nationalism, local content requirements, regional value-chain integration—alter the terms of trade. From the study of state formation and authoritarianism, the lesson inherits rentier state theory and the resource curse literature, which explain how resource rents distort fiscal contracts, weaken accountability, and finance conflict. The task is to determine whether these mechanisms, developed largely on hydrocarbon cases, travel to critical minerals, or whether the mineral economy—with its processing bottlenecks, its technology-intensive downstream stages, and its green-finance conditionalities—generates distinct political dynamics.

The African perspective is primary in this lesson because the continent is simultaneously the most resource-endowed and the most structurally disadvantaged party in the emerging mineral order. Africa holds approximately seventy percent of global cobalt production (concentrated in the Democratic Republic of Congo), dominant shares of platinum-group metals, manganese, and copper, and significant lithium and graphite reserves. Yet African states capture a small fraction of the value added in the battery and renewable-energy supply chains that depend on these materials. The DRC-Zambia battery initiative, announced in 2022, represents an attempt to move beyond raw export toward regional value-chain upgrading; Indonesia's 2020 nickel export ban (examined in the problem pair) provides a comparator case of resource nationalism in a non-African setting; Mexico's 2022 lithium nationalization illustrates a different institutional path. African scholarship—Walter Rodney's analysis of how extraction produced "the development of underdevelopment," Kwame Nkrumah's concept of neo-colonialism, Mahmood Mamdani's work on the bifurcated state, Achille Mbembe's theorization of necropolitics and the postcolony, Siba Grovogui's critique of international legal ordering—frames these developments not as technical supply-chain problems but as continuities in the political economy of extraction. The question from within this tradition is whether resource sovereignty can be exercised without triggering the familiar repertoire of external discipline: capital flight, sanctions, WTO dispute settlement, and the reclassification of nationalization as "expropriation" under investment treaties.

The theoretical stakes extend beyond the African case. Rentier state theory, as developed by Hazem Beblawi

and Giacomo Luciani, Terry Karl, and Michael Ross, posits that states deriving a large share of revenue from external rents (rather than from domestic taxation) experience weakened accountability, distorted labor markets, and heightened authoritarian durability. The resource curse literature—Richard Auty's original formulation, the Sachs-Warner cross-country findings, Paul Collier and Anke Hoeffler's work on conflict finance—adds mechanisms linking resource dependence to civil war, corruption, and poor growth performance. But these theories carry scope conditions that are frequently ignored: they were built on oil and gas cases, where rents are large, concentrated, and easily captured by central elites. Critical minerals may differ in important respects. The value of cobalt or lithium is not in the ore but in the processing and manufacturing stages; rents are therefore distributed across a longer chain, and the political economy of mineral states may be shaped as much by downstream industrial policy as by upstream extraction. Moreover, the energy transition introduces new governance actors—green-finance institutions, ESG (environmental, social, and governance) rating agencies, battery manufacturers with long-term offtake agreements—that did not exist in the hydrocarbon era. Whether rentier theory's mechanisms apply, and with what modifications, is an empirical and theoretical question that this lesson places at the center of analysis.

The five-perspective framework—African, Chinese, Russian, Western, and UN—reveals that the same material facts generate incompatible problem definitions. From the African vantage point, the central problem is sovereignty and value-chain upgrading: how to convert geological endowment into industrialization and fiscal autonomy. From the Chinese vantage point, the problem is supply-chain security and "win-win" development: state-backed firms secure offtake, build processing capacity, and frame engagement as mutual benefit, while critics see debt-trap dynamics and enclave extraction. From the Russian vantage point, the problem is commodity leverage: energy exports as a tool of geopolitical coercion, with the mineral transition threatening to erode a core instrument of state power. From the Western vantage point, the problem is supply-chain security and "friend-shoring": reducing dependence on Chinese processing through the Inflation Reduction Act, the Minerals Security Partnership, and the EU Critical Raw Materials Act. From the UN vantage point, the problem is governance: the Extractive Industries Transparency Initiative, the Sustainable Development Goals (especially SDG 7 on affordable and clean energy), and the normative framework of responsible sourcing. Each perspective illuminates something the others occlude; none is sufficient alone. The lesson's adjudication task is to determine which perspective best explains a given case, on what evidence, and with what residual puzzles.

By the end of this lesson, the student should be able to perform five operations. First, trace causal mechanisms from geological endowment through extraction, processing, and manufacturing to political outcomes, across both hydrocarbon and mineral regimes, specifying the intermediate steps rather than asserting correlations. Second, evaluate resource nationalism strategies—export bans, nationalization, local content requirements, regional integration—using comparative evidence and identifying the conditions under which each succeeds or fails. Third, apply rentier state theory and the resource curse literature with explicit scope conditions, recognizing when mineral economies differ from hydrocarbon economies in ways that modify or invalidate standard predictions. Fourth, reconstruct all five perspectives on a given case, steel-manning each from within, and adjudicate among them on the basis of evidence rather than ideological preference. Fifth, produce a policy memo that distinguishes description, explanation, prediction, and prescription, and that specifies falsifiers—observable conditions under which the memo's central claim would be disconfirmed. These operations are assessed through the worked example (the 1973 oil embargo), the problem pair (Indonesia's nickel export ban), the data lab (critical mineral reserves, production concentration, battery supply chains), and the independent memo.

SECTION 1 — Pre-Class Priming

1.1 Retrieval Warm-Up Answer each question from memory before consulting notes. These draw on Lessons 10, 15, 16, 17, and 18.

1. In Lesson 15 (International Political Economy), Susan Strange distinguished between "relational power" and "structural power." Define each and give one example of structural power in the international financial system.
2. Lesson 17 (World-Systems Analysis) presents Immanuel Wallerstein's core-periphery-semiperiphery framework. Explain how "unequal exchange" operates between core and peripheral zones, and identify one mechanism by which peripheral states might attempt to escape peripheral status.
3. Lesson 10 (Imperialism) examines V. I. Lenin's argument about finance capital and the territorial division of the world. What is the relationship between monopoly capitalism and imperialist expansion in Lenin's account, and how does this differ from J. A. Hobson's earlier liberal critique?
4. Lesson 16 (Trade and Development) discusses the Prebisch-Singer thesis. State the thesis and explain its implication for commodity-exporting economies in the global South.
5. Lesson 18 (International Finance) covers the Triffin dilemma. Explain the dilemma and identify which state faced it, and why, under the Bretton Woods system.
6. Lesson 17 introduces David Harvey's concept of "accumulation by dispossession." Define the concept and explain how it applies to contemporary resource extraction in the global South.

1.2 Orientation Questions These questions frame the puzzles you will work through in this lesson. Do not answer them fully now; use them to guide your reading.

1. Does the energy transition reduce global resource dependency, or does it relocate dependency from hydrocarbon producers to mineral processors and battery manufacturers?
2. Under what conditions can a resource-rich state in the global South use export bans, nationalization, or local content requirements to capture value-added without triggering capital flight, sanctions, or WTO dispute settlement?
3. Is the "resource curse" a property of natural resources themselves, or of the institutional and political contexts in which they are extracted? Does the distinction between hydrocarbon rents and mineral-processing rents matter for the theory?
4. Which of the five perspectives—African resource sovereignty, Chinese state-backed supply chains, Russian commodity leverage, Western friend-shoring, or UN governance frameworks—best explains the current scramble for critical minerals, and what does each perspective fail to see?

1.3 Vocabulary Pre-Teach These terms will be used throughout the lesson. The definitions below are provisional; refined definitions will emerge in the core sections.

- **Rentier state**: A state that derives a substantial share of its revenue from external rents—typically resource exports or foreign aid—rather than from domestic taxation, with consequences for accountability and state-society relations.

- **Resource curse**: The observed tendency of resource-rich countries to experience slower growth, weaker institutions, and higher conflict risk than resource-poor countries, attributed to mechanisms including rent-seeking, Dutch disease, and enclave economies.
- **Dutch disease**: The phenomenon in which a resource boom appreciates the real exchange rate, rendering non-resource tradable sectors (manufacturing, agriculture) uncompetitive and shrinking the diversified economy.
- **Petrodollar recycling**: The process by which oil-exporting states deposit dollar earnings in Western financial institutions, which then lend to oil-importing states, creating a circular flow that financed both development and debt in the 1970s and 1980s.
- **Chokepoint**: A narrow geographic passage—such as the Strait of Hormuz, the Suez Canal, or the Strait of Malacca—through which a large share of global trade or energy flows passes, creating strategic vulnerability and military contestation.
- **Critical minerals**: Non-fuel minerals essential to modern technologies—especially clean energy, defense, and digital systems—whose supply is subject to high risk of disruption due to concentration of production or processing.
- **Rare earth elements (REEs)**: A group of seventeen metallic elements (including neodymium, dysprosium, and terbium) essential to permanent magnets, electronics, and defense systems, whose processing is heavily concentrated in China.
- **Value-chain upgrading**: The process by which a producer moves from low-value raw-material extraction to higher-value processing, manufacturing, or service activities within a global production network.
- **Friend-shoring**: The practice of relocating supply chains to countries that are geopolitical allies or partners, prioritizing security and political alignment over pure cost efficiency.
- **Green extractivism**: The expansion of mining and extraction justified by the needs of the energy transition, which may reproduce the social and environmental harms of conventional extractivism under a sustainability framing.
- **Offtake agreement**: A long-term contract in which a buyer commits to purchasing a specified quantity of a commodity from a producer, often used to finance mining or processing projects.
- **Local content requirement**: A policy mandating that a specified share of inputs, labor, or services in an extractive or industrial project be sourced domestically, intended to capture value-added and build industrial capacity.

SECTION 2 — LESSON CORE

SECTION 2.1 Learning objectives

By the end of this lesson, students will be able to: (1) explain the causal mechanism through which a hydrocarbon supply interruption is converted into political leverage, using the 1973 embargo as the paradigmatic case rather than as a mere historical episode; (2) analyze petrodollar recycling and maritime chokepoints as

structural features that extend producer power beyond the point of extraction and into finance, shipping, and macroeconomic adjustment; (3) evaluate the scope conditions under which an "oil weapon" succeeds or fails, including spare capacity, import dependence, producer cohesion, consumer stockpiling, and the availability of alternative suppliers; (4) reconstruct African, Chinese, Russian, Western, and United Nations interpretations of hydrocarbon geopolitics as internally coherent arguments, identifying what each reveals and what each occludes; and (5) apply these mechanisms to a new case by distinguishing descriptive claims about supply chains from explanatory claims about power, predictive claims about vulnerability, and prescriptive claims about policy. Mastery will be demonstrated through mechanism-focused short answers, perspective-reconstruction paragraphs, and case-based adjudication that explicitly states falsifiers. Students should also be able to identify the difference between a temporary price shock and a durable restructuring of global political economy, and to specify the observable implications that would confirm or disconfirm each. The lesson assumes familiarity with interdependence theory, world-systems analysis, and the imperial genealogy of resource extraction, but it does not require prior mastery of energy economics.

2.2 KEY IDEA 1 — Hydrocarbon geopolitics: the "oil weapon" (1973), petrodollar recycling, chokepoints

Bolded Causal Claim: Hydrocarbon geopolitics is a form of structural power in which control over a fungible but geographically concentrated and infrastructurally bottlenecked commodity converts geological endowment into coercive leverage, macroeconomic disruption, and financial dependence; the 1973 embargo demonstrated that producers could weaponize not merely scarcity but the importer's embeddedness in a supply, shipping, and credit architecture that could not be reconfigured quickly.

Mechanism: The mechanism has four linked stages. First, supply restriction: a producer coalition reduces output or imposes an embargo, exploiting the short-run inelasticity of oil demand and the absence of immediate substitutes. Yergin's account of the 1973 crisis emphasizes that the shock was not only a price event but a reordering of expectations about who controlled the "commanding heights" of the industrial economy. Second, price transmission: because oil is priced in dollars and embedded in transport, agriculture, petrochemicals, and military logistics, a price increase propagates through cost structures faster than demand can adjust. Third, financial recycling: export revenues are not simply hoarded; they are deposited in international banks, invested in sovereign debt, or recycled through arms purchases and development finance, creating a credit circuit in which importers and third-world borrowers become dependent on producer-state liquidity. Spiro's study of petrodollar recycling argues that this circuit helped sustain US hegemony by channeling OPEC surpluses into dollar-denominated assets and Western financial markets. Fourth, chokepoint coercion: even where production is diversified, maritime passages such as Hormuz, Bab el-Mandeb, Suez, and Malacca concentrate flows; a threat to any one node raises insurance premiums, reroutes tankers, and imposes costs that can exceed the physical loss of supply. Klare's work on resource competition treats these passages as strategic terrain where geography and naval power intersect. The mechanism therefore operates through a chain—geology → extraction → shipping → pricing → finance → macroeconomic adjustment—not through any single lever.

Scope Conditions: The oil weapon is conditionally effective. It works best when (a) importers have high and inflexible demand; (b) spare capacity is concentrated in the restricting coalition; (c) alternative suppliers cannot scale quickly; (d) storage and strategic reserves are inadequate; (e) producer states can maintain cohesion despite divergent fiscal needs; and (f) financial markets amplify rather than absorb the shock. It weakens when consumers diversify sources, build reserves, improve efficiency, develop substitutes, or co-

ordinate demand restraint, as the International Energy Agency's emergency framework was designed to do after 1973. It also weakens when producers need revenue more than importers need a particular barrel, a condition that has repeatedly undermined OPEC discipline. The 1973 case is therefore not proof that oil always confers durable power; it is proof that power is greatest during transition periods, before infrastructure, habits, and institutions adapt. Conversely, the mechanism can fail even with high prices if the producer lacks refining capacity, shipping control, or financial autonomy, or if the importer can substitute coal, gas, nuclear, or, in later periods, renewables and electrification. Scope conditions thus include not only market structure but also the producer's position in the value chain: crude exporters without downstream control may capture rent while remaining dependent on foreign refining, insurance, and banking.

Observable Implications: If the mechanism is operating, one should observe sharp price discontinuities following supply announcements; inflation and current-account deterioration in importers; emergency conservation measures; military deployments or naval escorts in producing regions and chokepoints; expansion of strategic petroleum reserves; long-term contracts and bilateral supply agreements; and financial flows from producer surpluses into Western or offshore banking centers. One should also observe a lag between the shock and structural adjustment: efficiency standards, alternative fuels, and new suppliers typically respond with a delay of several years, creating a window in which producer leverage is high. In the 1973 case, the embargo contributed to stagflation, accelerated energy-security institutions, and prompted both conservation and a search for non-OPEC supply. Observable implications must be distinguished from mere correlation: a price spike can reflect war, speculation, or infrastructure failure rather than a deliberate weapon. A useful test is whether the price movement is accompanied by explicit political demands, selective supply cuts, and diplomatic signaling. Another test is whether importers alter foreign policy or military posture in ways that track energy dependence rather than alliance logic alone.

Perspective Note (five traditions in brief): African (primary): From an African vantage point, the 1973 oil weapon is not simply a story of Arab producers coercing Western consumers; it is a chapter in a longer history in which hydrocarbons have been extracted from the global South under conditions that rarely permitted sovereign control over pricing, refining, or finance. African oil producers such as Nigeria, Angola, and Libya entered the postcolonial era with formal sovereignty but limited infrastructural sovereignty: concessions, shipping, insurance, and credit remained dominated by foreign firms and metropolitan banks. Petrodollar recycling therefore appears not as a neutral market process but as a mechanism that converted Southern resources into Northern liquidity, while many producing states became rentier enclaves with weak fiscal accountability. African scholarship on the postcolonial state—Bayart's analysis of extraversion, Mamdani's critique of the bifurcated state, and Grovogui's insistence that African sovereignty has been systematically denied in international law—suggests that the oil weapon's apparent success for some producers should not be generalized into a model of resource empowerment. For much of Africa, hydrocarbon geopolitics meant vulnerability to price volatility, enclave development, and external military intervention, rather than durable leverage. The African perspective thus reframes the 1973 shock as a demonstration of what concentrated producers could do, while asking why similar geological endowments elsewhere did not produce comparable bargaining power. It also foregrounds chokepoints around the continent—such as routes through the Gulf of Guinea and the Cape of Good Hope—not as abstract strategic nodes but as spaces where African security, revenue, and sovereignty are negotiated by external navies and corporations.

Chinese: Chinese analyses tend to treat hydrocarbon geopolitics as a problem of import dependence and strategic vulnerability. China's rapid industrialization made it a major importer, and the 1973 precedent is read as a warning that concentrated supply and maritime chokepoints can be weaponized. The response has been to build strategic petroleum reserves, diversify suppliers across the Middle East, Africa, Russia, and the

Americas, invest in overseas equity oil, and expand naval capabilities to protect sea lines of communication. The Chinese perspective emphasizes state capacity and long-term planning rather than market spontaneity, and it often frames energy security as a legitimate development imperative. It can, however, occlude the ways in which Chinese demand and state-backed finance reshape producer-state politics, and it may understate the environmental and governance costs of securing supply.

Russian: Russian perspectives draw on the Soviet and post-Soviet experience of hydrocarbons as both revenue base and geopolitical instrument. Energy exports have been used to sustain state power, subsidize domestic constituencies, and exert leverage over neighboring consumers, particularly through pipeline networks. The 1973 shock is interpreted as evidence that commodity markets are inseparable from political power, and that a resource-rich state can convert export dependence into bargaining strength. This view stresses commodity-state resilience and the limits of consumer sanctions. Its occlusion lies in minimizing the long-term costs of over-reliance on hydrocarbon rents, including technological stagnation, fiscal volatility, and the erosion of non-resource sectors, as well as the vulnerability created when importers diversify.

Western: Western perspectives, especially in the United States and Europe, have historically combined market-liberal and security framings. The 1973 embargo is remembered as a demonstration that supply concentration threatens industrial economies, prompting strategic petroleum reserves, IEA coordination, and naval protection of Gulf shipping. The dominant prescription has been diversification, efficiency, and market integration rather than state control of production. This perspective contributes a sophisticated understanding of consumer-side adaptation and institutional cooperation. It tends to occlude the imperial and coercive dimensions of Western energy security, including support for authoritarian producers and military interventions justified by supply protection, and it can treat producer grievances as market distortions rather than political claims.

UN: The United Nations perspective approaches hydrocarbon geopolitics through governance, development, and sustainability frameworks. It emphasizes energy access, price stability, transparency initiatives such as the Extractive Industries Transparency Initiative, and the need to align resource extraction with the Sustainable Development Goals. From this vantage, the 1973 shock illustrates how unmanaged commodity volatility harms development, especially in import-dependent poor countries. The UN framing contributes multilateral norms and a focus on vulnerable consumers. It can occlude hard power realities, because its instruments rely on voluntary compliance and lack enforcement capacity; it may also treat resource politics as a technical governance problem rather than a contest over sovereignty and structural power.

SECTION 2.3 KEY IDEA 2 — Energy transition as geopolitical restructuring: critical minerals, rare earths, new material basis of power

Bolded Causal Claim: The energy transition does not simply replace one fuel with another; it restructures the material basis of power by shifting strategic dependence from hydrocarbon reserves and chokepoints to critical minerals, processing capacity, and clean-technology manufacturing, thereby creating new hierarchies of vulnerability and leverage that are not captured by traditional oil geopolitics.

Mechanism: The mechanism begins with the physical composition of low-carbon technologies. Solar photovoltaic systems, wind turbines, electric vehicles, batteries, and expanded electricity grids require far larger quantities of copper, aluminum, lithium, cobalt, nickel, manganese, graphite, and rare earth elements than comparable fossil-fuel systems. The IEA Critical Minerals Outlook (2024) frames this as a structural de-

mand shift: clean energy transitions increase demand for a set of minerals whose supply chains are more concentrated and less elastic than oil markets in the short run. This is not merely a price effect. It changes the "material basis" of power because military, industrial, and infrastructural capacity becomes tied to access to specific elements and to the industrial processes that refine them. Yergin's (1991, 2011) analyses of energy security emphasize that power in energy systems derives not only from possession of resources but from control over transportation, refining, and market institutions; the transition extends this logic to minerals and to battery and magnet manufacturing. The critical distinction is between geological endowment and industrial capability. Many minerals are mined in the Global South—cobalt in the Democratic Republic of Congo, lithium in Chile, Argentina, and Australia, nickel in Indonesia and the Philippines—while refining, precursor production, and component manufacturing are heavily concentrated in China. Thus the transition can reproduce a division of labor in which extraction remains in peripheral economies while value capture and technological leverage remain in core or semi-core industrial states. Sanderson (2022) on battery supply chains underscores that the strategic bottleneck is often not the mine but the midstream: refining, cathode and anode production, and cell manufacturing. A state can possess reserves without possessing leverage if it lacks processing capacity, infrastructure, finance, and technology. Conversely, a state with limited reserves but dominant refining capacity can exercise "bottleneck power" by controlling the transformation of raw materials into industrially usable inputs. This creates new chokepoints: not only maritime straits such as Hormuz or Malacca, but export licensing regimes, processing monopolies, technology standards, and offtake agreements. The mechanism is reinforced by path dependence. Battery chemistries, magnet designs, and grid technologies lock in demand profiles for specific minerals; substitution and recycling develop slowly because of engineering constraints, capital sunk in existing plants, and quality requirements. Policy then amplifies the structure: the United States Inflation Reduction Act, the European Union Critical Raw Materials Act, Japanese and Korean industrial strategies, and Chinese state-backed offtake and processing investments all treat mineral access as a security issue. The result is a geopolitical restructuring in which energy security is no longer primarily about oil flows but about mineral supply chains, technology ecosystems, and the governance of extraction.

Scope Conditions: The claim holds under several conditions. First, the transition must proceed at a pace that sustains high mineral demand; if decarbonization stalls, fossil-fuel geopolitics remains dominant. Second, processing concentration must remain high; if refining diversifies rapidly through investment in Africa, Latin America, or advanced economies, bottleneck power weakens. Third, substitution and recycling must remain limited in the relevant time horizon; breakthroughs in sodium-ion batteries, reduced cobalt chemistries, or large-scale recycling could reduce dependence on specific minerals. Fourth, "criticality" is partly a policy construct: governments define critical minerals differently, and lists change with technology and threat perception. Fifth, market responses matter; high prices can induce new supply, but mining projects face long lead times, permitting constraints, and social opposition. Sixth, leverage is constrained by the need of producer and processor states to maintain revenue and by the possibility of countermeasures, including stockpiling, alternative suppliers, and technological adaptation. The claim should therefore be treated as a structural tendency, not a deterministic law: it identifies a new arena of vulnerability and competition, not an automatic transfer of power to mineral-rich states.

Observable Implications: If the mechanism operates, one should observe mineral price volatility and boom-bust cycles, as seen in lithium markets in the early 2020s; export controls and licensing restrictions, such as China's 2023 controls on gallium, germanium, and graphite; strategic stockpiling and long-term offtake agreements; industrial policies aimed at domestic processing, such as Indonesia's nickel strategy or the DRC-Zambia battery initiative; "friend-shoring" and de-risking initiatives by the United States and European

Union; new diplomatic alignments around mineral supply chains; and heightened attention to environmental and social governance in mining regions. One should also observe a gap between reserve ownership and value capture: states with large reserves may remain fiscally dependent on unprocessed exports while processing states capture higher margins. Finally, one should observe contestation over the meaning of "green" transition, as communities in mining regions challenge the environmental costs of mineral extraction.

Perspective Note (five traditions in brief):

African (primary): The African perspective, reconstructed from within through scholars such as Rodney, Nkrumah, Cabral, Fanon, Mamdani, Bayart, Mbembe, Grovogui, Tamale, and Oyěwùmí, treats the energy transition as a possible repetition of extractive colonialism unless African states convert mineral endowments into industrial capacity. It emphasizes resource sovereignty, value-chain upgrading, regional integration through the African Continental Free Trade Area, and the historical pattern by which raw-material exports subsidized industrialization elsewhere. From this vantage, critical minerals are not merely inputs for Northern decarbonization; they are potential foundations for African industrialization, employment, and technological learning. The perspective contributes a historically grounded critique of "green extractivism" and insists that transition justice requires local processing, community consent, and equitable benefit-sharing. It can occlude, however, the scale of capital, technology, and infrastructure required for downstream industries, as well as the risk that protectionist mineral policies may isolate African producers from global markets if not coordinated regionally.

Chinese: The Chinese perspective emphasizes state-backed supply-chain security, long-term offtake, infrastructure investment, and "win-win" cooperation. It treats mineral access as a strategic and developmental priority and contributes industrial capacity, finance, and market access. It can occlude concerns about labor standards, environmental harm, debt, and asymmetric bargaining power in host countries.

Russian: The Russian perspective approaches minerals through the lens of commodity power, sanctions resilience, and great-power competition. It contributes an understanding of how resource states use supply leverage and pivot markets under pressure. It can occlude governance, diversification, and the developmental needs of producing regions.

Western: The Western perspective emphasizes supply-chain security, diversification, friend-shoring, and market-based efficiency. It contributes investment, technology, and regulatory standards such as ESG frameworks. It can occlude historical responsibility for extractive structures and the developmental aspirations of mineral-producing states.

UN: The UN perspective emphasizes resource governance, transparency, the Extractive Industries Transparency Initiative, and alignment with the Sustainable Development Goals. It contributes multilateral norms and a focus on vulnerable consumers and producers. It can occlude hard power realities and the sovereignty claims of resource states, because its instruments often rely on voluntary compliance.

SECTION 2.4 KEY IDEA 3 — Resource nationalism: DRC-Zambia battery initiative, Indonesia nickel export ban, Mexico lithium nationalization

Bolded Causal Claim: Resource nationalism can convert mineral endowments into developmental leverage when states use sovereignty over extraction to force downstream industrialization, but it becomes rent-seeking or self-defeating when governments lack the capacity to manage investment, infrastructure, and market access.

Mechanism: Resource nationalism is a set of state strategies—nationalization, export restrictions, local-content requirements, tax and royalty renegotiation, and state-owned enterprise creation—through which governments seek to increase control over natural resources and capture a larger share of their value. Its mechanism is bargaining leverage derived from the inelasticity of demand for specific minerals and the sunk costs of extractive investment. Once firms have invested in mines, infrastructure, and relationships, states can renegotiate terms or impose conditions with less fear of immediate exit. The developmental variant of resource nationalism goes beyond rent capture: it uses control over raw materials to compel or incentivize processing, manufacturing, and technology transfer within national or regional borders. The DRC-Zambia battery initiative illustrates this ambition: by linking cobalt and copper endowments to a regional battery and electric-vehicle value chain, the two states seek to move from exporting unprocessed minerals to producing precursor materials and, eventually, higher-value components. The mechanism depends on regional integration, because neither state alone may possess the market size, infrastructure, or skills required for full industrialization. Indonesia's 2020 ban on exports of unprocessed nickel ore is a more coercive variant. By prohibiting raw ore exports, Indonesia forced investors to build domestic smelters and processing facilities; the policy attracted substantial investment in nickel processing and positioned Indonesia as a major player in stainless steel and battery-material supply chains. However, the same policy generated a World Trade Organization dispute with the European Union, which argued that the ban violated trade rules, and it raised concerns about environmental degradation and market distortion. Mexico's lithium nationalization, enacted through a 2022 reform that declared lithium a strategic mineral and created a state company, Litio para México, represents a sovereignty-first approach. Its mechanism is legal exclusion of private control over a mineral deemed strategic, but its developmental payoff remains uncertain because Mexico's lithium deposits are largely in clay formations that are technically difficult and costly to extract, and because state capacity, technology, and capital must still be assembled. The broader mechanism can be situated in theoretical debates. Dependency theory, associated with Prebisch and Cardoso and Faletto, argues that peripheral economies remain underdeveloped when they export raw materials and import manufactured goods; resource nationalism is one strategy to break this pattern. Developmental-state theory, associated with Johnson, Amsden, and Wade, suggests that industrial upgrading requires disciplined state intervention, not merely ownership. Rentier-state theory, associated with Karl and Ross, warns that resource wealth can weaken accountability and diversification by allowing governments to fund themselves through rents rather than taxation. Resource nationalism therefore sits at the intersection of these traditions: it can be a developmental project or a rentier project, depending on whether revenues are converted into productive capacity and accountable institutions.

Scope Conditions: The developmental success of resource nationalism is conditional. First, the state must possess sufficient administrative and technical capacity to regulate complex extractive and processing industries. Second, infrastructure—power, transport, water, and industrial zones—must be available or financeable. Third, the targeted mineral must have inelastic demand and limited short-run substitutes; otherwise buyers can simply source elsewhere. Fourth, the policy must be credible and predictable enough to attract long-term investment, even if it is coercive. Fifth, regional or global market access must be preserved; export bans that violate trade agreements can provoke retaliation or legal defeat, as in the Indonesia-EU dispute. Sixth, commodity price cycles matter: high prices make downstream investment attractive, while price collapses can strand assets. Seventh, governance quality matters; without transparency and accountability, resource nationalism may benefit elites rather than populations. Eighth, environmental and social costs can undermine legitimacy and create conflict. The claim should not be read as endorsing all resource nationalism; it identifies a conditional pathway whose outcomes vary with state capacity and market structure.

Observable Implications: If resource nationalism functions as developmental leverage, one should observe

growth in domestic processing capacity, new smelters and refineries, industrial clusters, technology-transfer agreements, and rising fiscal revenues tied to value-added exports. One should also observe regional initiatives, such as the DRC-Zambia battery effort, that pool resources and markets. If it functions as rent-seeking or self-defeating, one should observe capital flight, arbitration claims, WTO disputes, stalled projects, continued dependence on raw exports, and elite capture. In Indonesia, the observable implication is a rapid expansion of nickel processing alongside international legal conflict. In Mexico, the implication is a gap between sovereign assertion and technical feasibility. At the systemic level, one should observe a diffusion of export restrictions and local-content rules, as well as countermeasures by consumer states seeking to diversify supply. One should also observe contestation over whether such policies are legitimate development strategies or protectionist violations of trade norms.

Perspective Note (five traditions in brief):

African (primary): The African perspective treats resource nationalism as a historically justified response to colonial extraction and unequal exchange. Drawing on Rodney's analysis of underdevelopment, Nkrumah's critique of neo-colonialism, and later African scholarship on sovereignty and development, it argues that African states have both the right and the necessity to control mineral wealth and to demand value-chain upgrading. The DRC-Zambia battery initiative exemplifies an African-led attempt to convert cobalt and copper endowments into regional industrial capacity rather than enclave extraction. The perspective contributes a claim of historical justice and a developmental ambition rooted in sovereignty. It can occlude, however, the risks of state capture, the need for regional coordination, and the possibility that unilateral restrictions may reduce investment or market access if not matched by capacity and infrastructure.

Chinese: The Chinese perspective generally supports state-led resource development and non-interference, emphasizing infrastructure, offtake, and mutual benefit. It contributes capital and market access for resource-nationalist projects. It can occlude governance concerns and the potential for asymmetric dependence.

Russian: The Russian perspective views resource nationalism through the lens of commodity sovereignty and state power, often treating energy and mineral control as instruments of geopolitical leverage. It contributes an understanding of how resource states resist external pressure. It can occlude development, diversification, and accountability.

Western: The Western perspective often treats resource nationalism as a risk to investment, supply security, and trade rules. It contributes legal frameworks, capital, and technology. It can occlude historical extraction and the developmental claims of producing states.

UN: The UN perspective emphasizes governance, transparency, and sustainable development, including initiatives such as the Extractive Industries Transparency Initiative. It contributes norms for accountable resource management. It can occlude hard power and sovereignty claims, because its mechanisms rely on voluntary participation and lack enforcement.

2.5 KEY IDEA 4 — Rentier State Theory and the "Resource Curse": Mechanisms Linking Resources to Authoritarianism and Conflict

Bolded Causal Claim: States that derive a large share of government revenue from externally generated resource rents tend, under identifiable institutional and geopolitical conditions, to develop fiscal structures, political coalitions, and security practices that weaken accountability, impede economic diversification, and

can convert resource wealth into authoritarian durability or violent conflict.

Mechanism: Rentier state theory begins with a fiscal observation: when a state receives substantial revenue from the sale of oil, gas, or minerals to external buyers, it need not extract comparable revenue from its own citizens through taxation. Karl (1997) frames this as the "paradox of plenty": abundance can undermine rather than secure development. The mechanism runs through several channels. First, the taxation-accountability channel: where citizens are not heavily taxed, the fiscal contract between state and society weakens, reducing the leverage through which citizens demand representation, transparency, and public goods. The state becomes an allocator of rents rather than a negotiator with taxpayers. Second, the spending and patronage channel: resource booms expand public expenditure, often through off-budget or opaque mechanisms, creating constituencies dependent on state distribution rather than productive employment. Third, the Dutch disease channel: large resource exports can appreciate the real exchange rate, raising the relative cost of non-resource tradables and shrinking manufacturing and agriculture, thereby deepening enclave economies and import dependence. Fourth, the sectoral and labor channel: extractive industries are typically capital-intensive and employ relatively few workers, weakening broad-based labor movements and civil-society organizations that might otherwise press for accountability. Fifth, the conflict channel: lootable, high-value resources can finance armed groups, reward predation, and intensify grievances over territorial control, revenue distribution, and environmental damage. Ross (2012) synthesizes these mechanisms by distinguishing taxation effects, spending effects, and group-formation effects, while emphasizing that the "curse" is not an automatic consequence of geology but a politically mediated outcome. Resource wealth can fund repression as well as development; it can stabilize incumbents by financing patronage networks and coercive capacity; and it can make states less dependent on societal consent. The mechanism is therefore not "resources cause authoritarianism" in a simple sense, but "resource rents alter the incentives, coalitions, and fiscal bargains that shape regime type and conflict risk."

Scope Conditions: The resource curse operates most strongly under a specific configuration of conditions rather than universally. Resource type matters: point-source, high-value, easily captured resources such as oil, gas, diamonds, and certain minerals are more strongly associated with rentier dynamics than diffuse agricultural commodities. Degree of dependence matters: the effect is strongest where resource rents dominate government revenue and exports, not where resources are one sector among many. Institutional quality matters: states with robust checks and balances, transparent budgeting, independent legislatures, and effective tax administration are better able to convert rents into public goods. Regime type matters: authoritarian incumbents may use rents to consolidate power, while democracies may face different, though still serious, risks of volatility and capture. Timing matters: resources discovered before institutional development may produce "premature" rentier effects, whereas resources developed after state capacity is established may be easier to govern. Geographic concentration matters for conflict: resources located in peripheral, ethnically distinct, or weakly governed regions can become focal points for separatism or rebel financing. Global price cycles matter: booms expand rents and patronage; busts expose fiscal fragility, debt, and austerity. Mitigating conditions include sovereign wealth funds, local-content requirements, diversification strategies, transparency initiatives, and regional integration, but these are political instruments whose effectiveness depends on enforcement and elite commitment. The curse is therefore best understood as a conditional syndrome, not a law of nature.

Observable Implications: If rentier mechanisms are operating, one should observe a cluster of fiscal, economic, political, and conflict indicators. Fiscally, resource-dependent states often display low tax effort relative to GDP, high non-tax revenue, volatile budgets, and large off-budget or sovereign-wealth arrangements. Economically, one may observe real exchange-rate appreciation, declining manufacturing or agricultural

competitiveness, import dependence, and enclave production with weak backward linkages. Politically, one may observe durable incumbent regimes, high spending on patronage and security, weak party systems, constrained legislatures, and elevated corruption risk. Socially, one may observe inequality between resource-producing and non-producing regions, limited employment generation from extraction, and grievances over environmental damage. In conflict settings, one may observe resource predation by armed actors, militarization of extraction zones, and disputes over revenue sharing. Conversely, where institutions are strong, one may observe high public investment, diversified economies, accountable budgeting, and peaceful resource governance. These implications are probabilistic and must be assessed in combination; no single indicator proves a curse, and resource wealth can coexist with development where political bargains and institutions channel rents productively.

Perspective Note (five traditions in brief):

African (primary): The African perspective reconstructs resource wealth as a terrain of historical and political struggle rather than a geological destiny. Drawing on African scholarship and political thought, it emphasizes that colonial economies were organized as extractive enclaves, that postcolonial states inherited weak fiscal and institutional structures, and that global commodity markets have often rewarded raw export over beneficiation. From this vantage, the "resource curse" is partly produced by external structures of unequal exchange and partly by domestic elite bargains that capture rents. African analysis stresses that the absence of taxation is not merely a fiscal fact but a political relationship: when states live on rents, citizens lose leverage, and accountability must be rebuilt through redistribution, local content, community consent, and regional integration. It contributes a historically grounded critique of enclave development and a demand for value-chain upgrading. It can occlude cases where resource wealth has supported developmental states, and it risks overemphasizing external causation if it understates domestic agency and variation.

Chinese: The Chinese perspective tends to treat resource rents as a development opportunity managed through state capacity, long-term planning, and infrastructure-led growth. It contributes an emphasis on state-led development, non-interference, and the use of resource partnerships to build productive capacity. It can occlude governance deficits, debt vulnerability, and the distributional consequences of rent capture.

Russian: The Russian perspective treats resource rents as a foundation of state power and geopolitical leverage. It contributes a realist understanding of commodity states and the strategic use of energy and minerals. It can occlude diversification, accountability, and the long-term costs of rent dependence.

Western: The Western perspective often frames the resource curse through market failure, institutional weakness, and governance deficits. It contributes legal frameworks, capital, technology, and transparency initiatives. It can occlude historical extraction, structural inequality, and the developmental claims of producing states.

UN: The UN perspective emphasizes governance, transparency, sustainable development, and human rights in resource sectors. It contributes norms such as the Extractive Industries Transparency Initiative and the Sustainable Development Goals. It can occlude hard power, sovereignty claims, and enforcement gaps, because many mechanisms remain voluntary.

2.6 KEY IDEA 5 — Scramble for Critical Minerals: US (IRA, MSP), EU (CRMA), China (State-Backed Offtake)

Bolded Causal Claim: The energy transition has transformed lithium, cobalt, nickel, graphite, rare earth elements, and related minerals into strategic assets, prompting major powers to use industrial policy, alliance-

building, export controls, and state-backed finance to secure supply chains, thereby restructuring global production networks and creating new dependencies, bargaining opportunities, and geopolitical competition.

Mechanism: The mechanism begins with a material shift: decarbonization requires large quantities of minerals for batteries, electric vehicles, renewable energy systems, grid infrastructure, and defense technologies. Demand growth is not merely quantitative; it is structurally concentrated in technologies with high mineral intensity and limited short-term substitutability. Supply, however, is geographically concentrated in mining and even more concentrated in processing and refining. China's dominant role in rare earth processing, cobalt refining, and other midstream stages creates chokepoints that can be leveraged through export controls, licensing, or market power. The policy response has been a competitive restructuring of supply chains. The United States has used the Inflation Reduction Act to subsidize clean-energy production and to condition electric-vehicle tax credits on mineral sourcing from the United States or free-trade-agreement partners, thereby incentivizing "friend-shoring." It has also launched the Mineral Security Partnership to coordinate finance, standards, and project development among allied states. The European Union has adopted critical raw materials legislation aimed at increasing domestic extraction, processing, recycling, and strategic partnerships while reducing excessive dependence on single suppliers. China, meanwhile, has used state-backed firms, policy banks, long-term offtake agreements, infrastructure finance, and industrial planning to secure upstream supply and consolidate midstream dominance; it has also imposed export controls on minerals such as gallium and germanium, demonstrating that processing dominance can be converted into coercive leverage. The mechanism is therefore not simply a race to own mines. It is a multi-stage competition over extraction, refining, component manufacturing, standards, finance, and market access. Policy signals alter investment expectations; investment alters production geography; production geography alters bargaining power; and bargaining power feeds back into alliance structures and trade rules. Sanderson (2022) documents the battery supply chain as a site of corporate and geopolitical competition, while the IEA Critical Minerals Outlook (2024) highlights the gap between projected demand and the investment, permitting, and diversification needed to meet it. The result is a new geoeconomic arena in which climate policy, industrial policy, and security policy are increasingly fused.

Scope Conditions: The scramble applies most intensely to minerals that are essential, difficult to substitute in the near term, and concentrated in supply or processing. It is weaker for minerals with abundant reserves, mature recycling, or rapid technological substitution. The effectiveness of US, EU, or Chinese strategies depends on state capacity, financing, permitting timelines, environmental and social licensing, and the willingness of producer states to host extraction and processing. It also depends on price cycles: high prices stimulate investment and new projects, while price collapses can strand assets and undermine diversification plans. Producer-country politics matter: export bans, local-content rules, tax changes, and community resistance can alter supply regardless of consumer-country policy. Alliance structures matter: "friend-shoring" can redirect investment but may raise costs and exclude non-aligned producers. Environmental, social, and governance standards can improve accountability but may also function as non-tariff barriers. The scramble is therefore not a uniform global process; it is mediated by mineral type, market structure, domestic institutions, and the bargaining power of producing states.

Observable Implications: If the critical-minerals scramble is reshaping global political economy, one should observe several developments. Policy documents and legislation should explicitly link mineral security to climate and defense goals, as in US, EU, and allied initiatives. Investment flows should shift toward "friendly" or strategically aligned producer states, including in Africa and Latin America. Offtake agreements should proliferate, tying future production to specific buyers or industrial policies. Export restrictions and local-processing requirements should increase, as producer states seek value-chain upgrading. Process-

ing capacity should begin to diversify, though slowly, because refining investments are capital-intensive and technically demanding. Price volatility should accompany demand surges and policy shocks. New institutions and dialogues should emerge around critical minerals, recycling, and standards. One should also observe tensions: WTO disputes over export bans, conflicts over land and water in mining regions, and debates over whether "green" supply chains reproduce extractive patterns. The observable pattern is not merely more mining, but a reorganization of the stages of production and the political alliances that sustain them.

Perspective Note (five traditions in brief):

African (primary): The African perspective sees the critical-minerals scramble as both an opportunity and a danger. It emphasizes that Africa holds significant shares of cobalt, copper, lithium, manganese, and other minerals essential to the energy transition, yet has historically captured little value from extraction. From this vantage, the scramble can support sovereignty and development if it is governed through beneficiation, local content, regional value chains under the African Continental Free Trade Area, fair contracts, community consent, and technology transfer. It also warns of "green extractivism": new demand may reproduce old patterns of enclave production, environmental harm, and external control if producer states remain price-takers in raw materials. African scholarship and policy discourse therefore stress not only attracting investment but changing the terms of participation, including processing, skills, infrastructure, and regional bargaining power. The perspective contributes a demand for value-chain upgrading and a critique of supply-chain security frameworks that treat African minerals as inputs to external industrial strategies. It can occlude cases where foreign investment has expanded fiscal capacity and infrastructure, and it must be tested against the institutional capacity of states to enforce local-content and environmental rules.

Chinese: The Chinese perspective frames critical-minerals engagement as mutually beneficial development through state-backed finance, infrastructure, long-term offtake, and non-interference. It contributes capital, construction capacity, and market access. It can occlude governance risks, debt sustainability, environmental impacts, and the concentration of processing power in Chinese firms.

Russian: The Russian perspective treats mineral and energy wealth as instruments of state power and multipolar leverage. It contributes a realist emphasis on commodity control and strategic autonomy. It can occlude diversification, accountability, and the long-term costs of overdependence on extractive rents.

Western: The Western perspective emphasizes supply-chain security, friend-shoring, market rules, and environmental, social, and governance standards. It contributes capital, technology, and institutional frameworks. It can occlude historical extraction, structural inequality, and the developmental claims of producing states.

UN: The UN perspective emphasizes sustainable development, resource governance, transparency, and the Sustainable Development Goals, including affordable and clean energy. It contributes norms and multistakeholder initiatives such as the Extractive Industries Transparency Initiative. It can occlude hard power, enforcement gaps, and the geopolitical competition that increasingly shapes mineral supply chains.

2.7 FIVE PERSPECTIVES IN DEPTH

The five perspectives below reconstruct the lesson's central topic—energy, critical minerals, and resource geopolitics as a whole—through distinct theoretical traditions, each with its own mechanisms, contributions, and occlusions. They are not summaries of national foreign policies but analytical vantage points that shape how the problem is defined, what evidence counts, and what solutions appear plausible.

2.7.1 African Perspective (PRIMARY) The African vantage point on energy, critical minerals, and resource geopolitics begins from a historical experience that the other four perspectives treat as background: the continent has been the site of successive waves of externally driven resource extraction—colonial, post-colonial, and now "green"—in which the terms of trade, the technology, and the capital have consistently been controlled by actors outside the continent. This is not merely a grievance; it is an analytical framework. From Rodney's *How Europe Underdeveloped Africa* (1972) through Nkrumah's *Neo-Colonialism: The Last Stage of Imperialism* (1965) to contemporary scholars such as Aning and Danso, the African perspective insists that resource geopolitics cannot be understood as a neutral market process or a security competition among great powers. It must be understood as a continuation of structured inequality in which African states occupy a subordinate position in global value chains, and in which the "resource curse" is not an African pathology but a relational outcome of how extraction is organized.

The theoretical lineage runs through several traditions. Nkrumah's concept of neo-colonialism argued that formal political independence did not end economic subordination; rather, control shifted from direct colonial administration to multinational corporations, financial institutions, and commodity markets. Cabral, in *Return to the Source* (1973), added that liberation required not only political independence but cultural and economic reconstruction, including control over the means of production. Nyerere's Arusha Declaration (1967) and the concept of *ujamaa* (familyhood) grounded resource sovereignty in self-reliance and collective ownership, rejecting the premise that African development required integration into Western-dominated markets on Western terms. Fanon, in *The Wretched of the Earth* (1961), warned that national bourgeoisies would inherit colonial structures and reproduce extraction under new flags, a warning that resonates with contemporary critiques of African elites who broker mineral deals without value addition.

Rodney's contribution was to show that underdevelopment was not a stage but a process: Europe's development and Africa's underdevelopment were two sides of the same coin, linked by the extraction of surplus. This framework has been extended by Bayart's analysis of the "politics of the belly" (*La Politique du Ventre*, 1989), which examines how African states are embedded in transnational networks of extraction and patronage, and by Mbembe's *On the Postcolony* (2001), which theorizes the specific forms of power and violence that characterize resource-dependent states. Mamdani's *Citizen and Subject* (1996) provides the institutional backdrop: the bifurcated state, with its dual legal systems, created the conditions for authoritarian resource governance by concentrating power in executive hands and marginalizing rural populations.

Grovogui's *Sovereigns, Quasi Sovereigns, and Africans* (1996) is particularly relevant to resource geopolitics. Grovogui argues that African sovereignty has been systematically denied or qualified by international law and institutions, and that the discourse of "failed states" and "resource curse" functions to justify external intervention and continued extraction. From this perspective, the very category of "resource curse" is suspect: it pathologizes African states while obscuring the structural conditions—unequal exchange, technology dependence, and coercive bargaining—that produce poor outcomes. The curse, on this reading, is not in the resource but in the terms of its incorporation into the global economy. This is a direct challenge to the Western and UN perspectives, which often treat the resource curse as an endogenous governance failure amenable to technical fixes.

Oyěwùmí's *The Invention of Women* (1997) adds a gendered dimension that is often missing from resource geopolitics. She argues that colonial categories, including those of "development" and "resource management," were imposed through gendered and hierarchical frameworks that marginalized women's roles in resource governance. In the context of critical minerals, this means that the communities most affected by extraction—often women in artisanal mining areas—are least represented in the negotiations over value

chains and benefit-sharing. Tamale's work on African feminism and decolonization reinforces this point: resource sovereignty must include gender justice, or it reproduces colonial hierarchies in new forms. This gendered critique is largely absent from the Chinese, Russian, Western, and UN perspectives, which treat resource governance as gender-neutral.

The contemporary African perspective on critical minerals is shaped by the recognition that the energy transition is creating a new scramble. The IEA's Critical Minerals Outlook (2024) documents that demand for lithium, cobalt, nickel, and rare earth elements is surging, and that production and refining are heavily concentrated. For African states, this presents both an opportunity and a threat. The opportunity is to move up the value chain: rather than exporting raw ore, African states can process, refine, and manufacture components, capturing more value and creating employment. The DRC-Zambia battery initiative, announced in 2022, is the most prominent example: the two countries, which together hold significant cobalt and copper reserves, have agreed to develop a regional battery value chain, including precursor and cathode active material production. This is framed not as a market opportunity alone but as a sovereignty project: it aims to break the pattern in which African resources are extracted, shipped abroad, processed, and re-imported as finished goods at high cost.

The threat is that the new scramble will reproduce old patterns. China's dominance in cobalt refining, rare earth processing, and battery manufacturing means that even when African states extract minerals, the value addition occurs elsewhere. The US Inflation Reduction Act and the EU Critical Raw Materials Act, while framed as supply-chain security measures, also create new conditionalities: minerals must meet sourcing requirements that African states may struggle to satisfy, and the "friend-shoring" logic may exclude African producers who are not aligned with Western geopolitical blocs. From the African perspective, these initiatives are not neutral technical measures; they are geopolitical instruments that reshape access to markets and technology. Klare's *The Race for What's Left* (2012) and Sanderson's *Cobalt Red* (2022) document the human and environmental costs of this extraction, costs that fall disproportionately on African communities.

Resource nationalism is a central theme. Indonesia's nickel export ban (2020) is often cited as a model: by banning raw ore exports and requiring domestic processing, Indonesia attracted investment in smelters and battery precursor plants, moving up the value chain. African states have drawn lessons from this. The DRC has revised its mining code to increase royalties and state equity; Zambia has reformed its mining fiscal regime; Namibia and Zimbabwe have banned raw lithium exports. These measures are defended as sovereignty claims, not protectionism. They reflect the argument that the state has a legitimate role in ensuring that resource extraction contributes to national development, a position that Nyerere articulated in the Arusha Declaration and that contemporary African leaders invoke. Karl's *The Paradox of Plenty* (1997) and Ross's *The Oil Curse* (2012) document the mechanisms by which resource rents can undermine governance, but the African perspective insists that these mechanisms are contingent on institutional and geopolitical context, not deterministic.

However, the African perspective also contains internal critiques. The "resource curse" literature documents how resource rents can fuel corruption, conflict, and authoritarianism. The African perspective does not deny these outcomes but reinterprets their causes. The mechanism, on this view, is not the resource itself but the way it is governed: weak institutions, external interference, and the absence of value addition. Mamdani's analysis of the bifurcated state and Bayart's analysis of extraversion—the tendency of African elites to seek external support rather than domestic legitimacy—provide the institutional and political mechanisms. The solution, from this perspective, is not to abandon resource extraction but to transform the terms of governance: transparency (EITI), local content requirements, community benefit-sharing, and regional integration

through AfCFTA.

AfCFTA is central to the African perspective on critical minerals. The argument is that no single African state can negotiate effectively with China, the US, or the EU on mineral supply chains; collective bargaining through regional and continental frameworks is necessary. AfCFTA's protocols on trade in goods and services, investment, and competition policy provide a framework for harmonizing mining codes, establishing regional value chains, and preventing a race to the bottom in fiscal terms. The DRC-Zambia battery initiative is explicitly framed as a precursor to broader regional integration. From this perspective, the African Continental Free Trade Area is not merely an economic arrangement but a geopolitical instrument: it enables African states to act as a bloc in a world where mineral supply chains are increasingly politicized. This is a claim that none of the other four perspectives makes, because none of them treats African collective agency as a primary variable.

What the African vantage point contributes that the other four cannot is a structural critique of the global political economy of resources. It insists that the "scramble" for critical minerals is not a new phenomenon but a continuation of patterns established in the colonial period, and that the language of "supply-chain security" and "green transition" can obscure continuities of extraction. It also insists that African agency matters: African states, communities, and social movements are not passive recipients of external initiatives but active participants in shaping outcomes. The DRC's mining code revisions, Zambia's fiscal reforms, and the DRC-Zambia battery initiative are examples of this agency. Yergin's *The Prize* (1991) and *The Quest* (2011) provide the hydrocarbon backdrop against which this African agency must be understood: the history of oil is a history of external control, and the African perspective insists that the history of critical minerals must not repeat it.

What it occludes is also important. The African perspective can understate the role of domestic elites in perpetuating extraction and corruption. Bayart's concept of extraversion and Fanon's warning about the national bourgeoisie are attempts to address this, but the structural critique can sometimes shift responsibility entirely to external actors, understating internal governance failures. It can also romanticize regional integration: AfCFTA's implementation has been slow, and the DRC-Zambia battery initiative faces significant technical, financial, and infrastructural challenges. Finally, the African perspective can struggle to account for the diversity of African experiences: the resource politics of Botswana (diamonds, relatively successful governance) differ sharply from those of the DRC (cobalt, conflict, weak state), and a continental framework may obscure these differences. These occlusions do not invalidate the perspective, but they mark the boundaries of its explanatory power.

2.7.2 Chinese Perspective The Chinese perspective on energy, critical minerals, and resource geopolitics is rooted in a state-led development model that treats resource security as a strategic imperative and supply-chain dominance as a source of national power. This perspective is shaped by China's own experience of resource scarcity—particularly in oil and gas, where China is a major importer—and by its success in building dominant positions in critical mineral processing and manufacturing. The theoretical lineage draws on Chinese strategic thought, including the concept of "comprehensive national power" and the emphasis on "self-reliance" (*zili gengsheng*) that has roots in Maoist economics but has been adapted to a market-oriented context.

The core claim is that resource geopolitics is not a zero-sum competition but a "win-win" arrangement in which China provides capital, infrastructure, and markets in exchange for resource access. This framing is central to the Belt and Road Initiative (BRI) and to China's bilateral mineral agreements, particularly in

Africa. The Chinese perspective emphasizes mutual benefit, non-interference in domestic affairs, and respect for sovereignty—principles that are contrasted with Western conditionalities. In practice, this means that Chinese state-backed enterprises (SOEs) sign offtake agreements, build infrastructure (roads, ports, power plants), and provide financing, often with less stringent environmental and governance requirements than Western counterparts.

The mechanism of Chinese resource power operates at multiple levels. At the extraction level, Chinese companies have secured mining rights and offtake agreements in the DRC (cobalt), Zambia (copper), and Zimbabwe (lithium). At the processing level, China dominates refining: it processes approximately 60-70% of the world's cobalt, 80-90% of rare earth elements, and a significant share of lithium. At the manufacturing level, China produces the majority of EV batteries, solar panels, and wind turbines. This vertical integration gives China leverage not only over resource-producing states but over consuming states, particularly in the West. The Chinese perspective treats this not as coercion but as the natural outcome of industrial policy and long-term planning.

The "win-win" framing is the central normative claim. Chinese officials and scholars argue that BRI and mineral partnerships are developmental: they build infrastructure, create jobs, and transfer technology. The Chinese perspective points to the fact that Western companies historically extracted African resources without building local processing capacity, and that China's approach—while imperfect—is more conducive to industrialization. This argument has resonance in African capitals, where Chinese financing has funded infrastructure that Western institutions declined to support.

What the Chinese perspective contributes is a demonstration that state-led industrial policy can reshape global supply chains. China's dominance in critical minerals was not an accident of geology but the result of deliberate policy: subsidies, state-backed financing, technology transfer requirements, and long-term planning. This provides a model that other states, including African states, can study. The Chinese perspective also highlights the hypocrisy of Western "friend-shoring" and "de-risking" rhetoric: the West, having outsourced processing to China for decades, now seeks to reshore or friend-shore without acknowledging its own role in creating the dependency.

What it occludes is significant. The "win-win" framing can obscure asymmetries of power: Chinese SOEs often negotiate with weak African states that lack technical capacity and bargaining power. The environmental and social costs of Chinese mining operations—documented in the DRC, Zambia, and elsewhere—can be externalized onto local communities. The debt implications of Chinese financing, while often overstated in Western narratives, are real in specific cases. The Chinese perspective also tends to treat African states as partners in a bilateral framework, which can undermine regional integration efforts such as AfCFTA. Finally, the Chinese perspective occludes the geopolitical implications of its own dominance: by controlling processing, China has leverage over both producing and consuming states, and this leverage can be exercised coercively, as seen in the 2010 rare earth export restrictions to Japan.

2.7.3 Russian Perspective The Russian perspective on energy, critical minerals, and resource geopolitics is shaped by Russia's identity as a commodity state—a major exporter of hydrocarbons, metals, and minerals—and by its experience of using energy as a geopolitical instrument. This perspective draws on a tradition of state capitalism and "sovereign democracy" in which natural resources are treated as strategic assets of the state, not as commodities subject to market logic. The theoretical lineage includes Soviet-era concepts of "resource rent" and "state monopoly," adapted to a post-Soviet context in which oligarchic control of resources was partially re-nationalized under Putin.

The core claim is that energy and mineral resources are instruments of state power, and that the global energy transition is a threat to Russia's economic and geopolitical position. Russia is a major producer of oil, gas, nickel, palladium, and other minerals; the transition to renewable energy and EVs threatens to reduce demand for Russian hydrocarbons while increasing demand for minerals that Russia also possesses. The Russian perspective thus combines defensive and offensive elements: defending its hydrocarbon rents while seeking to position itself in critical mineral supply chains.

The mechanism of Russian resource power is most visible in energy coercion. The 2006 and 2009 gas disputes with Ukraine, the 2022 cutoff of gas supplies to Europe following the invasion of Ukraine, and the use of oil price manipulation through OPEC+ coordination all demonstrate how Russia has weaponized energy. The Russian perspective treats these not as aggression but as legitimate statecraft: energy is a sovereign resource, and its deployment is a matter of national interest. This is consistent with the broader Russian doctrine of "sovereign democracy," which rejects Western liberal norms and asserts the primacy of state interest.

In the critical minerals space, Russia has sought to leverage its position in nickel (Norilsk Nickel is a major global producer), palladium, and other metals. The Russian perspective emphasizes that sanctions and "de-risking" efforts by the West are attempts to exclude Russia from global supply chains, and that Russia will respond by deepening partnerships with China and other non-Western states. The 2022 invasion of Ukraine and subsequent sanctions have accelerated this reorientation: Russia has redirected energy exports to China and India, and has sought to build alternative payment systems and supply chain arrangements outside Western control.

What the Russian perspective contributes is a candid acknowledgment that resource geopolitics is about power, not just markets. Unlike the Chinese "win-win" framing or the Western "supply-chain security" framing, the Russian perspective does not pretend that resource relations are cooperative; it treats them as competitive and zero-sum. This candor can be analytically useful: it strips away the normative language that other perspectives use to obscure power relations. The Russian perspective also highlights the vulnerability of the global energy system to disruption: the 2022 energy crisis demonstrated how quickly supply shocks can cascade through economies.

What it occludes is substantial. The Russian perspective treats resource extraction as a state prerogative without regard for environmental or social costs. It occludes the authoritarian governance that underpins resource control: the Russian state's dominance of the energy sector is linked to the suppression of political opposition, the concentration of wealth in oligarchic hands, and the use of resource rents to fund military aggression. It also occludes the long-term economic costs of overdependence on extractive rents: the "resource curse" dynamics that have produced stagnation, corruption, and vulnerability to price shocks. Finally, the Russian perspective occludes the agency of resource-producing states and communities: it treats resources as state assets to be deployed for geopolitical ends, not as sources of development for populations.

2.7.4 Western Perspective The Western perspective on energy, critical minerals, and resource geopolitics is organized around the concepts of supply-chain security, market efficiency, and governance standards. This perspective draws on liberal international economic theory, which treats resources as commodities traded in global markets, and on security studies, which treats supply-chain concentration as a vulnerability. The theoretical lineage includes classical trade theory (Ricardo, comparative advantage), institutional economics (North, Acemoglu), and the "resource curse" literature (Ross, Collier, Sachs).

The core claim is that critical mineral supply chains must be diversified, transparent, and governed by mar-

ket rules and ESG standards. The Western perspective treats China's dominance in processing as a strategic vulnerability and seeks to reduce dependence through "friend-shoring," reshoring, and the creation of alternative supply chains. The US Inflation Reduction Act (2022) provides tax credits for EVs and batteries that meet domestic content requirements; the EU Critical Raw Materials Act (2023) sets targets for domestic extraction, processing, and recycling; and the Minerals Security Partnership (MSP) coordinates allied efforts to develop alternative supply chains.

The mechanism operates through a combination of subsidies, trade policy, and normative conditionality. The IRA's sourcing requirements, for example, exclude minerals processed in "foreign entities of concern" (primarily China), creating incentives for producers to route supply chains through allied or neutral countries. The EU CRMA sets benchmarks for domestic capacity and requires strategic projects to meet sustainability criteria. These measures are framed as defensive: they aim to reduce vulnerability to coercion, not to dominate markets. The Western perspective also emphasizes governance: the Extractive Industries Transparency Initiative (EITI), the OECD Due Diligence Guidance, and various ESG frameworks are presented as tools for ensuring that resource extraction benefits local populations and meets environmental standards.

What the Western perspective contributes is a set of institutional and normative frameworks that can improve resource governance. EITI, in particular, has increased transparency in extractive sectors in many countries. The emphasis on ESG standards, while sometimes criticized as "greenwashing," has created pressure for better labor and environmental practices. The Western perspective also brings capital and technology: Western mining companies, while historically extractive, have developed advanced processing and recycling technologies that could support value-chain upgrading in producing states.

What it occludes is significant. The Western perspective can treat resource geopolitics as a technical problem of supply-chain management, obscuring the historical and structural inequalities that shape mineral markets. The "friend-shoring" logic, while framed as security, can reproduce colonial patterns: it designates some states as "friends" and others as threats, often on geopolitical rather than developmental grounds. The Western perspective also tends to understate its own role in creating the dependencies it now seeks to escape: Western companies and governments outsourced processing to China for decades, and Western consumption drives demand for minerals extracted under poor conditions. Finally, the Western perspective can occlude the developmental claims of producing states: when African or Latin American states impose export bans or local content requirements, these are often framed as market distortions or violations of trade rules, rather than as legitimate sovereignty claims.

2.7.5 UN Perspective The UN perspective on energy, critical minerals, and resource geopolitics is organized around sustainable development, resource governance, and the Sustainable Development Goals. This perspective draws on the UN's mandate for international cooperation and its normative frameworks, including the 2030 Agenda, the Paris Agreement, and the UN Guiding Principles on Business and Human Rights. The theoretical lineage includes development economics, human rights law, and the "resource curse" literature, but framed through a multilateral, normative lens.

The core claim is that resource extraction must be governed by principles of sustainability, transparency, and equity, and that the energy transition must be just and inclusive. The UN perspective emphasizes that critical minerals are essential for achieving SDG 7 (affordable and clean energy) and SDG 13 (climate action), but that their extraction must not undermine other SDGs, including those related to poverty, health, and environmental protection. The UN Environment Programme (UNEP), the UN Conference on Trade and Development (UNCTAD), and the UN Development Programme (UNDP) all produce analyses and frameworks

related to resource governance.

The mechanism operates through norm-setting, capacity-building, and multi-stakeholder initiatives. The Extractive Industries Transparency Initiative (EITI), while not a UN body, is supported by UN agencies and aligns with UN governance norms. The UN Guiding Principles on Business and Human Rights provide a framework for holding companies accountable for human rights impacts in mining. UNCTAD's work on commodity dependence and value-chain upgrading provides analytical support for producing states. The UN also convenes dialogues and produces reports, such as the UN Secretary-General's Panel on Critical Energy Transition Minerals (2024), which aims to develop principles for responsible mineral supply chains.

What the UN perspective contributes is a normative framework that transcends geopolitical competition. In a world where the US, China, Russia, and the EU are all pursuing strategic mineral interests, the UN provides a space for articulating shared principles: that extraction should benefit local communities, that environmental standards should be upheld, and that the energy transition should not reproduce inequalities. The UN perspective also brings attention to the human rights dimensions of mining: child labor in cobalt mining in the DRC, indigenous rights in lithium mining in South America, and the displacement of communities by large-scale mining projects.

What it occludes is also significant. The UN perspective lacks enforcement power: its norms and principles are voluntary, and states and companies can ignore them without consequence. The UN can be slow to respond to rapidly evolving geopolitical dynamics, and its frameworks can be captured by powerful states or corporate interests. The UN perspective also tends to treat resource governance as a technical and normative problem, which can obscure the hard power and geopolitical competition that increasingly shape mineral supply chains. Finally, the UN perspective can struggle to reconcile its development and environmental mandates: promoting mineral extraction for the energy transition can conflict with environmental protection and community rights, and the UN does not always resolve these tensions.

2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Reveals that resource extraction without value-chain upgrading reproduces dependency; frames resource sovereignty as a development imperative rather than merely a security problem; identifies AfCFTA and regional industrialization as structural correctives to extractive enclave economies	May overstate state capacity for upgrading in contexts of weak institutions and capital scarcity; can understate the genuine geopolitical competition among great powers that constrains African agency; risks romanticizing resource nationalism without accounting for rent-seeking and elite capture	Resources should serve African structural transformation; extraction without upgrading is neo-colonial; value addition is a right, not a concession	DRC-Zambia battery initiative (2022); cobalt refining concentration (China ~70% of global refining); AfCFTA protocols on rules of origin; Rodney's underdevelopment thesis applied to mineral enclaves	Western/Chinese: upgrading requires capital, technology, and market access that may not be available; sovereignty claims may deter investment and slow development

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Chinese	Demonstrates that state-backed long-term offtake, infrastructure finance, and vertical integration can secure supply chains and accelerate industrialization in partner states; shows that "win-win" frameworks can mobilize capital at scale	Obscures labor and environmental standards, debt sustainability, and local value capture; "win-win" rhetoric masks asymmetric bargaining power; state-backed opacity complicates accountability	Mutual benefit through non-interference; development through infrastructure and market access; South-South cooperation	Belt and Road Initiative mineral investments; CMOC/Tenke Fungurume cobalt operations; Zimbabwe lithium processing requirements; state-backed offtake agreements	African: "win-win" masks dependency; Western: lack of transparency and governance standards; UN: environmental and community rights deficits
Russian	Illustrates that commodity exports can be weaponized for geopolitical leverage; demonstrates that energy and mineral states can convert resource endowments into great-power status and coercive capacity	Underestimates long-term demand destruction from weaponization (accelerated diversification, sanctions); overstates coercive durability; ignores that commodity leverage is self-limiting as buyers adapt	Resources as instruments of state power and sovereign autonomy; commodity leverage as legitimate statecraft	2022 gas cutoff to Europe; oil price manipulation via OPEC+; Gazprom leverage over Central and Eastern Europe	Western: weaponization accelerates diversification and undermines long-term market position; African: commodity leverage without upgrading reproduces dependency

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Western	Identifies supply-chain security as a legitimate state interest; develops institutional frameworks (IRA, MSP, CRMA) for diversification and friend-shoring; emphasizes market efficiency, rule of law, and governance standards	Treats resource politics primarily as a security problem rather than a development problem; friend-shoring may exclude African upgrading by privileging allied suppliers; market rhetoric can mask protectionism and subsidy races	Open markets, rule of law, supply-chain resilience, democratic governance; resources as strategic assets requiring secure supply	Inflation Reduction Act (2022); Minerals Security Partnership; EU Critical Raw Materials Act (2023); IEA Critical Minerals Outlook (2024)	African: friend-shoring is neo-colonial exclusion; Chinese: market rhetoric masks protectionism; UN: governance standards may be inconsistently applied
UN	Establishes normative frameworks for resource governance (EITI, SDG 7, UN Resource Panel); promotes transparency, community rights, and sustainable development; provides multilateral legitimacy for governance standards	Lacks enforcement power; norms are voluntary; can be slow to respond to geopolitical dynamics; frameworks can be captured by powerful states or corporate interests; struggles to reconcile development and environmental mandates	Sustainable development, transparency, multilateral cooperation, intergenerational equity	EITI implementation in 50+ countries; SDG 7 (affordable clean energy); UN Secretary-General's Panel on Critical Energy Transition Minerals (2024)	All perspectives: voluntary norms insufficient against hard power competition; African: governance frameworks may privilege investor interests over sovereignty

2.8 WORKED EXAMPLE (I do)

Case: The 1973 Oil Embargo — OPEC, the Oil Weapon, and the Restructuring of Global Political Economy

The 1973 oil embargo remains the foundational case for understanding how commodity producers can weaponize supply to restructure global power. In October 1973, the Organization of Arab Petroleum Exporting Countries (OAPEC) imposed an embargo on oil shipments to the United States and other nations supporting Israel during the Yom Kippur War. Within months, oil prices quadrupled from roughly $3 to $12 per barrel. The embargo lasted until March 1974, but its consequences reshaped the global political economy for decades. The case is not merely a historical episode; it is the template through which subsequent resource geopolitics — including today's critical minerals competition — is understood.

Levels of Analysis

Individual. The embargo cannot be explained without the decisions of specific leaders operating under uncertainty. Egyptian President Anwar Sadat launched the Yom Kippur War to break the diplomatic stalemate; Saudi King Faisal, initially reluctant, was persuaded by Arab solidarity and domestic pressure to join the embargo; US Secretary of State Henry Kissinger pursued shuttle diplomacy that ultimately produced disengagement agreements; and OAPEC oil ministers, meeting in Kuwait, calibrated production cuts with deliberate ambiguity about targets and duration. Each actor operated with incomplete information about the others' red lines. Faisal, in particular, faced a domestic constituency that demanded action, while simultaneously fearing US retaliation and the long-term damage to the US-Saudi relationship. Kissinger's subsequent "Year of Europe" speech and his pursuit of a separate peace between Egypt and Israel were shaped by the recognition that energy vulnerability had become a strategic liability. The individual level reveals that the embargo was not an automatic response to war but a calculated political instrument whose architects debated its risks and duration.

State. At the state level, the embargo served distinct national interests. Saudi Arabia sought to demonstrate Arab solidarity while preserving its special relationship with Washington; Egypt needed to pressure the US into forcing Israeli withdrawal; Libya and Iraq, more radical, pushed for permanent production cuts and price increases. The US, for its part, faced a strategic dilemma: supporting Israel risked energy security, while abandoning Israel risked domestic political backlash and regional credibility. The state level also reveals the asymmetry of the crisis: the US was the world's largest oil consumer but not a major exporter, while Arab producers controlled roughly 85% of globally traded oil. This structural asymmetry gave producer states leverage that consumer states could not easily counter. The embargo also exposed the fragility of the Bretton Woods system, which collapsed in 1971 with the Nixon shock; the dollar's role as reserve currency meant that oil price increases were denominated in dollars, creating a feedback loop between energy and monetary power.

Systemic. The systemic level situates the embargo within the Cold War bipolar order and the broader transformation of the global economy. The embargo occurred as the postwar Bretton Woods system was unraveling, as decolonization had created a bloc of resource-rich developing states, and as the US was withdrawing from Vietnam. OPEC's success in raising prices demonstrated that a cartel of developing-country producers could challenge the economic dominance of industrialized nations — a direct challenge to the liberal international order. The systemic level also captures the petrodollar recycling mechanism that emerged: Arab

surpluses were deposited in Western banks and recycled as loans to developing countries and investments in US Treasury securities, reinforcing dollar hegemony even as it appeared to weaken US power. This recycling created a new financial architecture that tied oil producers to the US financial system, transforming a short-term supply shock into a long-term structural feature of global capitalism. The systemic level further reveals that the embargo accelerated the shift from a producer-dominated to a consumer-responsive energy order: the creation of the International Energy Agency (IEA) in 1974, strategic petroleum reserves, and energy conservation programs all represented systemic adaptations to producer power.

Transnational. The transnational level captures the role of multinational oil companies — the "Seven Sisters" — that controlled production, refining, and distribution across borders. These companies had historically operated as extensions of Western power, but the embargo exposed their vulnerability: they could not prevent host governments from restricting output. The embargo also triggered a wave of nationalizations, as producer states asserted sovereignty over resources previously controlled by foreign companies. Transnationally, the crisis accelerated the shift from concession agreements to production-sharing contracts, a restructuring of property rights that redistributed rents from companies to states. The petrodollar recycling itself was a transnational process: capital flows from oil producers through Western financial centers to global borrowers, creating new patterns of debt and dependency that would culminate in the 1980s debt crisis. The transnational level also reveals the role of non-state actors — banks, trading houses, and shipping companies — in mediating the crisis and shaping its outcomes.

Mechanism

The oil weapon operated through a clear causal chain. First, supply restriction: OAPEC reduced production by approximately 5% per month and imposed a total embargo on shipments to the US and Netherlands. Second, price spike: the reduction in supply, combined with inelastic short-term demand, drove prices from $3 to $12 per barrel. Third, economic transmission: higher oil prices raised production costs across the OECD economies, triggering inflation and recession. Fourth, political pressure: the economic pain generated domestic political pressure on governments to change their Middle East policies. Fifth, diplomatic response: the US pressured Israel to accept disengagement agreements, and the embargo was lifted in March 1974.

However, the mechanism was not purely coercive. The embargo also operated through the petrodollar recycling channel, which transformed a short-term supply shock into a long-term structural reinforcement of US financial power. Arab surpluses were recycled into US Treasury securities, lowering US borrowing costs and financing US deficits. This created a mutual dependency: the US needed Arab oil and Arab capital; Arab producers needed US security guarantees and US markets for their capital. The mechanism thus produced not simply a transfer of power from consumers to producers, but a restructuring of the global financial architecture that ultimately benefited the US.

The long-term mechanism was equally important. The embargo triggered energy conservation, diversification of supply (including North Sea and Alaskan oil), and the creation of strategic petroleum reserves. These responses reduced OPEC's market power over time, demonstrating that the oil weapon was most effective as a surprise instrument and least effective as a sustained strategy. By the 1980s, OPEC's share of global production had declined, and the cartel's ability to set prices had eroded. The mechanism of the oil weapon was thus self-limiting: its success generated the conditions for its own attenuation.

Perspective Reconstruction

African (primary). The 1973 embargo was read across Africa as a vindication of resource sovereignty and a demonstration that commodity producers could collectively challenge Western dominance. Nkrumah had

argued in *Neo-Colonialism* (1965) that control of natural resources was the foundation of genuine independence; the embargo seemed to prove that producer cartels could reshape global power. African leaders drew parallels between OPEC's oil and their own mineral endowments — copper in Zambia, cobalt in the DRC, uranium in Niger — and explored whether similar cartel strategies could be applied. The 1970s saw a wave of resource nationalizations across Africa, from Zambia's copper nationalization to Nigeria's creation of the Nigerian National Petroleum Corporation. Yet African scholars and leaders also recognized the limits of the OPEC model. Africa lacked the market concentration that OPEC enjoyed: no single African commodity commanded the global market share that oil did, and African states lacked the institutional capacity and capital to manage nationalized industries effectively. Rodney's analysis in *How Europe Underdeveloped Africa* (1972) provided a framework for understanding why resource wealth did not translate into development: the global structure of trade and finance ensured that surplus was extracted rather than reinvested. The embargo's aftermath — petrodollar recycling that channeled Arab surpluses into Western financial markets rather than African development — confirmed Rodney's thesis. The lesson for Africa was double-edged: resource power was possible but required cartel coordination, state capacity, and control over the full value chain, conditions that most African states did not meet. The embargo thus reinforced the African argument for value-chain upgrading and regional integration, later articulated in the AfCFTA, as the necessary complement to resource sovereignty.

Chinese. China viewed the embargo through the lens of anti-imperialism and Third World solidarity, interpreting OPEC's action as a blow against Western hegemony and a validation of producer sovereignty. Beijing had long supported the principle that developing countries should control their natural resources, and the embargo appeared to demonstrate that collective action by the Global South could challenge the industrialized North. The crisis also accelerated China's own energy security thinking, though China was not yet a major oil importer in 1973; the lesson was absorbed into a longer-term strategic calculus about vulnerability to supply disruption. Chinese analysts also noted the petrodollar recycling mechanism with concern, recognizing that it reinforced US financial hegemony even as it appeared to weaken US power. This concern would shape China's later efforts to internationalize the renminbi and develop alternative payment systems. The Chinese perspective thus saw the embargo as both a tactical victory for the Global South and a strategic reinforcement of US financial dominance — a duality that informed China's subsequent approach to energy and currency geopolitics.

Russian. The Soviet Union benefited substantially from the embargo, as a major oil exporter gaining hard currency and geopolitical leverage from the price spike. Moscow interpreted the crisis as evidence of the fragility of Western capitalism and the vulnerability of the US-led alliance system. The USSR was not an OPEC member and could not coordinate production, but it positioned itself as a reliable alternative supplier to countries affected by the embargo, gaining influence in Western Europe and the developing world. The crisis reinforced Soviet thinking about energy as a strategic asset — a lesson that would be applied with increasing sophistication in post-Soviet Russia, where energy leverage became a central instrument of foreign policy. However, the Russian perspective also recognized the limits of commodity power: the embargo's success in raising prices also accelerated Western diversification and conservation, reducing long-term demand for Soviet exports. The mechanism of self-limiting leverage — that weaponization generates adaptation — was thus visible even in the 1970s, though it would be repeatedly underestimated in subsequent decades.

Western. Western analysts and policymakers interpreted the embargo as a strategic shock that exposed the vulnerability of industrialized economies to supply disruption. The crisis triggered a comprehensive restructuring of Western energy policy: the creation of the IEA in 1974, the establishment of strategic petroleum reserves, the promotion of energy conservation and efficiency, and the diversification of supply sources in-

cluding North Sea and Alaskan oil. Yergin's *The Prize* (1991) frames the embargo as the moment when the "age of abundance" gave way to an "age of scarcity," fundamentally altering the relationship between energy and power. The Western perspective emphasizes that the embargo ultimately strengthened Western institutional capacity and reduced OPEC's leverage over time. The petrodollar recycling arrangement is interpreted as a pragmatic adaptation that preserved US financial hegemony while accommodating producer interests. The Western perspective also stresses the role of market mechanisms — price signals, investment responses, and technological innovation — in eroding cartel power, suggesting that market forces are more durable than political coercion in energy geopolitics.

UN. The UN framed the embargo within the broader context of North-South relations and the emerging demand for a New International Economic Order (NIEO). The 1974 Declaration on the Establishment of a New International Economic Order, adopted by the UN General Assembly, reflected the emboldened position of developing countries following OPEC's success. The UN emphasized resource sovereignty, equitable trade, and the right of states to control their natural resources. However, the UN lacked enforcement capacity, and the NIEO ultimately failed to materialize. The UN perspective also highlights the distributional consequences of the embargo: while oil producers gained, oil-importing developing countries — particularly in Africa and South Asia — suffered severe economic damage from higher energy prices, revealing that resource power could harm as well as help the Global South. The UN's framing thus captures both the promise and the limitations of producer solidarity, while underscoring the need for multilateral frameworks to manage the global energy economy.

Explicit Adjudication

The systemic perspective best explains the 1973 embargo's causes and consequences. The embargo was not merely a bilateral dispute between Arab states and the US; it was a systemic shock that restructured the global political economy through petrodollar recycling, institutional innovation (the IEA), and the acceleration of energy diversification. The systemic level captures the feedback loops between energy, finance, and geopolitics that the other levels miss. However, the systemic perspective risks obscuring agency: it can make the embargo appear as an inevitable structural response rather than a calculated political decision by specific leaders operating under uncertainty. The individual and state levels are necessary to explain why the embargo happened when it did and why it took the form it did.

The African perspective contributes a crucial corrective that the systemic perspective misses: the embargo's consequences for the Global South were not uniformly positive. While OPEC gained, oil-importing developing countries suffered, and the petrodollar recycling that followed channeled resources into Western financial markets rather than African development. The African perspective thus reveals that resource power is double-edged and that the global structure of finance and trade can convert producer gains into reinforced dependency. What the African perspective may understate is the genuine strategic achievement of the embargo: it did demonstrate that producer cartels could challenge Western dominance, and it did produce lasting institutional changes (the IEA, strategic reserves) that altered the balance of power in energy geopolitics. The African perspective's emphasis on value-chain upgrading and regional integration, while valid for minerals, may not fully account for the unique market concentration that made OPEC's oil weapon effective — a concentration that African mineral producers have rarely achieved.

The Western perspective captures the institutional and market responses that eroded OPEC's power, but it understates the distributional consequences for the Global South and treats the embargo primarily as a security problem rather than a development challenge. The Chinese and Russian perspectives, while contributing important insights about anti-imperialism and commodity leverage, are less directly relevant to the 1973

case than to subsequent energy geopolitics. The UN perspective captures the normative framing but lacks analytical precision on mechanisms.

In sum, the 1973 embargo is best understood as a systemic shock whose effects were mediated by state strategies, individual decisions, and transnational corporate and financial dynamics. The African perspective most accurately identifies the double-edged nature of resource power and the structural constraints on producer solidarity, but it may understate the embargo's genuine achievements in demonstrating that commodity producers could challenge Western dominance. The case remains the template for understanding resource geopolitics: it shows that the oil weapon is most effective as a surprise, that its success generates adaptation that erodes its power, and that the restructuring it produces can reinforce as well as challenge existing hierarchies.

2.9 PROBLEM PAIR (We do)

1. **Describe the policy and its stated objective.** Indonesia's 2020 ban on exports of unprocessed nickel ore was presented as a downstreaming strategy: force or incentivize domestic processing so that Indonesia captures more value from a mineral central to stainless steel and, increasingly, EV batteries. Identify the immediate policy lever, the targeted supply-chain stage, and the political coalition behind it.

2. **Specify the causal mechanism.** Explain how an export ban changes relative prices, investment incentives, and rent distribution. Who gains (smelters, battery-precursor firms, workers, regional governments), who loses (miners, foreign buyers, consumers), and what complementary conditions (energy, infrastructure, skills, environmental regulation) determine whether the mechanism actually produces industrial upgrading rather than smuggling or rent-seeking?

3. **Place the case at multiple levels of analysis.** Analyze it at the individual/firm level (mining companies, Chinese and Western processors, Indonesian conglomerates), the state level (industrial policy, resource nationalism, bureaucratic capacity), the systemic level (WTO rules, US–China rivalry, EV transition), and the transnational level (battery supply chains, offtake agreements, global price formation).

4. **Reconstruct all five perspectives.** Show how an African resource-sovereignty lens, a Chinese state-backed supply-chain lens, a Russian commodity-leverage lens, a Western supply-security lens, and a UN governance/SDG lens each interpret the same ban differently. What does each perspective see clearly, and what does it occlude?

5. **Choose and justify a historical analogue.** Compare Indonesia's nickel ban either to the 1973 oil embargo (resource control as geopolitical restructuring) or to earlier waves of resource nationalism (e.g., 1970s copper or oil nationalizations). State the respects in which the analogue illuminates the case and the respects in which it misleads.

6. **Define falsifiers.** What evidence, if observed over the next five to ten years, would show that the ban failed as development policy? Consider downstream capacity, employment quality, fiscal revenue, environmental damage, WTO retaliation, investment diversion, and distribution of rents between foreign firms and domestic citizens.

MODEL ANSWER

Indonesia's 2020 nickel export ban is best understood as both a development strategy and a WTO-inconsistent trade measure; these are not mutually exclusive categories, and adjudicating the case requires separating the policy's intent, its mechanism, its legal status, and its distributional and environmental consequences. At the state level, the ban is a classic downstreaming instrument: by prohibiting the export of unprocessed ore, Indonesia raises the effective cost of exporting raw material and lowers the relative cost of domestic processing, thereby redirecting investment toward smelters, ferronickel, and battery-precursor plants. The mechanism is not automatic. It depends on whether domestic energy is cheap and reliable, whether ports and industrial zones exist, whether firms can access technology and skilled labor, and whether regulators can prevent illegal ore exports. Where these complementary conditions are weak, the ban may produce smuggling, informal processing, or simply a transfer of rents to whichever foreign firms already control capital and technology. Where they are strong, it can shift Indonesia from an extractive enclave toward a processing and manufacturing node in the EV battery chain.

The case also operates at multiple levels of analysis. At the firm level, mining companies lose direct export revenue while processors and battery-material firms gain privileged access to ore; Chinese firms have been especially prominent in building Indonesian smelting capacity, which means the ban's developmental benefits may be partially captured by foreign capital even when physical production occurs domestically. At the systemic level, the ban collides with WTO disciplines, particularly the general prohibition on quantitative restrictions. A WTO panel found Indonesia's measure inconsistent with its obligations, and Indonesia appealed, leaving the dispute in a state of practical unresolvedness because of the paralyzed Appellate Body. This does not make the ban meaningless; it means Indonesia accepted, or at least risked, a legal cost in exchange for an industrial-policy gain. At the transnational level, the ban reshapes EV supply chains by making Indonesia a more important node in nickel processing, while also pushing buyers to seek alternative suppliers or to invest in Indonesian capacity.

The five perspectives reconstruct the same policy differently. An African resource-sovereignty perspective sees the ban as an assertion that mineral wealth should not leave the continent or country in raw form; it resonates with arguments for value-chain upgrading, regional processing, and AfCFTA-linked industrialization. But it also warns that sovereignty over extraction does not guarantee sovereignty over technology, finance, or environmental outcomes. A Chinese perspective tends to read the ban as compatible with state-backed supply-chain development: if Chinese firms build and operate Indonesian smelters, both sides can claim gains, though the distribution of rents and control may be asymmetrical. A Russian perspective emphasizes commodity leverage: even a non-hydrocarbon mineral can become a bargaining chip when global demand is concentrated and supply is politically managed. A Western perspective is split between supply-security concerns, which favor diversified and friend-shored processing, and trade-liberalization commitments, which treat export bans as market-distorting. A UN perspective foregrounds governance, transparency, environmental standards, and the Sustainable Development Goals, asking whether the ban improves public revenue, community welfare, and ecological outcomes or merely relocates harm.

Historically, the ban is closer to resource nationalism than to the 1973 oil embargo. The oil weapon was external coercion aimed at restructuring global political economy through price and supply shocks; Indonesia's ban is domestic industrial policy using export control to force upstream-downstream linkage. The analogue is useful insofar as both show that resource control can alter global bargaining power, but misleading if it implies that Indonesia possesses oil-style systemic leverage. Nickel is important, but it is not the central energy commodity of the global economy, and buyers can substitute, recycle, or develop alternative chemistries

over time.

The most defensible adjudication is therefore conditional. The ban is a WTO violation in legal terms and a plausible development strategy in economic terms. It should be judged a success only if it produces durable domestic processing capability, broad-based employment and fiscal gains, manageable environmental costs, and a gradual reduction in dependence on foreign-controlled technology. It should be judged a failure if it merely raises rents for foreign processors, damages ecosystems, provokes retaliation without compensating gains, or leaves Indonesia locked into a low-value segment of the battery chain. In short, the policy's value lies not in the ban itself but in whether the state can convert temporary resource leverage into long-term industrial capability.

2.10 INDEPENDENT MEMO (You do)

(a) Case description. In 2022–2023, the Democratic Republic of Congo and Zambia signed agreements to develop a joint battery and electric-vehicle value chain, including precursor manufacturing, supported by AfCFTA ambitions and external partners. The initiative responds to the fact that the DRC produces a large share of global cobalt while Zambia has copper and emerging processing capacity, yet both remain concentrated at the extraction end of the battery supply chain. It aims to move from ore export to precursor and eventually cell production, capturing more value, creating industrial employment, and reducing vulnerability to commodity price swings. Obstacles include energy deficits, infrastructure gaps, governance risks, financing constraints, and competition from established Asian processing hubs. The case also raises questions about environmental standards, community consent, and the distribution of rents among states, firms, and citizens.

(b) Required memo headings (prompts).

Mechanism: Identify the causal chain from the policy lever (regional industrial agreement, infrastructure investment, offtake arrangements) to the intended outcome (value-chain upgrading); specify scope conditions, intermediate variables, and observable implications.

Perspective reconstruction: Reconstruct how African, Chinese, Russian, Western, and UN perspectives would each interpret the DRC–Zambia initiative; state what each sees clearly and what it occludes.

Historical analogue: Compare the initiative to one prior case of resource-based industrialization or regional value-chain upgrading; justify the comparison and identify where it breaks down.

Falsifiers: List the evidence that would show the initiative failed—e.g., no durable processing capacity, foreign capture of rents, environmental harm, weak fiscal gains, or collapse of regional coordination.

(c) Self-check: Did you distinguish description (what happened), explanation (why), prediction (what would follow if the mechanism holds), and prescription (what should be done)?

2.11 HINGE QUESTION

Question: Which statement best captures the rentier-state mechanism linking resource wealth to authoritarianism?

A. Resource wealth automatically causes democracy by funding education, welfare, and broad-based public services.
B. Resource rents reduce the state's need to tax citizens, weakening fiscal bargaining and accountability

while enabling patronage and authoritarian consolidation.
C. Resource wealth causes authoritarianism solely through foreign intervention and external manipulation.
D. Resource wealth has no systematic political effect because competitive markets price resources efficiently.

Correct answer: B.

Distractor diagnosis:
- **A** mistakes revenue for accountability; it ignores the taxation-bargaining mechanism and assumes public spending automatically produces democratic responsiveness.
- **C** overstates the external cause; foreign intervention can matter, but the rentier mechanism operates primarily through domestic fiscal structure and elite rent management.
- **D** treats resource wealth as a neutral market outcome; it ignores how concentrated rents reshape state-society relations, regime incentives, and conflict dynamics.

SECTION 2A — DATA LAB

Table 1 — Selected critical-mineral reserve concentration (approximate, USGS Mineral Commodity Summaries, 2024)

Mineral	Leading reserve holders (approx. share of identified reserves)	Notes for interpretation
Lithium	Chile ~33%; Australia ~22%; Argentina ~13%; China ~11%; United States ~4%; Canada ~4%	Reserves are more geographically dispersed than oil, but "reserves" depend on price, technology, and reporting standards; Bolivia's large resources are often not counted as reserves.
Cobalt	DRC ~50%+; Australia ~14%; Indonesia ~5%; Cuba ~5%; Philippines ~2%; Russia ~2%; Canada ~2%	Reserve concentration is extreme in one state, but refining concentration is even more extreme in China.
Nickel	Indonesia ~42%; Australia ~18%; Brazil ~12%; Russia ~6%; New Caledonia ~5%; Philippines ~4%; China ~3%	Laterite deposits in Indonesia and the Philippines dominate; sulphide deposits in Russia, Canada, and Australia matter for battery-grade processing.
Graphite (natural)	Turkey ~24%; China ~21%; Brazil ~20%; Mozambique ~7%; Madagascar ~7%	Graphite is the largest battery input by mass; synthetic graphite adds a separate, energy-intensive supply chain.
Rare earth oxides	China ~34%; Vietnam ~17%; Brazil ~16%; Russia ~8%; India ~5%; Australia ~4%; United States ~1%	"Rare earths" are not rare in crustal abundance; concentration reflects processing economics and environmental regulation.

Mineral	Leading reserve holders (approx. share of identified reserves)	Notes for interpretation
Copper	Chile ~20%; Peru ~12%; Australia ~10%; DRC ~8%; Russia ~8%; United States ~5%	Copper is the cross-cutting mineral for electrification; its supply chain is less concentrated than cobalt or REEs but still geopolitically salient.

Table 2 — Production and processing concentration (approximate, 2023–2024)

Stage / commodity	Leading producer or processor (approx. share)	Secondary actors	Analytical reading
REE mining	China ~60–70%	United States ~10–15%; Australia ~8%; Myanmar ~8%	Mining is concentrated but not monopolized; Myanmar's role is politically fragile and often under-regulated.
REE separation and processing	China ~85–90%	Malaysia (Lynas-related processing); limited US/EU capacity	The bottleneck is midstream chemistry, not geology; this is where "weaponization" is most plausible.
Cobalt mining	DRC ~70%	Indonesia ~5%; Russia ~4%; Australia ~3%	Mining concentration creates exposure to conflict, child labor allegations, and artisanal supply-chain opacity.
Cobalt refining	China ~70–75%	Finland; Canada; limited others	Refining concentration converts DRC mining dominance into Chinese industrial leverage.
Primary gallium production	China ~98%	Negligible non-Chinese primary output	Gallium is a near-monopoly case; export controls in 2023 demonstrated how a small-volume mineral can disrupt semiconductor supply chains.

Stage / commodity	Leading producer or processor (approx. share)	Secondary actors	Analytical reading
Lithium processing (chemicals)	China ~60–70%	Chile; Argentina; Australia (spodumene)	Mining is dispersed; conversion to battery-grade lithium carbonate/hydroxide is concentrated.
Nickel mine production	Indonesia ~50%	Philippines ~10%; Russia ~6%; New Caledonia ~?; Australia ~4%	Indonesia's export ban and downstreaming policy shifted global nickel flows and prices.
EV battery cell manufacturing	China ~70–75%	South Korea ~10%; Japan ~6%; Europe and North America growing	Cell manufacturing is the high-value stage; it is not the same as mineral endowment.

Table 3 — EV battery supply chain by stage

Stage	Core inputs / activities	Geographic concentration	Main vulnerability
1. Mining	Lithium, cobalt, nickel, graphite, manganese, copper	DRC (cobalt); Indonesia (nickel); Chile/Argentina/Australia (lithium); China (graphite)	Resource nationalism, conflict, labor abuses, environmental damage, reserve nationalism
2. Refining / processing	Conversion to battery-grade chemicals and metals	China dominant in lithium chemicals, cobalt refining, REE separation, graphite anode material	Chokepoint leverage, export controls, energy cost, waste and pollution
3. Cathode and anode manufacturing	NMC, LFP, graphite anodes, silicon additives	China, South Korea, Japan; Europe and US expanding	Technology licensing, IP, scale economies, capital intensity
4. Cell manufacturing	Electrode coating, assembly, electrolyte, quality control	China dominant; South Korea and Japan significant; US/EU catching up	Capital intensity, yield rates, skilled labor, subsidy competition
5. Pack integration and vehicle assembly	Battery packs, BMS, thermal management, vehicle platforms	China, Europe, North America, Japan, South Korea	Market access, tariffs, standards, consumer demand, charging infrastructure

Stage	Core inputs / activities	Geographic concentration	Main vulnerability
6. Recycling and second life	Black mass, hydrometallurgy, pyrometallurgy, direct recycling	Nascent; China and Europe leading; US emerging	Collection logistics, economics at low volumes, hazardous waste regulation, design-for-recycling

Five numbered analysis questions

1. **Trend.** Compare the hydrocarbon era with the critical-mineral era. Oil reserves and production were concentrated in a cartelizable set of states, especially OPEC members, and the 1973 embargo demonstrated that supply restriction could restructure global politics. Critical minerals, by contrast, are more dispersed in the ground but more concentrated in processing. What does this imply for the feasibility of an "oil weapon" equivalent in minerals, and which stage of the battery supply chain is the most credible locus of leverage?

2. **Level of analysis.** Take Indonesia's 2020 nickel export ban. At the individual level, which leaders, firms, and communities gained or lost? At the state level, what was the Indonesian government's developmental objective and its WTO exposure? At the systemic level, how did the ban alter global nickel prices, Chinese investment, and EV supply-chain geography? At the transnational level, how did firms, investors, and civil-society actors respond across borders? Which level explains the most variance, and what is lost by privileging only that level?

3. **Perspective reconstruction (all five).** Reconstruct the African, Chinese, Russian, Western, and UN perspectives on critical-mineral geopolitics in 4–6 sentences each, in that order. The African account must begin from resource sovereignty and value-chain upgrading, not from Western supply security. The Chinese account must treat state-backed offtake as development strategy as well as leverage. The Russian account must connect commodity-state logic to energy and mineral rents. The Western account must distinguish supply-chain security from neo-colonial extraction. The UN account must connect EITI, SDG 7, and the energy transition to governance and human rights.

4. **Interpretation.** Does China's dominance in REE processing and cobalt refining constitute (a) a latent "weapon," (b) an industrial-policy success that others could emulate, or (c) a normal market outcome produced by cost, scale, and environmental regulation? Use the data above plus the 2023 gallium/germanium export controls and the 2010 rare-earth dispute with Japan as evidence. What would falsify each interpretation?

5. **Limitation.** The USGS and IEA data capture formal reserves and reported production, but they do not fully capture artisanal and small-scale mining, informal cobalt circuits in the DRC, environmental liabilities, reserve reclassification after price shocks, or the political risk embedded in "friendly" suppliers. Which of these omissions most seriously biases policy conclusions, and how would you triangulate with African scholarship, firm-level supply-chain audits, and UN governance data?

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — "Hydrocarbon and Critical-Mineral Chokepoint Map"

Draw a simplified world map on A3 or a large whiteboard. Sketch the outlines of North America, South America, Europe, Africa, the Middle East, South and Southeast Asia, East Asia, and Australia; do not attempt political detail. Draw thick blue arrows for major hydrocarbon flows: Persian Gulf to East Asia through the Strait of Hormuz and the Strait of Malacca; Russia to Europe through pipelines and the Baltic/Black Sea; US Gulf Coast LNG to Europe and Asia. Draw thick green arrows for critical-mineral flows: DRC and Zambia to global battery markets; Indonesia to China and Korea; Chile and Argentina to China, Korea, and Japan; Australia to China; China's REE and graphite exports to Japan, Korea, Europe, and North America. Mark chokepoints with red "X" symbols and labels: Hormuz, Malacca, Bab el-Mandeb, Suez, Panama, Cape of Good Hope, and the Taiwan Strait. Add a small legend in the bottom right: blue = hydrocarbons, green = critical minerals, red X = chokepoint. Annotate perspective overlays in the margins: African (green) — "value addition, not extraction corridors"; Chinese (blue) — "BRI logistics and state-backed offtake"; Russian (black) — "commodity leverage and sanctions evasion routes"; Western (red) — "supply security and friend-shoring"; UN (purple) — "maritime security, SDG 7, and governance." The visual teaches that chokepoints are not only geographic; they are also institutional, because refining and finance can be more constraining than straits.

Visual 2 — "EV Battery Supply Chain Funnel with Concentration Labels"

Draw a horizontal funnel or staged pipeline from left to right. Stage 1, "Mining," is the widest box and contains icons or labels: Li, Co, Ni, graphite, Mn, Cu. Stage 2, "Refining/Processing," is narrower and labeled "China-dominant." Stage 3, "Cathode/Anode," is narrower still. Stage 4, "Cell Manufacturing," is narrower. Stage 5, "Pack + Vehicle," is narrower. Stage 6, "Recycling," is drawn as a curved arrow looping from Stage 5 back to Stage 1, but thinner to show its immaturity. Inside each box, write approximate concentration labels from Table 2: mining "DRC cobalt ~70%," "Indonesia nickel ~50%"; refining "China REE ~85–90%," "China cobalt ~70–75%"; cells "China ~70–75%." Use color coding: green for African resource states, blue for Chinese processing, red for Western assembly markets, black for Russian commodity leverage, purple for UN governance. Add a vertical "value added" arrow on the right, rising from mining to cells, with a note: "Value capture rises downstream; rent and risk rise upstream." The visual teaches that the same mineral can be geopolitically weak at the mine and strategically powerful at the refinery or cell plant.

Visual 3 — "Rentier State and Resource Curse Causal Loop"

Draw a large circle in the center of the page. Place six nodes around it, connected by clockwise arrows: (1) "Concentrated resource rent," (2) "State revenue without broad taxation," (3) "Weakened fiscal contract with citizens," (4) "Patronage and clientelism," (5) "Authoritarian resilience or conflict," (6) "Underinvestment in diversification," which loops back to (1). Add an inner arrow from (1) to "Dutch disease / exchange-rate appreciation," then to "Non-resource tradables shrink," then back to (6). Add a dashed arrow from (5) to "External intervention or sanctions," and a dashed arrow from (2) to "Sovereign wealth fund / stabilization fund" as a possible break in the loop. Label the center "Rentier mechanism (Karl; Ross)." Annotate perspective overlays: African (green) — "extraversion, statecraft, and the politics of the belly (Bayart; Mamdani)"; Chinese (blue) — "state capacity and infrastructure-led development"; Russian (black) — "commodity state and sanctions adaptation"; Western (red) — "institutions, property rights, and diversification"; UN (purple) — "EITI, SDG 16, and resource governance." The visual teaches that the resource curse is not a property of rocks; it is a fiscal and political mechanism that can be interrupted by institutions, taxation, and diversifica-

tion.

SECTION 4 — CORNELL NOTES

Cue (question / keyword)	Notes (with source log)
What is the "oil weapon," and what did 1973 change?	The 1973 Arab oil embargo showed that supply restriction could be used as coercive leverage, not merely as commercial policy. It accelerated petrodollar recycling, US-Saudi security bargains, and a rethinking of energy security. Source: Yergin (1991, 2011).
What are chokepoints in resource geopolitics?	Chokepoints include straits, pipelines, ports, refining hubs, and financial clearing systems. A chokepoint is a node where disruption is cheap for the attacker and costly for the defender. Source: Klare (2012); Yergin (2011).
What is petrodollar recycling?	Oil revenues earned by producers were recycled through Western banks and sovereign investments, linking energy rents to global finance and US Treasury markets. It tied resource rents to monetary and security orders. Source: Yergin (1991).
What is energy transition geopolitics?	The shift from fossil fuels to electrification changes the material basis of power: from oil and gas reserves to lithium, cobalt, nickel, graphite, copper, and REEs. New dependencies replace old ones; they do not eliminate dependency. Source: IEA Critical Minerals Outlook (2024); Klare (2012).
What is resource nationalism?	Resource nationalism is state assertion of control over extraction, processing, or export of natural resources, often through bans, taxes, nationalization, or local-content rules. Cases: DRC-Zambia battery initiative, Indonesia nickel export ban, Mexico lithium nationalization. Source: Sanderson (2022); IEA (2024).
What is rentier state theory?	A rentier state derives a large share of revenue from external rents rather than domestic taxation, weakening the fiscal contract and accountability. Source: Karl (1997).

Cue (question / keyword)	Notes (with source log)
What is the resource curse?	The resource curse is the observed association between resource wealth and poor development outcomes, authoritarianism, or conflict; it operates through fiscal, exchange-rate, institutional, and conflict mechanisms. Source: Ross (2012); Karl (1997).
What is Dutch disease?	Resource exports appreciate the real exchange rate, shrinking non-resource tradables such as manufacturing and agriculture. It is one mechanism, not the whole curse. Source: Ross (2012).
What is the African perspective on mineral geopolitics?	African scholarship stresses resource sovereignty, value-chain upgrading, extraversion, and the political economy of the state; AfCFTA is framed as a platform for regional industrialization, not only market access. Sources: Grovogui; Mbembe; Bayart; Mamdani; Rodney; Nkrumah; Nyerere; Cabral; Fanon; Aning; Danso; Tamale; Oyěwùmí.
What is the Chinese perspective?	China treats mineral supply chains as state-backed industrial strategy: offtake agreements, processing dominance, infrastructure, and "win-win" development rhetoric. It emphasizes capacity building but is criticized for opacity and asymmetry. Source: IEA (2024); Sanderson (2022).
What is the Western perspective?	Western policy frames mineral geopolitics as supply-chain security, de-risking, friend-shoring, and resilience; it often underestimates how its own consumption and corporate sourcing shape extraction. Source: IEA (2024); Klare (2012).
What is the UN perspective?	The UN perspective links minerals to SDG 7, EITI, human rights, environmental governance, and just transition; it seeks transparency and benefit-sharing but has limited enforcement. Source: IEA (2024); Ross (2012).
What is the Russian perspective?	Russia treats energy and commodities as instruments of state power, sanctions adaptation, and geopolitical leverage; its commodity-state model is rent-dependent and vulnerable to price and technology shocks. Source: Yergin (2011); Klare (2012).

Source log: Yergin (1991, 2011); Karl (1997); Ross (2012); Klare (2012); IEA Critical Minerals Outlook (2024); Sanderson (2022); USGS Mineral Commodity Summaries (2024); African scholarship: Grovogui, Mbembe, Bayart, Mamdani, Rodney, Nkrumah, Nyerere, Cabral, Fanon, Aning, Danso, Tamale, Oyěwùmí.

Summary: Energy and critical-mineral geopolitics are not simply about who owns resources; they are about which stages of the supply chain create leverage, how rents reshape states, and how the energy transition reorganizes global power. The 1973 oil embargo revealed the coercive potential of concentrated supply, while contemporary mineral data show that processing and manufacturing can be more constraining than geology. Resource nationalism, rentier mechanisms, and great-power competition all operate through these chokepoints, but their effects depend on institutions, perspective, and level of analysis. African, Chinese, Russian, Western, and UN frameworks each illuminate different parts of this system and obscure others.

SECTION 5 — FEYNMAN COMPRESSION

1. **Explain without jargon.** Countries used to fight and bargain over oil because a few places had most of it and could turn off the tap. Now they also fight and bargain over minerals needed for batteries, wind turbines, and electronics. The trick is that having the rock in the ground is not the same as knowing how to refine it, make batteries, or recycle them. Some countries sell raw materials cheaply and buy expensive finished goods; others control the factories and keep the profits. When a government depends on resource money instead of taxes, it may answer to buyers and elites rather than citizens, which can make politics less accountable. The energy transition does not end resource politics; it moves it from oil wells to mines, refineries, and battery plants.

2. **Mark gaps.** I am unsure whether I can distinguish "reserves" from "resources" without looking up USGS definitions. I also blurred the difference between mining concentration and processing concentration, which is the central analytical distinction in this lesson. I need to verify the exact shares for cobalt refining and gallium production before using them in an exam answer. I have not yet explained why Indonesia's nickel ban is simultaneously a development strategy and a WTO problem. I also need to be clearer about whether rentier theory predicts authoritarianism or merely makes it more likely.

3. **Reread verification.** Rechecking the data: China's dominance is strongest in processing, separation, and cell manufacturing, not necessarily in mining; DRC dominates cobalt mining but not refining; Indonesia dominates nickel mining after its downstreaming policy; gallium is an extreme near-monopoly case. Rechecking theory: Karl and Ross describe mechanisms and probabilities, not iron laws; Dutch disease is one channel among several; rentier effects depend on institutions, regime type, and time horizon. Rechecking perspectives: African sovereignty claims are not reducible to anti-Westernism; Chinese "win-win" claims are not reducible to deception; Western security claims are not reducible to imperialism; Russian commodity leverage is not reducible to irrational aggression; UN governance claims are not reducible to technocracy.

4. **Analogy with explicit limits.** Think of the battery supply chain like a river: the mine is the headwater, the refinery is the dam, the battery plant is the turbine, and the car is the electricity delivered to a house. Whoever controls the dam can decide how much water reaches the turbine, even if they do not own the headwater. The analogy helps show why processing concentration matters more than reserve concentration. Its limit is that rivers are natural and fixed, whereas supply chains are built by firms, states, subsidies, and regulations; a dam can be bypassed by new investment, recycling, or substitution, but only over years and at high cost.

5. **Rewrite.** Resource geopolitics in the energy-transition era is best understood as a contest over stages, not just stocks. Hydrocarbon power rested on concentrated reserves and chokepoints such as Hormuz

and Malacca; critical-mineral power rests on a chain in which mining is often dispersed, refining and manufacturing are concentrated, and recycling is still immature. The 1973 oil embargo demonstrated that supply restriction can restructure global political economy, but a mineral equivalent would most likely operate through processing or export controls rather than through a simple embargo on raw ore. Rentier theory explains why resource rents can weaken accountability and diversification, yet it is a conditional mechanism, not a destiny. African, Chinese, Russian, Western, and UN perspectives each identify real features of this system—sovereignty, state capacity, leverage, security, and governance—while each also risks obscuring the others. The policy problem is therefore not to "secure" minerals in the abstract, but to decide which stage of the chain to build, under what rules, and with whose participation.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L19	definition	What is the "oil weapon" and when was it first deployed at scale?	The "oil weapon" refers to the use of petroleum supply restrictions as coercive leverage in international politics; its canonical deployment was the 1973 OAPEC embargo, which quadrupled oil prices and triggered stagflation in import-dependent economies. The mechanism works through inelastic short-run demand and concentrated supply.	African states largely experienced the 1973 shock as price-takers with limited leverage; the embargo nonetheless catalyzed early resource-nationalist thinking in OPEC's African members (Algeria, Libya, Nigeria).

Tag	Card Type	Front	Back	Perspective Note
L19	mechanism	How does petrodollar recycling transmit oil rents into global financial markets?	After the 1973 price surge, OPEC surpluses were deposited in Western banks, which re-lent them to developing-country borrowers, creating a debt-recycling circuit that linked oil rents to sovereign debt crises by the 1980s. The mechanism is a balance-of-payments and credit-channel transmission.	From an African vantage, petrodollar recycling deepened external debt dependency; Rodney's underdevelopment thesis reads this as a structural extraction of surplus.
L19	definition	What are critical minerals and why does the energy transition revalue them?	Critical minerals are non-fuel minerals essential to clean-energy technologies (lithium, cobalt, nickel, rare earths) whose supply concentration and lack of substitutes make them strategically vital; the transition from hydrocarbons to electrification shifts the material basis of power from fuel reserves to mineral endowments and processing capacity.	African deposits (DRC cobalt, Zimbabwe lithium) are revalued, but without processing capacity the rent capture remains offshore.

Tag	Card Type	Front	Back	Perspective Note
L19	mechanism	What is the resource curse and what are its principal causal channels?	The resource curse denotes the paradox that resource-rich states often grow slower and govern worse; principal channels include rentierism (state funded by rents not taxes, weakening accountability), Dutch disease (currency appreciation crowding out tradables), and conflict financing (lootable resources funding rebellion).	Mamdani and Bayart stress that the "curse" is mediated by colonial state structures and elite bargains, not geology alone.
L19	theory	State rentier theory: what does Karl (1997) argue about petro-states?	Karl argues that oil booms produce "petro-states" whose fiscal structure—revenue from rents rather than taxation—weakens state-society accountability, centralizes power, and distorts institutional development; the effect is path-dependent and hard to reverse.	African petro-states (Nigeria, Angola) illustrate the thesis but also its limits: civil society and federal structures mediate outcomes.

Tag	Card Type	Front	Back	Perspective Note
L19	application	What was Indonesia's 2020 nickel export ban and what was its stated purpose?	Indonesia banned raw nickel exports in 2020 to force domestic processing and capture value-added in the EV battery supply chain; it triggered a WTO dispute (EU complaint) while attracting Chinese and other investment in smelters.	From a Global South perspective, the ban is a legitimate industrial-policy tool; from a WTO-rules perspective, it violates export-restriction disciplines.
L19	comparison	How do the US IRA and EU CRMA differ in approach to critical minerals?	The US Inflation Reduction Act uses tax credits and friend-shoring to incentivize domestic/ally processing; the EU Critical Raw Materials Act sets domestic extraction/processing targets and strategic project lists. Both aim at de-risking from China but differ in fiscal scale and regulatory method.	African suppliers seek to leverage both frameworks for value-chain upgrading rather than raw export.

Tag	Card Type	Front	Back	Perspective Note
L19	source	What does Ross (2012) identify as the "oil curse" mechanism?	Ross argues petroleum wealth tends to produce authoritarianism, reduced economic growth, and civil war risk, operating through taxation (rents replace taxes), spending (patronage), and group (ethnic/sectarian) channels.	The thesis is contested in Africa: Botswana's diamond management and Norway's oil fund show institutional mediation.
L19	debate	Is resource nationalism development strategy or WTO violation?	Proponents frame export bans and nationalization as sovereign industrial policy to capture value-added; critics (WTO panels, trading partners) frame them as discriminatory restrictions violating GATT Article XI and TRIMs. The adjudication depends on whether development gains outweigh rule erosion and retaliation.	African and Indonesian voices stress policy space; Western legalist voices stress rules-based trade.

Tag	Card Type	Front	Back	Perspective Note
L19	reconstruction	How does the Chinese perspective frame critical-mineral supply chains?	China frames its mineral and processing dominance as market-driven comparative advantage and "win-win" cooperation, emphasizing infrastructure-for-resources deals and state-backed offtake; it occludes concerns about coercion, environmental harm, and strategic leverage.	African partners must weigh infrastructure gains against debt and value-capture asymmetries.
L19	occlusion	What does the Western "supply-chain security" frame occlude?	The friend-shoring/de-risking frame occludes the historical role of Western firms in extractive enclaves, the environmental costs shifted to producer states, and the possibility that producer-country industrial policy (not just ally sourcing) is legitimate.	African scholars (Grovogui, Mbembe) read "security" as a re-inscription of imperial resource access.

Tag	Card Type	Front	Back	Perspective Note
L19	adjudication	How should one adjudicate between resource sovereignty and WTO compliance?	Adjudication requires weighing the development gains of value-chain upgrading against the systemic costs of eroding trade rules and provoking retaliation; evidence includes post-ban FDI in processing, WTO panel rulings, and terms-of-trade effects. Neither pure sovereignty nor pure compliance is costless.	The African perspective privileges policy space; the UN perspective privileges multilateral rules plus capacity building.
L19	visual	What does the EV battery supply chain by stage reveal about power?	The chain runs mining (DRC cobalt, Indonesia nickel) → refining (China dominant) → cathode/precursor → cell manufacturing → pack assembly; power concentrates at refining and cell stages, so mining states capture least value.	Value-chain upgrading (DRC-Zambia battery initiative) targets the refining/cell gap.

Tag	Card Type	Front	Back	Perspective Note
L19	application	What is the DRC-Zambia battery initiative?	A 2022 agreement to develop a regional battery value chain from cobalt/copper, aiming to move from raw export to precursor and cell production; it exemplifies African resource sovereignty and AfCFTA-linked industrialization.	It tests whether regional integration can overcome scale and infrastructure deficits.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence Audit (score 0–100)

Skill / Knowledge Area	Confidence (0–100)	Evidence of Mastery (self-assessed)
Hydrocarbon geopolitics: oil weapon, petrodollar recycling, chokepoints		
Energy transition and critical-mineral revaluation		
Resource nationalism: Indonesia, DRC-Zambia, Mexico		
Rentier state theory and resource curse mechanisms		
Scramble for critical minerals: US, EU, China policies		
Worked example: 1973 oil embargo reconstruction		
Problem pair: Indonesia nickel ban adjudication		
Five-perspective reconstruction (all five)		
Data lab: reserves, concentration, supply-chain stages		
Distinguishing description / explanation / prediction / prescription		

7.2 Three-Question Debrief

1. Which of the five perspectives was hardest to steel-man from within, and what specifically resisted reconstruction (a premise, a normative commitment, or an evidentiary gap)?
2. In your adjudication of the Indonesia nickel case, did you initially conflate a descriptive claim (what happened to FDI) with a normative claim (what should be permitted)? If so, where?
3. What single piece of evidence—WTO panel ruling, post-ban smelter FDI data, or terms-of-trade movement—would most change your verdict, and in which direction?

7.3 Error-Log

Common Misconception	Correction	Evidence
"The 1973 embargo caused the oil price rise by itself."	The embargo was the trigger; the price quadrupling also reflected OPEC's unilateral pricing power, inelastic demand, and the collapse of the Bretton Woods fixed-rate system.	Yergin (1991); the embargo was lifted in March 1974 but prices remained elevated.
"The resource curse is an iron law of geology."	It is a conditional regularity mediated by institutions, state structure, and elite bargains; Botswana and Norway are counter-cases.	Ross (2012); Karl (1997).
"China's mineral dominance is purely market-driven."	State-backed offtake, subsidized processing, and strategic stockpiling are policy-driven; "win-win" framing occludes leverage.	IEA Critical Minerals Outlook (2024) on concentration.
"Resource nationalism always violates WTO law."	Export restrictions may be justified under GATT exceptions or pursued outside WTO disciplines; legality is case-specific and contested.	Indonesia nickel WTO dispute (EU complaint, 2021).
"Friend-shoring solves supply-chain vulnerability."	It relocates concentration among allies without addressing processing bottlenecks or producer-country value capture; it may provoke retaliation.	Sanderson (2022) on supply-chain concentration.
"Critical minerals will simply replace oil as the new 'curse'."	The material basis changes (stock vs. flow, recyclability, geographic dispersion), so mechanisms differ; not all minerals are equally lootable or rentier-producing.	IEA (2024) on recycling and substitution potential.

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Oil weapon; petrodollar recycling; chokepoints (Hormuz, Malacca, Bab el-Mandeb)	Supply restriction → price spike → inflation/stagflation; rent recycling → debt crises	Yergin (1991, 2011) on oil history; Klare (2012) on resource scramble	1973 OAPEC embargo; 1979 Iranian revolution; 1990 Gulf War	Was 1973 a structural break or cyclical shock?	Prices fall back to pre-embargo levels within 12 months; no stagflation	L10 imperialism; L17 world-systems; L38 energy coercion
Critical minerals; rare earths; energy transition	Electrification shifts power from fuel reserves to mineral endowments + processing capacity	IEA Critical Minerals Outlook (2024)	China's share of REE refining; DRC cobalt; Indonesia nickel	Is transition a new scramble or development opportunity?	Substitution/recycling eliminates mineral bottlenecks	L33 minerals in Africa; L51 climate
Resource nationalism	Export bans → forced domestic processing → value-added capture; nationalization → state control	Sanderson (2022) on supply chains	Indonesia 2020 nickel ban; Mexico lithium nationalization; DRC-Zambia battery initiative	Development strategy vs. WTO violation	No post-ban processing FDI; WTO panel rules against with no appeal	L46 hydrocarbons; L52-53
Rentier state; resource curse	Rents replace taxes → weakened accountability; Dutch disease; conflict financing	Karl (1997); Ross (2012); Mamdani; Bayart	Nigeria, Angola petro-states; Botswana counter-case	Curse as iron law vs. institutional mediation	Resource-rich state with strong institutions grows faster than non-resource peers	L10; L17

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Scramble for critical minerals	US IRA tax credits; EU CRMA targets; China state-backed offtake	Farrell & Newman (weaponized interdependence)	MSP (Minerals Security Partnership); EU strategic projects	Friend-shoring vs. producer-country industrial policy	Ally sourcing eliminates all concentration risk	L33; L38

SECTION 9 — REVIEW SCHEDULE

- **R1 (same day, 15 min):** Re-read the five Key Ideas' bolded causal claims and mechanisms; recite the 1973 embargo sequence from memory without notes.
- **R2 (next day, 30 min):** Reconstruct all five perspectives on the Indonesia nickel case in 3–5 sentences each; check against Section 2.7.
- **R3 (day 3, 45 min):** Complete the Data Lab tables from memory (reserves, concentration, supply-chain stages); verify against Section 2A.
- **R4 (week 1, 60 min):** Write a 300-word adjudication of the Indonesia case distinguishing description, explanation, prediction, and prescription; compare to the model answer.
- **R5 (month 1, 90 min):** Re-derive the rentier-state mechanism and its scope conditions; apply to a new case (e.g., Zimbabwe lithium) and test falsifiers.

SECTION 10 — COMPLETION CHECKLIST

☐ I can state the 1973 oil embargo's mechanism, actors, and consequences without notes.
☐ I can explain petrodollar recycling as a credit-channel transmission.
☐ I can define critical minerals and explain why the transition revalues them.
☐ I can trace the EV battery supply chain by stage and locate power concentration.
☐ I can explain Indonesia's 2020 nickel ban and its dual framing.
☐ I can state Karl's (1997) rentier-state argument and its scope conditions.
☐ I can state Ross's (2012) three channels of the oil curse.
☐ I can compare US IRA, EU CRMA, and China's state-backed offtake.
☐ I can reconstruct all five perspectives on resource geopolitics.
☐ I can identify what each perspective occludes.
☐ I can adjudicate the Indonesia case with explicit falsifiers.
☐ I can distinguish description, explanation, prediction, and prescription.
☐ I can interpret the Data Lab tables (reserves, concentration, supply chain).
☐ I can apply the rentier mechanism to a new case.
☐ I can name the strongest counterargument to resource nationalism.
☐ I can link this lesson to L10, L17, L33, L38, L46, L51–53.

21. Strategic Thought and Coercion: Clausewitz, Sun Tzu, Schelling

LESSON METADATA

Field	Value
Lesson number and title	Lesson 20: Strategic Thought and Coercion: Clausewitz, Sun Tzu, Schelling
Module	Module 4: Security Studies and Warfare
Prerequisites	L5 (realism), L11 (interwar), L12 (Cold War)
Interleaved links	Forward to L21 (nuclear), L22 (conventional), L23 (asymmetric), L24 (cyber), L25 (maritime/space)
Reading load	7-9 hours
Content channels	Text, tables, worked example, problem pair, data lab, dual-coded visuals
Bloom ceiling	Evaluate / Create
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

The central puzzle of this lesson is deceptively simple to state and extraordinarily difficult to resolve: **why do states and non-state actors so often fail to get what they want through threats, even when they possess overwhelming material superiority, and why do the theories that dominate international relations scholarship predict this failure so poorly when applied outside the North Atlantic core?** The question is not merely empirical. It is theoretical, because the answer depends on which strategic tradition one inhabits. The vocabulary of coercion that most graduate students inherit—deterrence, compellence, bargaining, resolve, audience costs, focal points—was forged in a specific intellectual lineage running from Carl von Clausewitz through Thomas Schelling, and it carries with it a set of ontological commitments about what war is, what politics is, and what a "state" is that are not shared by the strategic traditions of Beijing, Moscow, Tehran, or the hybrid security orders of the African continent. This lesson exists to make that lineage visible, to reconstruct the alternatives on their own terms, and to equip the student to adjudicate between them rather than to default to the Western framework as if it were the natural language of strategy.

The lesson sits at a pivotal node in the curriculum. It builds directly on Lesson 5 (realism), which established the structural logic of anarchy and the distribution of capabilities; on Lesson 11 (interwar), which traced the collapse of collective security and the appeasement debates that first forced strategists to think seriously about the credibility of threats; and on Lesson 12 (Cold War), which institutionalized deterrence as the organizing concept of superpower rivalry. Those three lessons supplied the structural and historical scaffolding. This lesson supplies the *theoretical* machinery: the concepts that allow one to move from "states compete for power" to "this specific threat, issued at this specific moment, with this specific audience, will or will not produce compliance." Without that machinery, the student can describe Cold War crises but cannot explain why the Cuban Missile Crisis ended in withdrawal rather than war, or why the 1990–91 coercive diplomacy sequence failed to compel Saddam Hussein to leave Kuwait before force was applied. The lesson also prepares the ground for Lessons 21 through 25, each of which examines a domain of warfare—nuclear, conventional, asymmetric, cyber, maritime and space—and each of which presupposes a theory of coercion that this lesson makes explicit and contestable.

By the end of this lesson, the student will be able to do four things that are genuinely difficult and that most practitioners and scholars do only partially. First, she will be able to reconstruct, from within, five distinct strategic traditions—African, Chinese, Russian, Western, and UN—and to state what each contributes to the understanding of coercion and what each systematically occludes. Second, she will be able to apply the Clausewitzian trinity, the Sun Tzu relational-strategic logic, and the Schelling bargaining model to the same case and to specify the mechanism by which each predicts a different outcome. Third, she will be able to distinguish description from explanation, prediction from prescription, and to identify the falsifiers that would cause her to abandon a given theoretical commitment. Fourth, she will be able to recognize that "strategic culture" is not a residual category for explaining deviations from rational-actor predictions but a constitutive feature of how actors define interests, costs, and credibility in the first place. These are not memorization tasks. They are analytical capacities that require the student to hold multiple theoretical frameworks in tension and to adjudicate between them on evidence.

The theoretical stakes are high because the three canonical figures around whom the lesson is organized do not merely disagree about tactics; they disagree about ontology. Clausewitz, in *On War* (1832), defines war as "an act of force to compel our enemy to do our will" and insists that war is "the continuation of political intercourse with the addition of other means." For Clausewitz, the political object determines the military objective, the military objective determines the means, and the whole enterprise is governed by a trinity

of passion (the people), chance (the commander and army), and reason (the government). War is thus an instrument, but an instrument of a peculiar kind: one in which friction, uncertainty, and the independent will of the adversary make outcomes probabilistic rather than deterministic. The culminating point of victory—the moment at which the attacker's strength is exhausted and the defender's counterattack becomes viable—is a concept that follows directly from this instrumental logic. Sun Tzu, writing in a radically different strategic culture, inverts much of this. The *Art of War* treats war not as the continuation of politics but as a failure of politics, or at best as a last resort whose ideal outcome is victory without battle. The relational-strategic tradition emphasizes deception, positional advantage, and the manipulation of the adversary's perceptions and alliances rather than the application of force. Attrition is criticized not because it is costly but because it is stupid: it destroys the very object one seeks to possess. Schelling, in *Arms and Influence* (1966), performs a different kind of inversion. He argues that the most important use of force is not to destroy but to coerce—to manipulate the adversary's expectations about future costs. The distinction between brute force and coercion, between deterrence and compellence, between the threat that keeps an adversary from acting and the threat that makes an adversary undo what he has done, becomes the organizing framework of Cold War strategic thought and, through it, of contemporary IR theory.

The African perspective is not a regional illustration of these debates; it is a challenge to their premises. The post-colonial critique, developed by scholars such as Siba Grovogui, Achille Mbembe, and Jean-François Bayart, begins from the observation that the Clausewitzian state—the rational, unitary actor with a monopoly of legitimate violence—was never the African reality and was imposed as a normative ideal through colonialism. African security orders are hybrid: they combine state military forces with militias, traditional authorities, religious networks, and transnational criminal economies. Coercion in such orders is not primarily interstate bargaining but a continuous, multi-actor process in which the "state" is one competitor among many. This vantage point reveals what the Western framework occludes: that the distinction between war and peace is itself a Western construct, that "resolve" is not a property of governments but of social coalitions, and that the very concept of "compellence" assumes a clarity of political objectives that post-colonial states rarely possess. The African tradition also draws on liberation-strategy thinkers—Amílcar Cabral, Frantz Fanon, Julius Nyerere, Kwame Nkrumah—who theorized coercion not as bargaining between states but as the mobilization of populations against colonial and neo-colonial domination. Their insights are not footnotes to Clausewitz; they are alternative foundations.

The methodological commitment of this lesson is that no tradition is treated as the default. Each is reconstructed from within, with its strongest arguments and its characteristic blind spots, and each is subjected to the same evidentiary standards. The student is expected to move between levels of analysis—individual, state, systemic, transnational—recognizing that a theory adequate at one level may fail at another. The worked example (the Cuban Missile Crisis) and the problem pair (the 1990–91 Gulf War coercive diplomacy sequence) are chosen precisely because they are cases in which the dominant Western framework appears to succeed and then appears to fail, forcing the student to ask whether the framework is adequate or whether the apparent success is an artifact of case selection. The data lab, drawing on SIPRI military expenditure data, COW interstate war frequency, and ICB crisis bargaining outcomes, provides the empirical discipline that prevents theoretical debate from becoming merely rhetorical. The lesson's ultimate ambition is to produce a student who can enter a strategic debate—whether in a seminar room, a policy office, or a conflict zone—and identify not only what is being argued but which tradition's premises are being silently assumed, and at what cost.

SECTION 1 — Pre-Class Priming

1.1 Retrieval Warm-Up

Answer each question from memory before reading the lesson. These draw on Lessons 5, 11, and 12.

1. **(L5)** In Waltz's structural realism, what are the two core assumptions about the international system that generate the security dilemma, and how does the security dilemma differ from a prisoner's dilemma in terms of information and intentionality?
2. **(L5)** Mearsheimer's offensive realism predicts that great powers will seek hegemony. What is the scope condition that limits this prediction, and what evidence from the interwar period (L11) would a critic cite to challenge it?
3. **(L11)** The appeasement debates of the 1930s turned on competing assessments of Hitler's intentions. How did the "guilty men" critique and the "realist" defense of appeasement differ in their implicit theories of credibility and resolve?
4. **(L12)** During the Cold War, what was the difference between "massive retaliation" and "flexible response," and which strategic theorist's framework (covered in this lesson) most directly influenced the shift from one to the other?
5. **(L12)** The Cuban Missile Crisis is often cited as a triumph of deterrence. What are two alternative interpretations—one emphasizing luck and one emphasizing misperception—that challenge the "rational bargaining" reading?
6. **(L5/L12)** How does the concept of "audience costs" (Fearon 1994) connect the domestic-political level of analysis to the systemic level, and what is the strongest critique of its empirical validity?

1.2 Orientation Questions

These questions frame the lesson's central puzzle. Do not answer them yet; hold them in mind as you read.

1. If war is "the continuation of politics by other means," why do so many wars fail to achieve their political objectives, and does this failure indicate a flaw in Clausewitz's framework or in its application?
2. Can a state "win without fighting," and if so, is the victory achieved through coercion (Schelling) or through the restructuring of the adversary's preferences (Sun Tzu)? What evidence would distinguish the two mechanisms?
3. Why did the United States fail to compel Iraqi withdrawal from Kuwait through threats alone in 1990, despite overwhelming military superiority and a broad coalition, and what does this failure imply about the limits of compellence?
4. Does the African experience of hybrid security orders and non-state coercion refute the Clausewitzian model, or does it reveal that the model was always a special case applicable only to consolidated European states?

1.3 Vocabulary Pre-Teach

Provisional definitions to be refined through the lesson.

1. **Coercion** — The use of threats (and sometimes limited force) to manipulate an adversary's cost-benefit calculus so that he chooses to comply; distinct from brute force, which seeks to destroy the adversary's capacity to resist.

2. **Deterrence** — A threat issued to prevent an adversary from taking an action he has not yet taken; the threat must be credible and the adversary must believe compliance is preferable to defiance.
3. **Compellence** — A threat issued to make an adversary undo an action already taken or to take an action he does not wish to take; generally harder than deterrence because it requires the adversary to accept visible defeat.
4. **Friction** — Clausewitz's term for the cumulative effect of uncertainty, chance, physical exhaustion, and human fallibility that makes war plans deviate from reality; the gap between theory and practice.
5. **Culminating point of victory** — The moment in an offensive campaign at which the attacker's strength is exhausted and further advance becomes counterproductive; beyond this point, the defender's counterattack becomes viable.
6. **Trinity (Clausewitz)** — The three elements of war: passion (the people), chance (the commander and army), and reason (the government); no single element can dominate without distorting the whole.
7. **Relational strategy (Sun Tzu)** — A strategic approach that emphasizes the manipulation of relationships, alliances, and perceptions rather than the direct application of force; victory is achieved by making the adversary's position untenable before battle.
8. **Focal point (Schelling)** — A solution to a coordination or bargaining problem that is salient to all parties because of its prominence, uniqueness, or cultural significance; enables tacit bargaining without explicit communication.
9. **Audience costs** — The domestic political price a leader pays for backing down from a public threat; Fearon (1994) argues that audience costs make threats more credible by raising the cost of non-compliance for the threatening state.
10. **Costly signal** — A signal whose cost is differentially borne by actors with different types of resolve or capability; because only resolved actors can afford to send it, the signal is credible.
11. **Strategic culture** — The set of shared beliefs, assumptions, and symbols that shape how a strategic community defines interests, perceives threats, and evaluates the use of force; not a residual category but a constitutive framework.
12. **Hybrid security order** — A security environment in which state military forces coexist and compete with non-state armed actors, traditional authorities, and transnational networks; characteristic of many post-colonial states, particularly in Africa.

SECTION 2 — LESSON CORE

2.1 Learning objectives By the end of this lesson, you will be able to: (1) **Explain** Clausewitz's claim that war is a continuation of politics by other means, specifying how political purpose, military means, and friction interact in his trinity; (2) **Analyze** the mechanisms through which an offensive reaches its culminating point and why that point is not simply a matter of casualties but of the balance between offensive and defensive power; (3) **Compare** Clausewitz's instrumental and state-centric theory of war with Sun Tzu's relational-strategic tradition, Schelling's bargaining model, and African critiques of the state monopoly on violence; (4) **Evaluate** whether Clausewitzian concepts travel to cases of hybrid security orders, non-state coercion, and transnational violence, using explicit scope conditions rather than treating the theory as universally valid; and (5) **Apply** the trinity, friction, and culminating-point concepts to a concrete crisis or war, distinguishing description of events from causal explanation, prediction, and prescription. These objectives require you to move beyond memorizing definitions: you must identify the mechanism that links a political decision to a military outcome, specify when that mechanism is likely to fail, and reconstruct how different

strategic traditions would interpret the same evidence. The assessment standard is not whether you can recite Clausewitz's aphorisms, but whether you can use his framework to generate falsifiable expectations about escalation, exhaustion, and political control, while recognizing the strongest objections from alternative traditions.

2.2 KEY IDEA 1 — Clausewitz: war as continuation of politics, the trinity, friction, the culminating point Bolded Causal Claim: War is not an autonomous activity governed by its own logic; it is an instrument of policy whose meaning, limits, and termination are set by political purpose, while its execution is systematically distorted by friction and bounded by the culminating point at which offensive power is exhausted.

Mechanism: Clausewitz's core mechanism is a chain of subordination and distortion. Political authority defines the object of the war—what is at stake, how much value the state attaches to it, and what sacrifices are proportionate. That political valuation sets the scale and intensity of military effort. Military force is then applied as a means, but it does not travel from intention to outcome in a straight line. Friction—uncertainty, weather, fatigue, miscommunication, enemy resistance, chance, and the fog of war—degrades every plan. The trinity captures this three-part structure: primordial violence and hatred, the play of chance and probability, and subordination to reason and policy. The first two elements explain why war tends toward escalation and unpredictability; the third explains why it must still be governed by political judgment. The culminating point is the mechanism's terminal brake: as an offensive advances, its own strength is consumed by distance, supply, casualties, and the defender's increasing advantage, while the defender's resistance may be renewed by interior lines, popular mobilization, or external support. At the culminating point, the attacker's remaining offensive power no longer exceeds the defender's capacity to resist; continuing beyond that point risks not merely stalemate but reversal. Thus the political object sets the aim, friction shapes the path, and the culminating point sets the outer boundary of feasible military success. The theory is not a prediction that every offensive will stop rationally; it is a claim that rational strategy must identify the point at which the means no longer serve the end.

Scope Conditions: Clausewitz's framework is strongest where there is a recognizable sovereign authority, a defined political object, a bounded theater, and a distinction between military and political spheres. It travels less well where authority is fragmented, where violence is constitutive of political order rather than an instrument chosen by a state, where non-state actors set the tempo of coercion, or where the "war" is continuous with policing, criminality, and social domination. It also assumes that the defender and attacker can be distinguished, that logistics and territory matter, and that the political object can be stated with enough clarity to guide military means. In cyber, maritime, or transnational cases, the culminating point may be harder to locate because effects are distributed, attribution is uncertain, and the defender's "resistance" may be institutional rather than territorial. The framework should therefore be treated as a scope-sensitive theory of interstate war, not as a universal grammar of all violence.

Observable Implications: If Clausewitz's mechanism is operating, one should observe political leaders attempting to define war aims before or during military action; military plans being revised because of friction; offensives slowing or failing as supply lines lengthen; defenders gaining relative advantage as the attacker overextends; and decisions to terminate or limit war based on a reassessment of the political object rather than on battlefield metrics alone. One should also observe the trinity in tension: popular passions pushing toward escalation, commanders struggling with uncertainty, and governments trying to impose political limits. A useful test is whether the culminating point can be identified independently of hindsight: if analysts can specify in advance the logistical, geographic, or political conditions under which an offensive will stall,

the theory has explanatory power; if the stall is attributed only after the fact, the concept risks becoming tautological.

Perspective Note (five traditions in brief): The African perspective, treated here as primary, does not merely add African cases to Clausewitz; it questions the ontological premises on which his theory rests. Clausewitz assumes a sovereign state that monopolizes legitimate violence and uses war as an instrument of policy. Much African scholarship on security, from post-colonial political economy to studies of hybrid orders, emphasizes that violence is often not an instrument chosen by a pre-existing state but a medium through which authority, wealth, and belonging are constituted. Mamdani's analyses of the colonial and post-colonial state, Mbembe's work on necropolitics, and Bayart's attention to the "politics of the belly" all point to settings in which the state is not a neutral container of policy but a site of predation, negotiation, and fragmentation. In such settings, the trinity's separation of passion, chance, and reason can obscure how violence produces political order rather than merely serving it. Rodney and Nkrumah, in different registers, remind us that colonial war was not a continuation of African politics but an imposition that restructured African political economies; to read Clausewitz as universal is to risk treating colonial violence as a normal instrument of policy. The African vantage point therefore asks whether "politics" in Clausewitz's sense is even the right category when coercion is exercised by militias, warlords, insurgents, private security actors, and state forces in overlapping and unstable configurations. It does not deny that war has political meaning; it denies that the political is always prior, centralized, or state-led. This is the longest and most consequential critique in this lesson because it challenges not just Clausewitz's conclusions but his unit of analysis.

The Chinese perspective, shaped by Sun Tzu and later by Maoist and post-Mao strategic thought, treats Clausewitz as useful but dangerously attritional. Chinese strategic culture emphasizes relational advantage, deception, and winning without fighting; from this vantage point, Clausewitz's focus on the clash of armed forces can overvalue the decisive battle and undervalue the political preparation of the battlefield. Yet Clausewitz's insistence on political control and his concept of friction resonate with Chinese ideas of active defense and the need to avoid overextension. The Chinese tradition is less likely to see war as a single culminating offensive than as a prolonged process of shaping the opponent's calculations.

The Russian perspective has historically absorbed Clausewitz through the lens of operational art, correlation of forces, and escalation management. Russian strategic thought often stresses the defensive superiority implied by the culminating point, the importance of depth and reserves, and the political-military nexus in a centralized state. It may treat Clausewitz less as a theory of limited war than as a warning about overextension and the need to manage the transition from war to peace without losing political gains.

The Western perspective, especially in the Anglo-American academy, has made Clausewitz canonical while also criticizing him. Western scholars often use him to professionalize military education and to insist that force must serve policy, but they also note his Eurocentric assumptions, his incomplete manuscript, and his tendency to privilege the state. Schelling's later work can be read as a Western attempt to correct Clausewitz by shifting attention from brute force to coercion and bargaining.

The UN perspective is normatively hostile to Clausewitz's instrumentalization of war. The Charter framework treats force as an exception, not a policy tool, and collective security aims to replace unilateral war with institutional authorization. From the UN vantage point, Clausewitz is descriptively important but normatively dangerous: if war is simply politics by other means, then any state can claim its violence is policy. UN peace operations and humanitarian law attempt to reinsert limits that Clausewitz's theory, taken alone, does not supply.

SECTION 2.3 KEY IDEA 2 — SUN TZU: RELATIONAL-STRATEGIC TRADITION, WINNING WITHOUT FIGHTING, CRITIQUE OF ATTRITION

Bolded Causal Claim: Sun Tzu's strategic theory treats victory as the product of shaping relationships—among states, armies, terrain, and information—rather than as the cumulative result of destroying enemy forces; consequently, the highest form of strategy is to win without fighting, and protracted attrition is a sign that strategy has already failed.

Mechanism: The mechanism is relational and positional. In the *Art of War*, strategic advantage (*shi*) is created by aligning deception, intelligence, logistics, terrain, alliances, and timing so that the adversary's options are constrained before battle begins. The commander attacks plans, alliances, and armies in that order; avoids prolonged campaigns because they exhaust the state's resources and morale; and seeks to make the enemy's position untenable rather than to annihilate its forces. Knowledge of self and enemy is not merely tactical reconnaissance but a political-strategic assessment of relative capacity, will, and circumstance. Victory emerges from asymmetry in perception and position: the strategist manipulates the enemy's expectations, induces errors, and preserves his own freedom of action. The critique of attrition follows directly: if war becomes a contest of endurance, both sides bleed, the political object is obscured, and the state that began with superior resources may still lose through exhaustion. Sun Tzu therefore privileges indirect approaches—diplomatic isolation, economic pressure, feints, alliances, and psychological disruption—over frontal collision. Later Western interpreters, especially Liddell Hart's "indirect approach," borrowed this emphasis, but the original logic is embedded in Warring States politics, where survival depended on coalition management and the avoidance of ruinous conflict. The mechanism is not "avoid all violence"; it is to make violence unnecessary or, when used, so disproportionate in positional terms that resistance collapses quickly.

Scope Conditions: Sun Tzu's framework applies best where actors are politically rational, information is imperfect but obtainable, resources are finite, and the political objective is limited enough to permit bargaining or accommodation. It is strongest in multipolar environments where alliances can be shifted and where the cost of prolonged war threatens domestic legitimacy. It is weaker when conflict is driven by non-negotiable ideological or identity commitments, when actors seek total conquest or annihilation, or when asymmetries of power make positional maneuver impossible. It also assumes a degree of centralized strategic control that may not exist in fragmented or hybrid security orders. In nuclear or total-war contexts, the "winning without fighting" ideal can become dangerous if it encourages overconfidence in deception or underestimates the adversary's resolve. The framework is descriptive of strategic possibility, not a moral guarantee that indirect coercion is less destructive than direct force.

Observable Implications: If Sun Tzu's logic is operative, states should invest heavily in intelligence, diplomacy, economic leverage, and alliance management; prefer short, decisive campaigns; avoid open-ended occupations; and use deception and ambiguity to shape adversary choices. Military doctrine should emphasize maneuver, disruption, and psychological effect over attrition. Crises should be managed through signaling and position rather than through immediate escalation. Conversely, prolonged wars of attrition, repeated frontal assaults, and failure to convert battlefield success into political settlement would indicate that Sun Tzu's conditions are absent or that leaders have misread the strategic environment. The framework also predicts that states with weaker material power will seek indirect strategies—proxy forces, economic coercion, information operations—rather than symmetric battle.

Perspective Note (five traditions in brief): The African perspective, reconstructed from within through scholars such as Grovogui, Mbembe, Bayart, Mamdani, and others, finds Sun Tzu's relational logic more congenial than Clausewitz's state-centric battle theory because African security orders have historically been hybrid, networked, and shaped by indirect rule, patronage, and non-state coercion; yet it also warns that "winning without fighting" can obscure the violence embedded in informal power, proxy warfare, and external intervention, and that African strategic thought must be theorized on its own terms rather than treated as an application of an ancient Chinese text. The Chinese perspective treats Sun Tzu as a foundational expression of indigenous strategic culture: holistic, relational, attentive to *shi*, and compatible with concepts such as active defense and political warfare, though modern Chinese doctrine also incorporates Western military science and does not reduce strategy to classical aphorisms. The Russian perspective appreciates indirect approaches and deception—*maskirovka*—but subordinates them to correlation of forces, escalation management, and the political-military balance; from Moscow, Sun Tzu's avoidance of attrition can appear naive when adversaries are ideologically committed or when strategic depth and mass are decisive. The Western perspective often reads Sun Tzu as a precursor to the indirect approach and to coercion theory, sometimes flattening his political context into universal maxims; Western strategic studies value his emphasis on intelligence and economy of force but may overstate the ease of "winning without fighting" in pluralistic, transparent societies. The UN perspective sees in Sun Tzu a partial convergence with Charter preferences for peaceful settlement and the avoidance of destructive war, but remains wary of deception, covert manipulation, and the normalization of coercion outside institutional authorization; from the UN vantage point, even non-violent strategic victory can undermine sovereignty, consent, and collective security if achieved through hidden pressure.

SECTION 2.4 KEY IDEA 3 — SCHELLING: COERCION VS BRUTE FORCE, DETERRENCE VS COMPELLENCE, FOCAL POINTS, BARGAINING MODEL OF WAR

Bolded Causal Claim: Schelling's central contribution is to separate coercion from brute force and to show that much of modern strategy consists of manipulating an adversary's expectations, costs, and risks so that it chooses to comply; in this bargaining model, war is not merely destruction but a communicative process in which limited violence, threats, and tacit coordination shape outcomes.

Mechanism: The mechanism is bargaining under risk. Brute force destroys or seizes; coercion changes behavior by making noncompliance costlier or riskier than compliance. Deterrence prevents an action by threatening unacceptable consequences; compellence induces an action or reversal by applying or threatening pressure. Schelling argues that compellence is harder than deterrence because it requires the adversary to act, to save face, and to accept visible defeat, whereas deterrence requires only inaction. The bargaining model of war treats military operations as moves in a negotiation: limited attacks, demonstrations, escalation, and restraint communicate resolve and define the price of continued resistance. Focal points—Schelling points—solve coordination problems by providing salient thresholds, such as borders, capitals, or symbolic lines, around which tacit bargaining can occur. Brinkmanship manipulates shared risk rather than certain destruction: by creating a risk of mutual catastrophe that neither side fully controls, a state can pressure the adversary to concede. Commitment devices, such as tying one's hands or making retaliation automatic, can strengthen credibility but also reduce flexibility. The mechanism depends on rational calculation, mutual recognition of interests, and some channel of communication or tacit understanding; without these, coercion collapses into either bluff or brute force.

Scope Conditions: Schelling's framework is most powerful in crises between nuclear or conventionally

capable states where both sides prefer a negotiated outcome to mutual catastrophe, and where stakes are high but not existential in the sense of requiring annihilation. It applies to limited wars, coercive diplomacy, and crisis bargaining. It is less applicable when actors are non-rational, ideologically absolutist, domestically constrained in ways that make concession impossible, or unable to communicate. Compellence in particular fails when the target's cost of compliance exceeds its cost of resistance, when reputation concerns dominate, or when the coercer lacks credible commitment. The framework also assumes a degree of symmetry in rationality and information that may not hold in asymmetric conflicts, civil wars, or hybrid security orders. Finally, Schelling's model can understate the role of domestic politics, moral constraints, and the material realities of force; a threat that is logically credible may still be politically unusable.

Observable Implications: If Schelling's bargaining model is operative, crises should feature signaling, graduated escalation, tacit thresholds, and attempts to manipulate risk rather than immediate all-out attack. States should distinguish carefully between deterrence and compellence in doctrine and diplomacy. Successful coercion should be associated with credible commitments, clear demands, and focal points; failed coercion should be associated with ambiguous demands, lack of credibility, or targets that cannot concede without regime-threatening costs. Military deployments and alerts should function as communicative acts, not just preparations for battle. The model predicts that compellence will be rarer and more difficult than deterrence, and that crises will often end through tacit bargains rather than formal treaties. It also implies that reputation and precedent matter: states may fight or concede to preserve credibility for future crises.

Perspective Note (five traditions in brief): The African perspective, drawing on scholars such as Grovogui, Mbembe, Bayart, Mamdani, and others, argues that Schelling's state-centric bargaining model captures only one layer of coercion in African security environments, where violence is often exercised through hybrid actors, patronage networks, proxy forces, and informal authority; from this vantage point, coercion is not merely interstate bargaining but a mode of political rule, and Schelling's rational-actor assumptions can obscure the colonial and post-colonial structures that make some actors' "choices" heavily constrained. At the same time, African scholars can use Schelling to analyze how weak states, insurgents, and external interveners manipulate risk and ambiguity, provided the model is adapted to non-state and hybrid actors. The Chinese perspective sees Schelling's deterrence logic as compatible with defensive strategic culture and no-first-use commitments, but views compellence and brinkmanship with suspicion as instruments of hegemony; Chinese strategic thought emphasizes relational stability, political warfare, and the avoidance of uncontrolled escalation, so Schelling's manipulation of shared risk may be read as destabilizing rather than stabilizing. The Russian perspective finds in Schelling a useful vocabulary for escalation management and coercive signaling, but Russian doctrine emphasizes correlation of forces, political will, and the possibility of non-linear or hybrid coercion; from Moscow, Schelling's assumption of mutual rationality and tacit communication may underestimate the role of historical grievance, domestic mobilization, and the deliberate creation of ambiguity. The Western perspective treats Schelling as foundational to modern coercion theory, deterrence, and limited war; Western strategic studies have built extensive models of signaling, audience costs, and credibility on his framework, though critics note its tendency to over-rationalize conflict and to neglect morality, domestic politics, and the experience of the coerced. The UN perspective is normatively ambivalent: Schelling's analysis of coercion is descriptively valuable for understanding crises, but the Charter's prohibition on the threat or use of force means that coercive bargaining is legally suspect; UN diplomacy and peace operations nevertheless rely on deterrence and compellence in practice, creating a tension between legal norms and strategic necessity that the UN manages through collective authorization, consent, and the language of protection rather than unilateral coercion.

SECTION 2.5 KEY IDEA 4 — Signaling and Resolve: Audience Costs, Costly Signals, and Reputation in Crises

Bolded Causal Claim: States signal resolve through costly actions that domestic audiences observe and punish leaders for abandoning, making the credibility of threats a function of domestic political incentives rather than of military capability alone.

Mechanism: The causal chain runs from domestic audience costs through leader incentives to observable crisis behavior. Fearon (1994) formalized the mechanism: when a leader makes a public threat, domestic audiences—voters, legislatures, military elites, party factions—form expectations about the leader's follow-through. If the leader subsequently backs down, these audiences impose costs: electoral defeat, loss of office, reputational damage within the ruling coalition, or even removal. The leader, anticipating these costs, is therefore more likely to follow through on threats than a leader without such audience exposure. The mechanism is not that audiences make threats credible by magic; it is that audiences change the leader's payoff structure so that backing down becomes more expensive than following through, at least within a range of stakes. The signal is "costly" in the sense that the leader has voluntarily incurred a domestic political liability that can only be discharged by action. This is distinct from cheap talk: a private assurance or a vague public statement carries no audience cost and therefore conveys no information about resolve. Fearon's model generates a striking implication: democracies, which typically have more powerful and more informed audiences, should be better able to signal resolve than autocracies, because their leaders face higher audience costs for backing down. This is the micro-foundation for the democratic peace in the crisis-bargaining domain: democracies can make more credible threats, which makes their commitments more believable and therefore reduces the probability of war through miscalculation. The mechanism also implies that leaders sometimes escalate crises they would prefer to avoid, because the domestic cost of backing down exceeds the cost of fighting—a phenomenon Fearon calls "audience costs as a source of war." The costly signaling literature extends this logic: signals are credible precisely because they are expensive to send and would not be sent by a state lacking resolve (Fearon 1997). Military mobilization, troop deployments, and public ultimatums are costly signals; diplomatic notes and press statements are not. The reputation literature adds a further layer: states build reputations for resolve through past behavior, and adversaries infer future resolve from past actions (Mercer 1996; Press 2005). The mechanism here is Bayesian updating: an adversary observes a state's past willingness to fight and updates its belief about the state's type (resolved or irresolute), then adjusts its bargaining behavior accordingly.

Scope Conditions: The audience-cost mechanism operates under specific conditions that bound its explanatory power. First, the domestic audience must be informed about the crisis and the leader's commitments; in authoritarian systems with controlled media, audience costs may be low or manufactured rather than genuine. Second, the stakes must be sufficient to trigger audience attention; minor territorial disputes may not generate the public salience needed for audience costs to bite. Third, the leader must have a realistic prospect of following through; audience costs cannot make a militarily infeasible threat credible. Fourth, the mechanism assumes rational leaders who anticipate audience reactions; leaders who misperceive domestic opinion or who are insulated from political consequences (as in personalist dictatorships) may not respond to audience costs in the predicted manner. Fifth, the reputation mechanism requires that adversaries can observe past behavior and attribute it correctly; if past actions were driven by idiosyncratic factors rather than by underlying resolve, reputation inferences will be noisy. Sixth, audience costs can be manipulated: leaders may manufacture crises to rally domestic support, converting a foreign policy problem into a domestic political asset (the "rally 'round the flag" effect), which complicates the causal direction. Seventh, the mechanism is most powerful in democracies with free media and competitive elections; in autocracies, audience costs

may operate through elite coalitions rather than mass publics, with different dynamics. Eighth, the costly signaling logic requires that the cost be differentially borne: if all states can send the signal at equal cost, it conveys no information.

Observable Implications: If audience costs drive crisis behavior, we should observe that democratic leaders who make public threats are less likely to back down than autocratic leaders who make private threats; that leaders facing elections are more likely to escalate than leaders with secure tenure; that public commitments are harder to reverse than private ones; that crises involving high public salience produce more escalation than low-salience crises; and that states with reputations for backing down face more challenges. The empirical record is mixed. Tomz (2007) found experimental evidence that American voters punish leaders who back down from public commitments, supporting the audience-cost mechanism. Weeks (2008) found that audience costs vary by regime type: personalist dictatorships face the lowest audience costs, single-party and military regimes face intermediate costs, and democracies face the highest. However, Snyder and Borghard (2011) challenged the empirical basis, arguing that audience costs are rarely observed in actual crises because leaders avoid making public commitments precisely to preserve flexibility. Trachtenberg (2012) and others have questioned whether the historical record supports the claim that democracies are more credible. The reputation literature is similarly contested: Press (2005) argued that reputation for resolve is less important than reputation for interests, because adversaries care more about what a state wants than about its willingness to fight; Mercer (1996) argued that reputation effects are weak because adversaries attribute past behavior to situational factors rather than to stable traits. The costly signaling literature has generated extensive debate about which signals are genuinely costly and whether adversaries can distinguish costly from cheap signals in real time.

Perspective Note (five traditions in brief): The African perspective treats audience costs as a concept developed in and for Western democracies, with limited applicability to African political systems where executive power is often concentrated, media is constrained, and domestic audiences are fragmented along ethnic, regional, and patronage lines; African scholars note that "audience costs" in many African states operate through elite coalitions and patronage networks rather than through mass publics, and that the concept of "resolve" itself may be culturally specific, reflecting Western assumptions about state rationality and public accountability that do not map onto African political realities where legitimacy derives from multiple sources including traditional authority, religious sanction, and ethnic solidarity. The Chinese perspective emphasizes that costly signaling is embedded in a relational context: signals are read not as isolated acts but as part of a long-term relationship, and the concept of "face" (mianzi) means that public commitments carry social costs that extend beyond electoral politics; Chinese strategic culture values ambiguity and indirection, so the Western preference for clear, public, costly signals may be culturally specific and strategically suboptimal in a Chinese framework. The Russian perspective stresses that audience costs operate differently in authoritarian and semi-authoritarian systems: the relevant audience is the security elite and the military, not the mass public, and signals of resolve are directed inward as much as outward; Russian crisis behavior reflects a tradition of demonstrating resolve through action rather than through public commitment, and the concept of "audience costs" may underestimate the role of elite cohesion and institutional loyalty. The Western perspective is the originator of the audience-cost and costly-signaling research programs, treating them as universal mechanisms of crisis bargaining; Western strategic studies have built extensive models of credibility, reputation, and signaling on these foundations, though critics within the Western tradition note the over-rationalization of politics and the neglect of emotion, culture, and domestic institutional variation. The UN perspective treats audience costs as a descriptive phenomenon that can undermine diplomatic flexibility: public commitments by member states can lock them into positions that make compromise harder,

and the UN's preference for quiet diplomacy and back-channel negotiation reflects an awareness that public signaling can escalate crises; at the same time, the UN relies on member states' domestic accountability to ensure that commitments made in multilateral forums are honored.

SECTION 2.6 KEY IDEA 5 — Strategic Culture: How Different Traditions Think About Coercion Differently

Bolded Causal Claim: Coercive strategy is shaped by historically transmitted beliefs, symbols, and institutional practices that constitute a "strategic culture," meaning that the same material capabilities and strategic situation will produce different coercive behaviors depending on which cultural tradition informs the decision-maker.

Mechanism: The causal chain runs from historical experience through cultural transmission to strategic preference. Snyder (1977) introduced the concept of strategic culture in his study of Soviet strategic thought, arguing that Soviet leaders' views on nuclear war were shaped not only by material capabilities and rational calculation but by a distinctive set of beliefs about the nature of war, the role of the party, and the historical experience of invasion and devastation. Johnston (1995) refined the concept, distinguishing between a "strategic culture" (a set of shared beliefs about the efficacy of force) and a "strategic subculture" (competing factions within a state), and arguing that strategic culture operates as a filter through which leaders interpret strategic situations and generate preferences. The mechanism is not deterministic: culture does not dictate behavior but constrains the range of options that leaders consider legitimate and effective. A leader socialized in a strategic culture that views war as a last resort will be less likely to threaten force than a leader socialized in a culture that views war as a normal instrument of policy, even when material incentives are identical. The transmission mechanism operates through military education, doctrinal publications, historical narratives, institutional rituals, and the socialization of elites within defense establishments. Gray (1999) emphasized that strategic culture is not static but evolves in response to experience, though it retains a "core" of enduring beliefs. The mechanism also operates at the level of perception: strategic culture shapes how leaders read adversary signals, assess risks, and define victory. A culture that values relational harmony may interpret a coercive threat as a breakdown of relationship rather than as a bargaining move; a culture that values honor and reputation may interpret backing down as existential humiliation. The concept thus bridges materialist and constructivist approaches: it acknowledges that capabilities matter but insists that their meaning and use are culturally mediated.

Scope Conditions: Strategic culture operates under conditions that limit its explanatory and predictive power. First, the concept is most useful when material factors are held relatively constant: if two states with similar capabilities behave differently, culture may explain the divergence. Second, strategic culture is not a substitute for interest-based analysis; it shapes how interests are pursued, not what interests are. Third, the concept risks reification: treating "Chinese strategic culture" or "Russian strategic culture" as monolithic entities ignores internal diversity, factional competition, and historical change. Johnston (1995) warned against "cultural essentialism" and argued for disaggregating strategic culture into testable propositions about specific beliefs. Fourth, strategic culture is difficult to measure independently of behavior, creating a risk of tautology: if behavior is used to infer culture and culture is then used to explain behavior, the argument is circular. Fifth, the concept struggles with change: if strategic culture is deeply rooted, how do we explain rapid shifts in strategic behavior, such as China's shift from revolutionary to pragmatic foreign policy after 1978? Sixth, strategic culture may be epiphenomenal: leaders may invoke cultural narratives to justify decisions driven by material interests, making culture a post-hoc rationalization rather than a causal factor.

Seventh, the concept is most powerful at the level of strategic preference and style, not at the level of specific tactical decisions. Eighth, cross-cultural comparison requires careful attention to translation and conceptual equivalence: terms like "deterrence," "compellence," and "resolve" may not have direct equivalents in all strategic traditions.

Observable Implications: If strategic culture shapes coercion, we should observe that states with similar capabilities but different cultural traditions employ different coercive strategies; that strategic behavior is path-dependent, reflecting historical experience; that leaders invoke cultural narratives to justify strategic choices; that military doctrines reflect culturally specific assumptions about the nature of war; and that cross-cultural misperception is a source of conflict. The empirical record supports some of these implications. Johnston (1995) found that Chinese strategic culture shifted from a "parabellum" (offensive, war-fighting) orientation to a "Confucian-pacifist" orientation over time, demonstrating that culture changes and that these changes affect strategic behavior. Snyder (1977) and subsequent scholars found that Soviet/Russian strategic thought emphasized the correlation of forces, escalation management, and the political character of war in ways that differed from Western approaches. African scholars have documented distinctive African approaches to security that emphasize human security, community-based conflict resolution, and the role of non-state actors, challenging the state-centric assumptions of Western strategic culture. However, the concept remains contested: some scholars argue that material factors and institutional incentives explain more variation in strategic behavior than culture does, and that "strategic culture" is too vague to generate testable predictions.

Perspective Note (five traditions in brief): The African perspective is the most critical of the strategic culture concept as conventionally formulated, arguing that Western strategic culture theory has been developed by and for Western states and reflects Western assumptions about the state as the primary unit of analysis, about war as interstate conflict, and about coercion as a tool of state policy; African scholars argue that African strategic cultures are not merely variants of Western strategic culture but constitute distinct traditions rooted in different historical experiences—colonialism, decolonization, Cold War proxy conflicts, and post-colonial state formation—and that these traditions emphasize human security, community resilience, non-state actors, and the interpenetration of domestic and international security in ways that Western strategic culture theory does not capture; Grovogui (2006) and others have argued that African strategic thought must be understood on its own terms, not as a deviation from a Western norm. The Chinese perspective is the most extensively theorized non-Western strategic culture, with a tradition stretching from Sun Tzu through Mao Zedong to contemporary PLA doctrine; Chinese strategic culture emphasizes relationality, patience, indirection, and the integration of military and non-military means, and scholars like Johnston (1995) and Scobell (2003) have documented how these cultural elements shape Chinese coercive behavior, including the preference for "active defense," the emphasis on "winning without fighting," and the integration of economic, diplomatic, and military instruments in a holistic strategy. The Russian perspective emphasizes the historical experience of invasion and devastation, the concept of the "correlation of forces," the integration of military and political means, and a tradition of escalation management that treats coercion as a continuous spectrum rather than a binary choice; Russian strategic culture, as analyzed by Snyder (1977) and subsequent scholars, reflects a distinctive view of war as a political act in which the boundary between war and peace is blurred, and in which the state must maintain a permanent readiness for conflict. The Western perspective is the originator of strategic culture theory and the dominant framework in strategic studies; Western strategic culture, as analyzed by Gray (1999) and others, emphasizes rationality, technological superiority, the decisive battle, and the separation of military and political spheres, though this characterization is itself contested and may reflect an idealized rather than actual Western practice. The UN perspective treats strate-

gic culture as a source of both diversity and misunderstanding: the UN's universalist aspirations require that member states transcend their particular strategic cultures in favor of shared norms, but the organization's effectiveness depends on understanding and accommodating the strategic cultures of its members; UN peace operations and diplomacy must navigate the strategic cultures of troop-contributing countries, host states, and regional organizations, and the UN's own institutional culture—emphasizing consensus, legitimacy, and the peaceful settlement of disputes—constitutes a distinctive strategic culture that shapes how the organization approaches coercion.

2.7.1 African Perspective (PRIMARY)

The African vantage point on strategic thought and coercion must be reconstructed from within, not as a regional application of Clausewitz, Sun Tzu, or Schelling to African cases. Its starting premise is that the postcolonial condition is not a deviation from a European norm of sovereign statehood but a distinct political ontology in which authority, violence, and order are layered, contested, and historically sedimented. From this vantage, coercion is not primarily an instrument wielded by a unitary state in interstate bargaining; it is a field of social practice through which political communities are constituted, fractured, and reconstituted. The African perspective therefore does not simply add African examples to Western theory; it questions the epistemic premises that make Western theory appear universal. It asks why the state monopoly on violence, the rational political objective, and the transparent signaling of resolve are treated as baseline assumptions when much of the world's experience of order has been organized through hybrid, non-state, and transnational authorities.

Clausewitz's claim that war is the continuation of politics by other means remains analytically powerful, but the African perspective insists on specifying its scope conditions. Clausewitz's trinity—people, army, government—presupposes a relatively coherent state that can align popular passion, military means, and political purpose. In many postcolonial African settings, the "government" is one competitor among several claimants to authority; the "army" may be fragmented, predatory, or fused with militias and political entrepreneurs; and the "people" are not a unified national subject but a constellation of ethnic, regional, class, and generational constituencies. Under these conditions, war is still political, but it is often politics within society rather than politics between states. Violence becomes a mode of social ordering, resource extraction, and identity formation, not merely an instrument for achieving a state-defined objective. Mamdani's distinction between citizen and subject, Bayart's analysis of the "politics of the belly," and Mbembe's work on necropolitics all suggest that coercion in postcolonial Africa is embedded in structures of domination that predate and outlast formal state institutions. The state may be less the monopolist of violence than the arena in which multiple coercive projects compete.

This critique does not require rejecting Clausewitz entirely. Rather, it reframes his insight: if war is politics by other means, then the relevant politics may be colonial, neo-colonial, racialized, or communal, not only the rational calculus of a sovereign cabinet. Rodney's analysis of underdevelopment and Nkrumah's critique of neo-colonialism show that coercion in Africa has often been externalized and structural—operating through debt, trade, military basing, and resource extraction rather than through declared war. Fanon's argument that colonial violence is totalizing and that anti-colonial violence can be regenerative adds a further complication: from this vantage, violence is not simply an instrument chosen by a political actor but a constitutive feature of colonial and postcolonial orders. Cabral's insistence that culture is a weapon of struggle similarly implies that coercion includes epistemic and cultural dimensions that Clausewitz's military framework does not capture. The African perspective thus expands the concept of coercion beyond the deployment of force to include the

coercion of economic dependence, legal subordination, and cultural domination.

Sun Tzu's relational-strategic tradition resonates with some African diplomatic and communal practices, but the resonance must be handled carefully. Many African societies have long traditions of mediation, consensus-building, alliance-making, and the use of ritual, kinship, and economic interdependence to manage conflict. Nyerere's emphasis on consensus and ujamaa, for example, reflects a strategic preference for relational harmony over zero-sum confrontation. Yet it would be a mistake to romanticize African politics as inherently consensual. African conflicts have also been brutally attritional, and "winning without fighting" can describe elite accommodation, co-optation, or the quiet violence of exclusion rather than peaceful resolution. The African perspective therefore treats Sun Tzu not as a mirror of African wisdom but as one resource among many, useful for highlighting relational strategy while requiring supplementation by attention to structural violence and historical inequality. Where Sun Tzu emphasizes deception, positioning, and the avoidance of costly battle, African scholarship often emphasizes the social costs of conflict and the difficulty of separating military victory from political legitimacy.

Schelling's bargaining model of war is especially revealing of the gap between Western and African vantage points. Schelling distinguishes coercion from brute force and analyzes deterrence and compellence as bargaining processes in which threats, commitments, and focal points shape outcomes. This framework assumes actors who can make credible threats, identify salient focal points, and calculate costs and benefits. In hybrid security orders, these assumptions are frequently violated. The relevant actors may include warlords, militias, customary authorities, religious leaders, multinational corporations, humanitarian agencies, and foreign militaries, none of which occupies the position of a unitary state. Focal points may be customary norms, religious calendars, market prices, or local grievances rather than the Schelling points of interstate crisis bargaining. Compellence often fails not because the target is irrational but because the coercer lacks the monopoly, legitimacy, or information required to make its demands stick. The target may have exit options in illicit economies, cross-border sanctuaries, or parallel governance structures. In such contexts, coercion is less a bargaining game between two states than a struggle over who can define and enforce the rules of social life.

Signaling and resolve take on different meanings in this setting. Fearon's audience-cost theory assumes that leaders face domestic publics who can punish them for backing down, thereby making threats more credible. In hybrid orders, audiences are multiple and fragmented: ethnic constituencies, militia fighters, religious communities, diaspora networks, international donors, and humanitarian organizations. A leader's resolve may be signaled not through transparent military deployments but through performative violence, patronage distributions, or ritualized displays of loyalty. Costly signals may include atrocities, not because atrocity is strategically efficient in a Schellingian sense, but because it communicates commitment to a constituency that values toughness, revenge, or group protection. Mbembe's concept of necropolitics captures this grim logic: the power to decide who may live and who must die becomes a mode of political communication. The African perspective thus reveals that signaling can be morally catastrophic and analytically opaque, and that the Western focus on credibility and resolve may obscure the human costs of making threats believable.

Strategic culture, from the African vantage, is not a fixed national attribute but a historically produced repertoire of practices shaped by colonialism, Cold War interventions, structural adjustment, and contemporary globalization. African strategic cultures are plural: a Sahelian state confronting jihadist insurgency, a Great Lakes state managing ethnic militias, and a coastal state facing maritime piracy do not share a single strategic culture. Yet they share a common experience of being objects of external strategic theorizing. Western security studies has often treated Africa as a theater for counterterrorism, peacekeeping, or resource protec-

tion rather than as a source of strategic knowledge. African scholarship challenges this epistemic asymmetry. Grovogui's work on sovereignty emphasizes that African states have been denied the full recognition granted to European states; Mamdani shows how colonial legal categories continue to structure political violence; Bayart reveals the informal networks through which power operates; and Tamale and Oyěwùmí demonstrate that gendered and epistemic assumptions shape what counts as security. These scholars do not merely add African cases to a universal theory; they show that the theory itself is partial.

The African perspective's contribution is therefore substantial. It reveals that coercion is often non-state, social, and embedded in global inequalities; that the state is not always the relevant unit of analysis; that legitimacy and authority are fragmented; and that Western strategic theory carries colonial and epistemic baggage. It also exposes the limits of models that assume transparent signaling, unitary actors, and clear focal points. What it may occlude, however, is equally important. By emphasizing hybridity and historical injustice, it can under-theorize interstate deterrence, nuclear coercion, and formal crisis bargaining, which remain central to global security. It may also risk romanticizing community-based or non-state authority, some of which can be coercive, patriarchal, or exclusionary. Finally, the diversity of African experiences makes generalization difficult; "African strategic culture" is a heuristic, not an essence. Nevertheless, as the primary vantage point of this lesson, the African perspective prevents the other four from treating Western state-centric models as the natural language of strategy.

2.7.2 Chinese Perspective

The Chinese perspective on strategic thought and coercion is anchored in a relational-strategic tradition most commonly associated with Sun Tzu, but it cannot be reduced to a single text or to a pacifist cliché. Its central idea is that strategy is the art of shaping relationships, positions, and perceptions so that victory becomes possible without costly battle. Winning without fighting is not merely a moral preference; it is a claim about efficiency, legitimacy, and the conservation of resources. In this tradition, coercion is less about issuing explicit threats and more about altering the strategic environment so that the adversary's options narrow. The concept of shi—strategic advantage or potential—captures the idea that power lies in configuration rather than in raw force. A state that has cultivated alliances, economic leverage, informational dominance, and positional advantage may compel without firing a shot, not because it has threatened destruction but because the adversary perceives that resistance is futile or disproportionately costly.

This perspective engages Clausewitz selectively. Chinese strategic thought does not deny that war is political, but it tends to treat war as a failure of strategy rather than its natural continuation. Where Clausewitz emphasizes the friction, uncertainty, and escalation inherent in war, the Sun Tzu tradition emphasizes control, deception, and the avoidance of attrition. Attrition is criticized not only because it is expensive but because it erodes the political and social foundations of the state. A war of annihilation may produce a pyrrhic victory; a strategy of exhaustion may destabilize the victor as well as the vanquished. The Chinese preference for indirect approaches, therefore, is not simply tactical; it is political. It reflects a view that legitimacy and social order are fragile and that military force should be used sparingly, precisely, and with an eye to postwar order.

Schelling's bargaining model is both illuminating and potentially misleading from the Chinese vantage. Schelling's distinction between coercion and brute force, and his analysis of deterrence and compellence, provide a vocabulary for understanding threats and commitments. Yet the Chinese tradition often treats explicit bargaining as crude and destabilizing. Focal points, in Schelling's sense, may be seen as artificial constructs that invite escalation by forcing adversaries into public tests of resolve. Chinese strategic practice has often favored ambiguity, gradualism, and fait accompli over clear demands and deadlines. The aim is

to shift facts on the ground while keeping the adversary uncertain about whether a red line has been crossed. This can be interpreted as compellence, but it is compellence through environmental shaping rather than through articulated bargaining. The risk is that ambiguity may be misread: what one side sees as patient, low-cost pressure, the other may see as salami-slicing or creeping aggression.

Signaling and resolve are therefore understood differently. Western audience-cost theory assumes that public commitments enhance credibility by raising the domestic cost of retreat. Chinese strategic culture, by contrast, often values restraint, patience, and the avoidance of public humiliation. Resolve may be demonstrated through endurance, economic resilience, and the willingness to absorb costs over time rather than through dramatic threats. Costly signals may take the form of infrastructure projects, diplomatic alignments, or military modernization that change the adversary's calculus without requiring an immediate crisis. This does not mean that China avoids coercion; rather, it often prefers coercion that is deniable, incremental, and embedded in broader political and economic relationships. The occlusion here is that such an approach can underestimate the destabilizing effects of ambiguity. Adversaries may respond with their own ambiguity, producing spirals of misperception. Moreover, the romanticized image of a uniquely peaceful Chinese strategic culture is challenged by Johnston's argument that Chinese strategic culture has also contained hard-realist, parabellum elements. The Chinese perspective thus contributes a powerful critique of attrition and a sophisticated theory of relational coercion, but it must be treated as internally contested rather than as a monolithic alternative to Western bargaining theory.

2.7.3 Russian Perspective

The Russian perspective on strategic thought and coercion is shaped by a strategic culture that emphasizes survival, territorial depth, escalation management, and the correlation of forces. It does not treat war as a continuation of politics in the Clausewitzian sense of a rational instrument calibrated to limited objectives; rather, it often treats war and coercion as existential struggles in which political survival, regime security, and great-power status are at stake. This perspective is historically rooted in experiences of invasion, encirclement, and imperial overstretch, and it tends to view the international system as inherently hostile. Clausewitz is studied and respected in Russian military thought, but his framework is often subordinated to a more holistic conception of conflict in which military, political, economic, informational, and psychological instruments are fused. The result is a strategic tradition that is less interested in distinguishing war from peace than in managing a continuous spectrum of confrontation.

Escalation management is the distinctive Russian contribution to the study of coercion. Rather than assuming that threats can be finely calibrated, Russian strategic thought often emphasizes the need to control the pace, intensity, and geographic scope of confrontation. The concept of de-escalation through escalation captures the idea that a limited show of force or a threat of further escalation can compel an adversary to retreat. This is not identical to Schelling's compellence, although it overlaps with it. Schelling assumes that coercion works through the adversary's rational calculation of costs and benefits; the Russian approach often assumes that coercion works through shock, uncertainty, and the demonstration of superior resolve. The adversary is not merely asked to recalculate; it is confronted with the possibility that the conflict may expand beyond its control. This makes Russian coercion inherently risk-acceptant, or at least risk-tolerant, in ways that Western bargaining models may find difficult to interpret.

The correlation of forces is central to this perspective. It is a broader measure than military balance alone, encompassing economic capacity, political stability, alliance structures, morale, and technological development. Russian strategic thought tends to treat coercion as effective when the overall correlation of forces favors the coercer, not merely when a specific threat is credible. This has implications for signaling and

resolve. A costly signal, in the Western sense, may be less important than a sustained demonstration of comprehensive capability. Resolve is communicated through the ability to endure hardship, absorb losses, and maintain strategic initiative over time. Audience costs, in Fearon's sense, are not absent, but they are refracted through a political system in which regime security and elite cohesion may matter more than public opinion. The Russian perspective thus contributes a valuable corrective to models that overemphasize discrete threats and underemphasize structural advantage.

Strategic culture, from the Russian vantage, is shaped by geography, history, and great-power identity. The experience of vast territory, harsh climate, and repeated invasion has produced a strategic preference for depth, defense in depth, and the ability to trade space for time. Yet this defensive posture has often coexisted with offensive operations justified as preemptive or protective. The Russian perspective therefore contains an internal tension: it presents itself as defensive and status-quo oriented while practicing coercion and intervention in neighboring regions. Its occlusions are significant. By emphasizing escalation management and comprehensive power, it may overestimate the ability of political leaders to control escalation once initiated. It may also understate the role of legitimacy, international law, and normative constraints in shaping outcomes. Western models of deterrence and compellence, for their part, may misread Russian signals by assuming a level of transparency and rational calibration that the Russian tradition does not prioritize. The Russian perspective is strongest when it reminds analysts that coercion is embedded in a broader struggle for position and that adversaries may not share Western assumptions about limited war.

2.7.4 Western Perspective

The Western perspective on strategic thought and coercion is the tradition most directly shaped by Clausewitz and Schelling, and it treats strategy as the rational employment of force and threats to achieve political objectives. Clausewitz provides the foundational premise: war is the continuation of politics by other means, and the conduct of war must be subordinated to political purpose. The trinity—people, army, government—remains a central heuristic for understanding how passion, probability, and reason interact in war. From this foundation, Western strategic studies developed a rich literature on deterrence, compellence, escalation, and crisis bargaining. Schelling's *Arms and Influence* is pivotal because it shifted attention from the destruction of enemy forces to the manipulation of the adversary's choices. Coercion, in this view, is not brute force but the art of making the adversary prefer compliance to resistance.

Schelling's framework distinguishes deterrence from compellence and emphasizes the role of threats, commitments, focal points, and bargaining. Deterrence aims to prevent an action; compellence aims to induce one. The distinction matters because compellence is generally harder: it requires the adversary to act, often publicly, and to incur the costs of retreat. Focal points—Schelling points—help solve coordination problems in crises by making certain outcomes salient. The bargaining model of war treats military force as a means of communication and a tool for shaping the adversary's expectations. This perspective has been enormously influential in Western policy and academic circles, particularly in the study of nuclear deterrence, crisis management, and coercive diplomacy.

Signaling and resolve are central to the Western perspective. Fearon's audience-cost theory argues that democratic leaders can make more credible threats because domestic audiences punish them for backing down. Costly signals—military mobilizations, alliance commitments, or public red lines—are thought to demonstrate resolve and reduce uncertainty. Reputation matters because adversaries learn from past behavior; a state that backs down today may be challenged tomorrow. This framework yields clear, testable hypotheses about crisis outcomes and has shaped Western approaches to deterrence and alliance management. It also provides a normative vocabulary for policy: credibility, resolve, and commitment become strategic goods

to be cultivated.

Strategic culture, in the Western tradition, is often treated as a variable that modifies rational calculation. Snyder's early work on strategic culture emphasized that states develop distinctive beliefs about the role of military force, shaped by historical experience and political institutions. Johnston's later work challenged both cultural determinism and cultural romanticism, arguing that strategic culture can be hard-realist and that its effects must be demonstrated rather than assumed. The Western perspective thus contains an internal debate: some scholars treat strategic culture as a deep constraint on behavior, while others treat it as a thin overlay on universal rationality. What the Western perspective contributes is analytical clarity, a well-developed theory of bargaining, and a large body of empirical research on deterrence and crisis outcomes. What it occludes is equally important. By privileging state actors, transparent signaling, and rational calculation, it may understate the role of non-state actors, hybrid security orders, and cultural variation. It may also universalize a historically specific experience of statehood and warfare, treating Western strategic practice as the template for all strategic thought. The African, Chinese, and Russian perspectives all challenge this universalism, albeit in different ways.

2.7.5 UN Perspective

The UN perspective on strategic thought and coercion is fundamentally normative and institutional. It begins from the Charter's prohibition on the threat or use of force against the territorial integrity or political independence of any state, and from the commitment to the peaceful settlement of disputes. From this vantage, coercion is not a neutral tool of statecraft but a legally and morally regulated activity. The UN does not deny that states think strategically; rather, it seeks to channel strategic behavior into collective frameworks that reduce the risk of war. Chapter VII provides for collective security measures, including sanctions and, in exceptional cases, the use of force, but only under Security Council authorization. The UN perspective therefore treats coercion as legitimate only when it is collective, authorized, and directed toward the maintenance of international peace and security.

This perspective engages the five key ideas differently. Clausewitz's claim that war is the continuation of politics is not denied, but it is normatively constrained: the UN Charter attempts to sever the link between political disagreement and military force. Sun Tzu's winning without fighting resonates with the UN preference for preventive diplomacy and peaceful settlement, though the UN does not endorse deception or covert coercion. Schelling's bargaining model is viewed with suspicion because it treats threats as a normal instrument of policy; the UN framework seeks to delegitimize unilateral threats and to replace bilateral coercion with multilateral processes. Signaling and resolve are interpreted through the lens of credibility and legitimacy: a threat may be credible, but if it violates the Charter, it is not legitimate. Strategic culture, from the UN vantage, is both a source of diversity and a challenge to universal norms. Member states bring different strategic traditions to the organization, and effective diplomacy requires understanding them; yet the UN's universalist aspirations require that particular strategic cultures be subordinated to shared principles.

The UN perspective contributes a crucial normative counterweight to the other four. It insists that coercion must be evaluated not only by its effectiveness but by its legality and legitimacy. It provides institutional mechanisms—mediation, peacekeeping, sanctions, and collective security—that attempt to manage coercion without war. It also offers a language of common security and human security that broadens the concept of threat beyond interstate war. What it occludes, however, is equally significant. The UN's effectiveness depends on the political will of its member states, especially the permanent members of the Security Council, and its collective security mechanisms are often paralyzed by great-power rivalry. The UN framework may also struggle to address non-state coercion, hybrid security orders, and the informal violence that char-

acterizes many contemporary conflicts. Its institutional culture—emphasizing consensus, legitimacy, and peaceful settlement—can be slow and cumbersome in crises requiring rapid response. Nevertheless, the UN perspective remains essential because it reminds strategists that coercion is not merely a technical problem of credibility and resolve but a political and legal problem of order, legitimacy, and human security.

2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African	Reveals that coercion operates through hybrid security orders, non-state actors, and informal violence that Clausewitzian state-centric frameworks cannot capture; exposes the colonial genealogy of "war as politics"	Tends to under-specify the mechanics of interstate nuclear bargaining and great-power crisis management; can overstate the irrelevance of formal military power	Coercion must be understood from within post-colonial sovereignty struggles; legitimate force is that which serves self-determination and human security, not state survival alone	Post-colonial conflicts in the Great Lakes region; non-state coercion by militias and informal security providers; Rodney's underdevelop-ment thesis applied to military expenditure patterns	Western: "Hybrid orders are real but do not invalidate the logic of credible threats; state-level deterrence still structures the international system"

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Chinese	Offers a relational-strategic tradition in which victory without fighting is the highest form of strategy; emphasizes positional advantage, patience, and the avoidance of attrition	May underweight the role of explicit, credible threats and the bargaining value of demonstrated resolve; can obscure the coercive function of ambiguity	Coercion is legitimate when it preserves harmony and territorial integrity; force is a last resort after relational and positional advantages have been exhausted	Sun Tzu's Art of War; China's no-first-use nuclear policy; active defense doctrine; historical Chinese strategic thought on winning without fighting	Russian: "Relational patience is admirable but insufficient when facing an adversary who interprets restraint as weakness; escalation management requires explicit red lines"
Russian	Provides a sophisticated framework for escalation management, correlation of forces, and the calibrated use of military and non-military means to achieve political objectives below the threshold of war	Risks normalizing coercion as a routine instrument of statecraft; may understate the destabilizing effects of ambiguous escalation thresholds on adversary decision-making	Coercion is a legitimate tool of great-power competition; the correlation of forces determines outcomes, and escalation must be managed to avoid uncontrolled war	Russian military doctrine on escalation management; hybrid warfare concepts; historical Soviet/Russian strategic thought on the correlation of forces	Western: "Escalation management can become self-fulfilling; ambiguous thresholds increase the risk of miscalculation and inadvertent war"

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Western	Delivers the most analytically developed framework for coercive bargaining: deterrence vs. compellence, audience costs, costly signals, focal points, and the bargaining model of war	Tends to overstate the rationality and information-processing capacity of decision-makers; underweights cultural, historical, and relational factors; can reduce coercion to a technical problem of credibility	Coercion is legitimate when it serves liberal international order, collective security, and the defense of sovereignty; force is justified as a last resort under just-war principles	Schelling's Arms and Influence; Fearon's audience costs; Cuban Missile Crisis; Gulf War coercive diplomacy; NATO deterrence posture	African: "The Western framework assumes a state-centric, rational actor model that erases the lived experience of coercion in post-colonial societies where violence is often informal, non-state, and structural"
UN	Provides a legal-normative framework that constrains coercion through Charter prohibitions, collective security, and the legitimization of force only in self-defense or Security Council authorization	Depends on great-power political will; often paralyzed by Security Council veto; struggles to address non-state coercion, hybrid orders, and informal violence	Coercion is legitimate only when authorized by the international community or exercised in self-defense; the use of force must be proportional, necessary, and last-resort	UN Charter Articles 2(4) and 51; collective security resolutions; peacekeeping operations; international humanitarian law	Chinese: "The UN framework reflects Western institutional dominance; its legitimacy claims are contested by states that view it as an instrument of great-power politics rather than genuine multilateral-ism"

2.8 WORKED EXAMPLE (I do)

The Cuban Missile Crisis (1962): Coercive Bargaining at the Nuclear Brink

The Cuban Missile Crisis of October 1962 remains the paradigmatic case of coercive bargaining between nuclear-armed adversaries. When the United States discovered Soviet medium-range and intermediate-range ballistic missiles deployed in Cuba, President Kennedy faced a choice that Schelling's framework illuminates with unusual clarity: how to compel the removal of weapons that had already been deployed without triggering the very war that both sides sought to avoid. The crisis is not merely a historical episode; it is a laboratory for testing the five key ideas developed in this lesson—Clausewitz's trinity and friction, Sun Tzu's winning without fighting, Schelling's coercion versus brute force, Fearon's audience costs and costly signals, and the strategic culture thesis. The following analysis reconstructs the crisis through four levels of analysis, identifies the operative mechanisms, reconstructs five perspectives, and adjudicates among them.

Levels of Analysis **Individual level.** The crisis was shaped profoundly by the personalities, beliefs, and cognitive frameworks of the key decision-makers. John F. Kennedy, scarred by the Bay of Pigs failure and the Vienna summit with Khrushchev, entered the crisis with a heightened sensitivity to credibility and a determination to avoid both appeasement and reckless escalation. Nikita Khrushchev, operating within a Soviet system that rewarded boldness but punished failure, faced domestic pressures from hardliners in the Presidium and the military. Robert Kennedy's role as informal channel to Soviet ambassador Anatoly Dobrynin illustrates how individual relationships can create bargaining space that formal institutions cannot. The ExComm deliberations reveal cognitive biases—groupthink, anchoring on the blockade option, and the availability heuristic shaped by Pearl Harbor—that influenced the choice of coercive instruments. Schelling's framework assumes rational actors, but the individual level reminds us that rationality is bounded by emotion, fatigue, and the fog of crisis.

State level. The United States and the Soviet Union operated as unitary actors with distinct strategic cultures, institutional constraints, and domestic political imperatives. The US possessed overwhelming conventional and nuclear superiority in the Caribbean theater, yet Kennedy chose a naval blockade (termed a "quarantine" to avoid the legal implications of a blockade under international law) rather than an air strike or invasion. This choice reflected not only military calculation but also domestic political constraints: Kennedy needed to demonstrate resolve to a Congress and public that had been alarmed by the "missile gap" rhetoric of the 1960 campaign. The Soviet Union, for its part, sought to alter the strategic balance in the Western Hemisphere, protect the Cuban revolution, and demonstrate solidarity with a socialist ally. The state-level analysis reveals that coercion is not merely about capability but about the political constraints that shape how capabilities are deployed.

Systemic level. The crisis occurred within a bipolar international system characterized by nuclear deterrence, alliance commitments, and a security dilemma. The deployment of Soviet missiles in Cuba was itself a response to the US Jupiter missiles in Turkey and Italy, to the failed Bay of Pigs invasion, and to the broader strategic imbalance favoring the United States. The systemic level explains why both sides were willing to risk nuclear war: the stakes were not merely Cuban but concerned the credibility of alliance commitments, the stability of the nuclear balance, and the rules of the Cold War order. The crisis also illustrates the systemic logic of deterrence: the existence of mutual assured destruction created both the incentive to avoid war and the bargaining leverage that made coercion possible.

Transnational level. The crisis had significant transnational dimensions. The Cuban revolution and its sur-

vival were transnational ideological stakes; the Non-Aligned Movement and the broader decolonizing world watched the superpower confrontation with alarm. The United Nations, through Secretary-General U Thant, played a mediating role that provided both sides with a face-saving exit. The transnational level also encompasses the role of intelligence communities, media, and public opinion in shaping the crisis: the discovery of the missiles by U-2 reconnaissance, the public announcement by Kennedy, and the global reaction all influenced the bargaining dynamics. The crisis was not merely bilateral; it was embedded in a transnational order of norms, institutions, and audiences.

Mechanism Section The operative mechanism in the Cuban Missile Crisis was Schelling's coercion-versus-brute-force distinction, operationalized through a sequence of costly signals, focal points, and audience costs. Kennedy's naval quarantine was not designed to physically prevent the delivery of missiles by force; it was designed to create a focal point for bargaining—a visible, credible, and limited commitment that forced Khrushchev to choose between escalation and concession. The quarantine's power lay not in its military effectiveness but in its communicative function: it signaled resolve while preserving the adversary's ability to retreat without humiliation.

The mechanism operated through several channels. First, the quarantine created a **focal point** (Schelling, *Arms and Influence*, 1966): a salient, mutually recognized threshold that structured the bargaining space. The "line of death" around Cuba was not militarily decisive but cognitively decisive—it gave both sides a shared reference point for negotiation. Second, Kennedy's public commitment to the quarantine generated **audience costs** (Fearon, 1994): having staked his credibility before Congress, the media, and the international community, Kennedy could not easily back down without suffering domestic political damage. This increased the credibility of his threat. Third, the crisis involved **costly signals**: the deployment of US forces, the alert of Strategic Air Command, and the naval mobilization were expensive, visible, and difficult to fake—precisely the properties that make signals credible under Schelling's framework.

The resolution mechanism was equally instructive. Khrushchev's withdrawal of the missiles was not compelled by brute force but by a coercive bargain: the US publicly pledged not to invade Cuba, and privately (through Robert Kennedy's back-channel communication to Dobrynin) agreed to withdraw the Jupiter missiles from Turkey. This secret concession was critical because it allowed Khrushchev to claim a victory to his domestic audience while actually conceding the central issue. The mechanism was thus not pure compellence but a negotiated settlement in which both sides could claim success—a "win-win" outcome that Schelling would recognize as the product of bargaining under the shadow of war.

Clausewitz's framework illuminates the friction and uncertainty that pervaded the crisis. The fog of war was literal: intelligence about the exact number and readiness of the missiles was incomplete, and the shooting down of a U-2 over Cuba on October 27 nearly triggered escalation that neither leader intended. The culminating point of attack—the point at which further military action would produce diminishing returns—was a constant concern for both sides. Kennedy's rejection of the air strike option reflected an intuitive grasp of the culminating point: an attack might destroy the missiles but would kill Soviet personnel, provoke retaliation, and potentially escalate to nuclear war. The trinity—passion, chance, and reason—was in full operation: public passion in the United States demanded action; chance manifested in the U-2 shootdown and the submarine incident; reason was embodied in the ExComm deliberations and the back-channel negotiations.

Sun Tzu's tradition offers a different lens. The crisis can be read as an attempt by both sides to achieve their objectives without fighting. Kennedy's blockade was a form of positional warfare: it sought to alter the strategic situation without direct combat. Khrushchev's withdrawal, similarly, was a strategic retreat that

preserved Soviet forces and avoided humiliation. The highest form of strategy, in Sun Tzu's terms, is to win without fighting—and both leaders, in different ways, sought to achieve this. Yet the crisis also reveals the limits of the Sun Tzu tradition: the missiles had already been deployed, and the situation required not merely positional advantage but explicit coercive bargaining. Winning without fighting is easier when the adversary has not yet committed; once committed, compellence becomes necessary.

Perspective Reconstruction African perspective (primary). The African vantage point on the Cuban Missile Crisis begins not with the superpower bargaining but with the question of whose security was at stake and who bore the costs. Cuba, a post-colonial state that had recently overthrown a US-backed dictatorship, was the terrain on which two great powers conducted their confrontation; Cuban sovereignty was subordinated to superpower interests. From an African perspective, this mirrors the experience of post-colonial states that became arenas for Cold War competition, their sovereignty compromised by external powers pursuing strategic objectives unrelated to local welfare. The crisis reveals how coercion in the international system often operates not through direct force but through the structural violence of great-power rivalry, which constrains the autonomy of weaker states. African strategic thought, drawing on Nkrumah's concept of neo-colonialism and Fanon's analysis of violence and liberation, would emphasize that the Cuban people were not merely pawns but actors whose revolutionary project was threatened by both superpowers. The African perspective also highlights the role of the Non-Aligned Movement and the broader decolonizing world in creating normative pressure for de-escalation; the crisis was not merely bilateral but embedded in a transnational order in which newly independent states demanded a voice. Furthermore, the African vantage point draws attention to the informal and non-state dimensions of security: the Cuban revolution's survival depended not only on Soviet missiles but on the mobilization of popular support, the construction of hybrid security orders, and the legitimacy of the revolutionary project. The crisis thus illustrates a broader pattern in which formal military power is necessary but insufficient for security, and in which the most durable forms of coercion are those that operate through legitimacy and popular mobilization rather than through the threat of force alone. The African perspective's strongest contribution is its insistence that coercion cannot be understood solely as an interstate phenomenon; it must be situated within the broader structures of global inequality, colonial legacies, and the struggle for self-determination.

Chinese perspective. The Chinese vantage point, rooted in Sun Tzu's relational-strategic tradition, would emphasize the importance of positional advantage and the avoidance of direct confrontation. China's own experience of the crisis—occurring during the Sino-Soviet split—was shaped by a strategic culture that valued patience, indirection, and the accumulation of advantage without provoking decisive conflict. The Chinese perspective would note that both Kennedy and Khrushchev sought to avoid war while achieving their objectives, consistent with the Sun Tzu ideal of winning without fighting. However, the Chinese tradition would also critique the crisis as an example of the dangers of brinkmanship: both sides pushed to the edge of nuclear war, a strategy that Sun Tzu would have considered reckless because it risked losing everything. China's no-first-use nuclear policy and active defense doctrine reflect a strategic culture that prioritizes avoiding the initiation of conflict while maintaining the capability to respond. The Chinese perspective would also highlight the relational dimension: the crisis was not merely about missiles but about the relationship between the superpowers, and its resolution required the restoration of a stable relational equilibrium. The strongest Chinese contribution is the emphasis on positional and relational factors over explicit bargaining; the strongest limitation is the underweighting of the role of credible threats and demonstrated resolve in compelling adversary concessions.

Russian perspective. The Russian vantage point, drawing on the tradition of escalation management and the

correlation of forces, would emphasize the strategic logic of Khrushchev's deployment and withdrawal. The deployment of missiles in Cuba was an attempt to alter the correlation of forces in the Western Hemisphere, compensating for US advantages in Turkey and Italy. The withdrawal, in this view, was not a capitulation but a managed de-escalation that preserved Soviet credibility and achieved the removal of US missiles from Turkey. The Russian perspective would highlight the importance of escalation control: Khrushchev's decision to withdraw was shaped by his assessment that further escalation would risk nuclear war, a calculation consistent with the Russian emphasis on managing the correlation of forces to avoid uncontrolled conflict. The Russian tradition would also note the role of ambiguity and signaling: the secret concession on Turkey allowed both sides to claim success, preserving the stability of the broader strategic relationship. The strongest Russian contribution is the emphasis on escalation management and the correlation of forces; the strongest limitation is the risk that this framework normalizes coercion as a routine instrument and underestimates the destabilizing effects of ambiguous thresholds.

Western perspective. The Western vantage point, rooted in Schelling's bargaining framework, provides the most analytically developed account of the crisis. The quarantine was a coercive instrument designed not to destroy the missiles but to create bargaining leverage; the secret concession on Turkey was a focal point that allowed mutual concession; the audience costs generated by Kennedy's public commitment increased the credibility of US threats. The Western perspective would emphasize that the crisis was resolved not by force but by bargaining under the shadow of war—a paradigmatic example of Schelling's central thesis. Fearon's audience costs theory explains why Kennedy's public commitment was credible: having staked his reputation, he could not easily back down. The Western framework also highlights the distinction between deterrence and compellence: the US was not merely deterring future Soviet action but compelling the removal of weapons already deployed, a more difficult task that required not just capability but credibility and bargaining skill. The strongest Western contribution is the analytical precision of the coercion-versus-brute-force distinction; the strongest limitation is the tendency to overstate the rationality of decision-makers and to underweight cultural, historical, and relational factors.

UN perspective. The UN vantage point emphasizes the role of international law, collective security, and multilateral mediation in the crisis. Secretary-General U Thant's intervention provided a face-saving mechanism for both sides, illustrating the UN's function as a forum for de-escalation. The UN perspective would also highlight the legal dimensions: the quarantine was legally questionable under international law, and the crisis underscored the tension between unilateral state action and the Charter's prohibition on the use of force. The UN framework would emphasize that the crisis was resolved not merely through bilateral bargaining but through the legitimizing function of international institutions and norms. The strongest UN contribution is the emphasis on legitimacy and multilateralism; the strongest limitation is the dependence on great-power political will and the inability to enforce compliance against determined adversaries.

Explicit Adjudication The Western (Schelling-derived) perspective provides the most analytically powerful explanation of the Cuban Missile Crisis, but it is not sufficient on its own. Schelling's framework of coercion versus brute force, focal points, and bargaining under the shadow of war captures the central mechanism of the crisis with precision: the quarantine was a coercive instrument, the secret Turkey concession was a focal point, and the resolution was a negotiated settlement rather than a military victory. Fearon's audience costs theory explains the credibility of Kennedy's commitment. These analytical tools are indispensable for understanding how the crisis was resolved.

However, the Western perspective's strength is also its limitation. By treating the crisis as a rational bargaining game, it underweights the role of individual psychology, domestic politics, and the near-miss accidents

that nearly derailed the process. The U-2 shootdown and the submarine incident were not part of any rational bargaining model; they were products of friction and chance that Clausewitz's trinity captures better than Schelling's framework. The Western perspective also underweights the transnational and post-colonial dimensions that the African perspective foregrounds: Cuba's sovereignty was subordinated to superpower interests, and the crisis was embedded in a global order of inequality that the bargaining framework takes as given.

The African perspective's contribution is essential but partial. It correctly identifies the structural violence and subordination of weaker states in the international system, and it foregrounds the role of legitimacy and popular mobilization. But it under-specifies the mechanics of nuclear crisis bargaining and the role of credible threats in compelling adversary concessions. The Chinese perspective's emphasis on winning without fighting and positional advantage illuminates aspects of both sides' strategies but underweights the explicit coercive bargaining that was necessary once missiles were deployed. The Russian perspective's escalation management framework captures Khrushchev's calculus but risks normalizing coercion and underestimating its destabilizing effects. The UN perspective's emphasis on legitimacy and multilateralism identifies an important but secondary factor: U Thant's mediation provided a face-saving mechanism, but the core bargaining was bilateral.

The most complete explanation combines the Western framework's analytical precision with the African perspective's structural critique, the Clausewitzian attention to friction and chance, and the Chinese emphasis on positional advantage. The crisis was resolved through coercive bargaining, but the bargaining occurred within a structure of global inequality, was shaped by individual psychology and domestic politics, and was nearly derailed by accidents that no rational model could predict. No single perspective captures all of these dimensions; the adjudication favors the Western framework as the primary explanatory lens while insisting that its limitations are substantial and that the other perspectives identify real phenomena that the Western framework occludes.

SECTION 2.9 PROBLEM PAIR (We do)

Tasks

1. **Sequence and classify.** Reconstruct the chronological sequence of coercive moves in the 1990–91 Gulf crisis from August 1990 through January 1991. For each move, classify it as deterrence, compellence, or brute force using Schelling's framework, and justify your classification in one sentence.

2. **Compellence vs. deterrence.** Explain why Operation Desert Shield—the US-led military buildup in Saudi Arabia—was a compellent rather than a deterrent threat. Identify the specific action Iraq was being compelled to take, and explain why the distinction matters analytically.

3. **Audience costs.** Apply Fearon's audience-cost logic to Saddam Hussein's position. What domestic and regional political constraints made withdrawal from Kuwait costly for him? How did these constraints affect the probability of Iraqi compliance with the coalition's demands?

4. **The ultimatum.** Evaluate UN Security Council Resolution 678, which set a January 15, 1991 deadline for Iraqi withdrawal. Did this fixed deadline strengthen or weaken compellence? Use Schelling's concepts of commitment, focal points, and the bargaining model of war.

5. **The final negotiation.** Assess the Baker–Aziz meeting in Geneva on January 9, 1991. What signals were exchanged? Why did the meeting fail to produce Iraqi withdrawal? What does this tell us about the conditions under which coercive bargaining succeeds?

6. **Synthesis.** Why did compellence fail in this case? Distinguish between (a) the target's refusal to comply and (b) the coercer's decision to shift from coercion to brute force. What does this case reveal about the structural limits of compellence as a strategy?

MODEL ANSWER

The 1990–91 Gulf crisis is the canonical modern case of compellence failure, and its analysis requires careful application of Schelling's distinction between coercion and brute force, Fearon's audience-cost theory, and the bargaining model of war. On August 2, 1990, Iraq invaded Kuwait. The international response unfolded in stages: UN Security Council Resolution 660 condemned the invasion on the same day; Resolution 661 imposed comprehensive economic sanctions on August 6; and the United States deployed forces to Saudi Arabia under Operation Desert Shield beginning August 7. Each of these moves was compellent in character. Under Schelling's framework, deterrence requires the target to refrain from an action it has not yet taken, whereas compellence requires the target to take a visible, costly action—in this case, withdrawing from Kuwait and reversing the annexation. The coalition was not merely trying to prevent further Iraqi aggression; it was trying to force Iraq to undo an action already accomplished.

The military buildup was designed to make continued occupation of Kuwait increasingly costly. Yet compellence failed for several interconnected reasons that illuminate the structural difficulties of the strategy. First, Saddam Hussein faced severe audience costs. Having annexed Kuwait as Iraq's "nineteenth province" and framed the invasion in terms of historical territorial claims and pan-Arab leadership, withdrawal would have constituted a humiliating public reversal. Fearon's audience-cost theory predicts that leaders who make public commitments find it politically costly to back down; the domestic and regional price of retreat can exceed the external costs of non-compliance. Saddam had staked his prestige and legitimacy on the annexation, making compliance with the coalition's demands politically expensive in ways that external threats could not easily offset. This is a core asymmetry: the coercer threatens future costs, while the target faces immediate, certain costs to its domestic standing if it complies.

Second, the fixed deadline in Resolution 678—January 15, 1991—created a focal point but also removed flexibility. Schelling's bargaining model suggests that deadlines can strengthen commitment by making threats credible and concentrating expectations, but they can also paint the target into a corner where backing down becomes equivalent to capitulation. Saddam may have calculated that the coalition's own deadline created pressure on the United States to negotiate rather than fight, especially given American casualty aversion and the approaching end of the congressional authorization window. The deadline thus functioned as a double-edged instrument: it signaled resolve but also reduced the space for face-saving compromise.

Third, the Baker–Aziz meeting in Geneva on January 9, 1991, represented a final coercive bargaining session. Baker presented an ultimatum demanding unconditional withdrawal; Aziz refused to commit and instead linked withdrawal to the Palestinian question and other regional issues. The meeting failed because Iraq's minimum acceptable terms were incompatible with the coalition's demand for unconditional reversal. This illustrates a central Schelling insight: coercion succeeds when there exists a mutually acceptable outcome that both sides prefer to war; when no such zone of agreement exists—when the target's reservation price exceeds the coercer's willingness to concede—coercion collapses into brute force. The linkage strategy,

whether sincere or tactical, eliminated the possibility of a negotiated exit.

Fourth, Saddam's strategic calculus included a misperception of American resolve. He appears to have discounted the credibility of the threat to use force, drawing on perceptions of American casualty sensitivity derived from the Vietnam experience. This signaling failure—where the target misreads the coercer's willingness to bear costs—meant that the compellent threat lacked the credibility necessary to induce compliance. Schelling emphasizes that threats must be credible to be effective; credibility depends on the target's belief that the coercer will carry out the threatened action, and Saddam's beliefs about American resolve were systematically wrong.

The case ultimately demonstrates that compellence is structurally harder than deterrence. Deterrence allows the target to save face by doing nothing; compellence demands visible capitulation. When the target's audience costs exceed the external costs of non-compliance, when no face-saving exit is available, and when the target misperceives the coercer's resolve, coercion fails. The coalition then faced a choice: accept the status quo or resort to brute force. It chose the latter, launching Operation Desert Storm on January 17, 1991. The lesson is not that compellence never works, but that its success depends on the target's cost-benefit calculus, the availability of face-saving exits, and the credibility of the threat—conditions that were absent in this case. The Gulf War thus stands as a reminder that military superiority alone does not guarantee coercive success; the political psychology of the target and the bargaining structure of the crisis matter as much as the balance of forces.

SECTION 2.10 INDEPENDENT MEMO (You do)

(a) Case description. In August 2022, a major power conducted large-scale military exercises around a contested island territory following a high-profile visit by a foreign legislative leader. The exercises included missile tests over the island's airspace and a temporary blockade of key ports. The visiting power's government condemned the actions but did not alter its policy or recall its ambassador. The exercising power maintained the blockade for 72 hours before withdrawing, claiming the exercises had "successfully tested combat readiness." The contested territory's government reported no change in its security posture or diplomatic alignment. Regional allies issued statements of concern but took no military action. Domestic audiences in the exercising power celebrated the display of resolve, while opposition parties criticized the cost and risk. The episode generated extensive debate about whether the blockade constituted compellence, deterrence, or signaling, and whether the exercising power achieved any of its stated strategic objectives.

(b) Required memo headings (respond to each as a prompt):

- **Mechanism:** Identify the causal mechanism at work. Is this a case of compellence, deterrence, signaling, or some combination? What specific action was the exercising power trying to induce or prevent? What was the target's cost-benefit calculus? Specify the mechanism, not just the outcome.
- **Perspective reconstruction:** Reconstruct how each of the five perspectives—African, Chinese, Russian, Western, and UN—would interpret this episode. What does each perspective contribute, and what does each occlude? Which perspective best explains the outcome, and on what evidence?
- **Historical analogue:** Identify one historical case that illuminates this episode. Does the analogue support or challenge the mechanism you identified? What are the limits of the comparison?

- **Falsifiers:** What evidence would disconfirm your mechanism? Specify at least two observable implications that, if absent, would weaken your explanation. Distinguish between evidence that would falsify the mechanism and evidence that would merely complicate it.

(c) Self-check: Before finalizing your memo, verify that you have clearly distinguished description (what happened), explanation (why it happened), prediction (what would happen under changed conditions), and prescription (what should be done). If any of these four is missing or conflated with another, revise.

SECTION 2.11 HINGE QUESTION

Question: Schelling's central contribution to strategic thought, as developed in *Arms and Influence* (1966), is the distinction between:

A) Offensive and defensive weapons systems, and their differential effects on crisis stability.

B) Coercion and brute force, with coercion further divided into deterrence and compellence.

C) Nuclear and conventional warfare, and the unique escalatory dynamics of each.

D) State and non-state actors in conflict, and the challenges of coercing non-state groups.

Correct answer: B

Distractor diagnoses:

- **A — Offense-defense theory:** This confuses Schelling with later theorists such as Jervis (1978) and Glaser (1997), who developed offense-defense theory to explain how the technical characteristics of weapons affect crisis stability and arms racing. Schelling's framework is about the logic of threats and bargaining, not the technical properties of weapons systems. A student selecting A has conflated two distinct theoretical traditions within security studies.
- **C — Nuclear vs. conventional warfare:** While Schelling wrote extensively about nuclear strategy and his work profoundly influenced nuclear deterrence theory, his foundational contribution in *Arms and Influence* is not the nuclear-conventional distinction. Nuclear strategy is an application domain for his coercion framework, not the framework itself. A student selecting C has mistaken an important application for the core theoretical contribution.
- **D — State vs. non-state actors:** This is anachronistic. Schelling's framework was developed in the context of interstate coercion during the Cold War and does not address non-state actors as a distinct category. While his concepts have since been applied to non-state coercion, this was not his contribution. A student selecting D has projected contemporary concerns onto a mid-twentieth-century theoretical framework.

SECTION 2A — DATA LAB

Table 1 — Global and Regional Military Expenditure, Selected Years (SIPRI, approximate, constant 2022 USD, billions)

Year	World total	United States	China	Russia / USSR	NATO Europe	Africa (all states)	World avg. % of GDP
1950	~180	~140	~5	~40	~25	~1	~4.5
1960	~320	~200	~10	~60	~40	~2	~4.0
1970	~520	~280	~20	~120	~60	~4	~3.5
1980	~900	~350	~30	~220	~120	~8	~3.8
1989	~1,150	~450	~40	~280	~160	~12	~3.6
1995	~900	~380	~35	~30	~120	~10	~2.5
2005	~1,250	~600	~90	~40	~180	~18	~2.4
2015	~1,750	~680	~220	~70	~220	~40	~2.3
2023	~2,443	~916	~296	~109	~388	~52	~2.3

Notes: Figures are rounded approximations drawn from SIPRI Trends in World Military Expenditure series and are intended to show orders of magnitude and directional trends, not exact annual values. "Africa (all states)" aggregates North and sub-Saharan Africa. The 1989–1995 drop reflects the post-Cold War "peace dividend" and the collapse of Soviet military spending; the 2015–2023 rise reflects renewed great-power competition, the Ukraine war, and NATO rearmament.

Table 2 — Interstate War Frequency by Decade (Correlates of War, interstate war threshold: 1,000+ battle deaths; approximate counts)

Decade	Interstate wars begun	Major-power participants	Median war duration (months)	Wars ending in decisive military victory
1940s	6	4	48	4
1950s	7	3	12	3
1960s	9	2	8	4
1970s	6	2	10	3
1980s	5	2	14	2
1990s	4	2	3	3
2000s	3	2	8	2
2010s	3	2	24+	1
2020s (to date)	2	2	ongoing	0

Notes: Counts are approximate and depend on COW coding rules (interstate war requires 1,000+ battle deaths and state actors on both sides). The table excludes civil wars, which dominate post-1945 conflict counts. The apparent decline in frequency of large interstate wars after 1945 is one of the most debated empirical patterns in security studies; it is consistent with both nuclear-deterrence and normative-evolution explanations.

Table 3 — Selected Crisis-Bargaining Episodes and Coercive Outcomes (ICB / historical record, approximate)

Episode	Coercer	Target	Coercive demand	Outcome	Key mechanism emphasized
Berlin blockade, 1948–49	USSR	US/UK/France	Withdraw from West Berlin	Failure (airlift sustained)	Brute-force denial failed; no compellence
Korean War armistice, 1953	US (UN)	PRC/DPRK	Accept armistice line	Success (stalemate)	Attrition + threat of escalation
Cuban Missile Crisis, 1962	US	USSR	Remove missiles from Cuba	Success	Compellence via naval quarantine + private concession (Turkey missiles)
1961 Berlin crisis	USSR	US	Recognize GDR sovereignty	Failure	US resolve signaled; no focal point for concession
1973 Yom Kippur (US alert)	US	USSR	Restrain intervention	Success	Costly signal (DEFCON 3)
Gulf War coercive diplomacy, 1990–91	US-led coalition	Iraq	Withdraw from Kuwait	Failure of compellence; success of deterrence (Saudi Arabia)	Compellence demands exceeded target's reservation price
1995–96 Taiwan Strait	PRC	US/Taiwan	Deter independence moves	Partial success	Costly signaling; ambiguity
2014 Crimea	Russia	Ukraine/West	Accept annexation	Success (de facto)	Faits accomplis; limited compellence resistance
2022 Ukraine (initial)	Russia	Ukraine/West	Regime change / neutrality	Failure of compellence	Underestimated target resolve; overestimated own capability

Analysis Questions

1. Trend. Table 1 shows world military expenditure rising from roughly $180 billion in 1950 to roughly $2,443 billion in 2023 (constant 2022 USD), yet Table 2 shows the frequency of large interstate wars declining over the same period. How can both trends be true simultaneously, and what does this imply about the relationship between military spending and the incidence of interstate war? Distinguish at least two mechanisms (one realist, one institutional/normative) and identify which data pattern each mechanism predicts.

2. Level of analysis. Using the four levels of analysis from Lesson 1 (individual, state, systemic, transnational), identify which level each of the three tables primarily illuminates and which level each most obscures. For example, Table 1's aggregate spending figures obscure individual decision-making and transnational arms-industry dynamics; Table 2's war counts obscure the bargaining processes that precede them. State one specific analytical gain and one specific analytical loss for each table.

3. Perspective reconstruction (all five). Reconstruct how each of the five perspectives would read the combined data pattern (rising spending, falling large-war frequency, persistent crisis bargaining). - *African*: What does the spending data reveal about the militarization of post-colonial states and the externalization of security costs to African populations? What do the war-frequency data obscure about African conflict (civil wars, proxy wars, non-state coercion)? - *Chinese*: How does the data support a narrative of "peaceful rise" under active defense, and what does it obscure about gray-zone coercion? - *Russian*: How does the correlation-of-forces framing read the spending gap with NATO, and how does it read the war-frequency decline? - *Western*: How does the Schelling-derived bargaining reading interpret the crisis table, and what does it assume about rationality? - *UN*: How does the Charter collective-security framing read the same data, and what does it occlude about enforcement gaps?

4. Interpretation. Table 3 shows that compellence (demanding a change in the status quo) succeeds less often than deterrence (preserving the status quo), and that faits accomplis (Crimea 2014) succeed more often than explicit demands (Gulf 1990–91). Using Schelling's distinction between brute force and coercion, and Fearon's audience-costs mechanism, explain why compellence is structurally harder than deterrence and why faits accomplis may bypass the bargaining problem. State one falsifying observation that would weaken your interpretation.

5. Limitation. Identify the most important limitation of each table for testing the five key ideas of this lesson (Clausewitzian friction, Sun Tzu's winning without fighting, Schelling's focal points, Fearon's audience costs, strategic culture). Which key idea is least testable with these data, and why? Propose one additional data source or method that would partially remedy the gap.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — Clausewitz's Trinity and the Culminating Point

What to draw. A large equilateral triangle. At each vertex, place a labeled circle: top vertex "PASSION / PEOPLE" (with sub-label "hatred, enmity, primordial violence"); bottom-left vertex "CHANCE / MILITARY" (sub-label "friction, genius, fog of war"); bottom-right vertex "REASON / GOVERNMENT" (sub-label "political purpose, policy"). Inside the triangle, draw a horizontal line roughly one-third from the bottom labeled "CULMINATING POINT OF VICTORY" with an arrow pointing left-to-right labeled "advance / attack" and a return arrow labeled "retreat / exhaustion." Below the line, shade the region and label

it "zone of diminishing returns / friction accumulates." Above the line, label "zone of political decision."

How to label it. Use bold caps for the three vertices. Use a dashed line for the culminating point. Annotate the left edge with "Clausewitz, On War, Book I, Ch. 1" and the right edge with "trinity = people + army + government."

Perspective overlay. In the bottom-left corner, draw a small inset box labeled "African critique (Grovogui, Mbembe)": "the trinity assumes a Weberian state; where the state is hybrid or absent, 'politics' is not government policy but social/communal negotiation." In the top-right corner, a small box labeled "Chinese reading (Sun Tzu lineage)": "the culminating point is reached earlier when the enemy's alliances are intact; attack the strategy, not the army."

Visual 2 — Schelling's Coercion Spectrum and Focal Points

What to draw. A horizontal axis running left to right, labeled "degree of violence applied." At the far left, a vertical bar labeled "PURE COERCION (no violence): threats, promises, focal points." In the middle, a shaded band labeled "COERCIVE VIOLENCE: limited force to demonstrate resolve (quarantine, bombing pauses, DEFCON alerts)." At the far right, a solid block labeled "BRUTE FORCE: destroying enemy capability to compel surrender." Above the axis, draw two overlapping bell curves: the left curve labeled "DETERRENCE (status quo preserved)" peaking in the pure-coercion zone; the right curve labeled "COMPELLENCE (status quo changed)" peaking in the coercive-violence zone. Below the axis, draw three "focal point" markers (stars) labeled "13-day deadline," "line of contact," and "UN Security Council resolution," with arrows pointing up to the axis.

How to label it. Title: "Schelling: Coercion vs. Brute Force (Arms and Influence, 1966)." Label the gap between the two curves "compellence is harder: requires target to act, not merely refrain." Label the stars "focal points reduce bargaining indeterminacy."

Perspective overlay. Annotate the pure-coercion zone with a Russian flag-colored note: "Russian reading: coercion without violence is preferred; escalation management keeps force below the nuclear threshold." Annotate the brute-force zone with a Western note: "Western reading: compellence often slides into brute force (Gulf 1991)." Annotate the focal points with a UN note: "UN reading: resolutions can create focal points but lack enforcement."

Visual 3 — Strategic Culture Map (Five Perspectives on Coercion)

What to draw. A five-column table drawn as a hand-sketched grid. Columns: "African," "Chinese," "Russian," "Western," "UN." Rows (top to bottom): "Core concept of coercion," "Preferred instrument," "View of Clausewitz," "View of Sun Tzu," "Blind spot." Fill each cell with a short phrase (3-6 words). In the African column, shade the entire column slightly darker to mark it as primary. Draw a large arrow from the African column to a marginal note: "reveals what the others occlude: coercion is often non-state, hybrid, and social."

How to label it. Title: "Strategic Culture and Coercion: Five Perspectives." Subtitle: "Lesson 20, Section 2.7." Label the shaded column "PRIMARY."

Perspective overlay. This visual IS the perspective overlay; no separate inset needed. Add a footer note: "Each column is a hypothesis about how actors think about force, not a description of what they do."

SECTION 4 — CORNELL NOTES

Cue (prompt)	Notes (with source log)
What is Clausewitz's trinity?	People (passion), army (chance/friction), government (reason/policy). War is continuation of politics by other means. Source: Clausewitz, *On War* (1832), Book I, Ch. 1; Book VIII.
What is friction?	The gap between war on paper and war in reality; cumulative small obstacles. Culminating point = moment when attack should stop. Source: Clausewitz, *On War*, Book I, Ch. 7; Book VII.
What is Sun Tzu's core claim?	Win without fighting; attack the enemy's strategy, then alliances, then army, then cities. Avoid prolonged war. Source: Sun Tzu, *Art of War*, Ch. 3.
How does Sun Tzu critique attrition?	Attrition exhausts the state; "there is no instance of a country having benefited from prolonged warfare." Source: Sun Tzu, *Art of War*, Ch. 2.
What is Schelling's coercion vs. brute force?	Brute force destroys capability; coercion manipulates the enemy's cost-benefit calculus via threats/promises. Source: Schelling, *Arms and Influence* (1966), Ch. 1.
Deterrence vs. compellence?	Deterrence: persuade enemy not to act (status quo). Compellence: persuade enemy to act/undo (change status quo). Compellence harder. Source: Schelling, *Arms and Influence* (1966), Ch. 2.
What are focal points?	Schelling points: salient solutions that reduce bargaining indeterminacy without communication. Source: Schelling, *The Strategy of Conflict* (1960), Ch. 3.
What are audience costs?	Domestic political costs of backing down after a public threat; makes threats credible. Source: Fearon, "Domestic Political Audiences and the Escalation of International Disputes," *APSR* (1994).
What is costly signaling?	Signals that are expensive to fake; separate types from cheap talk. Source: Fearon (1994); Jervis, *The Logic of Images in International Relations* (1970).
What is strategic culture?	Shared beliefs about the role of force; shapes how states coerce. Source: Snyder, *The Soviet Strategic Culture* (1977); Johnston, "Thinking about Strategic Culture" (1995).

Cue (prompt)	Notes (with source log)
How do the five perspectives differ on coercion?	African: hybrid/non-state coercion; Chinese: relational, active defense; Russian: escalation management, correlation of forces; Western: bargaining; UN: Charter prohibition. Source: Grovogui, Mbembe, Bayart, Mamdani (African); Johnston (1995) (Chinese); Snyder (1977) (Russian).
What is the African critique of Clausewitz?	Clausewitz presupposes a Weberian state; post-colonial states are hybrid; coercion is social and non-state. Source: Grovogui, *Sovereigns, Quasi Sovereigns, and Africans* (1996); Mbembe, *On the Postcolony* (2001).

Summary (3–5 sentences). Strategic thought about coercion runs from Clausewitz's trinity and friction, through Sun Tzu's relational preference for winning without fighting, to Schelling's bargaining model that distinguishes brute force from coercion and deterrence from compellence. Fearon's audience-costs mechanism explains why public threats can be credible, while strategic-culture scholarship shows that Chinese, Russian, African, Western, and UN traditions read coercion through different premises. The African vantage point is primary here: it reveals that coercion is often non-state, hybrid, and social, a reality that state-centric theories occlude. Data on spending and war frequency show rising militarization alongside fewer large interstate wars, a pattern that only makes sense once coercion is understood as bargaining rather than battle. The lesson's central puzzle is why states spend more to fight less, and why compellence so often fails where deterrence succeeds.

SECTION 5 — FEYNMAN COMPRESSION

Step 1 — Explain without jargon. Imagine two people arguing over a parking spot. One could smash the other's car (brute force) or threaten to call the police, flash a badge, or block the exit (coercion). Coercion works by changing what the other person thinks will happen, not by destroying their car. Deterrence is "don't take my spot"; compellence is "give me your spot." It is much easier to make someone not do something than to make them undo something they have already done. Clausewitz said war is just politics continued by other means, with three parts: the people's anger, the army's chance, and the government's reason. Sun Tzu said the best victory is winning without fighting. Schelling said threats and promises are weapons too. Fearon said that if a leader makes a public threat, backing down costs them politically at home, which makes the threat believable. Different cultures think about all of this differently: African scholars note that in many places the "state" is not the only actor using force, so theories built on states miss most of the coercion that actually happens.

Step 2 — Mark gaps. (a) I have not explained *why* focal points solve bargaining indeterminacy; the parking-spot analogy has no natural focal point. (b) I have not specified the scope conditions under which audience costs operate (democracies vs. autocracies). (c) I have not distinguished compellence's higher failure rate from its higher cost when it succeeds. (d) I have not addressed the African critique's implication for Clause-

witz's "culminating point," which assumes a single political authority. (e) I have not explained how Sun Tzu's "winning without fighting" maps onto Schelling's pure-coercion zone.

Step 3 — Reread verification. Re-reading Clausewitz, Book I, Ch. 1 confirms that the trinity is people/army/government and that war serves policy; the analogy's "government's reason" is accurate but omits the "fog of war" and "friction" that make execution uncertain. Re-reading Schelling, *Arms and Influence*, Ch. 1 confirms that coercion manipulates costs and benefits while brute force destroys capability; the analogy captures this. Re-reading Fearon (1994) confirms that audience costs require a domestic audience that can punish the leader; the analogy's "politically at home" is accurate but underspecified. The African critique (Grovogui, Mbembe) is accurately summarized as state-centrism's blind spot.

Step 4 — Analogy with explicit limits. The parking-spot analogy illuminates the brute-force/coercion distinction and the deterrence/compellence asymmetry, but it breaks down in four ways: (i) it has no focal points or salience, which Schelling shows are central to real crises; (ii) it has no domestic audience, so it cannot model audience costs; (iii) it treats both parties as unitary actors, occluding the African insight that coercion is often intra-communal and non-state; (iv) it has no escalation ladder or nuclear threshold, which the Russian and Chinese perspectives emphasize. The analogy is a starting scaffold, not a model.

Step 5 — Rewrite. Strategic coercion is the manipulation of an adversary's cost-benefit calculus through threats, promises, and limited violence, as distinct from brute force, which destroys capability. Clausewitz frames war as politics continued by other means, structured by a trinity of people, army, and government, and subject to friction and a culminating point beyond which advance becomes self-defeating. Sun Tzu inverts the Clausewitzian emphasis on battle, arguing that the highest form of victory is winning without fighting, by attacking strategy and alliances rather than armies. Schelling formalizes this into a bargaining model: deterrence preserves the status quo by threatening costs for action, while compellence demands a change in the status quo and is structurally harder because it requires the target to act rather than refrain. Fearon shows that public threats generate audience costs that make them credible, but only where domestic audiences can punish retreat. Strategic culture—Chinese relationalism, Russian escalation management, Western bargaining theory, UN legalism, and the African critique of state-centrism—determines which instruments actors prefer and which blind spots they carry. The African perspective is primary: it reveals that coercion is frequently non-state, hybrid, and social, a reality that state-centric theories of war systematically occlude, and that the "politics" in Clausewitz's formula is often not government policy at all.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L20-01	Definition	Define Clausewitz's claim that war is a continuation of politics by other means.	War is an instrument of policy rather than an autonomous realm; military force serves political ends even when violence escalates. The claim is conditional because friction, passion, and chance can weaken political control. It is most directly a Western state-centric formulation.	African critiques stress that colonial and post-colonial violence often suspended reciprocal politics and operated through racialized domination.
L20-02	Mechanism	What are the three elements of Clausewitz's trinity?	The trinity comprises the people and passion, the commander and chance, and the government and reason. War's dynamics emerge from their interaction, so no single element fully controls outcomes. The model assumes a coherent state with identifiable political authority.	African hybrid security orders add fragmented authority, militias, and patronage networks that the trinity does not capture.

Tag	Card Type	Front	Back	Perspective Note
L20-03	Mechanism	What is friction in Clausewitzian theory?	Friction is the resistance between planned war and actual war, produced by uncertainty, chance, physical difficulty, and psychological strain. It explains why even sound plans fail and why outcomes remain probabilistic. It applies broadly but intensifies where command structures are fragmented.	In African hybrid orders, friction is amplified by informal authority and multiple coercive actors.
L20-04	Mechanism	What is the culminating point of the attack?	The culminating point is where an offensive's power peaks and further advance risks exhaustion, overextension, or counterattack. The mechanism is the conversion of territorial gain into logistical and moral vulnerability. It warns that compellence may require stopping before maximal force.	Russian escalation-management thinking similarly stresses recognizing limits before overreach.

Tag	Card Type	Front	Back	Perspective Note
L20-05	Definition	What does Sun Tzu mean by winning without fighting?	Victory is achieved by shaping the enemy's calculations, alliances, and perceptions so that combat is unnecessary or already decided. The mechanism is indirect advantage through deception, positioning, and psychological disruption. It assumes a cost-sensitive adversary capable of recognizing disadvantage.	Chinese strategic culture treats relational advantage and patience as central to coercion.
L20-06	Comparison	How does Sun Tzu critique attrition?	Attrition wastes resources, cedes initiative, and turns war into a contest of endurance rather than judgment. Sun Tzu prefers disrupting strategy, alliances, and command before decisive battle. The critique assumes rational cost-benefit calculation by the adversary.	Western Clausewitzian traditions more readily accept decisive battle and material exhaustion.

Tag	Card Type	Front	Back	Perspective Note
L20-07	Definition	Distinguish coercion from brute force in Schelling's framework.	Brute force destroys or occupies; coercion manipulates the adversary's choices by threatening future costs or offering benefits. The mechanism is bargaining over pain rather than annihilation. It requires credible communication, restraint, and a rational adversary.	African hybrid actors may not share the signaling conventions assumed by Western bargaining models.
L20-08	Comparison	What is the difference between deterrence and compellence?	Deterrence prevents an action by threatening punishment; compellence demands a change in the status quo. Compellence is harder because it requires the adversary to act, retreat, or concede under pressure. The mechanism is status-quo bias and the political cost of visible concession.	The 1990-91 Gulf War shows compellence failing until military force reversed Iraqi occupation.

Tag	Card Type	Front	Back	Perspective Note
L20-09	Mechanism	What are focal points in Schelling's bargaining model?	Focal points are salient solutions that coordinate expectations without explicit agreement, such as the 38th parallel or Berlin. The mechanism is shared salience reducing uncertainty in crisis bargaining. Their power is culturally and historically contingent.	Chinese, Russian, and African actors may not assign the same salience to Western-default focal points.
L20-10	Mechanism	What are audience costs in Fearon's theory?	Audience costs are domestic political penalties leaders incur for making threats and then backing down. The mechanism is that public commitments make inconsistency costly, increasing credibility. The effect is strongest where domestic audiences can observe and punish leaders.	Fearon's mechanism is weaker or differently structured in autocracies and hybrid regimes.

Tag	Card Type	Front	Back	Perspective Note
L20-11	Mechanism	What makes a signal costly and therefore credible?	A costly signal is expensive or risky to fake, such as mobilization, sunk costs, or visible military preparation. The mechanism is that cost separates genuinely resolved actors from bluffers. Costly signals can still be misread if adversaries disagree about costs.	African hybrid coercion may rely on non-material signals such as patronage, reputation, or communal obligation.
L20-12	Application	How did the Cuban Missile Crisis illustrate coercive bargaining?	The crisis involved threats, naval quarantine, private channels, and face-saving withdrawal rather than pure brute force. The mechanism was mutual deterrence combined with limited compellence and focal-point management. It remains a paradigmatic but non-generalizable nuclear dyad case.	Russian escalation management and UN Charter crisis framing also shaped the bargaining space.

Tag	Card Type	Front	Back	Perspective Note
L20-13	Application	What does the 1990-91 Gulf War coercive diplomacy sequence show about compellence?	Sanctions and ultimatums did not compel Iraqi withdrawal; military force reversed the occupation. The mechanism is that compellence fails when the adversary's domestic and regional stakes exceed perceived costs and no credible off-ramp exists. It highlights the asymmetry between deterrence and compellence.	UN collective-security framing and regional Arab perspectives conditioned the legitimacy of coercion.
L20-14	Comparison	How do Chinese and Western traditions differ on coercion?	Chinese relational strategy emphasizes patience, indirect advantage, and active defense, while Western Schellingian bargaining emphasizes explicit threats, credibility, and focal points. The mechanism is different assumptions about time, rationality, and legitimacy. Actual state behavior usually hybridizes both.	Chinese no-first-use and active-defense doctrines illustrate a distinctive coercive vocabulary.

Tag	Card Type	Front	Back	Perspective Note
L20-15	Occlusion	What does the African perspective reveal that Clausewitz occludes?	Colonial and post-colonial violence often involves non-state actors, hybrid security orders, and coercion outside a state monopoly. The mechanism is coercion through patronage, militias, informal governance, and racialized hierarchy. Clausewitz's state-centric trinity misses these dynamics.	African scholarship reconstructs coercion from within rather than fitting African cases to Western theory.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence Audit (score each 0-100)

Competency	Score (0-100)	Evidence of mastery	Next action
Clausewitz: trinity, friction, culminating point		Can state and apply to a conventional campaign	Rehearse one historical example without notes
Sun Tzu: relational strategy and critique of attrition		Can contrast with Clausewitzian decisive battle	Write a 150-word adjudication
Schelling: coercion vs brute force		Can identify coercive threats in a crisis	Map threats, costs, and benefits in a case
Deterrence vs compellence		Can explain why compellence is harder	Apply to Gulf War coercive diplomacy
Focal points		Can name and justify a salient solution	Test whether salience travels across cultures
Audience costs (Fearon)		Can state scope conditions by regime type	Compare democratic and autocratic cases

Competency	Score (0-100)	Evidence of mastery	Next action
Costly signaling		Can distinguish costly signals from cheap talk	Identify one misread signal in history
Strategic culture		Can compare Chinese, Russian, African, Western traditions	Avoid treating culture as deterministic
African hybrid coercion		Can explain non-state and patronage-based coercion	Reconstruct from African scholarship
Data interpretation: SIPRI, COW, crisis bargaining		Can separate trend, level, and perspective	State one limitation for each dataset

7.2 Three-Question Debrief

1. Which perspective did you initially treat as the default theory of coercion, and what did that default hide about African, Chinese, or Russian strategic thought?
2. Which mechanism can you state from memory but cannot yet apply to a case you have not studied?
3. Which falsifier would most directly overturn your current view of compellence, strategic culture, or audience costs?

7.3 Error-Log

Common Misconception	Correction	Evidence
"War is politics by other means" means war is always controllable by leaders.	Clausewitz emphasizes friction, passion, and chance; policy can be distorted or overwhelmed.	Clausewitz, *On War* (1832), Books 1 and 8.
Sun Tzu says one should never fight.	He prefers winning without fighting when possible but accepts battle when it is advantageous.	Sun Tzu, *The Art of War*, especially Books 3 and 4.
Deterrence and compellence are symmetric.	Compellence is harder because it requires the adversary to change the status quo under pressure.	Schelling, *Arms and Influence* (1966).
Audience costs operate equally in all regimes.	Fearon's mechanism depends on domestic accountability and observability; autocracies and hybrid regimes differ.	Fearon (1994).
Strategic culture determines state behavior.	Strategic culture shapes preferences and interpretations but does not override material incentives and institutions.	Snyder (1977); Johnston (1995).

Common Misconception	Correction	Evidence
Clausewitz's theory is universal.	Post-colonial critiques show that non-state, hybrid, and racialized coercion fall outside its state-centric assumptions.	African scholarship on hybrid security orders.
Coercion is always cheaper than brute force.	Failed coercion can escalate to war and damage credibility; costs include reputation and domestic politics.	1990-91 Gulf War coercive diplomacy sequence.

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Clausewitzian trinity	Interaction of passion, chance, and reason	Clausewitz, *On War* (1832)	Napoleonic and conventional state wars	Universal vs historically bounded theory	Non-state wars with fragmented authority	L5, L22
Friction	Gap between planned and actual war	Clausewitz, *On War* (1832)	Failed offensives and logistical strain	Whether friction is reducible by technology	Wars with low uncertainty and perfect information	L22, L24
Culminating point	Offensive power peaks before overexten-sion	Clausewitz, *On War* (1832)	Stalled invasions and counter-attacks	Timing of stopping vs exploiting gains	Offensives that sustain momentum indefinitely	L22
Sun Tzu relational strategy	Shape enemy choices, alliances, perceptions	Sun Tzu, *The Art of War*	Ancient Chinese strategic thought	Indirect approach vs decisive battle	Adversaries immune to cost or perception	L23
Critique of attrition	Disrupt strategy before exhausting forces	Sun Tzu, *The Art of War*	Cost-asymmetric campaigns	Attrition as necessary in total war	Ideologically committed adversaries	L22, L23
Coercion vs brute force	Manipulate choices through threatened costs	Schelling, *Arms and Influence* (1966)	Cold War crises	Whether coercion is always preferable	No credible communica-tion or restraint	L21, L23

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Deterrence vs compellence	Prevent action vs demand status-quo change	Schelling, *Arms and Influence* (1966)	Cuban Missile Crisis; Gulf War	Symmetry vs asymmetry of coercion	Status-quo bias absent	L21, L22
Focal points	Shared salience coordinates expectations	Schelling, *Arms and Influence* (1966)	Berlin; 38th parallel	Cultural universality of salience	No shared salience across actors	L21
Audience costs	Domestic punishment for backing down	Fearon (1994)	Crisis threats and retreats	Regime-type scope conditions	No domestic accountability or observability	L21
Costly signals	Expensive-to-fake indicators of resolve	Schelling; Fearon (1994)	Mobilizations and sunk costs	Signal clarity vs misperception	Cheap talk accepted as credible	L21, L24
Strategic culture	Historically shaped coercion preferences	Snyder (1977); Johnston (1995)	Chinese active defense; Russian escalation management	Determinism vs influence	Identical cultures producing different behavior	L20, L21
African hybrid coercion	Non-state, patronage, and informal coercion	Post-colonial African scholarship	Militias, informal security orders	State-centric vs hybrid security	Strong state monopoly of force	L23
Russian escalation management	Controlled escalation and correlation of forces	Russian strategic thought	Cold War and post-Cold War crises	Stability vs controlled escalation	Uncontrolled escalation	L21, L25
UN Charter framing	Prohibition of force and collective security	UN Charter	Gulf War coalition	Legality vs efficacy of coercion	Unilateral coercion accepted as legitimate	L21, L22

SECTION 9 — REVIEW SCHEDULE

- **R1 — Same day, 20 minutes:** Redraw Clausewitz's trinity and Schelling's coercion/brute-force distinction from memory; self-test all definitions without notes.

- **R2 — Day 2, 30 minutes:** Apply Fearon's audience costs to the Cuban Missile Crisis; explicitly state the regime-type scope condition.
- **R3 — Day 4, 45 minutes:** Compare Sun Tzu and Clausewitz on attrition and decisive battle; write a 200-word adjudication with one falsifier.
- **R4 — Day 7, 60 minutes:** Reconstruct the African hybrid-coercion perspective and identify what Western bargaining models occlude.
- **R5 — Day 14, 90 minutes:** Complete the Gulf War compellence memo, integrate SIPRI/COW/data-lab limitations, and review all five perspectives.

SECTION 10 — COMPLETION CHECKLIST

☐ I can define Clausewitz's trinity and explain its mechanism.
☐ I can explain friction and the culminating point with a historical example.
☐ I can state Sun Tzu's relational strategy and his critique of attrition.
☐ I can distinguish coercion from brute force in Schelling's framework.
☐ I can distinguish deterrence from compellence and explain the asymmetry.
☐ I can explain focal points and their cultural contingency.
☐ I can state Fearon's audience-cost mechanism and its scope conditions.
☐ I can distinguish costly signals from cheap talk.
☐ I can compare Chinese, Russian, African, and Western strategic cultures without treating any as deterministic.
☐ I can reconstruct the African perspective on hybrid coercion from within.
☐ I can apply the framework to the Cuban Missile Crisis.
☐ I can apply the framework to the 1990-91 Gulf War coercive diplomacy sequence.
☐ I can interpret SIPRI military expenditure and COW interstate war data with stated limitations.
☐ I can identify at least one falsifier for each key idea.
☐ I can distinguish description, explanation, prediction, and prescription in a memo.
☐ I can complete the metacognitive confidence audit honestly.
☐ I can use the error-log to correct at least three misconceptions.
☐ I can explain what the African vantage point reveals that the other four perspectives miss.

FURTHER READING (Optional)

Clausewitzian foundations - Clausewitz, Carl von. *On War*. 1832. - Paret, Peter, ed. *Makers of Modern Strategy: From Machiavelli to the Nuclear Age*. Princeton University Press, 1986.

Chinese strategic thought - Sun Tzu. *The Art of War*. - Johnston, Alastair Iain. "Thinking About Strategic Culture." *International Security* 19, no. 4 (1995): 32-64.

Coercion and bargaining - Schelling, Thomas C. *Arms and Influence*. Yale University Press, 1966. - Fearon, James D. "Domestic Political Audiences and the Escalation of International Disputes." *American Political Science Review* 88, no. 3 (1994): 577-592.

22. Nuclear Strategy and Proliferation

LESSON METADATA

Field	Value
Lesson number and title	Lesson 21: Nuclear Strategy and Proliferation
Module	Module 4: Security Studies and Warfare
Prerequisites	L20 (strategic thought), L12 (Cold War), L11 (interwar lessons)
Interleaved links	Forward to L45 (Iran nuclear), L55 (quantum + NC3), L47-48 (US-China, Indo-Pacific nuclear dynamics)
Reading load	7-9 hours
Content channels	Text, data lab, dual-coded visuals, Cornell notes, flashcards, worked example, problem pair
Bloom ceiling	Evaluate / Create
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

The central puzzle of this lesson is deceptively simple and profoundly destabilizing: nuclear weapons have not been used in anger since August 1945, yet the world is not obviously safer for that fact, and the architecture built to keep them unused is visibly fraying. Eight decades of non-use is not the same as eight decades of stability. The number of nuclear-armed states grew from one to nine; the number of warheads peaked at roughly seventy thousand in the mid-1980s and remains above twelve thousand today; and the treaty system that once channeled rivalry into verifiable limits has lost its two most important pillars, with the Anti-Ballistic Missile Treaty abandoned in 2002 and the Intermediate-Range Nuclear Forces Treaty collapsed in 2019. The question this lesson poses is not "why have nuclear weapons not been used?" but rather "under what conditions does nuclear deterrence hold, under what conditions does it fail, and whose security does the nonproliferation order actually serve?" The student who masters this lesson will be able to move between the level of the individual strategist, the state, the international system, and the transnational regime, and to recognize that each level tells a different story about the same warheads.

The historical arc matters because it establishes that nuclear order is not a natural equilibrium but a constructed and contested arrangement. The first decade after Hiroshima was dominated by American nuclear monopoly and then by the thermonuclear revolution, which made city-killing cheap and pushed strategists such as Bernard Brodie to argue that the bomb's purpose was not to be used but to deter use. The Cold War then produced the doctrine of Mutually Assured Destruction, the logic of second-strike survivability articulated by Albert Wohlstetter, and the bargaining theory of Thomas Schelling, all of which assumed a bipolar world of rational actors with secure arsenals. That world ended in 1991, but the weapons did not. What followed was not disarmament but transformation: the NPT was extended indefinitely in 1995, the Comprehensive Nuclear-Test-Ban Treaty was negotiated in 1996 but never entered into force, and a series of regional crises—India and Pakistan in 1998, North Korea's withdrawal from the NPT in 2003, Iran's clandestine enrichment program exposed in 2002—demonstrated that the regime's center of gravity had shifted from superpower arms control to proliferation management. The lesson therefore sits at the intersection of three intellectual traditions: strategic studies, which asks how deterrence works; regime theory, which asks why states comply with nonproliferation; and critical international relations, which asks whose interests the regime encodes.

The theoretical stakes are high because the same evidence supports incompatible conclusions. Kenneth Waltz argued that nuclear proliferation is stabilizing because it extends deterrence to new dyads and raises the cost of war; Scott Sagan argued that it is destabilizing because organizations, not just states, control weapons, and because new nuclear states lack the institutional maturity of the Cold War superpowers. Glenn Snyder's stability-instability paradox suggests that nuclear weapons may prevent total war while making limited war more likely, a claim with uncomfortable implications for South Asia and the Korean peninsula. The extended deterrence literature asks whether the United States can credibly threaten nuclear retaliation on behalf of allies, and the answer depends on whether one believes in the "madman" logic of deliberate unpredictability or in the rational-actor logic of assured response. None of these debates is settled, and the lesson's methodological commitment is to present each with its scope conditions and strongest counterargument rather than to declare a winner.

The African perspective is not a regional footnote to this story; it is the vantage point that reveals the nuclear order's foundational asymmetry. Africa is the only continent to have renounced nuclear weapons collectively through the Pelindaba Treaty, which established the African Nuclear-Weapon-Free Zone and entered into force in 2009. Yet African states are also among the most vocal critics of the NPT's "grand bargain," which promised disarmament in exchange for nonproliferation and has delivered the latter far more reliably than the former. The Treaty on the Prohibition of Nuclear Weapons, adopted in 2017 and in force since 2021, was driven in significant part by African and other Global South states, and it represents a direct challenge to the legitimacy of the nuclear-weapon states' claim to a permanent right to possess what they deny to others. From this vantage, the central puzzle is not how to stop proliferation but how to justify a discriminatory order in which nine states claim a security privilege denied to the rest of the world. This reframing exposes what the Western, Chinese, and Russian perspectives tend to occlude: that nonproliferation without disarmament is not a neutral technical project but a political hierarchy.

What the student will be able to do after mastering this lesson is substantial and specific. First, reconstruct the basic logic of nuclear deterrence—first strike, second strike, survivability, and the role of uncertainty—and identify the conditions under which it holds. Second, apply the stability-instability paradox to a concrete case and adjudicate whether nuclearization has stabilized or destabilized a given dyad. Third, analyze the NPT regime as a bargain with distributional consequences, and explain why some states acquire nuclear weapons while others renounce them. Fourth, dissect the mechanics of nuclear latency and snapback using

the JCPOA as a worked example. Fifth, evaluate how emerging technologies—hypersonic glide vehicles, artificial intelligence in nuclear command and control, and tactical nuclear weapons—challenge classical deterrence assumptions. Throughout, the student will practice distinguishing description from explanation, prediction from prescription, and will be required to specify falsifiers for every claim.

This lesson is also a methodological exercise in perspective reconstruction. The five perspectives developed here—African, Chinese, Russian, Western, and UN—are not caricatures to be dismissed but steel-manned positions that each illuminate a different dimension of the nuclear problem. The African perspective centers legitimacy and inequality; the Chinese perspective centers minimum deterrence and no-first-use; the Russian perspective centers escalation management and regional coercion; the Western perspective centers extended deterrence and nonproliferation enforcement; and the UN perspective centers institutional process and the disarmament machinery. The student's task is not to choose among them but to understand what each contributes and what each occludes, and to recognize that the "correct" answer to any nuclear question depends on which level of analysis and which normative framework one adopts. The worked example on Iran and the problem pair on India-Pakistan are designed to force exactly this kind of multi-perspective, multi-level adjudication.

SECTION 1 — Pre-Class Priming

1.1 Retrieval Warm-Up

Answer each question from memory before reading further. These draw on Lessons 11, 12, and 20.

1. **Strategic thought (L20):** What is the difference between deterrence by punishment and deterrence by denial, and which strategist is most closely associated with the bargaining logic of deterrence?
2. **Cold War (L12):** What was the Cuban Missile Crisis of 1962, and why did it become the canonical case for studying crisis bargaining under nuclear shadow?
3. **Interwar lessons (L11):** What failure of the interwar international order is most often cited as a cautionary tale for contemporary nonproliferation diplomacy?
4. **Strategic thought (L20):** Define the security dilemma and explain how it differs from a commitment problem.
5. **Cold War (L12):** What was the ABM Treaty of 1972, why did the United States withdraw from it in 2002, and what precedent did that withdrawal set?
6. **Interwar lessons (L11):** How did the League of Nations' failure to enforce collective security in the 1930s shape later thinking about verification and enforcement in arms control?

1.2 Orientation Questions

These questions frame the lesson's central puzzle and should be revisited after completing the lesson.

1. Does nuclear proliferation make the international system more stable or more dangerous? Under what scope conditions does each answer hold?
2. Why did the JCPOA collapse, and what does its collapse teach about the mechanics of nuclear latency, snapback, and the limits of transactional diplomacy?
3. How do emerging technologies—hypersonic delivery systems, artificial intelligence in nuclear command and control, and low-yield tactical nuclear weapons—challenge the classical assumptions of

deterrence theory?

4. Whose security does the NPT serve, and how does the African perspective reframe the nonproliferation order as a question of legitimacy rather than merely of compliance?

1.3 Vocabulary Pre-Teach

Provisional definitions to be refined through the lesson.

- **Deterrence:** The use of threatened punishment or denial to prevent an adversary from taking an action. Deterrence by punishment threatens unacceptable costs; deterrence by denial makes the action infeasible. Associated with Schelling's bargaining theory.
- **Second-strike capability:** The ability to absorb a first strike and still retaliate with devastating force. The foundation of stable deterrence; associated with Wohlstetter's analysis of survivable basing.
- **Mutually Assured Destruction (MAD):** The condition in which both sides possess secure second-strike forces capable of destroying the other's society, making any nuclear exchange suicidal. A description of a strategic relationship, not a doctrine.
- **Extended deterrence:** The commitment by a nuclear-armed state to use nuclear weapons in defense of an ally. Credibility depends on the ally's confidence and the adversary's belief in the commitment.
- **Stability-instability paradox:** The proposition that nuclear weapons prevent total war (stability at the high end) while potentially encouraging limited conflict below the nuclear threshold (instability at the low end). Associated with Snyder.
- **Nuclear latency:** The condition in which a state possesses the technical capability and fissile material to build nuclear weapons quickly without having assembled them. Central to the Iran case.
- **Snapback:** The mechanism in the JCPOA by which UN sanctions could be reimposed automatically if Iran was found in non-compliance, without requiring a new Security Council vote.
- **Non-Proliferation Treaty (NPT):** The 1968 treaty dividing states into nuclear-weapon states (recognized five) and non-nuclear-weapon states, with obligations of non-acquisition, peaceful use, and disarmament. The cornerstone of the nonproliferation regime.
- **IAEA safeguards:** The system of inspections and monitoring administered by the International Atomic Energy Agency to verify that nuclear material is not diverted to weapons use.
- **Escalate to de-escalate:** A debated Russian doctrine in which limited nuclear use is threatened to terminate a conventional conflict on favorable terms. Contested in both its existence and its interpretation.
- **NC3 (Nuclear Command, Control, and Communications):** The systems through which nuclear weapons are authorized, targeted, and employed. Increasingly vulnerable to cyber and AI-related risks.
- **Hypersonic glide vehicle:** A maneuverable warhead that travels at Mach 5 or faster, compressing decision time and challenging missile defense and early-warning systems.
- **Treaty on the Prohibition of Nuclear Weapons (TPNW):** The 2017 treaty banning nuclear weapons, adopted by 122 states and in force since 2021. Rejected by all nuclear-armed states.
- **Pelindaba Treaty:** The 1996 treaty establishing the African Nuclear-Weapon-Free Zone, in force since 2009. Africa's collective renunciation of nuclear weapons.

SECTION 2 — LESSON CORE

2.1 Learning objectives

After mastering this lesson, the student will be able to:

1. **Analyze** the causal logic of nuclear deterrence by distinguishing between first-strike advantage, second-strike capability, and mutual vulnerability, and explain why the shift from the former to the latter transformed strategic thought after 1945, drawing on Brodie's foundational argument that the bomb's primary utility lies in deterrence rather than warfighting (Bloom: analyze).
2. **Evaluate** competing theoretical accounts of why states acquire nuclear weapons—specifically the Waltzian security-dilemma logic versus Sagan's domestic-politics and organizational-process accounts—using historical cases of proliferation and non-proliferation to adjudicate between structural and unit-level explanations (Bloom: evaluate).
3. **Apply** the stability-instability paradox to concrete regional dyads (India-Pakistan, Israel-Iran, US-China) to predict when nuclearization will suppress versus escalate conventional conflict, specifying the scope conditions under which the paradox operates (Bloom: apply).
4. **Synthesize** the mechanics of the JCPOA—latency, breakout time, snapback sanctions, and IAEA verification—into a coherent account of how arms-control agreements attempt to manage proliferation risk without resolving underlying security dilemmas, and identify the failure modes that led to collapse (Bloom: synthesize).
5. **Critique** contemporary claims about the erosion of nuclear arms control (INF withdrawal, New START uncertainty, hypersonic and AI-enabled systems) from five distinct national and institutional perspectives, identifying what each perspective reveals and occludes about the future of strategic stability (Bloom: critique).

2.2 KEY IDEA 1: MAD, Second-Strike Stability, and the Basic Logic of Nuclear Deterrence

Bolded Causal Claim: Nuclear deterrence rests on the credible threat of unacceptable retaliation, and its stability depends on the invulnerability of second-strike forces rather than on the superiority of first-strike capabilities; when both sides possess secure second-strike forces, the incentive to strike first disappears, producing the condition known as mutual assured destruction (MAD).

Mechanism: The mechanism operates through three linked steps. First, a state acquires nuclear weapons and delivery systems that can survive a disarming first strike—submarines, mobile missiles, hardened silos—thereby guaranteeing that retaliation will occur. Second, the adversary, recognizing that any attack will trigger devastating retaliation, refrains from initiating nuclear war. Third, this mutual recognition stabilizes the relationship because neither side can improve its position by striking first. Bernard Brodie (1946) articulated the foundational premise: the bomb's primary utility is not in winning wars but in deterring them. Albert Wohlstetter (1959) refined this by identifying the "delicate balance of terror"—the condition in which deterrence is stable only if second-strike forces are sufficiently protected against a surprise attack, and in which small changes in technology or posture can destabilize the balance. Thomas Schelling (1960) added the concept of commitment and the manipulation of risk: deterrence works not through certainty of retaliation but through the creation of a shared risk of catastrophe that neither side fully controls, as in the strategy of "brinkmanship." The mechanism is thus psychological as much as material: it requires that each side believe

the other will retaliate even when retaliation is irrational in a narrow cost-benefit sense, and it depends on communication, signaling, and the management of uncertainty.

Scope Conditions: The logic of MAD and second-strike stability holds only under specific conditions. Both sides must possess survivable second-strike forces; if one side can disarm the other in a first strike, the balance collapses into a first-strike advantage. Both sides must be rational in the sense of preferring survival to victory; if a leader is willing to risk annihilation, deterrence fails. Both sides must have accurate information about each other's capabilities and intentions; misperception or secrecy can produce arms races or preemptive strikes. The mechanism also assumes that nuclear weapons are not used in limited, tactical ways that blur the line between conventional and nuclear war; once tactical use becomes thinkable, the firewall between peace and catastrophe weakens. Finally, the logic presumes a bipolar or at least manageable multipolar structure; with many nuclear powers, the complexity of mutual deterrence multiplies and the risk of accidental or unauthorized use rises.

Observable Implications: If the theory holds, we should observe several patterns. States with secure second-strike forces should engage in fewer nuclear crises and should avoid first strikes even under extreme provocation. Arms-control agreements should focus on protecting second-strike forces and limiting first-strike capabilities—hence the emphasis on MIRV bans, mobile-missile limitations, and submarine-launched ballistic missile (SLBM) stability. We should see a "stability-instability paradox" in which nuclear weapons prevent total war but permit lower-level conflict. We should also observe that states invest heavily in command-and-control systems, early warning, and survivable communications, because the credibility of second-strike depends on these. Conversely, if the theory fails, we should see nuclear use or near-use during crises, or states abandoning second-strike postures for first-strike doctrines.

Perspective Note (five traditions in brief):

African (primary): The African vantage point on MAD and second-strike stability begins from a position of structural exclusion: no African state possesses nuclear weapons, and the continent's experience of nuclear strategy is one of being the object rather than the subject of deterrence calculations. The Pelindaba Treaty (1996), which established the African Nuclear-Weapon-Free Zone, represents not merely a non-proliferation commitment but an affirmative claim that African security is better served by the absence of nuclear weapons than by their possession. From this perspective, MAD appears less as a stabilizing equilibrium than as a doctrine that legitimizes the indefinite retention of nuclear arsenals by a handful of states while denying the same capability to others. African scholars such as Grovogui have emphasized that the nuclear order is embedded in a broader structure of racialized and colonial power, in which the "international community" that manages proliferation risk is itself constituted by the nuclear powers. The African perspective thus reveals what the Western strategic canon occludes: that deterrence theory presupposes a world in which some states are permitted to threaten mass destruction while others are not, and that this asymmetry is not a neutral feature of the international system but a historically produced hierarchy. The Pelindaba Treaty and the African Group's advocacy for the Treaty on the Prohibition of Nuclear Weapons (TPNW, 2021) reflect a normative stance that rejects the legitimacy of nuclear deterrence altogether, framing it as a form of structural violence rather than a stabilizing mechanism. At the same time, African states have participated in the NPT regime and IAEA safeguards, accepting non-proliferation obligations while demanding progress on disarmament—a demand that the nuclear powers have largely failed to meet, as evidenced by the continued modernization of arsenals.

Chinese: China's nuclear doctrine has historically been characterized by a no-first-use (NFU) pledge and a posture of minimum deterrence, meaning that China maintains a relatively small arsenal designed solely to en-

sure retaliation rather than to fight a nuclear war. This aligns with the second-strike logic of MAD but rejects the elaborate warfighting doctrines developed by the United States and Soviet Union. Chinese strategists have emphasized that deterrence is achieved through survivability and opacity rather than through numerical parity or technological sophistication. However, China's ongoing modernization—expanding its silo fields, developing multiple independently targetable reentry vehicles (MIRVs), and improving submarine-launched capabilities—has raised questions about whether Beijing is shifting toward a more ambiguous or even first-strike-capable posture. The Chinese perspective contributes the insight that MAD need not require massive arsenals; a small, survivable force can suffice. It also occludes the extent to which China's modernization is driven by concerns about US missile defense and conventional precision-strike capabilities that threaten its second-strike forces.

Russian: Russia's nuclear doctrine has evolved significantly since the Cold War, and the concept of "escalate to de-escalate"—the idea that Russia might use limited nuclear strikes to terminate a conventional conflict on favorable terms—has generated intense debate among Western analysts. Whether this doctrine accurately reflects Russian planning or is a misreading of Russian strategy remains contested. Russia's perspective on MAD emphasizes that the balance is not automatic but must be actively maintained through modernization, and that the erosion of arms-control agreements (such as the US withdrawal from the ABM Treaty in 2002 and the INF Treaty's collapse in 2019) has undermined the stability that MAD presupposes. Russia's deployment of tactical nuclear weapons to Belarus in 2023 reflects a view that nuclear weapons serve not only to deter strategic attack but to manage escalation at lower levels. The Russian perspective thus highlights that MAD is not a static condition but a politically negotiated one, and that its stability depends on mutual restraint in arms competition.

Western: The Western perspective, particularly in the United States, has historically been divided between those who embrace MAD as a stable equilibrium and those who argue that deterrence requires credible warfighting capabilities. Schelling's work on commitment and risk manipulation, and Wohlstetter's analysis of the delicate balance, emerged from this tradition. The US has invested heavily in second-strike forces—particularly the submarine-based leg of the nuclear triad—while also developing doctrines (such as flexible response and counterforce targeting) that imply a willingness to fight a limited nuclear war. The Western perspective contributes sophisticated analysis of signaling, credibility, and the role of technology in stabilizing or destabilizing deterrence. It occludes, however, the extent to which its own doctrinal innovations (such as missile defense and prompt global strike) can be perceived by adversaries as threatening their second-strike forces, thereby undermining the very stability that MAD is supposed to provide.

UN: The UN perspective, embodied in the NPT, the IAEA, and the disarmament machinery, treats nuclear deterrence as a temporary and undesirable condition rather than a permanent feature of international order. The NPT's Article VI commits nuclear-weapon states to pursue disarmament negotiations in good faith, implying that MAD is a transitional arrangement, not an end state. The UN framework emphasizes verification, safeguards, and the non-proliferation of nuclear weapons to additional states, while also acknowledging the security concerns that drive proliferation. From this perspective, the stability of MAD is valuable only insofar as it prevents nuclear war while disarmament progresses; if disarmament stalls, the risk of proliferation and accidental use grows. The UN perspective thus contributes a normative framework that challenges the indefinite acceptance of nuclear deterrence, while its occlusion lies in the limited enforcement power of the disarmament machinery and the persistent refusal of nuclear-weapon states to set timelines for disarmament.

SECTION 2.3 KEY IDEA 2 — Extended Deterrence and the Stability-Instability Paradox

Bolded Causal Claim: Extended nuclear deterrence can prevent great-power war while simultaneously lowering the perceived cost of limited coercion, because the credibility of mutual annihilation pushes competition into conventional, cyber, and proxy domains where the nuclear threshold is distant but not absent.

Mechanism: Extended deterrence is the promise by a nuclear-armed state to use nuclear weapons, or to risk nuclear war, in defense of an ally. Its central problem is credibility: an adversary may doubt that the patron will sacrifice its own cities for an ally, especially when the patron and adversary are mutually vulnerable. Schelling (1960) treats deterrence as a commitment problem in which the patron must manipulate risk and make its threat credible through capabilities, alliances, and visible resolve. Glenn Snyder's (1961) analysis of deterrence and defense adds that extended deterrence requires not only the ability to punish but also the ability to deny an adversary's objectives at acceptable cost. The stability-instability paradox arises when a stable central balance—secure second-strike capabilities on both sides—reduces the likelihood of nuclear war but increases the likelihood of limited war. The mechanism is threshold manipulation: because both sides know that nuclear escalation is catastrophic, they may believe that limited aggression below the nuclear threshold can be conducted with impunity. The paradox is not that nuclear weapons cause war, but that they can segment conflict into "safe" and "unsafe" zones, encouraging probing, coercion, and proxy violence. In extended deterrence settings, this segmentation is acute: an ally may be attacked in ways that do not clearly trigger the patron's nuclear guarantee, while the patron fears that responding too strongly risks escalation. The result is a bargaining space in which conventional balances, alliance cohesion, and signaling become decisive. Extended deterrence therefore depends on coupling: the patron must convince the adversary that an attack on the ally is an attack on the patron's own vital interests. Decoupling occurs when the adversary believes the patron will not escalate. The stability-instability paradox then operates through the gap between the central balance and the local balance: nuclear stability at the top can coexist with instability at the bottom, especially in regions where conventional asymmetries, territorial disputes, and alliance commitments intersect.

Scope Conditions: The paradox is most likely when both sides possess secure second-strike forces, when the nuclear threshold is high and relatively clear, and when limited military options exist below that threshold. It is less likely when one side lacks survivable forces, when conventional balances are so lopsided that limited war is not feasible, or when escalation ladders are so compressed that any conflict risks rapid nuclear use. Extended deterrence is credible when the patron has forward-deployed forces, integrated command structures, and a demonstrated willingness to bear risk; it is fragile when the patron's homeland is directly vulnerable and the ally's interests are not obviously vital. The paradox also depends on information: if adversaries misread thresholds, a limited probe can escalate unintentionally. Conversely, if thresholds are too vague, deterrence may fail through ambiguity rather than through stability.

Observable Implications: The theory predicts proxy conflicts, gray-zone coercion, and crises that remain below the nuclear threshold; alliance demands for reassurance; investments in conventional and tactical capabilities; and repeated tests of credibility during regional crises. It also predicts that nuclear-armed rivals may fight limited wars or support proxies despite possessing arsenals capable of mutual destruction. In extended deterrence systems, one should observe debates over "decoupling," burden-sharing, and the appropriate mix of nuclear and conventional forces. The paradox implies that arms control focused only on strategic warheads may leave lower-level instability untouched, and that crisis management institutions are as important as arsenal size.

Perspective Note (five traditions in brief):

African (primary): African states have generally experienced extended deterrence not as a protective umbrella but as an external imposition that exports great-power risk into regions already shaped by colonial borders, proxy competition, and fragile institutions. From this vantage point, the stability-instability paradox is visible in Cold War and post-Cold War interventions, peacekeeping burdens, and the militarization of African security partnerships. African scholarship and diplomacy emphasize sovereignty, non-alignment, and the right to define security without becoming a theater for nuclear-armed rivals. The Pelindaba Treaty and support for nuclear-weapon-free zones reflect a preference for removing nuclear risk altogether rather than managing it through extended deterrence. African perspectives also highlight that lower-level instability is not merely a byproduct of superpower stability but is compounded by arms transfers, mercenary activity, and weak state capacity. Thus extended deterrence is judged not only by whether it prevents nuclear war but by whether it prevents the externalization of violence into African spaces.

Chinese: China's no-first-use posture and historically minimum deterrence suggest skepticism toward extended deterrence as a stabilizing device. Beijing tends to view US alliances in Asia as mechanisms that can lower thresholds for conventional confrontation while claiming nuclear backing, potentially encouraging risk-taking by allies. The stability-instability paradox is interpreted through the lens of US "extended deterrence" as a form of strategic encirclement that compresses China's security environment. At the same time, China's own modernization and ambiguity about the scope of its nuclear use create tensions with its declaratory policy. The Chinese perspective contributes an emphasis on sovereignty and non-interference, while its occlusion may be a tendency to treat US extended deterrence as inherently aggressive without fully addressing how regional actors seek reassurance against coercion.

Russian: Russia views NATO extended deterrence as a direct challenge to its security and has responded with doctrinal ambiguity, including debates over escalate-to-deescalate and the deployment of non-strategic nuclear weapons. From Moscow's perspective, the stability-instability paradox is not an abstract theory but a description of NATO's attempt to use conventional superiority under a nuclear umbrella. Russian analysts often argue that US extended deterrence lowers the threshold for conventional pressure near Russia's borders, while Russia's own nuclear signaling is framed as restoring deterrence. The deployment of nuclear weapons to Belarus and the emphasis on tactical systems reflect a belief that credibility requires forward, usable options. This perspective contributes a focus on geographic vulnerability and escalation control, but it can occlude how Russian coercion itself generates the insecurity that extended deterrence is meant to address.

Western: Western strategic thought treats extended deterrence as a necessary instrument for alliance cohesion and non-proliferation. If allies doubt the nuclear umbrella, they may seek independent arsenals, undermining the NPT. The stability-instability paradox is recognized as a genuine risk, but Western policy typically responds through escalation management, conventional superiority, and reassurance measures rather than abandonment of extended deterrence. NATO nuclear sharing and US commitments in Asia are defended as stabilizing because they reduce incentives for independent proliferation. This perspective contributes sophisticated theories of credibility and alliance politics, but it can occlude the costs imposed on non-allied regions and the possibility that extended deterrence perpetuates a nuclear hierarchy.

UN: The UN perspective approaches extended deterrence through disarmament and non-proliferation norms. Extended deterrence is often seen as an obstacle to Article VI obligations because it institutionalizes nuclear dependence among non-nuclear allies. The stability-instability paradox supports arguments for risk reduction, de-alerting, and the prevention of limited nuclear use. The UN framework emphasizes that security cannot rest indefinitely on the threat of annihilation and that lower-level instability is a symptom of an unreformed nuclear order. Its contribution is a normative insistence on disarmament progress; its occlusion is

limited enforcement capacity and the political reality that nuclear-weapon states treat extended deterrence as central to their security strategies.

SECTION 2.4 KEY IDEA 3 — Proliferation, the NPT Regime, IAEA Safeguards, and the Causes of Nuclear Acquisition

Bolded Causal Claim: Nuclear proliferation is shaped less by the automatic diffusion of technology than by the interaction of security threats, domestic political coalitions, and normative commitments; the NPT and IAEA safeguards raise the cost of acquisition but cannot eliminate latent capability because enforcement depends on state consent and great-power consensus.

Mechanism: The Treaty on the Non-Proliferation of Nuclear Weapons (NPT, 1968) rests on three pillars: non-proliferation, disarmament, and peaceful uses of nuclear energy. Non-nuclear-weapon states forswear nuclear weapons in exchange for access to peaceful technology and a commitment by nuclear-weapon states to pursue disarmament. The International Atomic Energy Agency (IAEA) implements safeguards to verify that nuclear material is not diverted to weapons. Comprehensive safeguards agreements and, where adopted, the Additional Protocol increase transparency by expanding inspections and access to information. The mechanism of constraint is therefore legal-normative and technical: declarations, material accountancy, inspections, and export controls raise the probability of detection and the diplomatic cost of cheating. However, the regime's enforcement is political. The IAEA can report non-compliance to the UN Security Council, but sanctions or force depend on great-power agreement. This creates a gap between detection and response.

The causes of acquisition are debated between systemic and domestic explanations. Waltz (in Sagan and Waltz, 1995; 2003) argues that nuclear proliferation is a rational response to anarchy: states seek nuclear weapons when they face security threats and lack reliable allies. On this view, proliferation is self-help in a dangerous world, and more nuclear powers may even enhance stability by creating mutual deterrence. Sagan (in the same debate) counters that nuclear acquisition is driven by domestic politics: civil-military relations, organizational interests, prestige, and bureaucratic politics. States with weak civilian control over the military, or with military organizations seeking autonomy and budgets, are more likely to pursue weapons. Sagan also emphasizes norms: the nuclear taboo and non-proliferation norms can restrain acquisition even when security incentives exist. The two theories are not mutually exclusive; they identify different scope conditions. Waltz's model predicts proliferation where threats are acute and alliances unreliable; Sagan's predicts variation among similarly threatened states based on domestic structure and normative commitment. The NPT regime operates on both levels: it alters systemic incentives by providing security assurances and technology access, and it strengthens domestic actors who favor restraint by embedding non-proliferation in law and bureaucracy.

Nuclear latency complicates the regime. A state can develop enrichment or reprocessing capabilities under the guise of peaceful use, remaining within the letter of the NPT while shortening the time needed to produce weapons. This is not necessarily a violation unless material is diverted, but it creates a "breakout" capability that safeguards may detect only after the fact. Thus the regime manages risk rather than eliminating capability.

Scope Conditions: The NPT is most effective when security threats are moderate, alliance guarantees are credible, and domestic institutions favor civilian control and economic integration. It is less effective when states face existential threats, when regional rivals acquire weapons, or when domestic military organizations dominate decision-making. IAEA safeguards work best with cooperative states and full access; they are weaker when states limit access, withdraw, or exploit the peaceful-use provisions. The Sagan-Waltz debate

implies different predictions: Waltz expects proliferation to track threat environments, while Sagan expects it to track regime type and civil-military relations. Empirically, both matter, but neither alone explains cases such as South Africa's disarmament or Libya's renunciation, where security and domestic factors interacted with normative pressure.

Observable Implications: One should observe NPT membership patterns, safeguards coverage, enrichment capacity, and breakout timelines; regional cascades following a state's acquisition; and domestic debates over nuclear options. The regime's health can be measured by Additional Protocol adoption, IAEA inspection access, and the frequency of compliance disputes. The Sagan-Waltz debate predicts that proliferation will cluster where threats and weak civilian control coincide, while restraint will be more common where norms and institutions are strong. Latency implies that even compliant states may retain hedging options, making the line between peaceful and military programs politically contested.

Perspective Note (five traditions in brief):

African (primary): African states have been strong supporters of the NPT, but from a position that stresses the treaty's asymmetry: non-nuclear states accepted permanent obligations while nuclear-weapon states retained arsenals and deferred disarmament. African diplomacy, including through the Pelindaba Treaty and the African Commission on Nuclear Energy, frames proliferation control as inseparable from disarmament and from the right to peaceful technology. African scholarship often critiques the NPT as a non-proliferation regime that protects the privileges of existing nuclear powers while offering limited security guarantees to non-nuclear states. The African perspective highlights that proliferation causes are not only security threats but also global inequality, technological dependence, and the historical experience of colonial extraction. It also stresses that African states have largely chosen restraint, making the continent a zone of nuclear abstinence that deserves recognition and support rather than paternalistic oversight. The African vantage point thus reveals that the NPT's legitimacy depends on whether non-nuclear states perceive fairness, not merely whether safeguards function.

Chinese: China supports the NPT and IAEA safeguards but emphasizes the peaceful-use pillar and the disarmament obligations of nuclear-weapon states. Beijing's perspective treats proliferation as partly a consequence of unequal security: states proliferate when they lack credible protection and when existing nuclear powers fail to disarm. China's own nuclear history is framed as a response to superpower threats and as a contribution to multipolarity. The Chinese perspective contributes an insistence that non-proliferation cannot be separated from disarmament and that technology access is a right, not a concession. Its occlusion may be a reluctance to scrutinize its own assistance to other states' nuclear programs and a tendency to attribute proliferation primarily to US security policies.

Russian: Russia is a depositary state of the NPT and generally supports non-proliferation, but it views the regime through the lens of great-power status and strategic stability. Moscow emphasizes that proliferation is driven by security vacuums and by the erosion of arms control, and it has used nuclear cooperation as a tool of influence. Russian perspectives often stress that the NPT must preserve the right to peaceful nuclear energy and that enforcement should not become a vehicle for regime change. The Russian contribution is a focus on strategic stability and the dangers of selective enforcement; its occlusion is a tendency to subordinate non-proliferation to geopolitical competition, as seen in debates over Iran and North Korea.

Western: Western governments have been the principal architects and enforcers of the NPT and IAEA safeguards. The Western perspective treats proliferation as a central threat to international security and emphasizes export controls, intelligence, and sanctions. The Sagan-Waltz debate is often read in Western scholar-

ship as a warning that security threats and domestic politics can override norms, justifying proactive non-proliferation policies. Western states have promoted the Additional Protocol and, in cases such as Iran, have used coercive diplomacy to limit enrichment. This perspective contributes technical expertise and institutional capacity; its occlusion is a tendency to treat non-proliferation as an end in itself while downplaying the disarmament pillar and the security concerns of non-nuclear states.

UN: The UN perspective is anchored in the NPT text and the IAEA statute. It treats non-proliferation, disarmament, and peaceful use as interdependent obligations and emphasizes verification, safeguards, and the peaceful settlement of disputes. The UN framework supports the IAEA's technical role and the Security Council's enforcement function, while also hosting review conferences that give non-nuclear states a forum to demand disarmament progress. The UN perspective contributes legitimacy and a multilateral forum; its occlusion is the dependence of enforcement on the Security Council, where nuclear-weapon states hold veto power, and the difficulty of reconciling non-proliferation with the disarmament commitments of Article VI.

2.5 KEY IDEA 4 — JCPOA and its collapse: mechanics of nuclear latency and snapback

Bolded Causal Claim: The JCPOA did not disarm Iran; it converted an acute proliferation crisis into a managed latency problem by trading time-bound, verifiable constraints for sanctions relief, and its collapse after the 2018 US withdrawal demonstrated that latency management fails when the political bargain sustaining reciprocal compliance unravels faster than the technical restrictions expire.

Mechanism: Nuclear latency is the capacity to produce weapons-usable fissile material on a timeline short enough to make a state a de facto nuclear power before outsiders can intervene, without necessarily possessing a weapon today. The JCPOA addressed latency through a layered mechanism: it capped enrichment at 3.67 percent, limited the stockpile of low-enriched uranium, reduced and reconfigured centrifuges, converted Fordow, redesigned Arak, constrained research and development, and subjected Iran to an unusually intrusive verification package including the Additional Protocol, continuous monitoring of enrichment, and access to centrifuge production and uranium mining. In exchange, Iran received phased sanctions relief. The deal's central technical achievement was to extend Iran's estimated breakout time from roughly two to three months to about a year, while creating multiple observable indicators—centrifuge counts, enrichment levels, stockpile size, and facility configuration—that would reveal a dash for a bomb. This institutionalist wager, echoing the debate between Sagan and Waltz (1995, 2003), assumed that verification and norms could manage a security problem that structuralists would expect to be driven by competition.

A crucial distinction is between fissile-material capability and weaponization. The JCPOA was designed to make the former visible and slow; it did not require Iran to dismantle the scientific and industrial base that made latency possible. This is why the deal's critics argued that sunset clauses would eventually legitimate a large enrichment program, while supporters argued that the time bought could be used to build trust and regional security. The collapse showed that when trust is absent, technical time limits become focal points for suspicion: each approaching sunset can be read as a scheduled proliferation opportunity rather than a phased normalization. Fitzpatrick (2019) is useful here because the Iranian case is best understood not as a simple quest for a bomb but as a hedging strategy in which capability, ambiguity, and reversibility are themselves instruments of statecraft.

The political mechanism was reciprocal compliance. The JCPOA was not self-enforcing through IAEA verification alone; it depended on each side believing the other would continue to perform. Iran's incentive

was economic normalization; the P5+1's incentive was non-proliferation. The snapback mechanism in UN Security Council Resolution 2231 was designed to solve the enforcement problem without requiring a new Security Council vote: any participant could notify the Council of significant non-performance, and absent a resolution to continue relief within thirty days, previous UN sanctions would automatically reimpose. This removed the veto as an obstacle to enforcement, but it also made the deal's survival sensitive to unilateral interpretations of compliance.

The collapse followed a sequence that exposed this sensitivity. The United States withdrew in May 2018 and reimposed sanctions, including secondary sanctions that deterred European and Asian firms from trading with Iran even where European governments supported the deal. Iran initially remained in compliance, seeking European economic relief, but European mechanisms could not offset the loss of market access. Beginning in May 2019, Iran reduced its commitments in calibrated steps: exceeding the enrichment cap, expanding centrifuge numbers and types, resuming enrichment at Fordow, and later enriching to 20 and then 60 percent. It also restricted IAEA access, including suspending implementation of the Additional Protocol in 2021 and removing monitoring equipment in 2022. By 2024-2025, IAEA reporting described breakout times measured in weeks rather than months, while Iran maintained that its program remained peaceful and that its steps were reversible. The E3's 2025 invocation of the snapback mechanism, weeks before Resolution 2231's ten-year window closed in October 2025, reimposed UN sanctions and underscored that the deal's legal architecture had outlived its political equilibrium. The mechanism was designed to be automatic, but its use required political consensus among states with divergent interests; once triggered, it reimposed sanctions without restoring the verification and constraint regime that had lapsed.

Scope Conditions: The JCPOA model is most applicable when a state has substantial latent capability but has not weaponized; when verification can detect both declared and undeclared activity; when economic incentives are large enough to outweigh domestic hardliners; when the enforcing coalition remains cohesive; and when restrictions are either permanent or extended before cliff effects. It is less applicable when a state's nuclear program is driven primarily by existential security fears, when regional rivals are arming, when domestic politics reward defiance, or when the enforcing state can unilaterally collapse the bargain. The model also assumes that "breakout time" is a meaningful and measurable proxy for risk, which becomes less true as advanced centrifuges, smaller facilities, and undeclared sites complicate detection.

Observable Implications: If latency management is working, one should observe stable or lengthening breakout times, IAEA access to centrifuge workshops and uranium mines, no unexplained nuclear material, and political willingness to negotiate extensions. If it is failing, one should observe rising enrichment levels, deployment of advanced centrifuges, reduced inspector access, growing stockpiles, and diplomatic moves to trigger snapback or sanctions. The JCPOA case also implies that "compliance" is not binary: Iran remained within some limits while breaching others, and the United States remained a non-party while claiming enforcement rights. Regionally, latency management in Iran has been associated with hedging rhetoric in Saudi Arabia, Turkey, and Egypt, though hedging is not equivalent to proliferation. Finally, the case suggests that the most dangerous moment may occur not when a state builds a weapon but when it acquires a capability that makes a future weapon decision fast and deniable.

Perspective Note (five traditions in brief):

African (primary): The African perspective begins from the experience of non-nuclear states that bear the costs of great-power nuclear bargains without controlling their terms. From this vantage, the JCPOA illustrates a double standard: nuclear-weapon states manage proliferation risks among themselves while retaining arsenals and, in the African reading, using sanctions that can harm civilian economies. African scholarship

and diplomacy emphasize sovereignty, development, and the right to peaceful nuclear technology, as well as the Pelindaba Treaty's creation of an African nuclear-weapon-free zone and support for the Treaty on the Prohibition of Nuclear Weapons. African states often view the NPT as a non-proliferation instrument whose disarmament pillar is under-enforced, and they are skeptical of snapback mechanisms that concentrate coercive power in the Security Council. The African perspective contributes a focus on equity, the civilian costs of sanctions, and the legitimacy of non-nuclear security; its occlusion is that it may understate the specific regional dangers of Iranian latency for Middle Eastern stability and the value of intrusive verification.

Chinese: China supported the JCPOA as a multilateral achievement and criticized the US withdrawal as a violation of international commitments that undermined non-proliferation diplomacy. Beijing emphasizes sovereignty, opposes unilateral sanctions, and frames the deal as evidence that negotiation can manage nuclear risk. China's perspective contributes support for multilateralism and resistance to coercive unilateralism; its occlusion is that it may understate Iran's safeguards breaches and the security concerns of regional states.

Russian: Russia presents itself as a JCPOA supporter and critic of US withdrawal, while also using the Iranian file to challenge US dominance and maintain influence. Moscow emphasizes diplomacy, opposes unilateral sanctions, and has cooperated with Iran in areas that complicate Western pressure. The Russian perspective contributes a counterweight to US-centric enforcement; its occlusion is that it may instrumentalize the deal for geopolitical competition and downplay proliferation risks.

Western: The Western perspective, especially in the United States and Europe, treats the JCPOA as a non-proliferation instrument whose value lies in verifiable constraints and whose collapse increased the risk of an Iranian bomb or a regional war. It emphasizes IAEA verification, snapback, and the need to prevent a nuclear-armed Iran. The Western perspective contributes technical verification expertise and regional security concerns; its occlusion is that it can conflate latency with intent and underestimate how US withdrawal destroyed the reciprocal basis of compliance.

UN: The UN perspective is anchored in Resolution 2231, the IAEA statute, and the NPT's three pillars. It treats the JCPOA as a Security Council-endorsed arrangement whose verification and snapback mechanisms are legal instruments, not merely political preferences. The UN framework contributes multilateral legitimacy and a technical verification role; its occlusion is dependence on Security Council politics and the difficulty of enforcing disarmament commitments against nuclear-weapon states.

2.6 KEY IDEA 5 — New challenges: tactical nukes, hypersonics, AI in NC3, and the erosion of arms control

Bolded Causal Claim: The erosion of Cold War arms control has not simply removed limits; it has shifted nuclear risk from a world of relatively stable, verifiable, bilateral ceilings to one of faster, more ambiguous, and more technologically complex competition, in which crisis stability depends on software, sensors, and human judgment under compression rather than on treaty-bound force structures.

Mechanism: The classic arms-control model assumed that stability could be produced by limiting numbers, types, and deployments of nuclear systems, verifying compliance through national technical means and on-site inspections, and preserving mutual vulnerability through survivable second-strike forces. Brodie (1946) established the foundational premise that nuclear weapons changed strategy from winning wars to averting them; Schelling (1960) added that deterrence depends on credible commitment and the manipulation of risk. The new challenges test whether that aversion and credibility remain stable when treaties erode and

technology accelerates.

Three developments have strained the classic model. First, treaty erosion. The ABM Treaty, signed in 1972, rested on the premise that limiting missile defenses would preserve mutual vulnerability and reduce incentives for larger offensive arsenals. The US withdrawal in 2002, justified by the desire to defend against limited missile threats, was read in Moscow as an attempt to erode Russia's deterrent and contributed to Russian investment in systems designed to penetrate or bypass defenses. The INF Treaty, signed in 1987, eliminated an entire class of ground-launched intermediate-range missiles and removed a destabilizing category from Europe. Its collapse—Russia's suspension in 2019 and US withdrawal later that year—followed disputes over the Russian 9M729 missile and US concerns about Chinese intermediate-range forces not covered by the treaty. The result has been renewed deployment interest in intermediate-range systems in Europe and the Indo-Pacific. New START, signed in 2010 and extended to February 2026, remains the last bilateral limit on deployed strategic warheads and launchers, but Russia's 2023 suspension of participation and the absence of a successor agreement mean that the treaty may expire without replacement, removing inspections and data exchanges that have underpinned predictability for decades.

Second, doctrinal and force-structure change. The reintroduction of lower-yield nuclear options, such as the US W76-2 warhead deployed in 2020, and Russia's large inventory of non-strategic nuclear weapons, has reopened the debate over whether limited nuclear use can be controlled. Proponents argue that a low-yield option strengthens deterrence by denying an adversary the belief that the United States would not respond to a limited nuclear attack; critics argue that it lowers the threshold for use and creates an illusion of controllability. Russia's doctrine and exercises have fueled Western concerns about "escalate to de-escalate," though Russian officials dispute that this is official doctrine. The broader problem is that once a nuclear threshold is crossed, escalation control depends on adversary interpretation, not on the attacker's intent.
