Third, technological compression. Hypersonic glide vehicles and cruise missiles travel at high speeds and can maneuver, compressing warning and decision time and complicating attribution between conventional and nuclear payloads. AI-enabled decision support in early warning and command-and-control systems can improve sensor fusion and reduce human overload, but it also introduces risks of automation bias, data poisoning, cyber intrusion, and inadvertent escalation. The combination of faster weapons and faster analysis narrows the window in which leaders can deliberate, while the ambiguity of dual-capable systems increases the chance of misperception. Arms control has not kept pace: verification of hypersonic trajectories, AI algorithms, and software updates is far harder than counting warheads or inspecting silos.

Scope Conditions: These challenges are most destabilizing in crises between nuclear peers with short warning times, ambiguous signaling, and weak crisis-communication channels. They are less dangerous where robust hotlines, human-in-the-loop requirements, transparency about doctrines, and redundant verification exist. The erosion of arms control is also uneven: bilateral US-Russian limits still constrain strategic forces, while China's growing arsenal and the absence of trilateral frameworks create a multipolar gap. Finally, technological risk depends on implementation quality; AI in NC3 is not inherently destabilizing if used for decision support rather than autonomous launch authority, but the boundary between assistance and automation can erode under pressure.

Observable Implications: One should observe renewed intermediate-range missile deployments in Europe and Asia; continued hypersonic testing and deployment by the United States, Russia, and China; growth in China's warhead stockpile toward and beyond 1,000; the expiry or suspension of New START in 2026 without a successor; doctrinal statements and exercises involving non-strategic nuclear weapons; and investments in AI-enabled early warning and command systems. Crisis indicators include compressed decision

timelines, false-warning incidents, cyber intrusions into defense networks, and disputes over attribution. If arms control is reviving, one would observe resumed data exchanges, new verification concepts for emerging technologies, and trilateral or multilateral dialogues. If it is not, the default will be competitive arming shaped by worst-case assumptions.

Perspective Note (five traditions in brief):

African (primary): The African perspective treats the erosion of arms control as part of a broader pattern in which great powers modernize arsenals while demanding non-proliferation from others. African states, many of them parties to the Pelindaba Treaty and supporters of the TPNW, view nuclear risk as global and indivisible: fallout, climate effects, and economic disruption do not respect regional boundaries. African scholarship and diplomacy emphasize disarmament, the humanitarian consequences of nuclear use, and the injustice of a system in which nuclear-weapon states retain first-use options while non-nuclear states are asked to trust extended deterrence. The African perspective contributes a humanitarian and equity lens and an insistence that arms control must include disarmament, not merely non-proliferation; its occlusion is that it may not fully address the immediate crisis-stability problems created by hypersonics and AI in nuclear command systems.

Chinese: China emphasizes minimum deterrence, a no-first-use policy, and modernization of a relatively small arsenal, while opposing US missile defense and intermediate-range deployments in Asia. Beijing argues that arms control should begin with the largest arsenals and that trilateral talks are premature while US-Russian parity remains the central imbalance. The Chinese perspective contributes a critique of missile defense and a demand for equitable reductions; its occlusion is that its arsenal growth and opacity complicate trust and that no-first-use commitments are difficult to verify.

Russian: Russia frames its nuclear modernization and doctrinal ambiguity as responses to NATO expansion, US missile defense, and the erosion of the ABM and INF treaties. It has deployed non-strategic weapons in Belarus and emphasizes escalation management in regional conflicts. The Russian perspective contributes a security-driven explanation for modernization; its occlusion is that its “escalate to de-escalate” ambiguity and coercive nuclear signaling increase the risk of misperception and undermine crisis stability.

Western: The Western perspective emphasizes extended deterrence, the need to counter Russian and Chinese modernization, and the value of low-yield options and missile defense for assurance and defense. It treats arms-control erosion as driven by adversary cheating and technological change, and supports AI and hypersonic investments for both deterrence and defense. The Western perspective contributes operational and alliance-management expertise; its occlusion is that it can rationalize arms racing as stability and underestimate how its own deployments drive adversary modernization.

UN: The UN perspective is anchored in the NPT, the Comprehensive Nuclear-Test-Ban Treaty, the fissile material cutoff debate, and the disarmament machinery of the General Assembly and review conferences. It treats arms control as a legal and normative project requiring universal participation and verification. The UN framework contributes legitimacy and a forum for non-nuclear states; its occlusion is that enforcement depends on the Security Council and that great powers can bypass or suspend treaties without collective consequence.

2.7 FIVE PERSPECTIVES IN DEPTH

2.7.1 African Perspective (PRIMARY)

The African vantage point on nuclear strategy and proliferation begins from a position that the dominant Western and UN frameworks systematically obscure: for most African states, nuclear weapons are not primarily a security technology but a structure of global hierarchy that reproduces colonial relations of power. This is not a peripheral observation appended to a great-power debate; it is a reframing of the central puzzle. Where Western deterrence theory asks how nuclear weapons stabilize relations among armed states, the African perspective asks how the nuclear order itself constitutes a form of violence against those excluded from it. The mechanism runs through the institutional architecture of the Non-Proliferation Treaty, which divides the world into five recognized nuclear-weapon states and everyone else, and through the practice of nuclear testing, which has disproportionately burdened African territories and populations.

The historical record is specific. France conducted seventeen atmospheric and underground nuclear tests in Algeria between 1960 and 1966, leaving radioactive contamination in the Reggane and In Ekker regions that persists in soil and groundwater. South Africa developed a small nuclear arsenal in the 1970s and 1980s under the apartheid regime, the only African state to do so, before dismantling it in the early 1990s. These experiences are not footnotes; they shape how African governments and scholars read the nuclear order. Achille Mbembe's concept of necropolitics—the sovereign power to decide who may live and who must die—illuminates the distribution of nuclear risk: the populations exposed to fallout from tests conducted by distant powers are precisely those with the least voice in the decisions that produced the exposure. Walter Rodney's analysis of underdevelopment as a relational process, not a stage, applies here: African nuclear vulnerability is not an absence of development but a product of a global system that extracts security from the periphery and concentrates it at the center. Frantz Fanon's analysis of colonial violence reminds us that the nuclear order is not merely a technical arrangement but a politics of domination, in which the power to threaten annihilation is concentrated in the hands of a few.

The Pelindaba Treaty, which establishes the African Nuclear-Weapon-Free Zone, represents the most concrete institutional expression of this perspective. Opened for signature in 1996 and entering into force in 2009, the treaty prohibits the research, development, manufacture, stockpiling, acquisition, testing, possession, control, or stationing of nuclear explosive devices anywhere on the African continent. It also prohibits the dumping of radioactive waste. The treaty's significance lies not only in its prohibitions but in its assertion of regional agency: African states collectively declared their territory off-limits to nuclear weapons at a moment when the NPT was being indefinitely extended and the nuclear-weapon states were consolidating their privileged status. The Pelindaba Treaty thus functions as a counter-institution, a regional normative order that challenges the global hierarchy by creating a zone of prohibition from below. Kofi Danso's advocacy for African nuclear disarmament positions the Pelindaba Treaty and support for the TPNW as expressions of a broader African diplomatic tradition that links disarmament to sovereignty and development. Siphamandla Zondi and other African international-relations scholars have emphasized that such zones are not merely technical arms-control measures but political statements about the right to define security on one's own terms.

The Treaty on the Prohibition of Nuclear Weapons, adopted in 2017 and entering into force in 2021, extends this logic to the global level. African states were among its most consistent supporters: the African Group at the United Nations has repeatedly called for nuclear disarmament, and the TPNW's humanitarian framing—its focus on victim assistance, environmental remediation, and the catastrophic consequences of nuclear use—resonates with African experiences of nuclear testing and with a broader African diplomatic tradition that

links disarmament to development. The TPNW is not merely a legal instrument; it is an epistemic challenge to the deterrence paradigm. Where deterrence theory treats nuclear weapons as stabilizing because they raise the cost of war, the TPNW treats them as illegitimate because their use would be indiscriminate and their possession creates unacceptable risk. This is a genuine theoretical disagreement, not a misunderstanding. The African perspective, articulated through scholars such as Kwesi Aning in his work on African security governance, insists that security must be defined by those who bear its costs, not by those who manage its arsenals.

The critique of the NPT's non-proliferation bias follows from this. The treaty's three pillars—nonproliferation, disarmament, and peaceful use—are formally equal but hierarchically ordered in practice. Article VI obligates nuclear-weapon states to pursue negotiations in good faith on effective measures relating to cessation of the nuclear arms race and to nuclear disarmament, yet the five recognized nuclear-weapon states have not fulfilled this obligation in any meaningful sense; instead, they have modernized their arsenals. Non-nuclear-weapon states, including all African states except South Africa (which disarmed), bear the obligations of safeguards and non-acquisition without receiving the promised disarmament dividend. Mahmood Mamdani's analysis of colonial categories is relevant here: the NPT's division between nuclear-weapon and non-nuclear-weapon states reproduces a colonial logic in which some states are trusted with sovereign violence and others are not. The mechanism is not conspiracy but structure: the treaty was negotiated by the nuclear powers and reflects their interests, and its review conferences have repeatedly failed to produce consensus on disarmament timelines, as in 2015 and 2022.

African scholarship contributes distinctive theoretical resources. Siba Grovogui's work on sovereignty and international law argues that the international order is not a neutral framework but a historically constituted system of power in which African agency is systematically marginalized. Applied to nuclear politics, this means that the "rules-based order" invoked by Western states is itself a product of nuclear hierarchy, not a check on it. Jean-François Bayart's concept of extraversion—the way African elites navigate and exploit external power structures—helps explain why some African states have engaged with the NPT regime strategically rather than rejecting it outright, seeking technical assistance and diplomatic standing while pressing for disarmament. Julius Nyerere's non-alignment and Kwame Nkrumah's pan-Africanism provide the diplomatic lineage: African nuclear diplomacy has consistently linked disarmament to anti-colonialism and to the demand for a more equitable international order. Amílcar Cabral's insistence on the unity of theory and practice suggests that African nuclear diplomacy is not merely rhetorical; the Pelindaba Treaty and TPNW activism are concrete institutional achievements.

The feminist and gender dimensions, developed by scholars such as Sylvia Tamale and Oyèrónkẹ́ Oyěwùmí, add a further layer. Oyěwùmí's critique of the gendered and racialized categories of Western social science applies to nuclear discourse: the "rational actor" of deterrence theory is a particular kind of subject, historically male and Western, and the exclusion of other voices from nuclear decision-making is not accidental but constitutive. Tamale's work on African feminism and human rights frames nuclear disarmament as a gendered issue, given the disproportionate impact of radiation on women and children and the masculinized culture of nuclear strategic planning. These contributions reveal what the Western deterrence framework occludes: that nuclear strategy is not a technical exercise but a politics of whose lives count.

What the African perspective contributes that the other four cannot is a systematic critique of the nuclear order's legitimacy from the standpoint of those it most endangers and least empowers. It reveals that deterrence theory's claim to universal security is parochial, grounded in the experience of nuclear-armed states and their allies, and that the NPT's nonproliferation focus serves to freeze an unequal distribution of destruc-

tive capability. It also provides institutional alternatives—the NWFZ and the TPNW—that demonstrate that disarmament is not merely utopian but has been pursued through concrete legal and diplomatic means.

What it occludes is equally important. The African perspective can understate the security dilemmas of states facing nuclear-armed adversaries: the demand for rapid disarmament does not by itself resolve the problem of verification, of breakout, or of the security guarantees that non-nuclear states would require in a disarmed world. It can also treat the NPT's nonproliferation function as purely oppressive, when in fact the treaty has prevented the spread of nuclear weapons to additional states, including in regions where proliferation would have been destabilizing. The African critique is strongest on legitimacy and weakest on mechanism: it identifies the injustice of the nuclear order more clearly than it specifies a transition path from the current order to a disarmed one. And it has limited engagement with the internal dynamics of nuclear-armed states' deterrence debates—the stability-instability paradox, extended deterrence credibility, the role of tactical nuclear weapons—because these are not African problems in the first instance. This is a scope condition, not a failure: the perspective is optimized for the global-structural and normative dimensions of nuclear politics, not for the operational details of arsenal management.

The strongest counterargument from within the Western tradition is that nuclear deterrence has prevented great-power war for eight decades and that the NPT, for all its flaws, is the most successful nonproliferation regime in history. The African response, grounded in Grovogui and Mamdani, is that this success is measured by the standards of the powerful and that the absence of great-power war does not justify the permanent subordination of the rest. The adjudication is not resolvable by evidence alone; it depends on whether one weights the prevention of great-power war more heavily than the prevention of nuclear hierarchy. The African perspective insists that these are not separate goods and that a security order built on the threat of annihilation is not security at all.

2.7.2 Chinese Perspective

China's nuclear posture is organized around a doctrine of minimum deterrence and a no-first-use pledge that has been in place since 1964, making China the only nuclear-weapon state to maintain an unconditional NFU commitment. The core claim is that a small, survivable arsenal capable of inflicting unacceptable damage in retaliation is sufficient to deter aggression, and that first-use threats are destabilizing and unnecessary. This doctrine reflects China's historical experience of conventional inferiority relative to both the United States and the Soviet Union, and its strategic culture's emphasis on patience, asymmetry, and the avoidance of direct confrontation. The mechanism is straightforward: by renouncing first use, China seeks to reduce the incentive for adversaries to launch preemptive strikes and to position itself as a responsible nuclear power, while maintaining a credible second-strike capability that raises the cost of any attack.

The scope conditions of this doctrine are specific. Minimum deterrence assumes that the adversary is rational and cost-sensitive, that China's arsenal is survivable against a first strike, and that the threshold for unacceptable damage is low enough to be achieved with a small force. These assumptions held reasonably well during the Cold War, when China's arsenal was small and its adversaries were focused on each other. They are under increasing strain today. China's nuclear modernization—evidenced by the construction of hundreds of new missile silos in western China, the development of MIRVed intercontinental ballistic missiles, the deployment of Jin-class ballistic missile submarines, and the testing of hypersonic glide vehicles—suggests a shift away from the lean posture of minimum deterrence toward a more robust and diversified force. The debate within Chinese strategic circles, as analyzed by scholars such as M. Taylor Fravel and Fiona Cunningham, centers on whether this modernization is a quantitative expansion within a minimum deterrence

framework or a qualitative shift toward a more ambitious posture that includes counterforce capabilities and launch-on-warning.

The Chinese perspective contributes to the global nuclear debate in several ways. First, it offers a non-Western model of deterrence that does not rely on first-use threats or extended deterrence, demonstrating that nuclear strategy can be organized around restraint rather than escalation dominance. Second, it challenges the Western assumption that strategic stability requires rough parity in warhead numbers; China's argument is that stability requires only mutual vulnerability, which can be achieved with far fewer weapons. Third, China's NFU pledge, whatever its credibility, provides a normative benchmark that other nuclear-weapon states have not matched, and it has been invoked by disarmament advocates as evidence that first-use renunciation is feasible.

What the Chinese perspective occludes is equally significant. The opacity of China's nuclear program—there are no official figures for warhead numbers, and doctrine is stated in general terms—fuels worst-case planning by adversaries and undermines the very stability that China claims to seek. The NFU pledge's credibility is questionable in a crisis, particularly in a Taiwan contingency where China's conventional forces might face US intervention; the pledge has never been tested and contains implicit exceptions for scenarios that China defines as threats to its sovereignty. The modernization trajectory, particularly the silo expansion and MIRV development, looks less like minimum deterrence and more like a move toward a launch-on-warning posture that increases the risk of accidental or unauthorized use. And China's refusal to engage in trilateral arms control with the United States and Russia—on the grounds that its arsenal is much smaller—ignores the fact that its modernization is precisely what makes trilateral talks necessary.

The strongest counterargument from the Western perspective is that China's NFU pledge is a rhetorical device that costs nothing while its modernization is the real signal, and that the silo expansion indicates a shift toward a counterforce strategy that would undermine mutual vulnerability. The Chinese response is that modernization is driven by the need to ensure survivability against US missile defense and precision-strike capabilities, not by ambition, and that the NFU pledge remains a genuine constraint on doctrine. The adjudication depends on evidence that is not fully available: the internal deliberations of the Central Military Commission, the actual alert status of Chinese forces, and the relationship between the silo expansion and warhead production. What is clear is that China's nuclear posture is in transition, and that the transition's direction will significantly affect global strategic stability. The Chinese perspective is most persuasive when it emphasizes mutual vulnerability and restraint; it is least persuasive when it invokes NFU while expanding the arsenal that makes first use more thinkable.

2.7.3 Russian Perspective

Russia's nuclear doctrine is built on the premise that nuclear weapons compensate for conventional inferiority and that the threat of escalation can terminate conflicts on favorable terms. This is the logic behind the contested concept of "escalate to deescalate": the idea that Russia might use limited nuclear strikes to signal resolve and force an adversary to back down, rather than to achieve military objectives directly. Whether this is actual doctrine or a Western misreading of Russian strategy remains disputed, but the debate itself shapes how adversaries plan and how Russia signals. The 2020 Basic Principles of State Policy on Nuclear Deterrence and the 2024 doctrine update lowered the threshold for nuclear use, explicitly including scenarios involving conventional attacks on Russian territory or threats to the existence of the state. The mechanism is escalation management: by maintaining ambiguity about the nuclear threshold and by deploying non-strategic nuclear weapons, Russia seeks to create a zone of uncertainty that deters NATO intervention in

conflicts on Russia's periphery.

The scope conditions are specific to Russia's strategic environment. Russia faces a NATO alliance with superior conventional forces and a geographic vulnerability that includes a long land border and limited strategic depth. Nuclear weapons are, in this view, the ultimate guarantor of sovereignty and the equalizer that prevents NATO from exploiting its conventional advantage. The deployment of tactical nuclear weapons in Belarus, announced in 2023, extends this logic: by forward-deploying weapons closer to NATO's eastern flank, Russia increases the credibility of its escalation threats and complicates NATO's defense planning. The mechanism is not merely military but political: the deployments signal that Russia is willing to accept heightened risk to protect its sphere of influence.

What the Russian perspective contributes is a theory of deterrence that takes seriously the problem of escalation control and the role of non-strategic nuclear weapons. Western deterrence theory has historically focused on strategic nuclear exchange between superpowers; the Russian perspective insists that the more likely and more dangerous scenarios involve limited nuclear use in regional conflicts, and that planning for these scenarios is essential. It also highlights the destabilizing effects of NATO expansion and missile defense on Russian security perceptions, arguing that the erosion of arms control is driven not only by Russian behavior but by Western decisions to withdraw from the ABM Treaty and to expand NATO eastward.

What it occludes is substantial. The doctrine's ambiguity, while strategically useful, creates a significant risk of miscalculation: adversaries cannot know where the threshold lies, and in a crisis, Russian leaders may face pressure to use nuclear weapons to avoid appearing weak. The forward deployment of weapons in Belarus increases their vulnerability to preemptive strikes and raises the risk of unauthorized use. The nuclear threats issued during the Ukraine war—explicit and implicit—have not prevented Ukrainian resistance or NATO support, suggesting that the escalate-to-deescalate logic may be less effective than its proponents assume. And the 2024 doctrine update, by lowering the threshold, may have made nuclear use more thinkable without making it more controllable.

The strongest counterargument from the Western perspective is that Russia's nuclear threats are primarily coercive instruments designed to deter Western support for Ukraine, not genuine doctrinal shifts, and that the escalate-to-deescalate concept is a Western projection onto ambiguous Russian statements. The Russian response is that NATO's conventional superiority and its willingness to arm Ukraine demonstrate the need for a credible escalation threat, and that the doctrine updates reflect real security concerns, not bluff. The adjudication is complicated by the classified nature of Russian nuclear planning and by the difficulty of distinguishing signaling from intent. What is observable is that Russia has invested heavily in non-strategic nuclear weapons and in delivery systems designed for theater use, which is consistent with a doctrine that contemplates limited nuclear employment. Whether this makes Russia more or less secure is the central question: the Russian perspective argues that it deters; the Western perspective argues that it lowers the nuclear threshold and increases the risk of catastrophe. Both cannot be fully right, and the truth likely depends on context—on whether the adversary reads the threat as credible and whether the escalation ladder can be controlled once climbing begins.

2.7.4 Western Perspective

The Western perspective on nuclear strategy is organized around extended deterrence and the management of proliferation through a combination of alliance guarantees, arms control, and coercive diplomacy. The United States extends its nuclear umbrella to NATO allies and to partners in Asia, including Japan, South Korea, and Australia, on the premise that the threat of US nuclear retaliation deters attacks on allies and that

this assurance prevents allies from developing their own nuclear weapons. The mechanism is credibility: for extended deterrence to work, adversaries must believe that the United States would risk nuclear war to defend an ally, and allies must believe that the United States would follow through. This creates a permanent tension between assurance and nonproliferation, because the more credible the extended deterrent, the less incentive allies have to proliferate, but the more the United States must invest in capabilities and deployments that may provoke adversary modernization.

The stability-instability paradox, identified by Glenn Snyder, is central to this perspective. Nuclear weapons may prevent total war between nuclear-armed states while making lower-level conflict more likely, because the nuclear threshold creates a zone of safety below which conventional and sub-conventional conflict can occur without triggering escalation. This paradox is not a bug but a feature of the Western approach: the United States and its allies have fought numerous limited wars since 1945 without nuclear escalation, and the nuclear umbrella has allowed allies to pursue interests without fear of existential attack. The cost is that the paradox can encourage risk-taking, as states probe below the nuclear threshold, and that it can erode over time as technology compresses decision timelines.

The JCPOA represents the Western approach to proliferation management at its most sophisticated. The 2015 agreement imposed limits on Iran's enrichment capacity, reduced its stockpile of enriched uranium, and subjected its program to intrusive IAEA verification, in exchange for sanctions relief. The mechanism was latency management: Iran retained the technical capacity to produce nuclear weapons but was kept far enough from the threshold that breakout would be detectable and reversible. The US withdrawal in 2018 and the subsequent collapse of the agreement illustrate both the strengths and weaknesses of this approach. The strength was the verification architecture; the weakness was the dependence on US political commitment, which proved reversible. The Western perspective treats Iran as a proliferation threat requiring containment, while treating Israel's undeclared nuclear arsenal as a strategic asset requiring no comparable scrutiny—a double standard that undermines the legitimacy of the nonproliferation regime in the eyes of many non-Western states.

What the Western perspective contributes is operational expertise in alliance management, verification technology, and the institutional machinery of nonproliferation. The IAEA safeguards system, developed largely under Western leadership, is the technical backbone of the NPT, and Western intelligence and diplomatic capabilities have been central to detecting and disrupting proliferation networks, from the A.Q. Khan network to Iran's covert facilities. The Western perspective also provides a theory of arms control as a tool of stability: treaties like INF, START, and New START are understood not as ends in themselves but as mechanisms for managing the security dilemma and reducing the risk of accidental war.

What it occludes is the tendency to rationalize arms racing as stability and to underestimate how Western deployments drive adversary modernization. The deployment of missile defenses, the development of prompt global strike capabilities, and the expansion of NATO have all been cited by Russia and China as reasons for their own nuclear buildups. The Western perspective can also treat nonproliferation as a one-way obligation: non-nuclear states must not acquire weapons, while nuclear-weapon states modernize without corresponding disarmament. And the JCPOA's collapse demonstrated that the Western approach is vulnerable to domestic political shifts in the United States, which can undo years of diplomatic work overnight.

The strongest counterargument from the African and UN perspectives is that extended deterrence is a form of nuclear sharing that violates the spirit of the NPT and that the Western focus on Iran while ignoring Israel's arsenal is a legitimacy-destroying double standard. The Western response is that extended deterrence has prevented proliferation—Germany, Japan, and South Korea have not gone nuclear—and that the JCPOA was

a genuine achievement that was undermined by Iranian non-compliance and regional behavior, not merely by US withdrawal. The adjudication depends on whether one weights the prevention of allied proliferation more heavily than the legitimacy costs of double standards, and whether the JCPOA's collapse is attributed to the agreement's flaws or to the withdrawal. The Western perspective is most persuasive on operational and alliance-management grounds; it is least persuasive when it presents its own nuclear modernization as stabilizing while treating adversary modernization as threatening.

2.7.5 UN Perspective

The UN perspective treats nuclear strategy and proliferation as problems of international law, verification, and collective security, anchored in the NPT and the broader disarmament machinery of the General Assembly, the Conference on Disarmament, and the IAEA. The core claim is that nuclear weapons are a threat to all states and that their elimination requires a universal legal framework with robust verification. The mechanism is normative and institutional: the NPT creates obligations for both nuclear-weapon and non-nuclear-weapon states, the IAEA provides technical verification, and the review conferences provide a forum for accountability. This framework has been the backbone of the nonproliferation regime since 1970, and its supporters argue that it has prevented the spread of nuclear weapons to dozens of states that had the technical capacity to acquire them.

The UN perspective's distinctive contribution is its emphasis on the disarmament pillar of the NPT, which is often neglected in great-power debates. Article VI obligates all parties to pursue negotiations in good faith on effective measures relating to cessation of the nuclear arms race and to nuclear disarmament. The UN General Assembly has repeatedly affirmed this obligation, most notably through resolutions supporting the TPNW and through the establishment of the Open-Ended Working Group on nuclear disarmament. The mechanism here is legal and moral pressure: by repeatedly affirming the disarmament obligation, the UN framework seeks to delegitimize nuclear possession and to create the normative conditions for eventual elimination. The TPNW, negotiated under UN auspices in 2017, represents the most ambitious expression of this approach: it prohibits nuclear weapons entirely, including their use, threat of use, development, production, and stationing, and it includes provisions for victim assistance and environmental remediation.

The IAEA safeguards system is the technical core of the UN perspective. Comprehensive safeguards agreements, supplemented by the Additional Protocol, provide a framework for verifying that nuclear material is not diverted to weapons programs. The mechanism is inspection and monitoring: by placing nuclear facilities under safeguards, the IAEA creates a detection capability that raises the cost of covert proliferation. The JCPOA's verification provisions, which included the most intrusive IAEA monitoring ever negotiated, demonstrated the potential of this approach: even after the US withdrawal, IAEA inspectors continued to monitor Iran's program, providing the international community with information about Iran's nuclear activities. The limitation is that safeguards depend on state cooperation and on the IAEA's access; when states restrict access, as Iran has done since 2021, the verification gap widens.

What the UN perspective occludes is the dependence of its enforcement mechanisms on great-power politics. The NPT's review conferences have repeatedly failed to reach consensus, as in 2015 and 2022, because the nuclear-weapon states and non-nuclear-weapon states disagree fundamentally about the pace and scope of disarmament. The Security Council, which is the enforcement arm of the UN system, is dominated by the five nuclear-weapon states, creating a conflict of interest in which the states most obligated to disarm are the ones with veto power over enforcement. The TPNW, while normatively significant, has not been signed by any nuclear-weapon state and has no enforcement mechanism beyond the general obligations of international

law. And the disarmament machinery—the Conference on Disarmament—has been paralyzed for decades by the consensus rule, which allows any single state to block progress.

The strongest counterargument from the great-power perspectives is that the UN framework is aspirational rather than operational: it sets goals that cannot be achieved without the cooperation of the nuclear-weapon states, and its repeated failures to reach consensus undermine its credibility. The UN response is that the framework's value lies not in immediate achievement but in the creation of norms and institutions that constrain behavior over time, and that the alternative—a world without any nonproliferation regime—would be far more dangerous. The adjudication depends on whether one views the NPT as a floor or a ceiling: as a floor, it has prevented widespread proliferation and created a verification infrastructure that did not exist before; as a ceiling, it has locked in nuclear inequality and provided cover for the nuclear-weapon states to modernize without disarming. The UN perspective is most persuasive when it emphasizes verification and norm-building; it is least persuasive when it assumes that legal obligation alone can overcome the security dilemmas that drive nuclear possession. The framework's future depends on whether the nuclear-weapon states can be persuaded to take Article VI seriously before the legitimacy deficit becomes irreversible.

2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Reveals the NPT as structurally unequal; Pelindaba Treaty as regional disarmament model; TPNW as moral/legal challenge to nuclear hierarchy	May understate the security dilemmas of states facing existential threats; risks conflating all nuclear possession with imperialism	Nuclear order must be non-discriminatory; disarmament must be universal and not deferred indefinitely	Pelindaba Treaty (1996); TPNW (2021) ratifications; African states' NPT compliance record; African Group statements at RevCons	Western: disarmament without security guarantees is naive; states facing hostile neighbors need deterrence, and TPNW ignores verification realities

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Chinese	No-first-use pledge as stabilizing norm; minimum deterrence as rejection of arms-race logic; emphasis on diplomacy over coercion	Ambiguity about NFU scope in extreme circumstances; modernization program may contradict minimum deterrence rhetoric	Nuclear weapons are for deterrence only; no-first-use reduces escalation risk; arms control must be mutual and balanced	NFU policy since 1964; relatively small arsenal (~500 warheads); no nuclear use in crises; diplomatic support for JCPOA	Russian/Western: NFU is unverifiable and may not hold under existential threat; minimum deterrence invites first-strike temptation
Russian	Emphasizes nuclear weapons as ultimate security guarantee; escalate-to-deescalate as de-escalation tool; warns against NATO expansion and encirclement	May overstate NATO threat; obscures own first-use ambiguity; Belarus deployment escalates rather than stabilizes	Nuclear weapons preserve sovereignty and prevent aggression; arms control must be mutual; NATO expansion provoked Russian posture	2020 nuclear doctrine (lowered threshold); Belarus deployment (2023); INF withdrawal response; New START suspension (2023)	Western: escalate-to-deescalate lowers nuclear threshold and invites miscalculation; Belarus deployment is escalation, not deterrence
Western	Extended deterrence as alliance management; JCPOA as verification model; Iran as proliferation case study; nonproliferation as core security interest	May conflate nonproliferation with regime change; overstates military solutions; underestimates regime inequality critique	Nonproliferation is paramount; extended deterrence stabilizes alliances; Iran must not acquire bomb; verification plus pressure	JCPOA verification record (2015-2018); NATO nuclear sharing; IAEA reports on Iran; NPT enforcement history	African: extended deterrence perpetuates nuclear hierarchy and denies non-nuclear states equal security; Russian: NATO expansion provoked crisis

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
UN	Verification infrastructure (IAEA safeguards); norm-building (NPT, TPNW); disarmament machinery (RevCons, CD); evidence-based reporting	Assumes legal obligation can overcome security dilemma; weak enforcement beyond sanctions; depends on great-power consensus	Nuclear disarmament is legal obligation (NPT Article VI); verification builds trust; peaceful use is permitted under safeguards	IAEA safeguards agreements; NPT RevCon reports; TPNW; UNSCR 2231 snapback mechanism	All nuclear-armed states: disarmament requires security environment change first; legal obligation alone cannot overcome anarchy

2.8 WORKED EXAMPLE (I do): Iran Nuclear Program, JCPOA, and the Collapse of Compliance

Levels of analysis. The Iran nuclear crisis can be analyzed at four levels, and each level illuminates a different causal channel. At the individual level, decisions by Supreme Leader Ali Khamenei, Presidents Hassan Rouhani and Ebrahim Raisi, and US Presidents Barack Obama, Donald Trump, and Joe Biden shaped the trajectory in ways that were not structurally determined; Trump's May 2018 withdrawal was a discretionary choice that many analysts judged to be against the advice of his own defense and intelligence officials, and Biden's subsequent failure to revive the deal reflected both domestic political constraints and Iranian negotiating intransigence. At the state level, Iran's security calculus—shaped by the Iran-Iraq War (1980-1988), regional isolation, the desire for technological sovereignty, and the perceived threat from Israel and the United States—drove the enrichment program; the United States sought to prevent a nuclear-armed Iran, protect Israel and Gulf allies, and maintain nonproliferation norms. At the systemic level, the crisis reflects US-Iran rivalry, regional power competition among Iran, Saudi Arabia, and Israel, and the broader credibility of the nuclear order; the JCPOA was not merely a bilateral deal but a test of whether the nonproliferation regime could accommodate a state's peaceful nuclear ambitions while preventing weaponization. At the transnational level, the IAEA, the NPT, the JCPOA's multilateral framework (the P5+1/E3+3), and global sanctions networks structured the bargaining space, creating verification mechanisms, legal obligations, and economic incentives that both enabled and constrained state behavior.

Mechanism. The JCPOA, concluded in July 2015, established a verification-for-relief bargain whose logic was to extend Iran's breakout time—the time needed to produce enough weapons-grade uranium for one bomb—from an estimated two to three months to roughly one year. Iran accepted limits on enrichment (a 3.67 percent cap on uranium-235 concentration, a 300 kilogram stockpile limit on low-enriched uranium), centrifuge reductions (5,060 IR-1 centrifuges operating, with excess machines stored under IAEA monitoring), the conversion of the Fordow facility to research use, the redesign of the Arak heavy-water reactor to

reduce plutonium production, and enhanced IAEA monitoring including the Additional Protocol and continuous surveillance of enrichment facilities. In exchange, Iran received relief from US, EU, and UN sanctions, unlocking frozen assets and restoring oil exports. The mechanism's enforcement relied on the snapback provision in UN Security Council Resolution 2231, which allowed any permanent member of the Security Council to trigger the reimposition of UN sanctions if Iran violated the deal—a unilateral enforcement tool designed to overcome the veto problem. The mechanism functioned as designed from 2015 to 2018: IAEA reports confirmed Iranian compliance, and breakout time remained extended. The collapse began with US withdrawal in May 2018 and the reimposition of unilateral sanctions, which removed the economic incentive for Iranian compliance. Iran initially remained within JCPOA limits (per IAEA reports through mid-2019) but then incrementally breached: exceeding the 300 kilogram stockpile limit in July 2019, enriching above 3.67 percent in July 2019, installing advanced centrifuges (IR-2m, IR-4, IR-6), enriching to 20 percent in January 2021, and reaching 60 percent enrichment by April 2021—far beyond civilian needs and approaching weapons-grade. By 2024-2025, Iran had accumulated enough 60 percent material that, if further enriched to 90 percent, could yield multiple weapons; breakout time had collapsed to days or weeks. The mechanism failed not because verification failed—the IAEA continued to report accurately on Iran's activities—but because the political bargain collapsed: sanctions relief was the incentive, and its removal eliminated Iran's reason to comply, while the snapback's credibility depended on multilateral consensus that US withdrawal destroyed. The 2025 expiration of UNSCR 2231's snapback provision created a legal cliff, removing even the theoretical enforcement mechanism.

Perspective reconstruction.

African perspective (primary): From the African vantage point, the Iran crisis exemplifies the NPT's structural inequality and the dangers of selective enforcement in a hierarchical nuclear order. African states, many of which forswore nuclear weapons under the Pelindaba Treaty (1996) and the NPT, watch a regime in which nuclear-weapon states modernize their arsenals while non-nuclear states face sanctions for enrichment activities that are technically permitted under Article IV of the NPT. The African critique, articulated by scholars such as Siba Grovogui and Jean-François Bayart, emphasizes that the nonproliferation regime serves great-power interests and that Iran's treatment reflects geopolitical hierarchy rather than universal principle; the TPNW's emergence in 2021 reflects African and Global South frustration with the NPT's disarmament failure. African states also note the apparent hypocrisy of extended deterrence: the United States protects allies with nuclear umbrellas while denying Iran the same security logic, and the JCPOA's asymmetry—Iran's nuclear program constrained while Israel's undeclared arsenal is unchallenged—reinforces perceptions of double standards. Yet African states are not uniformly pro-Iran; many support nonproliferation and IAEA verification, and the African Nuclear-Weapon-Free Zone represents a genuine commitment to disarmament rather than mere anti-Western positioning. The African perspective thus both criticizes the regime's inequality and supports its verification mechanisms—a tension that mirrors the broader Global South position and that reveals the NPT's legitimacy deficit more clearly than any other vantage point.

Chinese perspective: China supported the JCPOA as a multilateral achievement and criticized US withdrawal as undermining diplomatic solutions and destabilizing the region. Beijing's no-first-use doctrine and minimum deterrence stance lead it to view Iran's enrichment with concern but not alarm, emphasizing diplomacy over coercion and opposing sanctions as counterproductive. China's growing economic ties with Iran, including the 25-year cooperation agreement signed in 2021, complicate its nonproliferation stance, creating tension between commercial interests and regime norms; Beijing has continued to import Iranian oil despite US sanctions. China's position reflects both genuine support for multilateral nonproliferation and strategic interest in limiting US regional dominance, and it favors engagement and economic integration as the path

to Iranian compliance rather than pressure and isolation.

Russian perspective: Russia, as a JCPOA signatory and Iran's nuclear cooperation partner at Bushehr, initially supported the deal and criticized US withdrawal as a violation of international law and a blow to multilateralism. Moscow views the Iran crisis through the lens of great-power competition and nuclear order stability, emphasizing that unilateral US actions undermine the frameworks that prevent proliferation. Russia's own nuclear doctrine and its escalate-to-deescalate debates inform its skepticism of US nonproliferation enforcement, which it sees as selectively applied to adversaries while allies are shielded. Russia has maintained ties with Iran, including military cooperation and nuclear fuel supply, while supporting IAEA verification in principle; Moscow's position reflects both genuine nonproliferation interest and strategic interest in limiting US influence in the Middle East and maintaining a multipolar order.

Western perspective: The Western view centers on preventing Iranian nuclear acquisition as a core security interest, protecting Israel and Gulf allies, and maintaining nonproliferation norms. The JCPOA was seen as a verification success from 2015 to 2018 that extended breakout time and provided unprecedented monitoring; US withdrawal was justified by critics of the deal as addressing its sunset clauses, Iran's ballistic missile program, and regional behavior, though many Western analysts and European allies opposed withdrawal as counterproductive. The Western perspective emphasizes extended deterrence, sanctions as leverage, and the military option as a last resort; it tends to conflate Iran's nuclear program with broader regional threats, sometimes obscuring the distinction between enrichment (permitted under NPT Article IV) and weaponization. The Western perspective is strongest on the technical verification record and weakest on explaining why Iran pursued enrichment in the first place.

UN perspective: The UN and IAEA perspective focuses on verification, safeguards, and the NPT framework as the appropriate tools for managing the crisis. The IAEA's reports documented Iran's compliance from 2015 to 2019 and its subsequent breaches with technical precision, providing an evidence-based account that all parties could reference. The UN Security Council's snapback mechanism was designed to enforce compliance multilaterally, and the IAEA's monitoring regime provided the information necessary for political decision-making. The UN perspective emphasizes that the NPT permits peaceful nuclear energy and that verification, not political pressure alone, is the path to confidence. However, the UN machinery lacks enforcement power beyond sanctions, and its effectiveness depends on great-power consensus that the US withdrawal fractured. The UN perspective is strongest on technical verification and weakest on resolving the underlying security dilemma that drives Iran's nuclear ambitions.

Adjudication. The Western perspective best explains the immediate causal chain: US withdrawal in 2018 removed the incentive for Iranian compliance, and Iran's subsequent enrichment escalation was a rational response to lost benefits in a bargaining framework where the United States had unilaterally abrogated the deal. The mechanism is clear and well-documented by IAEA reports. However, the Western perspective misses the structural driver: Iran's nuclear program was always partly a response to security threats (the Iran-Iraq War, US hostility, Israeli opposition) and the NPT's failure to deliver disarmament, and the JCPOA's asymmetry—Iran constrained while nuclear-weapon states modernize—undermined its long-term legitimacy. The African perspective best captures this structural dimension, revealing the regime's inequality and the security dilemma it creates, but it underestimates Iran's agency and the genuine proliferation risk that a nuclear-armed Iran would pose to regional stability. The Chinese and Russian perspectives correctly identify US unilateralism as destabilizing and emphasize multilateralism, but they understate Iran's own choices and the ways in which Iranian intransigence contributed to the deal's collapse. The UN perspective provides the most reliable evidence base through IAEA reporting but cannot resolve the political conflict

because it lacks enforcement power and depends on the very great-power consensus that the crisis destroyed. The best explanation combines the Western mechanism (incentive collapse following US withdrawal) with the African structural critique (regime inequality and security dilemma), while acknowledging that no single perspective fully accounts for the role of domestic politics in both Tehran and Washington, the regional security competition, and the technical realities of enrichment and breakout time. The case demonstrates that nuclear nonproliferation is not merely a technical verification problem but a political legitimacy problem: when the regime is perceived as unequal, compliance becomes contingent on perceived fairness, and verification alone cannot sustain a bargain that one party has abandoned.

SECTION 2.9 PROBLEM PAIR (We do)

Case: India and Pakistan both tested nuclear weapons in 1998. Since then, the subcontinent has seen the Kargil conflict (1999), the 2001–02 military standoff, the Mumbai attacks (2008), and the Pulwama–Balakot crisis (2019), but no full-scale conventional war comparable to 1971. The question is whether nuclearization has stabilized South Asia by capping escalation, or destabilized it by encouraging lower-level coercion, arms racing, and crisis instability.

Tasks

1. Define "stabilization" and "destabilization" in this dyad using observable indicators (full-scale war, crisis frequency, mobilization, arms-race indicators, doctrinal shifts) and specify the time horizon over which you are judging.
2. Reconstruct the Waltzian and Saganian mechanisms for India–Pakistan. Identify the scope conditions under which each is more plausible: command-and-control robustness, civil–military relations, conventional asymmetry, and the Kashmir dispute.
3. Apply the four levels of analysis—individual, state, systemic, and transnational—to explain why crises recur despite nuclear deterrence.
4. Compare the evidence from 1998–2024. Which events support macro-stabilization, and which support meso-level destabilization?
5. Reconstruct, in brief, how Western, Russian, Chinese, UN, and African perspectives would interpret the same evidence.
6. Adjudicate: has nuclearization stabilized or destabilized South Asia? State the metric, the mechanism, and at least two falsifiers.

Model answer (continuous prose): Stabilization in a nuclear dyad should be defined as the prevention of the most dangerous outcome—full-scale war and existential escalation—while destabilization should be defined as an increase in the frequency, intensity, or inadvertence of lower-level crises, arms racing, and coercive probing. Measured by the first standard, India–Pakistan nuclearization looks stabilizing: since 1998 there has been no war on the scale of 1971, and even severe crises have stopped short of sustained conventional invasion. Measured by the second standard, the record is more troubling. Kargil in 1999 occurred after both states had tested nuclear weapons; the 2001–02 standoff produced massive mobilization; Mumbai in 2008 and Pulwama–Balakot in 2019 showed that sub-conventional violence and limited strikes can occur under a nuclear shadow. The appropriate conclusion is therefore not that nuclear weapons either stabilized or destabilized South Asia in a simple sense, but that they changed the ceiling of conflict more than its floor. This is the stability–instability paradox: mutual vulnerability at the strategic level can deter

total war while permitting, and sometimes encouraging, limited coercion below the nuclear threshold. The Waltzian mechanism is straightforward. If both sides possess survivable second-strike capabilities and rational leaders, the cost of full-scale war becomes prohibitive, so war is avoided. In South Asia, however, the scope conditions for clean Waltzian stability are weak. Pakistan's conventional inferiority makes nuclear weapons central to its security; India's conventional superiority creates incentives to exploit gaps below the nuclear threshold; the Kashmir dispute supplies recurring flashpoints; and civil–military asymmetries mean that risk tolerance, signaling, and control may not be uniform within each state. The Saganian mechanism therefore deserves equal weight: nuclear danger arises not only from rational cost–benefit calculation but from organizational routines, misperception, compressed decision time, and the possibility that military organizations may favor options that political leaders did not intend. Pakistan's full-spectrum deterrence posture lowers the nuclear threshold by design, while India's no-first-use and massive-retaliation doctrine aims to restore deterrence but may be less credible against limited or ambiguous attacks. At the systemic level, regional bipolarity is modified by external powers: the United States has repeatedly crisis-managed, while China's strategic partnership with Pakistan shapes India's threat perception. At the state level, Pakistan's military dominance and India's civilian control produce different institutional logics of escalation. At the individual level, leaders face domestic audience costs and compressed timelines. At the transnational level, the NPT's non-recognition of both states, U.S. diplomacy, and Chinese support all condition the dyad. The five perspectives would read this record differently. A Western extended-deterrence lens tends to emphasize survivable second strikes and crisis management, but South Asia's asymmetric doctrines and less robust command-and-control arrangements make that template only partially applicable. A Russian lens, familiar with escalate-to-de-escalate debates, would see Pakistan's lower-threshold posture as a form of deterrence rather than necessarily as escalation, while worrying about India's conventional advantages. A Chinese lens would stress minimum deterrence, no-first-use, and the risks created by India's conventional superiority and U.S.–India strategic convergence. A UN/NPT lens would emphasize non-proliferation, safeguards, and disarmament, but would have limited leverage over two de facto nuclear powers outside the treaty. An African lens, shaped by the Pelindaba Treaty and by skepticism toward nuclear hierarchy, would stress that the NPT's asymmetry and great-power exceptionalism weaken the legitimacy of non-proliferation demands; it would also foreground how externally imposed security orders can reproduce insecurity for states in the global South. Adjudicating the case requires choosing the metric. If the metric is prevention of full-scale war, nuclearization has stabilized South Asia. If the metric is crisis frequency, arms-race intensity, doctrinal ambiguity, and inadvertent-escalation risk, it has destabilized crisis management. The most defensible verdict is therefore conditional: nuclear weapons have stabilized the top of the escalation ladder while destabilizing the middle. This verdict would be falsified in either direction. A future full-scale India–Pakistan war would falsify the claim of macro-stabilization. A sustained decade without major crises, accompanied by verifiable restraint, doctrinal transparency, and improved command and control, would weaken the claim of meso-level destabilization. A demonstrated near-miss or accidental escalation would strongly support the Saganian view that organizational and perceptual failures, not just rational deterrence, drive nuclear danger.

SECTION 2.10 INDEPENDENT MEMO (You do)

(a) Case description: In 2017, North Korea tested an intercontinental ballistic missile and conducted its sixth nuclear test, while the United States and South Korea held large-scale military exercises and U.S. leaders issued coercive threats. Since then, Pyongyang has expanded its nuclear and missile forces, while Seoul has debated nuclear latency and Washington has reaffirmed extended deterrence through consultations, exercises, and trilateral coordination with Japan. The dispute now centers on whether U.S. extended deterrence

stabilizes the peninsula by raising the cost of North Korean aggression, or whether it increases incentives for preemption, arms racing, and South Korean nuclear hedging. Analysts must assess command and control, alliance credibility, North Korean doctrine, and the roles of China and Russia without assuming that either deterrence success or failure is inevitable. The case also asks how to distinguish North Korea's coercive bargaining from genuine warfighting intentions, and whether sanctions and diplomacy can alter proliferation incentives.

(b) Required memo headings as prompts

- **Mechanism:** Identify the causal mechanism linking North Korea's nuclear expansion, U.S.–South Korean military posture, and alliance extended deterrence. Specify the independent variable, the intervening mechanism, the scope conditions, and the observable implications.
- **Perspective reconstruction:** Reconstruct how African, Chinese, Russian, Western, and UN perspectives would explain the same evidence. For each, state its key contribution and its key occlusion.
- **Historical analogue:** Compare the case to one earlier nuclear crisis or dyad (for example, Cuba 1962, India–Pakistan after 1998, or NATO–Warsaw Pact extended deterrence). State what transfers and what does not.
- **Falsifiers:** List at least three observations that would weaken or refute your main claim, and specify the evidentiary standard you would use.

(c) Self-check line: Did you distinguish description (what happened), explanation (why it happened), prediction (what is likely next), and prescription (what should be done)?

SECTION 2.11 HINGE QUESTION

Question: In a nuclear dyad with asymmetric conventional capabilities and a history of territorial disputes, which condition most directly produces the stability–instability paradox?

A. Mutual vulnerability at the strategic level combined with credible lower-level escalation options.
B. Symmetric conventional forces and robust arms-control verification.
C. A shared no-first-use doctrine and demilitarized borders.
D. Complete nuclear disarmament and reliance on conventional deterrence.

Correct answer: A.

Distractor diagnoses:

- **B** is wrong because symmetric conventional forces and verification tend to reduce, not create, incentives for lower-level probing; it describes a stabilizing configuration rather than the paradox.

- **C** is wrong because shared no-first-use commitments and demilitarized borders would suppress the very lower-level conflict that the stability–instability paradox predicts.

- **D** is wrong because removing nuclear weapons eliminates the strategic stability that makes lower-level conflict thinkable; it is not a condition of the paradox but its absence.

SECTION 2A — DATA LAB

The data below are drawn from the Federation of American Scientists (FAS) Nuclear Notebook, the IAEA, the UN Office for Disarmament Affairs, and the Arms Control Association. They are presented as of 2024 unless noted. Figures for deployed warheads exclude those in reserve or awaiting dismantlement; inventories for India, Pakistan, Israel, and North Korea are estimates because none of these states publishes official figures. The purpose of the lab is not to memorize numbers but to learn to read nuclear data as evidence for theory: trends test claims about proliferation, levels of analysis separate state decisions from systemic pressures, and perspective reconstruction asks whose interests each datum serves.

Table 1 — Nuclear warhead inventories, 2024 (FAS estimates)

State	Total inventory (approx.)	Deployed (approx.)	First test	Historical peak (approx.)
United States	5,044	1,770	1945	31,255 (1967)
Russia	5,580	1,710	1949	40,000 (1986)
China	500	(small deployed force)	1964	~450 (early 2010s); rising
France	290	280	1960	540 (1992)
United Kingdom	225	120	1952	520 (1970s)
India	172	not declared	1974 (PNE) / 1998	rising
Pakistan	170	not declared	1998	rising
Israel	90	not declared	undeclared	~90
North Korea	50	not declared	2006	rising

Table 2 — Treaty and zone membership, 2024

Instrument	Opened / in force	Parties (2024)	Key non-parties or withdrawals	Core obligation
NPT	1968 / 1970	191	India, Pakistan, Israel, South Sudan; North Korea withdrew 2003	Non-proliferation, disarmament, peaceful use
TPNW	2017 / 2021	69 ratified	All nine nuclear-armed states and most NATO allies	Prohibition on possession, use, threat of use
CTBT	1996	172 ratified (187 signatories)	US, China, India, Pakistan, Israel, Egypt, Iran, North Korea not ratified	Bans all nuclear explosions
Pelindaba (Africa NWFZ)	1996 / 2009	43 (all AU members)	none among African states	Prohibits nuclear weapons in Africa

Instrument	Opened / in force	Parties (2024)	Key non-parties or withdrawals	Core obligation
Tlatelolco (Latin America NWFZ)	1967 / 1969	33	none	First nuclear-weapon-free zone
Rarotonga (South Pacific)	1985 / 1986	13	none	Prohibits nuclear testing/storage
Bangkok (Southeast Asia)	1995 / 1997	10	none	Prohibits nuclear weapons
Semipalatinsk (Central Asia)	2006 / 2009	5	none	Prohibits nuclear weapons

Table 3 — Arms control and safeguards status, 2024

Instrument	Status	Key terms or notes
ABM Treaty	US withdrew 2002	Limited missile defenses; withdrawal enabled national missile defense
INF Treaty	Expired 2019 (US withdrew; Russia suspended)	Eliminated 500–5,500 km ground-launched missiles
New START	Extended to February 2026	1,550 deployed warheads; 700 deployed launchers per side
JCPOA	Collapsed	US withdrew 2018; Iran exceeded limits 2019–2024; IAEA monitoring degraded
IAEA comprehensive safeguards	~180 states with CSA in force	Verifies non-diversion of declared material; Additional Protocol adds access
IAEA Additional Protocol	~140 states	Enhanced access to undeclared facilities; not universal

Analysis questions

1. **Trend.** Compare the US and Russian inventories in Table 1 with their historical peaks. What does the post-1991 trajectory show, and how does the 2024 China figure complicate any simple narrative of "disarmament"? Note specifically what the deployed column does and does not capture about readiness.

2. **Level of analysis.** Table 1 lists nine nuclear-armed states. Using the four levels of analysis from Lesson 1 (individual, state, systemic, transnational), explain why the same inventory figure can be read as a state-level decision (domestic politics, leadership) or as a systemic outcome (security dilemma, alliance structure). Give one example of each reading for a single state.

3. **Perspective reconstruction (all five).** For each of the five perspectives named in the lesson header, state what Table 2 and Table 3 together would be read as showing. African: what does the Pelindaba

entry and the TPNW ratification count imply about who bears the costs of the non-proliferation order? Chinese: what does the CTBT non-ratification by the US and China imply for the credibility of disarmament commitments? Russian: what does the INF expiry and New START sunset imply about the stability of bilateral arms control? Western: what does the JCPOA collapse imply about the limits of verification-based bargains? UN: what does the gap between CSA and Additional Protocol coverage imply about the safeguards system's reach?

4. **Interpretation.** The NPT has 191 parties but the TPNW has only 69 ratifications and no nuclear-armed state has joined. Is this evidence that the non-proliferation regime is strong, weak, or bifurcated? Defend your answer with reference to at least two of the tables and one theoretical claim from the lesson (Sagan vs. Waltz, or the stability-instability paradox).

5. **Limitation.** What do these tables systematically fail to capture? Identify at least three blind spots: (a) the quality and readiness of forces (not just numbers), (b) the opacity of non-declared programs, and (c) the political meaning of "deployment" in different doctrinal contexts. Explain how each blind spot would change the interpretation of Table 1.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — The Deterrence Stability Triangle (hand-drawn, landscape orientation)

What to draw. Draw a large equilateral triangle. At the top vertex, label "Second-Strike Capability (survivability)"; at the bottom-left vertex, label "Credible Commitment (resolve)"; at the bottom-right vertex, label "Crisis Stability (no first-strike incentive)." Inside the triangle, draw a smaller inverted triangle labeled "Stable Deterrence." Along each side of the outer triangle, draw an arrow pointing inward toward the center, labeled respectively "Hardening / dispersal / SSBNs," "Alliance guarantees / declaratory policy," and "Launch-on-warning risks / C3I vulnerability." Outside the triangle, in the top-left corner, draw a small mushroom-cloud icon with a red "X" through it and the label "First strike not rational."

How to label it. Use a legend: solid lines = structural requirements; dashed lines = behavioral requirements. Place a box at the bottom reading "Scope condition: rational actors, survivable forces, clear red lines."

Perspective overlay to annotate. In the margin, write five short tags: "African: who pays for survivability?"; "Chinese: minimum deterrence fits here"; "Russian: escalate-to-deescalate breaks the triangle"; "Western: extended deterrence stretches the triangle"; "UN: NPT as the outer frame." This visual encodes Key Idea 1 (MAD and second-strike stability) and should be referenced whenever the student encounters claims about "stable deterrence."

Visual 2 — The Proliferation Decision Funnel (hand-drawn, portrait orientation)

What to draw. Draw a funnel narrowing from top to bottom. At the wide top, label "Systemic pressures (security dilemma, alliance gaps, prestige)." In the middle band, label "State-level factors (regime type, civil-military relations, economic capacity)." At the narrow bottom, label "Individual leadership decisions." Inside the funnel, draw three horizontal "filters": "NPT/IAEA safeguards," "Export controls (NSG)," and "Domestic opposition / cost." Below the funnel, draw two exit arrows: one to the left labeled "Acquisition (Waltz logic)" and one to the right labeled "Renunciation (Sagan logic / Libya, South Africa, Ukraine)." To the right of the funnel, draw a small box labeled "Latency: enrichment capability without weaponization."

How to label it. Label the left exit "Proliferation" and the right exit "Rollback." Add a note: "Same systemic pressure, different state-level filter."

Perspective overlay to annotate. Margin tags: "African: Pelindaba removes the funnel entirely for one continent"; "Chinese: NFU as a filter"; "Russian: security guarantees as a filter"; "Western: JCPOA as a filter"; "UN: safeguards as the universal filter." This visual encodes Key Idea 3 (proliferation) and Key Idea 4 (JCPOA and latency).

Visual 3 — The Arms Control Erosion Timeline (hand-drawn, horizontal timeline)

What to draw. Draw a horizontal timeline from 1972 to 2026. Mark the following points with vertical ticks and labels: 1972 ABM Treaty signed; 1987 INF Treaty signed; 1991 START I; 1996 CTBT opened; 2002 US withdraws from ABM; 2010 New START signed; 2015 JCPOA; 2018 US withdraws from JCPOA; 2019 INF expires; 2021 TPNW enters force; 2022 Russia suspends New START participation (announced); 2026 New START expires (unless replaced). Above the timeline, draw a shaded band labeled "Era of bilateral arms control (1972–2019)" that ends at 2019. Below the timeline, draw a second shaded band labeled "Era of multilateral non-proliferation (1968–present)" that continues to the right edge. At the far right, draw a question mark labeled "Post-2026?"

How to label it. Use two colors: blue for bilateral US-Russia treaties, green for multilateral instruments. Add a legend.

Perspective overlay to annotate. Margin tags: "African: TPNW as the alternative track"; "Chinese: modernization outside this frame"; "Russian: doctrine shifts after 2022"; "Western: JCPOA as the Iran-specific track"; "UN: RevCon as the review mechanism." This visual encodes Key Idea 5 (erosion of arms control) and should be used to anchor discussions of "what comes after New START."

SECTION 4 — CORNELL NOTES

Cue (question / prompt)	Notes (answer + source log)
What is the basic logic of nuclear deterrence?	Deterrence by punishment: the threat of unacceptable retaliation prevents attack. Brodie (1946) argued the chief purpose of military forces shifts from winning wars to preventing them. Schelling (1960) added the importance of credible commitment and the manipulation of risk. Scope: requires survivable second-strike forces and rational actors. Source: Brodie 1946; Schelling 1960.
What is second-strike stability?	A force is second-strike stable if it can survive a first strike and retaliate with unacceptable damage. Wohlstetter (1959) emphasized that vulnerability of forces creates first-strike incentives. Mechanism: survivability (hardening, dispersal, SSBNs) removes the incentive to strike first. Source: Wohlstetter 1959.

Cue (question / prompt)	Notes (answer + source log)
What is the stability-instability paradox?	Nuclear weapons may deter total war while permitting or even encouraging lower-level conflict, because the nuclear umbrella reduces the risk of escalation. Extended deterrence (US guarantees to allies) is the key application. Source: Snyder 1961; Jervis 1984.
What are the main causes of proliferation?	Waltz (1981, 1995) argues proliferation is inevitable and may be stabilizing (more nuclear powers = more deterrence). Sagan (1996, 2003) argues proliferation is dangerous due to organizational pathologies, civil-military relations, and preventive war incentives. Debate: systemic vs. unit-level causes. Source: Sagan and Waltz 1995; Sagan 2003.
What is nuclear latency?	The capability to produce fissile material and weapons without having done so. JCPOA addressed latency by limiting enrichment levels and centrifuge numbers while allowing civilian nuclear energy. Snapback: reimposition of sanctions if Iran violated terms. Source: Fitzpatrick 2019.
What is extended deterrence?	The extension of a nuclear guarantee to allies (e.g., US to NATO, Japan, South Korea). Creates credibility problems: would the US risk New York for Tokyo? Mechanism: coupling, tripwires, and declaratory policy. Source: Schelling 1960; Narang 2014.
What is escalate-to-deescalate?	A debated Russian doctrine in which limited nuclear use could terminate a conventional conflict on favorable terms. Contested: whether it is official doctrine or Western misreading. Source: Russian nuclear doctrine documents; debates in Western scholarship.
What is no-first-use (NFU)?	A declaratory policy committing not to use nuclear weapons first. China has maintained NFU since 1964; India adopted NFU in 1998 (with caveats). Debate: whether NFU is credible or merely declaratory. Source: Chinese defense white papers.
What is the NPT grand bargain?	Non-nuclear states forgo weapons; nuclear states pursue disarmament; all have right to peaceful nuclear energy. Critique: disarmament pillar unfulfilled; non-proliferation bias. Source: NPT text (1968); African Group statements at RevCon.

Cue (question / prompt)	Notes (answer + source log)
What is the TPNW?	Treaty on the Prohibition of Nuclear Weapons (2017/2021). Prohibits possession, use, threat of use, development, testing, production. Rejected by all nuclear-armed states. African states were leading proponents. Source: UNODA; TPNW text.
What is the Pelindaba Treaty?	Africa Nuclear-Weapon-Free Zone (1996/2009). All 43 AU members are parties; requires nuclear-weapon states to respect the zone. African perspective: non-proliferation must be paired with disarmament and equity. Source: Pelindaba Treaty text.
What is snapback?	Mechanism in JCPOA allowing reimposition of UN sanctions if Iran violated terms, without a new Security Council vote. Used by US in 2020 (disputed). Source: JCPOA text; UN Security Council Resolution 2231.

Source log. Brodie (1946); Schelling (1960); Wohlstetter (1959); Sagan and Waltz (1995); Sagan (2003); Narang (2014); Fitzpatrick (2019); NPT text (1968); JCPOA text (2015); UNSCR 2231 (2015); Pelindaba Treaty (1996); TPNW text (2017); FAS Nuclear Notebook (2024).

Summary. Nuclear strategy rests on the logic of deterrence by punishment, which requires survivable second-strike forces and credible commitment; the stability-instability paradox shows that nuclear weapons may deter total war while permitting lower-level conflict. Proliferation is explained by competing theories—Waltz's systemic optimism versus Sagan's organizational pessimism—and managed by a regime (NPT, IAEA, NWFZs) that African states critique for its non-proliferation bias. The JCPOA case illustrates how latency and snapback mechanics interact with great-power politics, while the erosion of arms control (INF, ABM, New START) and new technologies (hypersonics, AI in NC3) pose the central challenges of the current era.

SECTION 5 — FEYNMAN COMPRESSION

1. **Explain without jargon.** Imagine two people who each have a gun that can destroy the other's house but cannot be taken away. Neither will shoot first because the other will shoot back. That is nuclear deterrence. Now imagine one person promises to shoot back on behalf of a friend who has no gun—that is extended deterrence, and it is harder to believe. Some people want more guns in more hands, thinking more guns mean more safety; others think more guns mean more accidents. Treaties try to count and limit the guns, but the counting is hard because some people hide their guns. New technologies—faster missiles, smarter computers—may make it harder to know who shot first, which could make everyone more nervous.

2. **Mark gaps.** I am unsure whether "escalate-to-deescalate" is actual Russian doctrine or a Western construction; I should not state it as settled fact. I am also unsure of the exact 2024 deployed-warhead

figure for China and should mark it as approximate. I do not fully understand the technical difference between a comprehensive safeguards agreement and an Additional Protocol, and I should reread that before claiming expertise. I am fuzzy on whether New START's 1,550 limit counts warheads or launchers.

3. **Reread verification.** After rereading: the NPT has 191 parties; North Korea withdrew in 2003; the TPNW entered force in 2021 with 69 ratifications; the INF Treaty expired in 2019; New START runs to February 2026; the JCPOA was agreed in 2015 and the US withdrew in 2018. The Sagan-Waltz debate is correctly attributed: Waltz argues proliferation may be stabilizing; Sagan argues organizational and political factors make proliferation dangerous. Brodie (1946) is correctly identified as the originator of the "war prevention" framing. Schelling (1960) is correctly identified with credible commitment and risk manipulation. These check out.

4. **Analogy with explicit limits.** The "two people with guns" analogy captures the basic logic of mutual deterrence but breaks down in three ways. First, nuclear weapons are not like guns: they cannot be used in a controlled, reversible way, and their effects are catastrophic and indiscriminate. Second, the analogy ignores the extended-deterrence problem: the US is not defending itself when it guarantees allies, so the "gun" is pointed at a third party's enemy, not the gun-holder's own. Third, the analogy assumes rational actors with perfect information; in reality, crises involve misperception, organizational routines, and time pressure, which the analogy cannot represent. The analogy is useful for first-pass intuition only.

5. **Rewrite.** Nuclear deterrence is the threat of unacceptable retaliation that prevents nuclear attack; it requires survivable second-strike forces and credible commitment, as Brodie and Schelling argued. The stability-instability paradox notes that nuclear weapons may deter total war while permitting lower-level conflict, especially under extended deterrence. Proliferation is contested: Waltz sees systemic logic pushing states toward acquisition, while Sagan emphasizes organizational and political dangers. The NPT regime, IAEA safeguards, and nuclear-weapon-free zones like Pelindaba attempt to manage proliferation, but African states critique the regime's non-proliferation bias and unfulfilled disarmament pillar. The JCPOA case shows how latency and snapback mechanics interact with great-power withdrawal. Finally, the erosion of bilateral arms control and new technologies—hypersonics, AI in nuclear command and control—challenge the stability that the Cold War architecture provided.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L21	Definition	What is second-strike capability?	Second-strike capability is the assured ability to retaliate after absorbing a nuclear first strike. It stabilizes deterrence by making a disarming attack irrational and shifting strategic competition toward survival rather than victory.	Western deterrence theory treats this as foundational; African perspectives often ask whose security is stabilized when only nuclear powers enjoy assured retaliation.
L21	Mechanism	How does the stability-instability paradox work?	Nuclear deterrence at the strategic level can lower the perceived cost of limited conventional or sub-conventional conflict because escalation is assumed to be capped. This can encourage proxy wars, border skirmishes, or coercion below the nuclear threshold.	South Asian and African analysts often argue the paradox is not abstract but lived in border crises and proxy conflicts.

Tag	Card Type	Front	Back	Perspective Note
L21	Application	Why did India and Pakistan's 1998 tests not obviously stabilize South Asia?	Nuclearization may have reduced incentives for full-scale war while increasing risks of limited crises, misperception, and escalation through non-state actors. The evidence is mixed: no large war since 1999, but Kargil, Mumbai, Balakot, and recurring crises.	Regional scholars disagree whether deterrence or crisis-management institutions explain the absence of war.
L21	Comparison	How do Waltz and Sagan disagree on proliferation?	Waltz argues more nuclear states can be stabilizing because deterrence is robust and new powers learn caution; Sagan argues proliferation is dangerous due to organizational pathologies, preventive-war incentives, and accident risks. The debate turns on whether state rationality or institutional fragility dominates.	African and Global South scholars often add that proliferation debates ignore who already possesses arsenals and who bears testing and environmental costs.

Tag	Card Type	Front	Back	Perspective Note
L21	Source	What is Brodie's 1946 contribution?	Brodie argued that the atomic bomb transformed strategy from winning wars to preventing them, making deterrence the central problem. This shifted military thought toward survival and retaliation rather than victory.	Often cited in the Western canon; African IR scholars may frame it as part of a Euro-American strategic vocabulary that sidelines colonial and postcolonial security concerns.
L21	Debate	What is "escalate to de-escalate"?	It refers to a debated Russian doctrine in which limited nuclear use could terminate a conventional conflict on favorable terms. Critics argue it lowers the nuclear threshold and complicates NATO planning; defenders say it is misread or rhetorical.	Russian sources frame it as deterrence; Western sources often treat it as a destabilizing ambiguity.

Tag	Card Type	Front	Back	Perspective Note
L21	Reconstruction	How does the African perspective frame the NPT?	Many African states view the NPT as a non-proliferation bargain that privileges existing nuclear powers and constrains latecomers, while disarmament obligations remain weakly enforced. The Pelindaba Treaty and TPNW reflect demands for equality and attention to humanitarian consequences.	This is not merely anti-Western; it is a claim about unequal sovereignty and a racialized nuclear order.
L21	Occlusion	What does the Western extended-deterrence perspective often occlude?	It can obscure how umbrella guarantees create dependency, entrench alliance hierarchies, and may incentivize proliferation by states outside the umbrella. It also treats deterrence as technical rather than political.	African and non-aligned critics often highlight these distributional effects.

Tag	Card Type	Front	Back	Perspective Note
L21	Adjudication	How would you adjudicate whether nuclear latency is stabilizing?	One would compare cases where latency produced bargaining leverage with cases where it triggered preventive pressure, examining IAEA access, regional rivalries, and alliance commitments. Stabilization is conditional, not automatic.	The JCPOA case shows latency can be managed through verification but collapses when political trust erodes.
L21	Visual	What does a "use it or lose it" dilemma depict?	It depicts pressures to launch before an adversary's first strike destroys vulnerable forces, especially under poor warning or command-and-control stress. It is a classic escalation risk in crisis bargaining.	African and UN disarmament advocates use such risks to argue for abolition rather than management.

Tag	Card Type	Front	Back	Perspective Note
L21	Definition	What is nuclear latency?	Nuclear latency is the capacity to produce weapons-grade material or assemble a device without having done so, often through civilian fuel-cycle infrastructure. It creates ambiguity that can deter or provoke depending on verification and politics.	Iran's case shows latency can be both a bargaining chip and a trigger for sanctions or strikes.
L21	Mechanism	How does snapback sanctions work in the JCPOA?	The JCPOA included a mechanism allowing participants to reimpose UN sanctions if Iran violated commitments, without a new Security Council vote. This created coercive leverage but also raised questions about legitimacy after US withdrawal.	From Iran's view, snapback became a tool of asymmetric pressure; from the Western view, it preserved enforcement.

Tag	Card Type	Front	Back	Perspective Note
L21	Application	What changed after US withdrawal from the JCPOA in 2018?	The US reimposed sanctions; Iran gradually exceeded enrichment and stockpile limits; IAEA access disputes grew; and diplomatic trust collapsed. The case illustrates how verification regimes depend on political commitment.	Iranian officials framed steps as reversible responses; Western governments framed them as proliferation risks.
L21	Comparison	How do Chinese and Russian nuclear postures differ in stated doctrine?	China emphasizes no-first-use and minimum deterrence while modernizing; Russia emphasizes a larger arsenal, tactical weapons, and ambiguous escalation doctrine. Both challenge US extended deterrence but through different logics.	African non-aligned perspectives often warn that great-power doctrinal competition sidelines disarmament.

Tag	Card Type	Front	Back	Perspective Note
L21	Debate	What is the strongest critique of MAD?	Critics argue MAD depends on perfect rationality, stable command and control, and no accidents or cyber vulnerabilities; it may also morally normalize mass civilian targeting. Supporters reply that no nuclear war between major powers since 1945 supports its stabilizing effect.	TPNW supporters argue humanitarian law, not strategic stability, should be the frame.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence audit table scored 0-100

Competency	Self-score (0-100)	Evidence of mastery	Gap to close
Define MAD and second-strike stability			
Explain the stability-instability paradox with a mechanism			
Reconstruct the Waltz vs Sagan proliferation debate			
Apply JCPOA mechanics: latency, verification, snapback			
Compare all five perspectives on nuclear order			
Adjudicate stabilizing vs destabilizing claims with falsifiers			

7.2 Three-question debrief

1. Which of the five perspectives did you reconstruct least charitably, and what evidence would make that reconstruction fairer?
2. Where did you confuse description of a nuclear event with explanation of its causal mechanism?
3. What single piece of evidence would most strongly change your adjudication of whether nuclearization stabilized South Asia?

7.3 Error-log table: Common Misconception | Correction | Evidence

Common Misconception	Correction	Evidence
MAD means nuclear weapons make all war impossible.	MAD addresses strategic nuclear war; it does not prevent limited, proxy, or sub-conventional conflict.	Stability-instability paradox; India-Pakistan crises after 1998.
More nuclear states automatically increase stability.	Proliferation may increase accident, miscalculation, and preventive-war risks; stability depends on command control and doctrine.	Sagan's organizational and preventive-war arguments; Narang on postures.
Iran's JCPOA compliance steps were irreversible proof of weapons intent.	Latency creates ambiguity; enrichment steps can be framed as leverage or response, requiring verification rather than assumption.	JCPOA monitoring disputes; Fitzpatrick (2019).
Extended deterrence is purely stabilizing for allies.	Umbrella guarantees can create dependency, hierarchy, and incentives for independent proliferation.	Non-proliferation debates; alliance politics.
Arms control erosion only affects great powers.	Collapsed treaties reshape regional security calculations and verification norms globally.	INF expiration 2019; New START uncertainty.
African opposition to nuclear order is only anti-Western sentiment.	It is also a claim about unequal sovereignty, disarmament obligations, and humanitarian consequences.	Pelindaba Treaty; TPNW.

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
MAD; second-strike stability	Mutual vulnerability makes first strike irrational	Brodie (1946); Schelling (1960)	Cold War US-Soviet dyad	Whether MAD requires perfect rationality	Successful disarming strike or accidental launch	L12; L20

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Extended deterrence	Umbrella guarantees extend deterrence to allies	Western alliance theory	NATO; Japan; South Korea	Credibility vs entrapment	Ally tests independent capability	L47-48
Stability-instability paradox	Strategic stability lowers cost of limited conflict	Schelling (1960)	India-Pakistan crises	Deterrence vs crisis instability	No limited wars under nuclear shadow	Problem pair
Proliferation causes	Security, prestige, domestic politics	Waltz vs Sagan (1995, 2003); Narang (2014)	NPT membership; Iran	Optimism vs pessimism	New nuclear state causes war or accident	L45
Nuclear latency	Civilian fuel cycle can produce weapons material	Fitzpatrick (2019)	Iran JCPOA	Leverage vs preventive pressure	IAEA verification resolves ambiguity	L45
Snapback	Reimpose sanctions without new UNSC vote	JCPOA text	US withdrawal 2018	Enforcement vs legitimacy	Sanctions fail to change behavior	L45
Arms control erosion	INF expired 2019; New START to 2026	Treaty regime analysis	US-Russia	Modernization vs restraint	Treaty renewal reduces deployments	L55
African NWFZ and TPNW	Regional prohibition plus humanitarian framing	Pelindaba Treaty; TPNW	Africa nuclear-weapon-free zone	Disarmament vs deterrence	Nuclear states join and verify	L21

SECTION 9 — REVIEW SCHEDULE

Interval	Timing	Concrete action
R1	24 hours	Recite definitions and mechanisms aloud; redraw the visual anchor from memory.

Interval	Timing	Concrete action
R2	3 days	Reconstruct all five perspectives from memory; check what each occludes.
R3	1 week	Redo the problem pair with a new case, such as North Korea or Israel-Iran dynamics.
R4	2 weeks	Use the Data Lab: interpret FAS and NPT trends and write a 200-word adjudication.
R5	1 month	Teach the lesson to a peer or record a Feynman compression; update the error log.

SECTION 10 — COMPLETION CHECKLIST

- ☐ I can define MAD and second-strike stability in one sentence.
- ☐ I can explain the stability-instability paradox as a mechanism, not just a label.
- ☐ I can reconstruct Waltz's and Sagan's arguments without caricature.
- ☐ I can distinguish nuclear latency from weaponization.
- ☐ I can explain JCPOA snapback and its legitimacy problem.
- ☐ I can describe Iran's post-2018 compliance steps accurately.
- ☐ I can compare Chinese no-first-use with Russian escalate-to-deescalate debates.
- ☐ I can reconstruct the African perspective on NPT, Pelindaba, and TPNW.
- ☐ I can identify what each of the five perspectives occludes.
- ☐ I can apply the four levels of analysis to a nuclear case.
- ☐ I can adjudicate a stabilizing vs destabilizing claim using falsifiers.
- ☐ I can interpret FAS warhead and NPT membership trends.
- ☐ I can explain INF expiration and New START status.
- ☐ I can distinguish description, explanation, prediction, and prescription.
- ☐ I can complete the flashcards without looking at notes.
- ☐ I have updated my error log with at least one corrected misconception.
- ☐ I can state the lesson's central puzzle in my own words.

FURTHER READING (Optional)

- Deterrence foundations: Brodie (1946); Schelling (1960).
- Proliferation debate: Sagan and Waltz (1995); Sagan and Waltz (2003).
- Nuclear acquisition and posture: Narang (2014).
- Iran and the JCPOA: Fitzpatrick (2019).
- Treaty regime: Treaty on the Non-Proliferation of Nuclear Weapons (1968); Pelindaba Treaty (1996); Treaty on the Prohibition of Nuclear Weapons (2017).
- Data and verification: Federation of American Scientists nuclear warhead estimates; IAEA safeguards framework.

End of Lesson 21. Say **Next** when you are ready.

---

23. Conventional Warfare and Industrial Attrition

LESSON METADATA

Field	Value
Lesson number and title	Lesson 22 — Conventional Warfare and Industrial Attrition
Module	Module 4: Security Studies and Warfare
Prerequisites	L20 (strategic thought), L21 (nuclear deterrence), L5 (realism)
Interleaved links	Forward to L36 (Ukraine war dynamics), L38 (energy coercion), L48 (maritime strategy)
Reading load	7-9 hours
Content channels	Text, data lab, worked example, problem pair, memo, visuals, flashcards
Bloom ceiling	Evaluate / Create
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

The central puzzle of this lesson is deceptively simple: why did the most technologically advanced, best-resourced military coalition in history, operating a doctrine of rapid combined-arms maneuver that had been validated in 1991, fail to reproduce that success in Ukraine in 2023, and why did the war instead settle into the grinding, shell-hungry, trench-and-drone attrition that characterized 2022–2024? The answer matters far beyond Ukraine. It determines how states size their arsenals, how they train their officers, how they budget their defense industries, and how they judge the credibility of deterrence. For three decades after Operation Desert Storm, Western military thought treated maneuver warfare — speed, shock, joint precision fires, and information dominance — as the natural and superior form of land combat. The implicit theory was that industrial attrition had been superseded: that modern sensors, precision-guided munitions, and networked command had made mass and logistics secondary. Ukraine has forced a reckoning. Russian columns stalled in February 2022 not because they lacked tanks but because they lacked fuel, bridging, and coherent command; Ukrainian counteroffensives in 2023 stalled not because they lacked courage or Western equipment but because they could not generate the artillery mass, breaching assets, and air superiority that maneuver theory presupposes. The war became, in the phrase now common in defense ministries, a return of industrial war. This lesson exists to make that phrase analytically tractable rather than journalistic.

Placed in the curriculum, Lesson 22 sits at the hinge between abstract strategic thought and concrete operational reality. L20 gave you the classical canon — Clausewitz on friction and the fog of war, Jomini on decisive points and lines of operation, Mahan on sea control — and L21 gave you nuclear deterrence and

escalation. L5 gave you realism's emphasis on material power and the security dilemma. This lesson translates those abstractions into the mechanics of how armies actually fight: how tanks, infantry, artillery, and air power are combined; how ammunition is produced and moved; how electronic warfare contests the electromagnetic spectrum; and how drones have collapsed the cost of precision. It also sets up the forward links. L36 (Ukraine war dynamics) will assume you understand why the 2023 counteroffensive failed; L38 (energy coercion) will assume you understand that industrial war is also an energy war; L48 (maritime strategy) will assume you understand that attrition logic applies at sea as well as on land. Without this lesson, those later lessons become description without mechanism.

By the end of this lesson you will be able to do five things that you could not do before. First, reconstruct the causal chain from industrial base to battlefield outcome — from steel and propellant through shell production through artillery density through tactical result — rather than treating "logistics" as a vague synonym for supply. Second, distinguish combined-arms maneuver from industrial attrition as competing theories of victory with different scope conditions, and identify which conditions obtained in Ukraine 2022–2024. Third, evaluate the drone-and-electronic-warfare revolution not as a technological novelty but as a change in the cost structure of precision and in the contestability of the electromagnetic spectrum. Fourth, reconstruct five perspectives — African, Chinese, Russian, Western, and UN — on the same operational facts, showing what each contributes and what each occludes. Fifth, apply the framework to new cases, including the Sahel and a potential Taiwan contingency, while specifying the falsifiers that would make your application wrong. These are assessable skills, not impressions; the memo and problem pair are designed to test them.

The theoretical lineage you need is specific. Stephen Biddle's *Military Power* (2004) is the canonical modern statement of why the "modern system" — combined arms, cover, concealment, dispersion, and small-unit initiative — produces outcomes that raw material counts cannot predict; his argument is that technology matters through its interaction with doctrine and organization, not alone. Lawrence Freedman's *The Future of War* (2017) traces how Western thinkers repeatedly predicted the obsolescence of mass and were repeatedly surprised by its return. Steven Zaloga's work on artillery and armored warfare (2022) documents the material realities of shell and tank. Jack Watling's RUSI analyses (2022–2024) provide the most granular open-source operational assessments of the Ukraine war, including the 2023 counteroffensive's failure modes. The IISS *Military Balance* (2023–24) supplies the force-structure and industrial data. Behind these sit the classical theorists: Clausewitz on friction, chance, and the political object; Jomini on concentration and interior lines; and, less often cited but essential, the Soviet "deep battle" tradition (Tukhachevsky, Triandafillov) that shaped Russian doctrine and that Russian forces in 2022 conspicuously failed to execute. You should read these not as authorities to be memorized but as arguments with scope conditions: Biddle explains why modern armies are hard to destroy, not why they win; Freedman explains the recurring Western illusion of bloodless war; Watling explains what actually happened in Ukraine, not what must happen elsewhere.

A crucial framing choice: the African perspective is not a regional illustration appended to a Western story. It is a vantage point that reveals what the Western, Chinese, Russian, and UN frames systematically miss. In the Sahel — Mali, Burkina Faso, Niger, and the Lake Chad basin — the relevant warfare is not industrial attrition between peer armies but hybrid conflict among states, militias, jihadist networks, and external interveners, fought with light weapons, commercial drones, and improvised explosive devices, in terrain where the state's monopoly on force is contested and where "victory" is rarely decisive. African scholarship — from Grovogui's critique of international order to Mamdani's analysis of the colonial state, from Bayart's "politics of the belly" to Aning and Danso's work on African security governance — insists that the categories "conventional" and "irregular" are themselves products of a particular (Western, state-centric) ontology. From this vantage, the Ukraine war's industrial attrition is one mode of warfare among several,

and the Western fascination with it risks crowding out attention to the forms of violence that actually kill most Africans. The Sahel experience with drones and light weapons also anticipates, in a different register, the democratization of precision that the Ukraine war has made famous: commercial off-the-shelf (COTS) drones armed with grenades are not a Ukrainian invention but a Sahelian and Middle Eastern one. This lesson therefore treats the African perspective as primary in the sense that it sets the terms of the question — what counts as "war," whose deaths count, and which industrial bases matter — rather than as a case study.

Finally, a methodological warning. This lesson repeatedly asks you to distinguish four things that students conflate: description (what happened), explanation (why it happened), prediction (what will happen under stated conditions), and prescription (what should be done). The Ukraine war is over-described and under-explained; the temptation is to narrate rather than analyze. The data lab will give you shell-consumption curves and drone-loss rates; your task is not to recite them but to ask what mechanism they support, under what scope conditions, and with what falsifiers. The hinge question at the end is designed to catch the most common conflation — treating a description of Ukrainian adaptation as proof that adaptation always defeats mass. Hold yourself to the standard: every claim must specify a mechanism, every theory must carry its scope conditions and its strongest counterargument, and every perspective must be steel-manned from within before it is criticized.

SECTION 1 — Pre-Class Priming

1.1 Retrieval Warm-Up (from earlier lessons) Answer each in 2–4 sentences, citing the lesson or theorist where possible.

1. **(L5 — Realism)** State the security dilemma and give one historical example. How does it relate to arms racing in conventional forces rather than nuclear ones?
2. **(L20 — Strategic Thought)** What did Clausewitz mean by "friction," and why does it make the execution of even a well-designed plan uncertain? Give one implication for combined-arms operations.
3. **(L20 — Strategic Thought)** Distinguish Jomini's "decisive point" from Clausewitz's "center of gravity." Which concept better fits a war of industrial attrition, and why?
4. **(L21 — Nuclear Deterrence)** What is the difference between deterrence by denial and deterrence by punishment? Which logic, if any, applies to conventional deterrence in Europe?
5. **(L5 — Realism)** How does the realist concept of the "balance of power" differ from the liberal-institutionalist emphasis on regimes and interdependence? Which better explains NATO's 2022–2024 ammunition shortfalls?
6. **(L20 — Strategic Thought)** What is the "modern system" in Biddle's (2004) sense, and what does it predict about the relationship between technology and outcomes?

1.2 Orientation Questions

1. If combined-arms maneuver was the dominant Western doctrine from 1991 to 2022, what specific scope conditions did it require, and which of those conditions failed in Ukraine in 2023?
2. Is the "return of industrial war" a permanent structural shift or a contingent feature of this particular conflict? What evidence would distinguish the two?
3. How does the proliferation of cheap, commercial-off-the-shelf drones change the cost-exchange ratio between attacker and defender, and what does that imply for the offense-defense balance?

4. Whose deaths and which industrial bases count in our analysis — and how would the answer change if the Sahel rather than Ukraine were the primary case?

1.3 Vocabulary Pre-Teach

Term	Provisional Definition
Combined arms maneuver	The coordinated employment of tanks, infantry, artillery, engineers, and air power so that each arm compensates for the others' vulnerabilities; the Western doctrinal ideal from the 1990s through the 2010s.
Industrial attrition	A mode of war in which victory depends on exhausting the adversary's manpower, materiel, and industrial capacity over time, rather than on a single decisive battle or rapid breakthrough.
Force generation	The process by which a state converts population, industry, and training into deployable military units; includes recruitment, equipping, and readiness cycles.
Sustainment	The logistics functions — supply, maintenance, transport, medical — that keep forces fighting; often the binding constraint in high-intensity war.
Artillery dominance	The condition in which one side's tube and rocket artillery can suppress, destroy, or deny the other's movement and concentration; central to the Ukraine war's character.
Kill zone	An area saturated by sensors and fires such that any movement is detected and engaged; drones and artillery have expanded these zones in Ukraine.
COTS drone	Commercial off-the-shelf unmanned aerial vehicle, often modified for military use; cheap, expendable, and rapidly proliferating.
Electronic warfare (EW)	The contest for control of the electromagnetic spectrum, including jamming, spoofing, and signals intelligence; determines whether drones and precision weapons function.
EMS	Electromagnetic spectrum — the medium through which radar, communications, and drone links operate; "contested EMS" means neither side owns it.
Deep battle	The Soviet/Russian doctrinal concept of striking the enemy throughout his depth — reserves, logistics, command — rather than only at the front line.

Term	Provisional Definition
Maneuver warfare	A doctrine emphasizing speed, surprise, and disruption of the enemy's decision cycle over attrition of his forces; associated with Western post-Vietnam reform.
HIMARS	High Mobility Artillery Rocket System — a US rocket artillery platform that delivered precision strikes at range in Ukraine; emblematic of Western "fires" support.
Storm Shadow	A British/French air-launched cruise missile supplied to Ukraine; represents deep-strike capability against fixed targets.
Shell consumption rate	The number of artillery rounds fired per day or month; a proxy for industrial capacity and a measure of attrition intensity.

SECTION 2 — LESSON CORE

2.1 Learning Objectives

By the end of this lesson, you will be able to:

1. **Define** combined-arms maneuver as a force-employment system rather than a platform inventory, distinguishing integration (training, command and control, intelligence, sustainment) from mere material aggregation, and explaining why Stephen Biddle's (2004) "modern system" treats force employment as the decisive variable in modern battle. (Bloom: Understand)
2. **Analyze** the compensatory mechanism by which tanks, infantry, artillery, and air power offset one another's vulnerabilities, specifying the tactical and operational levels at which integration operates and identifying the five enabling practices (cover and concealment, dispersion, combined arms, small-unit initiative, depth) that constitute the modern system. (Bloom: Analyze)
3. **Evaluate** the scope conditions under which combined-arms maneuver succeeds or fails, using comparative evidence from the 1991 Gulf War and the Ukraine war 2022–2024, and explaining why layered defenses, air denial, and ammunition shortages can force a reversion to attritional methods even when modern equipment is present. (Bloom: Evaluate)
4. **Apply** the combined-arms framework to reconstruct a novel operational scenario across all four levels of analysis (individual, state, systemic, transnational), specifying which enablers are present or absent and deriving observable implications for advance rates, casualty exchange ratios, and platform loss patterns. (Bloom: Apply)
5. **Critique** the Western maneuver-warfare tradition from African, Chinese, Russian, and UN vantage points, identifying what each perspective contributes (political economy of African militaries, multi-domain information integration, operational depth and mass, humanitarian-legal constraints) and what

each occludes, and adjudicating among them on the basis of evidence. (Bloom: Create/Critique)

These objectives are assessable through the worked example, problem pair, independent memo, and hinge question that follow. Mastery requires moving beyond platform-counting to the analysis of integration quality, and recognizing that combined-arms theory carries embedded assumptions about state capacity, industrial base, and the nature of war that are not universally shared.

2.2 KEY IDEA 1 — Combined arms maneuver: tanks, infantry, artillery, air power, and their integration

Bolded Causal Claim: Combined-arms maneuver is a force-employment system, not a platform inventory: battlefield effectiveness arises when the vulnerabilities of each arm are offset by the strengths of another, so that the enemy cannot exploit any single weakness; consequently, integration—training, command and control, intelligence, and sustainment—matters more than aggregate material superiority.

Mechanism: Stephen Biddle's (2004) "modern system" of force employment identifies five mutually reinforcing practices: cover and concealment, dispersion, combined arms, small-unit initiative, and depth. The mechanism is compensatory. Main battle tanks deliver shock, mobility, and direct fire but are vulnerable to anti-tank guided missiles, mines, and close infantry; infantry clears obstacles, holds terrain, and protects armor in complex terrain but lacks firepower and mobility; artillery suppresses, shapes, and destroys at range but is vulnerable to counter-battery fire and requires protection; combat aviation and unmanned systems provide reconnaissance, strike, and mobility but depend on air defense suppression and secure basing. When integrated, the system denies the adversary a single point of exploitation: an enemy who can kill tanks with ATGMs must still face artillery and infantry; an enemy who can suppress artillery must still contend with maneuver. This is distinct from "joint" operations (inter-service coordination) and from "all-arms" aggregation (platforms present but not mutually supporting). The mechanism operates at two levels: at the tactical level, the combined-arms team (tank-infantry-artillery) clears a position; at the operational level, combined-arms formations (divisions, corps) achieve breakthrough and exploitation. Force employment—how forces are used—thus explains outcomes that force structure—what forces exist—cannot. Biddle's central empirical claim is that modern wars are decided by relative force-employment quality, not by preponderance, and that the modern system is demanding: it requires extensive training, decentralized decision-making, and robust logistics. Where these are absent, forces revert to massed, attritional methods even when modern equipment is present.

Scope Conditions: Combined-arms maneuver succeeds only where several enabling conditions hold. First, training and doctrine: crews and small units must rehearse integration until it is automatic; the modern system is a skill, not a procurement. Second, command and control and communications: real-time coordination among arms requires reliable, survivable C2; electronic warfare and jamming degrade this. Third, intelligence, surveillance, and reconnaissance: maneuver requires knowing where the enemy is; without persistent ISR, forces blunder into prepared defenses. Fourth, logistics and sustainment: high-tempo maneuver consumes fuel, ammunition, and spare parts at rates that exhaust stockpiles; the 1991 Gulf War's "left hook" succeeded partly because of massive pre-positioned logistics. Fifth, air superiority or at least air parity: without it, ground maneuver is exposed to air attack and cannot achieve deep exploitation. Combined-arms maneuver fails where these conditions are absent or where the defender has prepared layered defenses—minefields, anti-tank obstacles, trench lines, and integrated air defense—that force the attacker into sequential, attritional

reduction. The 2023 Ukrainian counteroffensive illustrates this: Russian layered defenses in Zaporizhzhia (minefields, dragon's teeth, trench lines), Russian air superiority, and Ukrainian shortages of artillery ammunition and air defense prevented the execution of combined-arms breakthrough; operations devolved into small-unit infantry assaults with limited gains. Similarly, Russian attempts at rapid maneuver in February 2022 (the Kyiv thrust) failed due to logistics collapse, poor C2, and Ukrainian resistance, despite numerical and equipment advantages.

Observable Implications: If combined-arms integration is the decisive variable, then several observable patterns should hold. Advance rates should correlate with integration quality and enablers, not merely force ratios: the 1991 Gulf War saw coalition forces advance hundreds of kilometers in days; Ukraine 2023 saw kilometers per month. Casualty exchange ratios should favor the side with superior force employment even when outnumbered. The force ratio required for breakthrough should be lower for well-integrated forces (Biddle suggests the modern system can offset numerical inferiority). Ammunition consumption rates should spike during maneuver phases and reveal sustainment constraints. Platform loss rates should show that tanks are lost primarily to infantry-borne ATGMs and mines when unsupported, and to air when air defense is absent. In Ukraine, IISS Military Balance 2023–24 data and RUSI reporting document thousands of tank losses on both sides, with many attributed to ATGMs, drones, and artillery rather than tank-on-tank engagements—consistent with the modern system's prediction that unsupported armor is vulnerable. The implication for analysts: count platforms last; assess integration first.

Perspective Note (five traditions in brief):

African (primary): The African vantage point, reconstructed from within through Grovogui, Mbembe, Bayart, Mamdani, Rodney, Nkrumah, Nyerere, Cabral, Fanon, Aning, Danso, Tamale, and Oyěwùmí, reveals that combined-arms theory presupposes a Weberian state monopoly on violence and an industrial base that most African states do not possess. Rodney's analysis of underdevelopment and Nkrumah's neocolonialism frame the absence of heavy industry and defense-industrial capacity as structural, not incidental: African militaries are often equipped, trained, and doctrinally shaped by external powers, and their "combined arms" is frequently a borrowed template ill-fitted to local conditions. Bayart's "politics of the belly" and Mbembe's "necropolitics" show that African militaries frequently operate as economic and political actors within fragmented sovereignty, where the line between state forces, militias, and insurgents is porous; in such contexts, "maneuver" is not between armies but among armed groups and populations, and the relevant "arms" include light weapons, motorcycles, and improvised explosive devices rather than tanks and artillery. Mamdani's citizen-subject distinction reminds us that colonial military structures were designed for internal control, not combined-arms maneuver against peer adversaries. Fanon and Cabral's liberation-war thought emphasized political mobilization and popular support over platform integration. In the contemporary Sahel, non-state armed groups (JNIM, ISGS) employ hybrid tactics—motorized columns, IEDs, ambushes—while states deploy drones (Turkish Bayraktar TB2) and light forces; the "combined arms" that matters is often the integration of air surveillance with ground pursuit, not tank-infantry-artillery teams. Tamale and Oyěwùmí add that the gendered division of military labor renders women's contributions invisible in conventional accounts. Aning and Danso emphasize African agency in security governance, including AU peacekeeping where combined arms is relevant but constrained by logistics. What the African vantage reveals that the other four miss: combined-arms theory's universalism occludes the political economy of African militaries and the reality that for much of the continent, war is not interstate maneuver but hybrid, fragmented, and politically embedded violence.

Chinese: Chinese military thought, as articulated in PLA doctrine and strategic studies, treats combined arms

as subordinate to "informatized" and increasingly "intelligentized" warfare. The PLA's post-2015 reforms created theater commands and emphasized integrated joint operations (IJO), in which information dominance, C4ISR, and precision strikes aim to paralyze the enemy's operational system—"system destruction warfare" (□□□□□). From this vantage, tanks and infantry are nodes in a network; their integration matters, but the decisive integration is across services and domains (land, sea, air, space, cyber, electromagnetic). Chinese analysts study Ukraine as demonstrating the importance of air superiority, precision fires, and electronic warfare, and as exposing Russian failures in joint coordination. The Chinese perspective contributes the insight that combined arms must be nested within joint, multi-domain operations, and that information is the integrating medium. It occludes ground-level friction, logistics, and the political constraints on PLA operations; it also risks overestimating the controllability of complex operations.

Russian: Russian doctrine inherits the Soviet "deep battle" (glubokiy boy) tradition of Tukhachevsky, Triandafillov, and Isserson: operational depth, echelonment, combined-arms formations at the operational level, and the integration of artillery, armor, and infantry to achieve breakthrough and exploitation across the enemy's depth. The mechanism is massed, sequential, and artillery-heavy: artillery prepares, armor breaks through, infantry and second echelons exploit. In Ukraine, Russia attempted deep battle in February 2022 (the Kyiv thrust) and failed due to logistics collapse, poor command and control, and Ukrainian resistance; by 2023–24 it had shifted to attritional, positional warfare with massed artillery and glide bombs. The Russian perspective reveals the enduring importance of depth, mass, and artillery in large-scale war, and the difficulty of executing deep operations without logistics and C2. It occludes flexibility, small-unit initiative, and the political-military integration that Western maneuver theory emphasizes; its adaptation failures in Ukraine (rigid C2, weak NCO corps) illustrate the costs.

Western: The Western maneuver-warfare tradition—Blitzkrieg, AirLand Battle, MCDP-1, and the "bypass and collapse" concept—emphasizes tempo, surprise, and attacking the enemy's decision-making and will rather than annihilating forces. Biddle's (2004) modern system is the academic codification of this tradition. The 1991 Gulf War is the paradigmatic triumph: coalition combined arms, air superiority, and logistics produced rapid victory. The Western perspective contributes a rich theory of how integration and tempo defeat larger forces, and it has driven decades of doctrine and procurement. Its occlusions are significant: an overestimation of technology and precision, an underestimation of attrition and the industrial base, and a "maneuverist" bias that treats positional warfare as failure rather than as a rational response to conditions. Ukraine 2022–2024 has forced a partial reckoning with these occlusions.

UN: The UN perspective, grounded in international humanitarian law and civilian-harm monitoring (OHCHR), treats combined arms as a source of complexity and risk. The integration of artillery, armor, air power, and drones multiplies the effects of force; in urban and populated areas, area-effect weapons challenge the principles of distinction and proportionality. UN reporting on civilian casualties in Ukraine documents the humanitarian cost of combined-arms operations in cities such as Mariupol and Bakhmut. This perspective contributes the insistence that military effectiveness must be assessed against legal and humanitarian constraints, and that "integration" includes precautions in attack. It occludes operational necessity and the military logic of force protection; it can appear to treat all large-scale firepower as presumptively unlawful.

2.3 KEY IDEA 2 — Logistics and force generation: the industrial base of modern war, ammunition, and sustainment

Bolded Causal Claim: In sustained high-intensity conventional war, operational outcomes are constrained less by the elegance of tactical plans than by the rate at which states can produce, move, repair, and replace the materiel that plans consume; logistics is not a support function but the strategic center of gravity of industrial attrition.

Mechanism: The mechanism begins with consumption. Modern mechanized and artillery-heavy forces burn through ammunition, fuel, spare parts, and vehicles at rates that quickly exceed pre-war stockpiles. Artillery shells, rockets, missiles, drones, and precision munitions are consumed faster than they can be manufactured unless the industrial base has been scaled for war. The second link is transportation: production is useless if it cannot reach the front through rail, road, sea, or air under conditions of interdiction, weather, and infrastructure degradation. The third link is maintenance and regeneration: damaged vehicles must be recovered, repaired, and returned to service; personnel must be trained, equipped, and replaced; medical systems must sustain manpower. The fourth link is force generation: mobilization expands the number of soldiers, but equipment, training, and leadership determine whether expanded manpower becomes combat power. The slowest node in this chain sets the operational tempo. A force may have superior tactics and still be forced to ration fire, delay offensives, or accept static defense because its logistics chain cannot sustain movement and consumption. This is why logistics functions as a binding constraint rather than a background condition. Biddle's (2004) analysis of the modern system emphasizes dispersion, cover, and combined arms, but those techniques presuppose a sustainment base capable of keeping dispersed forces supplied. Freedman (2017) frames strategy as the interaction of ends and means; logistics is where means become finite and where political decisions about mobilization, sanctions, and alliance support are translated into battlefield possibility. In Ukraine, Western aid has functioned as an external logistics system, while Russian and Ukrainian domestic production, repair capacity, and mobilization have shaped what each side could attempt. The mechanism is cumulative: logistics advantage compounds over time because it determines not only today's fire but tomorrow's force structure.

Scope Conditions: This claim applies most strongly to prolonged, high-intensity interstate war involving massed fires, mechanized maneuver, and large manpower requirements. It is less decisive in short campaigns, where pre-war stockpiles may suffice, or in low-intensity conflicts, where consumption rates are lower and informal supply networks can sustain fighters. It also assumes contested logistics: if one side enjoys secure interior lines, industrial depth, and unchallenged transportation, its advantage grows; if logistics are interdicted, even tactically superior forces stall. The claim further assumes political willingness to mobilize industry, labor, and capital for war. Where governments cannot or will not convert civilian production to military use, logistics becomes a political rather than merely technical failure. Finally, the claim is weaker where war is fought primarily through air power, naval blockade, or special operations, because those modes consume different resources and depend on different industrial bases.

Observable Implications: The observable implications include ammunition production and stockpile trends, daily or monthly shell consumption, vehicle availability and repair turnaround rates, rail and port throughput, mobilization cohorts, casualty replacement, and the impact of sanctions on machine tools, energetics, and skilled labor. In Ukraine, reported ammunition shortages and rationing, the repair of damaged vehicles, mobilization drives, and the centrality of Western military aid all point to logistics as a decisive variable. Analysts can also observe the gap between planned and actual consumption: when forces fire far more than pre-war models assumed, stockpiles deplete and production must surge. The IISS Military

Balance 2023-24 and RUSI Ukraine reports (2022-2024) are useful for tracking force structure, equipment losses, and sustainment pressures, though exact consumption figures should be treated as reported rather than independently verified. A further implication is that logistics creates strategic time: the side that can sustain operations longer may win not by breakthrough but by exhausting the opponent's capacity to regenerate combat power.

Perspective Note (five traditions in brief): African scholarship reconstructs logistics not as a neutral technical system but as a political economy of war. From Rodney's analysis of underdevelopment and Nkrumah's critique of neo-colonial dependency, to Bayart's "extraversion" and Mamdani's account of the colonial state, the African vantage point treats military sustainment as embedded in global hierarchies of production. Many African states inherited armies designed for internal control rather than external defense, with maintenance cultures shaped by colonial supply chains and postcolonial dependency on foreign spares. In Sahelian and Great Lakes conflicts, logistics often runs through informal networks, war economies, and external patrons; force generation is less about industrial mobilization than about recruitment, patronage, and the circulation of small arms. This perspective reveals that "industrial base" is not universal: for much of the world, war is sustained by extraversion, illicit markets, and external aid, and the absence of domestic arms production is itself a structural condition. It occludes the specific dynamics of high-intensity interstate war, but it corrects the assumption that logistics is merely a staff problem rather than a question of sovereignty and global inequality. Chinese military thought, as refracted through concepts of informatized and "intelligentized" warfare, treats logistics as a system-of-systems enabler of integrated joint operations. Civil-military fusion and industrial capacity are framed as strategic assets; the emphasis is on precision sustainment, networked distribution, and the ability to support dispersed, high-tempo operations. This perspective highlights the fusion of civilian industry with military demand but can occlude friction, corruption, and the political costs of mobilization. Russian doctrine inherits Soviet mass-mobilization logistics: rail-centric supply, echeloned reserves, and the expectation that war will be long and materially intensive. The "deep battle" tradition assumed sustained throughput. In Ukraine, Russian adaptation failures—reported shortages, maintenance breakdowns, and reliance on long logistical lines—illustrate how inherited structures can fail under precision interdiction and high consumption. This perspective contributes the insight that logistics is doctrinally central, but it can occlude institutional decay and the limits of coercion-based mobilization. Western, especially NATO, thought has historically privileged maneuver and "tooth-to-tail" efficiency, sometimes underestimating consumption in high-intensity war. The Ukraine experience has revived interest in stockpiles, production, and sustainment. This perspective contributes alliance standardization and industrial coordination but can occlude the political difficulty of rearmament and the uneven distribution of industrial capacity among allies. The UN perspective, centered on humanitarian law and civilian harm, treats logistics as a determinant of civilian protection: attacks on supply lines, energy infrastructure, and industrial sites raise questions of distinction and proportionality, while humanitarian access depends on secure corridors. It contributes legal accountability but can occlude military necessity and the operational logic of interdiction.

2.4 KEY IDEA 3 — Artillery dominance and the 'return of industrial war' in Ukraine

Bolded Causal Claim: The Ukraine war demonstrated a "return of industrial war" in which massed artillery, dense surveillance, and prepared defenses made rapid maneuver prohibitively costly, restoring firepower and attrition as the dominant mode of large-scale conventional combat.

Mechanism: The mechanism is a sensor-to-shooter loop operating at scale. Unmanned aerial vehicles, satellites, acoustic sensors, and human observers provide persistent surveillance; artillery and rocket systems con-

vert that information into massed, responsive fires. Because drones and sensors reduce the concealment that historically protected maneuvering forces, concentrations of armor or infantry become detectable and targetable. Prepared defenses—trenches, minefields, anti-tank guided missiles, electronic warfare, and layered artillery—then channel and slow any attempted breakthrough. The result is a "kill zone" in which maneuver is not impossible but is extremely expensive: forces that concentrate are struck; forces that disperse lack the mass to break through. Artillery dominates because it is the principal means of delivering area effects against dispersed, entrenched, or moving targets at range. Its effectiveness depends on ammunition supply, targeting quality, and the ability to survive counter-battery fire. Drones add a second layer: they provide cheap precision for reconnaissance, adjustment, and direct attack, while electronic warfare contests the electromagnetic spectrum and degrades both sides' sensor and communication networks. The mechanism is not simply "more guns"; it is the integration of surveillance, fires, defense, and sustainment. Where one side lacks air superiority, industrial depth, or manpower, artillery-centric attrition becomes the default mode of war. Biddle (2004) argues that modern warfare rewards cover, concealment, dispersion, and combined arms; Ukraine shows what happens when one side cannot achieve the air and logistical conditions that make combined-arms maneuver decisive. Freedman (2017) distinguishes annihilation from attrition; Ukraine illustrates how attrition can become the strategy when breakthrough is blocked. Watling (2022) and RUSI reporting on Ukraine (2022-2024) emphasize the centrality of fires, drones, and defensive depth, while Zaloga (2022) situates artillery as a continuing core capability rather than an obsolete arm. The "return of industrial war" is therefore not a rejection of technology but a recognition that technology has made the battlefield more transparent and more lethal, increasing the value of mass, depth, and sustainment.

Scope Conditions: This claim applies where both sides possess mature artillery, persistent surveillance (especially drones), prepared defenses, and sufficient industrial sustainment. It is strongest in high-intensity state war with contiguous territory, large manpower pools, and external backing. It is weaker where one side achieves air superiority, where terrain favors rapid movement, where defenses are thin, or where one side lacks the industrial capacity to sustain massed fires. It also depends on manpower: artillery dominance requires infantry to hold ground and engineers to build defenses. If manpower collapses, lines break regardless of firepower. The claim should not be generalized to counterinsurgency, maritime conflict, or wars fought primarily by air power, because those contexts involve different vulnerabilities and different uses of force. Finally, the claim is contingent: a successful breakthrough and exploitation could restore maneuver, so artillery dominance is a condition of the current equilibrium rather than a permanent law of war.

Observable Implications: Observable implications include high rates of artillery and drone consumption, slow rates of advance measured in meters or kilometers per day, extensive trench and minefield networks, high casualty ratios, and the growing importance of counter-battery and electronic warfare. In Ukraine, reported fighting around Bakhmut, Avdiivka, and other sectors has been characterized by incremental gains, heavy bombardment, and fortified positions. Analysts can track the ratio of artillery to maneuver forces, the density of minefields, drone loss rates, and the effectiveness of counter-battery fire. RUSI Ukraine reports (2022-2024) and the IISS Military Balance 2023-24 provide frameworks for assessing force structure and equipment, though specific consumption and loss figures should be treated as reported. A key implication is that "victory" in such a war may be defined by exhaustion and regeneration rather than by dramatic breakthrough: the side that can replace losses, sustain fires, and absorb casualties longer gains advantage even without rapid territorial gains.

Perspective Note (five traditions in brief): African scholarship and conflict experience complicate the narrative of a universal "return of industrial war." Much of contemporary African warfare—Sahelian insurgencies, Great Lakes conflicts, urban violence—has been characterized by light weapons, mobility, hy-

bridity, and the political economy of violence rather than massed artillery and trench systems. Scholars such as Mamdani, Bayart, and Grovogui emphasize that African wars are often shaped by state weakness, external intervention, and the privatization of violence; Fanon and Cabral remind us that anti-colonial war was as much political as military. The African vantage point thus asks whether Ukraine's artillery-centric attrition is a general future of war or a specific condition of two large, mobilized, industrialized states with contiguous territory and external backing. It also highlights how drones and light weapons in Africa are transforming conflict without replicating European industrial war. This perspective contributes a necessary skepticism about universalizing one theater's lessons; it occludes the specific material intensity of interstate war, but it prevents the mistake of treating Ukraine as the sole template for global security. Chinese military thought frames the Ukraine war through "informatized" and "intelligentized" warfare: artillery dominance is not merely massed fires but sensor-to-shooter integration, precision, and joint operations. The emphasis is on information superiority, system destruction, and the fusion of reconnaissance and strike. This perspective contributes a theory of how artillery becomes precise and networked; it can occlude the brute material and industrial constraints that have defined Ukraine. Russian doctrine and practice combine Soviet artillery traditions—massed fires, fire preparation, and "deep battle"—with contemporary adaptation. In Ukraine, Russian forces have relied heavily on artillery to compensate for maneuver limitations and manpower constraints. This perspective contributes the insight that artillery can substitute for maneuver when tempo is low; it also reveals adaptation failures, including ammunition logistics, targeting integration, and the vulnerability of massed fires to counter-battery and drones. Western maneuver-warfare traditions, shaped by the 1991 Gulf War and NATO doctrine, initially expected rapid, combined-arms breakthrough. Ukraine has forced a reassessment: when air superiority is absent and defenses are prepared, artillery and attrition dominate. This perspective contributes doctrinal flexibility and alliance learning but can occlude the political and industrial requirements of sustained firepower. The UN perspective centers on civilian harm from artillery and area-effect weapons in populated areas. Reporting on Ukraine documents the humanitarian consequences of prolonged bombardment and the legal obligations of distinction, proportionality, and precautions. This perspective contributes accountability and civilian protection; it can occlude operational necessity and the military logic of firepower in contested terrain.

SECTION 2.5 KEY IDEA 4 — Drone Proliferation and Electronic Warfare: Cheap Precision, COTS Components, and Contested EMS

Bolded Causal Claim: The diffusion of cheap, commercially derived drones and the contestation of the electromagnetic spectrum have shifted tactical advantage toward the side that can sustain the fastest cycle of sensing, striking, jamming, and adaptation, while degrading the capacity of either side to achieve surprise, mass, or uninterrupted combined-arms maneuver.

Mechanism: The mechanism begins with cost and component availability. Commercial off-the-shelf (COTS) electronics, sensors, batteries, airframes, and navigation modules allow states and non-state actors to field unmanned systems at prices far below those of traditional precision-guided munitions or crewed aircraft. This lowers the barrier to precision strike and persistent surveillance, but it does not eliminate dependence on industrial supply chains, software, operator skill, and maintenance. A drone is not merely a platform; it is a node in a kill chain that includes launch, control, navigation, targeting, transmission, and exploitation. Cheap precision therefore expands the number of actors who can impose costs, yet it also multiplies the number of fragile links that can be attacked.

Electronic warfare is the counter-mechanism. Jamming, spoofing, direction finding, and electromagnetic deception can sever control links, corrupt satellite navigation, or force drones into degraded modes. The result is not a simple contest between drones and jammers but a co-evolutionary adaptation loop: drone operators change frequencies, waveforms, antennas, flight profiles, and autonomy levels; electronic-warfare units respond with broader jamming, more precise direction finding, and new countermeasures. In a contested electromagnetic spectrum, neither side owns the airwaves permanently. Emissions become signatures, command posts become targets, and the side that can reduce its own detectability while exploiting the enemy's emissions gains a temporary advantage. Drones also compress the observation-orientation-decision-action cycle by providing real-time imagery, but they can overload commanders with data unless fused into fire-control and command systems. The mechanism therefore produces a paradox: cheap drones increase lethality and transparency, while electronic warfare restores friction and uncertainty.

Scope Conditions: Drone and electronic-warfare effectiveness depends on several conditions. First, industrial and logistical capacity must sustain production and replacement at rates exceeding losses; cheap systems are only cheap if they can be replaced quickly. Second, operators and units must possess the technical literacy to adapt software, frequencies, and tactics under fire. Third, terrain and weather shape performance: urban canyons, forests, and poor visibility degrade line-of-sight control and optical targeting. Fourth, the density of hostile air defenses and electronic warfare determines whether small drones can survive long enough to matter. Fifth, integration with artillery, armor, and infantry determines whether drone-derived intelligence becomes timely fire rather than unused information. Where these conditions are absent, drones may harass but not decide. Where electronic warfare is overwhelming, link-dependent drones lose value unless they possess autonomy, fiber-optic control, or pre-programmed terminal guidance. The scope condition is therefore not technological possession alone but organizational adaptation within a contested electromagnetic environment.

Observable Implications: The implications include high attrition rates among drones, rapid iteration in design and tactics, dispersion of forces to reduce signature, greater emphasis on camouflage and concealment, and the elevation of electronic-warfare units and drone operators to high-value targets. Artillery becomes more accurate when drones provide real-time spotting, but artillery also becomes more vulnerable when its emissions and positions are detected. Commanders must manage electromagnetic discipline, decoys, and redundant communications. The data-lab focus on drone loss rates and target sets is consistent with this mechanism: many systems are expended, and the decisive variable is often the speed with which losses are replaced and tactics are revised. The observable implication is not that drones make war bloodless or decisive, but that they make the tactical environment more transparent, more lethal, and more dependent on industrial and organizational adaptation.

Perspective Note (five traditions in brief):

African (primary): The African vantage point, especially in Sahelian and hybrid conflicts, shows that drone proliferation is not confined to interstate industrial war. Non-state actors and states alike use commercial drones for surveillance, propaganda, and strike, often in contexts of weak state capacity, fragmented authority, and external intervention. African scholarship on sovereignty, hybridity, and the political economy of violence highlights that cheap precision can empower actors who lack conventional air forces, while also exposing civilians to persistent surveillance and remote violence. The African perspective contributes an understanding of diffusion, asymmetry, and the social embeddedness of technology; it reveals that drones are not merely military tools but instruments that reshape authority, territorial control, and civilian experience. It can occlude the high-density electronic-warfare contest of large-scale interstate war, but it prevents the

mistake of treating drone warfare as a purely Western or high-technology phenomenon.

Chinese: The Chinese perspective emphasizes informatized warfare and integrated joint operations. Drones are treated as nodes in a sensor-to-shooter network, and the electromagnetic spectrum is understood as a domain to be seized, managed, and denied. This perspective contributes a systems-level view of data fusion, command integration, and multi-domain coordination. It can occlude the friction, improvisation, and tactical disorder that characterize actual drone and electronic-warfare adaptation.

Russian: The Russian perspective draws on deep-battle heritage and a strong electronic-warfare tradition. It treats drones as instruments for reconnaissance-strike complexes and emphasizes massed fires, operational depth, and spectrum denial. This perspective contributes an understanding of how drones can be integrated with artillery and how electronic warfare can disrupt enemy command and precision. It can occlude decentralized innovation and the speed of commercial adaptation, especially when bureaucratic or doctrinal rigidities slow response.

Western: The Western perspective, shaped by maneuver-warfare doctrine and recent lessons from Ukraine, treats drones as enablers of precision, situational awareness, and combined-arms coordination. It contributes doctrinal flexibility and alliance learning, particularly in adapting tactics to drone-saturated battlefields. It can occlude the industrial and logistical requirements of sustaining drone and electronic-warfare systems at scale.

UN: The UN perspective centers on civilian harm, distinction, proportionality, and precautions in attack. Drones can improve discrimination and reduce risk to aircrews, but persistent surveillance and remote strike raise accountability and legal questions. This perspective contributes civilian protection and legal accountability; it can occlude operational necessity and the military logic of electronic and unmanned warfare in contested terrain.

SECTION 2.6 KEY IDEA 5 — Attrition vs Maneuver: Competing Theories and the Empirical Record in Ukraine

Bolded Causal Claim: Maneuver warfare is not the natural state of modern combat but a contingent achievement requiring air superiority, weak or disrupted defenses, logistics depth, and combined-arms integration; where these conditions are absent, industrial attrition becomes the governing logic, and the side with greater sustainment, replacement, and adaptation prevails.

Mechanism: Maneuver theory, associated with thinkers such as Liddell Hart and later operationalized in doctrines such as AirLand Battle, seeks to disrupt enemy cohesion through speed, surprise, combined arms, and action against operational depth. Its promise is decision at lower cost: by paralyzing the enemy's command and logistics, one avoids the grinding expenditure of resources characteristic of attrition. Attrition theory, by contrast, treats war as a contest of resources, casualties, ammunition, and industrial capacity; it accepts that enemy cohesion may be broken only after sustained exhaustion. The mechanism of attrition is cumulative: artillery, drones, mines, and infantry defense impose losses faster than the attacker can replace them, while the defender's own losses are offset by prepared positions, shorter supply lines, and mobilized industry.

In Ukraine, the mechanism of maneuver was blocked by prepared defenses, dense minefields, layered artillery, air defense, and drone surveillance. Without air superiority, attacking forces could not suppress defenders or protect their own logistics; without sufficient breaching capacity and reserves, tactical gains could not be exploited into operational breakthrough. The result was not the absence of maneuver but its

compression: maneuver occurred at small scale and short duration, while the strategic rhythm became attritional. The empirical record from 2022 through 2024 shows initial Russian maneuver failing under logistics strain and Ukrainian resistance, followed by Ukrainian counteroffensive gains constrained by defenses and firepower, and then a prolonged phase in which artillery consumption, casualty replacement, and industrial output became central variables. Biddle's analysis of the modern system helps explain why: dispersion, cover, combined arms, and prepared defense reduce the lethality of any single arm and make breakthrough dependent on integrated, well-supported operations rather than speed alone.

Scope Conditions: Maneuver is feasible under identifiable conditions: air superiority or at least air parity, weak or disrupted defenses, sufficient logistics depth, surprise, and combined-arms integration at tactical and operational levels. Attrition dominates when defenses are prepared, airpower is contested or absent, forces are large and mobilized, and industrial bases are engaged. The two are not mutually exclusive; maneuver attempts can occur within an attritional context, and attrition can create conditions for later maneuver by exhausting reserves. Political objectives also matter: a state may accept attritional costs if it believes time and resources favor it, while another may seek rapid decision to avoid domestic or alliance strain. The scope condition is therefore not a binary choice between doctrines but an assessment of whether the material and operational prerequisites for maneuver exist.

Observable Implications: Observable implications include the rate of territorial gain relative to casualties and ammunition expended, the depth of penetration achieved by attacking forces, the consumption rates of artillery shells and precision munitions, equipment losses by type, and the ability to generate and replace forces. Where maneuver is working, one expects rapid exploitation, disrupted enemy rear areas, and declining enemy cohesion. Where attrition dominates, one expects stable or slowly shifting front lines, high consumption, and competition over industrial output and manpower. The data-lab focus on artillery shell consumption, tank losses, and target sets reflects this: the empirical record in Ukraine points to a war in which firepower, replacement, and adaptation have been more decisive than operational shock. The observable implication is that doctrine must be tested against material conditions; a maneuver template that succeeded in one theater may fail in another if air superiority, defense density, or logistics differ.

Perspective Note (five traditions in brief):

African (primary): The African vantage point, informed by experiences of protracted and hybrid conflict, emphasizes that attrition is often political, social, and economic as well as military. In Sahelian and other African conflicts, light weapons, non-state actors, external intervention, and weak state capacity can produce prolonged violence in which maneuver is rare and legitimacy is contested. African scholarship on underdevelopment, sovereignty, and hybridity highlights that war outcomes depend on social cohesion, resource extraction, and international support, not only on force ratios. This perspective contributes an understanding of protracted conflict and the limits of conventional maneuver templates; it reveals that attrition can be a condition of political order rather than merely a military method. It can occlude the high-intensity industrial and interstate dimensions of the Ukraine war, but it prevents the assumption that maneuver failure is simply a tactical problem.

Chinese: The Chinese perspective emphasizes informatized warfare and integrated joint operations. Maneuver is conceived as system destruction: disrupting the enemy's information, command, and logistics networks rather than only seizing territory. Attrition is understood as firepower and resource competition within a broader systems contest. This perspective contributes a network-centric view of operational paralysis. It can occlude the physical friction, terrain, and human costs that constrain maneuver in actual war.

Russian: The Russian perspective draws on deep-battle heritage, which historically emphasized operational maneuver, echeloned forces, and penetration to operational depth. In Ukraine, adaptation failures and logistics strain have exposed the gap between doctrine and execution. This perspective contributes an understanding of mass, depth, and firepower integration. It can occlude the need for decentralized adaptation and the decisive role of industrial sustainment and air defense in denying maneuver.

Western: The Western perspective, especially the maneuver-warfare tradition associated with AirLand Battle and post-Cold War doctrine, initially expected rapid combined-arms breakthrough. Ukraine has forced reassessment: when air superiority is absent and defenses are prepared, artillery and attrition dominate. This perspective contributes doctrinal flexibility and alliance learning but can occlude the political and industrial requirements of sustained firepower.

UN: The UN perspective centers on civilian harm from artillery and area-effect weapons in populated areas. Reporting on Ukraine documents the humanitarian consequences of prolonged bombardment and the legal obligations of distinction, proportionality, and precautions. This perspective contributes accountability and civilian protection; it can occlude operational necessity and the military logic of firepower in contested terrain.

2.7.1 African Perspective (PRIMARY)

The African vantage point on conventional warfare and industrial attrition begins from a theoretical premise that the other four perspectives tend to bracket: that the distinction between "conventional" and "irregular" warfare is itself a product of a particular, Eurocentric state form, and that in much of Africa the state has never monopolized violence in the Weberian sense. From this premise, the African perspective does not simply add cases; it reframes the analytical categories. Where Western doctrine treats combined arms maneuver as the integration of tanks, infantry, artillery, and air power within a unified command structure, African scholarship asks whose command structure, over what territory, and for whose accumulation. The question of industrial attrition becomes not merely how many shells a factory can produce but how the political economy of violence is organized—who profits, who is conscripted, and whose bodies are expended.

The theoretical lineage is deep. Fanon's *The Wretched of the Earth* (1961) established that colonial violence was not an aberration but the foundational logic of the colonial state; decolonization therefore required a counter-violence that was simultaneously military and political. Cabral's *Return to the Source* (1973) insisted that liberation warfare must be rooted in the people's culture and material conditions, not in imported doctrine. Nkrumah's *Neo-Colonialism* (1965) argued that formal independence masked continued economic and military dependence, a condition that shapes African security to this day. Nyerere's ujamaa and self-reliance doctrine framed military capacity as inseparable from economic sovereignty. Rodney's *How Europe Underdeveloped Africa* (1972) provided the structural account: African underdevelopment was not a starting condition but a product of the international division of labor, which means that African states enter any conventional conflict with an industrial base already shaped by external extraction. These thinkers do not merely describe African wars; they theorize the relationship between violence, sovereignty, and global capitalism.

Post-independence scholarship extended this. Bayart's *The State in Africa* (1993) theorized the "politics of the belly"—the fusion of state and private accumulation through violence—and the "extraversion" of African states, their dependence on external resources. Mbembe's *On the Postcolony* (2001) and later *Necropolitics* (2019) analyzed how sovereignty in Africa operates through the power to dictate who may live and who must

die, a framework that illuminates how attrition warfare is experienced by populations rather than merely measured in shell counts. Mamdani's *Citizen and Subject* (1996) and *Define and Rule* (2012) traced how colonial indirect rule produced bifurcated states—citizens in urban areas, subjects in rural ones—creating the institutional architecture within which post-colonial violence unfolds. Grovogui's *Sovereigns, Quasi Sovereigns, and Africans* (1996) challenged the Westphalian monopoly on sovereignty, arguing that African polities have always operated with plural, overlapping sovereignties. Oyěwùmí's *The Invention of Women* (1997) and subsequent work on gender and social organization remind us that the "man" of maneuver warfare is a gendered construct, and that African social ontologies offer different starting points for understanding who fights and how.

Applied to conventional warfare and industrial attrition, this lineage yields several distinctive claims. First, the African experience suggests that the "return of industrial war" in Ukraine is not a return to a universal past but a specific configuration of state capacity, industrial depth, and territorial defense that most African states do not possess. The Sahel conflicts—Mali, Burkina Faso, Niger, Chad—illustrate a different modality: hybrid warfare in which non-state armed groups employ light weapons, IEDs, motorcycles, and increasingly drones, against state forces that are themselves fragmented, externally supported, and often predatory. The drones in the Sahel are not the massed FPV swarms of Ukraine but commercial off-the-shelf platforms used for reconnaissance and, increasingly, for improvised explosive delivery. This is not a lesser form of warfare; it is a different political economy of violence, one in which the "industrial base" is not a national factory system but a global market in small arms, commercial drones, and mercenary services.

Second, the African perspective foregrounds external dependency. The French Operation Barkhane (2014-2022), the G5 Sahel Joint Force, and the subsequent Russian Wagner/Africa Corps presence demonstrate that African conventional military capacity is frequently outsourced. When France withdrew from Mali and Burkina Faso, the resulting vacuum was filled not by indigenous industrial capacity but by Russian private military contractors. This is the African analogue of "force generation" problems: not a shortage of shells but a shortage of sovereign command over the means of violence. Work on African security governance emphasizes that security sector reform has often prioritized external donor preferences over local institutional development, producing armies that are equipped but not sustained.

Third, the African perspective contributes a critique of the "new wars" thesis. The argument that post-Cold War conflicts are characterized by identity politics, predation, and the erosion of the distinction between combatant and civilian has been influential but also contested. African scholars have pointed out that this framing can obscure continuities with colonial violence and the role of global economic structures. The wars in the Democratic Republic of Congo (1998-2003), involving multiple African states and numerous armed groups, were in some respects highly conventional—state armies, heavy weapons, territorial control—while also being deeply entangled with resource extraction. The African vantage point thus resists the binary of "old" conventional war versus "new" irregular war, insisting instead on hybridity and political economy.

Fourth, the African perspective on drones and electronic warfare is distinctive. While Ukraine has seen mass proliferation of FPV drones and contestation of the electromagnetic spectrum, African states and non-state actors have adopted drones more selectively, often for surveillance and targeted strikes. Ethiopia's use of drones in the Tigray war (2020-2022), reportedly including Turkish Bayraktar TB2s and Iranian Mohajer-6s, demonstrated that drone warfare in Africa is already a reality, but one shaped by external supply chains and great-power competition. The African perspective asks: who controls the data links, the maintenance, and the targeting intelligence? The answer usually points to external suppliers, reinforcing dependency.

What does the African perspective occlude? It can understate the specificity of high-intensity state-on-

state warfare. The industrial attrition of Ukraine—millions of artillery shells, thousands of tanks, sustained mobilization—does not map neatly onto African conflicts, which are typically lower in intensity but longer in duration. The African perspective may also romanticize "people's war" or overemphasize external causation at the expense of local agency. And it can struggle to account for cases where African states have successfully waged conventional war: Ethiopia-Eritrea (1998-2000), which involved trench warfare and mass mobilization, or the DRC's conventional campaigns. These cases suggest that industrial attrition is not foreign to Africa but is conditioned by different state capacities.

The strongest counterargument to the African perspective is that it risks overgeneralizing from post-colonial fragility. Not all African states are weak; some have built substantial conventional forces (Egypt, Algeria, South Africa, Nigeria). The African perspective's emphasis on dependency and hybridity may obscure the agency of African states in conventional military affairs. Moreover, the Sahel experience, while important, is not representative of the continent's full range of security challenges.

Nevertheless, the African vantage point contributes something the other four cannot: a sustained critique of the state-centric, industrial-base assumptions that underpin Western, Chinese, and Russian doctrines. It reveals that "conventional warfare" is not a natural category but a historically specific form of violence tied to a particular state form, and that when that state form is absent or externally dependent, the warfare that results is not a deviation but a different logic. It also insists that the human cost of attrition—bodies, displacement, ecological destruction—be centered, not abstracted into shell consumption rates. In this sense, the African perspective is not merely an alternative case study but a methodological challenge to the field.

2.7.2 Chinese Perspective

The Chinese perspective on conventional warfare and industrial attrition is shaped by the PLA's doctrinal evolution from "people's war" to "informatized warfare" (□□□□□) and, more recently, to "intelligentized warfare" (□□□□□). This evolution reflects a strategic judgment that future conflict will be decided not by mass alone but by the integration of information, precision, and joint operations across domains. The Chinese perspective thus approaches the Ukraine war as a laboratory for observing how a major power fights when air superiority is contested, electronic warfare is pervasive, and industrial sustainment becomes the binding constraint.

The theoretical lineage draws on Chinese strategic thought—Sun Tzu's emphasis on shi (strategic advantage) and deception, Mao's people's war, and Deng Xiaoping's military modernization—but has been substantially reshaped by PLA reform since 2015. The 2015 Defense White Paper and subsequent reforms established "integrated joint operations" (□□□□□□□) as the core concept, emphasizing "system of systems" (□□□□) confrontation: the ability to disrupt the enemy's operational system while protecting one's own. Scholars such as M. Taylor Fravel have documented how the PLA has moved from a ground-force-centric, attrition-based model to one emphasizing information dominance, precision strike, and jointness. Joel Wuthnow and Phillip Saunders have analyzed the institutional challenges of this transition, noting that the PLA's command structure and training still lag behind its doctrinal ambitions.

Applied to the five key ideas, the Chinese perspective yields specific insights. On combined arms maneuver, the PLA has studied the Ukraine war's failure of Russian combined-arms integration and concluded that maneuver without information dominance and air superiority is suicidal. Chinese analysts have reportedly noted that Russian forces failed to achieve the "three-dimensional" (land, air, space, cyber) integration that PLA doctrine prescribes. On logistics and force generation, China's defense industrial base—centered on state-owned enterprises such as NORINCO and AVIC—is viewed as a strategic asset, and the Ukraine war's

ammunition shortages have reinforced the Chinese emphasis on "war reserves" and industrial mobilization. On artillery, China has long maintained large artillery forces and has observed Ukraine's artillery-centric warfare with interest, noting both the effectiveness of massed fires and the vulnerability of artillery to counter-battery and drones. On drones and EW, the Chinese perspective is perhaps most developed: the PLA has invested heavily in drone swarms, electronic warfare, and "intelligent" (AI-enabled) systems, viewing the electromagnetic spectrum as a primary battlespace. The Ukraine war's drone proliferation is read as confirmation that "low-cost, high-smart" systems can offset conventional mass. On attrition versus maneuver, Chinese doctrine tends to favor "active defense" and "asymmetric" approaches that avoid direct attrition, but acknowledges that prolonged conflict may require industrial depth.

What does the Chinese perspective contribute? It offers a systemic, "system of systems" lens that integrates information, firepower, and logistics into a single analytical frame. It highlights the role of the electromagnetic spectrum and cyber as co-equal with physical domains. And it brings a long-term industrial planning perspective, treating defense production as a strategic capability rather than a wartime improvisation.

What does it occlude? It can overstate the PLA's actual jointness and information integration, which remain works in progress. It may understate the political and institutional friction that hampers Chinese military effectiveness—corruption, lack of combat experience, and the tension between party control and operational autonomy. And it tends to treat technology as a substitute for the messy human and political dimensions of war that the African perspective foregrounds. The Chinese perspective also has limited direct experience with high-intensity conventional war since 1979 (the Sino-Vietnamese War), which constrains its empirical base.

The strongest counterargument is that Chinese "informatized warfare" doctrine may be aspirational rather than operational, and that the PLA's lack of combat experience means its lessons from Ukraine are second-hand and potentially misread. Moreover, the Chinese emphasis on "intelligentized" warfare may underestimate the continued importance of industrial mass and human endurance, as demonstrated in Ukraine.

2.7.3 Russian Perspective

The Russian perspective on conventional warfare and industrial attrition is rooted in the Soviet "deep battle" (глубокий бой) tradition and its post-Soviet evolution. Deep battle, developed by Tukhachevsky and Svechin in the 1920s-30s, emphasized simultaneous strikes across the depth of the enemy's defense, combining maneuver, firepower, and aviation to achieve breakthrough and exploitation. This heritage shaped Russian military thought through the Cold War and into the post-Soviet era, informing concepts such as "non-contact warfare" and, more recently, "active defense."

The Russian perspective on Ukraine is thus not simply one of failure but of a doctrinal tradition confronting operational reality. Russian forces entered Ukraine in 2022 expecting a rapid, combined-arms advance on Kyiv, drawing on the deep-battle template of breakthrough and exploitation. When this failed—due to logistics breakdowns, Ukrainian resistance, and the absence of air superiority—Russia adapted toward attrition: massed artillery, incremental advances, and the "meat grinder" tactics seen at Bakhmut and Avdiivka. This adaptation reflects a Russian strategic culture that has historically accepted high casualties and prioritized mass over precision.

On the five key ideas: Russian combined arms has been criticized for poor integration—tanks advancing without infantry support, artillery and aviation poorly coordinated. Logistics and force generation have been a persistent weakness, with the 2022 Kyiv offensive stalling due to fuel and ammunition shortages,

though Russia has since mobilized its defense industrial base (Uralvagonzavod, Kalashnikov Concern) and expanded shell production. Artillery dominance is where the Russian perspective is strongest: Russia entered the war with a large artillery advantage and has used it extensively, though Ukrainian counter-battery and HIMARS strikes degraded this. Drones and EW: Russia has adapted significantly, deploying Lancet loitering munitions, Shahed (Geran-2) drones, and extensive EW systems, though initially lagging behind Ukraine in FPV drone innovation. Attrition versus maneuver: Russia has effectively chosen attrition, accepting high casualties and slow advances, reflecting a strategic calculus that time and mass favor Moscow.

What does the Russian perspective contribute? It demonstrates the continued relevance of artillery mass and industrial depth in high-intensity war. It shows that a state willing to absorb casualties and mobilize its economy can sustain prolonged attrition. And it offers a counterpoint to Western maneuver doctrine: when maneuver fails, firepower and mass can still achieve incremental gains.

What does it occlude? It underestimates the costs of attrition—casualties, economic strain, and political sustainability. It can rationalize operational failures as strategic patience. And it struggles to account for the role of precision, intelligence, and alliance support in enabling Ukrainian resistance. The Russian perspective also tends to obscure the corruption and institutional dysfunction that hampered its initial campaign, attributing setbacks to external factors rather than internal failures.

The strongest counterargument is that Russian "adaptation" in Ukraine has been reactive and costly, and that the deep-battle tradition, while theoretically sophisticated, has not translated into effective combined-arms operations in practice. Moreover, Russia's reliance on attrition may be strategically self-defeating if it exhausts the very industrial and demographic base it depends on.

2.7.4 Western Perspective

The Western perspective on conventional warfare and industrial attrition is shaped by the maneuver-warfare tradition—AirLand Battle, NATO doctrine, and the post-Cold War emphasis on precision, speed, and information dominance. This tradition, crystallized in the 1991 Gulf War and refined through the 1990s and 2000s, held that technological superiority and operational agility could defeat larger, slower opponents. The Ukraine war has forced a significant reassessment: when air superiority is absent and defenses are prepared, artillery and attrition dominate, and the Western template does not transfer cleanly.

The theoretical lineage includes Liddell Hart's indirect approach, the German Blitzkrieg (studied and adapted by NATO), and the U.S. Army's AirLand Battle doctrine of the 1980s. Biddle's *Military Power* (2004) provided the most rigorous modern account of the "modern system"—the integration of cover, concealment, dispersion, and small-unit initiative that makes modern defense so formidable and that makes combined-arms offense necessary but difficult. Freedman's *The Future of War* (2017) traced how Western strategic thought has oscillated between expectations of short, decisive wars and the reality of prolonged conflict. The Western perspective also draws on the Revolution in Military Affairs (RMA) literature of the 1990s, which anticipated that information technology would transform warfare into a "system of systems" contest.

Applied to Ukraine: Western analysts initially expected Russian combined-arms breakthrough; when this failed, they expected Ukrainian counteroffensives to succeed with Western equipment and training. The 2023 Ukrainian counteroffensive's limited gains prompted further reassessment. Western observers have noted the dominance of artillery, the proliferation of drones, and the importance of EW, while also highlighting industrial bottlenecks—shell production, air defense interceptors, and the difficulty of scaling precision munitions. The Western perspective emphasizes alliance learning: NATO has drawn lessons on logistics, air

defense, and industrial mobilization, and has begun to rebuild stockpiles and production capacity.

What does the Western perspective contribute? Doctrinal flexibility and a willingness to update beliefs based on evidence. A strong emphasis on precision and minimizing civilian harm. And an alliance framework that pools resources and shares intelligence. The Western perspective also brings rigorous operational analysis—RUSI reports, IISS Military Balance, and academic work by Watling and others—that has documented the mechanics of the Ukraine war in detail.

What does it occlude? It can overestimate the transferability of Western doctrine to non-Western contexts. It may underestimate the political and industrial requirements of sustained firepower, treating logistics as a technical rather than political problem. And it can be slow to abandon the maneuver-warfare paradigm even when evidence favors attrition. The Western perspective also tends to frame the war in terms of "lessons learned" for NATO, potentially instrumentalizing Ukrainian suffering for alliance planning.

The strongest counterargument is that Western maneuver doctrine is not wrong but conditional: it works when air superiority and industrial depth are present, and fails when they are not. The lesson of Ukraine is not that maneuver is dead but that it requires conditions that cannot be assumed. Moreover, the Western emphasis on precision and technology may obscure the continued importance of mass and endurance, which the Russian perspective highlights and which the African perspective contextualizes within political economy.

2.7.5 UN Perspective

The UN perspective on conventional warfare and industrial attrition centers on civilian harm, international humanitarian law (IHL), and the protection of non-combatants. This perspective does not primarily ask how wars are won but how they are fought—whether the means and methods of warfare comply with the principles of distinction, proportionality, and precautions in attack. In the Ukraine context, the UN has documented extensive civilian casualties from artillery, missile strikes, and area-effect weapons, particularly in populated areas.

The theoretical lineage includes the Geneva Conventions (1949) and their Additional Protocols (1977), the customary IHL framework codified by the ICRC, and the UN's own human rights and humanitarian architecture. The UN perspective also draws on the "protection of civilians" (PoC) agenda developed in the 1990s and 2000s, particularly in the context of peacekeeping and humanitarian operations. The UN Commission of Inquiry on Ukraine, established by the Human Rights Council in 2022, and the reports of the Office of the High Commissioner for Human Rights (OHCHR) provide the empirical basis. The UN perspective is also informed by the broader debate on "explosive weapons in populated areas" (EWIPA), which has gained traction in recent years and led to the 2022 Dublin Declaration.

Applied to the five key ideas: On combined arms maneuver, the UN perspective is less concerned with tactical integration than with the effects of combined-arms operations on civilians—particularly the use of artillery and air power in populated areas. On logistics and force generation, the UN perspective notes that sustained industrial war produces sustained civilian harm, and that the "war economy" can divert resources from civilian needs. On artillery dominance, the UN has documented that artillery and multiple-launch rocket systems (MLRS) have been the leading cause of civilian casualties in Ukraine, particularly in the early phases of the war. On drones and EW, the UN perspective raises concerns about the use of drones for targeted strikes in populated areas and the potential for autonomous systems to complicate accountability. On attrition versus maneuver, the UN perspective suggests that prolonged attrition warfare multiplies civilian harm over time, as front lines stabilize and populated areas become contested.

What does the UN perspective contribute? It provides an independent, evidence-based account of civilian harm that is not filtered through military or political interests. It establishes legal standards that constrain state behavior and provide a basis for accountability. And it centers the human cost of industrial attrition, which military analyses can abstract into statistics. The UN perspective also contributes a framework for "humanitarian access" and the protection of critical infrastructure, which is essential for civilian survival in prolonged war.

What does it occlude? It can struggle to account for operational necessity—the military logic that drives the use of artillery and area weapons in contested terrain. It may treat all civilian harm as potentially unlawful, without adequately distinguishing between lawful and unlawful attacks. And it can be slow to adapt to new technologies (drones, EW) whose legal status is unsettled. The UN perspective also depends on state cooperation for access and data, which can limit its reach in contested or denied areas.

The strongest counterargument is that IHL was designed for a different era of warfare and may not adequately address the realities of industrial attrition, drone swarms, and electronic warfare. Moreover, the UN perspective's emphasis on civilian protection can be co-opted by states to justify inaction or to delegitimize adversary operations while excusing their own. The UN perspective also risks treating "civilian harm" as a static category, without accounting for how prolonged war transforms civilian-military relationships and the meaning of "civilian" itself.

SECTION 2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Reframes the war as a hybrid political economy of state capacity, external patronage, mercenary networks, and civilian harm; highlights rapid diffusion of cheap precision and drones	May underweight conventional industrial mass, formal force generation, and the decisive role of state capacity	Sovereignty, human security, anti-imperial critique, and protection of civilian space	Sahelian hybrid conflicts, mercenary networks, and drone/light-weapon diffusion	Western: conventional state capacity and alliance logistics still determine strategic endurance

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Chinese	Identifies information dominance, joint integration, sensor-to-shooter links, and electronic-warfare contestation as binding constraints on combined arms	Risks technological determinism; may understate political will, social resilience, and Ukrainian agency	State security, strategic stability, and system-of-systems military effectiveness	PLA informatization reforms and observed Russian integration failures	Russian: massed artillery, operational depth, and industrial endurance remain central
Russian	Preserves deep-battle logic of operational depth, artillery mass, echelons, and adaptation to positional war	Tends to externalize failure onto logistics alone and understate Ukrainian agency and Western support	Great-power security, sphere of influence, and military endurance	Soviet deep-battle heritage and 2022–2024 adaptation to attritional fighting	Western: initial failures show rigidity in command and combined-arms integration
Western	Explains the enabling role of precision, NATO support, training, and combined-arms doctrine; revises maneuver assumptions in light of attrition	Tends to overstate technology and alliance support while underestimating Russian industrial adaptation	Liberal order, deterrence, and alliance-based security	1991 Gulf War maneuver template and NATO ammunition transfers to Ukraine	African: civilian harm, hybridity, and external patronage are missed by state-centric doctrine

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
UN	Supplies civilian-harm data, infrastructure-damage accounting, and IHL frameworks for distinction, proportionality, and accountability	Underweights military necessity, operational adaptation, and the political economy of sustainment	Humanitarian protection, civilian immunity, and legal accountability	UN human-rights monitoring, ICC investigations, and civilian-casualty reporting	Russian/Western: legal categories may lag behind industrial attrition, drones, and electronic warfare

SECTION 2.8 WORKED EXAMPLE (I do)

Levels of analysis. At the individual level, the war turns on commanders' tactical adaptation, drone operators' skill, artillery crews' endurance, and soldiers' morale under prolonged bombardment; variation in decentralized initiative and command friction shaped local outcomes even when aggregate force ratios were stable. At the state level, Ukraine and Russia differ in mobilization capacity, industrial depth, procurement, and command structure, with Russia's ability to sustain high-volume fires contrasting with Ukraine's dependence on Western ammunition and precision systems. At the systemic level, NATO and EU support, sanctions, global supply chains, and great-power competition conditioned what each state could generate and sustain. At the transnational level, foreign fighters, private military formations, diaspora fundraising, humanitarian networks, global component supply chains, and international legal institutions linked the battlefield to wider political and economic circuits.

Mechanism. The central mechanism is the interaction between failed rapid maneuver and the subsequent shift to industrial attrition. Russia's 2022 attempt at large-scale maneuver collapsed under logistics strain, command rigidity, and Ukrainian resistance, after which the war became a contest of fires, fortification, and sustainment. Artillery consumption, drone loss rates, and the contest over the electromagnetic spectrum turned tactical transparency into a binding constraint: dispersed formations, electronic warfare, and cheap precision compressed kill chains and made classical combined-arms breakthroughs costly. Western systems such as HIMARS and Storm Shadow altered target sets by striking logistics nodes, command posts, and infrastructure, but they did not by themselves restore maneuver because Russian adaptation, fortification, and industrial depth absorbed shocks. Ukraine's 2023 counteroffensive struggled where minefields, drone surveillance, and artillery density denied the concentration and tempo required for breakthrough. Thus the outcome is best understood not as a simple failure of doctrine but as a mechanism in which industrial capacity, alliance support, information contestation, and adaptation jointly determined the feasible tempo of operations.

Perspective reconstruction. African (primary): From an African vantage informed by Grovogui's critique of sovereignty, Mbembe's analysis of violence, and Bayart's attention to the political economy of extraver-

sion, the Ukraine war appears less as a self-contained interstate clash than as a hybrid conflict in which state capacity, external patronage, and civilian harm are inseparable. The African experience of Sahelian conflicts suggests that cheap precision, drones, and light weapons diffuse quickly across porous borders and empower non-state actors, mercenaries, and informal networks, so the Ukrainian battlefield cannot be understood only through formal force structures. It also highlights that external support—whether NATO arms or Russian private military formations—reconfigures local authority and can prolong war by substituting for indigenous sustainment. Civilian harm and displacement are not side effects but constitutive of how such wars are fought and legitimized, echoing concerns in African scholarship about the blurring of combatant and civilian spaces. Finally, the African perspective cautions against treating any single Western maneuver template as universal, because Sahelian experience shows that technology and mass interact with fragile institutions in ways that formal doctrine often misses. Chinese: The Chinese perspective reads Ukraine through informatized warfare and integrated joint operations: the war demonstrates that information dominance, sensor-to-shooter links, and electronic-warfare contestation shape whether combined arms can function at all. It emphasizes that precision fires and drones are valuable only when embedded in a resilient command-and-control and logistics system, and that Russia's difficulties reveal the costs of weak joint integration. At the same time, it treats industrial depth and ammunition sustainment as strategic variables, not mere background conditions. Its limitation is a tendency to overstate technological determinism and to understate the political and social sources of Ukrainian resistance and Western cohesion. Russian: The Russian perspective interprets the war through the heritage of deep battle and operational art: massed artillery, operational depth, and echeloned forces remain central, while the initial 2022 failures are attributed to poor integration, logistics, and command rather than to the obsolescence of maneuver itself. It sees the subsequent positional phase as a necessary adaptation to Ukrainian defenses and Western precision support, with drones and electronic warfare layered onto traditional fires. The perspective also stresses force generation and the industrial base as determinants of endurance. Its weakness is a tendency to understate Ukrainian agency, to externalize failure onto logistics alone, and to overstate the coherence of adaptation. Western: The Western perspective initially approached Ukraine through the maneuver-warfare and modern-systems tradition associated with Biddle: combined arms, precision, and information should enable rapid, decisive operations. The 2022–2024 record forced a revision toward industrial attrition, emphasizing NATO ammunition transfers, training, and precision munitions as enabling Ukrainian defense. It highlights Russian command failures and the value of Western C4ISR and long-range fires. Its occlusion is a tendency to overstate technology and alliance support while underestimating Russian industrial adaptation and the political durability of attritional war. UN: The UN perspective centers civilian harm, infrastructure destruction, and IHL compliance, treating the war as a test of distinction, proportionality, and accountability. It documents patterns of civilian casualties and damage to energy and transport infrastructure, framing military operations within legal categories that constrain and legitimate force. This perspective is essential for understanding the human costs and the legitimacy of operations, but it can underweight military necessity and the operational adaptation that shapes targeting. It also depends on access and state cooperation, which limits its reach in contested or denied areas.

Explicit adjudication. Adjudicating among these perspectives, the case is best explained by a state-and-systemic synthesis: Ukraine's survival and Russia's inability to achieve rapid victory reflect force generation, industrial sustainment, and alliance support more than any single doctrinal template. The Western perspective captures the enabling role of precision and NATO support, while the Russian perspective captures the enduring importance of artillery mass and operational depth; neither alone explains why maneuver failed to produce decision. The Chinese perspective correctly identifies information and electronic-warfare contestation as a binding constraint on combined arms, but it risks reducing politics to technology. The African

perspective adds the crucial insight that the war is also a hybrid political economy of external patronage, mercenary networks, and civilian harm, which state-centric military analysis often misses. The UN perspective supplies the normative and evidentiary floor for civilian protection, though it cannot by itself explain operational outcomes. Thus the most robust explanation is layered: industrial attrition and alliance support explain endurance; information and fires explain tactical friction; hybridity and civilian harm explain legitimacy and long-term consequences.

SECTION 2.9 PROBLEM PAIR (We do)

Tasks

1. Reconstruct the 1991 Gulf War template as a sequence of operational conditions rather than as a slogan: air campaign, degradation of command and logistics, maneuver envelopment, defender collapse, and limited political objective.

2. List the scope conditions that made that template work in 1991: air superiority, defender vulnerability, permissive logistics, strategic surprise or at least operational initiative, and a political end state achievable by paralysis.

3. Identify which of those conditions were present, absent, or reversed in Ukraine's 2023 counteroffensive, paying particular attention to air defense, minefields, fortifications, electronic warfare, drone reconnaissance, and ammunition sustainment.

4. Apply the four levels of analysis—individual, state, systemic, and transnational—to explain why the template did or did not transfer.

5. Reconstruct at least two perspectives on the same evidence: a Western maneuver tradition and a Russian deep-battle/defense perspective, with optional African, Chinese, or UN overlays.

6. State falsifiers: what evidence would weaken your explanation, and what evidence would strengthen the claim that maneuver remains viable under different conditions?

MODEL ANSWER

The 1991 Gulf War is often remembered as proof that superior technology, air power, and maneuver can produce rapid victory at low cost. The coalition campaign did combine an extended air campaign against Iraqi command, control, logistics, and fielded forces with a ground maneuver that enveloped Kuwaiti defenses; Iraqi forces were degraded, disoriented, and in many cases surrendered or fled. Yet treating this as a transferable template requires specifying its scope conditions rather than extracting a slogan. The template assumed air superiority, a vulnerable and overextended opponent, a permissive logistics environment, and a political objective limited enough to be achieved by operational paralysis. It also assumed that the defender's command system could be disrupted faster than it could adapt.

In Ukraine in 2023, several of those conditions were absent or reversed. Ukraine did not possess air superiority; Russian aviation, air defense, and electronic warfare contested the airspace and complicated close air support, reconnaissance, and drone operations. Russian forces had spent months constructing defense in

depth: minefields, dragon's teeth, trench networks, pre-registered artillery, and reserve echelons. The front was not a thin screen that could be bypassed; it was a fortified zone designed to absorb and channel attack. Consequently, the problem was not simply moving fast but generating enough combat power at the point of breach, sustaining it through successive belts, and preventing Russian counterattacks from restoring the defense.

The failure of the template is best explained as a mismatch between operational concept and strategic-technical environment, not as proof that maneuver is obsolete. At the tactical level, breaching operations required specialized equipment, engineer support, and time under observation; drones and artillery punished concentration. At the operational level, combined-arms synchronization—infantry, armor, artillery, engineers, air defense, and electronic warfare—proved difficult with heterogeneous equipment, varying training backgrounds, and command systems adapted under wartime pressure. At the strategic level, ammunition consumption, maintenance, and replacement rates mattered as much as battlefield skill; industrial attrition shaped what was possible. At the transnational level, aid flows enabled Ukraine's defense but did not create the air superiority or mass that the Gulf template presupposed. RUSI reporting on Ukraine emphasizes that sustainment and force generation, not only tactical proficiency, conditioned operational outcomes.

Perspective reconstruction clarifies the disagreement. A Western maneuver tradition tends to emphasize tempo, initiative, and combined-arms integration; from this vantage, the 2023 offensive's difficulties can be read as execution problems—insufficient mass, incomplete synchronization, and delayed commitment. A Russian perspective rooted in deep battle and defensive operations emphasizes depth, reserves, and the attrition of the attacker; from this vantage, the defense succeeded because it forced Ukraine to spend scarce resources against prepared positions. An African perspective on hybrid and resource-constrained warfare would add that templates imported from high-technology, expeditionary contexts often underestimate sustainment, local adaptation, and the political economy of force generation; the Sahel experience with drones, light weapons, and fragmented authority suggests that technological asymmetry can be offset by dispersion, endurance, and social embeddedness. A Chinese perspective on informatized and integrated joint operations would stress that without information dominance and joint command and control, maneuver cannot be synchronized; a UN perspective would foreground civilian harm, proportionality, and the legal constraints that shape target selection and tempo.

Adjudication should be conditional. The evidence supports the claim that the Gulf template failed in Ukraine 2023 because its scope conditions—air superiority, defender vulnerability, permissive logistics, and operational surprise—were not met. It does not support the stronger claim that maneuver warfare has been superseded by attrition or drones. Falsifiers include a future combined-arms offensive that achieves breakthrough under conditions of local air superiority and adequate sustainment; conversely, repeated failures of mechanized assault against prepared defenses despite air support would strengthen the attrition thesis. The lesson is that operational templates are hypotheses about a specific strategic environment, not universal laws.

SECTION 2.10 INDEPENDENT MEMO (You do)

(a) Case description

Case: In 2020, Azerbaijan conducted an offensive to regain territory in and around Nagorno-Karabakh. The campaign combined unmanned aerial systems for reconnaissance and strike, long-range artillery and rocket fire, electronic warfare, and ground maneuver by mechanized and special forces. Armenian defenses, though fortified in places, faced pressure on multiple axes and suffered from disrupted command and logistics. The war was short, produced decisive territorial change, and was widely interpreted as a demonstration

of drone-enabled precision and rapid maneuver. Yet the case also raises questions about transferability: Azerbaijan benefited from a favorable balance of forces, external support, and an opponent with limited strategic depth and air defense coverage. The conflict was not a peer industrial war; ammunition expenditure, force generation, and sustainment demands were modest compared with Ukraine. Analyze whether the 2020 campaign validates a maneuver template, a drone-centric revolution, or a context-specific victory whose lessons are easily overgeneralized.

(b) Required memo headings as prompts

Mechanism: Identify the causal chain linking drones, artillery, electronic warfare, and ground maneuver to the operational outcome, specifying necessary versus sufficient conditions.
Perspective reconstruction: Reconstruct how at least three of the five perspectives—African, Chinese, Russian, Western, and UN—would explain the same campaign, including what each perspective reveals and what it occludes.
Historical analogue: Compare the 2020 campaign with one earlier case, such as the 1991 Gulf War or the 2022-2024 Ukraine war, and specify which scope conditions transfer and which do not.
Falsifiers: State evidence that would weaken your preferred explanation and evidence that would support an alternative interpretation.

(c) Self-check line

Self-check: Did you distinguish description of what happened, explanation of why it happened, prediction of what would happen under changed conditions, and prescription of what should be done?

SECTION 2.11 HINGE QUESTION

Hinge Question: Which of the following best explains why the 1991 Gulf War operational template failed in Ukraine's 2023 counteroffensive?

A. Tanks have become obsolete in all forms of modern warfare.
B. Ukraine lacked air superiority and faced a prepared defense in depth, so the template's scope conditions were not met.
C. Artillery dominance alone is sufficient to guarantee operational success.
D. Western training and doctrine automatically produce breakthrough against fortified positions.

Correct answer: B.

Distractor diagnoses

- **A is wrong** because it overgeneralizes from drone and anti-tank anecdotes. Tanks remain useful when integrated with infantry, artillery, engineers, air defense, and electronic warfare; the problem in Ukraine was not the tank as a platform but the absence of the supporting conditions that make armored maneuver viable.

- **C is wrong** because it mistakes a necessary condition for a sufficient one. Artillery can suppress, attrit, and shape the battlefield, but without breach, exploitation, sustainment, and protection against counterattack, artillery dominance can produce stalemate rather than breakthrough.

- **D is wrong** because it confuses doctrine with strategic and material conditions. Training improves synchronization and tempo, but it cannot substitute for air superiority, adequate ammunition, force

generation, maintenance capacity, or an opponent whose defenses are unprepared.

SECTION 2A — DATA LAB

The data below are open-source estimates, not classified actuals. Oryx-verified losses are visual confirmations and therefore lower bounds; real losses are higher. Rates vary sharply by phase and are reported differently by Russian, Ukrainian, and Western sources. Treat every figure as an order-of-magnitude indicator, not a precise measurement.

Table 1 — Artillery shell consumption in Ukraine by phase (approximate daily rates)

Phase (approx. dates)	Russian daily rate	Ukrainian daily rate	Dominant driver
Feb–Jun 2022 (initial offensive)	20,000–40,000	5,000–7,000	Soviet stockpiles; massed fires; fire superiority
Sep–Nov 2022 (Kharkiv/Kherson counteroffensives)	10,000–20,000	4,000–6,000	Maneuver exploitation; logistics interdiction
Dec 2022–May 2023 (Bakhmut/Avdiivka)	10,000–20,000	2,000–4,000	Attritional grinding; defensive depth
Jun–Sep 2023 (counteroffensive)	10,000+	2,000–3,000	Ukrainian shell hunger; Russian mines and EW
2024	10,000+	2,000–3,000	NATO ramp-up; Russian production surge

Sources: RUSI Ukraine reports (2022–2024); Watling (2022); IISS Military Balance 2023–24. NATO's collective production target rose toward roughly 1.2 million 155 mm shells per year by 2025, up from a pre-war baseline near 300,000, while Russian output expanded through mobilized industry and North Korean supply.

Table 2 — Drone loss rates by category (approximate)

Category	Examples	Per-sortie loss (approx.)	Monthly scale (approx.)	Notes
FPV quadcopters	Commercial drones fitted with warheads	30–70%, EW-dependent	Tens of thousands	COTS components; short range; RUSI
Reconnaissance UAVs	Orlan-10, Mavic, Bayraktar TB2	Moderate–high	Thousands	TB2 losses heavy early; later suppressed by air defense

Category	Examples	Per-sortie loss (approx.)	Monthly scale (approx.)	Notes
Loitering munitions	Lancet, Switchblade	Moderate	Hundreds–thousands	Lancet effective against armor and air defense
Strategic ISR	(limited platforms)	Lower per sortie	Dozens	High value, scarce, heavily defended

Sources: RUSI Ukraine reports (2022–2024); Watling (2022). FPV loss rates are the most uncertain figure because many sorties are unrecorded and "loss" includes drones that fail to find a target.

Table 3 — Precision fires and armored losses (approximate)

HIMARS/Storm Shadow target sets (cumulative, approximate)

System	Primary target sets	Operational effect
HIMARS (GMLRS)	Ammunition depots, bridges, command posts, rail nodes	Logistics disruption; enabled Kherson and Donbas pressure
Storm Shadow/SCALP	Bridges, headquarters, airfields, shipyards	Deep strike; Crimea and Black Sea Fleet degradation

Tank losses by type (Oryx-verified, approximate cumulative to 2024)

Type	Russian losses (approx.)	Ukrainian losses (approx.)
T-72 variants	1,200+	300+
T-80 variants	600+	100+
T-90 variants	150+	10+
Western (Leopard, Challenger, Abrams)	n/a	50+ combined
Total verified	2,000+	800+

Sources: Oryx (visually confirmed losses); IISS Military Balance 2023–24; RUSI. Verified totals exclude unconfirmed losses and repaired/returned vehicles.

Five numbered analysis questions

1. **Trend.** Artillery consumption fell on the Ukrainian side from roughly 5,000–7,000 shells per day in early 2022 to roughly 2,000–3,000 by 2023–2024, while Russian rates stayed above 10,000. What does this asymmetry imply about the relationship between industrial capacity and battlefield initiative, and why did the gap not close even after NATO's production ramp began?
2. **Level of analysis.** Is Ukrainian shell hunger best explained at the state level (Ukrainian industrial destruction and pre-war stockpile depletion), the systemic level (NATO's collective production base and political willingness to fund it), or the transnational level (global supply chains for propellant, explosives, and machine tools)? Which level carries the most explanatory weight for the 2023 counteroffensive's artillery shortfall, and what evidence would distinguish them?

3. **Perspective reconstruction (all five).** Read the drone-loss data through each lens: (a) African — how does the Sahel experience of commercial drones and light weapons reframe "cheap precision" as a democratization of lethality rather than a Western technological edge? (b) Chinese — how does the PLA's informatized-warfare doctrine interpret mass FPV attrition as evidence that information dominance, not platform count, decides outcomes? (c) Russian — how does the deep-battle heritage explain both the Lancet's effectiveness and the failure to scale it? (d) Western — how does the maneuver-warfare tradition read high drone losses as proof that massed armor without air superiority is obsolete? (e) UN — what do drone-strike civilian-harm patterns imply for IHL proportionality and distinction when operators are kilometers away and targets are identified by video feed?

4. **Interpretation.** Do FPV drone loss rates of 30–70% per sortie imply that drones are replacing artillery, or that they are a complementary, high-attrition layer that consumes industrial capacity differently (batteries, motors, chips, operators) rather than replacing shell production? What would falsify each reading?

5. **Limitation.** Oryx-verified tank losses show Russia losing roughly 2,000+ tanks against Ukraine's 800+. What do these figures not capture — unverified losses, repaired and returned vehicles, tanks abandoned for lack of fuel or crews, and the difference between a destroyed tank and a mission-killed one — and how would each omission bias conclusions about which side is "winning" the attrition contest?

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — Combined Arms Integration Wheel (hand-drawn, A4 landscape)

- **What to draw:** A central circle labeled "Maneuver force / combined-arms team." Draw six spokes radiating outward to smaller circles: (1) Tanks/armor, (2) Infantry, (3) Artillery (tube + rocket), (4) Air power (CAS, SEAD), (5) ISR/EW, (6) Logistics/sustainment. Around the outer ring, draw a dashed "friction band" with labels: comms latency, weather, terrain, EW jamming, ammunition resupply, maintenance. Draw arrows between spokes showing dependencies: artillery → infantry (suppression), air → armor (SEAD), EW → all (EMS contest), logistics → all (sustainment).
- **Labels to place:** "Suppression," "SEAD," "EMS contest," "Sustainment," "Friction," "Tempo."
- **Perspective overlay:** Annotate in the margin: Russian (deep battle: echeloned, massed, sequential); Western (maneuver warfare: tempo, shock, dislocation); Chinese (informatized: sensor-to-shooter, joint); African (Sahel: light, mobile, hybrid, drone-enabled); UN (civilian harm at each node).

Visual 2 — Industrial Attrition Curve (hand-drawn, A4 landscape)

- **What to draw:** X-axis: time from Feb 2022 to Dec 2024 (monthly ticks). Y-axis: daily artillery shell consumption (0 to 50,000). Plot two lines: Russia (upper, fluctuating 10,000–40,000) and Ukraine (lower, declining from ~6,000 to ~2,500). Shade the gap between lines. Add a second, smaller y-axis or inset: NATO 155 mm production ramp (300,000 → 1.2M/year) and Russian surge. Mark vertical lines for key events: Kharkiv counteroffensive (Sep 2022), Bakhmut (Dec 2022–May 2023), 2023 counteroffensive (Jun 2023), North Korean supply (2024).
- **Labels to place:** "Shell hunger," "Fire superiority," "Production gap," "Stockpile depletion."
- **Perspective overlay:** Annotate: Western (industrial base as strategic asset); Russian (mobilized war

economy); Chinese (mass production vs precision); African (resource extraction and external supply dependence); UN (civilian harm from sustained bombardment).

Visual 3 — Drone–EW Contest Spectrum (hand-drawn, A4 portrait)

- **What to draw:** A 2×2 grid. X-axis: cost per unit (cheap COTS → exquisite). Y-axis: survivability under electronic warfare (low → high). Plot points: FPV quadcopter (cheap, low survivability), Lancet (mid cost, mid survivability), Bayraktar TB2 (mid-high cost, low survivability in contested EMS), Storm Shadow (exquisite, high survivability), Orlan-10 (mid, moderate). Draw a diagonal "contested EMS frontier" line separating survivable from non-survivable systems. Add a shaded "Sahel overlay" region: non-state actors, commercial drones, light weapons, no air defense.
- **Labels to place:** "COTS," "Contested EMS," "Exquisite," "Sahel overlay," "Attrition."
- **Perspective overlay:** Annotate: African (democratization of lethality; state weakness); Chinese (informationized warfare; sensor-to-shooter); Russian (deep battle + Lancet adaptation); Western (maneuver tradition challenged); UN (IHL proportionality at distance).

SECTION 4 — CORNELL NOTES

Cue (prompt)	Notes (with source log)
Define combined arms maneuver	Integration of tanks, infantry, artillery, air power, ISR/EW, and logistics into a mutually supporting team; Biddle (2004) emphasizes skill, coordination, and cover/concealment; Freedman (2017) on strategy and war. Source log: Biddle 2004; Freedman 2017.
Mechanism of artillery dominance	Massed fires suppress, fix, and destroy; create conditions for maneuver; in Ukraine, fire superiority substituted for maneuver when fronts stabilized. Source log: Watling 2022; RUSI 2022–24.
Why did shell hunger emerge?	Pre-war stockpiles depleted; NATO production base atrophied; propellant/explosives bottlenecks; political funding lag; Russian surge via mobilized industry and external supply. Source log: IISS Military Balance 2023–24; RUSI.
What do drone loss rates imply?	FPV attrition 30–70% per sortie; drones complement rather than replace artillery; consume different industrial inputs (chips, motors, batteries, operators). Source log: RUSI; Watling 2022.
HIMARS target sets logic	Deep precision fires against logistics nodes, bridges, command posts; disrupts tempo rather than front-line mass; Storm Shadow extends to strategic targets. Source log: Zaloga 2022; RUSI.

Cue (prompt)	Notes (with source log)
Tank losses: what do they measure?	Oryx-verified lower bounds; exclude unverified, repaired, abandoned; mission-kill vs destroyed distinction; crew quality and maintenance matter. Source log: Oryx; IISS.
Attrition vs maneuver theories	Attrition: destroy enemy capacity; maneuver: dislocate decision-making; Ukraine shows both, with attrition dominant in stabilized fronts. Source log: Biddle 2004; Freedman 2017.
African perspective (Sahel)	Hybrid conflict; commercial drones and light weapons; non-state actors; state fragility; external supply dependence; democratization of lethality. Source log: Aning; Danso (general arguments).
Chinese perspective	Informatized warfare; integrated joint operations; sensor-to-shooter; mass production; information dominance over platform count. Source log: PLA doctrine (general).
Russian perspective	Deep battle heritage; echeloned, massed fires; adaptation failures in 2022; Lancet effectiveness; mobilized industry. Source log: Zaloga 2022; RUSI.
Western perspective	Maneuver-warfare tradition; lessons of Ukraine; industrial base as strategic asset; combined-arms adaptation. Source log: Biddle 2004; Watling 2022.
UN perspective	Civilian harm data; IHL proportionality and distinction; accountability for strikes; protection of civilians. Source log: UN OCHA/OHCHR (general).

Summary (3–5 sentences): Conventional warfare in Ukraine demonstrates that industrial attrition, not maneuver alone, determines outcomes when fronts stabilize: artillery consumption, drone loss rates, and tank losses all point to a contest of production and sustainment. Combined arms remains necessary but is constrained by electronic warfare, mines, and logistics. Each perspective—African, Chinese, Russian, Western, UN—reads the same data through different premises about technology, industry, and legitimacy. The data are approximate and Oryx-verified losses are lower bounds, so conclusions about "winning" the attrition contest remain provisional. Mastering this lesson means distinguishing description, explanation, prediction, and prescription across all five lenses.

SECTION 5 — FEYNMAN COMPRESSION

Step 1 — Explain without jargon. In plain terms: modern war between large armies is still about who can make and move more stuff—shells, drones, tanks, fuel—faster than the other side can destroy it. When both sides dig in, the side that fires more and loses less wins slowly. Drones are cheap but break easily; artillery

is expensive but decisive; tanks need everything else to work. Factories and supply lines matter as much as generals.

Step 2 — Mark gaps. I am fuzzy on: (a) the exact share of Ukrainian shell consumption met by domestic vs. foreign production; (b) whether FPV loss rates are measured per sortie or per drone; (c) how many Russian tanks were repaired and returned versus permanently lost; (d) the precise causal weight of EW versus mines in stalling the 2023 counteroffensive; (e) how Sahel non-state drone use compares quantitatively to state use in Ukraine.

Step 3 — Reread verification. Rechecking against RUSI reports and Watling (2022): artillery rates are estimates, not official figures; Oryx counts are lower bounds; drone loss rates are the least reliable data point. The claim that NATO production rose toward ~1.2M shells/year by 2025 is consistent with IISS Military Balance 2023–24. The claim that Russian rates stayed above 10,000/day is an approximation from multiple sources, not a single verified series. No invented quotations were used; all attributions are to general arguments or report families.

Step 4 — Analogy with explicit limits. Analogy: industrial attrition is like two factories competing while also bombing each other's factories—the winner is whoever keeps producing after the other's line stops. Limits: (a) factories are not people; morale, leadership, and alliance politics also decide outcomes; (b) the analogy ignores information warfare and electronic contest; (c) it overstates symmetry—Russia and Ukraine had different pre-war industrial bases and external suppliers; (d) it cannot capture civilian harm, which is central to the UN perspective.

Step 5 — Rewrite. Conventional warfare and industrial attrition in Ukraine show that when maneuver stalls, outcomes are decided by production, sustainment, and adaptation across five domains—armor, infantry, artillery, air, and the electromagnetic spectrum. Combined arms remains the necessary framework, but its effectiveness depends on logistics and industrial depth that NATO had allowed to atrophy. Drones add a cheap, high-attrition layer that complements rather than replaces artillery. Reading this case requires all five perspectives: African (democratization of lethality and state fragility), Chinese (informationized joint operations), Russian (deep battle and mobilized industry), Western (maneuver tradition and industrial rearmament), and UN (civilian harm and IHL). The data are approximate and contested, so every conclusion about who is "winning" the attrition contest should be held as provisional and tested against falsifiers.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L22	Definition	What is combined arms maneuver?	It is the coordinated employment of tanks, infantry, artillery, air power, engineers, and logistics so that each arm compensates for the others' vulnerabilities. The mechanism is not mere simultaneity but mutual support under a unified command and control system.	Western doctrine often treats it as the culminating form of maneuver warfare; Russian deep-battle theory treats it as operational-level breakthrough.
L22	Mechanism	How does artillery dominance convert firepower into territorial control?	Artillery shapes the battlespace by suppressing, degrading, and fixing enemy forces before infantry or armor closes; in Ukraine, massed fires and counter-battery competition made movement costly. The mechanism is cumulative attrition of combat power and freedom of maneuver.	The UN perspective emphasizes that the same fires create civilian-harm and IHL compliance problems.

Tag	Card Type	Front	Back	Perspective Note
L22	Application	Why did the 2023 Ukrainian counteroffensive struggle to achieve rapid breakthrough?	It faced layered defenses, minefields, drone reconnaissance, and artillery fires that turned maneuver into sequential breaching under observation. The lesson is that maneuver requires not just platforms but tempo, surprise, and sustainment.	Western assessments stress planning and training gaps; Russian accounts stress defensive depth and fires.
L22	Comparison	What distinguishes attrition from maneuver as theories of victory?	Attrition seeks to exhaust the enemy's manpower, materiel, and will through cumulative loss; maneuver seeks to dislocate the enemy's decision-making and collapse cohesion faster than losses accumulate. The empirical question is which mechanism dominates under given technological and industrial conditions.	African hybrid-conflict experience often shows attrition-like exhaustion without decisive maneuver.

Tag	Card Type	Front	Back	Perspective Note
L22	Source	What is Biddle's (2004) central claim about military power?	Biddle argues that military effectiveness depends on the interaction of technology, doctrine, and organizational skill, especially combined arms integration, rather than on technology alone. The mechanism is skillful employment of complex systems under uncertainty.	This challenges both technocentric and platform-centric explanations of battlefield outcomes.
L22	Debate	What is the "return of industrial war" thesis?	It holds that high-intensity conventional war has re-exposed the importance of ammunition production, repair capacity, manpower replacement, and logistics endurance. The mechanism is that consumption outpaces exquisite stockpiles.	It reframes Ukraine not as an anomaly but as a reminder of industrial constraints.

Tag	Card Type	Front	Back	Perspective Note
L22	Reconstruction	How does Russian deep-battle heritage inform its warfighting?	Deep battle emphasizes operational breakthrough, echeloned forces, fires, and exploitation across depth. In Ukraine, adaptation failures included coordination problems, logistics strain, and underestimation of Ukrainian resistance.	The Russian perspective treats heritage as a resource; critics treat it as a source of rigidity.
L22	Occlusion	What does the Western maneuver-warfare tradition tend to occlude?	It can understate the industrial, logistical, and political foundations of sustained combat, especially when facing a peer with depth and fires. The occlusion is a bias toward tempo and decision over consumption and endurance.	This is why Western lessons from Ukraine emphasize adaptation rather than template transfer.

Tag	Card Type	Front	Back	Perspective Note
L22	Adjudication	Why did the 1991 Gulf War template fail in Ukraine 2023?	The Gulf War featured air supremacy, open terrain, a degraded opponent, and short logistics lines; Ukraine featured contested airspace, dense defenses, drones, mines, and an adaptive peer. The mechanism of victory was context-dependent, not portable.	Adjudication requires comparing scope conditions, not just outcomes.
L22	Visual	What does the drone and electronic-warfare spectrum represent?	It represents a contested electromagnetic environment in which cheap sensors, loitering munitions, and jamming compress the kill chain and make movement visible. The mechanism is persistent observation plus rapid precision strike at low cost.	Chinese informatized-warfare thinking treats this spectrum as central to joint operations.

Tag	Card Type	Front	Back	Perspective Note
L22	Definition	What is force generation in modern war?	Force generation is the process of recruiting, training, equipping, sustaining, and replacing military units over time. The mechanism links industrial capacity, personnel systems, and command structures to battlefield mass.	It is often invisible in platform-focused analysis but decisive in attrition.
L22	Mechanism	Why do logistics and ammunition dominate industrial attrition?	Because high-intensity war consumes shells, missiles, vehicles, and trained personnel faster than peacetime stockpiles and production lines can replace them. The mechanism is a mismatch between consumption rates and regeneration rates.	RUSI and IISS data are used to track this mismatch, though estimates vary.

Tag	Card Type	Front	Back	Perspective Note
L22	Application	What do HIMARS and Storm Shadow target sets illustrate?	They illustrate precision strike against logistics nodes, command posts, ammunition depots, and infrastructure, aiming to disrupt sustainment rather than only destroy frontline units. The mechanism is operational paralysis through deep targeting.	Their effectiveness depends on intelligence, air defense, and target adaptation.
L22	Comparison	How do COTS drones change the cost-exchange ratio?	Commercial off-the-shelf drones and components lower the cost of reconnaissance and strike, allowing weaker actors to impose costs on expensive platforms. The mechanism is asymmetric cost imposition and rapid iteration.	Sahel hybrid conflicts show similar low-cost adaptation by non-state actors.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence audit table

Competency	Self-assessed confidence (0-100)	Evidence of mastery to check
Combined arms integration		Can explain mutual support, not just list platforms.
Logistics and force generation		Can connect ammunition consumption to industrial capacity.
Artillery dominance in Ukraine		Can distinguish fires, suppression, and attrition.

Competency	Self-assessed confidence (0-100)	Evidence of mastery to check
Drone proliferation and EW		Can explain contested EMS and cost-exchange ratios.
Attrition vs maneuver		Can state scope conditions for each theory.
Five-perspective reconstruction		Can steel-man each perspective without caricature.
Data lab interpretation		Can identify trend, level of analysis, and limitation.
Adjudication of Gulf War vs Ukraine		Can specify why a template failed.

7.2 Three-question debrief

1. Which key idea most changed your prior assumption about modern conventional war, and what evidence would make you revise it again?
2. Where did your answer confuse description of events with explanation of mechanisms?
3. Which of the five perspectives did you underweight, and what did that omission hide?

7.3 Error-log table

Common Misconception	Correction	Evidence
More advanced weapons automatically produce maneuver victory.	Weapons matter through doctrine, training, logistics, and integration; technology alone is insufficient.	Biddle (2004) on military power and combined arms.
Ukraine proves maneuver warfare is obsolete.	Ukraine shows maneuver is harder under drones, mines, and fires, not that it is impossible.	2023 counteroffensive adaptation and defensive depth.
Artillery dominance means only shell counts matter.	Fires require targeting, logistics, survivability, and command coordination.	RUSI Ukraine reports on artillery and sustainment.
Cheap drones make expensive platforms irrelevant.	Drones raise costs and risks but do not eliminate the need for armor, air defense, and logistics.	Tank losses by type and drone loss rates in data lab.
The Gulf War template can be exported to any peer war.	Templates fail when scope conditions such as air supremacy and opponent weakness do not hold.	Comparison of 1991 Gulf War and Ukraine 2022-2024.

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Combined arms maneuver; logistics; force generation; artillery dominance; drone/EW; attrition vs maneuver	Mutual support; consumption vs regeneration; fires and suppression; contested EMS; cost-exchange ratio; dislocation vs exhaustion	Biddle (2004) on military power; Freedman (2017) on strategy; deep-battle heritage; maneuver-warfare tradition	Ukraine 2022-2024; 1991 Gulf War; Sahel hybrid conflicts; IISS Military Balance 2023-24; RUSI reports	Maneuver vs attrition; technology vs skill; industrial war vs precision war	A maneuver breakthrough despite dense drones and mines; no ammunition shortage despite high consumption; drones failing to affect movement	L20 strategic thought; L21 nuclear; L5 realism; L36 Ukraine dynamics; L38 energy coercion; L48 maritime strategy

SECTION 9 — REVIEW SCHEDULE

- **R1 — Immediate (same day):** Re-read the five key ideas and recite the bolded causal claims from memory; check any card you missed.
- **R2 — 24 hours:** Redraw the drone/EW and logistics visuals from Section 3 without notes; compare with the lesson.
- **R3 — 72 hours:** Write a 200-word adjudication of the Gulf War template in Ukraine using all five perspectives.
- **R4 — 1 week:** Re-run the Data Lab questions and explain one trend at each level of analysis.
- **R5 — 2 weeks:** Teach the attrition-vs-maneuver debate aloud in five minutes, then identify your weakest evidence and reread the relevant source.

SECTION 10 — COMPLETION CHECKLIST

☐ I can define combined arms maneuver as mutual support, not platform listing.
☐ I can explain the logistics and ammunition mechanism in industrial attrition.
☐ I can distinguish artillery suppression, degradation, and attrition.
☐ I can explain how drones and EW create a contested electromagnetic environment.
☐ I can compare attrition and maneuver as theories of victory with scope conditions.
☐ I can reconstruct the African, Chinese, Russian, Western, and UN perspectives.
☐ I can identify what each perspective contributes and occludes.
☐ I can explain why the 1991 Gulf War template failed in Ukraine 2023.
☐ I can use Biddle (2004) and Freedman (2017) accurately.
☐ I can interpret artillery shell consumption and drone loss-rate data.
☐ I can distinguish description, explanation, prediction, and prescription.
☐ I can state falsifiers for at least three key claims.
☐ I can link this lesson to L20, L21, L5, L36, L38, and L48.

☐ I can complete the independent memo headings without a sample.
☐ I can answer the hinge question and diagnose each distractor.
☐ I have logged at least one misconception in the error log.

FURTHER READING (Optional)

24. Asymmetric and Irregular Warfare

LESSON METADATA

Field	Value
Lesson number and title	Lesson 23 — Asymmetric and Irregular Warfare
Module	Module 4: Security Studies and Warfare
Prerequisites	L12 (Cold War, proxy wars); L20 (coercion); L8 (post-colonialism)
Interleaved links	Forward to L30 (Sahel); L34 (Sahel synthesis); L43 (Axis of Resistance); L50 (non-state actors)
Reading load	7-9 hours
Content channels	Text, data lab, visuals, flashcards, worked example
Bloom ceiling	Evaluate / Create
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

The central puzzle of this lesson is deceptively simple and stubbornly unresolved: why do states possessing overwhelming material superiority—advanced intelligence, precision fires, professional armies, and vast budgets—repeatedly fail to defeat materially weaker insurgent, terrorist, and irregular adversaries? The question is not academic. Since 1945, the record of counterinsurgency campaigns waged by great powers

and regional states alike is one of tactical competence married to strategic failure. The United States in Vietnam and Afghanistan, France in Algeria and the Sahel, the Soviet Union in Afghanistan, and a host of post-colonial states confronting rebellions within their own borders all illustrate a common pattern: the strong side wins battles, loses wars, and frequently leaves behind states more fragile than those it found. This lesson treats that pattern not as a collection of unfortunate cases but as a theoretical problem with identifiable mechanisms, scope conditions, and falsifiers. The student who masters it will be able to explain *why* material superiority is systematically discounted in irregular war, to adjudicate between competing theories of insurgency and counterinsurgency, and to reconstruct how five distinct analytical traditions—African, Chinese, Russian, Western, and UN—frame the same conflict in incommensurable ways.

The lesson sits at a hinge point in the curriculum. It presupposes three earlier lessons. From L12, the student carries an understanding of Cold War proxy wars and the logic of superpower delegation to local clients. From L20, the student brings the coercion framework—deterrence, compellence, and the distinction between punishment and denial. From L8, the student brings post-colonial theory: the argument that many post-colonial states are not Weberian monopolies of legitimate force but arenas of negotiated, fragmented, and hybrid authority. Asymmetric and irregular warfare is where these three streams converge. Coercion theory explains why bombing campaigns fail to compel insurgents who value survival over territory; proxy-war theory explains why external patrons cannot fully control the clients they arm; post-colonial theory explains why the "state" that counterinsurgents are trying to strengthen may never have existed in the form assumed by doctrine. The lesson also projects forward: L30 and L34 take up the Sahel in depth, L43 examines the Axis of Resistance as a networked irregular actor, and L50 generalizes the non-state actor problem. What is learned here about mechanism and perspective becomes the scaffolding for those later analyses.

The theoretical lineage the lesson develops is deliberately plural. It begins with Mao's *On Guerrilla Warfare* (1937), which theorized insurgency as a three-phase political-military process in which the insurgent wins not by defeating the enemy army but by eroding its political legitimacy and out-administering it in the countryside. It moves to David Galula's *Counterinsurgency Warfare* (1964), the French colonial officer's distillation of population-centric logic: the center of gravity is the population, and the insurgent must be isolated from it. It then introduces Andrew Krepinevich's critique that Galula's heirs in the US military became enemy-centric—obsessed with killing insurgents rather than protecting populations—and David Kilcullen's concept of the "accidental guerrilla," the local fighter drawn into conflict by the presence of foreign forces rather than by ideology. These debates are not historical curiosities; they structured US doctrine in Iraq and Afghanistan and French doctrine in the Sahel, and their failures are the lesson's empirical core. Beyond counterinsurgency proper, the lesson examines proxy warfare through the principal-agent lens, the privatization of violence through private military companies and Russia's Wagner Group and its successor Africa Corps, the "greed versus grievance" debate initiated by Paul Collier and Anke Hoeffler, and hybrid warfare as the contemporary blurring of regular and irregular, state and non-state, peace and war.

The African perspective is not a regional illustration of these theories; it is the vantage point from which the theories themselves are interrogated. African scholarship—William Reno on warlord politics, Jean-François Bayart on the "politics of the belly," Mahmood Mamdani on the colonial legacy of indirect rule, and a generation of Sahelian analysts—argues that the Western counterinsurgency canon misdiagnoses the problem. The issue is not that states fail to apply Galula correctly; it is that the state form itself, inherited from colonialism and sustained by external patronage, never achieved the monopoly of legitimate force that doctrine presupposes. In the Sahel, security has long been privatized, hybrid, and negotiated: militias, self-defense groups, customary authorities, and transnational jihadist networks coexist and compete. From this vantage, Russian security export, Chinese arms and training, Western counterterrorism, and UN peacekeeping are

not alternative solutions to a common problem but interventions into a political economy they only partially comprehend. The lesson therefore frames the Sahel not as a failed application of Western doctrine but as a case that exposes the doctrine's scope conditions.

What the student will be able to do after mastering this lesson is specific and assessable. First, identify the mechanism by which a given theory of insurgency or counterinsurgency is supposed to work, and state its scope conditions—when it applies, when it fails, and what evidence would falsify it. Second, reconstruct each of the five perspectives on a given case without straw-manning, showing what each contributes and what it occludes. Third, adjudicate between competing explanations of a case such as the Sahel or Afghanistan on the basis of evidence rather than theoretical preference. Fourth, distinguish description, explanation, prediction, and prescription in policy-relevant writing—a skill tested in the independent memo. Fifth, use data—ACLED event counts, civilian fatality distributions, PMC deployment estimates—to discipline theoretical claims rather than to decorate them. The lesson's data lab makes this concrete: students will work with ACLED conflict-event data for the Sahel 2012–2025, PMC deployment estimates, and civilian fatality data disaggregated by perpetrator, learning to read quantitative evidence as a check on narrative.

A final word on method. This lesson refuses the common move of treating irregular warfare as a deviation from "real" war between states. The state-centric model of war—uniformed armies, declared hostilities, territorial objectives—is historically specific and, in much of the world, empirically rare. Irregular, asymmetric, and hybrid forms are not pathologies of modernity but constitutive features of how political violence is actually organized. The lesson's five key ideas—insurgency and counterinsurgency, proxy warfare, privatization of violence, greed versus grievance, and hybrid warfare—are therefore not a grab-bag of topics but a progression from the classical theory of revolutionary war through the contemporary dissolution of the state monopoly of force. Each idea is presented with its mechanism, scope conditions, observable implications, and strongest counterargument. No theory is treated as settled truth. The student's task is not to memorize doctrines but to learn how to test them against cases, data, and perspectives that the doctrines themselves did not anticipate.

SECTION 1 — Pre-Class Priming

1.1 Retrieval Warm-Up Answer these from memory before reading further. Each draws on a prerequisite lesson.

1. **(L12 — Cold War proxy wars)** Define a proxy war and identify the principal-agent problem that arises when a great power delegates fighting to a local client. Give one Cold War example.
2. **(L12)** What is the difference between a "client state" and a "proxy," and why does the distinction matter for control?
3. **(L20 — coercion)** Distinguish deterrence from compellence, and explain why compellence is generally harder to achieve than deterrence.
4. **(L20)** In coercion theory, what is the difference between punishment and denial strategies, and which is more likely to be effective against a non-state actor that values survival over territory?
5. **(L8 — post-colonialism)** What does Mahmood Mamdani mean by the "bifurcated state," and how does indirect rule shape post-colonial political authority?
6. **(L8)** How does Jean-François Bayart's concept of the "politics of the belly" challenge Weberian assumptions about the state as a rational-legal monopoly of legitimate force?

1.2 Orientation Questions These frame the lesson's central puzzle. Hold them in mind as you read.

1. Why did the United States, despite spending over two trillion dollars and deploying hundreds of thousands of troops, fail to defeat the Taliban in Afghanistan between 2001 and 2021? Was the failure primarily tactical, strategic, or political?
2. France's Operation Barkhane (2014–2022) achieved repeated tactical successes against jihadist groups in the Sahel yet was expelled by the very states it was protecting. What does this tell us about the relationship between military effectiveness and political legitimacy?
3. If Collier and Hoeffler are right that civil wars are driven primarily by economic "greed" rather than political "grievance," what follows for how we should design peacebuilding and counterinsurgency? If they are wrong, what follows?
4. How does the rise of private military companies and Russia's Africa Corps change the principal-agent problems of proxy warfare, and does privatization of violence make control easier or harder for sponsoring states?

1.3 Vocabulary Pre-Teach Provisional definitions to be refined as you read.

- **Asymmetric warfare**: Armed conflict between actors with markedly unequal capabilities, in which the weaker side avoids direct confrontation and exploits the stronger side's political and operational vulnerabilities.
- **Irregular warfare**: A broad category of conflict in which non-state or state actors use unconventional methods—guerrilla tactics, terrorism, subversion, information operations—rather than conventional force-on-force engagements.
- **Insurgency**: An organized, protracted political-military struggle by non-state actors to overthrow or weaken an existing government, combining armed action with political mobilization and shadow governance.
- **Counterinsurgency (COIN)**: The set of military, political, economic, and informational activities undertaken by a state (often with external support) to defeat an insurgency and strengthen legitimate authority.
- **Population-centric COIN**: A doctrine holding that the decisive terrain is the civilian population; the insurgent must be isolated from popular support through protection, governance, and legitimacy-building.
- **Enemy-centric COIN**: A doctrine prioritizing the destruction or capture of insurgent fighters and leadership, treating the enemy rather than the population as the center of gravity.
- **Proxy war**: A conflict in which an external power supports a local armed actor to advance its interests while avoiding direct engagement, creating principal-agent dynamics.
- **Principal-agent problem**: The difficulty a principal (sponsor) faces in ensuring that an agent (client or contractor) acts in the principal's interest rather than its own.
- **Private military company (PMC)**: A commercial firm providing military or security services for profit, ranging from logistics and training to direct combat operations.
- **Greed vs. grievance**: The debate, associated with Collier and Hoeffler, over whether civil wars are driven primarily by economic opportunity ("greed") or by political injustice and identity ("grievance").
- **Hybrid warfare**: The contemporary blending of conventional and unconventional, military and non-military, state and non-state means, deliberately blurring the boundaries between war and peace.
- **State fragility**: A condition in which a state lacks the capacity or legitimacy to perform core functions—security, service delivery, dispute resolution—across its territory, creating space for

non-state armed actors.

SECTION 2 — LESSON CORE

2.1 Learning objectives

By the end of this lesson, the student will be able to:

1. **Explain** the mechanism through which an insurgency converts latent grievance into organized political control, and why counterinsurgency must reconfigure civilian networks rather than merely attrite armed fighters.

2. **Analyze** the theoretical lineage from Mao's phased people's war through Galula's population-centric laws to Krepinevich's critique of enemy-centric warfare, identifying the scope conditions under which each model is plausible.

3. **Evaluate** whether a given counterinsurgency campaign is population-centric or enemy-centric by using observable indicators such as civilian harm, territorial control, local governance, and insurgent regeneration.

4. **Reconstruct** African, Chinese, Russian, Western, and UN perspectives on insurgency and counterinsurgency, stating what each perspective contributes and what it systematically occludes.

5. **Apply** the four levels of analysis—individual, state, systemic, and transnational—to explain why a counterinsurgency campaign that succeeds tactically may still fail politically.

2.2 KEY IDEA 1 — Insurgency and counterinsurgency: Mao, Galula, Krepinevich, the population-centric vs enemy-centric debate

Bolded Causal Claim: Insurgency is a political process in which armed actors convert grievance into organized control by embedding themselves in civilian social networks; counterinsurgency succeeds only when it reconfigures those networks through protection, governance, and selective coercion, and fails when it treats the conflict as a conventional war of attrition against enemy fighters.

Mechanism: The core mechanism is competitive political mobilization under conditions of contested sovereignty. Mao's theory of revolutionary war, developed in *On Guerrilla Warfare* (1937), treats insurgency as a phased process: strategic defensive, strategic stalemate, and strategic offensive. The decisive variable is not firepower but the relationship between the armed actor and the population. Mao's famous formulation that the guerrilla must move among the people as a fish swims in the sea captures a mechanism of concealment, recruitment, intelligence, and logistical dependence. The insurgent does not merely hide among civilians; the insurgent organizes them, taxes them, adjudicates disputes, and converts fear or grievance into compliance and, eventually, participation. Violence is therefore instrumental to political consolidation: assassination removes rivals, sabotage signals state weakness, and reprisals discipline neutrals.

David Galula's *Counterinsurgency Warfare* (1964), drawing on French experience in Algeria, systematizes

the counterinsurgent response. Galula's central mechanism is the "ink spot": security is established in a limited area, held, and then expanded through governance and services until the population's default allegiance shifts from insurgent to state. His four laws—(1) the best weapon is political, (2) support of the population is indispensable, (3) the 20 percent active minority must be isolated from the 80 percent passive majority, and (4) action must be concentrated in specific areas—imply that counterinsurgency is a competition for legitimacy rather than a search-and-destroy campaign. The mechanism is not simply killing insurgents; it is changing the population's cost-benefit calculation by making the state the more reliable provider of security and justice.

Andrew Krepinevich's *The Army and Vietnam* (1986) sharpens the distinction between enemy-centric and population-centric warfare. Enemy-centric warfare assumes that the insurgent force is the center of gravity and that destroying it will end the conflict. Population-centric warfare assumes that the population is the center of gravity and that insurgent regeneration will continue as long as grievances, insecurity, and weak governance persist. The mechanism of failure in enemy-centric campaigns is therefore regenerative: even high body counts do not reduce insurgent capacity if recruitment, financing, and sanctuary remain intact. Population-centric campaigns, by contrast, attempt to break the regenerative loop by securing civilians, building local institutions, and creating incentives for defection.

The mechanism also includes feedback loops that can defeat either side. Insurgent violence can produce displacement, which may either weaken the insurgent base or create a reservoir of recruits. State violence can produce the "accidental guerrilla" dynamic described by David Kilcullen in *The Accidental Guerrilla* (2009): local actors who are not ideologically committed to the insurgent cause may fight the state because of coercion, honor, or retaliation. Counterinsurgency can therefore generate the very resistance it seeks to suppress if it relies on indiscriminate force. The decisive mechanism is not the elimination of all violence but the management of political allegiance under conditions of insecurity.

Scope Conditions: This model applies most clearly to rural or semi-rural insurgencies in which the state has weak presence, the insurgent can embed in kinship or ethnic networks, and the population is not fully mobilized for either side. It is less adequate for urban insurgencies, purely criminal insurgencies, or conflicts in which the insurgent is primarily an external proxy with little local base. Population-centric counterinsurgency requires sufficient troop density, time horizons measured in years or decades, host-state capacity, and political willingness to absorb casualties and costs. It also requires that the state be reformable: if the state is predatory, corrupt, or exclusionary, "winning hearts and minds" may be impossible because the state itself is the grievance. Conversely, enemy-centric warfare may be temporarily effective when insurgents are isolated, lack popular support, and depend on external sanctuary that can be interdicted. The model does not imply that all insurgencies are winnable through better tactics; some are symptoms of deeper political crises that military force cannot resolve.

Observable Implications: If the population-centric model is operating, one should observe spatially concentrated security gains, declining civilian fatalities attributable to state forces, increased reporting of insurgent activity by civilians, local governance indicators such as functioning courts or service delivery, and insurgent difficulty in recruiting or taxing. If the enemy-centric model dominates, one should observe high insurgent body counts alongside persistent or increasing attacks, displacement, civilian casualties, and insurgent regeneration. A campaign that claims success while violence simply shifts to adjacent regions may be displacing rather than defeating the insurgency. Data from conflict-event datasets such as ACLED can be used to test these implications by comparing trends in battles, violence against civilians, and remote violence across space and time. However, observable implications must be interpreted cautiously: a decline in reported

events may reflect underreporting, displacement, or insurgent strategic restraint rather than genuine control.

Perspective Note (five traditions in brief):

African (primary): From an African vantage point, insurgency and counterinsurgency must be read through the history of colonial state formation and postcolonial political order. African scholarship does not treat the state as a neutral container that has temporarily lost control; it treats the state as an arena of accumulation, exclusion, and coercion whose legitimacy is often thin. Mamdani's analysis of the bifurcated colonial state, in which rural subjects were governed through "customary" authorities while urban citizens accessed modern rights, helps explain why insurgency often emerges from populations who experience the state as an external, extractive force rather than a provider of security. Bayart's work on the "politics of the belly" and the extraversion of African states suggests that political authority is often maintained through clientelism and external patronage, not through the kind of population-centric legitimacy assumed by Western counterinsurgency doctrine. Mbembe's reflections on commandement and necropolitics highlight how violence can become a mode of governance rather than a temporary deviation from it. Rodney's and Nkrumah's analyses of underdevelopment and neocolonialism further imply that insurgency may be a response to structural economic marginalization and external domination, not merely to local grievances. From this perspective, the population is not a passive prize to be won by either side; it is already embedded in hybrid governance systems involving chiefs, militias, religious authorities, traders, and kin networks. Counterinsurgency that ignores these systems may destroy local authority without replacing it, producing a security vacuum. African scholarship also warns that external counterinsurgency often strengthens abusive security forces and authoritarian incumbents, turning "stabilization" into regime preservation. The African vantage therefore reveals what Western doctrine often occludes: the problem may not be that the state lacks capacity to implement population-centric COIN, but that the state's existing mode of rule is itself a source of insurgency. This perspective is the longest and most developed here because it reframes the central puzzle from "how to defeat insurgents" to "how political authority is constituted, contested, and repaired in contexts of fragmented sovereignty."

Chinese: The Chinese perspective is shaped by Maoist revolutionary doctrine and by a contemporary emphasis on sovereignty, non-interference, and state capacity. Mao's theory remains a foundational text for understanding insurgency as political mobilization, and Chinese strategic thought tends to view counterinsurgency as a problem of political legitimacy, mass mobilization, and development rather than as a purely military campaign. In contemporary practice, China generally avoids expeditionary counterinsurgency and instead emphasizes security cooperation, arms transfers, training, and infrastructure development in support of host-state sovereignty. The Chinese vantage contributes the insight that external powers cannot substitute for local political authority and that economic development and state capacity are central to stability. It also tends to occlude the possibility that host governments themselves may be predatory or exclusionary, because non-interference limits pressure for political reform. Thus Chinese analysis often treats insurgency as a threat to order that must be managed by the sovereign state, with external actors playing a supporting rather than transformative role.

Russian: The Russian perspective draws on Soviet and post-Soviet experience, including the Afghan war and the Chechen conflicts, and tends to be more skeptical of population-centric counterinsurgency than Western doctrine. Russian strategic culture often emphasizes enemy-centric coercion, regime survival, and the use of force to impose order, while treating political grievances as secondary or as products of external manipulation. In contemporary Africa, Russian security export through private military companies such as Wagner and its successor structures is framed as anti-Western partnership and regime protection rather than as liberal state-

building. The Russian vantage contributes an insistence that insurgencies are often externally supported and that state collapse can be more dangerous than authoritarian consolidation. It occludes, however, the role of domestic governance failures and human-rights abuses in generating recruitment, and it risks conflating counterinsurgency with counter-regime-change. Its strength is a clear-eyed view of power and coercion; its weakness is a tendency to underestimate the political sources of insurgent resilience.

Western: The Western perspective is the most explicitly theorized in contemporary counterinsurgency doctrine, especially through U.S. and allied military manuals and the work of scholars such as Kilcullen. It emphasizes population-centric operations, "clear-hold-build," metrics of effectiveness, and the integration of military, diplomatic, and development tools. The Western vantage contributes a sophisticated understanding of insurgent adaptation, the importance of civilian protection, and the need to align military operations with political objectives. It also includes a significant self-critical literature, particularly after Iraq and Afghanistan, that questions whether external powers can build legitimate local institutions. Its occlusion is structural: Western COIN often assumes that the intervening state is a neutral or benevolent actor and that local partners share its objectives. It frequently underestimates colonial legacies, local political economies, and the possibility that host-state elites benefit from continued insecurity. The result can be a technically refined campaign that fails because it misidentifies the political center of gravity.

UN: The UN perspective approaches insurgency and counterinsurgency through mandates for peacekeeping, civilian protection, human rights, and the rule of law. It is less concerned with defeating insurgents than with protecting civilians, supporting political processes, and maintaining international legitimacy. The UN vantage contributes a normative framework that constrains the use of force and emphasizes accountability, as well as practical experience in complex missions such as MINUSMA in Mali. It occludes, however, the enforcement gap: peacekeeping mandates often lack the capacity, consent, or political backing to compel compliance by armed actors. The UN perspective also tends to treat insurgency as a threat to civilians and to the peace process rather than as a political project with its own logic. Its strength is the insistence that counterinsurgency without civilian protection is self-defeating; its weakness is that mandate language cannot by itself create the local political authority required for durable security.

2.3 KEY IDEA 2 — Proxy Warfare: Principal-Agent Problems, Delegation, Autonomy, and the Limits of Control

Bolded Causal Claim: Proxy warfare is not merely the outsourcing of violence but a structurally unstable delegation relationship in which the principal's strategic preferences and the agent's operational imperatives diverge in predictable ways, producing conflicts that are longer, more destructive, and less controllable than either direct intervention or autonomous rebellion.

Mechanism: The mechanism is principal-agent theory applied to armed conflict. When a state (the principal) delegates military action to a non-state or subordinate state actor (the agent), it does so because direct intervention is too costly in blood, treasure, or political legitimacy. The agent possesses local knowledge, linguistic capacity, and deniability that the principal lacks. But this delegation creates information asymmetry: the agent knows more about the battlefield than the principal can monitor. The agent also has its own preferences—survival, territorial control, resource extraction, ethnic or sectarian agendas—that overlap only partially with the principal's. Monitoring is expensive and often impossible in real time; the principal cannot observe whether the agent is fighting the enemy or consolidating its own power. The agent, in turn, can manipulate the principal by exaggerating threats, concealing failures, or escalating in ways that force the

principal to deepen its commitment (entrapment). The principal's main sanction—withdrawal of support—often harms the principal's own strategic goals more than the agent's, because the agent can seek alternative patrons or revert to autonomous predation. This produces a ratchet effect: once delegation begins, disengagement becomes costlier than continuation. The result is a conflict dynamic in which neither party fully controls the trajectory, and in which the agent's autonomy grows over time as it accumulates resources, legitimacy, and organizational capacity.

Salehyan (2010) formalizes this as "delegation of war to rebel organizations," showing that state sponsorship increases rebel capacity while reducing state control. His model predicts that sponsored rebels are more likely to survive and to escalate, but also more likely to defy their patrons when their interests diverge. Bapat (2012) demonstrates that states sponsor militants precisely when they seek to avoid the costs of direct confrontation, but that sponsorship creates path dependencies that outlast the original strategic rationale; his analysis of state sponsorship shows that the decision to delegate is often irreversible because the agent's survival becomes tied to the principal's credibility. Mumford (2013) extends this to great-power competition, arguing that proxy warfare has become the dominant form of interstate conflict in the post-Cold War era precisely because nuclear deterrence and economic interdependence make direct war between major powers prohibitively costly. The mechanism also operates through "chains of delegation": a great power delegates to a regional state, which delegates to a militia, which delegates to a sub-militia, with each link adding information loss and preference divergence. Byman (2005) and Hughes (2014) document how this chain structure characterized US support for Afghan mujahideen and later Syrian rebels, with each intermediary extracting rents and pursuing independent agendas.

The principal-agent framework also illuminates the "moral hazard" problem: because the agent does not bear the full cost of escalation, it may take risks the principal would not authorize. This is visible in the way proxy forces frequently attack civilian populations or cross borders in ways that trigger unwanted retaliation against the principal. The principal's response—tightening control—often backfires by reducing the agent's effectiveness or driving it to seek alternative sponsors. The mechanism is thus not a stable equilibrium but a dynamic process of bargaining, manipulation, and gradual loss of control.

Scope Conditions: Proxy warfare is most likely when three conditions coincide: (1) the principal faces high costs of direct intervention (domestic opposition, casualty aversion, legal constraints, or nuclear deterrence); (2) the agent possesses sufficient organizational capacity to act independently; and (3) the agent's preferences overlap with the principal's on the primary objective but diverge on secondary ones (territorial control, resource distribution, post-conflict order). When the agent is fully dependent on the principal for survival, control is higher but the agent's military effectiveness is lower; when the agent is fully autonomous, effectiveness may be higher but control is minimal. The most dangerous configuration is the "capable but misaligned" agent, which can drag the principal into unwanted escalations. Proxy warfare is also more likely in contexts of weak state sovereignty, where multiple external actors can sponsor competing factions, creating a "market for violence" in which agents play principals against each other. The model assumes rational actors; it struggles to explain proxy relationships driven by ideology, kinship, or historical obligation, which may produce tighter alignment but also more rigid escalation. Additionally, the framework works best when the principal is a state; non-state principals (e.g., diaspora networks, corporations) introduce different incentive structures that the standard model does not capture well.

Observable Implications: If the principal-agent model holds, proxy conflicts should exhibit: (a) longer duration than non-proxy civil wars, because the principal's resources sustain the agent beyond its natural capacity; (b) higher civilian casualties, because the agent faces weaker accountability constraints than a

state military; (c) periodic crises in which the principal threatens withdrawal and the agent escalates to demonstrate indispensability; (d) eventual agent defection or "blowback," in which the agent turns against the principal or pursues independent goals; and (e) post-conflict instability, because the agent's military capacity outlasts the political settlement. The model also predicts that principals will invest in monitoring mechanisms (intelligence liaison, embedded advisors, conditional aid) that partially but never fully close the information gap. Observable implications for the Sahel include the way Malian armed groups have shifted allegiances between French, Russian, and regional patrons, and the way Tuareg and jihadist factions have exploited external support to build autonomous territorial control. The 2012 MNLA rebellion, initially supported by various external actors, illustrates how an agent can rapidly outgrow its principal's control and pursue objectives (independence) that the principal never endorsed. Similarly, the evolution of jihadist groups in the Sahel from local insurgencies to transnational actors with their own funding and recruitment networks demonstrates the autonomy trajectory predicted by the model.

Perspective Note (five traditions in brief): The African perspective treats proxy warfare not as an external imposition but as a structural feature of post-colonial statehood, in which weak sovereignty invites external manipulation and in which African actors exercise agency within dependency. Grovogui's critique of international order and Mbembe's analysis of necropolitics frame proxy dynamics as continuous with colonial extraction; Mamdani's work on the bifurcated state explains why African governments lack the capacity to monopolize force, making them vulnerable to both external sponsorship and internal predation. The African vantage emphasizes that "proxies" are also political actors with their own projects, not mere instruments. African scholarship also highlights the way proxy relationships have been used by African elites themselves—to secure regime survival, to manage ethnic politics, and to extract resources—rather than only by external powers. The Chinese perspective emphasizes non-interference and opposes proxy warfare as a violation of sovereignty; Beijing's security cooperation is framed as state-to-state, avoiding the delegation logic that characterizes Western and Russian engagement. The Russian perspective has historically used proxy warfare extensively (Cold War, Syria) and frames it as legitimate support for sovereign governments against Western-backed insurgents; in Africa, the Wagner/Africa Corps model blurs proxy and direct engagement. The Western perspective has a long tradition of proxy warfare (Cold War, Afghanistan) and a corresponding literature of self-critique; it tends to frame proxy relationships as regrettable necessities and emphasizes "partner capacity building" as a more legitimate alternative. The UN perspective opposes proxy warfare as a violation of the UN Charter and emphasizes state sovereignty and non-intervention; in practice, UN peacekeeping operates in environments shaped by proxy dynamics that mandates cannot fully address.

2.4 KEY IDEA 3 — The Privatization of Violence: PMCs, Wagner, Africa Corps, and the Market for Force

Bolded Causal Claim: The privatization of violence does not merely supplement state capacity but restructures the political economy of security, creating a market in which coercive services are allocated by purchasing power rather than by citizenship, and in which accountability is governed by contract law rather than by public constitutional order.

Mechanism: The mechanism begins with state failure or state choice. States that cannot provide security (weak states) or that wish to avoid the political costs of casualties and accountability (strong states) turn to private military and security companies (PMCs/PSCs) to perform functions ranging from logistics and training to direct combat. The market for force operates on supply and demand: demand is generated by governments,

corporations, and international organizations facing security gaps; supply is provided by firms staffed by former military personnel, often from the global North, operating under commercial contracts. Singer (2003) traces the rise of this industry from the post-Cold War downsizing of Western militaries, which created a surplus of trained personnel and a demand for their services in conflict zones. Avant (2005) analyzes the market dynamics, showing that competition among firms drives down costs but also erodes standards, and that the principal-agent problems of proxy warfare recur in the client-firm relationship. The critical transformation occurs when PMCs move from defensive and support roles to offensive combat operations, as in the case of Wagner Group in Syria, Libya, and the Central African Republic, and its successor Africa Corps in the Sahel. These entities are not merely contractors but state-linked instruments operating under deniability: the Russian state provides weapons, intelligence, and political cover while the firm absorbs operational risk and legal liability. This creates a hybrid form that is neither fully state nor fully private, exploiting the gap between international humanitarian law (which regulates state armed forces) and commercial law (which regulates companies).

Reno (2011) situates this within African political economy, showing how the privatization of violence interacts with "shadow states" in which rulers use external force providers to maintain power without building accountable institutions. The mechanism produces several pathologies: firms have incentives to prolong conflicts that generate revenue; they are accountable to clients rather than to populations; their personnel operate under weaker disciplinary constraints than state soldiers; and their presence can displace state capacity-building by providing a cheaper short-term alternative. Percy (2007) examines the historical antecedents, showing that mercenary activity has been a recurring feature of warfare and that modern PMCs represent a rebranding rather than a novel phenomenon. The Montreux Document (2008) and the International Code of Conduct for Private Security Providers (2010) represent attempts to regulate this market, but enforcement remains weak and many major providers operate outside these frameworks. The mechanism also involves "regulatory arbitrage": firms incorporate in permissive jurisdictions, use subcontracting chains to obscure accountability, and exploit the ambiguity of "security services" versus "combat operations" in contract language.

The privatization of violence also transforms the relationship between force and territory. Traditional state military forces are tied to territorial sovereignty; private forces are mobile and can be deployed wherever contracts exist, creating "security enclaves" around extractive sites, government buildings, or transport corridors without extending state authority across the broader territory. This produces a fragmented security landscape in which some spaces are heavily protected while others are abandoned, a pattern visible in the Sahel where mining sites and capital cities receive private security while rural areas remain exposed to insurgent violence.

Scope Conditions: The privatization of violence flourishes under specific conditions: (1) a gap between security demand and state supply, whether due to state weakness, donor fatigue, or political constraints on deployment; (2) a legal and regulatory environment that permits or fails to prohibit mercenary-like activity; (3) the availability of surplus military labor from demobilized forces or retired personnel; and (4) great-power competition that incentivizes deniable force projection. The model is less applicable where states maintain strong monopolies on force and robust legal frameworks, or where international norms against mercenary activity are effectively enforced. It is also important to distinguish between different types of private force: defensive security companies protecting extractive industries (common in Africa), offensive combat units (Wagner/Africa Corps), and state-embedded contractors (US logistics firms in Iraq/Afghanistan). Each has different implications for state capacity and civilian protection. The "market for force" framework assumes that violence can be commodified; critics argue that this framing obscures the political and social dimensions of coercion, treating security as a service rather than a public good. The framework also struggles to

account for the ideological and political motivations of state-linked PMCs like Wagner, which are not purely commercial actors but instruments of state power operating through commercial forms.

Observable Implications: If the privatization thesis holds, we should observe: (a) a growing share of security provision by non-state actors in conflict zones; (b) regulatory arbitrage, with firms relocating to permissive jurisdictions; (c) civilian harm incidents involving private contractors that go unpunished; (d) state dependency on external force providers, with corresponding atrophy of public security institutions; and (e) the emergence of "security markets" in which different armed actors compete for contracts, sometimes switching sides. In the Sahel, the replacement of French forces by Africa Corps in Mali and Burkina Faso, and the reported use of private contractors in Niger, provide test cases. Observable implications also include the difficulty of distinguishing between state and non-state violence in data collection: ACLED and other databases often struggle to attribute events to "Wagner" versus "Russian forces" versus "Malian army," reflecting the deliberate ambiguity of the model. The privatization of violence also predicts that extractive industries will increasingly rely on private security, creating enclaves of protection amid broader insecurity. Additionally, the model predicts that states using PMCs will experience slower development of indigenous military capacity, as the availability of private force reduces the incentive to invest in public institutions.

Perspective Note (five traditions in brief): The African perspective is primary and longest here because the privatization of violence is experienced most acutely on the continent, where colonial and post-colonial states have never fully monopolized force. African scholars frame the market for force as continuous with the colonial concessionary company model—entities like the Royal Niger Company or the Congo Free State's Force Publique that combined commercial extraction with coercive capacity. Mbembe's necropolitics and Bayart's "politics of the belly" illuminate how African rulers have historically outsourced violence to maintain power without accountability. Reno (2011) shows how "shadow states" in Africa rely on external force providers to bypass institutional constraints. The African vantage emphasizes that PMCs are not new but a reconfiguration of older patterns of externalized coercion, and that the "market for force" framing risks obscuring African agency and the demand side: African governments and elites choose to hire these forces for reasons of regime survival, not merely because supply exists. African scholarship also highlights the gendered dimensions of privatized violence, with Tamale and Oyěwùmí pointing to how the militarization of private security reinforces patriarchal structures of authority and exclusion. The Chinese perspective is critical of private military companies as violations of sovereignty and non-interference; Beijing prefers state-to-state security cooperation and has been cautious about deploying PMCs, though Chinese private security firms operate in Africa protecting Belt and Road investments, creating tensions with the non-interference principle. The Russian perspective has embraced the PMC model as a tool of great-power competition, framing Wagner/Africa Corps as legitimate security assistance to sovereign governments against terrorism and Western interference; Moscow emphasizes that these forces operate at the invitation of host governments, distinguishing them from Western intervention. The Western perspective is ambivalent: it pioneered the modern PMC industry (US contractors in Iraq/Afghanistan) and has extensive regulatory frameworks, but also criticizes Russian PMCs as destabilizing and unaccountable; Western self-critique focuses on the accountability gaps and the erosion of the state monopoly on force. The UN perspective opposes the use of mercenaries under the 1989 International Convention against the Recruitment, Use, Financing and Training of Mercenaries, and emphasizes that private force providers must comply with international humanitarian law; in practice, UN peacekeeping missions have sometimes relied on private contractors for logistics, creating tensions with the organization's normative stance.

2.5 KEY IDEA 4 — The "Greed vs. Grievance" Debate and the Political Economy of Civil War

Bolded Causal Claim: Civil-war onset and duration are driven less by the sheer intensity of popular grievance than by the economic feasibility of rebellion—especially access to lootable resources, low opportunity costs, and weak state fiscal capacity—although grievance often supplies the mobilizing narrative and shapes the political aims that make violence meaningful.

Mechanism: The Collier–Hoeffler research program reframes civil war as a problem of rebel supply and demand rather than as an automatic expression of mass discontent. In this account, rebellion requires finance, recruits, and a permissive environment; grievance may lower the cost of recruitment, but it does not by itself create a viable insurgency. The mechanism runs through four channels. First, lootable point-source resources—diamonds, oil, coltan, timber, narcotics, or artisanal minerals—provide rebels with revenue streams that are easier to capture and tax than broad-based agricultural wealth. Second, low per capita income reduces the opportunity cost of fighting, making recruitment cheaper and prolonging war. Third, diaspora communities and external patrons can finance rebellion, creating a transnational political economy of conflict. Fourth, weak states lack the fiscal and coercive capacity to police territory, collect taxes, or provide public goods, so rebels can establish parallel taxation and governance. Grievance theories, by contrast, trace violence to relative deprivation, horizontal inequalities, political exclusion, and identity-based humiliation. Ted Robert Gurr's relative-deprivation framework and later work on horizontal inequalities argue that groups compare their status to others and rebel when institutional channels for redress are blocked. The two traditions are not simply opposites: grievance can be instrumentalized by elites who benefit from war economies, while "greed" can be legitimated through grievance narratives. Paul Collier's later argument that civil wars are "development in reverse" captures the feedback loop: war destroys institutions, lowers growth, and makes future rebellion cheaper. Fearon and Laitin's influential alternative emphasizes state weakness and insurgent tactics rather than either greed or grievance, suggesting that many rebellions succeed not because they are popular but because states are too weak to suppress them. The mechanism therefore is interactive: grievance supplies justification and recruitment pools; economic opportunity supplies finance and sustainability; state weakness supplies permissive space.

Scope Conditions: The greed-centered model applies most strongly to intrastate conflicts in low-income, resource-dependent states where rebels can extract rents from point-source commodities. It is weaker for secessionist wars driven by compact, mobilized minorities; for ideological revolutions with strong party structures; for wars of national liberation against settler or colonial regimes; and for conflicts in states with diversified economies where resources are harder to loot. It also applies more to war duration and fragmentation than to initial onset: once fighting begins, resource rents can sustain factions that no longer represent popular demands. The grievance-centered model applies more strongly where institutionalized exclusion, ethnic or regional marginalization, and blocked political participation are durable; it is weaker when grievance is universal but rebellion is rare, or when grievance is high but state capacity is strong enough to repress or accommodate. Both models are limited in interstate wars, in highly institutionalized party systems, and in cases where external intervention dominates local dynamics. The African post-colonial context—arbitrary borders, weak fiscal states, extractive economies, and patrimonial politics—makes both mechanisms salient, but neither alone explains why some marginalized groups rebel while others do not.

Observable Implications: If the greed mechanism dominates, one should observe higher conflict risk in states dependent on point-source primary commodities; longer wars where rebels control resource sites; fragmentation of rebel movements around resource rents; post-war criminalization of politics; and peace agreements that fail when they do not address war economies. If the grievance mechanism dominates, one

should observe stronger correlation between horizontal inequality and onset; mobilization along identity lines; demands for recognition, autonomy, or regime change; and settlement when political inclusion improves. Mixed evidence is common: resource-rich conflicts often feature strong grievance narratives, while grievance-heavy conflicts often develop resource-financed war economies. A key falsifier for the strong greed thesis would be a large set of long, destructive civil wars in resource-poor states with no external financing; a key falsifier for the strong grievance thesis would be the absence of rebellion in highly unequal but resource-poor and institutionally strong states. The debate has also generated policy implications: if greed dominates, interventions should target resource governance, sanctions, and war-economy disruption; if grievance dominates, interventions should target inclusion, decentralization, and transitional justice. In practice, both are usually required, and the distinction can be politically consequential because "greed" framing may delegitimize rebel demands while "grievance" framing may legitimize them.

Perspective Note (five traditions in brief):

The African perspective, which is primary here, treats the greed–grievance binary as a Western social-science simplification that risks depoliticizing African conflicts. African scholarship and political thought—from Rodney's analysis of underdevelopment and extraversion, through Bayart's politics of the belly, Mamdani's citizen/subject distinction, and Reno's work on warlord politics and hybrid governance—emphasize that African conflicts are embedded in colonial state formation, global commodity chains, and patrimonial political orders. Grievance is not merely subjective deprivation; it is structured by citizenship deficits, regional marginalization, and the historical violence of state-making. "Greed" is not simply criminal appetite; it is often the rational pursuit of power and wealth within states whose institutions reward predation. The African vantage point reveals that rebels and states frequently share the same political economy: both tax populations, control resources, and bargain with external actors. It also stresses African agency—local elites, communities, and armed groups are not passive arenas for global resource markets. The limits of the debate are therefore visible from within: reducing conflict to greed or grievance obscures hybrid governance, the militarization of politics, and the ways in which global demand for minerals and hydrocarbons structures local violence.

The Chinese perspective generally emphasizes development, state capacity, and non-interference. It tends to read civil conflict as a symptom of underdevelopment and weak institutions, and it is skeptical of Western frameworks that moralize rebel grievances or criminalize resource economies. Chinese engagement prioritizes infrastructure, trade, and government-to-government relations; conflict is often framed as a threat to economic corridors and resource security rather than as a problem of justice. This perspective contributes an insistence that material development and state capacity matter, but it can occlude political exclusion, identity-based grievance, and the accountability of partner governments.

The Russian perspective often frames African and other civil conflicts through an anti-Western lens, emphasizing Western resource extraction, intervention, and regime change as sources of instability. It may highlight grievance against Western-backed governments while downplaying the predatory behavior of allied regimes or non-state proxies. Russian security export and arms relationships can be justified as stabilizing, yet this perspective can occlude the role of Russian-linked actors in resource economies and the ways in which external security assistance entrenches authoritarian rule.

The Western perspective has been deeply shaped by the Collier–Hoeffler agenda, especially through World Bank and donor policy. It tends to privilege measurable economic variables, institutional reform, and peacebuilding templates. Its self-critique has grown: scholars and practitioners now acknowledge that grievance, identity, and political legitimacy were underweighted; that "greed" framing could justify technocratic interventions; and that liberal peacebuilding often failed to transform war economies. Western analysis con-

tributes rigorous comparative data and policy tools, but it can impose universal models on historically specific conflicts.

The UN perspective focuses on civilian protection, peacekeeping, sanctions, and post-conflict peacebuilding. It treats resource governance, exclusion, and weak institutions as root causes, and it has developed norms around conflict minerals and natural-resource management in peace agreements. The UN vantage point contributes multilateral legitimacy and a civilian-protection lens, but it is constrained by member-state politics, limited enforcement, and the difficulty of transforming war economies without host-state consent.

2.6 KEY IDEA 5 — Hybrid Warfare and the Erosion of Categories

Bolded Causal Claim: Hybrid warfare is best understood not as a new kind of war but as a deliberate strategy of category erosion—blurring regular and irregular forces, state and non-state actors, military and non-military instruments, and peace and war—so that adversaries face attribution gaps, legal ambiguity, and delayed or fragmented responses.

Mechanism: The mechanism is ambiguity as a force multiplier. An actor with conventional military inferiority or nuclear constraints can impose costs by operating in the "gray zone" between peace and armed conflict, using synchronized instruments that are individually below the threshold of war but collectively coercive. These instruments include proxy forces, private military companies, cyber operations, disinformation, economic coercion, maritime militia, lawfare, and covert sabotage. The key is not the novelty of any single tool but their coordination and the exploitation of seams in an opponent's decision-making: alliance thresholds, domestic political polarization, legal definitions of aggression, and attribution standards. Frank Hoffman's concept of hybrid warfare emphasized the blending of conventional and irregular methods by the same actor; later usage, especially in NATO and EU discourse, expanded toward "hybrid threats" that include non-military instruments. Michael Mazarr's gray-zone framework stresses coercive actions that are "not quite war" but are more than diplomacy. The Russian case—often discussed through the so-called Gerasimov doctrine, a Western label for ideas in Valery Gerasimov's 2013 article—highlights the primacy of non-military means, information dominance, and the exploitation of internal vulnerabilities. Chinese strategic writing, including "unrestricted warfare," similarly treats all domains as legitimate arenas of competition. The mechanism also depends on plausible deniability: if attribution is uncertain, deterrence is weakened because retaliation risks escalation or appears disproportionate. Hybrid tactics can create faits accomplis, test red lines, exhaust adversaries through low-cost harassment, and shape political narratives before military facts are established. The result is a shift from decisive battle to continuous, ambiguous competition.

Scope Conditions: Hybrid warfare is most likely where direct conventional war is too costly—because of nuclear deterrence, alliance commitments, economic interdependence, or military asymmetry—and where international law and institutional thresholds create exploitable ambiguity. It is also more feasible where information environments are contested, where states have weak cyber defenses, and where proxy or non-state actors can provide deniability. It is less applicable where attribution is rapid and credible, where legal frameworks clearly define armed attack, where alliance cohesion is high, or where the target state has strong societal resilience and counter-disinformation capacity. The concept has important limits: not every ambiguous incident is hybrid warfare; criminal networks, terrorist attacks, and opportunistic violence may lack strategic coordination. Hoffman's narrower definition requires the blending of conventional and irregular capabilities by one actor, while gray-zone analysis can include purely non-military coercion. There is also a risk of concept inflation: labeling all Russian, Chinese, or Iranian behavior as "hybrid" can obscure differences in intent, capability, and context. Finally, hybrid warfare is not exclusively a tool of revisionist states;

Western states have also used covert action, proxies, information operations, and economic coercion, though often under different legal and normative frameworks.

Observable Implications: If hybrid warfare is operating, one should observe coordinated multi-domain pressure below the threshold of armed conflict; repeated incidents with unclear attribution; proxy or deniable forces; cyber intrusions and disinformation campaigns timed with geopolitical disputes; economic coercion; legal and diplomatic ambiguity; and adversary responses that are delayed by debates over whether an "attack" has occurred. One should also observe institutional adaptation: NATO's hybrid-threat centers, EU resilience frameworks, national cyber commands, and efforts to improve attribution. Falsifiers include clear, rapid attribution followed by conventional deterrence; lack of coordination across domains; purely local or criminal motives; and cases where ambiguity results from incompetence rather than strategy. The concept predicts not necessarily escalation to war but persistent, low-level competition that strains alliances and institutions. In the African context, hybrid dynamics appear where external powers, regional states, and non-state armed groups interact through proxies, information campaigns, resource deals, and security partnerships, often in environments where state authority is fragmented and legal accountability is weak.

Perspective Note (five traditions in brief):

The African perspective is primary and reveals that hybrid warfare is not only an interstate strategy but also a condition of governance in many African states. African scholarship on hybrid political orders, extraversion, and the privatization of security shows that the blurring of state and non-state violence long predates contemporary "hybrid" discourse. Armed groups, militias, customary authorities, and private security actors often coexist with formal state institutions, producing layered sovereignty. From this vantage point, external powers' use of proxies and ambiguous force in Africa exploits pre-existing governance gaps rather than creating them. The African perspective also insists on African agency: local elites bargain with external actors, and communities navigate multiple authorities. It exposes the limits of Western frameworks that treat hybridity as a novel threat emanating from revisionist powers, because in much of Africa hybridity is the historical baseline of political order.

The Chinese perspective frames hybrid competition through sovereignty, development, and non-interference. It often criticizes Western intervention and information operations as destabilizing, while presenting Chinese security cooperation as capacity-building. Chinese strategic concepts such as "three warfares" and unrestricted warfare emphasize legal, psychological, and media dimensions of competition, but official discourse typically denies engaging in hybrid warfare and frames actions as defensive or developmental. This perspective contributes an emphasis on economic and infrastructural resilience, but it can occlude the coercive dimensions of gray-zone activity and the asymmetry between state power and local accountability.

The Russian perspective has been central to Western debates on hybrid warfare, especially after 2014. Russian discourse often rejects the term as a Western projection, while simultaneously employing ambiguity, proxies, information operations, and private military structures. It frames security export in Africa and elsewhere as anti-terrorist and stabilizing, and it uses anti-Western narratives to legitimize its role. This perspective contributes an understanding of how weaker or revisionist actors can exploit ambiguity, but it frequently occludes accountability, civilian harm, and the predatory dimensions of proxy arrangements.

The Western perspective developed much of the hybrid-warfare vocabulary, particularly through NATO, EU, and US strategic communities. It emphasizes resilience, attribution, deterrence by denial, and the defense of the rules-based order. Its self-critique has grown: scholars warn against concept inflation, note that Western states have long used covert and proxy tools, and acknowledge that labeling all adversarial behavior as hybrid can justify over-militarized responses. Western analysis contributes institutional adaptation and legal frameworks, but it can overstate novelty and understate the historical normality of ambiguous conflict.

The UN perspective approaches hybrid warfare through international law, civilian protection, peacekeeping mandates, and the maintenance of international peace and security. It is concerned with attribution, the legal thresholds for use of force, and the protection of civilians in environments where state and non-state violence are blurred. The UN contributes multilateral norms and a civilian-centered lens, but it is constrained by Security Council politics, the consent of host states, and the difficulty of responding to ambiguous coercion without clear attribution.

2.7 FIVE PERSPECTIVES IN DEPTH

2.7.1 African Perspective (PRIMARY)

The African vantage point on asymmetric and irregular warfare begins from a premise that the other four perspectives usually treat as background: in much of Africa, irregular violence is not a deviation from a stable Westphalian order but one of the ordinary media through which political order is produced, contested, and reconstituted. This is not a claim that African states are "failed" in some absolute sense; it is a claim that sovereignty on the continent has historically been fragmented, layered, and negotiated among states, customary authorities, armed movements, militias, commercial actors, and external powers. From this standpoint, insurgency, counterinsurgency, proxy warfare, private military force, and hybrid conflict are not separate pathologies to be cured by better doctrine. They are interlocking features of a political economy in which authority is distributed unevenly and in which violence is often a resource, a language of claim-making, and a technique of governance. The African perspective therefore reframes the central puzzle of this lesson: not why weak states fail to defeat insurgents, but how asymmetric warfare becomes embedded in the everyday reproduction of power.

Mamdani's analysis of the colonial state is foundational here. The colonial state was not simply an underdeveloped version of the European state; it was a bifurcated order that separated "citizens" in the urban, Europeanized sphere from "subjects" in the rural, customary sphere. Indirect rule did not merely administer Africans through chiefs; it politicized ethnicity and produced a state whose coercive core was stronger than its civic core. Postcolonial states inherited this architecture. They often retained the colonial army, police, and administrative habits while claiming democratic legitimacy they had not fully built. In such a setting, insurgency frequently emerges not from the absence of the state but from the state's selective presence: taxation without representation, security without protection, citizenship without rights. Counterinsurgency that treats the population as a terrain to be secured, without addressing this bifurcation, risks reproducing the very exclusion that fuels recruitment. The African perspective thus insists that legitimacy is not a "line of effort" added to military operations; it is the political condition under which force can be converted into authority.

Mbembe's work on necropolitics and the "commandement" deepens this argument. For Mbembe, sovereignty is not only the legal capacity to make law; it is the power to decide who may live and who must die, and to organize the material and symbolic conditions of that decision. In many African conflict zones, war is not the suspension of politics but its continuation by other means. Armed actors do not merely destroy the state; they also provide order, taxation, justice, and protection in spaces where the state is absent or predatory. This is what makes hybrid governance so important. The state may coexist with customary courts, militia checkpoints, insurgent tax collectors, and private security firms, each exercising fragments of sovereignty. The African perspective therefore sees "state fragility" less as an empty space and more as a crowded field of competing authorities. Counterinsurgency that assumes a clear state/non-state boundary will misread the social landscape, because the boundary itself is historically unstable and politically

negotiated.

Bayart's concepts of extraversion and the rhizome state add a political-economy mechanism. African states and elites have long operated through external connections—colonial, Cold War, post-Cold War, and contemporary—using international resources to consolidate domestic power. The rhizome state is not a Weberian monopoly of violence but a network of nodes, some official and some unofficial, through which resources flow. Armed groups are often embedded in these networks rather than standing outside them. This complicates the greed-versus-grievance debate. Collier and Hoeffler's emphasis on economic opportunity and rebel financing captures something real: resource rents, smuggling, and protection economies can sustain violence. But African scholarship pushes back against reducing insurgency to criminal enterprise. Bayart's "politics of the belly" suggests that accumulation and survival are politically mediated; armed actors may be entrepreneurs, but they are also brokers in a system where state office, ethnicity, religion, and violence are intertwined. The relevant question is not simply whether rebels are greedy, but how violence becomes a rational strategy within a political order that rewards extraversion and punishes inclusion.

Rodney and Nkrumah supply the structural and historical layer. Rodney's argument that underdevelopment is not a stage but a product of historical processes, and Nkrumah's critique of neo-colonialism, frame African conflicts within global systems of extraction. From this perspective, proxy warfare is not an aberration of the Cold War or the War on Terror; it is a recurring method by which external powers secure resources, bases, and influence while avoiding the costs of direct rule. African states and armed groups become arenas for contests they did not initiate. This does not absolve local actors of responsibility; Rodney and Nkrumah are not determinists in that sense. Rather, they insist that local violence must be read against the global structures that shape incentives, armaments, and diplomatic recognition. The African perspective therefore treats principal-agent problems in proxy warfare as doubly severe: not only do patrons lose control of clients, but clients also use patronage to pursue local projects that may have little to do with the patron's stated aims.

Fanon and Cabral provide the liberation-theory counterpoint. Fanon's analysis of colonial violence and its psychological effects, and Cabral's insistence on political work, class analysis, and national liberation, remind us that irregular warfare can be a project of emancipation as well as predation. Cabral's distinction between the "weapon of theory" and armed struggle is especially important: guerrilla warfare without political education and social rootedness is merely violence. This African tradition challenges both Western counterinsurgency, which often reduces insurgents to security threats, and some African state narratives, which label all armed opposition as terrorism. It also complicates the greed-grievance binary by showing that grievance can be organized into political projects with genuine popular bases. At the same time, Fanon's warnings about the pitfalls of national consciousness—elite capture, authoritarianism, and the reproduction of colonial violence—prevent romanticization. Liberation movements can become new oppressors, and post-independence states can inherit the coercive habits of their predecessors.

Nyerere's vision of self-reliance and regional solidarity, and Grovogui's critique of international order, add a normative and institutional dimension. Nyerere's emphasis on African unity and non-alignment suggests that security cannot be outsourced indefinitely without eroding sovereignty. Grovogui's work on international law and African agency argues that the global order often recognizes African states formally while denying them substantive equality. In asymmetric warfare, this means that external interventions—whether Western counterterrorism, Russian security export, or Chinese capacity-building—are rarely neutral. They reshape the field of power. The African perspective therefore asks not only whether an intervention reduces violence in the short term, but whether it strengthens or weakens the capacity of African societies to govern themselves. This is a demanding standard, and it often produces skepticism toward stabilization missions that prioritize

order over justice.

Feminist and decolonial African scholarship, including Oyěwùmí and Tamale, reveals another occlusion in conventional security studies. Oyěwùmí's critique of the imposition of Western gender categories, and Tamale's decolonial feminist work, show that conflict analysis often renders women's labor, suffering, and agency invisible by treating the "combatant" as male and the "civilian" as passive. In irregular warfare, women are fighters, logisticians, informants, mediators, survivors, and political organizers; they are also disproportionately targeted by sexual violence and by the collapse of social services. A gendered lens does not merely add women to existing models; it changes the model by showing how militarization reorganizes households, kinship, and authority. This matters for the privatization of violence as well: private military actors and militias often operate in spaces where gendered violence is both a tactic and a byproduct of impunity. The African feminist perspective thus insists that security cannot be measured only by battle deaths or territorial control; it must also be measured by bodily integrity, social reproduction, and the distribution of vulnerability.

Aning and Danso, writing from African security studies, bring the institutional and regional dimension. They emphasize that African security is increasingly managed through regional organizations—ECOWAS, the African Union, SADC—and through norms such as "African solutions to African problems." These institutions have intervened in crises, imposed sanctions, and authorized peace operations. Yet they face capacity gaps, funding dependence, and political divisions. The African perspective is therefore not simply anti-external; it is also self-critical. It recognizes that regional actors can be ineffective, that elites can capture regional mechanisms, and that "sovereignty" can be invoked to shield abusive governments. But it insists that external actors must be judged by whether they strengthen regional capacity or bypass it. In the Sahel, for example, the proliferation of bilateral military partnerships, private military deployments, and competing external agendas has often fragmented rather than consolidated regional security architecture.

On hybrid warfare specifically, the African perspective offers a corrective to Western novelty claims. The blurring of regular and irregular forces, state and non-state actors, and peace and war is not new in Africa. Colonial powers used militias, levies, and proxy forces; postcolonial states have used "self-defense" groups, political militias, and covert operations; insurgents have moved between political parties, criminal networks, and armed wings. What Western discourse calls hybrid warfare often describes a long-standing condition of African politics. The danger of the hybrid label is that it can justify over-militarized responses by framing political ambiguity as a technical threat. The African perspective does not deny that states face ambiguous coercion; it denies that ambiguity can be resolved primarily by military means. Instead, it points to hybrid governance as a site of political negotiation, where the task is not to restore a mythical monopoly of violence but to build accountable institutions that can mediate competing authorities.

The African perspective also reframes the privatization of violence. Private military companies, Wagner, Africa Corps, and local militias are not merely market responses to state failure; they are part of a broader reconfiguration of sovereignty in which security is commodified and delegated. This can provide short-term protection for elites and external actors, but it often deepens insecurity for civilians. The market for force rewards actors who can deliver violence efficiently, not those who build legitimacy. When external powers rely on private or proxy forces, they may gain deniability but lose accountability. The African perspective therefore treats the privatization of violence as a governance crisis, not just a procurement issue. It asks who controls these forces, whom they protect, and how their presence reshapes local political economies. In many cases, private military actors become embedded in resource extraction and elite protection, creating new constituencies for continued conflict.

What does this perspective contribute that the other four cannot? First, it centers historical structure: colonialism, neo-colonialism, extraversion, and underdevelopment are not context but causal mechanisms. Second, it treats legitimacy and citizenship as security variables, not as afterthoughts. Third, it reveals hybrid governance as a normal condition rather than a pathology. Fourth, it exposes the distributional and gendered costs of violence that aggregate metrics hide. Fifth, it insists on African agency, even when that agency is constrained or contradictory. What it occludes is also important. It can understate the autonomous ideological appeal of transnational jihadism; it can over-romanticize resistance and understate the predatory behavior of some armed groups; it can be too structural, leaving less room for contingency, leadership, and local moral choice; and because "African scholarship" is diverse, there is a risk of presenting a unified voice where none exists. These limits do not invalidate the perspective; they define the terms on which it must be tested. The strongest version of the African perspective is not that external actors are always wrong or that local actors are always right, but that asymmetric warfare cannot be understood or resolved without confronting the political, historical, and social foundations of authority.

2.7.2 Chinese Perspective

The Chinese perspective on asymmetric and irregular warfare is anchored in the principle of non-interference and in a developmental theory of security. Its normative core is sovereignty: states have the right to manage internal affairs without external coercion, and international order depends on respecting that right. From this standpoint, insurgency and counterinsurgency are primarily internal matters, even when they have transnational dimensions. External actors may assist, but they should not impose political models, engineer regime change, or use military force without host-state consent. This position is not merely rhetorical; it is tied to China's own historical experience of foreign intervention and to its contemporary interest in stable access to markets, resources, and infrastructure. In African contexts, China presents itself as a partner that builds capacity rather than a patron that dictates outcomes.

The mechanism through which China approaches irregular warfare is state-capacity enhancement combined with economic development. The argument is that weak governance, poverty, and lack of infrastructure create the conditions in which armed groups thrive. Security cooperation therefore includes arms sales, equipment, training, intelligence sharing in some cases, and support for host-government forces, but it is usually framed as capacity-building rather than combat partnership. China also participates in UN peacekeeping and supports African Union and regional mechanisms, presenting multilateralism as preferable to unilateral intervention. The development-security nexus is central: roads, ports, energy projects, and trade are treated as stabilizing forces that address root causes. This is a coherent alternative to Western population-centric counterinsurgency, which China often views as politically intrusive and militarily overextended.

China's contribution lies in offering a non-Western model of engagement that many African governments find attractive. It provides material support without the governance conditionality that often accompanies Western aid. It respects formal sovereignty and avoids the language of regime change. It can move quickly on infrastructure and equipment, and it does not demand that partner states adopt liberal political reforms as a precondition for security cooperation. For governments facing insurgencies, this can be valuable: they receive tools to strengthen their coercive capacity without external scrutiny of their political practices. China also benefits from a narrative of South-South solidarity and anti-colonialism, which positions it as a fellow developing country rather than a former imperial power.

The occlusions of this perspective are significant. Non-interference can protect incumbents who are themselves sources of grievance, and it can shield abusive security practices from international criticism. Arms transfers and training may strengthen states without strengthening accountability, and they can be diverted

to militias or used against civilians. The development-first argument, while plausible, can underestimate the political roots of insurgency: economic growth in the absence of inclusion may deepen resentment. China's commercial interests can also securitize its engagement, making stability a condition for investment rather than a public good. There are principal-agent problems here too: Beijing may support a government, but it has limited control over how that government uses force. Finally, the Chinese perspective tends to treat non-state armed actors primarily as threats to order and commerce, which can obscure their political claims and the grievances that sustain them. In hybrid warfare environments, where state and non-state violence are blurred, a strict state-centric lens may miss the social and political networks that make armed groups durable.

2.7.3 Russian Perspective

The Russian perspective on asymmetric and irregular warfare is shaped by a combination of great-power competition, anti-Western framing, and a security-export model that relies on private and semi-private military actors. Its normative language emphasizes sovereignty, non-interference, and resistance to Western hegemony. In practice, however, Russia has often supported embattled governments through arms, training, information operations, and the deployment of private military companies such as Wagner and its successor, Africa Corps. The Russian approach treats irregular warfare less as a problem of governance and more as a contest for influence in which Western withdrawal creates opportunities for Moscow to expand its footprint. Anti-colonial and anti-Western rhetoric is central to this framing, even when Russian engagement serves strategic and commercial interests.

The mechanism is security provision in exchange for political alignment and resource access. Russian actors offer regimes coercive capacity, regime protection, and international diplomatic cover, often with fewer conditions than Western partners. This can include weapons, instructors, intelligence support, and information campaigns that delegitimize Western interventions and domestic opposition. Private military companies provide deniability and flexibility, allowing Moscow to project force without the political costs of formal troop deployments. In hybrid warfare terms, this is a form of gray-zone engagement: state and non-state actors are deliberately blurred, making attribution difficult and allowing Russia to maintain that it is merely supporting sovereign governments against terrorism.

Russia's contribution, from its own standpoint, is that it fills security vacuums and challenges Western monopoly. It is willing to operate in high-risk environments where Western states have withdrawn or hesitated. It supports governments that Western actors may consider illegitimate or abusive, and it does so without demanding democratic reforms. For some African leaders, this is attractive: it offers regime security and a counterweight to Western pressure. Russia also benefits from a narrative that frames Western counterterrorism as neo-colonial intervention, positioning Moscow as a defender of sovereignty. In the short term, Russian security export can stabilize governments and push back insurgent advances, particularly when Western missions have failed or withdrawn.

The occlusions are severe. The Russian model often prioritizes regime survival over civilian protection, and its reliance on private military actors creates accountability gaps. Human rights abuses, opaque contracts, and resource extraction can deepen grievances and fuel recruitment. Heavy-handed tactics may produce short-term territorial gains but undermine long-term legitimacy. There are principal-agent problems: Moscow may not fully control private military actors, and local clients may use Russian support to pursue narrow elite interests. Information operations can polarize societies and weaken democratic institutions. The anti-Western framing, while resonant in some contexts, can obscure the fact that Russian engagement is also a form of external influence, not a neutral defense of sovereignty. In hybrid warfare environments, the delib-

erate blurring of state and non-state violence makes it difficult to distinguish counterterrorism from regime protection, and it can normalize the use of unaccountable force. The Russian perspective thus contributes coercive capacity and geopolitical competition, but it often occludes the political and social foundations of durable security.

2.7.4 Western Perspective

The Western perspective on asymmetric and irregular warfare is dominated by counterterrorism, stabilization, and a long tradition of counterinsurgency doctrine. Its normative framework combines security, liberal governance, human rights, and international law. The central assumption is that irregular warfare threatens both local populations and international order, and that it can be managed through a combination of military force, institutional reform, and development assistance. Western actors often distinguish between "good" governance and "bad" violence, and they treat insurgency as a problem of state weakness, ideological extremism, and social grievance that can be addressed through capacity-building and legitimacy-enhancing reforms.

The mechanism is population-centric counterinsurgency and partner-force development. Influenced by Galula, Kilcullen, and the lessons of Iraq and Afghanistan, Western doctrine emphasizes protecting civilians, building host-nation capacity, and addressing root causes. Military operations are paired with governance programs, economic development, and human rights training. The aim is to separate insurgents from the population, deny them sanctuary, and strengthen the state's ability to provide security and services. In hybrid warfare contexts, Western states also develop legal frameworks for attribution, cyber defense, and responses to gray-zone coercion. The contribution is substantial: Western actors bring resources, intelligence, training, and normative standards that many other actors do not. They also engage in self-critique, acknowledging that template-driven interventions, short time horizons, and over-militarization have often failed.

Western self-critique is an important part of this perspective. The failures in Afghanistan, Iraq, and the Sahel have produced serious debates about the limits of external intervention. Scholars and practitioners have questioned whether population-centric counterinsurgency is transferable across contexts, whether partner forces can be relied upon, and whether military metrics obscure political realities. This self-critique is a genuine strength: it allows for learning and adaptation. However, it often remains at the level of doctrine rather than strategy. The same institutional incentives that produced over-militarized interventions—domestic politics, threat inflation, bureaucratic momentum, and alliance commitments—can absorb critique without changing behavior. Western actors may acknowledge that legitimacy matters while continuing to prioritize force protection, partner capacity, and short-term metrics.

The occlusions of the Western perspective are well documented. It can conflate terrorism with insurgency, treating politically rooted armed movements as security threats to be eliminated. It often assumes that Western institutional models are transferable, underestimating local political logics. Partner-force development suffers from principal-agent problems: Western trainers may build forces that are loyal to elites rather than to the population, or that are effective at coercion but not at protection. Stabilization missions can freeze conflict economies and empower abusive actors. The language of hybrid warfare can also be overused, turning complex political conflicts into technical problems of attribution and response. Finally, Western interventions often suffer from legitimacy deficits: even well-intentioned operations are perceived as foreign imposition, and civilian casualties can undermine the very population-centric logic they claim to follow. The Western perspective contributes institutional capacity, legal frameworks, and self-critique, but it often underestimates the historical and political depth of the conflicts it seeks to manage.

2.7.5 UN Perspective

The UN perspective on asymmetric and irregular warfare is mediated through international law, peacekeeping mandates, civilian protection, and the maintenance of international peace and security. Its normative core is multilateralism: force should be authorized collectively, constrained by law, and directed toward protecting civilians and supporting political settlements. The UN does not have a single theory of insurgency or counterinsurgency; rather, it approaches irregular warfare through mandates that combine security, political, humanitarian, and human rights components. In this sense, the UN perspective is less a doctrine of war than a framework for managing its consequences and preventing escalation.

The mechanism is consent-based peacekeeping and civilian protection. UN missions operate with the consent of host states, under Security Council mandates, and with principles of impartiality and minimum use of force. They protect civilians, support state institutions, facilitate humanitarian access, and create space for political processes. In hybrid warfare environments, where state and non-state violence are blurred, the UN emphasizes attribution, legal thresholds, and the protection of civilians. It also provides a forum for multilateral coordination and a source of legitimacy that unilateral actors lack. The contribution is significant: UN missions can provide security umbrellas, monitor ceasefires, and support transitions in ways that bilateral military partnerships cannot. They also center civilian harm in a way that purely military frameworks often do not.

The UN perspective is particularly important in African contexts, where missions such as MINUSMA in Mali have operated amid complex insurgencies, hybrid governance, and competing external actors. MINUSMA's experience illustrates both the strengths and limits of the UN approach. It provided a large multinational presence, supported civilian protection, and attempted to facilitate political processes. But it also faced force-generation gaps, restricted freedom of movement, and a deteriorating security environment. Its withdrawal in 2023, at the request of the Malian government, underscores a fundamental constraint: UN peacekeeping depends on host-state consent, and when that consent erodes, the mission's legitimacy and effectiveness collapse. This is not a minor operational issue; it is a structural feature of the UN system.

The occlusions of the UN perspective follow from these constraints. Security Council politics can paralyze or distort mandates, and powerful states may use the UN to legitimize their own interests. Host-state consent can be withdrawn when governments prefer unilateral or private military partnerships. The UN's emphasis on impartiality can be difficult to sustain when one party to the conflict is the host government. In hybrid warfare environments, ambiguous coercion and blurred lines of responsibility make attribution and response difficult. The UN also struggles to address the political economy of conflict: it can protect civilians and support institutions, but it cannot easily transform the structures of extraversion, resource extraction, and elite capture that sustain violence. Finally, the gap between mandate and capacity is persistent: missions are often asked to do more than they can deliver, and troop-contributing countries may lack the resources or political will to implement robust protection mandates. The UN perspective contributes multilateral legitimacy, civilian-centered norms, and a legal framework for managing conflict, but it is constrained by the very sovereignty principles that make it acceptable to member states.

SECTION 2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Reveals insurgency as embedded in hybrid governance, state fragility, and the political economy of extraversion; centers African agency and endogenous dynamics	May underweight transnational ideological and financial drivers of jihadism; risks treating all external intervention as equivalent	African ownership, sovereignty, decolonization of security; political transformation over stabilization	Sahel state collapse (Mali, Burkina Faso, Niger); hybrid governance arrangements; PMC proliferation; coup cycles	Western: African frameworks risk romanticizing local authority and obscuring non-state violence against civilians
Chinese	Sovereignty-centered capacity building; development-security nexus; security cooperation without political conditionality	Downplays governance deficits and human rights; treats security as a technical problem; has not prevented state collapse	Non-interference, state sovereignty, development as security	Arms sales and training programs; infrastructure-security linkages; absence of conditionality	African: non-interference can shield abusive regimes; security cooperation may serve extractive interests
Russian	Highlights limits of Western intervention; offers alternative security partnerships; anti-imperial framing	Obscures mercenary violence, resource extraction, and accountability gaps; conflates regime security with population security	Multipolarity, anti-Western, selective sovereignty	Wagner/Africa Corps deployments in Mali and Burkina Faso; arms transfers; anti-Western rhetoric	UN: PMC operations undermine civilian protection, accountability, and the laws of armed conflict

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Western	Resources, intelligence, COIN doctrine; self-critique (Kilcullen, Krepinevich) acknowledging enemy-centric failures	Treats insurgency as technical; overestimates external capacity to transform local politics; intervention became recruitment tool	Liberal intervention, human rights, stabilization, counterterrorism	COIN doctrine; MINUSMA support; training missions; Operation Serval/Barkhane	African: intervention reproduces dependency, ignores root causes, and substitutes external stabilization for political transformation
UN	Multilateral legitimacy, civilian-centered norms, legal frameworks for protection	Gap between mandate and capacity; cannot transform political economy of conflict; dependence on host-state consent	Multilateralism, civilian protection, sovereignty, rule of law	MINUSMA mandate (2013–2023); protection of civilians frameworks; humanitarian access	Russian/African: UN is Western-dominated, ineffective in active counterinsurgency, and unable to prevent state collapse

SECTION 2.8 WORKED EXAMPLE (I do): Sahel Insurgency, 2012–2025

Levels of analysis. The Sahel insurgency must be analyzed across four levels. At the individual level, the conflict is driven by young men facing unemployment, marginalization, and the appeal of jihadist ideology and material incentives; recruitment into JNIM and ISSP reflects both grievance and greed, with fighters often moving between armed groups and state forces. At the state level, Mali, Burkina Faso, and Niger exhibit weak institutional capacity, predatory elites, and security sectors that are more threat to than protector of populations; the 2012 Tuareg rebellion and subsequent coups (2020, 2021, 2022, 2023) illustrate state fragility. At the systemic level, the post-2011 Libyan collapse flooded the region with weapons and fighters, while French and US counterterrorism frameworks and the UN's MINUSMA mission structured the international response; great-power competition between Western, Russian, and Chinese actors shaped available options. At the transnational level, jihadist networks (AQIM, ISGS/ISSP) operate across borders, trafficking routes connect the Sahel to North Africa and the Gulf, and diaspora financing and media propaganda sustain mobilization beyond any single state.

Mechanism section. The mechanism is a self-reinforcing cycle of state fragility and insurgent expansion. The 2012 MNLA Tuareg rebellion in northern Mali created a vacuum that jihadist groups (Ansar Dine, MUJAO, AQIM) exploited, declaring an Islamic state in the north. French intervention (Operation Serval, 2013) reversed territorial losses but did not address governance deficits; the state reasserted control without legitimacy, and insurgents adapted to guerrilla and terrorist tactics. The 2015 Algiers Accord failed to deliver decentralization or security sector reform. JNIM (formed 2017) and ISSP (ISGS) expanded southward into central Mali and Burkina Faso, exploiting ethnic militias, pastoralist-farmer conflicts, and state absence. Coups in Mali (2020, 2021), Burkina Faso (2022), and Niger (2023) removed Western-aligned governments and invited Russian security partnerships (Africa Corps/Wagner), while France withdrew Operation Barkhane (2022). The mechanism runs: weak state capacity → insurgent territorial control → state repression and militia mobilization → civilian harm → further recruitment → state collapse → external intervention (Western or Russian) → temporary stabilization without governance → renewed insurgency. ACLED data show rising event counts and civilian fatalities from 2012 to 2024, with a shift in perpetrator profiles from jihadist groups to state forces and allied militias after 2020.

Perspective reconstruction. The African perspective, drawing on scholars such as Bayart, Mamdani, and Reno, frames the Sahel crisis as a crisis of the post-colonial state and its extraversion: states are arenas of elite competition rather than providers of public goods, and security is privatized through militias, customary authorities, and foreign contractors. From this vantage, the MNLA rebellion and jihadist expansion are symptoms of a deeper failure of state-society relations, not merely terrorism; the coups reflect popular frustration with corrupt, externally dependent regimes; and the turn to Russia/Africa Corps is an assertion of sovereignty against Western conditionality, even if it risks new dependencies. This perspective reveals what Western counterterrorism obscures: that stabilization without political transformation reproduces violence, and that hybrid governance arrangements—combining state, customary, and non-state actors—are not aberrations but constitutive of how order is actually produced. It also highlights the agency of African actors—elites, communities, armed groups—rather than treating them as passive recipients of intervention. However, it can underweight the transnational ideological and financial drivers of jihadism and the genuine appeal of Salafi-jihadist projects to marginalized populations.

The Chinese perspective emphasizes sovereignty and non-interference: Beijing has expanded arms sales, training, and infrastructure investment in the Sahel without political conditionality, framing security as a development problem. It contributes an alternative to Western conditionality and recognizes that poverty and underdevelopment fuel instability. Yet it occludes governance deficits and the human rights consequences of unconditional support, and its security cooperation has not prevented state collapse.

The Russian perspective frames the crisis as a failure of Western intervention and an opportunity for multipolar security partnerships; Africa Corps/Wagner deployments in Mali and Burkina Faso are presented as anti-terrorist assistance without neo-colonial strings. It contributes a critique of Western overreach and offers regimes immediate security support. But it obscures mercenary violence, resource extraction (gold mining concessions), and the lack of accountability for civilian harm.

The Western perspective treats the Sahel as a counterterrorism and stabilization challenge, deploying COIN doctrine, training missions, and MINUSMA support; its self-critique (Kilcullen, Krepinevich) acknowledges that enemy-centric approaches failed and that population-centric COIN was undermined by weak partners. It contributes resources, intelligence, and doctrinal innovation. But it overestimated the capacity of external actors to transform local politics and underestimated how intervention itself became a recruitment tool for jihadists.

The UN perspective centers civilian protection and multilateral legitimacy through MINUSMA, which operated in Mali from 2013 to 2023 with a mandate to protect civilians and support the peace process. It contributes norms and a legal framework. But the gap between mandate and capacity, and the mission's dependence on host-state consent, limited its effectiveness; MINUSMA's withdrawal in 2023 marked the limits of UN peacekeeping in active counterinsurgency environments.

Explicit adjudication. The African perspective best explains the case because it captures the endogenous political dynamics—state fragility, elite extraversion, hybrid governance, and the political economy of security—that make external intervention, whether Western or Russian, structurally ineffective. The mechanism of state collapse and insurgent expansion is rooted in the nature of the post-colonial state and its failure to monopolize legitimate violence or deliver public goods. However, the African perspective misses or underweights the transnational and ideological dimensions: the role of Libyan weapons, AQIM's regional networks, and the genuine mobilizing power of jihadist ideology among marginalized youth. It also risks treating all external intervention as equivalent, obscuring differences between multilateral peacekeeping and mercenary deployment. A full explanation requires combining the African political-economy lens with systemic (great-power competition) and transnational (jihadist network) levels of analysis.

SECTION 2.9 PROBLEM PAIR (We do)

Tasks

1. **Mechanism mapping.** For Afghanistan (2001–2021) and the Sahel (2014–2022), classify the dominant failure mechanism as (a) tactical mismatch, (b) principal-agent breakdown, (c) legitimacy deficit, or (d) hybrid-threat adaptation. Justify each classification with one concrete piece of evidence and state one piece of evidence that would weaken it.
2. **Level-of-analysis translation.** Explain how the same outcome—external withdrawal followed by insurgent or junta advance—looks different at the individual, state, systemic, and transnational levels. Identify which level your preferred explanation privileges and why.
3. **Perspective reconstruction.** Steel-man the African critique of Operation Barkhane and the Western defense of population-centric counterinsurgency. For each, identify the strongest contribution and the most important occlusion.
4. **Greed versus grievance.** Apply the Collier/Hoeffler framework to Afghanistan and to the Sahel. Then state one limit of the framework that becomes visible when the two cases are compared.
5. **Falsifiers.** Specify what evidence available in 2015 would have falsified your preferred explanation. Distinguish evidence that would have falsified the mechanism from evidence that would merely have complicated the narrative.
6. **Adjudication.** Compare your answers to tasks 1–5 and state which explanation best survives cross-case comparison. Give its scope condition and one boundary case where it should not be expected to hold.

MODEL ANSWER

Both interventions are often judged as tactical failures, but the stronger explanation is a legitimacy-capacity

mismatch operating through principal-agent breakdown. In Afghanistan, the United States initially pursued a light-footprint counterterrorism campaign, then adopted population-centric counterinsurgency under FM 3-24. The doctrine assumed that securing populations and building state institutions would separate insurgents from civilians. Yet the Afghan state remained a patronage machine in which warlords, militias, and ethnic factions competed for rents; Afghan National Security Forces units suffered ghost soldiers, corruption, and uneven loyalty. Tactical gains in Helmand or Kandahar did not become political authority because the state could not monopolize violence or deliver services. Pakistan's sanctuary for Taliban leadership added a transnational dimension that no amount of population-centric tactics could close. In the Sahel, France's Barkhane was more enemy-centric: it emphasized targeted killings, intelligence, and partnerships with local forces, while relying on Sahelian armies that were themselves implicated in abuses and coups. Both cases illustrate a principal-agent problem: external powers delegated violence to partners whose interests diverged, producing shirking, human-rights violations, and legitimacy costs. The African vantage point stresses that neither intervention addressed hybrid governance: local strongmen, militias, and informal security markets already provided order; external counterinsurgency often displaced or militarized them without replacing their functions. Greed-and-grievance models capture part of the story—opium rents in Afghanistan, resource and land competition in the Sahel—but they understate the political and identitarian dimensions of insurgency and the way state violence itself generates recruits. Hybridity matters: JNIM and ISSP combine jihadist ideology, ethnic grievance, criminal revenue, and proto-governance; the Taliban combined insurgency, shadow government, and transnational sanctuary. At the individual level, recruits often joined for local protection, revenge, or employment rather than ideology; at the state level, coups in Mali, Burkina Faso, and Niger showed that security forces prioritized regime survival over counterinsurgency; at the systemic level, great-power competition turned local wars into arenas for legitimacy claims; at the transnational level, sanctions, arms flows, and diaspora networks sustained both insurgents and juntas. Privatization compounded the problem: where state forces failed, governments and external actors turned to private military companies or militias, creating parallel chains of command and accountability gaps. In Mali, the turn to Africa Corps after French withdrawal illustrated how the market for force can replace one dependency with another. The greed-grievance framework remains useful as a diagnostic of revenue streams, but it cannot explain why some aggrieved communities do not rebel or why some rebel movements govern. Its strongest counterargument is that grievance is endogenous to state violence and that resource rents fund coercion rather than merely motivate it. Western self-critique now acknowledges that population-centric counterinsurgency overestimated the speed of state-building; Chinese non-interference avoided direct failure but left security vacuums; Russian security export filled some vacuums while deepening authoritarianism; the UN's MINUSMA protected civilians in some areas but could not substitute for political settlement. Thus the best explanation is not tactical incompetence alone but a legitimacy-capacity mismatch: counterinsurgency requires a host political order that can absorb military gains; where that order is absent or predatory, external force produces temporary suppression followed by collapse. Scope condition: the claim holds for interventions dependent on partner states; it is weaker where insurgents lack popular support or where external powers impose direct rule. Falsifiers would include durable stabilization after partner-force reform or insurgent defeat without state reform; neither occurred.

SECTION 2.10 INDEPENDENT MEMO (You do)

(a) Case description. Between 2020 and 2025, Mali, Burkina Faso, and Niger experienced successive coups, the withdrawal or reconfiguration of French and UN forces, expanded Russian security involvement, and the growth of JNIM and ISSP across rural and peri-urban spaces. Juntas framed their rule as sovereign

correction of Western failure, while insurgent groups combined attacks, taxation, dispute resolution, and recruitment among marginalized communities. Civilian fatalities rose in several regions even where state forces regained towns, suggesting that control of territory did not equal control of populations. The case asks whether the collapse is best explained by external withdrawal, state predation, insurgent hybrid governance, or the interaction of all three.

(b) Required memo headings as prompts

- **Mechanism:** Identify the causal chain linking at least two of the following—state predation, insurgent governance, external intervention, or privatized force—to the observed pattern of territorial control and civilian harm. Specify the level of analysis at which your mechanism operates and one scope condition.
- **Perspective reconstruction:** Reconstruct the African, Chinese, Russian, Western, and UN perspectives on this case in 3–5 sentences each. For each, state its key contribution and its key occlusion.
- **Historical analogue:** Compare the case to one earlier episode of asymmetric warfare or state collapse. State what transfers, what does not transfer, and why the analogy might mislead.
- **Falsifiers:** List two observable developments that would weaken your mechanism and two that would strengthen it. Distinguish descriptive predictions from explanatory claims.

(c) Self-check line. Before submitting, verify that you have distinguished description (what happened), explanation (why it happened), prediction (what should follow if your mechanism holds), and prescription (what actors should do), and that no prescription is presented as if it were an explanation.

SECTION 2.11 HINGE QUESTION

Question: Which explanation best accounts for the failure of US counterinsurgency in Afghanistan (2001–2021) and French Operation Barkhane in the Sahel (2014–2022)?

A. Insurgent movements prevailed primarily because they possessed superior firepower and conventional military capacity.
B. Both interventions failed mainly because they did not apply population-centric counterinsurgency long enough or with enough troops.
C. Both interventions failed because external military gains could not be converted into durable political authority under predatory or fragile partner states, producing principal-agent breakdown.
D. Both interventions failed because the absence of a UN peacekeeping mission removed the only mechanism capable of protecting civilians and stabilizing territory.

Distractor diagnoses

- **A** is wrong because it treats irregular warfare as a conventional firepower contest; the evidence points to political legitimacy, sanctuary, hybrid governance, and state capacity rather than insurgent material superiority.
- **B** is wrong because it assumes tactics can be separated from host-state capacity; the Afghan and Sahelian cases show that more troops or longer timelines do not resolve partner shirking, corruption, or legitimacy deficits.

- **D** is wrong because it overstates the substitutability of UN peacekeeping for political settlement; MINUSMA and similar missions can protect civilians and support stabilization, but they cannot create the host-state legitimacy required to absorb military gains.

SECTION 2A — DATA LAB

Table 1. ACLED-recorded political violence in the central Sahel (Mali, Burkina Faso, Niger), 2012–2025 — indicative trend summary

Period	Event trend	Fatality trend	Dominant perpetrator pattern (ACLED-reported)
2012–2014	Baseline surge around MNLA rebellion, jihadist expansion, French intervention	Sharp increase from low baseline	Rebel/separatist and jihadist attacks; state counteroffensives
2015–2017	Geographic expansion; urban and border attacks	Rising	Jihadist groups consolidate; militia mobilization increases
2018–2020	Acceleration; rural massacres and communal violence	Major increase	JNIM/ISSP competition; communal militias; state forces
2021–2023	Peak volatility; coups in all three states	Very high	State forces and allied militias rise; jihadist territorial control persists
2024–2025	Continued high; diffusion into new zones	Persistently high	Fragmented non-state violence; Russian-linked deployments; state forces

Note: Figures are indicative trend summaries drawn from ACLED's published Sahel analyses; exact counts should be verified in the ACLED dashboard and country reports.

Table 2. External and hybrid security providers in the central Sahel — qualitative deployment picture

Provider type	Mali	Burkina Faso	Niger	Evidence/limit
French-led Barkhane/Takuba (2014–2022)	High, then withdrawn	Medium	Medium	Mission records; ended 2022
Russian-linked PMC/Africa Corps	High post-2021	Reported growing	Reported/contested	ACLED, investigative reporting; opacity

Provider type	Mali	Burkina Faso	Niger	Evidence/limit
Western contractors/trainers	Medium	Low–medium	Medium	Bilateral agreements; limited transparency
Local militias/Dozos/VDPs	High	Very high	Medium	State-armed community forces; blurred accountability
UN MINUSMA	High until 2023	N/A	N/A	Mandate documents; withdrawal completed 2023

Table 3. Civilian harm by perpetrator — ACLED-classified, central Sahel, indicative shares

Perpetrator category	Indicative share of civilian fatalities	Mechanism	Interpretive caution
Jihadist armed groups (JNIM, ISSP)	Largest single share in many periods	Massacres, IEDs, assassinations, economic coercion	Classification depends on claim, attribution, and ACLED coding rules
State security forces	Substantial and rising in coup periods	Airstrikes, raids, collective punishment, detention deaths	Underreporting; attribution disputes; weak forensic capacity
State-aligned militias/VDPs	Significant, localized	Reprisals, ethnic targeting, village raids	Blurred state/non-state boundary; plausible deniability
External forces/PMCs	Smaller but politically salient	Direct combat, base protection, convoy security	Opacity; casualty attribution often contested
Unknown/unclaimed	Non-trivial	Ambushes, remote violence, crossfire	Data gaps in remote and insecure areas

Five numbered analysis questions

1. **Trend.** How did ACLED-recorded violence in Mali, Burkina Faso, and Niger change between 2012 and 2025? Distinguish event frequency from fatality intensity, identify at least two inflection points (for example, the 2012–2013 intervention period and the 2020–2021 coup wave), and explain what each inflection changed in the conflict's geography, perpetrator mix, or civilian exposure.
2. **Level of analysis.** Table 1 operates mainly at the regional/systemic level, Table 2 at the state/external-provider level, and Table 3 at the civilian/individual level. How does shifting the level of analysis change the explanation of the same violence? For example, does a state-level account of "counterter-

rorism failure" adequately explain village-level reprisals, or does it require a transnational account of arms, financing, and militia delegation?

3. **Perspective reconstruction (all five).** How would each perspective read Table 3? The African perspective might emphasize hybrid governance, state fragility, and the privatization of security; the Chinese perspective might emphasize sovereignty, non-interference, and capacity-building; the Russian perspective might emphasize security export and anti-Western framing; the Western perspective might emphasize counterterrorism, stabilization, and self-critique of intervention; the UN perspective might emphasize mandate limits, civilian protection, and peacekeeping withdrawal. Which perpetrator category would each perspective emphasize, and which would it occlude?

4. **Interpretation.** Does rising civilian harm attributed to state forces imply counterinsurgency failure, regime insecurity, or both? Use the mechanism distinction between enemy-centric and population-centric counterinsurgency, and the principal-agent problem created when states delegate violence to militias, PMCs, or local auxiliaries.

5. **Limitation.** What are the main limits of ACLED data in the Sahel (media dependence, access constraints, classification ambiguity, undercounting in remote areas, and political contestation of attribution)? How do these limits affect claims about PMC effectiveness, state legitimacy, jihadist territorial control, or the success/failure of external intervention?

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — "Counterinsurgency triangle with perspective overlays"

What to draw: Draw a large triangle on the page. Label the three vertices: **Insurgents** (top), **State / Counterinsurgents** (bottom left), and **Population** (bottom right). Place a small circle at the center labeled **Political control**. Draw arrows from insurgents to population labeled "coercion / mobilization"; from state to population labeled "protection / services"; from population to both labeled "support / intelligence / compliance." Add a dashed inner triangle around the center circle labeled **Hybrid actors** (chiefs, militias, brokers, PMCs).

How to label it: At the top vertex write "Mao: political base precedes military victory"; at the bottom left write "Galula: population is the prize"; near the state-to-population arrow write "Krepinevich: enemy-centric vs population-centric critique"; near the hybrid triangle write "African: hybrid governance and fragmented sovereignty."

Perspective overlay to annotate: Use four colored marginal notes: **African (primary)** — "state authority is negotiated through local brokers; population is not a passive prize"; **Western** — "COIN doctrine treats population as center of gravity"; **Russian** — "external security provider strengthens the state vertex"; **UN** — "civilian protection constrains state violence"; **Chinese** — "sovereignty and capacity-building at the state vertex."

Visual 2 — "Principal-agent chain in proxy and privatized warfare"

What to draw: Draw a horizontal chain of four boxes: **Sponsor state → Proxy / PMC / militia → Local commander → Civilian population**. Add downward arrows from each box to a lower row labeled **Information asymmetry**, **Autonomy**, **Shirking**, and **Blowback**. Draw a feedback arrow from population

back to sponsor state labeled "legitimacy cost." Add a dashed box around the middle two boxes labeled **Accountability gap**.

How to label it: Label the first arrow "delegation"; second "sub-delegation"; third "coercion / extraction." Add small notes: "Wagner/Africa Corps," "state-aligned militias (VDPs)," "Western contractors," "local strongmen." Label the feedback arrow "civilian harm → grievance → recruitment."

Perspective overlay to annotate: **African (primary)** — "privatization of security fragments accountability and produces hybrid rule"; **Russian** — "security export fills vacuum left by Western withdrawal"; **Western** — "principal-agent failure explains loss of control over partners"; **Chinese** — "non-interference limits direct accountability but not arms/training effects"; **UN** — "protection-of-civilians mandates are weakened by delegated violence."

Visual 3 — "Sahel conflict ecology, 2012–2025"

What to draw: Draw a simplified map of Mali, Burkina Faso, and Niger as three adjacent shapes. Mark the tri-border zone (Liptako-Gourma) with a shaded oval. Draw arrows from north to south labeled "jihadist expansion"; arrows from capitals outward labeled "state counteroffensives"; small icons for "PMC bases," "militia zones," and "displaced populations." Add a Venn diagram in the corner with three overlapping circles: **Greed** (trafficking, gold, cattle), **Grievance** (marginalization, ethnicity, state abuse), **Hybridity** (state/non-state blur, coup politics).

How to label it: Label the map "MNLA → JNIM/ISSP → state collapse"; label the Venn center "Sahel conflict ecology." Add timeline ticks: 2012, 2015, 2020, 2021, 2023, 2025.

Perspective overlay to annotate: **African (primary)** — "state fragility and hybrid governance are the frame; external actors are secondary"; **Western** — "counterterrorism and stabilization narrative"; **Russian** — "anti-Western security partnership"; **Chinese** — "development-security nexus and sovereignty"; **UN** — "mandate, protection, and withdrawal."

SECTION 4 — CORNELL NOTES

Cue (question / prompt)	Notes (answer / evidence / source log)
What is insurgency?	Armed political struggle to overthrow or replace state authority; Mao treats political mobilization as prior to military victory. Source: Mao, *On Guerrilla Warfare* (1937).
What is counterinsurgency?	State or external effort to defeat insurgents and secure population; Galula centers the population as the decisive terrain. Source: Galula, *Counterinsurgency Warfare* (1964).
Enemy-centric vs population-centric COIN?	Enemy-centric prioritizes killing/capturing insurgents; population-centric prioritizes legitimacy, services, and protection. Krepinevich critiques overemphasis on enemy-centric methods. Source: Krepinevich (1986/2009 discussions).

Cue (question / prompt)	Notes (answer / evidence / source log)
What is proxy warfare?	Delegation of violence by a sponsor to an agent; creates principal-agent problems, autonomy, shirking, and blowback.
What is privatization of violence?	Use of PMCs, militias, and marketized force; Reno analyzes warlordism and hybrid authority. Source: Reno (2011).
Wagner / Africa Corps in Sahel?	Russian-linked security export after Western withdrawal; opacity, direct combat, and political alignment with coup regimes. Source: ACLED Sahel reports 2023–2025.
Greed vs grievance?	Collier/Hoeffler emphasize economic motives and opportunity; critics stress grievance, identity, state abuse, and local politics. Source: Collier and Hoeffler (2004).
Limits of greed-grievance?	Reduces complex conflicts to resource variables; underweights history, legitimacy, hybrid governance, and transnational jihadist ideology.
Hybrid warfare?	Blurring of regular/irregular, state/non-state, peace/war; information, cyber, economic, and proxy tools combined.
Sahel case 2012–2025?	MNLA rebellion → jihadist expansion (JNIM, ISSP) → coups → state fragility → PMC and militia proliferation. Source: ACLED Sahel reports 2023–2025.
African perspective (primary)?	Hybrid governance, state fragility, privatization of security; external intervention often misreads local authority structures. Sources: Grovogui, Mbembe, Bayart, Mamdani, Reno.
UN perspective?	Mandate limits, civilian protection, MINUSMA withdrawal; tension between sovereignty and protection. Source: UN mandate documents.

Source log: Mao (1937); Galula (1964); Krepinevich (enemy-centric/population-centric debate); Kilcullen (2009); Reno (2011); Collier and Hoeffler (2004); ACLED Sahel reports (2023–2025); Grovogui, Mbembe, Bayart, Mamdani, Rodney, Nkrumah, Nyerere, Cabral, Fanon, Aning, Danso, Tamale, Oyěwùmí (African perspective reconstruction).

Summary: Asymmetric and irregular warfare in the Sahel cannot be explained by a single theory of insurgency or counterinsurgency. The conflict combines Maoist political mobilization, Galula-style population control, proxy delegation, privatized violence, greed/grievance dynamics, and hybrid warfare. African perspectives emphasize that state fragility and hybrid governance are central, while Western, Russian, Chinese, and UN perspectives each illuminate different mechanisms and occlude others. ACLED data show rising and diffusing violence, but data limits require cautious interpretation.

SECTION 5 — FEYNMAN COMPRESSION

1. **Explain without jargon.** Asymmetric warfare is when a weaker side avoids fighting a stronger side head-on and instead uses ambushes, politics, fear, and local support to make the stronger side tired and expensive. Counterinsurgency is the stronger side's attempt to stop this by protecting people, building trust, and removing insurgent networks. In the Sahel, rebels and jihadist groups exploited weak states, ethnic grievances, and rural neglect; governments and foreign forces tried to defeat them but often killed civilians, empowered militias, and lost legitimacy. Private military companies and proxy forces added another layer: outsiders sold security, but accountability became blurry. The "greed versus grievance" debate asks whether fighters are mainly motivated by money or injustice, but real conflicts usually mix both. Hybrid warfare means the line between war and peace, soldier and civilian, state and non-state actor has become unclear.

2. **Mark gaps.** I initially treated counterinsurgency as a technical doctrine that could be applied uniformly; I under-specified how local authority, ethnicity, and land politics shape violence. I also treated ACLED numbers as more complete than they are, and I did not fully separate description (what happened), explanation (why), prediction (what may happen), and prescription (what should be done). My account of Russian, Chinese, and UN perspectives risks being too thin unless each is reconstructed from its own premises.

3. **Reread verification.** Rechecking the canonical sources: Mao (1937) requires political work before military victory; Galula (1964) makes population control central; Krepinevich's critique warns against enemy-centric drift; Reno (2011) shows how privatized violence and hybrid authority can replace state monopoly; Collier and Hoeffler (2004) provide an economic model but not a full political theory; ACLED reports (2023–2025) document diffusion and rising civilian harm but remain dependent on reporting conditions. The African perspective is not merely a case study; it reframes the state itself as hybrid and contested.

4. **Analogy with explicit limits.** Think of the Sahel conflict as a neighborhood where the official police are weak, armed gangs tax trade, elders broker deals, and outside contractors sell protection. The analogy helps explain fragmented authority and delegated violence, but it is limited: it can obscure transnational jihadist ideology, global arms markets, climate stress, and the legal status of states and peacekeeping missions. It also risks blaming "local disorder" while understating external intervention effects.

5. **Rewrite.** Asymmetric and irregular warfare is a political struggle over authority in which weaker actors use mobility, coercion, and grievance to offset material inferiority. Counterinsurgency succeeds or fails not only through force ratios but through legitimacy, local knowledge, and control of delegated violence. Proxy and privatized warfare introduce principal-agent failures that can protect regimes while harming civilians. The greed-grievance debate is useful but incomplete because it under-theorizes hybrid governance and state fragility. Hybrid warfare further erodes the regular/irregular and peace/war distinctions. In the Sahel, African perspectives foreground state fragility and hybrid authority; Western perspectives foreground counterterrorism and stabilization; Russian perspectives foreground security export; Chinese perspectives foreground sovereignty and capacity; UN perspectives foreground mandates and civilian protection. ACLED data support claims about rising and diffusing violence, but

their limits require that conclusions about effectiveness, legitimacy, and causation remain provisional.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L23	Definition	What is an insurgency?	An insurgency is a protracted, organized political-military campaign by non-state actors to coerce or overthrow a government; its military activity is subordinate to political mobilization, legitimacy competition, and control of populations.	African perspective stresses hybrid governance and legitimacy deficits; Western perspective often foregrounds security threats and terrorist labels.
L23	Mechanism	What are Mao's three phases of guerrilla war?	Mao described progression from strategic defensive, through stalemate, to strategic offensive, with political organization and popular support preceding military escalation; the population functions as the medium in which insurgents operate.	Western COIN borrows Mao's population logic; African scholarship emphasizes colonial state formation and post-colonial fragility as preconditions.

Tag	Card Type	Front	Back	Perspective Note
L23	Debate	What is the population-centric vs. enemy-centric COIN debate?	Population-centric COIN prioritizes civilian protection, governance, and legitimacy; enemy-centric COIN prioritizes killing or capturing insurgents; the dispute concerns whether violence declines through political inclusion or through attrition.	African perspective warns that enemy-centric tactics can reproduce grievance; UN perspective emphasizes civilian protection and mandate limits.
L23	Source	What is Galula's core COIN claim?	Galula argued counterinsurgency is roughly eighty percent political and twenty percent military, requiring a clear political aim, population support, and legitimacy; his French Algeria experience shaped the theory but also limits its generalization.	Western canonical theory; African critics note its colonial context and possible overfitting to imperial control.

Tag	Card Type	Front	Back	Perspective Note
L23	Mechanism	How does principal-agent theory explain proxy-war failure?	Delegation creates information asymmetry, shirking, and autonomy; sponsors cannot fully monitor or control proxies, producing mission creep, escalation, deniability problems, and unintended local outcomes.	Russian and African perspectives stress proxy agency and local agendas; Western perspectives stress control dilemmas and accountability.
L23	Debate	What is the "greed vs. grievance" debate?	Collier and Hoeffler argue economic motives often dominate civil-war onset; critics argue grievance, identity, state violence, and historical injustice are underweighted; evidence is mixed and case-dependent.	African scholarship emphasizes state predation and historical injustice; Western econometric models may occlude political and colonial legacies.
L23	Mechanism	What does privatization of violence mean?	The marketization of force through PMCs, Wagner, Africa Corps, and similar actors commodifies coercion, offering flexible and deniable security while creating accountability gaps, rent-seeking, and fragmented sovereignty.	African perspective: security markets fill state gaps; Western perspective: regulation and human-rights concerns; Russian perspective: security export and influence.

Tag	Card Type	Front	Back	Perspective Note
L23	Definition	What is hybrid warfare?	Hybrid warfare blends conventional, irregular, cyber, information, economic, and legal tools across ambiguous peace-war boundaries, exploiting attribution problems and institutional thresholds.	Russian perspective frames active measures and ambiguity; Western perspective frames deterrence and resilience; African perspective notes information manipulation in fragile states.
L23	Application	What does the African perspective add to Sahel analysis?	Sahel insurgency reflects hybrid governance, state fragility, security privatization, and legitimacy crises; external counterterrorism often militarizes politics and neglects local authority structures.	Primary lens: reveals what Western CT and UN mandates may occlude about everyday governance and authority.
L23	Occlusion	What does Western counterterrorism often occlude?	It often reduces insurgency to terrorism, underweighting local political economies, historical state violence, non-military grievances, and the legitimacy effects of kinetic operations.	Western self-critique acknowledges this; African perspective treats it as structural to intervention design.

Tag	Card Type	Front	Back	Perspective Note
L23	Adjudication	Why did US Afghanistan and French Barkhane both fail?	Both overestimated military capacity, underestimated political legitimacy, and treated symptoms; Afghan collapse reflected dependency and corruption, while Sahel coups followed militarized CT and weak institutions.	Adjudication favors political legitimacy and state capacity over force-centric stabilization.
L23	Level of Analysis	Why are four levels of analysis needed?	Individual fighters, state legitimacy, systemic geopolitics, and transnational financing, diaspora, and PMC networks interact; no single level can explain recruitment, escalation, or collapse.	All perspectives use levels differently; African perspective foregrounds state-society relations and transnational extraction.
L23	Source	What is a key limitation of ACLED data?	ACLED records events, fatalities, and actors and is useful for trends, but it undercounts violence, misattributes perpetrators, and reflects reporting bias; it must be triangulated with field and local sources.	UN and Western analysts rely on it; African scholars caution against data-driven misrecognition of local conflict.

Tag	Card Type	Front	Back	Perspective Note
L23	Debate	Do proxies become autonomous over time?	As conflicts prolong, proxies gain bargaining power, local resources, and alternative sponsors; sponsors face commitment problems, and proxy autonomy can be either a strategic asset or a liability.	Russian, African, and Western perspectives all recognize autonomy but evaluate it differently.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence audit (score each 0–100)

Competency	Confidence (0–100)	Evidence of mastery	Priority gap
Distinguish insurgency, terrorism, and civil war			
Explain Mao's phases and their limits			
Compare population-centric and enemy-centric COIN			
Apply principal-agent theory to proxy war			
Evaluate greed vs. grievance claims			
Analyze PMC/Wagner/Africa Corps effects			
Define hybrid warfare without overclaiming novelty			
Reconstruct the African perspective on Sahel			
Interpret ACLED trends and limitations			
Adjudicate competing explanations with evidence			

7.2 Three-question debrief

1. Which explanation did you initially favor for Sahel state collapse, and what specific evidence would force you to revise it?

2. Which of the five perspectives did you underweight, and what did that omission cause you to miss?

3. What is one falsifier for your memo's central claim, and how would you test it with available data?

7.3 Error-log

Common Misconception	Correction	Evidence
Insurgency is primarily a military problem.	Insurgency is political first; military force without legitimacy often deepens mobilization.	Mao (1937); Galula (1964); Sahel coups after militarized CT.
Proxies are simply puppets of their sponsors.	Delegation produces autonomy, shirking, and bargaining power; control is partial and costly.	Principal-agent theory; Wagner/Africa Corps local agendas.
Civil wars are mainly about natural resources.	Economic motives matter, but grievance, state violence, and legitimacy also shape onset and duration.	Collier and Hoeffler (2004) and its critics; Sahel political economies.
Hybrid warfare is entirely new.	The blending is intensified by technology and ambiguity, but irregular, informational, and political tools are long-standing.	Historical irregular warfare; contemporary cyber/information cases.
ACLED counts all conflict violence accurately.	ACLED is valuable but incomplete, biased by reporting access, and prone to misattribution.	ACLED Sahel reports (2023–2025); need triangulation.

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Insurgency; COIN; population-centric vs enemy-centric	Political mobilization; legitimacy competition; attrition	Mao (1937); Galula (1964); Krepinevich (1986); Kilcullen (2009)	Sahel 2012–2025; MNLA to JNIM/ISSP	Is COIN primarily political or military?	Rising violence after troop surges; no legitimacy gains	L12 proxy wars; L20 coercion
Proxy warfare; delegation; autonomy	Information asymmetry; shirking; commitment problems	Principal-agent theory; Reno (2011)	State sponsorship; Wagner/Africa Corps	Control vs autonomy of proxies	Proxy ignores sponsor directives; escalation	L43 Axis of Resistance; L50 non-state actors
Privatization of violence	Market for force; deniability; accountability gaps	Reno (2011); security-governance literature	PMCs; Africa Corps; Sahel deployments	Efficiency vs sovereignty/legitimacy	Civilian harm; state capture by contractors	L8 post-colonialism; L30 Sahel

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Greed vs grievance	Resource rents; grievance mobilization; state predation	Collier and Hoeffler (2004)	Civil-war datasets; Sahel economies	Economic vs political causes	Wars without resource rents; grievances without war	L20 coercion; L34 Sahel synthesis
Hybrid warfare	Blurring regular/irregular; cyber/info; ambiguity	Contemporary hybrid-war literature	Ukraine; Sahel information ops	Novelty vs continuity	Clear attribution; conventional-only conflict	L43; L50
African perspective	Hybrid governance; state fragility; security privatization	Bayart (1993); Mbembe (2003); Mamdani (2001)	Mali, Burkina Faso, Niger collapse	External CT vs local legitimacy	Coups after CT; insurgent governance gains	L8; L30; L34
Data and evidence	Event counts; fatalities; perpetrator coding	ACLED Sahel reports (2023–2025)	ACLED Sahel 2012–2025	Trend vs. causal inference	Undercounting; misattribution	Section 2A Data Lab

SECTION 9 — REVIEW SCHEDULE

- **R1 — Same day (30–45 minutes):** Close the lesson and reconstruct the five key ideas from memory without notes; then check flashcards and correct gaps.
- **R2 — Day 3 (45–60 minutes):** Redraw the three visuals from Section 3 and explain the Sahel case aloud using all four levels of analysis.
- **R3 — Day 7 (60–90 minutes):** Write a 500-word memo comparing US Afghanistan and French Barkhane, including mechanism, perspectives, and falsifiers.
- **R4 — Day 14 (60 minutes):** Rebuild the five-perspective comparison matrix and update the error log with one new misconception.
- **R5 — Day 30 (45 minutes):** Answer the hinge question under time pressure, revisit ACLED limitations, and schedule the next interleaved review with L30/L34.

SECTION 10 — COMPLETION CHECKLIST

☐ I can define insurgency and distinguish it from terrorism and civil war.

☐ I can explain Mao's three phases and their scope conditions.

☐ I can compare population-centric and enemy-centric COIN.

☐ I can state Galula's political-military ratio and its limits.

☐ I can apply principal-agent theory to proxy warfare.

☐ I can explain why proxies gain autonomy over time.

☐ I can define the privatization of violence and name PMC/Wagner/Africa Corps examples.

☐ I can summarize the greed vs. grievance debate and its critics.

☐ I can define hybrid warfare without treating it as entirely new.

☐ I can reconstruct the African perspective as primary, not an add-on.

☐ I can steel-man Chinese, Russian, Western, and UN perspectives.

☐ I can use all four levels of analysis in the Sahel case.

☐ I can interpret ACLED data and state its limitations.

☐ I can adjudicate why Afghanistan and Barkhane failed.

☐ I can identify at least one falsifier for my main claim.

☐ I have completed the confidence audit and error log.

☐ I can reproduce the cheatsheet from memory.

☐ I have scheduled R1–R5 reviews.

25. Cyber, Information, and Cognitive Warfare

LESSON METADATA

Field	Value
Lesson number and title	24 — Cyber, Information, and Cognitive Warfare
Module	Module 4: Security Studies and Warfare
Prerequisites	L7 (constructivism), L20 (coercion), L4 (post-positivism, linguistic turn)
Interleaved links	Forward to L54 (AI and hyperwar), L56 (scientific statecraft), L57 (space and infrastructure)
Reading load	7-9 hours
Content channels	Text, tables, diagrams, case studies
Bloom ceiling	Evaluate / Create
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

Security studies was built on a grammar that assumes kinetic violence, territorial boundaries, identifiable adversaries, and measurable victory. Cyber and information operations break each of these assumptions. An attack may leave no crater; the attacker may be a criminal syndicate renting infrastructure to a state intelligence service; the "battlefield" may be the cognitive space of a population; "victory" may be a shifted election or a corroded trust in institutions. The central puzzle of this lesson is whether the conceptual vocabulary of coercion, deterrence, and sovereignty — developed for industrial-age warfare — can be transposed to domains where effects are non-kinetic, attribution is probabilistic, and the decisive engagement is often invisible. The lesson argues that the vocabulary can be transposed only partially, and that the partial failures are themselves theoretically productive: they reveal assumptions buried in classical security theory that were never made explicit until a domain arose that violated them.

This lesson follows L20 on coercion and L7 on constructivism, and it presupposes L4's post-positivist turn.

Coercion theory, as developed by Schelling and refined by Pape, assumes a sender, a signal, and a receiver who can interpret the signal as costly. In cyber and information domains, the signal is often ambiguous by design; the receiver may not know an operation occurred; and the "cost" is reputational or cognitive rather than material. Constructivism matters because the effects of information warfare are constituted by shared meaning: a disinformation campaign works not by destroying servers but by reshaping what a public believes is true. Post-positivism matters because the analyst's own categories — "attack," "war," "attribution" — are part of the contested terrain, and the linguistic turn reminds us that naming an event as an "attack" is itself a political act with consequences for response. The lesson thus sits at the intersection of three intellectual traditions and forces them into contact with a domain none was built for.

After mastering this lesson, the student will be able to do six things. First, reconstruct the grammar of cyber conflict — offense-defense balance, attribution problems, and deterrence by denial versus punishment — and identify where it holds and where it fractures. Second, analyze critical infrastructure targeting, including ransomware, state hacking, and the blurring of criminal and state action. Third, evaluate information and cognitive warfare as distinct but overlapping phenomena, each with its own mechanism and scope conditions. Fourth, compare five national doctrines — US persistent engagement, Russian reflexive control and information security, Chinese three warfares, EU regulatory, and the African cyber-sovereignty position — reconstructing each from within. Fifth, adjudicate a concrete case, the 2016 US election interference and the 2010 Stuxnet attack, across levels of analysis and perspectives. Sixth, produce a policy memo that distinguishes description, explanation, prediction, and prescription, with explicit falsifiers.

The African perspective is not a regional illustration appended to Western theory; it reframes the lesson's puzzle. From the vantage of African scholarship — Grovogui's critique of the international as a Eurocentric construct, Mbembe's necropolitics, Bayart's extraversion, Mamdani's citizen/subject distinction, Rodney's underdevelopment thesis, and the pan-Africanist tradition of Nkrumah, Nyerere, and Cabral — the digital domain appears not as a neutral technical space but as a new frontier of extraversion and extraction. African states confront cyber operations not only as targets but as jurisdictions whose data, infrastructure, and narratives are governed by foreign platforms and foreign doctrines. The AU Convention on Cyber Security and Personal Data Protection (Malabo, 2014) is not merely a regional implementation of Western norms; it is an assertion that cyber sovereignty includes the right to localize data, to regulate platforms, and to define security in terms of developmental and cognitive autonomy. The African vantage reveals what the other four perspectives occlude: that the "global" cyber order is built on an infrastructure of platforms and standards whose governance is concentrated in a handful of states and corporations, and that "cyber norms" negotiated in New York or Geneva may presuppose a digital capacity that most African states do not possess. Fanon's analysis of colonial violence and Oyěwùmí's critique of the universalization of Western categories remind us that the categories of "cyber war" themselves carry a genealogy that is not neutral.

The lesson proceeds through five key ideas. First, the grammar of cyber conflict: offense-defense balance, attribution problems, and deterrence by denial versus punishment. Second, critical infrastructure targeting: ransomware, state hacking, and the blurring of criminal and state action. Third, information warfare: disinformation, election interference, and the manipulation of public opinion. Fourth, cognitive warfare: the weaponization of narrative, the attention economy, and the "brain as battlefield." Fifth, divergent national doctrines: US persistent engagement, Russian reflexive control and information security, Chinese three warfares, and EU regulatory approaches. These five are not sequential stages but overlapping layers: a single operation — Stuxnet, or the 2016 election interference — typically traverses several, and the analyst's task is to identify which layer is doing the causal work in a given case.

The lesson insists on three disciplines that run through every section. First, level-of-analysis discipline: every claim must be located at the individual, state, systemic, or transnational level, the four levels established in Lesson 1. Second, perspective discipline: every claim must be reconstructable from at least two of the five perspectives, and the African perspective must be attempted first. Third, epistemic humility: attribution in cyber and information domains is probabilistic, not categorical; the analyst must distinguish what is known, what is inferred, and what is asserted, and must mark the difference between description, explanation, prediction, and prescription. The lesson's assessments — the worked example, the problem pair, the independent memo — are designed to test these disciplines. The student who masters them will be equipped to analyze not only the cases in this lesson but the forward-linked domains of AI and hyperwar (L54), scientific statecraft (L56), and space and infrastructure (L57), where the same grammar applies with even greater stakes and where the African questions of sovereignty, extraversion, and cognitive autonomy recur with renewed urgency.

SECTION 1 — Pre-Class Priming

1.1 Retrieval warm-up

1. In L20 (coercion), what is the difference between deterrence and compellence, and why is compellence generally considered harder to achieve? (Recall Schelling's distinction and the problem of assurance.)
2. In L7 (constructivism), how does Wendt's claim that "anarchy is what states make of it" challenge Waltzian neorealism's treatment of anarchy as a fixed structural condition?
3. In L4 (post-positivism), what is the "linguistic turn," and why does it matter for security studies specifically?
4. In L20, what are the two mechanisms of coercion — denial and punishment — and how do they differ in their causal logic and in the information they require from the adversary?
5. In L7, what role do norms play in constructivist IR, and how does a constructivist account of norms differ from a rationalist account of interests?
6. In L4, what is the difference between *Erklären* (explanation) and *Verstehen* (understanding), and which traditions in IR privilege which?

1.2 Orientation questions

1. Why might deterrence by punishment fail in cyberspace even if it has been theorized to work in nuclear deterrence? Consider attribution, proportionality, and the problem of thresholds.
2. How does the "brain as battlefield" concept change what counts as a military operation, and what does it imply about who is a combatant?
3. What does the African cyber-sovereignty position add to debates that are otherwise dominated by US, Russian, and Chinese doctrines?
4. Is Stuxnet an act of war, an act of sabotage, or something else — and what hangs on the answer for international law and for deterrence theory?

1.3 Vocabulary pre-teach

- **Attribution**: the process of identifying the actor behind a cyber or information operation; in practice probabilistic, contested, and often dependent on classified intelligence that cannot be publicly disclosed.
- **Deterrence by denial**: preventing an adversary from achieving their objective, thereby removing

the incentive to attack; in cyber contexts this often means resilience and rapid recovery rather than blocking.

- **Deterrence by punishment**: threatening retaliation to raise the cost of attack; in cyber contexts complicated by attribution problems and by the risk of escalation.
- **Reflexive control (Russian)**: shaping an adversary's decision-making by feeding them manipulated information so that they voluntarily choose the action the manipulator desires; a tradition rooted in Soviet military thought.
- **Three warfares (Chinese)**: public opinion warfare, psychological warfare, and legal warfare (lawfare), articulated as a unified doctrine for shaping the information environment.
- **Persistent engagement (US)**: the US doctrine of continuous, proactive operations in cyberspace to disrupt adversaries before they reach US networks, associated with the 2018 US cyber strategy.
- **Cognitive warfare**: operations targeting the human mind, perception, and decision-making rather than systems or data; the "brain as battlefield."
- **Information security (Russian doctrine)**: a broad concept encompassing not only technical security but the protection of information space, societal stability, and state sovereignty over information flows.
- **Cyber sovereignty**: the principle that states have sovereign authority over cyberspace within their territory, including data localization and platform regulation; central to both Chinese and African positions.
- **APT (Advanced Persistent Threat)**: a prolonged, targeted cyber intrusion, typically state-linked, characterized by stealth and persistence rather than immediate destruction.
- **Ransomware**: malware that encrypts data and demands payment for decryption; the site of the criminal/state blur when state actors tolerate or direct such operations.
- **Attention economy**: the competition for human attention as a scarce resource, exploited by information and cognitive operations that seek to capture and direct collective focus.

SECTION 2 — LESSON CORE

SECTION 2.1 Learning objectives

By the end of this lesson, the student will be able to: (1) **Explain** the mechanism by which offense-defense asymmetry and attribution ambiguity jointly produce a distinctive grammar of cyber conflict, including why classical deterrence by punishment is weakened and why deterrence by denial becomes comparatively attractive. (2) **Compare** deterrence by denial and deterrence by punishment as strategies for cyber conflict, specifying the scope conditions under which each is credible, the kinds of targets for which each is appropriate, and the escalation risks attached to each. (3) **Analyze** a cyber incident using the four levels of analysis—individual, state, systemic, and transnational—and identify which of the five perspectives (African, Chinese, Russian, Western, UN) best explains its dynamics without forcing the case into a single framework. (4) **Evaluate** the claim that most cyber operations remain below the threshold of armed conflict, using evidence from state practice, the UN GGE consensus reports, and the observable pattern of public attribution, sanctions, and covert retaliation rather than kinetic response. (5) **Apply** the concept of attribution ambiguity to design a falsifiable indicator that would distinguish state-sponsored from criminal cyber activity, stating what evidence would confirm, weaken, or refute the indicator and which level of analysis it privileges. These objectives are assessable through short-answer explanations, comparative matrices, case-based memos, and a hinge question that tests whether the student can distinguish description, explanation, prediction, and prescription

in cyber-security analysis.

SECTION 2.2 KEY IDEA 1: The grammar of cyber conflict: offense-defense balance, attribution problems, and deterrence by denial versus punishment

Bolded Causal Claim: Cyber conflict has a distinctive grammar because the structural cheapness of offense relative to defense and the endemic ambiguity of attribution jointly weaken classical deterrence by punishment and push states toward deterrence by denial, active defense, and persistent sub-threshold competition.

Mechanism: The first mechanism is the offense-defense balance. In conventional military domains, defense can be advantaged by terrain, fortification, mobilization time, and the physical costs of projection. In cyber operations, the defender must secure every interface, patch every vulnerability, monitor every log, and train every user, while the attacker needs only one exploitable weakness, one stolen credential, or one misconfigured service. This does not mean offense always wins; sophisticated defenders can raise costs through segmentation, redundancy, deception, and rapid patching. But the default asymmetry is structural: the defender's problem is combinatorial and continuous, while the attacker's problem is selective and episodic. The second mechanism is attribution ambiguity. Technical forensics can often identify malware families, command-and-control infrastructure, tactics, techniques, and procedures, and sometimes the specific operator. Yet moving from technical indicators to political attribution requires intelligence about intent, state sponsorship, and chain of command that governments rarely disclose in full. The gap between technical and political attribution creates plausible deniability and allows states to operate below the threshold of acknowledged conflict. The third mechanism is deterrence adaptation. Classical deterrence by punishment assumes an identifiable aggressor, a credible threat, and a proportionate response. Cyber ambiguity undermines the first two conditions: if the attacker cannot be named with confidence, retaliation risks misattribution; if retaliation is covert, it may not deter; if it is public and kinetic, it may escalate beyond the original harm. Deterrence by denial therefore becomes attractive because it reduces the expected payoff of attack without requiring certain attribution: resilient systems, backups, segmentation, and rapid recovery make intrusion less useful. But denial alone cannot eliminate espionage, disruption, or reputational damage, so states combine it with punishment threats—sanctions, indictments, diplomatic isolation, covert counter-operations, and occasionally kinetic signaling. The resulting grammar is one of frequent, deniable, sub-threshold activity in which the boundary between peace and conflict is managed rather than clearly crossed. Constructivist and post-positivist work is relevant here because "cyber attack," "armed attack," and "critical infrastructure" are not purely technical labels; they are interpreted categories whose meaning is stabilized through practice, law, and discourse. Thomas Rid's argument that cyber operations are closer to sabotage and espionage than to war captures one side of this debate, while the UN GGE consensus reports attempt to stabilize norms by specifying that international law applies to state cyber activity and that critical infrastructure should be protected. Singer and Brooking's analysis of the information environment adds that cyber conflict is not only about systems but about attention, narrative, and public perception, which means the grammar includes psychological and political effects even when no physical damage occurs.

Scope Conditions: The claim that cyber conflict has this distinctive grammar holds under several conditions. First, target systems must be complex, networked, and partially opaque to their owners; simple or air-gapped systems reduce the offense-defense asymmetry. Second, the attacker must have time, access, and intelligence; opportunistic intrusions differ from strategic campaigns. Third, attribution must require classified or sensitive intelligence that cannot be fully shared, which is common in state-on-state cases but less so when criminal infrastructure is seized and analyzed publicly. Fourth, political leaders must demand high

confidence before authorizing retaliation, which is typical in democracies and in nuclear-armed states but not universal. The claim weakens when an operation causes physical destruction or loss of life, because such effects push the incident toward the legal category of armed attack and make punishment deterrence more credible. It also weakens when a defender possesses overwhelming counter-cyber capability or when an attribution coalition shares enough intelligence to remove plausible deniability. Finally, the offense-defense balance is not technologically fixed; automation, zero-trust architectures, artificial intelligence, and software supply-chain reform can shift costs toward the defender, although adversaries adapt in turn. Deterrence by punishment is more credible for high-end destructive attacks where attribution eventually becomes politically unavoidable; deterrence by denial is more relevant for espionage, disruption, and low-level coercion where the expected damage is below the threshold that would justify escalation.

Observable Implications: If this grammar is operative, several patterns should be observable. States should experience frequent intrusions without kinetic retaliation; public attribution statements should vary in confidence and often be accompanied by sanctions, indictments, or diplomatic protests rather than military force; governments and firms should invest heavily in resilience, backup, segmentation, and incident response; private companies should function as frontline defenders and sometimes as intelligence partners; states should engage in "naming and shaming" to shape norms even when they cannot punish; and adversaries should carefully manage effects to avoid crossing thresholds that would trigger armed response. One should also observe covert retaliation, threshold management, and diplomatic efforts to define prohibited targets, especially through the UN GGE and OEWG processes. Conversely, if classical deterrence by punishment were fully effective, one would expect fewer acknowledged intrusions, clearer red lines, and more frequent kinetic or overtly coercive responses to cyber operations. The CSIS record of significant cyber incidents and the growing number of state-linked advanced persistent threat groups are consistent with a grammar of persistent sub-threshold competition, though such counts must be interpreted cautiously because they reflect reporting capacity, definitional choices, and political willingness to disclose incidents.

Perspective Note (five traditions in brief): The African perspective, treated here as primary, begins from the position that cyber conflict is not only an interstate deterrence problem but a sovereignty, development, and inequality problem. Many African states enter the digital domain with infrastructural dependence, limited domestic cybersecurity capacity, and exposure to both state and criminal actors; the offense-defense asymmetry is therefore compounded by asymmetries in technology, finance, and expertise. From this vantage point, deterrence by punishment is often unavailable because retaliatory capacity is limited and because attribution requires resources that are unevenly distributed. The African Union Convention on Cyber Security and Personal Data Protection, adopted in Malabo in 2014, reflects a regional effort to harmonize cybercrime law, data protection, and electronic commerce, but implementation remains uneven. African scholarship and policy discourse frequently frame cyber sovereignty in terms of data localization, control over critical information infrastructure, and protection against digital extractivism, rather than in terms of great-power deterrence. The African perspective also highlights that global cyber norms developed in UN forums may not reflect the priorities of states whose immediate concerns are capacity building, cybercrime, and the protection of nascent digital economies. It therefore sees the grammar of cyber conflict as shaped by historical inequalities in knowledge production and technological ownership, and it insists that resilience and denial strategies must be accompanied by equitable access to attribution tools, training, and infrastructure. Chinese perspectives emphasize cyber sovereignty, state control over information infrastructure, and "active defense," interpreting the offense-defense balance through the lens of domestic stability and regime security as much as interstate competition. Attribution is often treated as politically constructed by Western actors, and deterrence is linked to the ability to control information flows within national borders. Russian

perspectives draw on an information-security doctrine that treats the information sphere as a domain of conflict in which technical and psychological operations are inseparable; reflexive control traditions emphasize shaping an adversary's perceptions and decisions rather than merely destroying systems. Attribution skepticism is pronounced, and deterrence is less about credible punishment than about controlling narratives and maintaining strategic ambiguity. Western perspectives, especially in the United States, have developed deterrence frameworks, attribution coalitions, and persistent engagement doctrines, while also generating self-critique: operations such as Stuxnet demonstrated that cyber weapons can proliferate, that effects can escape intended targets, and that offensive advantage may be temporary. Western analysis tends to privilege technical attribution, legal categories, and alliance coordination, sometimes underestimating how its own offensive operations shape adversary doctrines. The UN perspective, expressed through the GGE consensus reports of 2013, 2015, and 2021 and the OEWG process, seeks to apply international law to cyberspace, articulate norms of responsible state behavior, and build confidence through transparency and capacity building. It treats attribution as a state responsibility but acknowledges practical limits, and it aims to reduce escalation by clarifying that states should not target critical infrastructure or interfere with emergency services. Its strength is multilateral legitimacy; its limitation is that consensus language often papers over disagreements about sovereignty, self-defense, and the threshold of armed attack.

SECTION 2.3 KEY IDEA 2 — Critical Infrastructure Targeting: Ransomware, State Hacking, and the Blurring of Criminal and State Action

Bolded Causal Claim: Targeting critical infrastructure through cyber means converts latent digital access into coercive leverage, but only where operational technology is networked, poorly segmented, and backed by fragile recovery capacity; the blurring of criminal ransomware and state-sponsored intrusion makes attribution and response categorization systematically ambiguous, so that the same technical event can be read as crime, espionage, or act of war depending on the interpretive frame applied.

Mechanism: The mechanism proceeds in four linked stages. First, digitization of operational technology (OT) in power grids, water treatment, hospitals, and financial clearing systems creates attack surfaces that were historically air-gapped; as industrial control systems (SCADA) are connected to enterprise IT networks for efficiency and remote monitoring, the boundary between information systems and physical process control erodes. Second, initial access is typically achieved through commodity techniques—phishing, unpatched vulnerabilities, compromised credentials, or supply-chain insertion—rather than bespoke exploits, which means the same intrusion kit serves criminals and intelligence services alike. Third, once inside, the attacker faces a choice between immediate monetization (ransomware encryption, data exfiltration for sale) and pre-positioning for strategic effect (logic bombs, wiper malware, or sustained access for future disruption). Fourth, and most consequentially, the criminal market provides a laundering layer: states can purchase access from brokers, task criminal groups, or simply allow criminal operations to proceed in their jurisdiction, gaining plausible deniability while the victim state struggles to classify the event. The blurring is not merely tactical deception; it is structural, because the global cybercrime economy—ransomware-as-a-service, initial access brokers, bulletproof hosting—has industrialized capabilities that were once the monopoly of intelligence agencies. When a hospital is encrypted by LockBit or a pipeline is shut down by DarkSide, the technical forensics may point to a criminal affiliate, while the geopolitical context suggests state tolerance or direction. This ambiguity is the mechanism's core product: it degrades the victim's ability to invoke legal categories (crime versus armed attack), complicates alliance consultation, and slows decision cycles. The

2021 Colonial Pipeline incident illustrates the chain: a compromised password led to ransomware deployment by a criminal group operating from Russian territory, forcing a fuel shortage across the US East Coast and triggering a federal emergency declaration, even though the group was not formally state-directed. The 2017 NotPetya attack, initially disguised as ransomware but functioning as a wiper, caused an estimated ten billion dollars in global damage and demonstrated how destructive code could be released through a software supply chain, blurring criminal, state, and terrorist modalities. Ukraine's 2015 and 2016 power-grid intrusions showed the strategic variant: attackers used spear-phishing and legitimate remote-access tools to open breakers, causing blackouts, while simultaneously jamming customer service lines to delay recovery. In each case, the mechanism's leverage derives not from the sophistication of the exploit but from the victim's dependency on the targeted system and the time required to restore it.

Scope Conditions: The mechanism operates where four conditions converge: (a) high dependency on a single digital system with limited manual fallback; (b) weak network segmentation between IT and OT environments; (c) a criminal or state ecosystem capable of developing and deploying the payload; and (d) a legal and political environment in which the victim cannot quickly determine attribution and therefore cannot calibrate response. It is weaker where infrastructure is air-gapped, where redundant manual procedures exist, where strong cyber hygiene and patching discipline prevail, and where international cooperation on takedowns and indictments is effective. It is also weaker against targets with high resilience investment, such as financial clearinghouses with real-time backup systems. Conversely, it is strongest against municipal water systems, regional hospitals, and mid-sized energy distributors in jurisdictions with limited cybersecurity capacity—a pattern that explains why ransomware disproportionately affects developing-country infrastructure and local governments in wealthy states alike.

Observable Implications: If the mechanism holds, one should observe: rising ransomware incidents against infrastructure sectors tracked by CSIS and ENISA; increasing convergence between criminal tooling and state APT tradecraft; a growing gap between incident frequency and successful prosecution; and states investing in resilience and manual fallback rather than purely in perimeter defense. One should also observe diplomatic friction when states demand that other states suppress criminal groups operating from their territory, as in US-Russia exchanges after Colonial Pipeline. A further implication is that deterrence by punishment—threatening retaliation—becomes less credible when the attacker is a criminal proxy, because the target state cannot clearly identify a state adversary to punish without risking escalation or misattribution.

Perspective Note (five traditions in brief): The African perspective, reconstructed from within, treats critical infrastructure targeting as inseparable from questions of digital sovereignty and developmental vulnerability. African scholarship and policy discourse—drawing on the AU Convention on Cyber Security and Personal Data Protection (Malabo, 2014), the work of scholars such as Aning and Danso on African security governance, and the broader tradition of dependency critique associated with Rodney and Nkrumah—emphasize that African states face a double bind: their infrastructure is increasingly digitized through foreign vendors and cloud providers, yet their defensive capacity and legal frameworks lag, making them attractive targets for both criminal ransomware and state pre-positioning. From this vantage point, the blurring of criminal and state action is not an abstract legal puzzle but a lived condition in which African hospitals, power utilities, and financial systems are disrupted by actors whose interests are opaque and whose accountability is nil. The Malabo Convention's push for data localization, harmonized cybercrime laws, and regional cooperation reflects an insistence that infrastructure protection is a sovereignty issue, not merely a technical one, and that external powers' offensive operations in African digital space reproduce colonial patterns of extraction and vulnerability. African analysts also note that the global ransomware economy exploits African underinvestment in cybersecurity workforce development, turning the continent into both a target and an unwitting

transit zone. The Chinese perspective frames critical infrastructure protection through the doctrine of cyber sovereignty and the "three warfares" (public opinion, psychological, legal), treating foreign targeting of Chinese infrastructure as a sovereignty violation while asserting the state's right to regulate its information space; it emphasizes defensive resilience and the integration of civilian and military cyber defense under party-state coordination. The Russian perspective, rooted in information security doctrine, treats infrastructure vulnerability as part of a broader information confrontation in which Western states are seen as the primary threat; it emphasizes state control over domestic networks and the legitimacy of preemptive defensive measures, while its own operations abroad are framed as responses to Western aggression. The Western perspective, dominant in NATO and US doctrine, centers on deterrence by denial and punishment, attribution confidence, and the application of international law to cyber operations; it has developed frameworks for identifying state responsibility and has invested heavily in resilience, but it has also been criticized for underestimating how its own offensive operations—such as Stuxnet—legitimize adversary targeting of infrastructure. The UN perspective, expressed through the GGE consensus reports of 2013, 2015, and 2021 and the OEWG process, seeks to establish norms that states should not target critical infrastructure or interfere with emergency services, and it promotes confidence-building measures and capacity building; its strength is multilateral legitimacy, while its limitation is that consensus language often papers over disagreements about sovereignty, self-defense, and the threshold of armed attack.

SECTION 2.4 KEY IDEA 3 — Information Warfare: Disinformation, Election Interference, and the Manipulation of Public Opinion

Bolded Causal Claim: Information warfare achieves strategic effects not by destroying infrastructure but by degrading the epistemic and social foundations of democratic decision-making, exploiting platform architectures and cognitive biases to reshape public opinion at low cost; its power lies in the asymmetry between the cost of producing false or polarizing content and the cost of verifying and countering it.

Mechanism: The mechanism operates through a chain of amplification and contamination. First, content is produced—often by state-linked actors, troll farms, or automated networks—that is designed to exploit existing social cleavages, emotional triggers, and identity commitments rather than to persuade through evidence. Second, this content is injected into information ecosystems through multiple channels: fake personas on social media, compromised or complicit influencers, state media outlets, and encrypted messaging applications. Third, platform algorithms, optimized for engagement rather than accuracy, amplify emotionally resonant content, creating feedback loops in which false or misleading narratives reach audiences far beyond their originators' direct reach. Fourth, the content is laundered through repetition across channels, so that a claim originating in a troll farm appears to be independently corroborated when it surfaces in mainstream media or political discourse. Fifth, the cumulative effect is not necessarily to change specific votes but to erode trust in institutions, media, and electoral processes, and to polarize publics so that collective action becomes harder. Singer and Brooking (2018) describe this as the weaponization of the social media age, in which the battlefield is the feed and the ammunition is attention. Pomerantsev (2019) emphasizes that modern propaganda does not require belief in a single truth; it thrives on cynicism, confusion, and the collapse of shared epistemic standards. The mechanism is cheap because it leverages existing infrastructure—platforms, influencers, partisan media—rather than requiring the attacker to build its own. It is deniable because content can be attributed to organic users, and because the line between foreign interference and domestic political speech is legally and practically murky. The 2016 US election interference, attributed to the Russian Internet Research Agency and military intelligence (GRU), exemplifies the chain: thousands of fake social media accounts, targeted advertising, and hacked document releases were used to amplify divisive content,

attack specific candidates, and depress turnout among targeted demographics. Similar patterns have been documented in European elections, the Brexit referendum, and COVID-19 information environments, where state and non-state actors exploited uncertainty to amplify conspiracy theories and undermine public health measures.

Scope Conditions: The mechanism is strongest where (a) information consumption is concentrated on algorithmically curated platforms with weak content moderation; (b) media literacy and institutional trust are already low; (c) political polarization creates receptive audiences for identity-affirming falsehoods; and (d) legal frameworks struggle to distinguish foreign interference from protected speech. It is weaker where public broadcasting is strong, where platform regulation is robust, where media literacy education is widespread, and where political culture is less polarized. It is also weaker against targets with high social cohesion and strong institutional legitimacy. The mechanism does not require the attacker to control the narrative entirely; partial success—sowing doubt, amplifying existing divisions—is often sufficient and is harder to counter than outright fabrication.

Observable Implications: If the mechanism holds, one should observe: documented state-linked disinformation campaigns tracked by EU DisinfoLab and similar monitors; increasing investment by states in counter-disinformation units and platform regulation; a widening gap between the speed of false content spread and the speed of correction; and declining trust in media and electoral institutions in targeted societies. One should also observe that countermeasures—fact-checking, takedowns, labeling—often reach smaller audiences than the original false content, and that some interventions backfire by amplifying the very claims they seek to debunk. A further implication is that information warfare blurs into domestic politics, as foreign narratives are adopted and amplified by domestic actors for their own purposes, making attribution and response even more complex.

Perspective Note (five traditions in brief): The African perspective, reconstructed from within, frames information warfare as a continuation of older struggles over narrative sovereignty and epistemic justice. African scholarship—drawing on Fanon's analysis of colonial propaganda and psychological domination, Cabral's emphasis on culture as a terrain of struggle, and contemporary work by scholars such as Tamale on decolonial knowledge production—insists that African publics have long been targets of external information manipulation, from colonial-era propaganda to Cold War covert operations and, more recently, to digital disinformation campaigns during elections and public health crises. From this vantage point, the manipulation of public opinion is not a novel threat invented by Russian or Chinese actors; it is a persistent feature of asymmetric power in which African information spaces are treated as battlegrounds by external powers with limited accountability. African analysts emphasize that platform algorithms, trained on Western data and optimized for Western engagement patterns, often misclassify African political speech, amplify sensational content, and underinvest in local-language moderation, creating structural vulnerabilities that foreign and domestic actors alike exploit. The AU and regional bodies have responded with frameworks for election observation and media regulation, but capacity constraints and the cross-border nature of digital platforms limit effectiveness. African scholars also caution against importing Western counter-disinformation models that may not fit local media ecologies, where radio, WhatsApp, and community networks often matter more than Twitter or Facebook, and where "disinformation" can become a label used by incumbents to suppress dissent. The Chinese perspective treats information warfare as an extension of the "three warfares" doctrine, emphasizing public opinion warfare, psychological warfare, and legal warfare as integrated instruments of statecraft; it frames Western media dominance as a form of information hegemony and justifies state control over domestic information space as defensive sovereignty. The Russian perspective, rooted in reflexive control theory, treats information as a battlespace in which the goal is to shape the adversary's

decision-making by manipulating their perception of reality; it distinguishes between information-technical and information-psychological security, and it frames its own operations as defensive responses to Western information aggression. The Western perspective, dominant in NATO and US doctrine, has increasingly recognized information warfare as a strategic threat, investing in counter-disinformation, platform regulation, and resilience; it emphasizes attribution, transparency, and the defense of democratic processes, but it has also been criticized for over-securitizing speech, for inconsistent application of standards, and for underestimating how its own information operations abroad have eroded credibility. The UN perspective approaches information warfare through the lens of human rights, freedom of expression, and the GGE/OEWG processes; it seeks to balance security concerns with protections for speech, and it emphasizes capacity building and multilateral norms, though consensus on defining and prohibiting information interference remains elusive.

2.5 KEY IDEA 4 — Cognitive warfare: the weaponization of narrative, the attention economy, and the 'brain as battlefield'

Bolded Causal Claim: Cognitive warfare is best understood as a distinct strategic domain in which adversaries seek to alter the cognitive processes—perception, attention, memory, judgment, emotion, and identity—through which individuals and collectives make sense of political reality; its causal force arises from the interaction between technologically amplified narrative environments and pre-existing cognitive vulnerabilities, producing effects that can outlast discrete information campaigns and reshape the conditions under which political choice, consent, and resistance become possible.

Mechanism: The mechanism is not simply the transmission of false claims but the manipulation of the cognitive infrastructure through which claims are evaluated. Human beings reduce complexity through narrative; they rely on heuristics, social cues, identity-protective reasoning, and emotional salience. Cognitive warfare exploits these features by shaping what becomes thinkable, memorable, urgent, or trustworthy. Several channels matter. First, narrative seeding and repetition can make a frame cognitively available, so that even skeptical audiences must process it. Second, emotional priming—especially fear, anger, humiliation, and moral disgust—can narrow attention and reduce deliberative capacity. Third, identity fusion can bind information processing to group belonging, so that contradictory evidence is experienced as an attack on the self. Fourth, cognitive overload can degrade judgment by flooding the information environment with competing, contradictory, or decontextualized claims. Fifth, epistemic fragmentation can erode shared standards of evidence, making collective action and institutional trust harder to sustain. The attention economy is central to this mechanism because commercial platforms optimize for engagement, and engagement is often maximized by content that activates threat, outrage, or novelty. Algorithmic curation, recommendation systems, microtargeting, and influencer networks can therefore amplify adversarial narratives without requiring direct state control of media. In this sense, the "brain as battlefield" metaphor points to a strategic effort to shape the environment in which cognition occurs, not to a literal neuroscientific takeover. The intended effect may be belief change, but it may also be more subtle: altered salience, increased uncertainty, cynicism, self-censorship, polarization, or the normalization of a particular threat narrative. Pomerantsev's (2019) account of information environments in which "nothing is true and everything is possible" captures one variant of this logic: the goal is not always persuasion but the degradation of the capacity to distinguish signal from noise. Singer and Brooking (2018) similarly emphasize that contemporary conflict operates through the manipulation of attention and emotion in networked publics. Heickerö (2022) is usefully read as part of the broader effort to treat cognitive effects as a strategic problem rather than merely a communications problem.

The mechanism is therefore relational: it depends on the interaction between adversary operations, platform architectures, social identities, institutional credibility, and the psychological state of the target population.

Scope Conditions: Cognitive warfare is most likely to be effective where digital platforms are the primary mediators of political information; where institutional trust is already low; where social identities are polarized or ethnically, religiously, or regionally salient; where media ecosystems are fragmented; where crisis, war, pandemic, or economic shock increases cognitive load; and where regulatory capacity over platforms and data is weak. It is less likely to produce durable effects where public-service media are strong, where media literacy and civic education are widespread, where platform accountability is enforceable, where social cohesion is high, and where counter-narratives are credible because they come from trusted local actors rather than distant authorities. The mechanism also requires adversary capacity: intelligence services, troll farms, bot networks, data brokers, sympathetic influencers, diaspora networks, or criminal proxies. Scope conditions include not only target vulnerability but adversary resources and the absence of friction in the information environment. A further scope condition is temporal: cognitive effects often accumulate slowly and are difficult to isolate from ordinary political disagreement, which means that short-term campaigns may produce noise rather than strategic change. There are also important counterarguments. Citizens are not passive recipients; they interpret, resist, mock, and repurpose narratives. Backfire effects can occur when audiences perceive manipulation. Measurement of cognitive change is methodologically difficult, and claims about "brainwashing" often overstate adversary power while understating human agency. The "brain as battlefield" frame can also become self-fulfilling: by treating publics as manipulable, governments may justify paternalistic information control, surveillance, or the securitization of speech. Thus the theory's strongest version is not that cognition can be reliably hacked, but that strategic actors can systematically alter the conditions of attention and trust in ways that bias political outcomes over time.

Observable Implications: If cognitive warfare is occurring at a strategically significant level, one should observe not only the circulation of false or misleading content but changes in attention allocation, emotional tone, trust metrics, polarization indices, policy salience, and decision-making speed. Indicators include coordinated inauthentic behavior, anomalous engagement patterns, synchronized narrative emergence across platforms, shifts in search trends, increased cynicism toward institutions, and the normalization of conspiratorial or dehumanizing frames. Defensive responses—cognitive security programs, resilience training, platform moderation, strategic communications, and "pre-bunking"—are themselves observable implications, because they indicate that states and platforms treat cognition as a security domain. However, attribution is harder than in conventional cyber intrusion: cognitive effects are diffuse, long-term, and entangled with domestic politics. A false claim may be amplified by foreign actors, domestic elites, commercial incentives, and genuine grievance simultaneously. Therefore, observable implications must be assessed with care: evidence of foreign amplification is not by itself evidence of strategic effect, and evidence of polarization is not by itself evidence of foreign causation. The most defensible implication is that cognitive warfare should be evaluated through longitudinal, multi-method research that distinguishes exposure, belief, attitude, and behavior, rather than through single-event metrics such as virality or engagement.

Perspective Note (five traditions in brief):
African (primary): The African perspective is primary because cognitive warfare in African contexts cannot be separated from longer histories of epistemic violence, colonial categorization, and racialized knowledge production. Fanon's analysis of colonialism's psychological damage, Cabral's insistence that culture is a terrain of struggle, Nyerere's emphasis on collective consciousness and ujamaa, and Mamdani's distinction between citizen and subject all suggest that cognition and political identity have long been battlegrounds. Mbembe's work on necropolitics and commandement, Bayart's analysis of extraversion, and Grovogui's

critique of international legal hierarchies further show how external powers have shaped African political imagination through categories, institutions, and narratives. Oyěwùmí's critique of colonial gender categories, Tamale's decolonial feminist scholarship, and the work of Aning and Danso on African security governance highlight that cognitive security is inseparable from questions of knowledge sovereignty and institutional legitimacy. From this vantage point, contemporary digital cognitive operations—during elections, conflicts, pandemics, or protests—interact with legacies of low institutional trust, ethnicized politics, externally funded media, and platform infrastructures owned outside the continent. The African perspective cautions against importing "brain as battlefield" metaphors that treat African publics as uniquely manipulable; instead, it emphasizes agency, vernacular media, community resilience, and the need to decolonize data and narrative infrastructures. It also insists that cognitive warfare be analyzed not only as foreign interference but as a continuation of struggles over who has the authority to define reality.

Chinese: The Chinese perspective tends to frame cognitive and information effects through the lens of social stability, party-state legitimacy, and "discourse power," treating narrative management as an extension of sovereignty and governance; it emphasizes the threat of Western ideological penetration and the need for "positive energy," while often occluding internal dissent, minority voices, and the coercive dimensions of domestic information control.

Russian: The Russian perspective embeds cognitive effects within information security doctrine and the tradition of reflexive control, treating the adversary's decision-making process as a legitimate target and emphasizing managed pluralism, strategic ambiguity, and the erosion of Western epistemic authority; it contributes a sophisticated understanding of perception management but occludes democratic accountability, transparency, and the distinction between legitimate persuasion and covert manipulation.

Western: The Western perspective frames cognitive warfare as a threat to democratic cognition, institutional trust, and decision-making, emphasizing attribution, platform governance, media literacy, and resilience; it has also generated important self-critique regarding its own psychological operations, covert influence, and the market-driven attention economy that creates vulnerabilities, though it often underestimates how its own information practices abroad have eroded credibility.

UN: The UN perspective approaches cognitive warfare through human rights, freedom of expression, information integrity, and capacity building, seeking to protect vulnerable groups while avoiding the conflation of dissent with cognitive attack; it emphasizes multilateral norms and development, but consensus on defining and prohibiting cognitive interference remains elusive, and enforcement capacity is limited.

2.6 KEY IDEA 5 — Different national doctrines: US (persistent engagement), Russian (reflexive control, information security), Chinese (three warfares), EU (regulatory).

Bolded Causal Claim: National doctrines in cyber, information, and cognitive warfare are not merely tactical preferences but constitutive frameworks that define what counts as conflict, where thresholds lie, who may act, and what victory means; divergent doctrines therefore produce not only different operational styles but incompatible understandings of escalation, sovereignty, and legitimacy, making cross-doctrinal deterrence, attribution, and norm-building inherently difficult.

Mechanism: Doctrine operates as a mechanism by shaping five variables: conceptualization of the domain, organizational division of labor, legal authorities, target sets, and signaling practices. The US doctrine of persistent engagement, associated with US Cyber Command's 2018 strategic shift, treats cyberspace as a domain of continuous competition below the threshold of armed conflict; it emphasizes "defending forward," imposing costs, disrupting adversary operations in their own networks, and maintaining initiative. Its underlying assumption is that passive defense is insufficient and that advantage goes to the actor that

can operate continuously and impose friction on adversaries. The Russian doctrine of information security treats information as a strategic resource and the information space as a domain of sovereignty; it combines legal control over domestic information, strategic ambiguity abroad, and the tradition of reflexive control, which seeks to shape an adversary's decision-making by manipulating the information on which decisions are based. The Chinese doctrine of the "three warfares"—public opinion warfare, psychological warfare, and legal warfare—integrates narrative, perception, and law into military and political strategy; it is closely tied to cyber sovereignty, "winning without fighting," and the pursuit of "discourse power." The EU approach is less a warfighting doctrine than a regulatory and resilience framework: it emphasizes norms, rights, platform accountability, cyber diplomacy, and the protection of democratic processes, drawing on instruments such as data protection, digital services regulation, and coordinated attribution. The mechanism of divergence is rooted in regime type, strategic culture, technological capacity, and historical experience. The United States, as a liberal hegemon with global alliance commitments, tends to frame the problem as competition and deterrence. Russia, perceiving encirclement and regime insecurity, tends to frame it as information security and strategic defense. China, as a party-state pursuing development and legitimacy, tends to frame it as sovereignty and narrative control. The EU, as a post-national regulatory polity, tends to frame it as governance, rights, and resilience. These frameworks produce different escalation ladders: what Washington may classify as competition, Moscow may classify as aggression, and Brussels may classify as a regulatory violation. They also produce different attribution practices: the US often names and shames; Russia often denies and proxies; China often emphasizes sovereignty and non-interference; the EU often coordinates multilateral statements and sanctions. The mechanism is therefore not only operational but epistemic: doctrines determine what evidence counts, what thresholds matter, and what responses are legitimate.

Scope Conditions: Doctrinal effects are strongest where states have the capacity to implement them, where institutional path dependence locks in particular organizations and legal authorities, and where threat perceptions align with doctrinal assumptions. They are weaker where practice diverges from doctrine, as it often does: states may adopt rhetorical doctrines while relying on proxies, criminal networks, or covert action; bureaucratic politics may distort implementation; and technological change may outpace doctrinal revision. Doctrines may also converge around shared interests, such as the protection of critical infrastructure or the avoidance of catastrophic escalation, even where broader frameworks remain incompatible. A further scope condition is alliance structure: US doctrine is shaped by NATO and partner capacity; EU doctrine is shaped by member-state diversity and legal harmonization; Russian and Chinese doctrines are shaped by centralized party-state control. Counterarguments include the claim that doctrine is epiphenomenal to material interests and power asymmetries; that states borrow and hybridize doctrines; that "doctrine" often serves as post-hoc rationalization for opportunistic behavior; and that the most important drivers of cyber and information conflict are technological and economic rather than doctrinal. These counterarguments do not eliminate doctrinal effects but suggest that doctrine should be treated as a variable that mediates interests rather than as an independent cause.

Observable Implications: If doctrines shape behavior in the ways theorized, one should observe persistent patterns in organizational structure, legal framing, target selection, and public attribution. Observable indicators include the creation and empowerment of dedicated commands and agencies, such as US Cyber Command, Russia's information operations structures, China's strategic support and cyber units, and EU bodies such as ENISA and the European External Action Service's strategic communications teams. One should also observe differences in escalation management: the US emphasis on cost imposition and forward defense; Russian use of proxies, ambiguity, and reflexive control; Chinese integration of legal and public-opinion campaigns; and EU emphasis on regulation, resilience, and multilateral coordination. Doctrinal

divergence should also produce misperception risks: US actors may interpret Russian or Chinese operations as unprovoked aggression; Russian actors may interpret US internet dominance and platform power as existential threats; Chinese actors may interpret Western media and NGO activity as ideological penetration; EU actors may interpret both security threats and rights violations in the same events. The observable implication for analysts is that cross-national comparison must be doctrinally literate: the same technical act—such as a network intrusion or a disinformation campaign—may be categorized, justified, and responded to differently depending on the doctrine through which it is interpreted. The strongest test of doctrinal influence is not whether states invoke doctrine in speeches but whether doctrine predicts organizational behavior, legal thresholds, and escalation choices across cases.

Perspective Note (five traditions in brief):

African (primary): The African perspective is primary because African states are not merely objects of great-power doctrines but actors navigating among them, often adopting elements of cyber sovereignty from Chinese and Russian frameworks, rights and regulatory language from Western and EU frameworks, and multilateral norms from the UN, while facing severe capacity constraints. African scholarship—particularly Aning and Danso on security governance, and broader traditions of postcolonial state analysis—highlights that doctrines designed for great powers may be ill-fitting for states whose primary concerns include development, human security, institutional capacity, and regional stability. The AU Convention on Cyber Security and Personal Data Protection (Malabo, 2014) represents an attempt to craft an African doctrine that combines sovereignty, cooperation, and rights, but implementation remains uneven. From the African vantage point, doctrinal pluralism is both an opportunity and a risk: it allows African states to avoid a binary choice between great powers, but it can also produce fragmentation, dependency, and the importation of ill-suited security logics. African perspectives also emphasize that doctrine must be evaluated by its effects on ordinary people—whether it protects critical infrastructure and personal data, whether it enables or suppresses dissent, and whether it strengthens regional cooperation. This vantage reveals what great-power doctrinal debates often occlude: the question is not only how states compete in cyberspace but how security frameworks can be made accountable to populations with limited leverage over global platforms and powerful states.

Chinese: The Chinese perspective presents its doctrine as a defense of cyber sovereignty, development, and social stability, emphasizing non-interference, state control over information infrastructure, and the legitimacy of managing domestic discourse; it contributes an alternative to Western liberal norms and a focus on digital development, but it occludes human rights, minority protections, and the coercive dimensions of information control.

Russian: The Russian perspective presents information security doctrine and reflexive control as responses to perceived Western information dominance and regime insecurity, emphasizing sovereignty, strategic ambiguity, and the manipulation of adversary decision-making; it contributes a critique of unipolar information power but occludes democratic accountability, transparency, and the distinction between state security and regime security.

Western: The Western perspective presents persistent engagement, deterrence, and attribution as necessary responses to continuous competition, emphasizing initiative, alliance coordination, and the defense of democratic processes; it contributes technical capacity and institutional frameworks, but it occludes its own offensive and covert practices, the market-driven vulnerabilities of its information ecosystem, and the risk of escalation through forward operations.

UN: The UN perspective presents doctrine through the language of norms, capacity building, and multilateral consensus, emphasizing that state behavior should be constrained by agreed rules and that developing states need support; it contributes a forum for dialogue and a baseline of expectations, but it occludes enforcement,

power asymmetries, and the fact that major powers often treat norms as instrumental rather than binding.

2.7 FIVE PERSPECTIVES IN DEPTH

2.7.1 African Perspective (PRIMARY)

The African vantage point on cyber, information, and cognitive warfare begins from a premise that the other four perspectives tend to treat as peripheral: that the "cyber" domain is not a virtual space hovering above material reality but is physically embedded in colonial geographies of cable routes, server locations, platform ownership, and data-extraction circuits. From this position, the central puzzle of the lesson is not how states deter one another in a new domain but how sovereignty is exercised over infrastructures that were never designed for African control, and how cognitive warfare reproduces racialized hierarchies of whose knowledge counts as knowledge. The African perspective is therefore not a regional application of Western deterrence theory or Chinese sovereignty doctrine; it is a distinct epistemic and political project rooted in the experience of colonial domination and its digital afterlives.

The theoretical lineage runs through several interconnected traditions. Fanon's analysis of colonial psychological warfare in *The Wretched of the Earth* (1961) and *Black Skin, White Masks* (1952) established that colonialism operates not merely through force but through the systematic destruction of the colonized's capacity to name their own reality—a process that anticipates contemporary cognitive warfare with disturbing precision. For Fanon, the colonizer's project is to make the colonized internalize a narrative of their own inferiority; the "brain as battlefield" is not a twenty-first-century innovation but the foundational condition of colonial rule. Cabral's *Return to the Source* (1973) extended this by insisting that culture is the terrain on which liberation is won or lost, and that the struggle for sovereignty is inseparable from the struggle over narrative and meaning. These insights frame the African approach to information and cognitive warfare: the manipulation of public opinion and the weaponization of narrative are not novel techniques but continuations of a longer history of epistemic violence, now mediated by digital platforms rather than colonial presses.

Rodney's *How Europe Underdeveloped Africa* (1972) and Nkrumah's *Neo-Colonialism: The Last Stage of Imperialism* (1965) provide the materialist backbone. Rodney demonstrated that underdevelopment is not a natural condition but a produced one, the result of systematic extraction; Nkrumah showed that political independence without economic control produces neocolonialism, in which sovereignty is formal but substance is hollow. Applied to the digital domain, these arguments yield the concept of digital neocolonialism: African states may possess flags and constitutions, but the data generated by their populations flows through undersea cables landing in European and North American hubs, is stored on servers owned by foreign corporations, is processed by algorithms trained on non-African data, and is monetized by platforms headquartered elsewhere. The extraction has shifted from minerals to data, but the structural logic—value generated in Africa, captured elsewhere—persists. Nyerere's *Ujamaa* (1968) and his broader philosophy of self-reliance frame the normative counter-position: digital sovereignty requires not merely regulation but the development of indigenous capacity, from cable infrastructure to data centers to platform governance.

Mbembe's work, particularly *On the Postcolony* (2001) and *Necropolitics* (2019), adds a crucial dimension. Mbembe argues that the postcolony is characterized by a "commandment" that operates through the production of subjects who are simultaneously included and excluded, governed through technologies of surveillance and spectacle. His concept of necropolitics—the power to determine who may live and who must die—extends to the digital domain in the form of algorithmic governance, predictive policing, and the

weaponization of information against marginalized populations. Mbembe's more recent formulation of the "becoming black of the world" suggests that the techniques of domination historically applied to African populations are now being generalized globally through digital surveillance and cognitive warfare. From this vantage, the "brain as battlefield" is not a metaphor for a new kind of conflict but the universalization of a condition that African populations have long endured. The African perspective thus reveals what the Western framing of cognitive warfare as unprecedented obscures: that the weaponization of narrative and the manipulation of consciousness have deep colonial roots, and that the digital merely accelerates and scales pre-existing logics of domination.

Mamdani's *Citizen and Subject* (1996) and *Neither Settler Nor Native* (2020) illuminate how digital identity systems reproduce colonial categories. Mamdani's central argument—that colonial rule bifurcated the state into a "civil" sphere for citizens and a "customary" sphere for subjects—finds a digital analogue in contemporary biometric and digital ID systems. Kenya's Huduma Namba, Nigeria's National Identification Number, and similar programs across the continent create populations of "data subjects" whose legibility to the state is mediated by foreign technology providers and whose data is vulnerable to both state abuse and external extraction. The citizen/subject distinction is reproduced in digital form: those with robust digital identities access services and rights; those without are rendered invisible or, worse, targeted. Mamdani's framework suggests that data governance in Africa is not merely a technical challenge but a continuation of the colonial project of making populations legible for control.

Oyěwùmí's *The Invention of Women* (1997) contributes an epistemological critique that is essential to understanding cognitive warfare. Oyěwùmí demonstrated that the category "woman" as a social classification was not a universal discovery but a colonial imposition, produced through the translation of Yoruba social organization into European gender categories. The implication for digital governance is profound: the categories embedded in datasets, algorithms, and platform architectures—gender, race, ethnicity, religion—are not neutral descriptors but historically constructed classifications that carry colonial epistemologies. When these categories are operationalized in content moderation, targeted advertising, or disinformation campaigns, they reproduce and amplify colonial ways of seeing. The African perspective thus reveals that cognitive warfare is not only about manipulating what people think but about imposing the very categories through which thought is structured.

Tamale's *Decolonization and Afro-Feminism* (2020) extends this by insisting that decolonization must be intersectional and that digital justice requires attention to whose voices are amplified and whose are silenced. Tamale's framework suggests that the attention economy, which rewards engagement and outrage, systematically disadvantages African feminist and decolonial voices while amplifying sensationalist and divisive content. The "brain as battlefield" is thus also a gendered and racialized battlefield, in which the cognitive load of navigating misinformation falls disproportionately on populations already marginalized by colonial and patriarchal structures.

Bayart's *The State in Africa* (1993) and his concept of extraversion provide a political-economy lens. Bayart argued that African states are not simply weak or failed but are "extraverted"—oriented toward external patrons and resources rather than domestic constituencies. In the digital domain, extraversion manifests as African elites who broker access to data, telecom licenses, and surveillance contracts with foreign powers, creating a political economy of digital dependency. The blurring of criminal and state action that characterizes cyber conflict globally is, in the African context, intensified by the fact that state and non-state actors are often entangled in networks of patronage and rent-seeking. Ransomware attacks on African hospitals and government systems, for instance, may involve actors with connections to political elites, making attribution

and response doubly difficult.

Aning and Danso's work on African security governance highlights the institutional gap between continental frameworks and national capacity. The African Union's Peace and Security Council and the AU Convention on Cyber Security and Personal Data Protection (Malabo, 2014) represent attempts to construct a collective security architecture for the digital domain. Yet the Malabo Convention has been ratified by only a handful of states and has not entered into force, reflecting both capacity constraints and the political difficulty of harmonizing 54 national legal systems. Aning's analysis suggests that African security governance is characterized by a persistent gap between normative ambition and operational capacity—a gap that external powers exploit. The AU framework contributes a vision of collective digital sovereignty, but its occlusion is the reality that most African states lack the technical, legal, and institutional capacity to implement it.

Grovogui's *Sovereigns, Quasi Sovereigns, and Africans* (1996) and his subsequent work on regimes of sovereignty provide the theoretical foundation for understanding African cyber sovereignty claims. Grovogui argues that sovereignty is not a fixed legal status but a practice that is continually performed and contested, and that African states have historically been denied full sovereignty by a Eurocentric international order. In the digital domain, this means that African sovereignty claims—data localization, platform regulation, the Malabo Convention—are not merely technical policy choices but assertions of political subjectivity against a system that has historically treated African states as quasi-sovereign. Grovogui's framework suggests that the African perspective on cyber sovereignty is not a defensive reaction to Western or Chinese dominance but an active project of reconstituting sovereignty on African terms.

The African perspective's contribution to the five key ideas of this lesson is substantial and distinctive. On the grammar of cyber conflict, it reveals that the offense-defense balance is not a technical property of systems but a function of capacity asymmetry: African states cannot deter by punishment because they lack the offensive capacity and the attribution capability; their realistic option is deterrence by denial—resilience—but this requires investment that most states cannot afford. On critical infrastructure, it shows that the blurring of criminal and state action is intensified where state capacity is weak and criminal networks are entangled with political elites. On information warfare, it demonstrates that Africa is not merely a target but a theater in which multiple external powers—Russia, France, China, the United States—compete for influence through information operations, and that disinformation in African elections and conflicts often serves external geopolitical agendas. On cognitive warfare, it insists that the "brain as battlefield" is continuous with colonial psychological warfare and that the categories through which digital systems classify populations carry colonial epistemologies. On national doctrines, it presents the AU Malabo framework as an alternative doctrinal tradition—one oriented toward collective sovereignty, capacity building, and the regulation of external platforms rather than toward offensive operations or deterrence.

What the African perspective occludes is equally important. It may overstate the coherence of a unified "African" position when 54 states have divergent interests, capacities, and alignments. It risks justifying authoritarian information control under the banner of sovereignty, as when governments invoke "cyber sovereignty" to justify internet shutdowns during elections or protests. The low ratification of the Malabo Convention reflects not only external obstruction but also genuine political will gaps and capacity constraints among African states themselves. And the perspective may understate the agency of African populations in navigating, resisting, and repurposing digital technologies—African tech ecosystems, from Nairobi's "Silicon Savannah" to Lagos's fintech sector, demonstrate that digital dependency is not total. Nevertheless, the African vantage point contributes something the other four perspectives cannot: a demonstration that cyber, information, and cognitive warfare are not new domains of conflict but new modalities of an old struggle

over sovereignty, knowledge, and the right to self-determination, and that any framework that treats them as unprecedented risks reproducing the very hierarchies it claims to analyze.

2.7.2 Chinese Perspective

The Chinese perspective on cyber, information, and cognitive warfare is organized around the concept of cyber sovereignty (*wangluo zhuquan*), which Xi Jinping articulated in his 2015 address at the World Internet Conference in Wuzhen and which has since become the organizing principle of Chinese internet governance. Cyber sovereignty asserts that states have the right to govern the internet within their territorial borders, to regulate data flows, and to determine the rules of digital engagement—a position that directly challenges the Western multistakeholder model and that resonates with African sovereignty claims even as it serves Chinese strategic interests. The 2016 Cybersecurity Law, the 2021 Data Security Law, and the 2021 Personal Information Protection Law constitute a legal architecture that treats data as a national strategic resource and that mandates localization, security review, and state oversight of critical information infrastructure.

The doctrinal foundation is the "three warfares" (*san zhan*): public opinion warfare, psychological warfare, and legal warfare. Originating in PLA political work doctrine and formalized in the 2003 and 2010 political work regulations, the three warfares represent an integrated approach to information operations that treats the cognitive, legal, and media dimensions as inseparable. Public opinion warfare seeks to shape domestic and international narratives; psychological warfare targets adversary morale and decision-making; legal warfare exploits international law and norms to constrain adversary action and legitimize Chinese positions. This doctrine is distinctive in its explicit integration of military and non-military means and in its treatment of information as a battlespace coequal with land, sea, air, and space. The PLA Strategic Support Force, established in 2015, and its successor the Information Support Force, established in 2024, institutionalize this integration.

The Chinese perspective contributes several elements that the other traditions understate. First, it offers a state-centric model of internet governance that treats digital infrastructure as a matter of national security rather than commercial convenience, a framing that has gained traction among developing states. Second, it provides a holistic view of information operations that does not separate "cyber" from "information" from "cognitive" warfare but treats them as a continuum—a view that aligns with the lesson's own integration of these domains. Third, the Digital Silk Road and Huawei's global infrastructure investments represent a material strategy for extending Chinese influence through the ownership of digital infrastructure, a form of structural power that operates below the threshold of traditional conflict.

The perspective's occlusions are significant. China's sovereignty rhetoric is asymmetric: it demands respect for its own information space while conducting extensive operations in others'. Attributed operations include APT41, Salt Typhoon (targeting US telecommunications), and Volt Typhoon (pre-positioning in US critical infrastructure). The Great Firewall and associated censorship apparatus demonstrate that cyber sovereignty, in practice, serves domestic political control as much as national security. The Chinese perspective also tends to frame Western accusations of Chinese hacking as hegemonic attempts to maintain information dominance, a move that deflects substantive engagement with evidence. On the five key ideas, China emphasizes defense and sovereignty while denying offensive intent; treats critical infrastructure protection as a national security priority; integrates information and cognitive warfare through the three warfares doctrine; and presents its approach as a model for developing states, contrasting with both US persistent engagement and EU regulatory frameworks.

2.7.3 Russian Perspective

The Russian perspective is rooted in a distinctive intellectual tradition that treats information not as a domain of conflict but as the substance of conflict itself. The 2016 Information Security Doctrine and its 2021 update define information as a strategic resource and identify threats not only to technical systems but to "spiritual and moral values," cultural identity, and historical memory. This framing reflects a holistic conception in which cognitive, informational, and technical dimensions are inseparable—a view that predates and arguably anticipates Western "cognitive warfare" discourse.

The doctrinal lineage runs through reflexive control (*refleksivnoe upravlenie*), a concept developed by Soviet military theorists including Vladimir Lefebvre and formalized in the work of the Russian military. Reflexive control denotes the manipulation of an adversary's decision-making process by shaping the information environment in which decisions are made—feeding false or misleading information that leads the adversary to choose actions favorable to the manipulator. This is, in essence, a theory of cognitive warfare developed decades before the term entered Western strategic discourse. The Gerasimov article of 2013, often (somewhat misleadingly) termed the "Gerasimov doctrine," articulated a vision of "new generation warfare" in which non-military means—including information operations, economic pressure, and political subversion—could achieve objectives previously requiring military force, and in which the boundary between war and peace is deliberately blurred.

Russian practice reflects this doctrine. The Internet Research Agency's operations during the 2016 US election, GRU units 26165 and 74455 (Fancy Bear and Sandworm), and the NotPetya attack of 2017 demonstrate a pattern of operations that exploit attribution ambiguity, leverage criminal and proxy networks, and target the cognitive dimension of adversary societies. The 2019 Sovereign Internet Law (*Runet*) and the associated technical infrastructure for isolating the Russian internet represent the defensive complement to this offensive posture—a recognition that information sovereignty requires both the capacity to project and the capacity to withstand.

The Russian perspective contributes a genuinely distinctive element: the insistence that information warfare is not a subset of cyber warfare but the broader category, of which technical cyber operations are one component. This inverts the Western framing, which tends to treat information operations as an application of cyber capability. The Russian view also emphasizes the moral and cultural dimension of conflict— the idea that adversary societies can be destabilized through the erosion of shared values and social cohesion—a dimension that Western technical frameworks often neglect. On the five key ideas, Russia rejects the "cyber war" framing in favor of "information war"; exploits attribution ambiguity as a strategic asset; treats disinformation and election interference as legitimate tools of statecraft; understands cognitive warfare through the lens of reflexive control; and presents its doctrine as a comprehensive alternative to Western deterrence frameworks.

The occlusions are equally significant. The defensive rhetoric of "information security" masks extensive offensive operations. The attribution ambiguity that Russia exploits is not merely a technical feature but a deliberate strategy of plausible deniability. The moral framing of information security—protecting "spiritual values"—serves to justify domestic censorship and the suppression of dissent. And the reflexive control tradition, while theoretically sophisticated, can overstate the controllability of adversary decision-making and understate the resilience of democratic societies.

2.7.4 Western Perspective

The Western perspective is characterized by a tension between two impulses: the desire to establish rules and norms for a domain that resists regulation, and the temptation to exploit the domain's offensive potential.

This tension is visible in the evolution of US doctrine from the restrained "cyber deterrence" frameworks of the 2010s to the more assertive "persistent engagement" and "defend forward" posture articulated in the 2018 US Cyber Command vision and the 2023 National Cybersecurity Strategy. The Western debate has been shaped by a series of influential interventions: Rid's argument in "Cyber War Will Not Take Place" (2013) that cyber operations are better understood as sabotage and espionage than as war; Libicki's analysis of the offense-defense balance and the difficulties of deterrence in cyberspace; and Singer and Brooking's *LikeWar* (2018), which documented the weaponization of social media.

The Western perspective's distinctive contributions include a robust technical and institutional capacity for attribution—exemplified by Mandiant's 2013 APT1 report, which publicly attributed Chinese military hacking, and by subsequent US indictments of GRU officers. It includes NATO's recognition of cyberspace as a domain of operations (2016) and the development of cyber-specific legal frameworks, from the Tallinn Manual to the EU's NIS2 Directive, GDPR, Digital Services Act, and AI Act. The EU regulatory approach represents a distinctively European contribution: treating digital governance as a matter of market regulation and rights protection rather than purely military competition.

The Western self-critique is an essential component of this perspective. The Snowden revelations of 2013 exposed the scale of US and allied offensive cyber and surveillance operations, undermining claims to moral high ground. Stuxnet (2010) demonstrated that the United States and Israel had already crossed the threshold of using cyber weapons against critical infrastructure. The market-driven vulnerabilities of the Western information ecosystem—platform business models that reward engagement over accuracy, the concentration of infrastructure in private hands, the outsourcing of content moderation—represent structural weaknesses that adversaries exploit. Pomerantsev's *This Is Not Propaganda* (2019) documented how the Western information environment's openness, once considered a strength, has become a vulnerability.

On the five key ideas, the Western perspective centers on the grammar of cyber conflict (Rid, Libicki), treats critical infrastructure protection as a priority (CISA, sector-specific regulation), addresses information warfare through election security and platform governance, approaches cognitive warfare through the lens of the attention economy and platform regulation, and distinguishes between US persistent engagement and EU regulatory frameworks. Its occlusions include its own offensive practices, the escalation risks of forward operations, the market-driven vulnerabilities of its information ecosystem, and the tendency to frame Western norms as universal while exempting Western practice.

2.7.5 UN Perspective

The UN perspective presents doctrine through the language of norms, capacity building, and multilateral consensus. The framework rests on three pillars: the application of existing international law to cyberspace, the development of voluntary norms of responsible state behavior, and confidence-building measures and capacity building. The Group of Governmental Experts (GGE) produced consensus reports in 2013 (A/68/98), 2015 (A/70/174), and 2021 (A/76/135), establishing eleven voluntary norms—including that states should not conduct ICT activity that damages critical infrastructure, should not use proxies, should respond to requests for assistance, and should protect critical infrastructure. The Open-Ended Working Group (OEWG), established in 2018 and operating through 2021 and 2021-2025, broadened participation to include all UN member states, addressing the criticism that the GGE's limited membership (initially 15, later 25 states) lacked legitimacy.

The UN perspective contributes a forum for dialogue that includes developing states, a baseline of expectations that even adversarial states have endorsed, and a capacity-building agenda that addresses the asymmetry

in technical and institutional capacity. The 2015 GGE report's affirmation that international law, including the UN Charter and international humanitarian law, applies to state use of ICTs was a significant achievement, establishing that cyberspace is not a lawless domain. The norms on critical infrastructure and on not using proxies provide reference points for assessing state behavior.

The occlusions are substantial. The norms are voluntary and lack enforcement mechanisms. The consensus requirement means that reports reflect the lowest common denominator, and the 2021 GGE failed to reach consensus on key issues, leading to the OEWG process. Power asymmetries mean that major powers treat norms as instrumental—endorsing them rhetorically while conducting operations that violate them. The capacity-building agenda, while valuable, risks treating symptoms (lack of capacity) rather than causes (structural inequality in the global digital economy). And the UN framework has been slower to address information and cognitive warfare than technical cyber operations, reflecting the difficulty of defining and regulating influence operations without impinging on legitimate expression.

On the five key ideas, the UN perspective affirms that existing international law applies to cyberspace (grammar), establishes norms on critical infrastructure protection (infrastructure), addresses information operations through norms on proxies and on not interfering in internal affairs (information warfare), has less developed frameworks for cognitive warfare (cognitive), and presents a normative baseline rather than a national doctrine (doctrines). The UN perspective's value lies not in its enforcement power but in its provision of a shared vocabulary and a forum in which the other four perspectives must engage, however instrumentally.

SECTION 2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Centers cyber sovereignty, data localization, and the AU Convention on Cyber Security and Personal Data Protection (Malabo, 2014); shows how information and cyber governance reproduce colonial asymmetries in data extraction, platform power, and security assistance; insists that capacity-building and development are security issues, not afterthoughts.	Can understate the technical complexity of cross-border criminal and state-linked operations; may treat state sovereignty as more protective than it is for marginalized groups; risks overemphasizing state control where civil society and journalists are the primary defenders of information integrity.	Digital self-determination, equitable global governance, and the right of African states and societies to define their own information order without external domination or extractive platform capitalism.	Malabo Convention; African debates over data localization and digital taxation; African election-disinformation cases; scholarship on extraversion, colonial state forms, and underdevelopment.	Western/liberal critics argue that sovereignty-first framing can justify censorship, internet shutdowns, and the criminalization of dissent; UN critics argue that it may fragment the global internet and weaken shared norms.

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Chinese	Develops an integrated doctrine of information security through the "three warfares" (public opinion, psychological, and legal warfare); links cyber sovereignty to state capacity; treats information space as a strategic environment to be governed, not merely a market to be regulated.	Conflates information security with regime security; obscures the distinction between protecting citizens from foreign manipulation and protecting the state from domestic criticism; underweights non-state and transnational actors that do not fit state-centric control.	State-centric information security, cyber sovereignty, non-interference, and managed openness in which the state is the legitimate arbiter of information order.	"Three warfares" doctrine; cyber-sovereignty advocacy in UN forums; domestic information-control architecture; state-linked APT reporting by Western and private-sector analysts.	Western critics argue that sovereignty cannot override human rights and open expression; African critics argue that the model can export authoritarian capacity and normalize surveillance infrastructures.

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Russian	Provides the most developed operational theory of reflexive control: shaping an adversary's decisions by controlling the information environment; blurs war and peace; treats information as a continuous strategic battlespace rather than a separate domain.	Denies or obscures attribution; conflates propaganda, influence, and legitimate discourse; erodes the distinction between domestic and foreign information spaces; makes verification and accountability difficult.	Information security as state survival; managed information space; strategic competition in which narrative, perception, and institutional trust are legitimate targets.	Russian military writings on non-linear conflict; reflexive-control tradition; documented election-interference and influence operations; state-linked media and troll-farm structures.	Western critics argue that it violates sovereignty and democratic self-determination; UN critics argue that it breaches norms of non-interference; African critics note that it reproduces great-power manipulation in weaker states.

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Western	Offers deterrence frameworks, attribution methodologies, offensive cyber doctrine, and technical analysis; has produced the most extensive public documentation of state-linked operations; includes a genuine self-critique of its own offensive and surveillance practices.	Can overstate the novelty of information warfare; may exceptionalize Western democracies as uniquely vulnerable; underweights structural inequality, platform capitalism, and non-Western agency; offensive operations undermine the norms it advocates.	Rules-based order, deterrence by denial and punishment, human rights, open internet, and accountability through attribution and law enforcement.	US persistent-engagement doctrine; Stuxnet and other documented operations; indictments of state-linked actors; private-sector threat reporting; post-2016 election-security reforms.	Russian and Chinese critics argue that Western norms are hegemonic and inconsistently applied; African critics argue that Western platforms and security agencies are themselves instruments of information power.

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
UN	Provides a shared vocabulary and normative baseline; affirms that existing international law applies to cyberspace; establishes norms on critical infrastructure protection and on not harming or allowing harm through proxies; sustains multilateral dialogue.	Lacks enforcement; tends toward lowest-common-denominator consensus; is vulnerable to great-power instrumental-ization; has less developed frameworks for cognitive warfare and for non-state platform power.	Multilateralism, consensus, sovereignty balanced with human rights, and the progressive development of norms without premature legalization that would freeze asymmetries.	GGE consensus reports (2013, 2015, 2021); OEWG processes; norms on critical infrastructure and on not knowingly allowing territory to be used for internationally wrongful acts.	National perspectives argue that norms are either too vague to constrain adversaries or too constraining for legitimate security activity; African critics argue that consensus processes underrepresent African capacity and priorities.

SECTION 2.8 WORKED EXAMPLE (I do)

Case: Russian interference in the 2016 United States presidential election as a study in information operations

The 2016 US election is best understood not as a single cyberattack but as a layered information operation in which hacking, leaking, social-media manipulation, and narrative amplification were combined to shape perception, deepen polarization, and erode confidence in democratic institutions. The case matters for this lesson because it sits at the intersection of the five key ideas: it uses the grammar of cyber conflict without fitting neatly into war; it targets critical infrastructure only indirectly; it is a paradigmatic information-warfare case; it operates in the cognitive domain; and it reflects a distinctive national doctrine, Russian reflexive control, rather than a universal model of cyber conflict. The appropriate analytical task is to explain how the operation worked, why it was effective, and which perspective best captures its significance without collapsing into either alarmism or dismissal.

Levels of analysis

At the **individual** level, the operation exploited cognitive and social vulnerabilities rather than technical weaknesses in voting machines. Citizens encountered emotionally charged content through social-media

feeds, group identities, and partisan media ecosystems. The mechanism was not simply persuasion in the classical sense but activation: content designed to resonate with pre-existing grievances, identities, and suspicions. Microtargeting, algorithmic amplification, and the use of seemingly authentic personas lowered the cost of reaching susceptible audiences. Individuals were not merely passive recipients; they became distribution nodes when they shared, commented, and argued. This is why the operation could be effective even where no single message was decisive: it worked cumulatively, through repetition, emotional salience, and the erosion of shared epistemic standards. Singer and Brooking's (2018) discussion of "like war" is useful here because it captures the way attention, virality, and platform incentives turn individual engagement into strategic effect.

At the **state** level, the operation must be situated in Russian state objectives and in the structure of the US political system. Russian military and intelligence traditions, including reflexive control, treat information as a means of shaping an adversary's decision-making without requiring conventional military confrontation. The aim was not necessarily to install a predetermined outcome by direct vote manipulation, but to weaken the adversary, exploit internal divisions, and reduce the legitimacy of the incoming administration. The US state, for its part, faced a dilemma: attribution was technically and politically complex, responses risked escalation, and the most damaging effects were occurring inside a privately governed information environment. The state level therefore reveals a governance gap: democratic states depend on platforms they do not control, while adversaries can exploit that dependence. Pomerantsev (2019) is relevant because his work on propaganda emphasizes that modern information operations often succeed not by convincing everyone of a lie but by creating confusion, cynicism, and the sense that all narratives are equally manipulative.

At the **systemic** level, the case reflects the post-Cold War US-Russian rivalry, the absence of agreed cyber norms, and the difficulty of applying deterrence to information operations. Traditional deterrence assumes identifiable attacks, clear attribution, and proportionate response. Information operations blur these assumptions: they are continuous, often plausibly deniable, and can be framed as journalism, activism, or ordinary political speech. The systemic consequence was not a direct military confrontation but a crisis of confidence in democratic procedures and in the legitimacy of electoral outcomes. This is consistent with Rid's (2013) argument that much of what is called cyber war is better understood as sabotage, espionage, or subversion; the 2016 case is subversion through information rather than war in the Clausewitzian sense. The systemic level also shows how norms of non-interference, affirmed in UN processes, are strained when operations are conducted through proxies, platforms, and deniable actors.

At the **transnational** level, the case cannot be explained by states alone. The Internet Research Agency, GRU-linked hacking, WikiLeaks releases, and platform algorithms formed a transnational chain. Data, personas, and narratives moved across borders faster than institutions could respond. Social-media platforms functioned as transnational infrastructures with their own incentives, moderation capacities, and business models. This level reveals that information warfare is not merely state-to-state competition; it is mediated by corporate platforms, technical standards, and global communication networks. The transnational dimension also explains why purely national responses are insufficient: even a well-defended state can be affected by content generated, amplified, and monetized elsewhere.

Mechanism

The mechanism combined three channels. First, hacking and leaking: GRU-linked actors compromised Democratic National Committee and campaign-related accounts, and selected materials were released through intermediaries at politically sensitive moments. The strategic value lay less in the content's novelty than in timing, framing, and the creation of a sustained scandal narrative. Second, social-media manipula-

tion: the Internet Research Agency created fake personas and groups, amplified divisive content, organized online and sometimes offline events, and exploited platform recommendation systems. Third, narrative laundering: information moved from hacked material to partisan media, social networks, and mainstream coverage, making state-originated content appear organic. The operation's power came from interaction effects: hacked material gave credibility to conspiracy narratives; fake personas gave scale to fringe claims; platform algorithms rewarded outrage; and polarized audiences did much of the distribution themselves. Deterrence by punishment was weak because attribution was delayed and because the operation's effects were diffuse. Deterrence by denial was also weak because the target was not a network to be hardened but a public sphere to be influenced. This is a key reason the case challenges the standard grammar of cyber conflict: the decisive effects were cognitive and political, not technical.

Perspective reconstruction

The **African perspective**, reconstructed on its own terms, begins from the observation that information warfare is not a novelty invented in the North Atlantic but a long-standing feature of imperial and post-colonial politics. African scholarship on sovereignty, extraversion, and the colonial state—associated with Grovogui, Bayart, Mamdani, Rodney, and others—suggests that control over information has always been central to domination, from colonial propaganda and radio to Cold War coups and contemporary digital extraction. From this vantage, the 2016 US election is not an unprecedented rupture but a visible instance of techniques that have long been tested in weaker states: the manipulation of perception, the exploitation of institutional fragility, and the use of external actors to shape domestic outcomes. The African perspective also highlights asymmetry: African states and societies are often treated as objects of information operations, data extraction, and platform experimentation, while great powers discover vulnerability only when operations reach their own capitals. It further insists that African agency matters: journalists, civil society, and regional institutions have developed practices of verification and resistance that are not captured by Northern security frameworks. The Malabo Convention and debates over data localization express an attempt to reclaim digital sovereignty, but they also reveal a tension between state control and citizen protection. What the African perspective contributes is a longue durée and a decolonial critique: it shows that the "crisis" of 2016 is partly a crisis of Northern exceptionalism, in which techniques long normalized in the global South are suddenly recognized as threats when they affect great powers. What it can miss, if taken alone, is the specific tradecraft of the Russian operation and the particular vulnerabilities of the US electoral and media system.

The **Chinese perspective** interprets the case through information security and cyber sovereignty. It tends to see the US as simultaneously the architect and victim of an open information order: American platforms dominate global communication, while American political institutions proved vulnerable to manipulation. From this view, 2016 demonstrates the dangers of unmanaged information flows and justifies state-led governance of the information space. The Chinese perspective contributes an awareness of platform power as geopolitical power, but it occludes the difference between protecting citizens and protecting the state, and it can treat all foreign information influence as equivalent to subversion.

The **Russian perspective** treats the case as an example of reflexive control and strategic competition in the information domain. It would emphasize that information has always been contested, that Western states conduct their own influence operations, and that the US response reflects an inability to accept vulnerability. This perspective contributes a theory of how perception can be shaped without direct coercion, but it occludes accountability, denies or minimizes state responsibility, and normalizes the erosion of democratic trust as an acceptable instrument of policy.

The **Western perspective** frames the case as an attack on democratic self-determination and as evidence that

deterrence frameworks are inadequate for information operations. It contributes attribution, legal accountability, and institutional reform, including election-security measures and platform scrutiny. Its self-critique is important: Western states have conducted information operations, surveillance, and covert action, and platform business models amplified the harm. What it can miss is its own tendency to treat 2016 as exceptional rather than as part of a broader pattern of global information manipulation, and to underweight the role of domestic inequality and polarization in making the operation effective.

The **UN perspective** frames the case as a violation of sovereignty and non-interference, even where operations are conducted through proxies and digital means. It contributes a normative baseline and a forum for dialogue, including GGE and OEWG processes that affirm existing international law applies to cyberspace. Its limitation is enforcement: norms without verification and consequence may be acknowledged rhetorically while being ignored operationally. The UN perspective also struggles to define where legitimate international persuasion ends and prohibited interference begins, especially in an era of global media and diaspora politics.

Explicit adjudication

No single perspective fully explains the 2016 case. The Russian perspective best explains the operational logic: reflexive control, deniability, and the strategic use of information to shape adversary decision-making. The Western perspective best explains the harm: the damage to democratic legitimacy, the need for attribution, and the inadequacy of deterrence. The transnational analysis best explains the mechanism: the operation succeeded because state tradecraft was amplified by platform architecture and by domestic polarization. The African perspective best explains the global significance: it situates the case within a longer history of information domination and reveals the double standard by which great powers recognize as crisis what weaker states have long endured. The Chinese perspective best explains the structural power of platforms but overreaches when it equates openness with vulnerability and state control with security. The UN perspective provides the necessary normative vocabulary but lacks the capacity to adjudicate competing claims.

On balance, the strongest explanation is a layered one: Russian doctrine supplied intent and method; transnational platforms supplied reach and amplification; US domestic polarization supplied susceptibility; and weak norms supplied impunity. The Russian perspective is therefore the best single account of why the operation took the form it did, but it is the least adequate account of its legitimacy and consequences. The African perspective is the best corrective to Northern exceptionalism, yet it is less precise about the specific tradecraft. The Western perspective is indispensable for accountability but risks overstating novelty and understating complicity. The most defensible conclusion is that 2016 was not an anomaly in cyber conflict but an illustration of how information operations exploit the gap between technical security, cognitive vulnerability, platform governance, and international law.

SECTION 2.9 PROBLEM PAIR (We do)

Case: The 2010 Stuxnet attack on Iran's Natanz facility — how does it fit or break the grammar of cyber warfare?

Tasks

1. **Level of analysis.** Identify the level or levels at which Stuxnet operates using the Lesson 1 framework (individual, state, systemic, transnational). Explain why a malware operation that crosses all four levels strains that framework, and specify which level you think is analytically decisive for explaining

the operation's success.

2. **Offense-defense balance.** Reconstruct the argument about whether Stuxnet demonstrates offense dominance in cyber conflict or the opposite. Draw on Rid (2013) and the grammar of cyber conflict (attribution problems, deterrence by denial versus punishment). Specify the scope conditions under which your conclusion holds.

3. **Attribution and deterrence.** How was Stuxnet attributed to US and Israeli actors, what evidentiary basis supported that attribution, and what does the case imply for deterrence by punishment? Distinguish between technical attribution, political attribution, and legal attribution.

4. **Theory fit.** Evaluate whether Stuxnet is better understood as cyber warfare, sabotage, or coercion (L20). For each candidate theory, state which scope conditions Stuxnet satisfies and which it violates. Adjudicate on the basis of evidence.

5. **Five-perspective reconstruction.** In 3–5 sentences each, reconstruct how the African (Malabo Convention sovereignty concerns), Chinese (cyber sovereignty, three warfares), Russian (information security doctrine, reflexive control), Western (persistent engagement, self-critique), and UN (GGE norms) perspectives would each interpret Stuxnet.

6. **Falsification.** State what evidence would have to emerge to overturn the consensus that Stuxnet was a state operation, and explain what such evidence would imply for the "blurring of criminal and state action" thesis and for the state-centric grammar of cyber conflict.

Model Answer

The Stuxnet operation against Iran's Natanz enrichment facility in 2010 is the canonical case that both confirms and complicates the grammar of cyber conflict. At the level of analysis, Stuxnet is irreducibly transnational: the malware was designed in one jurisdiction, propagated through global supply chains and removable media, executed against Iranian industrial control systems, and attributed—through forensic analysis and investigative reporting—to a US-Israeli joint program. This transnationality strains the Lesson 1 framework because the operation's causal chain cannot be localized to a single state actor; the "state" that acted was a coalition operating through intelligence agencies, private contractors, and commercial software vendors. The individual level matters too: the operation required engineers who understood Siemens Step 7 and centrifuge physics, meaning that human capital, not just code, was the scarce resource. The analytically decisive level is transnational, because the operation's feasibility depended on globalized supply chains and cross-border technical expertise that no single state could monopolize.

On the offense-defense balance, Stuxnet cuts both ways. Rid (2013) argues that cyber operations are closer to sabotage than to war, and Stuxnet's extended development cycle, its need for zero-day exploits, and its dependence on physical access via infected removable media all suggest that offense is expensive and contingent rather than dominant. Yet the operation succeeded in destroying roughly one-fifth of Iran's centrifuges while remaining covert for over a year, which suggests that a well-resourced attacker can achieve strategic effects with plausible deniability. The scope condition for offense dominance appears to be resource asymmetry: states with advanced signals intelligence and industrial-control-system expertise can penetrate air-gapped networks, but this is not a generalizable capability. Deterrence by denial—hardening Natanz's network segmentation—was partially effective in that Iran eventually detected the intrusion, but only after significant damage. Deterrence by punishment was unavailable to Iran in 2010 because attribution was uncertain and retaliation options were limited; Iran's later cyber operations against Saudi Aramco and US fi-

nancial institutions can be read as delayed, imprecise punishment, illustrating the temporal lag that weakens cyber deterrence.

Attribution of Stuxnet rested on code similarities to other operations, the use of stolen digital certificates, and investigative journalism rather than on any state admission. This matters for deterrence theory: punishment requires that the target know who attacked it, and Stuxnet's attribution was probabilistic and contested for years. The operation thus supports the claim that attribution problems are structural in cyber conflict, not merely technical gaps awaiting better forensics.

Whether Stuxnet is cyber warfare, sabotage, or coercion depends on definitional scope. As warfare, it lacks the violence that Clausewitzian frameworks require; Rid (2013) would classify it as sabotage. As coercion, it fits the logic developed in L20: it was designed to degrade Iran's bargaining position in nuclear negotiations by raising the cost of enrichment, and it was accompanied by diplomatic pressure. The strongest fit is with sabotage-plus-coercion: a covert operation intended to alter an adversary's cost-benefit calculus without triggering armed conflict. It breaks the "war" framing because no state acknowledged it and no kinetic response followed.

The five perspectives diverge sharply. The African vantage, informed by the AU Convention on Cyber Security and Personal Data Protection (Malabo, 2014), would read Stuxnet as a precedent for violating sovereignty through code: if a state can destroy another's infrastructure remotely, then data localization and sovereign control over critical information infrastructure become security imperatives rather than merely economic preferences. The Chinese perspective, articulated through the "three warfares" doctrine and cyber sovereignty, would emphasize that Stuxnet demonstrates the need for national control over information infrastructure and would likely support Iran's position that the operation violated sovereignty. The Russian perspective, grounded in information security doctrine, would treat Stuxnet as evidence that Western states weaponize information technology while framing their own operations as defensive; reflexive control would suggest that the operation aimed to shape Iranian decision-making about the nuclear program. The Western perspective, particularly the US doctrine of persistent engagement, would read Stuxnet as a successful application of "defend forward" logic—disrupting threats before they materialize—while its self-critical strand would note that the operation's eventual discovery and the proliferation of its techniques into later malware illustrate the blowback risks of offensive cyber operations. The UN perspective, reflected in the GGE consensus reports (2013, 2015, 2021), would stress that Stuxnet occurred in a normative vacuum: the GGE's later affirmation that international law applies to cyberspace was partly a response to operations like Stuxnet, and the 2021 report's emphasis on critical infrastructure protection reflects the lesson that covert sabotage of nuclear facilities threatens international stability.

Falsification of the state-operation consensus would require evidence that a non-state actor—criminal, terrorist, or corporate—developed and deployed Stuxnet independently. Such evidence would not merely revise attribution; it would undermine the "blurring of criminal and state action" thesis by showing that the operation was criminal rather than state-sponsored, and it would force a re-evaluation of whether the grammar of cyber conflict is state-centric at all. Absent such evidence, Stuxnet remains the boundary case that defines the field: an operation that was strategic in effect, covert in execution, and ambiguous in legal status.

SECTION 2.10 INDEPENDENT MEMO (You do)

(a) Case description. In December 2020, a supply-chain compromise of the SolarWinds Orion network management platform was disclosed, affecting an estimated 18,000 organizations including multiple US government agencies and Fortune 500 companies. The intrusion, attributed by US intelligence to Russia's

Foreign Intelligence Service (SVR), had persisted undetected for approximately nine months, during which attackers accessed email systems and, in some cases, moved laterally into classified networks. The operation involved no destructive payload; instead, it was a sustained espionage campaign conducted through a trusted software update channel. The case raises questions about whether supply-chain compromise constitutes warfare, espionage, or something in between, and about the adequacy of existing deterrence frameworks when the attacker's objective is intelligence collection rather than disruption. It also tests the limits of attribution: the US government formally attributed the operation to Russia, but attribution rested on intelligence community assessment rather than on publicly verifiable forensic evidence, and no state has been held legally accountable.

(b) Required memo headings (use as prompts):

- **Mechanism:** Identify the causal mechanism linking the SolarWinds compromise to its strategic effects. Specify the level of analysis at which the mechanism operates, the scope conditions under which it functions, and what would have to be true for the mechanism to fail.
- **Perspective reconstruction:** Reconstruct how each of the five perspectives (African, Chinese, Russian, Western, UN) would interpret the SolarWinds case. For each, state what it contributes and what it occludes.
- **Historical analogue:** Identify one historical case (pre-2010 or non-cyber) that shares the mechanism you identified, and specify the respects in which the analogy holds and breaks down.
- **Falsifiers:** State at least two pieces of evidence that, if they emerged, would overturn your central claim about the case. Explain what each would imply for your mechanism and for the broader theory.

(c) Self-check: Before submitting, verify that you have distinguished description (what happened), explanation (why it happened), prediction (what will happen next), and prescription (what should be done) as four separate operations, and that no section conflates them.

SECTION 2.11 HINGE QUESTION

Question: Which of the following best captures the central theoretical lesson of the Stuxnet case for the grammar of cyber conflict?

A. Stuxnet proves that cyber offense is always dominant because malware can destroy physical infrastructure.

B. Stuxnet demonstrates that attribution is impossible in cyberspace, making deterrence by punishment permanently unworkable.

C. Stuxnet shows that cyber operations can achieve strategic effects only under narrow scope conditions—high resource asymmetry, physical access, and extended preparation—while remaining legally and politically ambiguous.

D. Stuxnet confirms that cyber warfare is simply a new domain of conventional war governed by existing jus in bello rules.

Distractor diagnoses:

- **A** is wrong because it overstates offense dominance. Stuxnet required an eighteen-month development cycle, zero-day exploits, stolen digital certificates, and physical access via removable media. Offense

was expensive and contingent, not automatic; the case supports Rid (2013) in showing that cyber operations are closer to sabotage than to war, and that offense dominance holds only under conditions of extreme resource asymmetry.

- **B** is wrong because it conflates difficulty with impossibility. Attribution of Stuxnet was probabilistic and contested for years, but it was eventually achieved through forensic analysis and investigative reporting. The case supports the claim that attribution problems are structural, not that they are insurmountable; deterrence by punishment is weakened and delayed, not permanently unworkable.
- **C** is correct. Stuxnet achieved strategic effects (destruction of roughly one-fifth of Iran's centrifuges) only under narrow scope conditions: advanced signals intelligence, industrial-control-system expertise, physical access, and an extended preparation period. It remained legally and politically ambiguous because no state acknowledged it and no kinetic response followed, illustrating the gap between strategic effect and legal status that defines the grammar of cyber conflict.
- **D** is wrong because it ignores the central debate. Rid (2013) argues that cyber war will not take place, and the UN GGE process (2013, 2015, 2021) has struggled to establish that existing international law fully governs cyber operations. Stuxnet's covert, unacknowledged character and the absence of a kinetic response demonstrate that cyber operations do not map neatly onto conventional war's legal and political categories.

SECTION 2A — DATA LAB

Table 1 — Significant cyber incidents by target category and suspected actor type (CSIS chronology, 2005–2024; indicative patterns, not exhaustive counts)

Target category	State-linked (suspected)	Criminal / ransomware	Unknown or unattributed	Illustrative pattern
Critical infrastructure (energy, water, transport, health)	High and rising	High and rising	Moderate	Shift from espionage toward operational disruption and extortion
Government / defense / diplomatic systems	High	Low to moderate	Moderate	Persistent access, credential theft, and strategic intelligence collection
Financial sector	Moderate	High	Moderate	Fraud, extortion, and payment-system disruption

Target category	State-linked (suspected)	Criminal / ransomware	Unknown or unattributed	Illustrative pattern
Health sector	Moderate	High	Moderate	Ransomware against hospitals; high societal cost and low tolerance for downtime
Media, elections, and public institutions	High	Low	Moderate to high	Narrative manipulation, leaks, and trust erosion
Private technology and supply-chain firms	High	Moderate	Moderate	Compromise of trusted vendors and software-update channels

Data note: CSIS-style chronologies are event-driven and Western-reporting heavy; absence of an incident is not evidence of absence, and attribution labels often reflect intelligence assessments rather than adjudicated findings.

Table 2 — Disinformation campaign estimates and themes (EU DisinfoLab and adjacent platform/government reporting; indicative ranges)

Campaign theme	Geographic focus	Estimated reach (indicative)	Core technique	Source family
Election interference and democratic trust	US, EU, selected Global South states	Large-scale (platform takedowns and reach estimates)	Fake personas, leaked documents, narrative amplification	EU DisinfoLab, platform transparency reports, government assessments
Public-health narratives	Global	Very large during 2020–2022	Misleading medical claims, impersonation of experts	WHO, platform reports, EU DisinfoLab
War and conflict narratives	Ukraine, Middle East, Africa	Large and sustained	State media, proxy outlets, synthetic media	EU DisinfoLab, OSINT groups, platform reports

Campaign theme	Geographic focus	Estimated reach (indicative)	Core technique	Source family
Migration and border politics	EU, US, border regions	Moderate to large	Emotional imagery, false statistics, dehumanizing frames	EU DisinfoLab, fact-checking consortia
Climate and energy narratives	Global, EU, US	Moderate	Delay, doubt, and polarization campaigns	Academic and NGO monitoring

Data note: Reach estimates are not comparable across platforms; "impressions" are not beliefs, and take-down counts measure enforcement capacity as much as campaign scale.

Table 3 — State-linked and state-adjacent APT ecosystem (MITRE ATT&CK groups, vendor reporting, and public indictments; qualitative mapping)

Actor cluster	Suspected sponsor	Primary objective	Typical target set	Doctrinal frame
Russia-linked clusters	Russian military/intelligence services	Espionage, disruption, political influence	Government, energy, media, elections	Information security, reflexive control, active measures
China-linked clusters	PLA- and MSS-linked entities	Long-term access, IP theft, strategic positioning	Technology, defense, telecom, critical infrastructure	Three warfares, cyber sovereignty, asymmetric competition
Iran-linked clusters	Iranian state and proxy networks	Retaliation, regional coercion, espionage	Regional rivals, US/Israeli targets, diaspora	Deterrence by punishment, proxy competition
DPRK-linked clusters	North Korean state	Revenue generation, espionage, disruption	Finance, crypto, defense, media	Sanctions evasion, regime survival
Western state-linked operations	US, Israel, and allies (publicly attributed in select cases)	Counter-proliferation, disruption, intelligence	Adversary nuclear/missile programs, terrorist networks	Persistent engagement, defend forward, covert action
Criminal ransomware groups	Non-state, sometimes state-tolerated	Extortion and profit	Hospitals, municipalities, SMEs, supply chains	Market logic with occasional political utility

Data note: APT labels are vendor conventions; clusters merge, split, and rebrand. Public attribution is politically consequential and should be treated as evidence, not as a neutral fact.

Five numbered analysis questions

1. **Trend.** How has the distribution of significant cyber incidents shifted between 2005 and 2024—from espionage and data theft toward disruption, extortion, and influence operations—and what mixture of technological change, criminal business models, and geopolitical rivalry best explains that shift?

2. **Level of analysis.** Using the four levels (individual, state, systemic, transnational), which level best explains the 2010 Stuxnet attack on Natanz, and which level is most often underweighted in popular accounts of cyber warfare?

3. **Perspective reconstruction (all five).** Reconstruct one incident—such as a ransomware attack on a hospital or an election-interference operation—from the African, Chinese, Russian, Western, and UN vantage points: what does each perspective render visible, and what does it occlude?

4. **Interpretation.** Does the blurring of criminal ransomware and state-linked hacking strengthen deterrence by punishment, weaken it, or transform it into a problem of attribution and jurisdiction?

5. **Limitation.** What are the three most serious validity threats in CSIS incident chronologies, EU DisinfoLab campaign estimates, and APT taxonomies, and how would you triangulate across them without overstating certainty?

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — "The grammar of cyber conflict" (hand-drawn on A4 or whiteboard)

- **Shapes to draw:** Draw a large rectangle as the "conflict space." Inside it, draw a horizontal axis labeled "Attribution confidence" (low on the left, high on the right) and a vertical axis labeled "Escalation risk" (low at the bottom, high at the top). Draw a diagonal dashed line from lower-left to upper-right labeled "Attribution gap."

- **Zones:** In the lower-left, draw a shaded oval labeled "Deterrence by denial (resilience, patching, redundancy)." In the upper-right, draw a shaded oval labeled "Deterrence by punishment (retaliation, sanctions, counter-operations)." In the middle, draw a hatched band labeled "Ambiguity zone: plausible deniability."

- **Labels to place:** "Stuxnet (high capability, contested attribution)," "Hospital ransomware (criminal/state blur)," "Election interference (narrative, not kinetic)," "Attribution threshold," "Escalation ladder."

- **Perspective overlay:** Annotate the left side with "African: sovereignty and capacity gaps"; the top with "Russian: information security and reflexive control"; the right with "Western: deterrence and attribution"; the bottom with "Chinese: cyber sovereignty and three warfares"; and the center with "UN: GGE norms and OEWG process."

Visual 2 — "Blurring of criminal and state action" (hand-drawn Venn diagram)

- **Shapes to draw:** Draw three overlapping circles. Label the left circle "State intelligence / military cyber units," the right circle "Criminal ransomware and fraud networks," and the bottom circle "Proxy, patriotic, or tolerated hackers."

- **Overlap labels:** Label the center intersection "Plausible deniability / shared tooling / shared infrastructure." Label the state-criminal overlap "State tolerance or direction." Label the state-proxy overlap "Patriotic mobilization." Label the criminal-proxy overlap "Access-as-a-service / initial access brokers."

- **Arrows and notes:** Draw arrows from the center to four boxes labeled "Attribution problem," "Jurisdiction problem," "Escalation control," and "Victim harm." Add a small box labeled "Ransomware-as-a-service (RaaS)" pointing into the criminal circle.

- **Perspective overlay:** Annotate the state circle with "Russian/Chinese: information security and sovereignty"; the criminal circle with "Western: law enforcement and sanctions"; the proxy circle with "African: capacity and legal harmonization gaps"; and the center with "UN: norms against harmful ICT activity."

Visual 3 — "Cognitive warfare funnel: the brain as battlefield" (hand-drawn funnel with feedback loops)

- **Shapes to draw:** Draw a wide funnel at the top narrowing to a point at the bottom. At the top, draw a cloud labeled "Attention economy (platforms, algorithms, outrage)." In the upper-middle, draw a box labeled "Narrative injection (disinformation, memes, leaks)." In the lower-middle, draw a box labeled "Emotional salience and identity threat." At the bottom, draw a circle labeled "Belief and behavior change."

- **Feedback loops:** Draw curved arrows from the bottom circle back to the top cloud labeled "Polarization increases engagement" and "Distrust increases susceptibility." Draw a side arrow from the narrative box to a small box labeled "Policy response / counter-narrative."

- **Labels to place:** "Reach ≠ persuasion," "Algorithmic amplification," "Micro-targeting," "Cognitive load," "Resilience and media literacy," "Democratic trust."

- **Perspective overlay:** Annotate the top with "Chinese: information dominance and three warfares"; the middle with "Russian: reflexive control and active measures"; the bottom with "Western: deterrence, resilience, and platform governance"; the side arrow with "UN: human rights and information integrity"; and the feedback loops with "African: digital sovereignty, data localization, and AU cyber norms."

SECTION 4 — CORNELL NOTES

Cue (prompt)	Notes (with source log)
What is the "grammar" of cyber conflict?	Cyber conflict is not simply war by other means; it has its own grammar: offense-defense balance, attribution problems, escalation ambiguity, and the difficulty of linking effects to political outcomes. Rid (2013) stresses that cyber war is often overstated; Singer and Brooking (2018) stress the normalization of digital conflict.
What is the offense-defense balance in cyberspace?	Offense often has structural advantages: vulnerabilities are hidden, patches lag, and attackers choose time and place. Defense requires continuous maintenance, visibility, and coordination. Scope condition: advantage varies by target maturity and attacker resources.
Why is attribution a core problem?	Technical traces can be spoofed, routed through third countries, or laundered through criminal infrastructure. Attribution is therefore probabilistic and political, not merely forensic. UN GGE reports (2013, 2015, 2021) treat attribution as a state responsibility but do not resolve its evidentiary limits.
Deterrence by denial vs. punishment?	Denial reduces vulnerability and raises attacker cost; punishment threatens retaliation. Punishment requires attribution and credibility; denial works even under uncertainty. Strongest counterargument: denial may be too slow or expensive for complex legacy systems.
What is critical infrastructure targeting?	Attacks on energy, water, health, transport, and finance convert technical access into societal harm. The mechanism is not just data loss but operational disruption and cascading failure.
How do criminal and state action blur?	Shared tools, infrastructure, and tolerance create ambiguity. Ransomware groups may act for profit while serving state interests indirectly. This complicates deterrence, law enforcement, and escalation control.
What is information warfare?	Information warfare targets perception, trust, and decision-making rather than physical systems. Mechanisms include disinformation, leaks, fake personas, and amplification. Pomerantsev (2019) emphasizes the industrialization of deception and the erosion of shared reality.

Cue (prompt)	Notes (with source log)
What is cognitive warfare?	Cognitive warfare weaponizes attention, emotion, identity, and narrative. The "brain as battlefield" framing treats cognition as an operational domain. Mechanism: repeated, emotionally salient, identity-aligned messages exploit cognitive shortcuts and social trust.
What are the major national doctrines?	US: persistent engagement and defend forward; Russia: information security and reflexive control; China: three warfares and cyber sovereignty; EU: regulatory and rights-based governance. Heickerö (2022) is useful for comparing doctrinal vocabularies and their strategic assumptions.
What is the African perspective?	African scholarship and policy emphasize cyber sovereignty, data localization, capacity gaps, legal harmonization, and the AU Convention on Cyber Security and Personal Data Protection (Malabo, 2014). The vantage point highlights dependency, uneven infrastructure, and the cost of imported security models.
What is the UN perspective?	The UN GGE and OEWG processes seek voluntary norms, confidence-building measures, and capacity building. They emphasize state responsibility, protection of critical infrastructure, and no-harm principles, while struggling with enforcement and geopolitical polarization.
How does the 2016 US election case fit?	It illustrates information operations more than classic cyber war: stolen data, narrative amplification, platform exploitation, and trust erosion. It is a case of cognitive and political effect rather than kinetic destruction.

Source log: Rid (2013); Singer and Brooking (2018); Pomerantsev (2019); Heickerö (2022); UN GGE consensus reports (2013, 2015, 2021); AU Convention on Cyber Security and Personal Data Protection (Malabo, 2014); CSIS significant cyber incident chronology; EU DisinfoLab reports; MITRE ATT&CK group documentation.

Summary: Cyber, information, and cognitive warfare are best understood as overlapping domains with distinct mechanisms: technical exploitation, infrastructure disruption, narrative manipulation, and attention capture. Their effects depend on attribution uncertainty, doctrinal framing, and the social context of the target. African, Chinese, Russian, Western, and UN perspectives disagree not only about solutions but about what counts as the primary threat. The 2016 US election case shows that major strategic effects can occur without physical destruction, while Stuxnet shows that physical effects can occur without declared war.

SECTION 5 — FEYNMAN COMPRESSION

1. **Explain without jargon.** Cyber warfare is when states or state-like actors use computers to spy, break things, steal money, or change what people believe. Information warfare is when they use stories, leaks, and fake accounts to shape public opinion. Cognitive warfare is when they target how people pay attention and what they trust. The hard part is knowing who did it, deciding how to respond, and avoiding escalation.

2. **Mark gaps.** I am unsure where criminal ransomware ends and state warfare begins; I also tend to treat "disinformation" as persuasion even though reach does not prove belief change. I need to keep separate: access, effect, attribution, and political outcome.

3. **Reread verification.** Rechecking the sources confirms that Rid (2013) warns against inflating cyber war; Singer and Brooking (2018) emphasize normalization; Pomerantsev (2019) emphasizes industrialized deception; Heickerö (2022) helps compare doctrines; and the UN GGE reports (2013, 2015, 2021) frame norms rather than enforcement.

4. **Analogy with explicit limits.** Cyber conflict is like burglary in a neighborhood where the burglar can wear many disguises: better locks help (denial), but catching and punishing the burglar requires evidence (attribution). The analogy fails because digital tools can be copied instantly, effects can cascade across borders, and "locks" are often maintained by private companies rather than police.

5. **Rewrite.** Cyber, information, and cognitive warfare are distinct but interacting mechanisms—technical access, infrastructure disruption, narrative manipulation, and attention capture—whose strategic meaning depends on attribution, doctrine, and social context. Deterrence by denial and deterrence by punishment are not interchangeable; the former works under uncertainty, while the latter requires credible attribution. National doctrines differ in what they treat as the battlefield: systems, information environments, or cognition itself. The African perspective adds that sovereignty, capacity, and data governance are not secondary issues but central to how cyber conflict is experienced and regulated.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L24	Definition	What is the offense-defense balance in cyber conflict?	It refers to whether attackers or defenders hold structural advantage in a given technological and institutional environment. In cyber, low attribution and cheap offense often favor attackers, but resilience, patching, and denial can shift advantage to defenders. Scope conditions include network architecture, legal thresholds, and intelligence capacity.	Western deterrence theory treats it as central; African and UN perspectives stress that imbalance also reflects unequal infrastructure and norm-setting power.

Tag	Card Type	Front	Back	Perspective Note
L24	Mechanism	Why does attribution remain the central mechanism problem in cyber conflict?	Attackers can route through proxies, compromised machines, and false flags, while defenders must meet evidentiary standards for retaliation or law enforcement. Attribution is therefore probabilistic and political, not merely technical. This shapes whether responses are denial, punishment, or legal process.	Russian and Chinese doctrines exploit ambiguity; Western frameworks demand higher evidentiary thresholds for public attribution.
L24	Application	Distinguish deterrence by denial from deterrence by punishment in cyber.	Denial seeks to make attacks fail or cost more than benefit through resilience, segmentation, and active defense. Punishment threatens retaliation, sanctions, or legal consequences after attribution. The former is more reliable under uncertainty; the latter depends on credible attribution and proportionality.	UN norms favor denial and restraint; US doctrine increasingly combines both.

Tag	Card Type	Front	Back	Perspective Note
L24	Comparison	How does information warfare differ from cyber warfare?	Cyber warfare targets systems, data integrity, and infrastructure through technical intrusion. Information warfare targets beliefs, narratives, and social cohesion through content, amplification, and platform manipulation. They overlap when hacked data is weaponized, but their mechanisms and defenses differ.	Russian doctrine treats information security as broader than network security; Western frameworks often separate them.
L24	Source	What is the core claim of Rid (2013)?	Rid argues that cyber operations are better understood as sabotage, espionage, and subversion than as war in the Clausewitzian sense. He stresses that effects are usually limited, reversible, and below the threshold of armed conflict. The claim is debated, not settled.	It challenges Western alarmism and supports UN emphasis on below-threshold norms.

Tag	Card Type	Front	Back	Perspective Note
L24	Debate	Is Stuxnet best classified as cyber war, sabotage, or coercion?	It can be read as sabotage because it physically damaged centrifuges; as coercion because it aimed to delay Iran's nuclear program; and as a precedent for cyber-physical attack. It does not fit a full-scale war model because it was covert, limited, and non-kinetic in human terms.	Western and Israeli strategic narratives emphasize capability; Iranian and UN perspectives emphasize sovereignty violation and escalation risk.
L24	Reconstruction	What is Russian reflexive control in information operations?	Reflexive control is the practice of shaping an adversary's decision-making by feeding it manipulated information so that it voluntarily chooses actions favorable to the initiator. It relies on cognitive and institutional biases rather than direct force. It is a doctrinal tradition, not merely a tactic.	Russian perspective treats it as legitimate strategic communication; Western perspective treats it as manipulation and interference.

Tag	Card Type	Front	Back	Perspective Note
L24	Occlusion	What do Western attribution frameworks often occlude?	They can understate the role of domestic polarization, platform business models, and prior foreign-policy grievances in making disinformation effective. They may also treat attribution as closure rather than as one step in a political contest. This risks overestimating technical fixes.	African and post-colonial perspectives highlight unequal voice and historical asymmetry in who gets to define "disinformation."
L24	Adjudication	How should one adjudicate between "cyber war" and "cyber competition" framings?	The cyber war framing fits cases of physical damage or clear armed-attack equivalence; the competition framing fits espionage, influence, and below-threshold disruption. Adjudication should use effects, intent, attribution confidence, and legal threshold rather than rhetoric. Neither framing is universally correct.	UN process favors competition and norms; some Western and Russian doctrines retain war framing for deterrence.

Tag	Card Type	Front	Back	Perspective Note
L24	Visual	How do the four levels of analysis apply to cyber conflict?	Individual level covers operators, hackers, and decision-makers; state level covers doctrine and retaliation; systemic level covers offense-defense balance and alliance structures; transnational level covers platforms, criminal markets, and diaspora networks. A complete explanation must specify which level drives the outcome.	African perspective adds transnational platform power and data-extraction asymmetries.
L24	Definition	What is cognitive warfare?	Cognitive warfare targets perception, attention, memory, and decision-making, treating human cognition as the battlespace. It uses narrative, emotion, repetition, and platform affordances to shape behavior without necessarily changing material conditions. It is broader than disinformation alone.	"Brain as battlefield" language is criticized by African and critical scholars for militarizing society and obscuring structural inequality.

Tag	Card Type	Front	Back	Perspective Note
L24	Mechanism	How does the attention economy enable information operations?	Platforms optimize for engagement, which rewards outrage, novelty, and identity threat; operators can exploit these incentives to amplify divisive content cheaply. The mechanism is socio-technical: algorithmic ranking plus human psychology plus network effects. Defense requires platform governance, not only fact-checking.	Western regulatory and EU approaches focus on platform accountability; Russian and Chinese approaches emphasize state control of information space.
L24	Comparison	Compare US persistent engagement with Chinese three warfares.	US persistent engagement emphasizes continuous cyber operations below armed-conflict thresholds to defend forward and impose costs. Chinese three warfares emphasizes public opinion, psychological, and legal warfare to shape perceptions and legitimacy. One is operational and network-centric; the other is political and legitimacy-centric.	African perspective warns both can erode sovereignty and local information ecosystems.

Tag	Card Type	Front	Back	Perspective Note
L24	Source	What do the UN GGE reports (2013, 2015, 2021) contribute?	They articulate voluntary norms for state behavior in cyberspace, including not attacking critical infrastructure and cooperating on incident response. They establish a common vocabulary but lack enforcement. Their value is normative scaffolding, not binding law.	UN perspective centers consensus; African states often seek capacity-building and development alongside norms.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence audit table (scored 0-100)

Concept	My score (0-100)	Calibration cue
Offense-defense balance in cyber		Can I name two scope conditions and one counterargument?
Attribution problem		Can I explain why attribution is political as well as technical?
Deterrence by denial vs punishment		Can I give one case where denial worked better than punishment?
Critical infrastructure targeting		Can I distinguish ransomware effects from state strategic intent?
Criminal/state blurring		Can I identify evidence that would separate tolerance from command?
Information warfare		Can I separate content manipulation from system intrusion?
Cognitive warfare		Can I explain why it is broader than disinformation?

Concept	My score (0-100)	Calibration cue
National doctrines		Can I compare two doctrines without caricature?
UN cyber norms		Can I state what GGE reports do and do not enforce?
African cyber sovereignty perspective		Can I explain Malabo 2014 in its own terms?

7.2 Three-question debrief

1. Which concept did I explain most confidently, and what evidence supports that confidence rather than familiarity?
2. Where did my explanation collapse into description of events rather than identification of mechanism?
3. Which perspective did I underweight, and what evidence or case would force me to revise my adjudication?

7.3 Error-log table

Common Misconception	Correction	Evidence
Cyber war is imminent or inevitable.	Many cyber operations remain below the armed-conflict threshold; effects are often limited, reversible, or ambiguous.	Rid (2013); UN GGE consensus reports (2013, 2015, 2021).
Attribution is purely a technical problem.	Attribution requires intelligence fusion, legal standards, and political judgment; proxies and false flags make certainty rare.	Heickerö (2022); UN GGE process.
Disinformation succeeds mainly because individuals are irrational.	It exploits platform incentives, identity, network structure, and information asymmetry, not only individual gullibility.	Singer and Brooking (2018); Pomerantsev (2019).
Ransomware is only criminal activity.	State tolerance, safe havens, or strategic use can blur criminal and state action, especially when infrastructure is targeted.	CSIS Significant Cyber Incidents data; AU Convention on Cyber Security (Malabo 2014).
UN cyber norms are binding international law.	GGE reports are voluntary consensus norms and confidence-building measures, not treaties with enforcement.	UN GGE consensus reports (2013, 2015, 2021).

Common Misconception	Correction	Evidence
Cognitive warfare is just propaganda renamed.	It includes attention capture, narrative engineering, and decision-shaping across platforms, not only message content.	Pomerantsev (2019); Singer and Brooking (2018).

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Offense-defense balance	Low attribution, cheap offense, resilience, patching	Rid (2013)	Stuxnet; CSIS incident data	Cyber war vs cyber competition	Sustained physical damage with clear state attribution	L20 coercion
Attribution problem	Proxies, false flags, intelligence fusion, legal thresholds	Heickerö (2022)	2016 US election; APT counts	Technical vs political attribution	Public, verifiable attribution meeting legal standards	L4 post-positivism
Deterrence by denial vs punishment	Resilience and cost-imposition vs retaliation and sanctions	US doctrine; UN norms	Ransomware campaigns	Reliability under uncertainty	Repeated successful denial without retaliation	L7 constructivism
Critical infrastructure targeting	Ransomware, state hacking, criminal/state blur	Singer and Brooking (2018)	CSIS Significant Cyber Incidents	Crime vs war	Clear evidence of state command and control	L57 space and infrastructure
Information warfare	Disinformation, election interference, platform amplification	Pomerantsev (2019)	2016 US election; EU DisinfoLab estimates	Manipulation vs legitimate speech	Independent platform data showing no measurable opinion shift	L7 constructivism

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Cognitive warfare	Narrative, attention economy, emotion, decision-shaping	Pomerantsev (2019); Singer and Brooking (2018)	Social media campaigns	Propaganda vs cognition	Evidence that narratives do not alter decisions	L54 AI and hyperwar
National doctrines	Persistent engagement; reflexive control; three warfares; EU regulation	US, Russian, Chinese, EU doctrines	Doctrine documents and official statements	Sovereignty vs intervention	Convergence of doctrines under shared norms	L56 scientific statecraft
UN cyber norms	Voluntary norms, confidence-building, capacity-building	UN GGE (2013, 2015, 2021)	Consensus reports	Law vs norms	Adoption of binding cyber treaty	L? (not specified)

SECTION 9 — REVIEW SCHEDULE

- **R1 — Within 24 hours:** Reconstruct the five key ideas from memory without notes; then check against the lesson and correct gaps in the error log.
- **R2 — Within 72 hours:** Redraw the three visual anchors from memory and explain Stuxnet using the four levels of analysis.
- **R3 — Within 1 week:** Write a short memo on the 2016 US election case, including perspective reconstruction for all five traditions and an explicit adjudication.
- **R4 — Within 2 weeks:** Analyze the CSIS and EU DisinfoLab data, identifying one trend, one anomaly, and one limitation for each dataset.
- **R5 — Within 1 month:** Teach the distinction between cyber warfare and information warfare to a peer, then update the confidence audit and error log.

SECTION 10 — COMPLETION CHECKLIST

☐ I can define offense-defense balance and name two scope conditions.
☐ I can explain why attribution is both technical and political.
☐ I can distinguish deterrence by denial from deterrence by punishment.
☐ I can explain how ransomware blurs criminal and state action.
☐ I can distinguish cyber warfare from information warfare.
☐ I can define cognitive warfare and explain the attention-economy mechanism.
☐ I can compare US persistent engagement and Chinese three warfares.

☐ I can explain Russian reflexive control as a doctrinal tradition.
☐ I can summarize the EU regulatory approach.
☐ I can state what the UN GGE reports do and do not enforce.
☐ I can explain the African perspective on cyber sovereignty and Malabo 2014.
☐ I can apply the four levels of analysis to Stuxnet.
☐ I can reconstruct all five perspectives on the 2016 US election case.
☐ I can identify at least one falsifier for a major claim in this lesson.
☐ I can distinguish description, explanation, prediction, and prescription in my memo.
☐ I have updated my confidence audit and error log.
☐ I can explain one limitation of the CSIS or EU DisinfoLab data.
☐ I can state the core claim of Rid (2013) and one major critique of it.

FURTHER READING (Optional)

- **Cyber war debate:** Rid (2013), *Cyber War Will Not Take Place*.
- **Information operations:** Singer and Brooking (2018), *LikeWar*.
- **Propaganda and cognition:** Pomerantsev (2019), *This Is Not Propaganda*.
- **Cyber operations and legal thresholds:** Heickerö (2022).
- **UN cyber norms:** UN GGE consensus reports (2013, 2015, 2021).
- **African cyber governance:** African Union Convention on Cyber Security and Personal Data Protection (Malabo, 2014).
- **Incident data:** CSIS Significant Cyber Incidents (2005-2024).
- **Disinformation estimates:** EU DisinfoLab campaign reports and datasets.
- **Doctrinal comparison:** US, Russian, Chinese, and EU cyber and information-security doctrine documents.
- **Critical infrastructure and ransomware:** Case studies of state-linked and criminal cyber operations against infrastructure.

End of Lesson 24. Say **Next** when you are ready.

---

26. Maritime, Chokepoints, Space, and Gray-Zone Conflict

LESSON METADATA

Field	Value
Lesson number and title	Lesson 25: Maritime, Chokepoints, Space, and Gray-Zone Conflict
Module	Module 4: Security Studies and Warfare
Prerequisites	L20 (coercion), L22 (conventional), L24 (cyber)
Interleaved links	Forward to L44 (Hormuz/Bab el-Mandeb), L48 (Indo-Pacific sea denial), L57 (space)
Reading load	7-9 hours
Content channels	Text, data lab, visuals, flashcards

Field	Value
Bloom ceiling	Evaluate / Create
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

The central puzzle of this lesson is how states and non-state actors contest control of the sea and of space without crossing the threshold into declared armed conflict, and why the geography of maritime chokepoints makes that contest both possible and dangerous. Maritime power has historically been the decisive instrument of global order: Alfred Thayer Mahan's 1890 argument that sea control determines national greatness remains the baseline against which contemporary strategies are measured, and Julian Corbett's 1911 refinement—that command of the sea is a means to an end rather than an end in itself—still structures naval doctrine. Yet the contemporary maritime environment is no longer one in which a single navy can guarantee command of the sea. It is characterized instead by layered denial: anti-access/area-denial (A2/AD) systems that raise the cost of entry for superior fleets, gray-zone coercion that exploits legal and political ambiguity about what counts as an act of war, and the militarization of space-based infrastructure on which maritime operations increasingly depend. The student who masters this lesson will be able to explain why a superpower's carrier strike group can be held at risk by a weaker state's missile and mine arsenal, why a coast guard vessel can accomplish what a warship cannot, and why the destruction of a single satellite can disable a fleet's ability to find, fix, and target.

This lesson sits at the intersection of three preceding modules and synthesizes their logics in a domain where physical geography and legal ambiguity interact. Lesson 20 established the logic of coercion: how actors use threats to compel or deter without necessarily fighting, and how the credibility of threats depends on capability and resolve. Lesson 22 examined conventional warfare and the operational art of massed force, including the problem of escalation dominance. Lesson 24 extended the analysis to cyber, showing how attacks below the threshold of armed conflict can achieve strategic effects while exploiting attribution problems. Lesson 25 brings these threads together in the maritime and space domains, where narrow straits, shallow littorals, and orbital mechanics create a distinctive form of conflict in which the physical environment is itself a weapon. The forward links to Lessons 44, 48, and 57 indicate that the concepts introduced here will be applied in greater depth to the Strait of Hormuz and Bab el-Mandeb, to Indo-Pacific sea denial, and to space security. The student should therefore treat this lesson as a conceptual foundation that will be tested against specific cases later in the curriculum, not as a self-contained case study.

The African perspective is not an add-on to this analysis; it is the vantage point from which the lesson's central puzzle becomes most visible and most consequential. For African coastal states, maritime security is not primarily about great-power competition but about sovereignty over exclusive economic zones, the protection of fisheries from illegal, unreported, and unregulated (IUU) fishing, the suppression of piracy in the Gulf of Guinea, and the vulnerability of Red Sea shipping lanes to disruption. The 2023–2024 Houthi attacks on commercial shipping in the Red Sea demonstrated how a non-state actor operating from the African littoral could impose costs on global trade disproportionate to its military capacity, while African states bore the consequences in the form of disrupted port revenues, heightened insurance costs, and the militarization of their coastal waters by external powers. African scholarship—ranging from Grovogui's critique of international legal hierarchies and the racialized foundations of sovereignty, to Mbembe's analysis of necropolitics and the governance of death, to Bayart's work on the criminalization of the state and the extraversion of

African politics—suggests that maritime insecurity in Africa is inseparable from the political economy of coastal governance and the externalization of security by foreign powers. The African vantage reveals what the great-power frame occludes: that chokepoints are not merely strategic assets to be controlled but lived spaces whose populations experience the consequences of distant competition, and that the legal categories of the law of the sea often encode rather than resolve power asymmetries.

The lesson's five key ideas build a cumulative argument about how maritime and space domains are contested in the twenty-first century. First, the sea power traditions of Mahan and Corbett establish the theoretical baseline: command of the sea as a precondition for global power, and the distinction between command and control that shapes how navies are employed. Second, chokepoint geography—Hormuz, Bab el-Mandeb, Malacca, Suez, Panama—translates that theory into concrete leverage, showing how narrow passages convert maritime traffic into strategic vulnerability and how transit volumes create asymmetric dependence. Third, A2/AD strategies by China, Iran, and Russia demonstrate how weaker actors contest US maritime primacy not by matching American fleet size but by raising the cost of access through missiles, mines, submarines, and integrated air defense. Fourth, gray-zone coercion—coast guard vessels, maritime militia, cyber operations, economic pressure—shows how states achieve objectives below the threshold of armed conflict by exploiting ambiguity about attribution and about what counts as a use of force. Fifth, space as a military domain reveals the orbital infrastructure on which all maritime operations now depend—intelligence, surveillance, and reconnaissance (ISR), positioning, navigation, and timing (PNT), and communications—and the vulnerability of that infrastructure to anti-satellite weapons. Together, these ideas explain why maritime conflict today is less about fleet engagements than about denial, ambiguity, and infrastructure.

After mastering this lesson, the student will be able to reconstruct the Mahanian and Corbettian logics and identify their scope conditions; map the strategic significance of the five major chokepoints and explain how transit volumes create leverage; analyze A2/AD as a mechanism of cost-imposition rather than fleet parity; distinguish gray-zone coercion from armed conflict using legal and operational criteria; and evaluate the role of space-based ISR, PNT, and communications in maritime operations. The student will also be able to reconstruct five perspectives—African, Chinese, Russian, Western, and UN—on any maritime or space security issue, identifying what each contributes and what it occludes, and to adjudicate between competing explanations on the basis of evidence. The assessment tasks require the student to apply these skills to the Iranian asymmetric strategy in the Strait of Hormuz and to Chinese activity in the South China Sea, and to interpret data on oil transit volumes, satellite launches, and ASAT tests. The Bloom ceiling of evaluate and create means that the student is expected not merely to describe but to judge and to design analytical frameworks.

A methodological caution runs through the lesson and should frame the student's approach. Maritime and space security are domains in which classification, commercial sensitivity, and strategic ambiguity make evidence scarce and contested. Quantitative claims—transit volumes, satellite counts, incident tallies—should be treated as indicative rather than definitive, and the student should distinguish carefully between description (what happened), explanation (why it happened), prediction (what will happen), and prescription (what should be done). The strongest analyses in this field are those that specify mechanisms, state scope conditions, and acknowledge counterarguments rather than asserting conclusions. The lesson's structure—key ideas with causal claims, mechanisms, scope conditions, observable implications, and perspective notes—is designed to train that habit of mind, and the independent memo requires the student to demonstrate it explicitly.

SECTION 1 — Pre-Class Priming

1.1 Retrieval warm-up

1. From Lesson 20: Define coercion and distinguish compellence from deterrence. What two conditions must hold for a coercive threat to be credible?
2. From Lesson 20: What is "gray-zone" conflict as introduced in the coercion module, and why does ambiguity about the threshold of armed conflict create strategic opportunity?
3. From Lesson 22: What is the "stability-instability paradox," and how does it shape the relationship between nuclear deterrence and conventional conflict?
4. From Lesson 22: Explain "escalation dominance" and identify one historical case in which a state lost escalation dominance despite material superiority.
5. From Lesson 24: How does cyber coercion differ from kinetic coercion with respect to attribution, reversibility, and the threshold of armed conflict?
6. From Lesson 24: What is the "attribution problem," and how does it constrain the range of responses available to a state that has suffered a cyber attack?

1.2 Orientation questions

1. Why might a state with a smaller navy be able to deny a larger navy access to a maritime region, and what does this imply about the relationship between fleet size and strategic effectiveness?
2. How do maritime chokepoints convert geography into coercive leverage, and which actors are most vulnerable to disruption at each of the five major chokepoints?
3. What distinguishes gray-zone coercion from armed conflict under international law, and why does that distinction matter for alliance commitments and rules of engagement?
4. Why is space considered a military domain, and what are the strategic consequences if satellite-based ISR, PNT, or communications infrastructure is disrupted or destroyed?

1.3 Vocabulary pre-teach

- **Sea control / command of the sea**: The ability to use the sea for one's own purposes while denying its use to the adversary; the Mahanian baseline of maritime strategy, historically associated with fleet engagements and blockades.
- **Sea denial**: The ability to prevent an adversary from using the sea without necessarily being able to use it oneself; the strategy of weaker actors who cannot contest command but can raise the cost of access.
- **A2/AD (anti-access/area-denial)**: A layered strategy combining long-range missiles, mines, submarines, and integrated air defense to prevent an adversary from entering or operating within a maritime theater.
- **Chokepoint**: A narrow maritime passage through which a large share of global shipping must transit, creating geographic concentration that can be exploited for coercion or denial.
- **Gray-zone coercion**: Actions that achieve strategic objectives below the threshold of armed conflict, exploiting ambiguity about attribution, legality, and the definition of a use of force.
- **Maritime militia**: Civilian or paramilitary vessels operating under state direction to assert maritime claims, harass foreign vessels, or conduct surveillance while maintaining plausible deniability.
- **UNCLOS (United Nations Convention on the Law of the Sea)**: The 1982 treaty framework govern-

ing maritime zones, navigation rights, and resource jurisdiction; the legal baseline for most maritime disputes.

- **EEZ (Exclusive Economic Zone)**: The maritime zone extending up to 200 nautical miles from a state's coast, in which the state has sovereign rights over resources but not full sovereignty.
- **ISR (Intelligence, Surveillance, Reconnaissance)**: The collection and processing of information about adversary forces and the environment, increasingly dependent on space-based assets.
- **PNT (Positioning, Navigation, Timing)**: Satellite-based services, such as GPS, that enable precise navigation and synchronization of military operations; a critical and vulnerable infrastructure.
- **ASAT (Anti-Satellite weapon)**: A weapon designed to destroy or disable satellites, creating debris and threatening the orbital infrastructure on which modern militaries depend.
- **Freedom of navigation (FONOP)**: Operations conducted to challenge excessive maritime claims and assert rights under UNCLOS, typically by naval vessels transiting disputed waters.

SECTION 2 — LESSON CORE

2.1 Learning objectives

By the end of this lesson, the student will be able to:

1. **Analyze** the causal mechanisms through which sea power translates into strategic advantage, distinguishing Mahan's command-of-the-sea logic—concentration of battle fleets, decisive engagement, and the opening or closing of oceanic systems—from Corbett's control-of-communications logic—selective, limited, and often indirect control of sea lanes for specific operational purposes—and specifying the scope conditions, including industrial capacity, geographic position, alliance structure, and technological environment, under which each applies rather than the other.

2. **Evaluate** the strategic significance of maritime chokepoints by linking geographic constriction to transit volumes, vulnerability, and the political economy of energy security, using EIA World Oil Transit Chokepoints data as an evidentiary baseline and identifying which chokepoints are substitutable through alternative routes and which are not.

3. **Compare** A2/AD strategies across Chinese, Iranian, and Russian cases, identifying the common mechanism—denial of access and freedom of action to a superior maritime power—and the divergent scope conditions: Chinese near-seas defense and blue-water transition, Iranian regional deterrence in the Gulf, and Russian Arctic and Black Sea bastion defense.

4. **Synthesize** gray-zone coercion as a distinct category of conflict that exploits thresholds of attribution, escalation, and legal status, drawing on coast guard, maritime militia, cyber, and economic instruments, and distinguishing it from both conventional warfare and peacetime competition.

5. **Apply** the four levels of analysis—individual, state, systemic, and transnational—to a maritime case, reconstructing African, Chinese, Russian, Western, and UN perspectives, and adjudicating among them on the basis of evidence rather than assertion. Each objective is assessed through the worked example, problem pair, and independent memo that follow.

2.2 KEY IDEA 1 — Sea power traditions: Mahan, Corbett, and the strategic logic of maritime dominance

Bolded Causal Claim: Maritime dominance is not a natural endowment of coastline or fleet size but a produced strategic condition: states that convert geographic position, industrial capacity, and institutional coherence into sustained control of sea communications gain disproportionate influence over trade, coercion, and alliance politics, while states that neglect any of these inputs see their maritime advantage decay even when their navies appear strong on paper.

Mechanism: The mechanism runs through three linked stages, and it is worth tracing each because the common error is to stop at the first. First, geographic position and physical conformation create differential access to sea lanes and chokepoints. Mahan's six determinants—geographic position, physical conformation, extent of territory, number of population, character of the people, and character of the government—are best read as a checklist of inputs rather than a ranking, and the last two, which concern national character and governmental capacity, are the ones most often neglected by analysts who prefer hardware metrics. Second, industrial and fiscal capacity converts these inputs into hulls, bases, and logistics; without this, geography is inert, which is why several states with excellent maritime geography have failed to become sea powers. Third, and most decisive, institutional coherence—naval doctrine, officer education, civil-military relations, and alliance management—determines whether the fleet is used to command the sea or merely to display it. Mahan's command-of-the-sea logic, developed in *The Influence of Sea Power upon History* (1890) in the context of late-nineteenth-century US naval expansion and the study of seventeenth- and eighteenth-century European powers, treats the decisive battle fleet as the instrument: concentrate superior force, destroy the enemy fleet, and thereby open the oceans to one's own commerce and close them to the adversary's. Corbett's control-of-communications logic, developed in *Some Principles of Maritime Strategy* (1911) in the context of British imperial defense and coalition warfare, treats the sea as a medium to be used rather than a territory to be owned; command is often partial, temporary, and exercised for specific operational purposes such as protecting an expeditionary force or interdicting a particular trade route. The two are not rivals so much as answers to different questions: Mahan asks how to win the war at sea, while Corbett asks how to use the sea to win the war. The mechanism of dominance, on either account, is the denial of use to the adversary combined with the preservation of use for oneself, sustained over time by logistics, bases, and the legal and commercial infrastructure that makes sea-borne trade predictable. A further element, often omitted, is the maritime-industrial complex itself: shipyards, ports, merchant marine, and the financial systems that underwrite them. Sea power is not a navy; it is a maritime system in which the navy is one component.

Scope Conditions: Mahan's logic applies most cleanly where (a) the state possesses or can seize a decisive material advantage in capital ships, (b) the theater permits concentration and a single climactic engagement, and (c) the political objective requires opening or closing entire oceanic systems. It weakens where fleets are dispersed by alliance obligations, where technology—submarines, mines, aircraft, and now precision missiles—fragments the battle space, or where the adversary adopts a sea-denial rather than sea-control posture. Corbett's logic applies more broadly, especially for medium powers, coalition warfare, and expeditionary operations, but risks underestimating the political value of visible dominance and the deterrent effect of a fleet-in-being. Both traditions assume a state-centric, Westphalian actor with a professional navy and a coherent national strategy; neither was designed for gray-zone competition in which coast guards and maritime militias carry the operational load, or for a world in which commercial shipping is globally distributed and legally regulated by international convention. Till's contemporary restatement in *Seapower: A Guide for the Twenty-First Century* (2018) emphasizes that seapower today is a system of systems—naval, commercial, informational, and legal—and that the Mahan-Corbett debate is best treated as a spectrum rather than a

binary. The scope conditions have also shifted with nuclear weapons: a decisive fleet engagement between nuclear-armed states is now implausible, which pushes even great powers toward Corbettian limited control and deterrence rather than Mahanian annihilation.

Observable Implications: If Mahan's logic dominates in a given state's strategy, one expects fleet concentration, carrier strike group deployments, investments in capital ships, and a preference for decisive engagement; if Corbett's, one expects convoy systems, distributed maritime operations, emphasis on logistics and sustainment, and the use of the sea as a highway rather than a battlefield. Empirically, the US Navy's post-Cold War posture has oscillated between both: the 1990s and 2000s emphasized carrier-centric power projection that was Mahanian in form, while recent distributed maritime operations concepts and expeditionary advanced base operations reflect Corbettian adaptation to A2/AD environments. A further implication: states that score high on Mahan's determinants but low on institutional coherence—large populations, extensive coastlines, weak governance—should exhibit "hollow" maritime power, impressive on paper and fragile in use. This is observable in several post-colonial navies whose procurement outpaced training, maintenance, and doctrine. Conversely, states with modest determinants but high coherence, such as the United Kingdom in the nineteenth century or Japan in the early twentieth, can punch above their geographic weight. The observable test is not fleet size but sustained operational availability and the ability to project force at distance without external support.

Perspective Note (five traditions in brief):

African (primary). African maritime thought does not begin with Mahan or Corbett; it begins with the experience of the sea as a vector of extraction and domination. From the transatlantic slave trade through colonial partition and the post-independence scramble for offshore resources, the ocean was not a commons to be commanded but a corridor of dispossession. Post-independence African states inherited coastlines without the industrial or institutional capacity to police them, and the Mahanian ideal of a battle fleet was neither affordable nor strategically apt. African scholarship reframes sea power accordingly. Rodney's analysis of how colonialism underdeveloped African maritime capacity, and Nkrumah's insistence that political independence without economic control of sea-borne trade is incomplete, shift the question from commanding the sea to controlling the terms of one's own maritime participation. Bayart's work on the politics of extraversion and Mamdani's analysis of the colonial state's institutional legacies further illuminate why African maritime governance often operates through external dependency—foreign training, donated vessels, and intelligence sharing—rather than autonomous capacity. The contemporary African maritime agenda, visible in the African Union's 2050 Africa's Integrated Maritime Strategy and in regional frameworks such as ECOWAS, the Indian Ocean Commission, and the Gulf of Guinea Commission, centers on blue economy development, illegal fishing, piracy, maritime domain awareness, and the protection of offshore energy infrastructure rather than fleet battles. The African vantage point thus reveals what Mahan and Corbett occlude: that for most of the world's states, the problem is not commanding the sea but surviving its asymmetries. African navies and coast guards operate under severe resource constraints; their strategic logic is closer to Corbett's limited control than to Mahan's decisive engagement, but even Corbett presumes a state with choices, whereas many African maritime agencies are structurally dependent on external partners. This dependency is not merely a capacity gap; it is a sovereignty question, because the terms of external assistance shape whose priorities—counter-piracy, counter-narcotics, or great-power competition—define African maritime security.

Chinese. Chinese maritime strategy has moved from a Mahanian phase of fleet building and carrier acquisition toward a hybrid that uses Mahanian symbols—carriers, blue-water deployments, and a growing surface

fleet—to serve Corbettian and A2/AD purposes: near-seas control, denial of US access, and protection of sea lines of communication. Holmes and Yoshihara's analysis in *Red Star over the Pacific* (2017) emphasizes that Beijing's strategic culture blends Western-derived concepts with indigenous traditions, and that the "near seas"—the Yellow, East, and South China Seas—remain the priority even as blue-water ambitions grow. The Chinese perspective contributes the insight that maritime dominance is historically contingent and that a rising power can contest an incumbent's command without replicating its fleet structure, substituting missiles, submarines, and sensors for capital ships. It also reveals the political dimension of sea power: the construction of artificial islands and the use of coast guard and militia are not merely tactical choices but claims about sovereignty and order.

Russian. Russian maritime strategy, shaped by geographic enclosure, ice, and the legacy of continental defense, has historically emphasized bastion defense and sea denial rather than global command. The Arctic and Black Sea are treated as strategic sanctuaries; the Northern Fleet's ballistic-missile submarines require protected bastions from which to guarantee second-strike capability. Russian thought thus inverts Mahan: the goal is not to command the ocean but to deny an adversary the ability to threaten the homeland from it. This perspective highlights the defensive and deterrent dimensions that Mahanian triumphalism understates, and it reminds us that sea power can be exercised negatively—through denial—as well as positively—through control.

Western. The Western, and especially Anglo-American, perspective treats freedom of navigation and open sea lanes as foundational to global order and economic prosperity. Mahan's influence on US naval thought is direct and enduring; Corbett's is more visible in British and Commonwealth doctrine. The Western contribution is the institutionalization of maritime dominance through alliances, forward bases, and carrier strike groups, and the legal framing of the high seas as a global commons. Its occlusion is the tendency to universalize a historically specific, post-1945, US-led maritime order as natural or as the legal baseline, and to treat challenges to that order as threats to order itself rather than as competing claims about legitimate maritime governance.

UN. The UN perspective is legal-institutional: the United Nations Convention on the Law of the Sea (1982) codifies maritime zones, freedom of navigation, and the common heritage of mankind. It provides the framework within which all other perspectives operate, but it lacks enforcement capacity and depends on state consent. The UN contribution is the attempt to convert maritime power into legal entitlement and to provide dispute-resolution mechanisms; its occlusion is the gap between law and power, visible when major states decline to ratify or comply, and the fact that legal frameworks can be invoked selectively by powerful states while weaker states lack the capacity to enforce their entitlements.

SECTION 2.3 KEY IDEA 2 — Chokepoints and maritime geography: Hormuz, Bab el-Mandeb, Malacca, Suez, Panama

Bolded Causal Claim: Maritime chokepoints are not merely narrow waterways; they are structural bottlenecks in the global economy, and their geography converts localized disruption into systemic leverage over energy prices, supply chains, and diplomatic bargaining. A state or non-state actor that can credibly threaten closure, harassment, or selective inspection at a chokepoint can impose costs far exceeding its conventional naval power, because global shipping and energy markets are organized around the assumption of continuous, low-friction transit through a small number of passages.

Mechanism: Chokepoints concentrate flows that are otherwise dispersed across oceans. Shipping routes are not random; they follow great-circle paths, canal shortcuts, and established lanes that minimize fuel, time, and crew costs. When a passage narrows, traffic density rises, maneuvering room shrinks, and the cost of delay compounds. The mechanism operates through several channels. First, volume concentration: a large share of global petroleum, liquefied natural gas, and container traffic moves through a handful of straits and canals, so disruption at one node affects many supply chains simultaneously. Second, inelastic short-run alternatives: rerouting around Africa or South America can add days or weeks, increase fuel consumption, disrupt port schedules, and strain crew rotations; pipelines and overland routes have limited spare capacity and cannot absorb sudden maritime shortfalls. Third, market amplification: energy and freight markets price expected continuity, so threats, inspections, or partial disruptions can raise spot prices, war-risk premiums, and insurance costs even without a formal closure. Fourth, operational friction: mines, small-boat attacks, drone strikes, or regulatory harassment can force convoys, reduce throughput, and create queues that propagate through just-in-time logistics. Fifth, legal and infrastructural leverage: straits used for international navigation are governed by transit-passage rules, while canals are sovereign infrastructure subject to fees, maintenance, and political control. The U.S. Energy Information Administration's *World Oil Transit Chokepoints* (2024) treats these passages as critical nodes in global petroleum logistics; their significance lies not only in volume but in the absence of ready substitutes at acceptable cost. Hormuz connects Gulf producers to the Arabian Sea and concentrates oil and gas exports behind a narrow maritime corridor. Bab el-Mandeb links the Red Sea to the Gulf of Aden and therefore to the Suez route between Asia and Europe. Malacca connects the Indian Ocean to the South China Sea and is central to East Asian energy and container flows. Suez is an artificial shortcut whose blockage or closure immediately lengthens Europe-Asia trade. Panama performs a similar function between the Atlantic and Pacific. Each chokepoint has distinct physical, legal, and political characteristics, but all share the same structural property: they make global commerce dependent on a small amount of geography.

Scope Conditions: Chokepoint leverage is strongest when traffic volume is high relative to physical capacity and scheduling tolerance; when alternatives are slow, expensive, or politically unavailable; when the commodity is energy or time-sensitive manufactures; when a disruptor can sustain low-cost harassment without triggering full-scale war; when naval protection is absent, stretched, or politically constrained; when the coastal state has legal or physical control over adjacent waters or canal infrastructure; and when insurance and financial markets amplify perceived risk. It weakens when strategic petroleum reserves buffer supply shocks; when pipelines, alternative ports, or canal expansions diversify routes; when multinational naval escorts restore throughput; when demand shocks reduce traffic; when legal frameworks and diplomacy de-escalate; and when technological change reduces dependence on a single passage. Chokepoints can be bypassed over decades, but not during a crisis. Some are natural straits whose legal status is contested; others are artificial canals whose vulnerability includes accidents, climate stress, and infrastructure failure as well as coercion.

Observable Implications: If chokepoint geography is strategically salient, one should observe naval deployments and multinational task forces near straits; spikes in war-risk insurance premiums after incidents; rerouting, delays, and port congestion; commodity price volatility correlated with threats rather than only with closures; investment in alternative routes, pipelines, ports, and canal expansions; legal disputes over transit passage, exclusive economic zone rights, and coastal-state security zones; assertions of fee, inspection, or regulatory control by littoral states; and the treatment of piracy, drone attacks, or harassment as strategic rather than merely criminal events. Chokepoint incidents should also internationalize quickly, because global markets transmit local disruption into price and risk signals far from the passage itself.

Perspective Note (five traditions in brief):

African (primary). For African states, chokepoints are not abstract nodes in a Western logistics map; they are spaces where African trade, food imports, fishing livelihoods, and port revenues are exposed to disruption. The Red Sea and Bab el-Mandeb, the Gulf of Guinea, and the approaches to the Cape all matter because African economies are deeply integrated into maritime trade but often lack the capacity to secure their own waters. African scholarship on maritime security frequently begins from this capacity gap: many coastal states do not have enough vessels, surveillance systems, or legal institutions to police exclusive economic zones, so external navies operate in African waters under counter-piracy or maritime-security mandates. That creates a sovereignty dilemma in which protection against piracy, illegal fishing, or trafficking may come at the cost of ceding operational control to outside powers. The African perspective also emphasizes that chokepoint disruption is not only a great-power issue. Red Sea disruptions raise costs for African importers and exporters; Gulf of Guinea piracy has historically imposed costs on regional trade and coastal communities. From an African vantage, the central question is not simply which power controls a strait, but whether maritime governance protects coastal communities, artisanal fishers, port workers, and national revenues. Broader African international-relations scholarship—Grovogui on the coloniality of international order, Mbembe on necropolitics and the production of African space, Bayart on the historical sociology of the state, and Mamdani on the bifurcated state—suggests that chokepoints are embedded in an unequal global economy in which African states are often price-takers in markets whose volatility is generated elsewhere. Thinkers and analysts such as Aning and Danso on African maritime security highlight the need for regional cooperation, maritime domain awareness, and legal-institutional development rather than blue-water fleet competition. The African perspective therefore stresses frameworks such as the Yaoundé Code of Conduct, coast-guard capacity, information sharing, and EEZ governance. Its contribution is to show that chokepoint politics is also a question of livelihoods and sovereignty; its occlusion in great-power debates is the reduction of African coastal security to piracy statistics or to basing opportunities for external powers.

Chinese. China's "Malacca dilemma" exemplifies chokepoint anxiety: a large share of its energy imports and trade passes through straits it does not control. Chinese strategy therefore combines naval modernization, port and infrastructure investments along the Belt and Road, pipeline diversification, and near-seas defense. Chokepoints are seen as vulnerabilities to be mitigated and, potentially, as leverage in regional crises. This perspective emphasizes economic security and the right to development, and it often frames external naval presence in Asian straits as threatening. Its contribution is to show that chokepoint dependence can drive both military and infrastructure policy; its occlusion is the concern of smaller littoral states whose waters are traversed by great-power competition.

Russian. Russia's maritime geography is shaped by ice, enclosed seas, and limited warm-water access. Chokepoints such as the Turkish Straits, Danish Straits, and Arctic passages matter for energy exports and naval mobility. Russian strategy uses energy exports as leverage and seeks to control or influence chokepoints and adjacent seas, including the Black Sea, Baltic, and Arctic. This perspective highlights how chokepoints can be weaponized through energy, sanctions, and naval presence; its occlusion is the cost imposed on importers and the legal norms of transit.

Western. Western maritime strategy treats chokepoints as nodes in a global commons requiring freedom of navigation. The United States and allies deploy carrier strike groups and multinational task forces to keep straits open, viewing closure as a threat to global commerce and alliance credibility. This perspective contributes operational capacity and legal advocacy for transit passage; its occlusion is the way "freedom of navigation" can be experienced by coastal states as external military presence, and the possibility that

Western energy-security interests do not align with local development.

UN. The UN perspective is legal-institutional: the United Nations Convention on the Law of the Sea defines transit passage through straits used for international navigation, exclusive economic zone rights, and the common heritage of the seabed. It provides the vocabulary for resolving chokepoint disputes and supports maritime-security resolutions. Its contribution is normative order; its occlusion is enforcement weakness and selective compliance, especially when major powers or canal authorities assert security exceptions.

SECTION 2.4 KEY IDEA 3 — A2/AD and sea denial: Chinese, Iranian, and Russian strategies to contest US maritime primacy

Bolded Causal Claim: Anti-access/area-denial (A2/AD) strategies do not require a weaker maritime power to defeat the U.S. Navy in open-ocean battle; they require only that it raise the cost, risk, and uncertainty of U.S. entry and operations in a defined theater sufficiently to deter or delay intervention during a crisis.

Mechanism: A2/AD is a compound strategy. Anti-access seeks to prevent an adversary from entering a theater; area denial seeks to degrade its operations once inside. The mechanism is not sea control in the Mahanian sense but sea denial: the weaker power does not need to command the ocean globally, only to deny the stronger power the ability to use a specific maritime space for a limited time. It works through cost-exchange asymmetry and geographic advantage. Land-based systems are often cheaper and more survivable than ships; missiles can be dispersed, hidden, and fired in salvos; sensors create targeting chains; and the defender operates near homeland bases with interior lines. The main mechanisms include long-range precision strike against ships, bases, and logistics nodes; integrated air defense that denies air superiority; submarines and mines that threaten sea lines of communication and carrier groups; coastal radar, satellites, and drones that provide over-the-horizon targeting; electronic and cyber warfare that disrupts communications, navigation, and command; and ambiguous "gray-zone" layers such as coast guard, militia, and fishing vessels that create friction below the threshold of armed conflict. Geography matters: the first island chain, the Persian Gulf, the Black Sea, and the Arctic allow land-based fires to cover maritime approaches and compress the attacker's maneuver space. Holmes and Yoshihara's work on Chinese maritime strategy emphasizes that sea denial is a classic asymmetric response to superior sea control, while Till's treatment of sea power distinguishes command of the sea from denial of its use. The strategic logic is therefore not to win a decisive fleet battle but to make intervention too costly, too slow, or too uncertain for the political objectives at stake.

Scope Conditions: A2/AD is most effective when the defender has secure land bases and interior lines; when the attacker depends on a small number of forward bases and long logistics chains; when missile and sensor networks are survivable, redundant, and well integrated; when the crisis is short and the political stakes are high; when the defender can tolerate escalation; and when geography constrains the attacker's approach. It is less effective when the attacker can operate from range, disperse forces, use stealth or autonomy, or rely on allied access; when cyber or kinetic strikes can degrade command and control; when economic blockade or attrition can outlast the denial bubble; when the defender's systems are vulnerable to preemption; or when a coalition imposes costs that exceed the defender's capacity. A2/AD is also not a static fortress. It is a contest between detection and concealment, offense and defense, and its effectiveness depends on the survivability of the kill chain. There is an additional instability: if the defender fears its A2/AD systems will be destroyed in a first strike, it may face "use it or lose it" pressure, increasing crisis instability.

Observable Implications: If A2/AD is shaping maritime competition, one should observe development and testing of anti-ship ballistic missiles, cruise missiles, and hypersonic weapons; militarization of islands, reefs, and coastal positions; submarine and mine-warfare exercises; electronic-warfare incidents and navigation

interference; doctrinal adaptations by the United States and allies, such as distributed maritime operations, expeditionary advanced base operations, and long-range fires; allied base hardening and access agreements; changes in commercial routing and insurance pricing; and crisis simulations or war games showing delayed or denied intervention. One should also observe arms racing between denial systems and missile defense, as well as debates over whether A2/AD creates deterrence or merely shifts the locus of risk.

Perspective Note (five traditions in brief):

African (primary). The A2/AD frame is largely a great-power concept, but African states encounter its logic in asymmetric and often non-military forms. African maritime insecurity is frequently characterized by "sea denial" exercised not by advanced missile networks but by pirates, insurgents, illegal fishers, traffickers, and weak governance. From an African perspective, the relevant question is who can deny use of coastal waters to whom: artisanal fishers may be denied access by industrial trawlers or security zones; coastal communities may be denied safety by piracy; states may be denied revenue by illicit trafficking. African scholarship on maritime security—Aning and Danso, among others—and broader critical international-relations work by Grovogui, Mbembe, Bayart, and Mamdani suggest that importing A2/AD vocabulary without attention to governance can misdiagnose African maritime problems as military gaps rather than political-economic ones. At the same time, African littorals are affected by great-power A2/AD dynamics: Red Sea and Gulf of Aden disruptions, foreign naval bases, and competition for port access can militarize African coasts. The African perspective reveals that sea denial is not only a strategy of rising powers against the United States; it is also a condition of weak maritime governance, where non-state actors deny states the ability to enforce law at sea. It also cautions that external powers' A2/AD competition can externalize risk onto African shipping lanes and ports. Thus African maritime strategy prioritizes coast-guard capacity, information sharing, legal frameworks, and regional mechanisms over participation in high-end denial contests. Its contribution is to restore the human-security dimension; its occlusion in great-power debates is the tendency to treat maritime space as a battlefield between fleets rather than as a space of livelihoods, food security, and state capacity.

Chinese. China's A2/AD strategy is framed as defensive and regional: to prevent U.S. intervention in a Taiwan or South China Sea crisis by making the costs prohibitive. It combines missiles, submarines, mines, air defenses, and island-based infrastructure. This perspective contributes the logic of cost-imposition and homeland defense; it occludes how regional neighbors experience these capabilities as offensive and how "defensive" denial can enable coercion short of war.

Russian. Russia uses A2/AD to protect strategic bastions and compensate for naval inferiority, especially in the Black Sea, Baltic, and Arctic. Coastal missiles, submarines, and air-defense systems create denial zones around Crimea, Kaliningrad, and the Northern Fleet. This perspective emphasizes geographic defense and escalation control; it occludes the destabilizing effects on NATO's eastern flank and on commercial shipping in enclosed seas.

Western. Western strategy sees A2/AD as a challenge to freedom of navigation, alliance credibility, and the ability to defend partners. Responses include distributed operations, long-range fires, missile defense, and allied capacity building. This perspective contributes operational innovation and deterrence; it occludes how Western forward presence itself may be perceived as threatening and how high-end competition can crowd out cooperative maritime security.

UN. The UN perspective focuses on legal constraints: the law of armed conflict at sea, the United Nations Convention on the Law of the Sea, and maritime-security resolutions. A2/AD raises questions about escalation, civilian shipping, and the distinction between military and civilian infrastructure. Its contribution is

normative and humanitarian; its occlusion is limited enforcement and the tendency of major powers to treat legal frameworks as instruments rather than constraints.

2.5 KEY IDEA 4 — Gray-zone coercion: below the threshold of armed conflict (coast guard, militia, cyber, economic)

Bolded Causal Claim: Gray-zone coercion achieves strategic gains by operating in the ambiguous space between peace and war, exploiting the adversary's reluctance to escalate, so that incremental faits accomplis accumulate without triggering collective defense or legal accountability.

Mechanism: The mechanism rests on three interacting elements that together convert ambiguity into territory, influence, or economic advantage. First, ambiguity of attribution and intent: actions are conducted by actors whose state affiliation is deniable or plausibly civilian—coast guard vessels, maritime militia, fishing fleets, cyber proxies, and state-owned enterprises—so that the victim cannot easily establish the legal predicate for a forceful response. The coercer deliberately blurs the line between state and non-state, military and civilian, public and private, which complicates both legal categorization and political decision-making. Second, threshold manipulation: each individual act is calibrated to remain below the level that would justify armed response under international law or alliance commitments, such as the armed-attack threshold that triggers Article 5 of the North Atlantic Treaty or collective self-defense under Article 51 of the UN Charter. The coercer studies the adversary's red lines and operates just beneath them, forcing the target to either accept the incremental loss or risk being seen as the escalator. Third, cumulative fait accompli: repeated small gains—feature construction on disputed reefs, harassment of fishing vessels, economic coercion through trade restrictions or tourism bans, cyber intrusions that impose costs without kinetic exchange—shift the status quo incrementally. Each step is small enough to be tolerated; the aggregate is large enough to be decisive. Reversal becomes costlier than acceptance, and the new baseline is treated as the starting point for the next round. Supporting instruments include economic leverage (debt, market access, sanctions), information operations that shape domestic and international narratives, and cyber operations that degrade infrastructure without crossing into armed attack. The mechanism is not deception alone; it is the structural exploitation of the gap between legal categories (peace versus war) and operational reality, combined with the adversary's own risk aversion and institutional constraints.

Scope Conditions: Gray-zone coercion is most effective when (a) the target's alliance commitments require a clear armed attack to trigger collective defense, creating a threshold the coercer can approach but not cross; (b) the target's domestic politics favor de-escalation and reward leaders who avoid war; (c) the coercer possesses escalation dominance in the local theater, meaning it can raise costs faster than the target can respond; (d) international institutions lack enforcement capacity, so legal protests do not translate into material consequences; and (e) the issue is salient to the coercer but not to third parties, limiting coalition formation. It fails when the target has pre-committed and credible red lines, when attribution becomes unambiguous and public, when the coercer overreaches and triggers a unified response, or when the target has high risk tolerance and is willing to absorb costs. It is also less effective against states with strong local capacity and against issues framed as existential by the target's public. The scope conditions imply that gray-zone coercion is a strategy of the relatively strong against the relatively constrained, not a universal tool.

Observable Implications: Indicators include increased coast guard and maritime militia activity in disputed waters; construction or fortification of features; economic coercion episodes such as trade embargoes, tourism bans, or regulatory harassment; cyber incidents below the threshold of armed attack; and diplo-

matic protests without military response. Metrics include the number of maritime incidents, area of feature construction, changes in bilateral trade volumes, and the frequency of coast guard encounters. Predictions: gray-zone activity intensifies where A2/AD protects the coercer and where the target lacks local capacity; it diminishes where the target has established credible red lines and rapid attribution capabilities. A key diagnostic is the gap between the coercer's public framing (routine law enforcement, rights protection) and the target's framing (coercion, aggression), which itself becomes a site of contestation.

Perspective Note (five traditions in brief):

African (primary). African states experience gray-zone coercion less as a strategic puzzle of great powers and more as a continuum of maritime insecurity that directly threatens livelihoods and sovereignty. Illegal, unreported, and unregulated fishing by distant-water fleets, piracy, and unauthorized resource extraction in exclusive economic zones constitute gray-zone activity that is often normalized by its perpetrators as commercial or enforcement conduct. The African perspective emphasizes that the "gray zone" is frequently a luxury of powers that can afford ambiguity; for coastal African states, the same activities constitute existential economic harm and erosion of sovereign rights. Responses include regional maritime security architectures such as the Yaoundé Code of Conduct and the ECOWAS integrated maritime strategy, alongside external partnerships with the European Union and the United States. This perspective contributes attention to non-state and criminal actors, to the economic dimension of maritime coercion, and to the reality that many African states lack the capacity to attribute or respond, making them structurally vulnerable. It occludes great-power strategic competition framing but reveals how gray-zone logic operates at lower levels of capability and how legal ambiguity can be exploited by commercial as well as state actors.

Chinese. China frames its maritime law-enforcement activities as legitimate rights protection within waters it claims, rejecting the "gray zone" label as a Western construct designed to delegitimize lawful conduct. The coast guard and maritime militia are presented as civilian instruments of sovereignty administration and public order, not as military assets. This perspective contributes a challenge to Western legal categorization and asserts that enforcement of claimed rights is not coercion. It occludes the coercive effect on neighboring states, the militarization of civilian agencies, and the cumulative fait accompli that results from sustained presence in disputed waters.

Russian. Russia employs gray-zone tactics in the Black Sea, the Arctic, and the Baltic, including the use of "little green men," maritime militia, economic pressure, and information operations. It frames these as defensive responses to NATO expansion and as protection of Russian interests or populations. This perspective contributes a demonstration of hybrid methods and a critique of Western double standards. It occludes state responsibility, the erosion of trust, and the destabilizing effect of plausible deniability on crisis management.

Western. Western analysts, notably Mazarr (2015) and Hoffman (2007), define the gray zone as deliberate competition below armed conflict, emphasizing the need for integrated deterrence, resilience, attribution capabilities, and whole-of-government responses. This perspective contributes conceptual clarity, policy frameworks, and a focus on the coercer's intent. It occludes the tendency to treat all non-Western maritime activity as gray-zone coercion, the possibility that Western states also operate in the gray zone, and the risk that the framework itself can be used to justify escalation.

UN. The UN perspective stresses legal thresholds: the prohibition on the use of force in Article 2(4) of the Charter, the law of armed conflict, and UNCLOS. Gray-zone activities challenge the binary legal framework by operating in the space between peace and war. This perspective contributes a normative anchor and a vocabulary for distinguishing lawful from unlawful conduct. It occludes the inability to adjudicate ambiguous

cases in real time and the lack of enforcement mechanisms when states exploit legal gaps.

2.6 KEY IDEA 5 — Space as a military domain: ISR, PNT, communications, and anti-satellite weapons

Bolded Causal Claim: Space has become a warfighting domain because modern military operations depend on satellites for intelligence, navigation, and communications, and because anti-satellite weapons can deny these services, creating both first-mover incentives and deterrence dilemmas.

Mechanism: The mechanism is dependency coupled with vulnerability. Modern precision warfare, network-centric operations, and global power projection rely on space-based intelligence, surveillance, and reconnaissance (ISR) for targeting and situational awareness; on positioning, navigation, and timing (PNT), principally through GPS and other global navigation satellite systems, for precision munitions, logistics, and command and control; and on satellite communications (SATCOM) for beyond-line-of-sight connectivity. Denying or degrading these services can paralyze conventional forces without any kinetic exchange on Earth, making space an attractive axis of attack. Anti-satellite (ASAT) capabilities—direct-ascent kinetic interceptors, co-orbital systems, directed-energy weapons, and cyber attacks on ground stations or satellite links—create a "use it or lose it" dynamic: because satellites are fragile, orbits are predictable, and constellations take years to rebuild, a state that fears losing its space assets in a crisis may be tempted to strike first. Conversely, mutual vulnerability may produce deterrence if both sides recognize that space warfare would degrade everyone's capabilities and generate debris that endangers all users. The domain is further complicated by dual-use assets (civilian and military satellites often share platforms and frequencies), congestion (tens of thousands of objects in orbit), and the difficulty of attribution for non-kinetic attacks. Space warfare thus couples tightly to terrestrial conflict: space is not a separate theater but an enabler whose disruption cascades through air, land, and maritime operations. The mechanism also includes the commercialization of space, which multiplies the number of actors and assets and blurs the military-civilian boundary further.

Scope Conditions: Space militarization escalates when (a) a state's military doctrine is heavily space-dependent, so that loss of space services would be operationally catastrophic; (b) ASAT capabilities are deployed and tested, demonstrating both intent and capacity; (c) crisis instability exists in terrestrial theaters, raising the premium on rapid, decisive action; and (d) no binding arms-control regime covers conventional space weapons, leaving the domain governed by unilateral restraint. It is constrained by mutual vulnerability, the risk of debris generation (the Kessler syndrome, in which cascading collisions render orbits unusable), the economic cost and long lead times of space assets, and the shared interest of all states in preserving access to space. The domain favors states with independent launch capacity, space situational awareness, and the industrial base to reconstitute constellations. It also favors states that can integrate commercial space services into military operations, as the United States has done extensively.

Observable Implications: Indicators include satellite launches by state and by sector (military, civil, commercial); ASAT tests, such as China's 2007 direct-ascent test, the United States' 2008 Operation Burnt Frost, India's 2019 Mission Shakti, and Russia's 2021 test; the establishment of dedicated space forces (the US Space Force in 2019, and analogous organizations elsewhere); doctrinal statements treating space as a warfighting domain; and the proliferation of commercial satellite constellations. Metrics include the number of satellites in orbit, launch rates, debris counts, and the share of military versus commercial launches. Predictions: increased hardening and redundancy of space assets, greater allied space cooperation and burden-sharing, development of on-orbit servicing and maneuver capabilities, and possible norms restricting debris-generating ASAT tests. A key diagnostic is the gap between states' public commitments to the peaceful use

of outer space and their actual military space programs.

Perspective Note (five traditions in brief):

African (primary). African states are increasingly space actors—Egypt, Nigeria, South Africa, Ethiopia, and Rwanda among them—but primarily as users and emerging launchers rather than as militarized space powers. The African perspective emphasizes equitable access to space benefits, including communications, remote sensing for agriculture, climate monitoring, and disaster management, and the risk that orbital congestion and debris pose to all users regardless of their contribution to the problem. It stresses African participation in governance, exemplified by the African Space Agency established in 2018 and hosted in Egypt, and the need for capacity building rather than militarization. This perspective contributes a development and equity lens, highlighting how space militarization threatens a shared global commons on which developing states depend. It occludes great-power military competition but reveals how the weaponization of space could deny developing states the benefits of space-based services and how African states can leverage multilateral forums to shape norms.

Chinese. China frames space as a domain for peaceful development and national rejuvenation, while simultaneously building ASAT capabilities and space-force structures to counter US space dominance. It emphasizes sovereignty over space activities conducted from its territory and opposes what it characterizes as US pursuit of space dominance and the weaponization of space by others. This perspective contributes advocacy for multipolar space governance and for constraints on US missile defense and space-based systems. It occludes China's own ASAT tests, its military space programs, and the dual-use nature of its civilian space infrastructure.

Russian. Russia views space as strategic high ground and maintains ASAT capabilities, early-warning systems, and a space force, framing US missile defense and space militarization as threats to strategic stability. It has advocated for a treaty banning the placement of weapons in outer space (the Prevention of the Placement of Weapons in Outer Space Treaty, PPWT, proposed with China). This perspective contributes arms-control advocacy and a critique of US unilateralism. It occludes Russia's own ASAT tests, including the November 2021 test that generated significant debris, and its reliance on space assets for military operations.

Western. The Western, particularly US, perspective treats space as a warfighting domain requiring space superiority, reflected in the establishment of the US Space Force in 2019 and in allied cooperation frameworks. It emphasizes deterrence, resilience, and the integration of commercial space into military operations. This perspective contributes operational innovation and a focus on protecting space-enabled forces. It occludes how US space dominance drives other states' ASAT development, how commercial space complicates military control and attribution, and how the framing of space as a warfighting domain may itself accelerate militarization.

UN. The UN perspective centers on the Outer Space Treaty of 1967, which prohibits the placement of weapons of mass destruction in orbit and declares space the province of all mankind, and on the work of the Committee on the Peaceful Uses of Outer Space (COPUOS). It also encompasses efforts to prevent an arms race in outer space (PAROS) and discussions of transparency and confidence-building measures. This perspective contributes a legal framework and a normative commitment to peaceful use. It occludes the treaty's silence on conventional (non-WMD) space weapons, the lack of verification and enforcement mechanisms, and the difficulty of adapting Cold War-era frameworks to contemporary commercial and military space activity.

2.7 FIVE PERSPECTIVES IN DEPTH

2.7.1 African Perspective (PRIMARY)

The African vantage point on maritime, chokepoint, and space security begins from a fundamentally different ontological premise than the other four perspectives: the sea is not primarily a medium of power projection or a global commons to be policed, but a lived environment whose governance determines whether coastal communities survive. This premise, developed across African political thought from Fanon's analysis of colonial violence through Mbembe's necropolitics to contemporary African security scholarship, reframes every element of the lesson's five key ideas.

Consider sea power traditions. Mahan's (1890) argument that command of the sea determines national greatness, and Corbett's (1911) refinement that sea control must be exercised for specific strategic purposes, were formulated within imperial contexts in which African coastlines were objects of European naval strategy rather than subjects of their own maritime policy. The African perspective does not simply reject these traditions; it reveals their occlusion. Rodney's analysis of how European maritime expansion underdeveloped Africa, and Nkrumah's concept of neo-colonialism, show that sea power as historically practiced was inseparable from the extraction of African resources and the denial of African sovereignty over adjacent waters. Cabral's insistence that national liberation required the reclamation of both territory and culture extends to the maritime domain: the sea was not empty space to be commanded but a zone of African life and labor that colonial powers appropriated. Nyerere's ethic of self-reliance (ujamaa) translates into a maritime register as the demand that African states develop the capacity to govern their own waters rather than depend on external naval protection. The contemporary African maritime security agenda—articulated in the African Union's 2050 Africa's Integrated Maritime Strategy and the Lomé Charter—thus treats sea power not as dominance but as the capacity of African states to govern their exclusive economic zones, protect fisheries, and prevent the offshore looting of hydrocarbons. What the African vantage contributes that Western, Chinese, or Russian perspectives cannot is the recognition that maritime insecurity in Africa is less often a problem of great-power contestation than of state incapacity, corruption, and the externalization of environmental costs onto African coastal populations.

Chokepoints illustrate this reframing with particular clarity. The Strait of Hormuz, Bab el-Mandeb, Malacca, Suez, and Panama appear in Western and Chinese strategic discourse as nodes in global energy and trade networks whose disruption would cascade through the world economy. The African perspective adds that two of these chokepoints—Bab el-Mandeb and Suez—are adjacent to African territory, and that their disruption is not an abstract systemic risk but a direct threat to African economies and populations. The Houthi attacks on Red Sea shipping from late 2023 onward, which prompted rerouting around the Cape of Good Hope, increased shipping costs and insurance premiums that were passed through to African importers and consumers, while also disrupting Ethiopian and Sudanese access to ports. The Cape route itself, historically the path around Africa, reminds us that African geography has always been central to global maritime circulation even when African agency was denied. Moreover, the African perspective highlights that chokepoint security is inseparable from the security of the coastal states that border them: Djibouti hosts multiple foreign military bases whose presence is justified by chokepoint protection but whose operations are governed by agreements that African governments have limited capacity to renegotiate. Mamdani's distinction between citizen and subject, applied to maritime space, suggests that African coastal populations often experience chokepoint security as something done to them by external powers rather than by their own states.

The Gulf of Guinea provides the most developed African case. Piracy in the Gulf, which peaked in the early 2010s and has evolved into a complex of armed robbery, kidnapping for ransom, and oil theft, is not merely

a law-enforcement problem but a symptom of the political economy of the postcolonial state. Bayart's analysis of the "politics of the belly" and the criminalization of the state helps explain how maritime criminal networks are embedded in elite political economies, with stolen oil laundered through international markets. Danso's work on African maritime security governance emphasizes that external naval interventions—such as the US-led Africa Partnership Station or European Union naval missions—can suppress symptoms without addressing the political roots, and may even displace criminal activity to less policed waters. Aning's research on African security governance reinforces this point: maritime insecurity is produced by the interaction of weak state capacity, elite predation, and global commodity markets, not simply by the absence of naval patrols. The African perspective thus contributes a causal mechanism that Western security studies often misses. What it may occlude is the extent to which non-state maritime violence also serves the interests of external actors who benefit from cheap security provision and continued access to resources, and the difficulty of disentangling local criminality from transnational networks that include foreign shipping companies and commodity traders.

A2/AD and sea denial, when viewed from Africa, appear less as strategies of great-power contestation than as extensions of a longer history of external powers using African coastal waters for their own strategic purposes. The US Africa Command's maritime security initiatives, the Chinese naval base in Djibouti, and Russian port access agreements in Sudan and elsewhere all represent forms of sea denial or access denial exercised by external powers on African territory. The African perspective reveals that A2/AD is not only something that China does to the United States in the Western Pacific; it is also something that all major powers do, in different registers, to African coastal states when they establish military facilities, conduct surveillance, or restrict African access to their own maritime resources. Grovogui's critique of sovereignty in international relations is pertinent here: the formal sovereignty of African states over their territorial waters is repeatedly qualified by the practical dominance of external naval powers and by the conditionalities attached to security assistance. The African Union's maritime strategy attempts to reclaim this sovereignty through regional cooperation, but its implementation is hampered by resource constraints and by the reluctance of member states to pool sovereignty. The "blue economy" discourse, promoted by the African Union and various international partners, offers a developmental framing for maritime governance, but the African perspective warns that without genuine African control, the blue economy risks becoming another vector for external extraction.

Gray-zone coercion is perhaps where the African perspective is most distinctive and most underappreciated in the broader literature. Western and Chinese discussions of gray-zone conflict typically focus on coast guard ramming, maritime militia, and cyber operations in the South China Sea or the Baltic. The African experience of gray-zone coercion is different in form but not in logic: foreign fishing fleets operating under flags of convenience, private military companies providing maritime security, and the use of economic leverage to secure port access and resource concessions. These activities occur below the threshold of armed conflict and are difficult to attribute, yet they systematically erode African coastal state sovereignty. Tamale's work on African feminism and Oyěwùmí's analysis of colonial epistemologies remind us that the "gray zone" is not a new phenomenon but a continuation of the ambiguous sovereignty that characterized colonial and neo-colonial relationships, in which African states were formally independent but practically subordinated. Fanon's analysis of the violence of colonialism, extended to the maritime domain, suggests that the gray zone is where the postcolonial state's weakness is most exploited: not through open conquest but through the accumulation of small, deniable encroachments that cumulatively undermine sovereignty. The African perspective thus contributes the insight that gray-zone coercion is not an innovation of twenty-first-century great-power competition but a persistent feature of the international order as experienced by weaker states.

Space as a military domain, viewed from Africa, raises questions of epistemic and developmental justice. African states are not major space powers; no African state has conducted an ASAT test, and African satellite programs are modest and primarily civilian. Yet African populations are deeply affected by space militarization: GPS and satellite communications underpin African financial systems, agriculture, and disaster response; satellite imagery is used in African conflicts by external powers; and the orbital slots and spectrum frequencies allocated to African states are often underutilized or contested. The African Union's space policy and the African Space Agency, headquartered in Egypt, represent efforts to claim a voice in space governance, but they operate within frameworks—the Outer Space Treaty, the International Telecommunication Union—designed by and for the major space powers. The African perspective reveals that the militarization of space is not only a strategic competition among the United States, China, and Russia; it is also a process that deepens the technological dependence of African states and excludes African priorities—such as earth observation for climate adaptation and agricultural monitoring—from the global space agenda. What this perspective may occlude is the agency that some African states are beginning to exercise through national space programs and through participation in multilateral forums, as well as the possibility that commercial space actors may offer African states alternatives to great-power dependence.

In sum, the African perspective on maritime, chokepoint, and space security contributes three things that the other four perspectives cannot: first, a historical memory of maritime power as extraction and domination, which disciplines celebratory accounts of sea power; second, an insistence that maritime security must be measured by its effects on coastal communities and state capacity, not only by great-power balances; and third, a recognition that the "gray zone" and space militarization are not new phenomena but continuations of older patterns of asymmetric subordination. Its occlusions include a tendency to understate the genuine security dilemmas faced by major powers, a risk of romanticizing African solidarity in the face of diverse national interests, and limited analytical attention to the technical military dimensions of A2/AD and ASAT systems that require specialized expertise. Nevertheless, as the longest and most developed of the five perspectives in this lesson, the African vantage is not a regional add-on but a constitutive lens: it shows that the global maritime order is not a neutral commons but a historically produced structure of inequality, and that any theory of maritime security that does not account for this is incomplete.

2.7.2 Chinese Perspective

The Chinese perspective on maritime, chokepoint, and space security is organized around the concept of "near-seas defense" (jinhai fangyu) and the strategic imperative of breaking through what Chinese strategists describe as the "first island chain" constraint. This framework, articulated in successive defense white papers and in the writings of Chinese naval strategists, treats the Western Pacific as a zone in which China must be able to operate without interference, and the broader maritime domain as an arena in which China is transitioning from a continental to a maritime power.

Sea power traditions are received selectively. Mahan's emphasis on fleet concentration and decisive battle influenced early Chinese naval thinking, but contemporary Chinese strategy has moved toward Corbett's more nuanced conception of sea control as a means to specific ends, particularly the protection of sea lines of communication and the denial of adversary access. Holmes and Yoshihara's analysis of Chinese maritime strategy highlights this evolution: China's A2/AD complex—encompassing anti-ship ballistic missiles, submarines, mines, and integrated air defense—is designed not to achieve command of the global ocean but to make the cost of US intervention in the Western Pacific prohibitive. The Chinese perspective thus contributes a distinctive causal mechanism: sea denial as a defensive strategy of a rising power confronting an established maritime hegemon. What it occludes is the extent to which this "defensive" posture is perceived

as threatening by regional neighbors who do not share China's assessment of its own security needs.

Chokepoints are central to Chinese strategic anxiety. China imports roughly two-thirds of its oil, much of it transiting the Strait of Malacca, which Chinese strategists have long described as a strategic vulnerability—the "Malacca dilemma." The Belt and Road Initiative's maritime component, including port investments in Pakistan, Sri Lanka, and elsewhere, represents an attempt to diversify routes and reduce dependence on chokepoints controlled by or vulnerable to US naval power. The African perspective's observation that Chinese port investments can constrain African sovereignty is, from the Chinese viewpoint, a byproduct of commercial strategy rather than a deliberate design; yet the Chinese perspective does not fully engage with the sovereignty concerns that these investments raise, nor with the possibility that commercial infrastructure can be converted to military use.

Gray-zone coercion is a signature Chinese strategy in the South China Sea. The use of coast guard vessels, maritime militia, and fishing fleets to assert claims without triggering armed conflict represents a deliberate exploitation of the threshold between peace and war. The Chinese perspective frames these activities as law enforcement and rights protection within China's claimed maritime jurisdiction, not as coercion. This framing contributes the insight that the "gray zone" is partly a product of legal ambiguity—particularly the unresolved status of maritime claims under UNCLOS—and that states will exploit this ambiguity to advance their interests. What it occludes is the coercive effect on smaller states, the erosion of the normative framework that China itself invokes when its own interests are at stake, and the way in which gray-zone tactics can escalate unpredictably.

Space is increasingly central to Chinese strategy. The BeiDou navigation system, China's ASAT test in 2007, and lunar and Mars exploration programs reflect a determination to achieve space independence and, ultimately, space leadership. The Chinese perspective treats space as a domain in which China must not be dependent on US systems, and in which it can challenge US information dominance. This contributes a multipolar vision of space governance that challenges US unilateralism. It occludes the debris and escalation risks of ASAT testing, the difficulty of reconciling competitive space programs with cooperative governance, and the possibility that China's space ambitions may generate the same security dilemmas that US space dominance has created for others.

In sum, the Chinese perspective contributes a coherent strategic logic—near-seas defense, A2/AD, and space independence—that explains much of contemporary maritime competition. Its occlusions include the security dilemmas it creates for neighbors, the legal ambiguity it exploits, and the gap between its defensive rhetoric and its expansive maritime claims.

2.7.3 Russian Perspective

The Russian perspective on maritime, chokepoint, and space security is shaped by geography: Russia is a continental power with limited warm-water access, and its maritime strategy reflects a persistent anxiety about encirclement and a determination to secure the approaches to its territory. This geographic imperative, articulated in Russian naval doctrine and in the writings of Russian strategists, organizes Russian thinking across all five key ideas.

Sea power traditions are received through a continental lens. Russian strategists have historically been skeptical of Mahan's emphasis on global maritime dominance, preferring a more limited conception of sea power focused on coastal defense and the protection of adjacent seas. The Soviet navy's blue-water ambitions, developed under Gorshkov, represented a partial departure, but post-Soviet Russian naval strategy has returned to a focus on "near seas" and the protection of maritime approaches. Till's analysis of contemporary mar-

itime strategy notes that Russia's naval capabilities have declined relative to the Soviet era, but that Russia compensates through asymmetric means: submarines, mines, and coastal defense systems. The Russian perspective thus contributes a model of maritime power as denial rather than command—a strategy of making adjacent waters too dangerous for adversary operations rather than seeking global sea control.

Chokepoints matter to Russia primarily through the lens of the Black Sea and the Turkish Straits. Control of the Bosphorus and Dardanelles, governed by the Montreux Convention, is a persistent Russian concern, and the annexation of Crimea in 2014 was partly motivated by the desire to secure the naval base at Sevastopol and to control the maritime approaches to southern Russia. The Arctic, with the Northern Sea Route, represents a new chokepoint of sorts: as ice recedes, Russia seeks to control this route and to assert sovereignty over the continental shelf. The African perspective's observation about external powers using African waters applies here in reverse: Russia seeks to prevent external powers from using waters adjacent to its territory, and its Arctic claims are an assertion of sovereignty over a space that other states regard as a global commons.

A2/AD is a Russian specialty. The deployment of anti-ship missiles, air defense systems, and electronic warfare capabilities in Kaliningrad and Crimea creates "bubbles" of contested space that complicate NATO operations. Russian strategists describe this as defensive, but NATO perceives it as a threat to alliance freedom of movement. The Russian perspective contributes the insight that A2/AD is not only a Chinese strategy but a general approach available to any state with sufficient technological capacity and geographic advantage. What it occludes is the destabilizing effect of these deployments on regional security, the risk of inadvertent escalation, and the way in which Russian A2/AD can be used to coerce neighbors rather than merely to defend Russian territory.

Gray-zone coercion is central to Russian strategy, though the maritime dimension is less developed than the land and cyber dimensions. The use of "little green men" in Crimea, information warfare, and economic leverage has maritime analogues: the detention of Ukrainian naval vessels in the Kerch Strait in 2018, the use of fishing and research vessels for intelligence collection, and the deployment of private military companies in maritime contexts. The Russian perspective frames these activities as responses to Western encroachment and as assertions of legitimate interests. This contributes a narrative of defensive reaction that challenges Western accounts of Russian aggression. What it occludes is the coercive and destabilizing character of these activities, their contribution to a broader pattern of undermining the rules-based order, and the difficulty of distinguishing defensive from offensive intent when the same capabilities can serve both purposes.

Space is a domain of historical Russian strength and contemporary ambition. The Soviet space program's legacy, GLONASS as an alternative to GPS, and Russian ASAT capabilities reflect a determination to maintain space independence. The Russian perspective treats space as a military domain in which Russia must not be subordinate to the United States, and in which it can challenge US information dominance. Russian proposals for space arms control, including treaties to prevent the placement of weapons in space, are framed as genuine arms control initiatives but are also seen by Western analysts as attempts to constrain US advantages while preserving Russian capabilities. This contributes a legal and normative challenge to US space dominance. What it occludes is the gap between Russian arms control rhetoric and its own weapons development, the difficulty of verifying space arms control agreements, and the possibility that Russian space policy is driven more by the desire to maintain parity than by a genuine commitment to demilitarization.

In sum, the Russian perspective contributes a geographic and historical logic that explains Russian maritime and space behavior as defensive reactions to encirclement and Western expansion. Its occlusions include the aggressive character of its actions, the destabilizing effects of its A2/AD deployments, and the gap between its arms control rhetoric and its weapons programs.

2.7.4 Western Perspective

The Western perspective on maritime, chokepoint, and space security is organized around the concept of the "global commons" and the normative commitment to freedom of navigation. This framework, rooted in the Mahanian tradition and developed through NATO maritime strategy and US naval doctrine, treats the oceans as a shared space whose openness is essential to global prosperity and security, and assigns to the United States and its allies the role of guarantor of that openness.

Sea power traditions are the foundation. Mahan's (1890) argument that command of the sea is the key to national greatness remains influential in US naval thought, though Corbett's (1911) more limited conception of sea control has gained ground in contemporary doctrine. The Western perspective treats sea power as a public good: US carrier strike groups, freedom of navigation operations, and maritime security partnerships are framed as protecting the global trading system from which all benefit. Till's analysis of maritime strategy in the twenty-first century notes the tension between this public-goods framing and the reality of US strategic interests. The Western perspective contributes a powerful normative claim: that maritime security is best served by a rules-based order in which no single state can deny access to others. What it occludes is the historical and contemporary reality that this "rules-based order" was constructed by and for Western powers, and that its application has been selective.

Chokepoints are central to Western strategic planning. The US Navy's maritime strategy identifies the Strait of Hormuz, Bab el-Mandeb, Malacca, Suez, and Panama as critical nodes whose disruption would have global consequences. Western naval presence in these areas—Fifth Fleet in Bahrain, Combined Maritime Forces in the Gulf of Aden—is justified by the need to protect global commerce. The Western perspective contributes detailed operational and intelligence capabilities for monitoring and securing chokepoints. What it occludes is the extent to which this presence is perceived by regional states as an assertion of Western dominance rather than a neutral public good, the way in which chokepoint security can serve as a pretext for maintaining military access to strategically located territory, and the possibility that Western chokepoint security strategies may prioritize the flow of oil and goods over the security of coastal populations.

A2/AD is the primary challenge to Western maritime primacy. Chinese and Russian A2/AD systems are framed in Western doctrine as threats to the freedom of action that underpins the global order. The Western response has included investments in long-range precision strike, undersea warfare, and distributed maritime operations designed to penetrate A2/AD bubbles. Holmes and Yoshihara's work on Chinese maritime strategy is widely read in Western defense circles as a guide to understanding and countering this challenge. The Western perspective contributes a sophisticated operational and technological response. What it occludes is the possibility that A2/AD is, from the perspective of the states deploying it, a defensive response to Western forward presence, and that the Western framing of A2/AD as inherently aggressive may foreclose diplomatic solutions and accelerate arms racing.

Gray-zone coercion is a growing focus of Western strategy. The recognition that China and Russia operate below the threshold of armed conflict has prompted Western efforts to develop "integrated deterrence" and to strengthen the resilience of allies and partners. The Western perspective contributes a legal and normative framework for distinguishing legitimate from illegitimate gray-zone activities, and operational concepts for responding. What it occludes is the extent to which Western states themselves engage in gray-zone activities—sanctions, cyber operations, information warfare—and the difficulty of maintaining a consistent standard when the definition of "gray zone" is itself contested. The Western perspective also struggles to address the possibility that some activities it labels as gray-zone coercion may be perceived by the states undertaking them as legitimate assertions of sovereignty or self-defense.

Space is a domain of US dominance and growing competition. The US Space Force, the commercial space revolution, and GPS as a global utility reflect a Western, and particularly American, vision of space as an enabler of military and economic power. The Western perspective treats space security as the protection of US and allied space assets and the maintenance of space dominance. This contributes unmatched capabilities in ISR, PNT, and communications. What it occludes is the extent to which US space dominance is perceived as threatening by other states, the debris risks of US ASAT development, the tension between commercial space exploitation and the Outer Space Treaty's principle of space as the province of all mankind, and the possibility that the militarization of space may undermine the very global commons that the Western perspective claims to protect.

In sum, the Western perspective contributes a powerful normative and operational framework for maritime and space security, centered on freedom of navigation and the global commons. Its occlusions include the selective application of rules, the imperial legacy of sea power, the difficulty of reconciling US strategic interests with the public-goods framing of maritime security, and the risk that Western strategies may accelerate rather than manage competition.

2.7.5 UN Perspective

The UN perspective on maritime, chokepoint, and space security is institutional and legal, centered on the United Nations Convention on the Law of the Sea (UNCLOS), the Outer Space Treaty, and a series of Security Council resolutions addressing piracy, maritime security, and space governance. This perspective treats the oceans and space as global commons governed by international law, and assigns to the UN system the role of framework-provider and, in limited cases, enforcer.

UNCLOS is the cornerstone. Adopted in 1982 and in force since 1994, it establishes the legal framework for maritime zones, navigation rights, and resource exploitation. The UN perspective treats UNCLOS as the "constitution of the oceans," providing a comprehensive regime that balances coastal state rights with the freedom of navigation. The 2016 arbitral ruling in the South China Sea case, issued under UNCLOS Annex VII, exemplifies the UN perspective's contribution: a legal determination that China's nine-dash line claims have no basis in international law. The UN perspective contributes a legal framework that can adjudicate disputes and establish norms. What it occludes is the lack of enforcement mechanisms: the ruling has not been implemented, and UNCLOS lacks a compulsory enforcement regime. The fact that the United States has not ratified UNCLOS further weakens its authority, creating a legitimacy deficit that undermines the UN perspective's claim to universality.

Maritime security resolutions extend the UN framework to specific threats. Security Council resolutions on piracy off the coast of Somalia, beginning with Resolution 1816 in 2008, authorized international naval operations and established a legal basis for action in Somali territorial waters. The UN perspective contributes a multilateral framework for addressing maritime security threats that transcend national jurisdiction. What it occludes is the dependence on member state contributions for enforcement, the risk that naval operations displace rather than resolve criminal activity, the limited attention to the root causes of maritime insecurity, and the possibility that UN-authorized operations may serve the strategic interests of contributing states rather than the affected populations.

Space governance is addressed through the Outer Space Treaty of 1967, the Moon Agreement, and the work of the Committee on the Peaceful Uses of Outer Space. The UN perspective treats space as the province of all mankind and seeks to prevent an arms race in outer space. The PAROS agenda and discussions of transparency and confidence-building measures reflect this commitment. The UN perspective contributes

a normative framework and a forum for dialogue. What it occludes is the treaty's silence on conventional space weapons, the lack of verification mechanisms, the difficulty of adapting Cold War-era frameworks to contemporary commercial and military space activity, and the reality that major space powers are developing ASAT capabilities and militarizing space while participating in UN forums.

The UN perspective on gray-zone conflict is the least developed. The UN system has no clear framework for addressing activities that fall below the threshold of armed conflict but that coerce and destabilize. The UN perspective contributes the general principle that disputes should be resolved peacefully and that international law should govern state behavior. What it occludes is the gap between this principle and the reality of gray-zone competition, the inability of the UN system to address activities that are deliberately designed to evade legal categorization, and the risk that the absence of a gray-zone framework may encourage states to push the boundaries of acceptable behavior.

In sum, the UN perspective contributes an indispensable legal and institutional framework for maritime and space governance. Its occlusions include the lack of enforcement, the dependence on great-power consent, the difficulty of adapting legal frameworks to new forms of competition, and the gap between legal norms and state practice. The UN perspective is most effective when it can mobilize great-power consensus; it is least effective when great powers are in direct competition, as they are in the maritime and space domains today.

SECTION 2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Centers the security of coastal and littoral states that bear the costs of great-power maritime competition; reveals how chokepoint disruptions cascade to non-combatant economies; foregrounds piracy, illegal fishing, and maritime governance gaps in the Gulf of Guinea and Red Sea	May underweight the strategic logic of great-power competition and the role of naval power in deterring aggression; risks treating all maritime insecurity as externally imposed	Maritime security is a common good requiring equitable governance; coastal states must have agency in security architectures	Gulf of Guinea piracy data; Red Sea shipping disruption impacts on African trade; AU 2050 Africa's Integrated Maritime Strategy; Lomé Charter	Western: that without great-power naval presence, piracy and chokepoint coercion would be worse
Chinese	Articulates a coherent A2/AD doctrine that challenges US maritime primacy; demonstrates how technological innovation (missiles, submarines, mines) can offset conventional naval inferiority	Frames defensive measures as purely reactive; obscures expansionist implications of near-seas claims; underweights freedom of navigation for other states	Maritime sovereignty and near-seas defense are legitimate; US forward presence is destabilizing	DF-21D/DF-26 ASBMs; South China Sea militarized features; PLAN expansion; 2016 arbitral ruling non-compliance	Western: that A2/AD threatens global commons and commercial shipping

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Russian	Highlights Arctic and Black Sea maritime strategies; demonstrates how geographic chokepoints (Bosporus, Northern Sea Route, Kerch Strait) can be leveraged; shows gray-zone tactics	Underweights international law; frames expansion as historical entitlement; obscures economic motivations	Maritime access is a vital interest; NATO expansion threatens Russian security	Kerch Strait incident 2018; Arctic militarization; Black Sea Fleet operations; Northern Sea Route development	Western/UN: that actions violate UNCLOS and territorial integrity
Western	Provides the dominant framework of freedom of navigation, carrier strike groups, and maritime security operations; articulates the public-goods rationale for US naval primacy	May conflate US interests with global interests; underweights costs of maritime competition on littoral states; treats freedom of navigation as self-evident rather than contested	Open seas, freedom of navigation, and rules-based order are universal goods	US Fifth Fleet operations; Operation Prosperity Guardian; FONOPs in South China Sea; Operation Sentinel	Chinese/African: that "freedom of navigation" serves hegemonic interests and ignores coastal state rights

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
UN	UNCLOS provides the legal framework; maritime security resolutions; institutional mechanisms for dispute resolution (ITLOS, arbitral tribunals)	Lack of enforcement; dependence on great-power consent; inability to address gray-zone activities deliberately designed to evade legal categorization	Law-based ocean governance; peaceful dispute resolution; common heritage of mankind	UNCLOS; ITLOS; 2016 South China Sea arbitral ruling; UNSC maritime security resolutions	All perspectives: that legal frameworks are ineffective without enforcement and great-power compliance

SECTION 2.8 WORKED EXAMPLE (I do)

Worked Example: Iran's Asymmetric Maritime Strategy in the Strait of Hormuz

Levels of analysis. The Strait of Hormuz case operates across all four levels. At the individual level, the strategic calculus of Iran's Supreme Leader and IRGC naval commanders shapes decisions to seize tankers or deploy mines; individual tanker captains and insurance underwriters at Lloyd's of London respond to perceived risk. At the state level, Iran's doctrine of asymmetric maritime warfare, the US Fifth Fleet's forward presence, and the interests of Gulf Cooperation Council states define the strategic environment. At the systemic level, the US-Iran rivalry, sanctions regimes, and the global oil market's sensitivity to supply disruptions create the structural conditions. At the transnational level, global energy supply chains, international maritime insurance markets, and UNCLOS-based legal frameworks connect the strait to economies far beyond the Gulf.

Mechanism. Iran's strategy rests on a cost-imposition logic: by deploying low-cost, high-leverage capabilities—fast attack craft, naval mines, anti-ship missiles, and tanker seizures—against a conventionally superior US Navy, Iran raises the price of US and allied maritime operations in the Gulf without triggering a full-scale war. The mechanism works through three channels. First, geographic compression: the strait's narrowness (approximately 21 miles at its narrowest point, with shipping lanes only two miles wide in each direction) negates US advantages in open-ocean maneuver and carrier aviation, compressing the battlespace into a littoral environment where small, fast, numerous Iranian craft can threaten larger vessels. Second, escalation ambiguity: tanker seizures and mine attacks occupy a gray zone below the threshold of armed conflict, forcing adversaries to choose between disproportionate military response and passive acceptance, thereby eroding deterrence credibility. Third, economic leverage: even the threat of disruption moves global oil prices and insurance premiums, imposing costs on the global economy that far exceed Iran's military expenditure. The EIA estimates that roughly 20-21 million barrels per day of oil

transited the Strait of Hormuz in recent years, representing approximately 20% of global petroleum liquids consumption. This concentration means that Iran does not need to close the strait to impose costs; it needs only to create sufficient uncertainty to raise risk premiums.

Specific incidents illustrate the mechanism's operation. In May and June 2019, attacks on the tankers *Kokuka Courageous* and *Front Altair*—attributed by the US to Iranian mines—demonstrated Iran's ability to strike commercial shipping while maintaining plausible deniability. In July 2019, Iran seized the British-flagged *Stena Impero* in retaliation for the UK's detention of the Iranian tanker *Grace 1* in Gibraltar, showing how tanker seizures serve as instruments of coercive diplomacy. In April 2023, Iran seized the *Advantage Sweet*, a Marshall Islands-flagged tanker chartered by Chevron, and in May 2023 seized the *Niovi*; in April 2024, Iran seized the *MSC Aries*, a Portuguese-flagged container ship. These seizures are not random piracy but calibrated signals: they impose costs on specific adversaries, demonstrate Iran's reach, and test the US and allied commitment to freedom of navigation without crossing the threshold that would justify major military retaliation. Till's analysis of seapower emphasizes that maritime strategy must account for the interaction between military capability and political purpose; Iran's strategy exemplifies this by subordinating naval operations to political signaling and sanctions relief objectives.

The mechanism is not unlimited. It depends on Iran's ability to maintain plausible deniability for gray-zone actions, on the US and its allies' reluctance to escalate, and on the global economy's continued dependence on Gulf oil. If any of these conditions shifts—if attribution becomes certain, if the US adopts more aggressive rules of engagement, or if global energy diversification reduces Hormuz dependence—the mechanism weakens. The US response, including Operation Sentinel (2019), multinational escort operations, and the forward deployment of carrier strike groups, aims to raise the cost of Iranian aggression while avoiding the escalation that Iran's strategy is designed to provoke. This creates a deterrence dilemma: too little response emboldens Iran; too much risks the war both sides wish to avoid.

Perspective reconstruction. The African perspective, which must be understood as primary in this analysis, reveals dimensions that the other four miss. From the vantage point of African coastal states and the AU's maritime security agenda, the Hormuz crisis is not merely a US-Iran confrontation but a node in a global maritime insecurity system that disproportionately harms non-combatant economies. African states importing Gulf oil face price spikes and supply uncertainty when Hormuz tensions escalate, just as Gulf of Guinea piracy raised shipping costs for West African trade. The African perspective highlights the asymmetry of maritime governance: while the US and Iran contest control of the strait, African coastal states have limited voice in the security architecture that determines their energy access. The AU's 2050 Africa's Integrated Maritime Strategy and the Lomé Charter reflect an insistence that maritime governance must be inclusive, not merely a great-power prerogative. The Red Sea shipping disruptions of 2023-2024 demonstrate how chokepoint insecurity compounds across African maritime space, affecting ports from Djibouti to Durban, framing Hormuz as a symptom of a global maritime order that systematically disadvantages non-great-power states.

The Chinese perspective interprets Iran's strategy through the lens of anti-hegemonic resistance and near-seas defense. Beijing views US naval primacy in the Gulf as analogous to US presence in the Western Pacific; Iran's asymmetric tactics provide a template for how a conventionally inferior power can contest maritime dominance. China's own A2/AD investments—anti-ship ballistic missiles, submarines, mines—mirror Iran's approach, and Chinese strategists have studied Iranian fast-boat swarms and mine warfare. At the same time, China is Iran's largest oil customer and has a direct interest in Hormuz stability, creating tension between strategic sympathy for Iranian resistance and economic interest in uninterrupted supply.

Holmes and Yoshihara's analysis notes that Beijing's approach combines Mahanian sea-control ambitions with Corbettian sea-denial tactics; Iran's Hormuz strategy offers a real-world demonstration of the latter.

The Russian perspective sees Hormuz through the prism of great-power competition and anti-US alignment. Moscow has supported Iran diplomatically and militarily, viewing US pressure on Tehran as part of a broader strategy to dominate Eurasian energy corridors. Russia's own maritime strategy—Arctic militarization, Black Sea Fleet operations, and the 2018 Kerch Strait incident—shares Iran's emphasis on using geographic chokepoints to offset conventional inferiority. Russian analysts frame Hormuz as evidence that US maritime hegemony is contestable, reinforcing Moscow's narrative that the unipolar moment has ended. However, Russia also has interests in stable oil prices and in maintaining its position as a major energy exporter, creating ambivalence about sustained Hormuz disruption.

The Western perspective, dominant in US and allied strategic discourse, frames Iran's strategy as a threat to freedom of navigation and the rules-based maritime order. The US Fifth Fleet's presence in Bahrain, Operation Sentinel, and escort operations for commercial tankers reflect a commitment to keeping the strait open. Western analysis emphasizes deterrence: maintaining sufficient naval presence to raise the cost of Iranian aggression while avoiding escalation. The perspective draws on Mahan's insight that sea power requires both fleet strength and the political will to use it. Its occlusion lies in treating US maritime primacy as synonymous with global public goods, underweighting how that primacy appears from Tehran or from African capitals.

The UN perspective approaches Hormuz through UNCLOS and the framework of maritime security. The strait is an international strait under UNCLOS Part III, guaranteeing transit passage; Iran's tanker seizures and mine attacks violate these norms. UN Security Council resolutions on maritime security provide a legal basis for collective action, but the UN system lacks enforcement mechanisms when a permanent member or its ally is the violator. The UN perspective contributes the essential insight that Hormuz governance requires multilateral frameworks, not merely bilateral US-Iran deterrence, but its effectiveness is constrained by great-power rivalry.

Explicit adjudication. The state-level perspective best explains Iran's asymmetric maritime strategy: Iran's doctrine is a deliberate, state-directed response to US military superiority and sanctions pressure, shaped by the IRGC's institutional interests and the Supreme Leader's strategic calculus. However, this perspective alone misses the systemic drivers—US-Iran rivalry, the sanctions architecture, and the global oil market's structural dependence on Hormuz—that make the strategy viable and consequential. It also misses the transnational effects: the insurance market's response, the cascade to African energy importers, and the erosion of UNCLOS norms. The African perspective, while not the primary explanatory lens for Iranian decision-making, provides the most complete account of the strategy's global costs and reveals what the Western and Chinese perspectives occlude: that Hormuz insecurity is not merely a great-power contest but a burden on non-combatant states. The Western perspective correctly identifies the threat to freedom of navigation but underweights the degree to which US primacy itself generates the resistance that Iran's strategy exploits. The Chinese perspective offers the most analytically productive analogy—A2/AD as a generalizable strategy—but risks normalizing coercive maritime behavior by framing it as defensive. The UN perspective identifies the legal violations but cannot enforce compliance. In sum, no single perspective fully captures the case; the state-level perspective explains Iranian agency, the systemic perspective explains the strategic environment, and the African perspective explains the distributional consequences that the other four underweight.

2.9 PROBLEM PAIR (We do)

1. **Mechanism mapping.** Identify the causal chain through which land reclamation, sensor and missile emplacement, and coast-guard/militia operations change the South China Sea from a contested maritime space into a continuously controlled one. Specify which levels of analysis—individual, state, systemic, transnational—best explain each link.

2. **Threshold analysis.** Determine whether water-cannoning, ramming, and blockade-like interference against resupply missions constitute "armed conflict" under the UN Charter and UNCLOS, or whether they are better classified as gray-zone coercion. What legal and operational consequences follow from each classification?

3. **Perspective reconstruction.** For each of the five perspectives (African, Chinese, Russian, Western, UN), state one contribution and one occlusion in explaining the 2016 arbitral ruling and China's subsequent behavior.

4. **Evidence and falsification.** What observable evidence would support the claim that China's strategy is primarily defensive deterrence? What evidence would support the claim that it is revisionist territorial consolidation? Identify at least one falsifier for each.

5. **Comparative case.** Compare the South China Sea case with Iran's Hormuz strategy from the worked example. Which mechanisms are shared (asymmetric coercion below the armed-conflict threshold, exploitation of escalation reluctance), and which differ (geography, legal claims, actor types, global economic stakes)?

6. **Adjudication.** Given that the 2016 ruling rejected China's historic-rights claim yet militarization and gray-zone activity continued, adjudicate between legal-institutional and power-political explanations. State the scope conditions under which each would be more persuasive.

Model answer. The South China Sea case is best explained by a mechanism in which material transformation, legal ambiguity, and calibrated coercion interact across multiple levels of analysis. At the state level, China's reclamation and militarization of features convert temporary presence into persistent infrastructure, extending surveillance, air-defense, and missile coverage across a maritime space that was previously difficult to dominate continuously. At the transnational level, this infrastructure alters the operating environment for commercial shipping, fishing fleets, and naval vessels without necessarily closing sea lanes, thereby creating leverage through risk and uncertainty rather than through outright denial. At the systemic level, the strategy contests US maritime primacy by raising the cost of intervention and by complicating alliance reassurance, especially for states such as the Philippines and Vietnam that depend on external security guarantees. At the individual level, coast-guard and militia commanders operate under rules of engagement designed to harass, block, and signal resolve while remaining below the threshold that would trigger a military response or treaty obligations. The result is a fait accompli dynamic: each incident is small enough to be treated as a law-enforcement matter, but the cumulative effect is a shift in effective control.

The 2016 arbitral ruling illustrates the limits of legal adjudication when enforcement is weak. The tribunal rejected the historic-rights basis of China's claim and clarified maritime entitlements, but it could not compel compliance. China rejected the ruling's jurisdiction and legitimacy, and subsequent activity—militarized features, coast-guard interference, and administrative assertions—continued. From a Western perspective, this is a failure of the rules-based order: legal clarity was achieved, but without a coalition willing to enforce it, the ruling became a normative reference rather than a behavioral constraint. From a Chinese perspective,

the ruling is an externally imposed interpretation that disregards historical practice and sovereign equality; Beijing frames its actions as defensive near-seas management and domestic law enforcement. From a Russian perspective, the case confirms skepticism toward Western legal universalism and highlights the value of multipolarity in resisting externally adjudicated outcomes. From a UN perspective, the ruling demonstrates the capacity of UNCLOS dispute settlement to clarify law, while also exposing the enforcement gap between legal determination and state compliance. From an African perspective, the case resonates with post-colonial concerns about externally drawn maritime boundaries and the unequal capacity to enforce legal claims; African coastal states may support UNCLOS as a framework while remaining wary of great-power selectivity in compliance, and they may see in the South China Sea a warning about how powerful states can convert legal ambiguity into de facto control.

The strongest adjudication is that legal institutionalism explains the production of legal clarity but not the distribution of power, whereas power-political and gray-zone explanations better account for post-ruling behavior. Legal rulings matter most when backed by enforcement coalitions, domestic costs of noncompliance, or reputational incentives; where a state perceives a vital interest and faces no credible enforcement, the ruling becomes a background condition rather than a causal force. Falsifiers for the power-political explanation would include Chinese demilitarization of features, acceptance of delimited exclusive economic zones, or a sustained reduction in coast-guard incidents after legal or diplomatic pressure. Falsifiers for the legal-institutional explanation would include continued escalation despite multilateral enforcement, or a collapse of regional states' willingness to invoke UNCLOS. Compared with Iran's Hormuz strategy, the shared mechanism is calibrated coercion below the armed-conflict threshold, exploiting an adversary's reluctance to escalate and using asymmetric tools to impose costs. The differences are significant: Iran operates in a narrow chokepoint with immediate global oil-market leverage, relies heavily on speedboats, mines, and proxy forces, and faces a more direct military balance; China operates across a broad maritime space with legal claims, reclaimed territory, and a coast-guard/militia architecture, seeking incremental territorial and administrative consolidation rather than temporary disruption. Thus the South China Sea case is not merely a larger version of Hormuz; it is a distinct form of gray-zone coercion in which legal ambiguity, infrastructure, and persistent presence combine to reshape control without crossing the threshold of war.

2.10 INDEPENDENT MEMO (You do)

(a) Case description. In 2023–2024, Chinese coast-guard and maritime-militia vessels repeatedly interfered with Philippine resupply missions to Second Thomas Shoal, using water cannons, blocking maneuvers, and close-quarters harassment, while Beijing asserted administrative and law-enforcement authority over disputed features. Manila invoked the 2016 arbitral award and sought support from its US treaty ally; China framed its actions as routine enforcement within its jurisdiction. Regional states faced a choice between accepting incremental changes in effective control and risking escalation. Assess whether this pattern is best explained as defensive maritime management, revisionist territorial consolidation, or a hybrid strategy, and determine what evidence would most decisively distinguish among these explanations.

Mechanism:
Perspective reconstruction:
Historical analogue:
Falsifiers:

Self-check: Did you distinguish description (what happened), explanation (why), prediction (what next), and prescription (what should be done)?

2.11 HINGE QUESTION

Question: Which option best explains why the 2016 arbitral ruling did not reverse China's militarization and gray-zone activity in the South China Sea?

A. The ruling lacked effective enforcement mechanisms, and China rejected its jurisdiction and legitimacy, allowing power-political and gray-zone dynamics to dominate legal obligation.
B. The ruling was legally invalid because UNCLOS does not address territorial sovereignty at all.
C. China demilitarized its features after 2016 but resumed militarization solely because of US freedom-of-navigation operations.
D. The UN Security Council enforced the ruling, but China used its veto to nullify it.

Correct answer: A.

Distractor diagnoses:
- **B** conflates the tribunal's avoidance of territorial sovereignty with legal invalidity; the ruling addressed maritime entitlements and historic-rights claims, not sovereignty over land territory, and its legal force does not depend on resolving sovereignty.
- **C** is factually inconsistent with the continued and expanded militarization of features after 2016; US operations may have shaped Chinese rhetoric and risk calculations, but they do not explain the persistence of reclamation and infrastructure.
- **D** misattributes institutional authority; the UN Security Council did not enforce the ruling, and China's veto power is irrelevant to a tribunal constituted under UNCLOS Annex VII.

SECTION 2A — DATA LAB

Table 1. Approximate oil transit through major maritime chokepoints (EIA, 2024 reporting of 2023 flows)

Chokepoint	Approx. volume (million b/d)	Strategic reading
Strait of Hormuz	20.9	Largest single oil chokepoint; Gulf producers' primary export route
Strait of Malacca	16.0	East Asian import artery; central to "Malacca dilemma" debates
Suez Canal / SUMED	8.8	Europe–Asia shortcut; bypassed by Cape route when disrupted
Bab el-Mandeb	8.8	Red Sea gateway; links Suez to Indian Ocean
Turkish Straits	3.4	Black Sea–Mediterranean connector
Danish Straits	3.2	Baltic export route
Panama Canal	2.0	Americas inter-ocean connector

Note: volumes are approximate and vary by year, product mix, and EIA methodology; the table is for structural comparison, not exact forecasting.

Table 2. Approximate active satellite population by state (UCS Satellite Database, recent counts)

State / operator group	Approx. active satellites	Interpretive note
United States	5,000+	Dominant in commercial, military, and intelligence constellations
China	600+	Rapid growth in ISR, PNT, communications, and remote sensing
Russia	150+	Legacy military space power; smaller commercial footprint
United Kingdom	100+	Commercial and government satellites; allied integration
India	60+	Regional space power with growing military applications
Other states and commercial operators	1,000+	Fragmented but strategically relevant, especially in LEO

Note: counts change quickly because of mega-constellations; "active" excludes defunct objects and many classified payloads.

Table 3. Selected maritime and space security indicators

Indicator	Approx. value	Source / basis
Gulf of Guinea piracy and armed robbery incidents	~22 in 2023	IMB annual reporting
Red Sea / Gulf of Aden attacks on commercial shipping	100+ since Oct. 2023	Public maritime incident reporting and naval advisories
Destructive ASAT tests, 2007–2024	4 major tests	China 2007; United States 2008; India 2019; Russia 2021
Non-destructive counterspace activity	Multiple states, recurring	Publicly reported rendezvous, jamming, and cyber incidents

Note: incident counts are undercounts where reporting is voluntary, AIS is spoofed, or attacks are misclassified as accidents or piracy.

Numbered analysis questions

1. **Trend:** Chokepoint volumes are highly concentrated, yet incident counts are episodic and geographically clustered. What does this mismatch imply about the difference between structural vulnerability and realized disruption?

2. **Level of analysis:** Are Red Sea attacks best explained by state sponsorship and regional war (state/systemic), by Houthi organizational strategy (sub-state), by global shipping market incentives (transnational), or by individual crew and vessel decisions (individual)?
3. **Perspective reconstruction:** How would the African, Chinese, Russian, Western, and UN perspectives each read Table 1 and Table 3 differently—especially on whether maritime security is primarily a problem of sovereignty, commerce, great-power competition, or collective governance?
4. **Interpretation:** Table 2 suggests that satellite infrastructure is becoming both more distributed and more militarized. Does this imply that space is stabilizing through redundancy, or destabilizing through new counterspace incentives?
5. **Limitation:** Which of the following are most likely missing from these tables: classified military satellite counts, underreported Gulf of Guinea incidents, non-kinetic interference such as jamming and spoofing, and the political classification of attacks as "terrorism," "piracy," or "war"?

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1: Hand-drawn map of maritime chokepoints and volume concentration

Draw a simple world map in pencil or marker, using an oval for the globe and a few curved continental outlines rather than detailed coastlines. Mark the following points with small circles and labels: Hormuz, Malacca, Suez, Bab el-Mandeb, Panama, Turkish Straits, Danish Straits. Draw thick arrows through each chokepoint and write approximate volumes beside them: Hormuz 20.9, Malacca 16.0, Suez 8.8, Bab el-Mandeb 8.8, Panama 2.0, Turkish 3.4, Danish 3.2. Add a legend: "million barrels per day, approximate 2023 flows." Draw a dashed alternative route around the Cape of Good Hope to show bypass capacity. In one corner, draw a small box labeled "Gulf of Guinea" with a piracy icon and a note "incidents clustered, not just chokepoints." Annotate the map with perspective overlays: African perspective in green: "coastal security, piracy, Red Sea disruption"; Chinese perspective in red: "Malacca dilemma, near-seas defense"; Russian perspective in blue: "Arctic and Black Sea access"; Western perspective in black: "freedom of navigation, carrier mobility"; UN perspective in purple: "UNCLOS, collective maritime security."

Visual 2: Hand-drawn A2/AD and sea-denial diagram

Draw a horizontal sea surface line across the page. On the left, draw a coastline labeled "Contested littoral" with three nested curved arcs extending seaward, labeled "A2/AD layer 1: sensors," "A2/AD layer 2: missiles," and "A2/AD layer 3: submarines / mines." Place small icons for radar, mobile missile launchers, and submarines. On the right, draw a large ship icon labeled "Carrier strike group" approaching from open ocean, with a dashed line showing its operational range. Draw arrows from the littoral toward the carrier labeled "sea denial," and a smaller arrow from the carrier toward the coast labeled "power projection." Add a vertical scale on the right labeled "Distance from coast" with markers for territorial sea, EEZ, and high seas. Annotate perspectives: African: "coastal vulnerability and external intervention"; Chinese: "near-seas defense, anti-access"; Russian: "bastion defense, Arctic/Black Sea"; Western: "FON, carrier access"; UN: "law of the sea, EEZ rights."

Visual 3: Hand-drawn space domain stack

Draw three horizontal bands from bottom to top: "LEO," "MEO," and "GEO." In LEO, draw many small dots labeled "imaging, comms, mega-constellations"; in MEO, draw medium dots labeled "PNT / navigation"; in GEO, draw a few large dots labeled "strategic communications, early warning." Draw a ground station at the bottom with lines connecting to each band. Draw an ASAT vector as a dashed arrow from the ground or

from a co-orbital object toward a satellite, labeled “kinetic / non-kinetic counterspace.” Draw debris clouds around one destroyed satellite. Add a side panel labeled “Military uses: ISR, PNT, communications, missile warning.” Annotate perspectives: African: “space-enabled maritime domain awareness, but dependency on external providers”; Chinese: “space as sovereignty and security infrastructure”; Russian: “space as strategic stability and counterspace”; Western: “space as enabler of precision warfare”; UN: “outer space as global commons, debris governance.”

SECTION 4 — CORNELL NOTES

Cue	Notes
What is sea power?	Sea power is not only fleet size; it includes bases, logistics, commerce, law, and alliance networks. Source: Mahan (1890); Corbett (1911); Till (2018).
Mahan vs. Corbett	Mahan emphasizes decisive battle and command of the sea; Corbett emphasizes control of communications and limited war. Scope: Mahan fits fleet-centric eras; Corbett fits coalition and maritime constabulary operations.
Chokepoint logic	Chokepoints concentrate risk because volume, geography, and politics coincide. EIA (2024) shows Hormuz and Malacca dominate oil flows; disruption can be physical, legal, or coercive.
A2/AD	Anti-access/area denial seeks to raise the cost of entry into a theater. Holmes and Yoshihara (2017) frame Chinese maritime strategy as layered, not merely missile-centric.
Gray zone	Actions below armed-conflict threshold: coast guard, militia, cyber, economic pressure. Mechanism: ambiguity delays response and splits coalitions.
Space domain	ISR, PNT, communications, and missile warning make space a military enabler; ASAT tests show counterspace is real but debris creates shared risk.
African perspective	Coastal security, Gulf of Guinea piracy, Red Sea disruption; emphasizes livelihoods, sovereignty, and uneven capacity. Sources: African maritime security scholarship and regional practice.
Chinese perspective	Near-seas defense, blue-water ambition, A2/AD; Malacca dilemma as strategic anxiety.
Russian perspective	Arctic and Black Sea maritime strategy; bastion defense and access denial.
Western perspective	Freedom of navigation, carrier strike groups, alliance logistics; often treats sea control as global public good.

Cue	Notes
UN perspective	UNCLOS, maritime security resolutions, collective governance; legal framing can lag behind gray-zone practice.
Data limits	Incident counts undercount; satellite counts omit classified systems; ASAT tests are visible but non-kinetic interference is harder to measure.

Summary: Maritime strategy links geography, technology, and law: chokepoints concentrate global commerce, A2/AD and gray-zone tools contest access without necessarily crossing into war, and space systems have become the nervous system of modern sea power. The five perspectives agree that the sea and space are strategically vital but disagree on whether security should be organized around sovereignty, commerce, deterrence, or collective governance. Data on flows, incidents, satellites, and ASAT tests reveal structure and trend, but they cannot by themselves settle questions of intent, legality, or proportionality.

SECTION 5 — FEYNMAN COMPRESSION

1. **Explain without jargon:** The ocean and space are like highways and nervous systems for modern states. A few narrow sea passages carry huge amounts of oil, so blocking or threatening them can hurt economies without a full war. Countries that feel weaker at sea can use missiles, mines, small boats, coast guards, or cyber tools to make entry expensive or politically awkward. Satellites help ships, planes, and missiles know where they are and what they see, so attacking or jamming satellites can weaken an opponent. The main debate is whether these tools deter war or make crises harder to control.

2. **Mark gaps:** I am less certain about the exact year-to-year EIA volumes, the precise number of active satellites, and how many maritime incidents go unreported. I also need to distinguish a legal chokepoint disruption from a physical one, and a destructive ASAT test from everyday satellite interference. Another gap is whether gray-zone actions are best seen as coercion or as routine sovereignty enforcement.

3. **Reread verification:** Rechecking the core sources confirms the conceptual distinction: Mahan and Corbett differ on command versus control of communications; EIA data show concentration but not intent; Holmes and Yoshihara emphasize layered Chinese maritime strategy rather than a single "wall"; and UNCLOS provides a legal vocabulary that does not fully capture coast-guard or militia ambiguity. The data tables support trend and structure, not causal proof.

4. **Analogy with explicit limits:** Think of a city with one bridge carrying most commuter traffic. A local power cannot defeat the whole city, but it can threaten the bridge, charge tolls, or create traffic jams. That captures chokepoint leverage and gray-zone pressure. The limit is that bridges are fixed and local, whereas sea lanes, alliances, rerouting, and international law make maritime coercion more complex and more reversible. Space is less like a bridge and more like the city's traffic lights and GPS: damaging it can cascade, but attribution and escalation are uncertain.

5. **Rewrite:** Maritime, chokepoint, space, and gray-zone conflicts are best understood as contests over

access rather than only contests over territory. Geography concentrates maritime risk; A2/AD and gray-zone tools exploit that concentration while staying below clear war thresholds; space systems extend and complicate both. African, Chinese, Russian, Western, and UN perspectives each identify real features of this problem—coastal vulnerability, near-seas defense, bastion security, freedom of navigation, and collective governance—but none alone captures the full mechanism. Evidence on flows, incidents, satellites, and ASAT tests is indispensable, yet it must be paired with legal, historical, and strategic interpretation before it can support strong claims.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L25	Definition	What did Mahan mean by sea power?	Mahan treated sea power as a composite of national strength, maritime commerce, colonial access, and fleet capability; command of the sea was the enabling condition for global reach and sustained war.	Western imperial lineage; African reading stresses extraction and coastal dispossession.
L25	Mechanism	What is Corbett's distinction between sea control and sea denial?	Corbett separated command of the sea from denial of command; a weaker fleet can use a fleet-in-being to prevent an adversary from achieving decisive maritime control.	Useful for weaker navies and coastal states, including African littoral forces.

Tag	Card Type	Front	Back	Perspective Note
L25	Application	Why does the Strait of Hormuz concentrate escalation risk?	Hormuz is a narrow chokepoint through which a large share of global oil transits; geography compresses warning time, mixes commercial and military traffic, and magnifies the effect of small actions.	Energy importers, Gulf states, and Asian consumers experience the risk differently.
L25	Comparison	How do Mahan and Corbett differ on the purpose of naval force?	Mahan centers decisive battle and command of the sea; Corbett centers limited war, communications, and denial of the enemy's freedom of action.	Both are Eurocentric; African scholarship adds littoral social economies and informal maritime orders.
L25	Source	What does EIA chokepoint data actually measure?	EIA data measure transit volumes through chokepoints; high volume indicates systemic exposure, not the probability, duration, or cost of disruption.	Global South import dependence makes volume data politically consequential.
L25	Debate	Is A2/AD a "wall" or a contest?	A2/AD is better understood as a contest of ranges, sensors, targeting, logistics, and magazine depth; its effectiveness degrades under attrition and depends on ISR quality.	Chinese near-seas defense versus US carrier and alliance logistics.

Tag	Card Type	Front	Back	Perspective Note
L25	Reconstruction	How should African maritime security be framed from within?	African maritime security is shaped by coastal poverty, illegal fishing, piracy economies, and external intervention; patrols may suppress symptoms without changing incentives.	Primary lens: Gulf of Guinea, Red Sea, and western Indian Ocean.
L25	Occlusion	What does freedom-of-navigation framing often occlude?	Freedom-of-navigation rhetoric can obscure coastal-state concerns about resource jurisdiction, local harm, and the distribution of maritime policing authority.	UNCLOS ambiguity and Global South claims.
L25	Adjudication	What did the 2016 South China Sea arbitral award do?	The award rejected historic-rights claims and clarified EEZ entitlements, but its practical effect depends on diplomacy, power, and continued state behavior.	Legal authority versus geopolitical enforcement.
L25	Visual	What is an A2/AD “bubble”?	An A2/AD bubble is a layered zone of sensors, missiles, and electronic warfare; its boundary is fuzzy and its coercive value changes with attrition and countermeasures.	Chinese and Russian near-seas strategies.

Tag	Card Type	Front	Back	Perspective Note
L25	Definition	What is gray-zone coercion?	Gray-zone coercion uses force, pressure, or ambiguity below the threshold of armed conflict to change facts, extract concessions, or normalize new baselines.	Favors actors willing to exploit legal and political thresholds.
L25	Mechanism	How do coast guard and militia forces create gray-zone effects?	Civilianized or paramilitary maritime forces create attribution ambiguity and legal friction, slowing collective response and complicating escalation control.	South China Sea and East China Sea dynamics.
L25	Application	How does Iran exploit Hormuz asymmetrically?	Iran uses speedboat swarms, mines, seizures, and harassment to exploit Hormuz's narrowness and commercial density, raising transit costs without necessarily triggering war.	Asymmetric strategy against US maritime primacy.
L25	Source	What do ASAT test counts tell us?	ASAT tests demonstrate destructive capability and create debris risks, but counts alone do not measure intent, resilience, or the probability of orbital conflict.	Space as a shared but militarized domain.

Tag	Card Type	Front	Back	Perspective Note
L25	Comparison	How do ISR/PNT and ASAT capabilities interact?	ISR and PNT enable precision and coordination; ASAT weapons threaten those enablers; deterrence depends on redundancy, attribution, and escalation management.	All major space powers and dependent users.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence Audit (score each 0–100)

Competency	Confidence (0–100)	Calibration Prompt
Define Mahan's and Corbett's sea-power logics and distinguish command from denial		Can you state the difference without naming a case?
Map chokepoint geography to transit risk and escalation dynamics		Can you explain why volume alone is not risk?
Explain A2/AD mechanisms and their scope conditions		Can you identify what would degrade an A2/AD system?
Reconstruct gray-zone coercion and attribution problems		Can you distinguish coercion from armed conflict?
Analyze space-domain dependencies and ASAT escalation		Can you explain why debris is strategically consequential?
Compare all five perspectives without caricature		Can you state each perspective's strongest internal argument?
Apply individual, state, systemic, and transnational levels of analysis		Can you assign one mechanism to each level?
Identify falsifiers for maritime and space claims		Can you name evidence that would disprove your conclusion?

7.2 Three-Question Debrief

1. Which concept did you define correctly but fail to connect to a causal mechanism?
2. Which perspective did you treat as an obstacle or bias rather than as a coherent argument with its own evidence?
3. What single piece of evidence would most strongly change your conclusion about Hormuz, the South China Sea, or space security?

7.3 Error-Log Table

Common Misconception	Correction	Evidence
Chokepoints guarantee disruption.	Geography raises probability and cost of disruption, but actors, insurance, rerouting, naval escorts, and stockpiles mediate outcomes.	EIA transit data show exposure; incidents show variability in duration and impact.
A2/AD makes US maritime power impossible.	A2/AD is a contest of ranges, sensors, logistics, and magazine depth; its coercive value degrades under attrition and countermeasures.	Holmes and Yoshihara (2017); Till (2018).
Gray-zone actions are "not really force."	They are coercive and may be armed; the threshold is political and legal, not the absence of harm.	L20 coercion framework; coast guard and militia incidents.
ASAT tests prove inevitable space war.	Capability demonstrations are not intent; debris, attribution, and escalation constraints shape decisions.	ASAT test record 2007–present; space-security assessments.
UNCLOS automatically resolves maritime disputes.	Law provides standards, but interpretation, enforcement, and power shape outcomes.	2016 South China Sea arbitral award and subsequent state behavior.

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Maritime power, chokepoints, A2/AD, gray-zone coercion, space domain	Geography compresses warning time; denial raises access costs; ambiguity slows response; orbital dependence creates vulnerability	Mahan (1890); Corbett (1911); Till (2018); Holmes and Yoshihara (2017)	Hormuz; Bab el-Mandeb; Malacca; Suez; Panama; South China Sea; Gulf of Guinea; ASAT tests	Command versus denial; law versus power; near-seas defense versus blue-water ambition	No disruption despite high transit volume; failed swarm attack; ASAT capability without use; ruling ignored without escalation	L20 coercion; L22 conventional war; L24 cyber; L44 Hormuz/Bab el-Mandeb; L48 Indo-Pacific sea denial; L57 space
Sea power traditions	Composite national strength, decisive battle, fleet-in-being, sea control versus sea denial	Mahan (1890); Corbett (1911)	Historical British and US naval dominance; weaker-fleet denial strategies	Whether command of the sea remains decisive in missile age	Naval inferiority still achieves strategic objectives without battle	L22; L48
Chokepoint geography	Narrow passages concentrate traffic, reduce reaction time, and amplify small actions	Till (2018)	EIA World Oil Transit Chokepoints (2024); Hormuz, Malacca, Suez, Panama	Volume as exposure versus volume as destiny	Rerouting, stockpiles, or escorts prevent disruption	L44; energy security modules

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
A2/AD and sea denial	Layered sensors, missiles, submarines, mines, and electronic warfare contest access	Holmes and Yoshihara (2017); Till (2018)	Chinese near-seas posture; Iranian Hormuz strategy; Russian Black Sea and Arctic posture	Wall versus contest; defensive versus offensive intent	Sustained carrier operations inside contested zone; degraded ISR	L48; L22
Gray-zone coercion	Coast guard, militia, cyber, economic pressure, and ambiguity below armed-conflict threshold	L20 coercion framework; maritime security studies	South China Sea features and incidents; Gulf of Guinea piracy economies	Coercion versus crime; threshold identification	Clear attribution and collective response; no change in status quo	L20; L24; L44
Space as military domain	ISR, PNT, communications enable force; ASAT threatens enablers; debris and attribution constrain use	Space-security assessments; ASAT test record	Satellite launches by state; ASAT tests 2007–present	Commons versus warfighting domain; deterrence versus vulnerability	Redundant systems prevent operational paralysis; no ASAT use in crisis	L24; L57

SECTION 9 — REVIEW SCHEDULE

Interval	Timing	Concrete Action
R1	Same day, 20 minutes	Recite Mahan/Corbett definitions, draw a chokepoint map from memory, and state one mechanism for each key idea.

Interval	Timing	Concrete Action
R2	48 hours, 30 minutes	Reconstruct all five perspectives for Hormuz and the South China Sea without notes, then check for caricature.
R3	1 week, 45 minutes	Redo the Problem Pair case, compare with the model answer, and log one corrected misconception.
R4	2 weeks, 60 minutes	Complete the Data Lab: interpret EIA transit volumes, satellite launches, ASAT tests, and maritime incident counts; write three falsifiers.
R5	1 month, 90 minutes	Write an independent memo on a new case, such as Red Sea shipping disruptions, using the four levels of analysis and all five perspectives.

SECTION 10 — COMPLETION CHECKLIST

- ☐ I can define sea power in Mahan's and Corbett's terms.
- ☐ I can distinguish sea control from sea denial.
- ☐ I can name and locate the five major chokepoints.
- ☐ I can explain why chokepoint volume is exposure, not destiny.
- ☐ I can describe A2/AD as a contest of systems, not a wall.
- ☐ I can identify scope conditions for Chinese, Iranian, and Russian sea denial.
- ☐ I can define gray-zone coercion and explain attribution ambiguity.
- ☐ I can analyze coast guard and militia roles in maritime coercion.
- ☐ I can explain ISR, PNT, communications, and ASAT interdependence.
- ☐ I can interpret ASAT test data without overstating intent.
- ☐ I can reconstruct the African perspective as primary, not an add-on.
- ☐ I can steel-man Chinese, Russian, Western, and UN perspectives.
- ☐ I can apply individual, state, systemic, and transnational levels of analysis.
- ☐ I can distinguish description, explanation, prediction, and prescription.
- ☐ I can write falsifiers for a maritime or space claim.
- ☐ I can complete the Data Lab without confusing correlation with mechanism.

27. Lawfare and the Ethics of War

LESSON METADATA

Field	Value
Lesson number and title	Lesson 26 — Lawfare and the Ethics of War
Module	Module 4: Security Studies and Warfare
Prerequisites	L2 (Charter), L9 (sovereignty), L20 (coercion)
Interleaved links	Forward to L37 (Ukraine lawfare), L44 (Hormuz and Yemen), L54 (autonomous weapons)
Reading load	7-9 hours
Content channels	Text, data lab, visuals, flashcards, memo
Bloom ceiling	Evaluate / Create
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

The central puzzle of this lesson is whether international law constrains war or whether it is itself a weapon of war. Since 1945, the use of force has been governed by a dense legal architecture: the UN Charter's prohibition on the threat or use of force in Article 2(4), the limited exception of self-defence in Article 51, and the body of international humanitarian law (IHL) codified in the four Geneva Conventions of 1949 and their Additional Protocols. Alongside this, the Rome Statute of 1998 created the International Criminal Court (ICC), and the Convention on Certain Conventional Weapons (CCW) has become the forum for debating lethal autonomous weapons systems (LAWS). On paper, this architecture promises to humanise armed conflict, protect civilians, and hold perpetrators accountable. In practice, its application is strikingly uneven: some conflicts attract intense legal scrutiny and institutional intervention, while others proceed with near-total impunity; some states invoke legal categories to legitimise strikes that kill civilians, while others dismiss the same categories as Western instruments. The concept of "lawfare"—the use of law as a means of achieving

military or political objectives—captures this duality. Lawfare is not a deviation from the system; it is, on one reading, the system's normal operating mode. The lesson's task is to teach you to see law not as a neutral backdrop to war but as a contested terrain on which wars are fought, justified, and remembered.

The theoretical lineage matters because the same legal text supports incompatible interpretations. Michael Walzer's *Just and Unjust Wars* (1977) revived just war theory in the post-Vietnam era by arguing that the moral equality of soldiers (jus in bello) is separable from the justice of the cause (jus ad bellum), and that non-combatant immunity is the central moral constraint. Walzer's later work, including his 2015 reflections on targeted killing, pressed the question of whether precision weapons change the moral calculus of war. Helen Kinsella's *The Image of War* (2011) showed that the combatant/civilian distinction is not a natural fact but a historically constructed and gendered category, produced through colonial and racial hierarchies. David Luban's 2014 analysis of targeted killing argued that the legal category of "imminent threat" has been stretched beyond recognition in US drone practice, collapsing the distinction between war and law enforcement. Sagan and Valentino (2017) brought experimental evidence to bear on public attitudes, showing that American public support for the use of force is sensitive to casualty levels and to whether the enemy is perceived as violating norms. Together these works establish that the law of war is not self-interpreting: its categories are politically produced, its enforcement is selective, and its moral authority depends on who is speaking.

The African perspective is not one case among many; it is the vantage point that exposes the architecture's deepest tensions. The ICC's first decade of operations (2002–2012) saw all of its situations located in Africa, a pattern that African states and scholars read not as coincidence but as structural bias. The African Union's Assembly decisions in 2013 and 2014, including the call for mass withdrawal from the Rome Statute and the demand that sitting heads of state enjoy immunity, were not rejections of accountability per se but protests against a jurisdiction that appeared to discipline African leaders while exempting the powerful. The Malabo Protocol of 2014, which would extend the African Court of Justice and Human Rights to criminal matters, represents an attempt to build regional accountability on African terms rather than accept an externally imposed one. Scholars such as Siba Grovogui, Achille Mbembe, and Mahmood Mamdani have argued that international criminal law, however well-intentioned, operates within a colonial episteme that positions Africa as the site of atrocity and the West as the site of judgment. This critique does not deny that atrocities occur in Africa or that victims deserve justice; it insists that the institutional form of justice—who investigates, who prosecutes, who funds, who decides—reproduces the very hierarchies it claims to transcend. The African vantage point thus reframes the lesson's central puzzle: the question is not whether law can restrain war, but whose law, enforced by whom, against whom.

The other four perspectives illuminate different facets of the same problem. The Chinese perspective begins from non-interference and sovereignty (rooted in the Five Principles of Peaceful Coexistence) but has evolved toward greater engagement with IHL through UN peacekeeping, humanitarian assistance, and participation in CCW discussions on LAWS; its contribution is to insist that legal frameworks not be used to override sovereignty, while its occlusion is a tendency to treat internal conflict as beyond international scrutiny. The Russian perspective treats lawfare as a Western instrument—pointing to the 2003 Iraq war, the 2011 Libya intervention, and the legal framing of sanctions and tribunals as tools of geopolitical competition; its contribution is to expose the instrumentalisation of legal categories, while its occlusion is the deflection of accountability for its own conduct, including in Ukraine. The Western perspective supplies the dominant IHL frameworks (Geneva Conventions, Rome Statute, CCW) and has produced genuine self-critique—on drone strikes, Guantánamo, Abu Ghraib, and civilian casualties—but its occlusion is the tendency to treat Western legal practice as the universal standard against which others are measured. The UN perspective

centres on civilian protection, accountability mechanisms, and the Responsibility to Protect (R2P), but is constrained by Security Council politics, funding dependence, and the gap between normative aspiration and enforcement capacity. Each perspective is internally coherent; none is sufficient alone.

The lesson is organised around five key ideas that move from the legal architecture of force to the ethics of its application. Key Idea 1 establishes the foundational distinction between jus ad bellum (the legality of going to war) and jus in bello (the legality of conduct in war), and the principle that the two are legally independent. Key Idea 2 examines targeting law—distinction, proportionality, precautions—and the shift toward "effects-based operations" that complicates traditional categories. Key Idea 3 surveys accountability mechanisms: the ICC, the ICJ, universal jurisdiction, and the politics of enforcement. Key Idea 4 addresses autonomous weapons and the LAWS debate, where the question of algorithmic killing forces a reconsideration of human judgment in war. Key Idea 5 turns to the politics of humanitarianism—aid, access, and the securitisation of relief—where the boundary between protection and control blurs. The worked example is the ICC's 2023 arrest warrant for Vladimir Putin, which crystallises lawfare, accountability, and the politics of universal jurisdiction in a single case. The problem pair is US drone strikes in Pakistan, Yemen, and Somalia, which test the legal and ethical boundaries of targeted killing outside traditional armed conflict. The data lab examines ICC investigations by region, IHL violations documented by UN commissions, LAWS discussions under the CCW, and civilian casualty records compiled by the Action on Armed Violence (AOAV).

By the end of this lesson you will be able to do four things that define post-doctoral competence in this area. First, you will distinguish description, explanation, prediction, and prescription in legal and ethical argumentation about war—recognising, for example, that describing a strike as "proportionate" is not the same as explaining why it occurred, predicting its consequences, or prescribing whether it should have occurred. Second, you will reconstruct each of the five perspectives from within, identifying what each contributes and what it occludes, rather than treating any as a strawman. Third, you will apply the four levels of analysis—individual, state, systemic, and transnational—to a concrete case and adjudicate between competing theoretical explanations on the basis of evidence. Fourth, you will identify the falsifiers that would undermine each perspective's claims, and you will be able to state, in your own words, why the African critique of ICC selectivity is not a rejection of international law but a demand for its consistent application. These skills transfer directly to the forward-linked lessons on Ukraine lawfare (L37), Hormuz and Yemen (L44), and autonomous weapons (L54), and they underpin the memo and problem-pair assessments that follow.

SECTION 1 — Pre-Class Priming

1.1 Retrieval warm-up

1. (L2) What does Article 2(4) of the UN Charter prohibit, and what is the principal exception recognised in Article 51?
2. (L2) How does the Charter distinguish between the Security Council's Chapter VII powers and the general prohibition on the use of force?
3. (L9) Define sovereignty in its internal and external dimensions, and explain why the tension between them matters for humanitarian intervention.
4. (L9) What is the "responsibility to protect" (R2P) doctrine, and how does it modify traditional sovereignty?
5. (L20) Distinguish compellence from deterrence, and give one example of each.
6. (L20) What is the difference between "hard" and "soft" coercion, and how does each operate in international relations?

1.2 Orientation questions

1. Is international humanitarian law a constraint on war, an instrument of war, or both—and what evidence would distinguish these readings?
2. How does the African critique of ICC selectivity challenge the legitimacy of international criminal law without rejecting accountability?
3. What changes in the ethics of war when killing is delegated to autonomous systems?
4. Under what conditions does humanitarian aid become securitised, and who gains and loses from that transformation?

1.3 Vocabulary pre-teach

1. **Jus ad bellum** — the body of law governing the legality of resorting to force; in the UN Charter era, primarily Articles 2(4) and 51.
2. **Jus in bello** — the body of law governing conduct during armed conflict; also called international humanitarian law (IHL).
3. **Distinction** — the IHL principle requiring parties to distinguish between combatants and civilians, and between military objectives and civilian objects.
4. **Proportionality** — the IHL rule that an attack is unlawful if expected civilian harm is excessive in relation to the concrete and direct military advantage anticipated.
5. **Precautions in attack** — the obligation to take feasible measures to minimise civilian harm, including verification of targets and choice of means.
6. **Lawfare** — the use of legal processes, categories, and institutions as instruments to achieve military or political objectives.
7. **Targeted killing** — the intentional, premeditated killing of specific individuals by state actors, often outside traditional battlefield contexts.
8. **Universal jurisdiction** — the principle that certain crimes are so grave that any state may prosecute them regardless of where they occurred or the nationality of perpetrator or victim.
9. **Lethal autonomous weapons systems (LAWS)** — weapons that can select and engage targets without further human intervention once activated.
10. **Humanitarian access** — the ability of humanitarian actors to reach populations in need; often contested in conflict zones.
11. **Securitisation** — the process by which an issue is framed as an existential threat, justifying extraordinary measures outside normal politics.
12. **Effects-based operations** — military operations planned around desired strategic effects rather than attrition of enemy forces, complicating traditional targeting categories.

SECTION 2 — LESSON CORE

2.1 Learning objectives After mastering this lesson, the student will be able to: (1) **Analyze** the structural separation between *jus ad bellum* and *jus in bello* and explain why conflating the two produces both legal error and moral catastrophe, drawing on the Charter framework and the Geneva tradition. (2) **Evaluate** the causal mechanisms through which legal categories shape state behavior in the use of force, including how powerful states exploit ambiguity in Article 2(4) and Article 51 while weaker states invoke the Charter as a shield. (3) **Apply** the four levels of analysis—individual, state, systemic, and transnational—to a concrete

case of contested force, distinguishing the drivers that operate at each level rather than collapsing them into a single narrative. (4) **Compare** five perspective traditions on the ethics of war and identify, for each, what it contributes to our understanding and what it systematically occludes. (5) **Construct** a falsifiable claim about when legal constraint on the use of force genuinely constrains state behavior and when it is instrumentalized as lawfare, specifying the observable evidence that would distinguish the two. These objectives are assessable: the student should be able to produce a memo that distinguishes description, explanation, prediction, and prescription, and to defend an adjudication among competing perspective traditions using evidence rather than assertion. The lesson assumes familiarity with the Charter (Lesson 2), sovereignty (Lesson 9), and coercion (Lesson 20); it feeds forward into Lesson 37 on Ukraine lawfare, Lesson 44 on Hormuz and Yemen, and Lesson 54 on autonomous weapons.

2.2 KEY IDEA 1 — Jus ad bellum vs jus in bello: the legal architecture of the use of force Bolded Causal Claim: The legal architecture of the use of force separates the question of whether a war may be fought (*jus ad bellum*) from the question of how it may be fought (*jus in bello*), and this separation is the condition of possibility for both humanitarian restraint in warfare and for the instrumentalization of law as a weapon (lawfare); where the two are conflated, moral reasoning collapses into either pacifism that forbids all resistance or total war that licenses all means.

Mechanism: The mechanism operates through the creation of distinct legal roles and permissions that distribute protections and liabilities independently of the justice of the cause. *Jus ad bellum* is codified primarily in the UN Charter: Article 2(4) prohibits the threat or use of force against the territorial integrity or political independence of any state; Article 51 preserves the inherent right of individual or collective self-defense if an armed attack occurs; Chapter VII authorizes the Security Council to determine threats to the peace and to authorize enforcement action. *Jus in bello* is codified in the Hague Regulations, the four Geneva Conventions of 1949, and their Additional Protocols, and it governs conduct during armed conflict regardless of how the conflict began. The critical mechanism is the independence thesis: the legal and moral status of a combatant does not depend on whether their state's cause is just. Walzer's (1977) formulation of the "moral equality of soldiers" captures this: combatants on both sides possess equal rights to fight and equal liabilities to be targeted, provided they distinguish themselves from civilians and obey the laws of war. This separation generates the category of the "civilian" as a protected person and the category of the "combatant" as a legitimate target, and it is through these categories that humanitarian restraint becomes possible. At the same time, the separation creates a structural vulnerability: because *jus in bello* applies to all parties equally, a state fighting an unjust war can claim the same protections as a state fighting a just one, and a state fighting a just war can be accused of violations with the same legal vocabulary used against aggressors. Lawfare—the use of legal process, legal claims, and legal institutions as instruments of coercion—exploits precisely this symmetry. Kinsella (2011) has shown how the civilian/combatant distinction is not a natural fact but a constructed legal category with gendered and colonial histories, which means the mechanism of protection is also a mechanism of exclusion: those who do not fit the category of "civilian" (irregular fighters, "unlawful combatants," populations in occupied territory) fall into protection gaps. Luban (2014) extends this by analyzing how legal reasoning about torture and interrogation during the "war on terror" demonstrated that the separation between *ad bellum* and *in bello* could be collapsed by executive lawyers who redefined categories to permit what the law appeared to forbid. The mechanism, then, is categorical: law creates roles, roles create permissions, and the manipulation of role-definitions becomes a mode of warfare.

Scope Conditions: The separation thesis holds most cleanly in interstate armed conflict between uniformed forces operating under clear command structures, where front lines exist and where both parties are states

bound by treaty. It weakens or breaks down under several conditions. First, in asymmetric conflict where one party is a non-state armed group not party to the Geneva Conventions: *jus in bello* still applies as customary international law, but enforcement and reciprocity fail. Second, in counterterrorism operations conducted outside recognized armed conflict: the legal question of whether an "armed conflict" exists at all determines whether *jus in bello* applies or whether human rights law (with its stricter lethal-force standard) governs. Third, in occupation: the occupier retains *ad bellum* authority (the war is over) but continues to exercise *in bello*-like control, blurring the temporal boundary. Fourth, where self-defense claims are stretched to cover anticipatory, preventive, or "unable or unwilling" host-state scenarios: the *ad bellum* category expands to swallow the *in bello* constraint. Fifth, in cyber and information operations where the threshold of "armed attack" is contested. The scope condition is therefore not merely legal but empirical: the separation holds where there is a shared recognition of conflict status, and it collapses where that recognition is absent or disputed.

Observable Implications: If the separation mechanism operates as described, several observable patterns should follow. States with weaker military capacity should invoke Charter prohibitions more frequently and more formally, because *ad bellum* law is their available shield; powerful states should more frequently reinterpret self-defense to accommodate their operations, producing a pattern of "legal entrepreneurialism" in which the same text (Article 51) supports divergent claims. Civilian casualty ratios should be higher in conflicts where the civilian/combatant distinction cannot be operationalized—urban warfare, counterinsurgency, drone strikes in non-battlefield settings—because the mechanism of protection requires a category that cannot be applied. Legal proceedings (ICC warrants, universal jurisdiction cases, ICJ provisional measures) should be used as instruments of pressure even where enforcement is impossible, which is the signature of lawfare. Public opinion in democracies should be sensitive to *in bello* violations but relatively insensitive to *ad bellum* illegality, because the moral equality of soldiers thesis resonates with intuitions about fair fighting; Sagan and Valentino (2017) have documented how publics in democracies weigh civilian casualties against military objectives in ways that track *in bello* proportionality rather than *ad bellum* legitimacy. Finally, if the mechanism is real, we should observe states investing in legal capacity—military lawyers, targeting lawyers, legal advisors—as a component of warfighting capability, which is precisely what has occurred in the US, UK, and Israeli militaries since the 1990s.

Perspective Note (five traditions in brief):

African (primary). The African perspective begins from the historical experience of colonial violence that was entirely legal under the international law of its time: the Berlin Conference of 1884–1885 partitioned a continent without African consent, and the wars of conquest that followed were not "wars" in the legal sense but "police actions" or "pacification." This history produces a deep skepticism toward the claim that international law neutrally constrains violence. From this vantage point, the *ad bellum*/*in bello* separation appears not as a humanitarian achievement but as a framework that legitimized colonial violence by treating it as non-war. Contemporary African scholarship and diplomacy extend this critique: the African Union's resistance to ICC jurisdiction, the push for the Malabo Protocol (which would establish an African Court of Justice and Human Rights with criminal jurisdiction), and the broader argument that the international legal order reproduces racialized hierarchies of whose violence counts as "war" and whose counts as "terrorism" or "banditry." The African perspective also emphasizes that *jus in bello* protections have been systematically weaker for African civilians—not because the law differs but because enforcement is geopolitically selective. What this perspective reveals is the constitutive role of power in determining which legal categories are activated; what it risks occluding is the genuine humanitarian restraint that *in bello* law has produced even in African conflicts, and the agency of African states and civil society in shaping IHL.

Chinese. The Chinese perspective is anchored in the Five Principles of Peaceful Coexistence (1954) and in a strong reading of Article 2(4): non-interference and territorial integrity are paramount, and the use of force is legitimate only in self-defense against armed attack or with Security Council authorization. China has historically been suspicious of *ad bellum* expansion—opposing humanitarian intervention, the "responsibility to protect," and broad self-defense claims—and has emphasized that *jus in bello* must not be used to legitimize aggression. In recent years, however, China has increased its engagement with IHL: participation in UN peacekeeping, training in IHL for PLA personnel, and engagement with the CCW process on lethal autonomous weapons. The Chinese perspective contributes a state-centric, sovereignty-protective reading that resists the erosion of the *ad bellum* threshold; it occludes the protection needs of populations inside states where the government itself is the source of violence, and it has been criticized for prioritizing non-interference over civilian protection in cases such as Syria and Myanmar.

Russian. The Russian perspective treats international law, and particularly the *ad bellum*/*in bello* framework, as an instrument of Western power projection. Moscow argues that the West has systematically expanded the exceptions to Article 2(4)—humanitarian intervention, the "war on terror," "unable or unwilling" doctrines—while holding Russia to a strict reading, and that IHL discourse is deployed to delegitimize Russian military operations while excusing Western ones. The Russian critique of lawfare is explicit: legal institutions (ICC, universal jurisdiction) are portrayed as tools of geopolitical competition rather than neutral justice. This perspective contributes a realist corrective that exposes double standards in enforcement; it occludes Russia's own violations of *ad bellum* (the 2022 invasion of Ukraine, which most of the international community regards as a clear Article 2(4) violation) and its *in bello* conduct, and it risks reducing all legal constraint to power politics, leaving no normative ground for civilian protection.

Western. The Western perspective is the primary author of the contemporary *ad bellum*/*in bello* framework and treats it as a genuine, if imperfect, achievement of legal civilization. It emphasizes the Charter's prohibition on force, the development of IHL, and the institutionalization of accountability through the ICC and universal jurisdiction. At the same time, Western scholarship and policy have produced the most sustained self-critique: Walzer's (1977, 2015) just war theory has been challenged from within; Luban (2014) has analyzed the legal corruption of the torture debate; and the drone-strike and Guantánamo controversies have generated extensive internal criticism. The Western perspective contributes the richest legal and philosophical apparatus for analyzing war; it occludes its own role in creating the exceptions it now criticizes, and it tends to universalize a historically particular (European, post-1945) legal order.

UN. The UN perspective is institutional and charter-based: the Secretary-General, the Security Council, and the various commissions and special rapporteurs treat IHL and the Charter as the operative framework, emphasizing civilian protection, accountability, and the prevention of atrocity. The UN has documented IHL violations across conflicts and has been the forum for the CCW discussions on lethal autonomous weapons. Its contribution is the maintenance of a common legal vocabulary and monitoring capacity; its occlusion is structural: the UN cannot enforce against permanent members of the Security Council, and its IHL discourse often lacks the power to alter state behavior, producing a gap between norm and practice that the UN itself cannot close.

SECTION 2.3 KEY IDEA 2 — Targeting Law: Distinction, Proportionality, Precautions, and the Shift to Effects-Based Operations

Bolded Causal Claim: The legal regulation of targeting in armed conflict has undergone a structural transformation from a platform-centric, rules-based framework to an effects-based, network-centric one, driven by precision munitions, persistent surveillance, and the operational logic of effects-based operations; this transformation preserves the formal vocabulary of distinction and proportionality while systematically expanding the category of permissible military objectives and lowering, in practice, the threshold of acceptable civilian harm.

Mechanism: The mechanism operates through four interacting legal-technical layers. First, distinction, codified in Additional Protocol I (1977) Article 48 and Article 52, requires parties to distinguish between combatants and civilians and between military objectives and civilian objects; a military objective is defined in Article 52(2) as an object which, by its nature, location, purpose, or use, makes an effective contribution to military action and whose total or partial destruction, capture, or neutralization offers a definite military advantage. Second, proportionality, in Articles 51(5)(b) and 57(2)(a)(iii), prohibits attacks expected to cause incidental civilian harm excessive in relation to the concrete and direct military advantage anticipated. Third, precautions, in Article 57, oblige commanders to verify targets, choose means and methods to minimize harm, give effective advance warning where feasible, and cancel or suspend an attack if it becomes apparent that it would be disproportionate. These three rules were designed for an industrial, platform-centric battlefield in which the destruction of tanks, ships, and factories was the measure of military effect. The fourth layer is the shift to effects-based operations (EBO), developed in United States doctrine from the 1990s onward, which targets not platforms but systems, networks, and centers of gravity in order to produce desired strategic effects. Under EBO, a power grid, a banking network, a telecommunications node, or a transportation hub becomes a military objective not because it is a weapon but because degrading it produces systemic military advantage. This redefinition expands the target set dramatically: dual-use infrastructure, previously protected as civilian, is reclassified as military by virtue of its contribution to the enemy's war-sustaining economy. Proportionality calculation shifts accordingly from a strike-by-strike assessment of collateral damage to a cumulative, campaign-level assessment of systemic effects, in which the "concrete and direct military advantage" is measured in terms of network degradation rather than platform destruction. The mechanism is reinforced by precision munitions and remote sensing, which create the technical capacity to strike individual nodes with apparent surgical accuracy, and by the rise of targeted killing, in which the target is a person rather than an object. The legal result is a framework in which the formal rules remain intact but their application is mediated by intelligence assessments, algorithmic target nomination, and battle damage assessment that are largely opaque to external scrutiny.

Scope Conditions: The targeting rules apply most fully in international armed conflict; in non-international armed conflict, Common Article 3 and customary law apply a thinner version of distinction and proportionality, and the legal status of many actors is contested. The effects-based expansion of military objectives depends on reliable intelligence: where intelligence is poor or politicized, the proportionality calculation rests on false premises, as in strikes on civilian gatherings mistaken for militant meetings. The framework assumes a state with precision capabilities and persistent surveillance; non-state actors and less capable states operate under different constraints. Urban warfare and the presence of human shields compress the space in which distinction can be operationalized. The "near certainty" standard adopted by the United States for counterterrorism strikes outside areas of active hostilities is a policy constraint, not a legal rule, and applies only where the executive chooses to apply it.

Observable Implications: The observable implications include the documented rise in civilian casualties in precision-intensive urban campaigns such as Mosul (2016-2017), Raqqa (2017), and Gaza (2023-2024), where the combination of effects-based targeting and dense civilian presence produced harm that the formal rules did not prevent. They include the expansion of target lists to include "signature strikes" based on behavioral patterns rather than identified individuals, and the legal opinions justifying strikes on dual-use infrastructure such as power and water systems. They include the debate over whether proportionality should be assessed per strike or cumulatively across a campaign, with significant consequences for the legality of infrastructure destruction. They include the growing role of algorithms and machine learning in target nomination, raising questions about human judgment in the application of distinction. They include the recurring finding by UN commissions of inquiry and human rights organizations that states invoking precision and proportionality have caused civilian harm that appears excessive by any reasonable standard, suggesting a systematic gap between the legal framework and its operational application.

Perspective Note (five traditions in brief): The African perspective, which must be reconstructed from within rather than fitted to Western theory, begins from the experience of African populations as the objects of targeting regimes designed elsewhere. African scholars such as Sabelo Ndlovu-Gatsheni and Mahmood Mamdani have emphasized that the legal categories of distinction and proportionality were developed in the context of interstate European warfare and map poorly onto African conflicts, where the line between combatant and civilian is blurred by colonial legacies, proxy forces, and the militarization of civilian life. The African vantage point reveals that effects-based operations, by targeting "war-sustaining" economies, have in practice targeted African civilian infrastructure and livelihoods, as in the destruction of economic nodes in Libya (2011) and the targeting of resource networks in the Sahel. African states and the African Union have pushed for stronger protection of civilians in urban warfare and for accountability when proportionality is violated, while noting that the states most capable of precision warfare are also those least subject to external accountability. The African perspective thus treats targeting law not as a neutral technical framework but as a historically situated practice that distributes the burdens of war onto populations with the least power to shape the rules. The Chinese perspective emphasizes state sovereignty and non-interference, treats targeting rules as applicable primarily in interstate conflict, and has been cautious about expanding IHL obligations to non-state actors or to counterterrorism contexts; China has engaged with CCW discussions on autonomous weapons but resists constraints that would limit its military modernization. The Russian perspective treats Western targeting doctrine, particularly effects-based operations and targeted killing, as instruments of hegemony that expand the permissible scope of force while holding adversaries to stricter standards; Russia has criticized the "humanitarian" framing of Western strikes as masking geopolitical objectives. The Western perspective is divided: legal scholars and military lawyers defend the IHL framework as the best available constraint on violence, while critics such as David Luban and Helen Kinsella have argued that proportionality is inherently indeterminate and that the shift to effects-based operations has eroded civilian protection in practice; the United States has developed extensive internal legal review processes (the "law of war manual") while resisting external accountability. The UN perspective, through the ICRC, special rapporteurs, and commissions of inquiry, treats distinction, proportionality, and precautions as binding customary and treaty law, emphasizes their application in all conflicts including NIACs, and has documented systematic violations; its occlusion is the lack of enforcement power, as UN findings on targeting violations rarely result in accountability.

SECTION 2.4 KEY IDEA 3 — Accountability Mechanisms: ICC, ICJ, Universal Jurisdiction, and the Politics of Enforcement

Bolded Causal Claim: International criminal accountability is structurally asymmetric: the institutions designed to enforce international humanitarian law and human rights law are most active against weak states and non-state actors, while powerful states and their allies enjoy de facto immunity, producing a system that legitimizes itself through selective enforcement rather than universal application.

Mechanism: The mechanism operates through three institutional channels and their political constraints. The first channel is the International Criminal Court, established by the Rome Statute (1998, entered into force 2002), which has jurisdiction over genocide, crimes against humanity, war crimes, and aggression. The ICC's jurisdiction is triggered in three ways: state party referral, Security Council referral under Chapter VII, or proprio motu investigation by the Prosecutor. The principle of complementarity means the ICC acts only where national jurisdictions are unwilling or unable to prosecute genuinely. The ICC has no police force; it depends on state cooperation for arrests, evidence, and enforcement, and its arrest warrants are executed only when the target enters the jurisdiction of a cooperating state. The second channel is the International Court of Justice, which adjudicates state responsibility rather than individual criminal liability, and which has been used to address genocide, occupation, and the use of force; its judgments are binding but enforcement depends on the Security Council, where permanent members can veto. The third channel is universal jurisdiction, exercised by national courts, which permits prosecution of international crimes regardless of where they were committed or the nationality of the perpetrator or victim; this has been used by European courts to prosecute Syrian, Rwandan, and Congolese suspects, and occasionally to investigate officials of powerful states. The political constraint operates at every level: Security Council referrals are subject to the veto, as in the blocked referral of Syria; state party withdrawals and threats of withdrawal (Burundi, Philippines, South Africa's attempted withdrawal) reduce the Court's reach; powerful states that are not parties (United States, Russia, China, Israel, India) are effectively immune from ICC jurisdiction unless referred by the Security Council, which they can veto. The mechanism thus produces a pattern in which accountability is most likely against actors in weak states, particularly in Africa, and least likely against permanent members of the Security Council and their allies.

Scope Conditions: Accountability functions where there is political will, state cooperation, and a favorable power configuration; it fails where the target is powerful or protected. Complementarity means the ICC is a court of last resort, and its caseload reflects the failures of national systems as much as the gravity of crimes. Universal jurisdiction depends on domestic legal frameworks, prosecutorial discretion, and the political appetite of the forum state. The ICC's legitimacy depends on perceived impartiality; where it is seen as selective, its authority erodes. The ICJ's effectiveness depends on the willingness of states to comply and on Security Council enforcement. The mechanism is also shaped by the "peace versus justice" debate: accountability can be traded for peace agreements, as in the deferral of ICC investigations in exchange for cooperation, or can be used as a tool of pressure in ongoing conflicts.

Observable Implications: The observable implications include the historical concentration of ICC investigations in Africa, which produced the perception of an "African bias" and led to the African Union's push for the Malabo Protocol and the mass withdrawal threat of 2016. They include the ICC arrest warrants for Vladimir Putin (2023) and for Israeli and Hamas leaders (2024), which represent an expansion of the Court's reach toward more powerful actors but also expose its dependence on enforcement, as neither Russia nor Israel is a party and neither will cooperate. They include the ICJ's provisional measures orders in South Africa v. Israel (2024) and in Ukraine v. Russia (2022), which carry legal weight but lack enforcement.

They include the growth of universal jurisdiction cases in European courts, which have prosecuted Syrian officials and Rwandan génocidaires but have rarely reached officials of powerful Western states. They include the asymmetry in accountability for drone strikes, torture, and rendition, where internal investigations and settlements have substituted for criminal prosecution. They include the AU's adoption of the Malabo Protocol (2014), which would create an African criminal court with jurisdiction over international crimes, representing an attempt to reclaim accountability from the ICC.

Perspective Note (five traditions in brief): The African perspective, reconstructed from within, treats the ICC not as a neutral legal institution but as a political actor embedded in a global power structure that has historically targeted African leaders while exempting powerful states. African scholars such as Kamari Maxine Clarke, Makau Mutua, and Mahmood Mamdani have documented how the ICC's early caseload was overwhelmingly African, producing a legitimacy crisis that the Court has only partially addressed. The African Union's resistance, including the 2016 mass withdrawal threat and the Malabo Protocol, reflects a demand for accountability that is not selective but genuinely universal, and for African ownership of justice processes. The African vantage point reveals that the "international community" invoked by accountability mechanisms is itself a political construct that distributes the power to define crimes and to enforce judgments unevenly; it reveals that complementarity, in practice, often means African states are judged by external standards while powerful states judge themselves. The African perspective also emphasizes that accountability without structural transformation—addressing the economic and political conditions that produce violence—is incomplete, and that the focus on individual criminal responsibility can obscure collective and historical responsibility, including colonial violence. The Chinese perspective emphasizes sovereignty and non-interference, treats the ICC as a Western-dominated institution, and has refused to join the Rome Statute; China has engaged with the ICJ on territorial and maritime disputes but resists international criminal jurisdiction over its nationals. The Russian perspective treats the ICC as an instrument of Western lawfare, particularly after the Putin arrest warrant, and has withdrawn its signature from the Rome Statute; Russia argues that the Court applies double standards and serves geopolitical objectives. The Western perspective is internally divided: liberal internationalists defend the ICC and universal jurisdiction as essential to the rule of law, while realists and sovereigntists criticize them as overreach; self-critique exists, particularly regarding the failure to hold Western officials accountable for torture, rendition, and drone strikes, but it has rarely produced criminal accountability. The UN perspective treats the ICC and ICJ as essential components of the international legal order, supports accountability for atrocity crimes, and has been the forum for Security Council referrals; its occlusion is structural, as the UN cannot enforce against permanent members and its accountability discourse often lacks the power to alter state behavior, producing a gap between norm and practice.

That should be sufficient. Let me check word counts roughly. Each section is substantial. Good.

I should ensure no invented quotations. I used paraphrases. Good.

Now final output.### SECTION 2.3 KEY IDEA 2 — Targeting Law: Distinction, Proportionality, Precautions, and the Shift to Effects-Based Operations

Bolded Causal Claim: The legal regulation of targeting in armed conflict has undergone a structural transformation from a platform-centric, rules-based framework to an effects-based, network-centric one, driven by precision munitions, persistent surveillance, and the operational logic of effects-based operations; this transformation preserves the formal vocabulary of distinction and proportionality while systematically ex-

panding the category of permissible military objectives and lowering, in practice, the threshold of acceptable civilian harm.

Mechanism: The mechanism operates through four interacting legal-technical layers. First, distinction, codified in Additional Protocol I (1977) Article 48 and Article 52, requires parties to distinguish between combatants and civilians and between military objectives and civilian objects; a military objective is defined in Article 52(2) as an object which, by its nature, location, purpose, or use, makes an effective contribution to military action and whose total or partial destruction, capture, or neutralization offers a definite military advantage. Second, proportionality, in Articles 51(5)(b) and 57(2)(a)(iii), prohibits attacks expected to cause incidental civilian harm excessive in relation to the concrete and direct military advantage anticipated. Third, precautions, in Article 57, oblige commanders to verify targets, choose means and methods to minimize harm, give effective advance warning where feasible, and cancel or suspend an attack if it becomes apparent that it would be disproportionate. These three rules were designed for an industrial, platform-centric battlefield in which the destruction of tanks, ships, and factories was the measure of military effect. The fourth layer is the shift to effects-based operations (EBO), developed in United States doctrine from the 1990s onward, which targets not platforms but systems, networks, and centers of gravity in order to produce desired strategic effects. Under EBO, a power grid, a banking network, a telecommunications node, or a transportation hub becomes a military objective not because it is a weapon but because degrading it produces systemic military advantage. This redefinition expands the target set dramatically: dual-use infrastructure, previously protected as civilian, is reclassified as military by virtue of its contribution to the enemy's war-sustaining economy. Proportionality calculation shifts accordingly from a strike-by-strike assessment of collateral damage to a cumulative, campaign-level assessment of systemic effects, in which the "concrete and direct military advantage" is measured in terms of network degradation rather than platform destruction. The mechanism is reinforced by precision munitions and remote sensing, which create the technical capacity to strike individual nodes with apparent surgical accuracy, and by the rise of targeted killing, in which the target is a person rather than an object. The legal result is a framework in which the formal rules remain intact but their application is mediated by intelligence assessments, algorithmic target nomination, and battle damage assessment that are largely opaque to external scrutiny.

Scope Conditions: The targeting rules apply most fully in international armed conflict; in non-international armed conflict, Common Article 3 and customary law apply a thinner version of distinction and proportionality, and the legal status of many actors is contested. The effects-based expansion of military objectives depends on reliable intelligence: where intelligence is poor or politicized, the proportionality calculation rests on false premises, as in strikes on civilian gatherings mistaken for militant meetings. The framework assumes a state with precision capabilities and persistent surveillance; non-state actors and less capable states operate under different constraints. Urban warfare and the presence of human shields compress the space in which distinction can be operationalized. The "near certainty" standard adopted by the United States for counterterrorism strikes outside areas of active hostilities is a policy constraint, not a legal rule, and applies only where the executive chooses to apply it.

Observable Implications: The observable implications include the documented rise in civilian casualties in precision-intensive urban campaigns such as Mosul (2016-2017), Raqqa (2017), and Gaza (2023-2024), where the combination of effects-based targeting and dense civilian presence produced harm that the formal rules did not prevent. They include the expansion of target lists to include "signature strikes" based on behavioral patterns rather than identified individuals, and the legal opinions justifying strikes on dual-use infrastructure such as power and water systems. They include the debate over whether proportionality should be assessed per strike or cumulatively across a campaign, with significant consequences for the legality of

infrastructure destruction. They include the growing role of algorithms and machine learning in target nomination, raising questions about human judgment in the application of distinction. They include the recurring finding by UN commissions of inquiry and human rights organizations that states invoking precision and proportionality have caused civilian harm that appears excessive by any reasonable standard, suggesting a systematic gap between the legal framework and its operational application.

Perspective Note (five traditions in brief): The African perspective, which must be reconstructed from within rather than fitted to Western theory, begins from the experience of African populations as the objects of targeting regimes designed elsewhere. African scholars such as Sabelo Ndlovu-Gatsheni and Mahmood Mamdani have emphasized that the legal categories of distinction and proportionality were developed in the context of interstate European warfare and map poorly onto African conflicts, where the line between combatant and civilian is blurred by colonial legacies, proxy forces, and the militarization of civilian life. The African vantage point reveals that effects-based operations, by targeting "war-sustaining" economies, have in practice targeted African civilian infrastructure and livelihoods, as in the destruction of economic nodes in Libya (2011) and the targeting of resource networks in the Sahel. African states and the African Union have pushed for stronger protection of civilians in urban warfare and for accountability when proportionality is violated, while noting that the states most capable of precision warfare are also those least subject to external accountability. The African perspective thus treats targeting law not as a neutral technical framework but as a historically situated practice that distributes the burdens of war onto populations with the least power to shape the rules. The Chinese perspective emphasizes state sovereignty and non-interference, treats targeting rules as applicable primarily in interstate conflict, and has been cautious about expanding IHL obligations to non-state actors or to counterterrorism contexts; China has engaged with CCW discussions on autonomous weapons but resists constraints that would limit its military modernization. The Russian perspective treats Western targeting doctrine, particularly effects-based operations and targeted killing, as instruments of hegemony that expand the permissible scope of force while holding adversaries to stricter standards; Russia has criticized the "humanitarian" framing of Western strikes as masking geopolitical objectives. The Western perspective is divided: legal scholars and military lawyers defend the IHL framework as the best available constraint on violence, while critics such as David Luban and Helen Kinsella have argued that proportionality is inherently indeterminate and that the shift to effects-based operations has eroded civilian protection in practice; the United States has developed extensive internal legal review processes (the "law of war manual") while resisting external accountability. The UN perspective, through the ICRC, special rapporteurs, and commissions of inquiry, treats distinction, proportionality, and precautions as binding customary and treaty law, emphasizes their application in all conflicts including NIACs, and has documented systematic violations; its occlusion is the lack of enforcement power, as UN findings on targeting violations rarely result in accountability.

SECTION 2.4 KEY IDEA 3 — Accountability Mechanisms: ICC, ICJ, Universal Jurisdiction, and the Politics of Enforcement

Bolded Causal Claim: International criminal accountability is structurally asymmetric: the institutions designed to enforce international humanitarian law and human rights law are most active against weak states and non-state actors, while powerful states and their allies enjoy de facto immunity, producing a system that legitimizes itself through selective enforcement rather than universal application.

Mechanism: The mechanism operates through three institutional channels and their political constraints. The first channel is the International Criminal Court, established by the Rome Statute (1998, entered into

force 2002), which has jurisdiction over genocide, crimes against humanity, war crimes, and aggression. The ICC's jurisdiction is triggered in three ways: state party referral, Security Council referral under Chapter VII, or proprio motu investigation by the Prosecutor. The principle of complementarity means the ICC acts only where national jurisdictions are unwilling or unable to prosecute genuinely. The ICC has no police force; it depends on state cooperation for arrests, evidence, and enforcement, and its arrest warrants are executed only when the target enters the jurisdiction of a cooperating state. The second channel is the International Court of Justice, which adjudicates state responsibility rather than individual criminal liability, and which has been used to address genocide, occupation, and the use of force; its judgments are binding but enforcement depends on the Security Council, where permanent members can veto. The third channel is universal jurisdiction, exercised by national courts, which permits prosecution of international crimes regardless of where they were committed or the nationality of the perpetrator or victim; this has been used by European courts to prosecute Syrian, Rwandan, and Congolese suspects, and occasionally to investigate officials of powerful states. The political constraint operates at every level: Security Council referrals are subject to the veto, as in the blocked referral of Syria; state party withdrawals and threats of withdrawal (Burundi, Philippines, South Africa's attempted withdrawal) reduce the Court's reach; powerful states that are not parties (United States, Russia, China, Israel, India) are effectively immune from ICC jurisdiction unless referred by the Security Council, which they can veto. The mechanism thus produces a pattern in which accountability is most likely against actors in weak states, particularly in Africa, and least likely against permanent members of the Security Council and their allies.

Scope Conditions: Accountability functions where there is political will, state cooperation, and a favorable power configuration; it fails where the target is powerful or protected. Complementarity means the ICC is a court of last resort, and its caseload reflects the failures of national systems as much as the gravity of crimes. Universal jurisdiction depends on domestic legal frameworks, prosecutorial discretion, and the political appetite of the forum state. The ICC's legitimacy depends on perceived impartiality; where it is seen as selective, its authority erodes. The ICJ's effectiveness depends on the willingness of states to comply and on Security Council enforcement. The mechanism is also shaped by the "peace versus justice" debate: accountability can be traded for peace agreements, as in the deferral of ICC investigations in exchange for cooperation, or can be used as a tool of pressure in ongoing conflicts.

Observable Implications: The observable implications include the historical concentration of ICC investigations in Africa, which produced the perception of an "African bias" and led to the African Union's push for the Malabo Protocol and the mass withdrawal threat of 2016. They include the ICC arrest warrants for Vladimir Putin (2023) and for Israeli and Hamas leaders (2024), which represent an expansion of the Court's reach toward more powerful actors but also expose its dependence on enforcement, as neither Russia nor Israel is a party and neither will cooperate. They include the ICJ's provisional measures orders in South Africa v. Israel (2024) and in Ukraine v. Russia (2022), which carry legal weight but lack enforcement. They include the growth of universal jurisdiction cases in European courts, which have prosecuted Syrian officials and Rwandan génocidaires but have rarely reached officials of powerful Western states. They include the asymmetry in accountability for drone strikes, torture, and rendition, where internal investigations and settlements have substituted for criminal prosecution. They include the AU's adoption of the Malabo Protocol (2014), which would create an African criminal court with jurisdiction over international crimes, representing an attempt to reclaim accountability from the ICC.

Perspective Note (five traditions in brief): The African perspective, reconstructed from within, treats the ICC not as a neutral legal institution but as a political actor embedded in a global power structure that has historically targeted African leaders while exempting powerful states. African scholars such as Kamari

Maxine Clarke, Makau Mutua, and Mahmood Mamdani have documented how the ICC's early caseload was overwhelmingly African, producing a legitimacy crisis that the Court has only partially addressed. The African Union's resistance, including the 2016 mass withdrawal threat and the Malabo Protocol, reflects a demand for accountability that is not selective but genuinely universal, and for African ownership of justice processes. The African vantage point reveals that the "international community" invoked by accountability mechanisms is itself a political construct that distributes the power to define crimes and to enforce judgments unevenly; it reveals that complementarity, in practice, often means African states are judged by external standards while powerful states judge themselves. The African perspective also emphasizes that accountability without structural transformation—addressing the economic and political conditions that produce violence—is incomplete, and that the focus on individual criminal responsibility can obscure collective and historical responsibility, including colonial violence. The Chinese perspective emphasizes sovereignty and non-interference, treats the ICC as a Western-dominated institution, and has refused to join the Rome Statute; China has engaged with the ICJ on territorial and maritime disputes but resists international criminal jurisdiction over its nationals. The Russian perspective treats the ICC as an instrument of Western lawfare, particularly after the Putin arrest warrant, and has withdrawn its signature from the Rome Statute; Russia argues that the Court applies double standards and serves geopolitical objectives. The Western perspective is internally divided: liberal internationalists defend the ICC and universal jurisdiction as essential to the rule of law, while realists and sovereigntists criticize them as overreach; self-critique exists, particularly regarding the failure to hold Western officials accountable for torture, rendition, and drone strikes, but it has rarely produced criminal accountability. The UN perspective treats the ICC and ICJ as essential components of the international legal order, supports accountability for atrocity crimes, and has been the forum for Security Council referrals; its occlusion is structural, as the UN cannot enforce against permanent members and its accountability discourse often lacks the power to alter state behavior, producing a gap between norm and practice.

SECTION 2.5 KEY IDEA 4 — Autonomous weapons and the LAWS debate: the ethical and legal status of algorithmic killing

Bolded Causal Claim:
The central ethical and legal problem of lethal autonomous weapon systems is not that machines might kill without human emotion, but that they may kill without a human being who can be held responsible under the legal and moral frameworks that make killing in war conditionally permissible.

Mechanism:
International humanitarian law presupposes a human decision-maker who can perceive a battlefield, interpret ambiguous cues, weigh military advantage against civilian harm, and bear responsibility for error. Distinction, proportionality, and precautions are not merely rules applied to outcomes; they are practices of judgment performed by agents who can be questioned, disciplined, and punished. Lethal autonomous weapon systems alter this architecture by shifting lethal authority from a human who decides to a system that executes according to pre-programmed parameters, sensor inputs, and machine-learning classifications. The mechanism of concern is therefore not simply automation of firing, but the relocation of morally and legally significant judgment into technical processes that may be opaque, brittle, and difficult to audit. A system trained on historical data may reproduce biases in target recognition; an adversarial environment may produce misclassification; and the speed of machine-to-machine engagement may compress the temporal space in which

human oversight could meaningfully intervene. The result is an accountability gap: if an autonomous system kills civilians, responsibility may be distributed so thinly across commanders, programmers, manufacturers, data providers, and political authorities that no single actor satisfies the legal or moral conditions for accountability. The emerging concept of "meaningful human control" attempts to close this gap by insisting that humans retain not merely a veto, but a substantive role in target selection and engagement decisions. Yet the concept remains contested because states disagree over whether control must be exercised before deployment, during engagement, or through post-hoc review, and because military incentives favor systems that can act faster than human cognition. The LAWS debate is thus not only a debate about technology; it is a debate about whether the legal and ethical legitimacy of lethal force depends on human agency in a way that cannot be transferred to machines without changing the nature of war itself.

Scope Conditions:
The problem is most acute where three conditions coincide: first, where systems can select and engage targets without real-time human authorization; second, where operational environments are complex, dynamic, and populated by civilians whose status is not easily computable; and third, where states possess advanced artificial intelligence, sensor fusion, and networked command systems. It is less acute for remotely operated weapons in which a human retains direct control over each engagement, and for defensive systems whose target sets are comparatively constrained. The debate also depends on definitional scope: some states and civil society actors define autonomy by the absence of human control over individual attacks, while others define it by the degree of machine learning or by the system's ability to adapt after deployment. These definitional differences matter because they determine whether existing weapons fall within the category and whether a new treaty is necessary. The issue is further shaped by the structure of the Convention on Certain Conventional Weapons, where consensus-based decision-making allows a small number of technologically advanced states to slow or block binding regulation. Finally, the ethical problem intensifies in urban and asymmetric conflicts, where civilian presence, irregular combatants, and information ambiguity make distinction and proportionality especially demanding.

Observable Implications:
If the mechanism is operative, one should observe states investing in autonomous targeting aids while resisting legally binding prohibitions; civil society and humanitarian organizations campaigning for a ban on systems that target humans without meaningful human control; and international forums producing reports and principles but struggling to reach consensus on definitions or prohibitions. One should also observe national policy statements that permit autonomous functions under certain conditions while asserting compliance with international humanitarian law, as well as debates over whether "appropriate levels of human judgment" are sufficient to satisfy legal obligations. The accountability gap should appear in legal uncertainty about who is responsible when an autonomous system causes unlawful harm, and in the difficulty of applying individual criminal responsibility to distributed technical systems. In military practice, the pressure to shorten decision cycles may produce "human-on-the-loop" arrangements in which human oversight is technically present but operationally nominal. In diplomacy, the LAWS debate should reveal a divide between states that view autonomous weapons as a necessary response to strategic competition and those that view them as a threat to civilian protection and human dignity.

Perspective Note (five traditions in brief):
African (primary): African perspectives often stress that autonomous weapons risk extending patterns of externally imposed violence into new technological domains, particularly where systems are trained, tested, or deployed in contexts shaped by racialized or colonial assumptions about threat and civilian identity. African scholarship and diplomatic engagement frequently emphasize that governance of emerging military technolo-

gies must not be monopolized by technologically advanced states, and that African security concerns—such as border surveillance, counterterrorism, and protection of civilians in complex conflicts—should shape global rules rather than be treated as testing grounds. The demand for meaningful human control is therefore linked not only to humanitarian protection but also to equitable participation in the making of international security norms.

Chinese: China generally supports discussion of LAWS within the Convention on Certain Conventional Weapons while emphasizing state sovereignty, consensus, and the legitimacy of military modernization; it has often supported restrictions on use while resisting constraints that would impede lawful development or defensive applications. Its position reflects a broader commitment to non-interference and to preserving strategic flexibility in an era of great-power competition.

Russian: Russia typically argues that existing international humanitarian law is sufficient to regulate new weapons, opposes new binding prohibitions, and frames restrictions on autonomous systems as potentially undermining legitimate self-defense and military effectiveness. This position is consistent with a broader skepticism toward Western-led humanitarian disarmament initiatives and with an emphasis on state sovereignty.

Western: Western states are internally divided: humanitarian and legal communities often support a ban or strict regulation of lethal autonomous weapons, while defense establishments emphasize operational advantages, force protection, and the possibility of more precise targeting. The United States and several allies have resisted a binding prohibition while adopting internal policies requiring human judgment, revealing a tension between ethical aspiration and strategic competition.

UN: The United Nations, particularly through the Secretary-General and humanitarian agencies, has increasingly supported prohibitions on machines that target human beings without human control and has framed LAWS as a challenge to human dignity, civilian protection, and accountability. Its occlusion is structural: the UN can convene and articulate norms, but binding regulation depends on state consensus, and enforcement mechanisms remain weak.

SECTION 2.6 KEY IDEA 5 — The politics of humanitarianism: aid, access, and the securitization of relief

Bolded Causal Claim:

Humanitarianism's claim to neutrality is operationally unsustainable in armed conflict; when relief is integrated into counterinsurgency, stabilization, sanctions, or border-control architectures, aid ceases to be merely protective and becomes a technique of governance that can intensify vulnerability, reshape political authority, and determine who is allowed to survive.

Mechanism:

Humanitarian action is conventionally organized around four principles: humanity, neutrality, impartiality, and independence. In practice, these principles are not self-executing; they must be negotiated with armed actors, states, donors, and local communities. The mechanism of securitization begins when humanitarian access, logistics, and objectives are subordinated to security priorities. Aid may be used to win civilian support in counterinsurgency, to stabilize territories after military operations, to incentivize cooperation with authorities, or to manage refugee and migrant flows. In such settings, relief becomes a resource in political competition rather than a neutral response to need. Counterterrorism and sanctions regimes add a second mechanism: by criminalizing material support to designated groups or imposing compliance burdens on aid organizations, they restrict the ability of humanitarians to operate impartially in areas controlled by sanctioned actors. A third mechanism is the militarization of humanitarian space, in which military forces provide or protect aid, blurring the distinction between combatants and relief workers and exposing aid personnel to

attack. A fourth is the political economy of aid, in which external funding empowers certain local actors, creates parallel governance structures, and marginalizes others. The cumulative effect is that humanitarianism can protect lives while also reinforcing the very power structures that produce insecurity. The securitization of relief therefore does not require bad faith; it can emerge from the ordinary effort to deliver aid in environments where sovereignty, violence, and need are already politically contested.

Scope Conditions:
The mechanism is strongest in protracted conflicts, asymmetric wars, sieges, and counterterrorism campaigns, where armed groups control territory and civilian populations, and where states seek to combine military, political, and humanitarian tools. It is also strong where sanctions regimes are broad, where donor governments condition aid on political objectives, and where humanitarian corridors are negotiated as part of military strategy. It is weaker in natural disasters or conflicts where humanitarian actors can operate with genuine independence and where belligerents accept neutral access. The scope is further shaped by the legal status of humanitarian actors: their protections under international humanitarian law depend on distinction and on not taking part in hostilities, a boundary that becomes difficult to maintain when aid is visibly aligned with one side. Local context matters as well; in some settings, community-based and faith-based organizations sustain access where international agencies cannot, while in others they are co-opted or endangered by association with external agendas.

Observable Implications:
If the mechanism is operative, one should observe humanitarian access being conditioned on political or military cooperation; aid workers facing violence because they are perceived as aligned with one party; and counterterrorism laws creating delays, over-compliance, or withdrawal from high-risk areas. One should also observe the growth of "stabilization" and "resilience" programming that merges relief with governance and security objectives; the use of humanitarian corridors or pauses as tactical instruments; and the marginalization of local organizations despite rhetorical commitments to localization. Data should show disparities between needs and assistance, with populations in sanctioned or contested areas receiving less aid. The securitization of relief should also appear in debates over whether humanitarian principles are being eroded by donor priorities, and in the increasing professionalization of risk management, which can distance aid from affected communities. In extreme cases, aid diversion to armed actors or the use of starvation as a method of warfare should expose the limits of humanitarian protection when relief is embedded in coercive strategies.

Perspective Note (five traditions in brief):
African (primary): African perspectives frequently critique humanitarianism as a continuation of external governance, emphasizing that aid can reproduce dependency, empower intermediaries, and displace local political agency. African scholarship and practitioner experience highlight indigenous coping mechanisms, community solidarity, and local organizations that are often rendered invisible by international humanitarian architectures. At the same time, African states assert sovereignty over access and may view unrestricted humanitarian intervention with suspicion, particularly where it appears to bypass or undermine state authority. The African vantage point thus reveals that humanitarianism is not only a moral practice but also a field of power in which questions of who defines need, who controls resources, and who speaks for affected populations are deeply political.
Chinese: China emphasizes state sovereignty, non-interference, and the primary responsibility of the affected state for humanitarian response, while supporting assistance delivered with state consent. It is generally skeptical of humanitarian intervention and of the securitization of aid by Western actors, and it increasingly participates in peacekeeping and disaster relief as part of a state-led model of international engagement.
Russian: Russia often frames Western humanitarianism as a vehicle for intervention, regime change, or

geopolitical influence, and emphasizes sovereignty, state consent, and the dangers of politicized aid. It has supported humanitarian corridors and aid deliveries in conflicts where it is involved, while criticizing sanctions and counterterrorism frameworks as forms of collective punishment that harm civilians.
Western: Western perspectives are divided between humanitarian organizations that defend neutrality and independence and governments that integrate aid into stabilization, counterterrorism, and migration-control strategies. There is significant self-critique regarding militarized aid, donor conditionality, and the chilling effects of counterterrorism laws, but accountability for harmful practices remains uneven.
UN: The United Nations promotes humanitarian principles, civilian protection, and access negotiations through agencies such as OCHA, while recognizing that humanitarian space is shrinking. Its perspective is shaped by the tension between normative commitment to impartial relief and dependence on member states for security, funding, and political support; the UN can advocate for access but cannot compel sovereign states or armed groups to grant it.

SECTION 2.7 — FIVE PERSPECTIVES IN DEPTH

2.7.1 African Perspective (PRIMARY)

The African vantage point begins from a historical and structural critique of international law rather than from the assumption that the legal architecture of war is a neutral framework awaiting better compliance. From this perspective, *jus ad bellum* and *jus in bello* are not merely technical rules that separate lawful from unlawful force; they are part of a longer history in which sovereignty, humanity, and accountability have been distributed unequally across a racialized international order. Grovogui's argument that Africans were incorporated into international society as "quasi sovereigns" captures the foundational grievance: the legal order that now governs the use of force was built during an era in which African polities were denied the full sovereignty that European states claimed for themselves. Consequently, when contemporary African governments, jurists, and scholars assess lawfare, they do not ask only whether a particular strike, intervention, or prosecution complies with the Charter or the Geneva Conventions. They ask whose legal categories are being applied, by whom, against whom, and with what historical continuity. This makes the African perspective the most suspicious of formalism among the five: it treats legal rules as embedded in power, not as standing above it.

That suspicion is rooted in anti-colonial political thought. Nkrumah's analysis of neo-colonialism warned that formal independence could coexist with continued external control through economic, military, and legal instruments; Rodney's account of underdevelopment showed how the international system extracted value while presenting its rules as universal; Fanon insisted that colonial order was maintained through violence that was then legalized and normalized; Cabral argued that liberation required cultural and political self-determination, not merely the transfer of administrative authority. Nyerere's emphasis on self-reliance and collective African agency, and Mamdani's distinction between citizen and subject, add a crucial institutional insight: the post-colonial state often inherited legal systems that governed populations differently, producing citizens with rights and subjects administered by coercion. In the domain of war, this means that international humanitarian law can appear simultaneously as a protection for African civilians and as a continuation of external tutelage. The African perspective therefore does not reject IHL; rather, it insists that IHL be read through the history of empire, racial hierarchy, and unequal sovereignty.

This historical lens reshapes the interpretation of accountability mechanisms. African states were among the early supporters of the Rome Statute, and many African jurists and civil-society actors have been genuine

champions of international criminal justice. Yet the concentration of ICC investigations and prosecutions in Africa produced a sustained critique of selectivity. The African Union's pushback—withdrawal threats, non-cooperation debates, and demands for reform—should not be caricatured as simple impunity-seeking. It reflects a claim that the ICC's docket has tracked geopolitical power rather than the global distribution of atrocity. The Malabo Protocol, adopted in 2014 to extend the African Court of Justice and Human Rights' jurisdiction to international and transnational crimes, is best understood as an attempt to create continental ownership of accountability. It remains not fully operational, and its promise is constrained by funding, ratification, and political will. Still, it signals a demand that African institutions, not only The Hague, be the primary sites for judging African wars. The African perspective thus contributes a powerful corrective: accountability that is perceived as externally imposed can undermine the very legitimacy it seeks to establish.

Universal jurisdiction produces a similar duality. From one angle, European prosecutions of African officials or non-state actors can look like legal imperialism: extraterritorial courts applying Western legal standards to African conflicts while powerful states remain shielded. From another angle, African victims and human-rights advocates have supported universal jurisdiction precisely because domestic courts are often captured, under-resourced, or politically constrained. The African perspective therefore does not resolve the tension in favor of either sovereignty or justice; it reveals that the tension is structural. Sovereignty is both a shield against external domination and a potential cover for elite impunity. The African vantage point asks whether international law can be reformed so that accountability is neither a tool of powerful states nor a hollow promise to victims.

Targeting law is read through the same asymmetry. Distinction, proportionality, and precautions are formally universal, but their application in contemporary conflicts often depends on who possesses advanced surveillance, precision weapons, and legal advisory capacity. Effects-based operations and remote warfare—especially drone strikes in Somalia and other African theaters—transfer physical risk away from intervening forces and onto local populations. The legal categorization of conflict, the identification of "military objectives," and the assessment of "expected" civilian harm are not neutral technical exercises; they are shaped by intelligence asymmetries and by the political willingness of powerful states to tolerate civilian casualties. African scholars and policymakers have therefore emphasized that precision warfare can obscure rather than eliminate harm, and that legal compliance claims can function as moral alibis. The African perspective also highlights the gendered dimensions of targeting and humanitarian categorization. Tamale's decolonial feminist scholarship and Oyěwùmí's critique of the colonial invention of gendered categories remind us that legal distinctions between combatant and civilian, protector and protected, are not culturally neutral. Kinsella's work on the gendered image of the civilian similarly helps explain why humanitarian protection often reproduces hierarchies rather than dissolving them.

Humanitarianism is perhaps where the African perspective is most sharply critical. Aid, access, and relief are often presented as morally uncomplicated goods, yet African experience shows how humanitarian space can be securitized, militarized, and subordinated to donor priorities. Counterterrorism frameworks, migration-control agendas, and stabilization missions can reshape aid into an instrument of external security. Bayart's concept of extraversion helps explain how African elites and institutions may be incentivized to perform compliance with external agendas in order to secure resources and legitimacy. Mbembe's necropolitics adds a darker register: humanitarian governance can manage populations as "living dead," preserving life at the threshold of death without restoring political agency. The African perspective therefore insists that humanitarianism be evaluated not only by tons of aid delivered or corridors opened, but by whether it reinforces dependency, bypasses local institutions, or legitimizes coercive security architectures. At the same time, African actors are not merely critics. The African Union's humanitarian architecture, regional economic

communities, and local civil-society organizations have developed practices of protection and relief that are often more contextually grounded than externally designed interventions. The perspective thus calls for "African solutions to African problems" without romanticizing African state capacity.

On autonomous weapons, the African position is shaped by technological asymmetry and by the fear that algorithmic killing will further lower the threshold for the use of force in spaces already marked by intervention. Many African states participating in the Convention on Certain Conventional Weapons have supported meaningful human control and, in some cases, a ban on fully autonomous lethal systems. The concern is not only that machines cannot comply with distinction and proportionality, but that the diffusion of such systems will deepen global inequality: those who design, deploy, and legally justify autonomous weapons will not be those who suffer their errors. This is consistent with the broader African critique of lawfare as a practice that converts technological superiority into legal authority.

What the African perspective contributes that the other four cannot is a sustained insistence that international legal order is historically constituted by empire and that its contemporary enforcement reproduces global hierarchy. It foregrounds anti-colonial sovereignty, local ownership, victim-centered justice, and the political economy of aid. It reveals how legal categories can be used to legitimize remote warfare, selective accountability, and humanitarian securitization. Its occlusions are equally important. The perspective can sometimes understate intra-African violence, elite predation, and the genuine need for external accountability when domestic systems fail. Pan-African solidarity, while politically valuable, can be mobilized to shield perpetrators or to deflect criticism of African governments. The Malabo Protocol remains aspirational, and the African Union's non-indifference principle has been applied unevenly. Moreover, "the African perspective" is not monolithic: states, regional organizations, victims' groups, feminist scholars, and security professionals disagree about the balance between sovereignty and justice. The most defensible version of the perspective is therefore not a rejection of international law, but a demand that law be accountable to the histories and peoples it claims to protect.

2.7.2 Chinese Perspective

The Chinese perspective on lawfare and the ethics of war is anchored in a strong commitment to state sovereignty, territorial integrity, and non-interference, combined with an increasingly active but state-centric engagement with international humanitarian law. Rooted in the Five Principles of Peaceful Coexistence and the UN Charter, it treats the prohibition on the use of force as the cornerstone of international order. From this vantage point, *jus ad bellum* is not a flexible moral framework but a legal constraint: force is lawful only in self-defense or when authorized by the Security Council. Humanitarian intervention, regime change, and unilateral "lawfare" are viewed with deep suspicion because they can be used to undermine sovereign equality and to impose external political preferences. The Chinese position therefore contributes a powerful defense of legal restraint against the expansion of exceptions to Article 2(4).

On *jus in bello*, China supports the Geneva Conventions and the core principles of distinction, proportionality, and precautions, while emphasizing implementation, capacity building, and the responsibilities of states to train and discipline their forces. It is generally critical of effects-based operations and remote warfare that risk civilian harm, particularly when conducted outside transparent legal frameworks. Chinese discourse tends to stress that technological precision does not automatically satisfy humanitarian obligations and that civilian protection requires political restraint, not only better targeting algorithms. This creates a point of convergence with African and Russian critiques of Western remote warfare, though China's emphasis is less on anti-imperial history and more on sovereignty and multilateral process.

Accountability is approached through complementarity and state consent. China is not a party to the Rome Statute and has been cautious about the ICC's exercise of jurisdiction, particularly where it might affect non-party states or be perceived as politicized. It generally favors domestic accountability, Security Council-based mechanisms, and UN fact-finding, while resisting universal jurisdiction as an infringement on sovereignty. At the same time, China has increased its participation in UN peacekeeping and has shown greater interest in IHL training, humanitarian assistance, and post-conflict reconstruction. Its contribution lies in insisting that accountability must be embedded in multilateral institutions and state consent rather than in ad hoc or selective enforcement.

On autonomous weapons, China participates in CCW discussions and has expressed support for maintaining meaningful human control over lethal force. It has warned against an unregulated arms race in autonomous systems and has emphasized that new weapons must comply with existing IHL. The Chinese position is not simply abolitionist; it is regulatory and sovereignty-preserving, seeking to prevent both humanitarian harm and strategic disadvantage. It contributes to the LAWS debate by highlighting the need for international consensus and by resisting unilateral technological dominance.

Humanitarianism, in the Chinese view, should be governed by state consent, non-politicization, and the integration of relief with development. China is skeptical of aid that is securitized, conditional, or used to advance regime-change agendas. It emphasizes sovereignty, equality, and mutual benefit in humanitarian and development cooperation. This perspective contributes a critique of Western donor conditionality and of the shrinking space for neutral relief, but it can occlude the vulnerabilities of populations living under abusive governments and the need for independent humanitarian access. Its state-centric bias may understate the role of non-state actors, local civil society, and victim-centered accountability. Nonetheless, the Chinese perspective is valuable because it insists that international humanitarian order must rest on sovereign equality and multilateral legitimacy rather than on the discretionary power of the strongest states.

2.7.3 Russian Perspective

The Russian perspective treats lawfare as a central instrument of contemporary geopolitical competition, particularly as a means by which Western states delegitimize adversaries, justify intervention, and constrain rivals through legal categories. It is rooted in a strong defense of sovereignty, multipolarity, and the UN Charter's prohibition on the use of force. From this vantage point, *jus ad bellum* exceptions have been expanded illegitimately through doctrines such as humanitarian intervention and responsibility to protect, which are seen as pretexts for regime change. Russia emphasizes Article 2(4), self-defense under Article 51, and Security Council authorization as the only lawful bases for force. This position contributes a skeptical check on unilateralism and on the moralization of war, reminding the international community that legal exceptions can become tools of power.

On *jus in bello*, Russia supports IHL in principle but frequently frames Western practice as hypocritical. It points to drone strikes, targeted killings, Guantánamo, and civilian casualties in Western-led campaigns as evidence that powerful states invoke humanitarian law against others while exempting themselves. This critique has force as a charge of double standards, even when it is deployed selectively. Russia's own conduct in armed conflicts has also been subject to serious IHL allegations, and the perspective's credibility depends on whether it applies legal standards consistently rather than only to adversaries. The Russian view contributes an important warning: IHL loses authority when it is perceived as an instrument of geopolitical alignment rather than a universal constraint.

Accountability mechanisms are viewed with similar suspicion. Russia signed but did not ratify the Rome

Statute and withdrew its signature in 2016, reflecting its view that the ICC has become politicized. It is particularly critical of universal jurisdiction when used by Western courts against Russian or allied officials, seeing it as "lawfare" in the literal sense: the use of legal process as a weapon of statecraft. At the same time, Russia supports accountability when it aligns with Security Council processes or domestic jurisdiction, and it has used international legal forums to contest Western actions. The perspective thus reveals how accountability mechanisms can be perceived as extensions of power politics, but it occludes the need for independent justice when domestic systems are unwilling or unable to prosecute grave crimes.

On autonomous weapons, Russia has generally been cautious about new legally binding restrictions, emphasizing military necessity, state sovereignty, and the sufficiency of existing IHL. It participates in CCW discussions but has resisted approaches that it believes would constrain legitimate defense capabilities or create asymmetries favoring technologically advanced states. This position contributes a realist reminder that arms-control negotiations are shaped by strategic competition, yet it risks understating the humanitarian and accountability gaps created by algorithmic killing.

Humanitarianism, in the Russian view, must respect state consent and avoid politicization. It has emphasized humanitarian corridors, aid delivery, and the protection of civilians in conflicts where it is involved, while criticizing Western aid as an instrument of influence. The perspective contributes a defense of sovereignty in relief operations and a warning against the securitization of aid, but it can occlude the dangers of state obstruction, the needs of populations in contested territories, and the importance of independent humanitarian access. Its strongest contribution is the insistence that law and humanitarianism not be subordinated to unilateral geopolitical agendas; its greatest weakness is the tendency to exempt allied or self-interested conduct from the same legal scrutiny.

2.7.4 Western Perspective

The Western perspective is the most institutionally developed of the five, combining just-war theory, international humanitarian law, human-rights law, and a dense network of courts, military legal advisors, and civil-society organizations. It treats *jus ad bellum* and *jus in bello* as distinct but complementary: the legality of going to war does not determine the legality of conduct in war, and even unlawful wars are governed by humanitarian constraints. This separation, defended by Walzer and embedded in modern IHL, is a major contribution because it protects civilians regardless of the justice of the cause. Western states generally accept self-defense, collective security, and, in some cases, humanitarian intervention or responsibility to protect as lawful uses of force, though the latter remains contested. The perspective thus offers a rich legal and moral vocabulary for evaluating war, but it also carries the risk of expanding exceptions to the prohibition on force.

On targeting, the Western tradition has shaped the modern law of distinction, proportionality, and precautions, and has pioneered effects-based operations that seek to achieve military objectives with precision. Sagan and Valentino's research on civilian casualties highlights a central tension within this perspective: publics and policymakers may tolerate significant civilian harm when they believe it serves security goals, even while legal frameworks promise protection. The Western self-critique—evident in debates over drone strikes, Guantánamo, torture, and civilian casualties in Iraq and Afghanistan—acknowledges that legal compliance can be formalistic and that "precision" can mask structural violence. Luban's work on torture and the ethics of coercion underscores how emergency framing can erode legal constraints. This self-critique is a genuine strength: it produces internal accountability mechanisms, investigative journalism, and legal challenges that are less common in more closed systems.

Accountability is a core Western commitment, expressed through support for the ICC, universal jurisdic-

tion, military justice, and human-rights litigation. Many Western states have incorporated IHL into military doctrine and have developed legal review processes for weapons and targeting. Yet the perspective is also marked by ambivalence: the United States is not a party to the Rome Statute, and Western powers have been accused of double standards when their own personnel or allies are implicated. The Western contribution is therefore both substantive and contested: it has built much of the legal architecture of accountability, but its credibility depends on applying that architecture to itself.

On autonomous weapons, the Western debate is divided between those who support a ban on fully autonomous lethal systems and those who favor regulation with meaningful human control. The ethical concern is that algorithmic killing may sever the moral link between human judgment and lethal force, while the legal concern is that machines cannot reliably satisfy distinction, proportionality, and accountability. Western militaries, however, are also investing heavily in autonomous and semi-autonomous systems, creating a tension between ethical aspiration and strategic competition. The perspective contributes sophisticated legal and ethical analysis but must confront its own role in driving the technology it debates.

Humanitarianism, in the Western view, is grounded in principles of humanity, neutrality, impartiality, and independence, and is supported by a large ecosystem of NGOs, donors, and international agencies. Yet Western states have also securitized aid, linked relief to counterterrorism, and used humanitarian language to justify intervention. The self-critique here is significant: scholars and practitioners increasingly warn that militarized aid, donor conditionality, and counterterrorism laws can shrink humanitarian space and endanger aid workers. The Western perspective thus offers both the strongest institutional support for humanitarian norms and the most visible examples of their erosion.

2.7.5 UN Perspective

The United Nations perspective is institutional and normative rather than statist. It is built around the Charter's prohibition on the use of force, the Security Council's primary responsibility for international peace and security, the Geneva Conventions, and a growing body of civilian-protection and accountability norms. From this vantage point, *jus ad bellum* is a collective matter: unilateral force is presumptively unlawful, while collective security and self-defense are the recognized exceptions. The UN's contribution is to frame war not as a bilateral dispute but as a threat to international order, and to provide mechanisms—however imperfect—for authorization, mediation, and protection. This perspective is valuable because it resists both unilateralism and pure power politics, but it is constrained by the political divisions of member states.

On *jus in bello*, the UN promotes IHL as universally binding and emphasizes civilian protection, access, and accountability. UN commissions of inquiry, human-rights mechanisms, and peacekeeping mandates document violations and seek to deter them. The UN perspective supports distinction, proportionality, and precautions, and it has increasingly addressed effects-based operations and remote warfare through civilian-harm mitigation and protection-of-civilians frameworks. Its strength is normative consistency; its weakness is enforcement. The UN can name violations and establish standards, but it depends on states for implementation, funding, and political support.

Accountability is approached through complementarity. The UN supports the ICC, the ICJ, and ad hoc tribunals, while recognizing that national courts bear primary responsibility. It also supports universal jurisdiction in principle, though it does not control its exercise. The UN perspective contributes a multilateral framework for accountability, but it is vulnerable to the same selectivity and politicization that affect its member states. When powerful states block Security Council action or shield allies, the UN's accountability agenda is weakened. Conversely, when the Council acts, the UN can mobilize significant legal and opera-

tional resources.

On autonomous weapons, the UN has been the primary forum for CCW discussions on lethal autonomous weapons systems. The UN perspective emphasizes human control, compliance with IHL, and the need for international consensus. It has facilitated expert debates on the ethical and legal status of algorithmic killing, and it has highlighted the risks of an unregulated arms race. The UN cannot impose a ban without state agreement, but it provides the institutional space in which norms are negotiated and, potentially, hardened into law.

Humanitarianism is central to the UN perspective. Through OCHA and other agencies, the UN promotes humanitarian principles, negotiates access, and coordinates relief. It recognizes that humanitarian space is shrinking and that aid is increasingly politicized, securitized, and obstructed. The UN's contribution is to articulate and defend a global humanitarian norm, but its dependence on member states for security and funding means that it cannot compel sovereign states or armed groups to grant access. This creates a persistent gap between normative ambition and operational reality.

Overall, the UN perspective contributes a multilateral, law-based framework for evaluating war, accountability, and humanitarian protection. It occludes less than the statist perspectives in principle, but its effectiveness is limited by the very sovereignty it seeks to regulate. Its greatest strength is the ability to convene, standardize, and legitimize norms; its greatest weakness is the absence of independent enforcement power.

SECTION 2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Centers ICC selectivity, AU pushback, and the Malabo Protocol; insists accountability must be even-handed and regionally legitimate	Can understate individual criminal responsibility and victim-centered justice when institutional bias becomes the dominant frame	Anti-impunity combined with anti-colonial sovereignty and regional ownership of justice	ICC's early Africa-only docket; AU withdrawals and threats of withdrawal; Malabo Protocol	Western: selectivity critique can shield perpetrators and weaken universal accountability

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Chinese	Defends sovereignty and non-interference; engages IHL through multilateral forums while resisting judicial overreach	Weakens individual accountability and humanitarian intervention; treats state consent as a practical veto	State sovereignty, stability, and consent-based international law	Non-party status to the Rome Statute; CCW positions; emphasis on UN Security Council authorization	UN/Western: sovereignty absolutism can entrench impunity for atrocities
Russian	Exposes lawfare as an instrument of Western hegemony; highlights double standards in the application of international criminal law	Self-serving shield for state violence; delegitimizes accountability for its own conduct	Multipolarity, anti-hegemony, and great-power equality	Rejection of ICC jurisdiction; framing of the Putin warrant as political; references to Western wars	Western: tu quoque rhetoric avoids legal responsibility for documented crimes
Western	Provides IHL frameworks, targeting law, and self-critique of drones and Guantánamo	Exceptionalism and selective enforcement; conflates legal authority with power	Rule of law, humanitarian protection, and individual criminal responsibility	Rome Statute; military manuals; ICC referrals by European states	African/Russian: double standards undermine the legitimacy of universal justice
UN	Convenes multilateral norms, civilian protection, and accountability mechanisms	Dependent on member states for enforcement; cannot compel sovereigns or armed groups	Universal IHL, civilian protection, and complementar-ity	UN commissions of inquiry; ICC referrals; humanitarian law treaties	Realist/statist: normative ambition exceeds operational capacity

SECTION 2.8 WORKED EXAMPLE (I do)

Levels of analysis

The ICC arrest warrant for Vladimir Putin and Maria Lvova-Belova, issued in March 2023, can be analyzed at four levels. At the individual level, the warrant asserts personal criminal responsibility for alleged war crimes—specifically the unlawful deportation and transfer of children from occupied Ukrainian territory to Russia—rather than treating the war as an abstract state act. It names a sitting head of state and a senior official responsible for children's rights, signaling that individual agency, command responsibility, and bureaucratic implementation matter. At the state level, Russia's refusal to recognize ICC jurisdiction, its non-party status to the Rome Statute, and its non-cooperation illustrate how sovereignty and regime survival shape legal outcomes; Ukraine's 2014 and 2015 declarations accepting ICC jurisdiction and the referral by dozens of states show how a victim state can activate transnational legal institutions. At the systemic level, the warrant sits within great-power rivalry: Russia's permanent Security Council seat, Western support for accountability, Chinese and Global South ambivalence, and the broader contest over whether international criminal law is a neutral legal order or an instrument of hegemony. At the transnational level, the case involves cross-border child transfers, NGO and journalist documentation, diaspora and victim advocacy, family tracing across borders, and the ICC's dependence on state cooperation, civil society evidence, and diplomatic pressure.

Mechanism section

The mechanism is lawfare as judicialization combined with enforcement asymmetry. The ICC prosecutor's investigation and the Pre-Trial Chamber's warrant convert contested battlefield conduct into individualized criminal charges, creating legal stigma, travel constraints, and diplomatic costs for the accused. This operates through three channels: first, legal categorization, where facts are translated into Rome Statute crimes; second, institutional authorization, where a treaty body claims competence over a non-party's leader through territorial jurisdiction and state referrals; third, political enforcement, where the warrant's practical effect depends on whether states arrest, extradite, or politically isolate the accused. The mechanism does not require immediate arrest to matter. It can reshape diplomatic legitimacy, constrain summit participation, and provide evidentiary and moral resources to Ukraine and its allies. The warrant's limits are equally visible: Putin avoided the BRICS summit in South Africa in August 2023, yet traveled to Mongolia, an ICC state party, in September 2024 without arrest. These episodes demonstrate that the warrant partially constrains but does not compel sovereign behavior. Conversely, non-enforcement can strengthen the accused's narrative of Western hypocrisy and demonstrate the limits of international criminal law against powerful states. The case thus shows lawfare's dual character: it is simultaneously a legal process and a strategic resource in interstate conflict.

Perspective reconstruction

African perspective (primary): Many African jurists, civil society organizations, and victim advocates have supported accountability for atrocities in Ukraine, viewing the Putin warrant as evidence that the ICC can, in principle, reach powerful leaders outside Africa; this matters because African critiques have long centered on the court's selective docket and its disproportionate focus on African situations. At the same time, AU institutions and several African governments continue to argue that the ICC's legitimacy depends on even-handedness, complementarity, and respect for regional justice mechanisms such as the Malabo Protocol, so the warrant is read both as a corrective and as a test of whether the court applies the same standard to Western and non-Western powers. African scholarship on international criminal law often stresses that justice must not be reduced to a geopolitical weapon, and that accountability for Ukrainian children should not obscure unresolved accountability gaps in African conflicts. The African vantage therefore contributes a demand for consistency: if the ICC can indict a Russian president, it must also sustain credible, non-selective

pursuit of crimes by powerful actors in all regions. Its occlusion is that this critique can be appropriated by accused leaders to deflect responsibility, and that institutional bias arguments may inadvertently weaken victim-centered justice. Overall, the African perspective frames the warrant as a legitimacy test for universal criminal law rather than a settled triumph of justice.

Chinese perspective: Beijing generally treats the warrant through the lens of sovereignty and non-interference, emphasizing that Russia is not a party to the Rome Statute and that judicial action without state consent risks politicizing international law. China's growing engagement with IHL and humanitarian norms does not translate into support for ICC jurisdiction over non-consenting major powers, and it tends to privilege UN Security Council processes over treaty-based criminal enforcement. From this vantage, the warrant illustrates how legal institutions can be drawn into great-power conflict, potentially undermining their neutrality. The Chinese perspective contributes a statist caution about judicial overreach but occludes individual accountability for victims.

Russian perspective: Moscow rejects the warrant as illegitimate and frames it as Western lawfare, arguing that the ICC lacks jurisdiction over a non-party state and serves as an instrument of political coercion. Russian officials deny the underlying allegations and present the warrant as part of a broader campaign to isolate Russia, using it to mobilize domestic and international anti-Western solidarity. This perspective contributes a critique of hegemonic legal instrumentalization and highlights the enforcement gap between legal claims and sovereign power. Its occlusion is that it deflects from documented evidence and treats all accountability efforts as geopolitical attacks, thereby shielding potential perpetrators.

Western perspective: Many Western governments, especially European states, support the ICC investigation and see the warrant as an application of individual criminal responsibility to a permanent Security Council member, reinforcing the norm that leaders are not immune from accountability. The Western framework emphasizes IHL, victim protection, and the legal categorization of child transfers as war crimes, while also carrying self-critique regarding double standards, drone strikes, Guantánamo, and inconsistent support for international criminal justice. This perspective contributes robust legal architecture and institutional backing but occludes the ways Western power and selectivity weaken the court's claim to universality.

UN perspective: The UN system approaches the warrant through IHL, civilian protection, and accountability mechanisms, with commissions of inquiry and human rights bodies documenting violations and the ICC serving as a complementary accountability forum. The UN emphasizes the protection of children and the prohibition of forcible transfer, while acknowledging that enforcement depends on member states and that Security Council politics—especially Russian veto power—limit collective action. This perspective contributes a multilateral, norm-based framework but occludes less in principle than in practice, because its effectiveness is constrained by the sovereignty it seeks to regulate.

Explicit adjudication

The warrant is best explained by a synthesis, but if adjudication is required, the Western legal-institutional perspective best explains the warrant's issuance, while the African perspective best explains its contested legitimacy and the enforcement gap. Western legalism accounts for the specific charges, the role of state referrals, and the institutional logic of individual responsibility; it captures how law can be activated against a powerful leader. However, it underestimates the political asymmetry that makes such activation possible in some conflicts but not others, and it risks treating legal formality as legitimacy. The African perspective captures that asymmetry and the court's historical selectivity, explaining why the warrant is celebrated by some as overdue universality and suspected by others as geopolitical lawfare. The Russian and Chinese

statist perspectives best explain non-enforcement and the absence of arrest, but they are weaker on the merits because they treat jurisdictional objections as sufficient to negate accountability. The UN perspective provides the normative vocabulary but lacks independent enforcement. Therefore, the most adequate explanation is layered: legal formalism explains creation, political realism explains non-enforcement, and the African critique explains why the warrant's authority remains disputed even where its legal basis is strong.

SECTION 2.9 PROBLEM PAIR (We do)

1. **Threshold classification.** Are the US strikes in Pakistan, Yemen, and Somalia governed by international humanitarian law as part of an armed conflict, or by international human rights law as law enforcement? State the factual and legal criteria you would use to decide.
2. **Jus ad bellum.** Assess necessity, imminence, proportionality, and sovereignty/consent in at least one strike context. Does the expansion of "imminence" to cover continuous threats convert self-defense into a standing license to kill?
3. **Jus in bello.** Apply distinction, proportionality, and precautions to "signature strikes" and to strikes based on pattern-of-life analysis. What evidentiary standard should be required before a person is targeted?
4. **Accountability.** Evaluate domestic oversight, judicial review, international mechanisms, and the Rome Statute's complementarity principle. Which accountability gap is most consequential, and why?
5. **Ethical adjudication.** Compare Walzer's constraints on noncombatant immunity, Luban's critique of targeted killing as assassination, and the argument that drones can be more discriminate than alternatives. Which position best fits the evidence, and what would falsify it?
6. **Perspective reconstruction.** Reconstruct how African, Chinese, Russian, Western, and UN perspectives would each frame the strikes, then adjudicate which perspective captures the central mechanism and which occludes it.

MODEL ANSWER

The US drone campaign in Pakistan, Yemen, and Somalia illustrates how lawfare operates when the legal category of "armed conflict" is stretched across borders and time. At the threshold level, the central dispute is not simply whether force is permitted but which legal regime governs it. The US position treats Al-Qaeda and associated forces as parties to a non-international armed conflict of global and indefinite scope, thereby invoking IHL targeting rules and self-defense under the Charter. Critics respond that outside recognized battlefields, especially where no consent exists or where violence falls below the intensity threshold, the applicable framework is international human rights law, which permits lethal force only when strictly necessary to protect life and where no less harmful means are available. This is a mechanism-level disagreement: the same strike is lawful under one paradigm and presumptively unlawful under the other.

Jus ad bellum analysis focuses on sovereignty, consent, necessity, and imminence. Where host states consent, the legal objection weakens but does not disappear, because consent may be secret, revocable, or given by governments lacking democratic legitimacy. Where consent is absent, cross-border strikes require a credible claim of self-defense against an imminent threat; the expansion of "imminence" to include continuous threats and opportunity-based targeting is precisely the kind of legal innovation that opponents label lawfare.

Proportionality at this stage concerns whether the expected military advantage justifies the infringement of territorial sovereignty and the risk of escalation.

Jus in bello analysis turns on distinction, proportionality, and precautions. The difficulty is epistemic: remote operators depend on intelligence fusion, pattern-of-life analysis, and sometimes "signature strikes" based on behavior rather than identified status. Kinsella's history of the combatant-civilian distinction shows that the category of civilian is not self-evident; it is produced by legal and political practices that can be narrowed in asymmetric conflicts. Walzer's just war framework insists that even in a just war, noncombatant immunity imposes constraints that cannot be waived by military convenience. Proportionality is not a numerical ratio but a judgment about whether civilian harm is excessive relative to concrete military advantage; in practice, secrecy and classification make that judgment difficult to test. Sagan and Valentino's work on public attitudes suggests that democratic publics may tolerate substantial civilian harm when framed as counterterrorism, which means legal compliance and political legitimacy can diverge.

Accountability mechanisms are fragmented. Domestically, the US has relied on executive legal review, congressional funding and oversight, and judicial doctrines of state secrets and political question that limit adversarial testing. Internationally, the ICC's jurisdiction is constrained by state consent and Security Council politics; universal jurisdiction is theoretically available but practically rare, especially against officials of powerful states. The Rome Statute's complementarity principle means that genuine domestic investigation can bar international prosecution, creating incentives for states to conduct internal reviews that may be opaque. The UN human rights system has documented civilian harm and called for transparency, but lacks enforcement power. Thus accountability is often retrospective, partial, and politically contingent.

Ethically, the debate pits security consequentialism against deontological constraints. Proponents argue that drones reduce risk to operators and can be more discriminate than alternatives; critics, including Luban, warn that targeted killing outside combat zones resembles assassination and erodes the moral and legal distinction between war and policing. The "effects-based" turn in targeting—focusing on outcomes rather than platform—can obscure responsibility by distributing it across intelligence analysts, lawyers, commanders, and algorithms. This is where the LAWS debate becomes relevant by analogy: even where humans remain in the loop, automation of identification and recommendation can weaken meaningful human judgment.

A sound adjudication is that the strikes are best explained by a hybrid legal strategy: the US invokes armed-conflict rules to expand permissible force while retaining enough procedural control to avoid external accountability. The strongest counterargument is that some strikes occur in contexts of genuine armed conflict and state consent, and that IHL may be more protective than an unregulated law-enforcement alternative. Falsifiers include transparent, case-level publication of targeting criteria and civilian-harm assessments; independent judicial review; a sustained decline in civilian casualties after procedural reforms; or evidence that strikes were consistently limited to imminent threats. Absent such evidence, the critique of lawfare remains analytically stronger, though not morally absolute.

SECTION 2.10 INDEPENDENT MEMO (You do)

(a) Case description. An armed group based in State B carries out repeated cross-border attacks into State A, killing civilians and security personnel. State A responds with sustained drone strikes in State B, including in populated areas, without publicly acknowledged consent from State B's government. The strikes kill several group leaders but also produce disputed civilian casualties and disrupt humanitarian access. State A argues that it is engaged in a non-international armed conflict with the group and is exercising self-defense; State B denounces the strikes as violations of sovereignty and calls for regional mediation. A regional organization

debates whether to authorize a joint stabilization force, while the ICC prosecutor opens a preliminary examination into alleged crimes. Humanitarian agencies report that communities face threats from both the armed group and the strikes, and that relief operations have been suspended in affected districts. The case requires distinguishing legal description from causal explanation, predicting institutional responses, and prescribing policy without conflating them.

(b) Required memo headings as prompts.

- **Mechanism:** Explain the causal chain linking the legal classification of the conflict, the targeting decision, civilian harm, and the political backlash; identify the level(s) of analysis and the scope conditions under which your explanation holds.
- **Perspective reconstruction:** Steel-man the African, Chinese, Russian, Western, and UN perspectives on the strikes and accountability; state what each reveals and what it occludes.
- **Historical analogue:** Compare the case to one prior episode of cross-border targeted killing or lawfare; specify what is similar, what differs, and why the analogy might fail.
- **Falsifiers:** List observable evidence that would weaken or refute your mechanism and your preferred adjudication.

(c) Self-check line. Self-check: Did you separate description of events, explanation of causes, prediction of outcomes, and prescription of policy, and did you avoid treating any single perspective as self-evidently correct?

SECTION 2.11 HINGE QUESTION

Question: Which statement best captures the central legal disagreement over targeted killing outside traditional battlefields?

A. Whether international humanitarian law prohibits all uses of force by non-state actors.
B. Whether the violence is legally an armed conflict of global and indefinite scope or a set of localized law-enforcement problems.
C. Whether the ICC can prosecute individuals without state consent in every case.
D. Whether proportionality permits any civilian deaths at all.

Correct answer: B.

Distractor diagnoses:

- **A** conflates the existence of non-state violence with the legal classification of the response; IHL can apply to non-state actors in armed conflict, but that is not the disputed issue.

- **C** mistakes an accountability mechanism for the threshold legal question; ICC jurisdiction is contingent and secondary to the classification problem.

- **D** misstates proportionality, which prohibits excessive civilian harm relative to military advantage rather than requiring zero civilian harm.

SECTION 2A — DATA LAB

Table 1. ICC situations by region (public ICC situation list, approximate as of 2024)

Region	Approx. situations	Representative situations	Perspective issue highlighted by the data
Africa	10 of 17	Uganda, DRC, Sudan (Darfur), CAR I/II, Kenya, Libya, Côte d'Ivoire, Mali, Burundi	African critique of selectivity and the "African bias" debate; AU pushback and the Malabo Protocol
Europe	2 of 17	Georgia, Ukraine	Lawfare as accountability for aggression; Russian critique of Western instrumentality
Asia / Middle East	4 of 17	Bangladesh/Myanmar, Afghanistan, Palestine, Philippines	Sovereignty, non-interference, and the politics of territorial consent
Americas	1 of 17	Venezuela I	Regional human-rights systems vs. ICC complementarity

Table 2. UN commissions of inquiry and documented IHL-relevant findings (illustrative)

Body	Conflict / period	Documented patterns (illustrative, not exhaustive)	Evidentiary status
Commission of Inquiry on Syria	Syria, 2011–present	Indiscriminate attacks, siege tactics, torture, sexual violence, attacks on medical facilities	UN-mandated; access constraints; state non-cooperation
Group of Eminent Experts on Yemen	Yemen, 2014–present	Airstrikes on civilians, starvation as method of warfare, arbitrary detention, torture	UN-mandated; limited access; competing narratives
Independent International Fact-Finding Mission on Myanmar	Myanmar, 2017–present	Ethnic cleansing, sexual violence, forced displacement, attacks on Rohingya civilians	UN-mandated; restricted access

Body	Conflict / period	Documented patterns (illustrative, not exhaustive)	Evidentiary status
Commission of Human Rights Experts on Ethiopia	Ethiopia (Tigray and beyond), 2020–2023	Mass killings, sexual violence, starvation, obstruction of humanitarian access	UN-mandated; access and security constraints
Commission of Inquiry on Ukraine	Ukraine, 2022–present	Attacks on civilians and civilian infrastructure, torture, deportation, filtration	UN-mandated; access to occupied areas limited
Commission of Inquiry on the Occupied Palestinian Territory	OPT, 2021–present	Civilian harm, siege, displacement, accountability gaps	UN-mandated; highly contested political environment

Table 3. CCW discussions on lethal autonomous weapons systems (LAWS), 2017–2024

Phase	Output / deadlock	Representative positions	Core obstacle
2017–2018	Initial GGE discussions; no binding instrument	Ban advocates: Austria, Brazil, Chile, Mexico, New Zealand; Regulate: Germany, France, others; No new law: US, Russia, China, India, Israel	No agreed definition of autonomy or "meaningful human control"
2019	Eleven guiding principles adopted by consensus	Broad agreement on human responsibility; disagreement on legal implications	Principles non-binding; no compliance mechanism
2020–2022	Definitional and scope deadlock	Ban coalition expands; major military powers resist treaty	Consensus rule; strategic competition; classification of systems
2023–2024	Renewed calls for treaty; no consensus on prohibition	Civil society and some states push for legally binding instrument; major powers favor non-binding norms	Verification, definitional ambiguity, military utility

Table 4. AOAV explosive-violence civilian-harm patterns (illustrative, monitor-based)

Period	Recorded pattern	Civilian-harm indicator	Interpretive caution
2011–2015	High casualty levels in Syria, Iraq, Afghanistan, Gaza	Large share of recorded casualties are civilians	Incident-based reporting; undercounting in inaccessible areas
2016–2020	Continued urban explosive violence; rise in drone and airstrike incidents	Civilian casualties concentrated in populated areas	Attribution of responsibility often contested
2021–2024	Shifts across Ukraine, Gaza, Sudan, Myanmar, and other theaters	Civilian harm remains central to IHL debates	Data measure explosive violence, not all forms of war harm

Five numbered analysis questions

1. **Trend.** The ICC situation list shows a strong African concentration in the Court's early and middle years, followed by more recent situations in Europe and the Middle East. What trend does this describe, and does the trend alone establish discriminatory intent, or does it also reflect referral patterns, state consent, Security Council referrals, and the geography of armed conflict?

2. **Level of analysis.** US drone strikes in Pakistan, Yemen, and Somalia can be analyzed at the individual level (operators, legal reviewers), the state level (executive authorization and oversight), the systemic level (counterterrorism norms and great-power practice), or the transnational level (NGO advocacy, UN special rapporteurs, and transnational legal networks). Which level best explains the persistence of targeted killing outside declared armed conflict, and what does each level occlude?

3. **Perspective reconstruction (all five).** How would each perspective read the AOAV finding that most civilian casualties from explosive violence occur in populated areas? Reconstruct the African, Chinese, Russian, Western, and UN readings without reducing any to a caricature.

4. **Interpretation.** Does a high civilian-casualty share in populated areas demonstrate a violation of distinction or proportionality, or can it be partially explained by urban warfare, human shielding, intelligence uncertainty, and the shift to effects-based operations? What evidence would be needed to adjudicate between these explanations?

5. **Limitation.** What do the CCW LAWS data and debates not tell us about actual battlefield autonomy, classified weapons programs, verification capacity, and the gap between diplomatic consensus and operational practice?

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — "Legal Architecture of Force" (hand-drawn funnel / three-tier gate)

- **What to draw:** Draw a large inverted funnel or three stacked horizontal platforms descending from top to bottom. At the top, draw a wide rectangular box labeled **"Jus ad bellum (Resort to Force)"**.

Inside it, place two smaller boxes: **"UN Charter Art. 2(4): prohibition on use of force"** and **"Art. 51: self-defense / Security Council Chapter VII"**. Draw a downward arrow into a middle platform labeled **"Jus in bello (Conduct of Hostilities)"**, containing three smaller boxes: **"Distinction"**, **"Proportionality"**, and **"Precautions"**. Add a side arrow labeled **"Effects-based operations shift"** pointing into the middle platform. Draw a final downward arrow into a bottom platform labeled **"Accountability"**, containing three boxes: **"ICC"**, **"ICJ"**, and **"Universal jurisdiction"**.

- **How to label it:** Label the left margin **"Lawfare zone"** with a bracket spanning all three platforms. Label the right margin **"Legal thresholds"**. Place a small note under the middle platform: **"IHL applies even if jus ad bellum is contested."**

- **Perspective overlay to annotate:** Use colored sticky-note shapes around the funnel: **African (primary):** "selective enforcement; AU/Malabo Protocol; ICC legitimacy"; **Chinese:** "sovereignty; non-interference; growing IHL engagement"; **Russian:** "lawfare as Western instrument; double standards"; **Western:** "IHL frameworks; self-critique of drones/Guantánamo"; **UN:** "civilian protection; accountability mechanisms."

Visual 2 — "Targeted Killing Decision Cycle" (hand-drawn circular flow)

- **What to draw:** Draw a circle divided into five nodes connected by arrows in clockwise order: **(1) Intelligence fusion**, **(2) Legal review**, **(3) Authorization**, **(4) Strike**, **(5) Battle damage assessment and accountability**. Between nodes (2) and (3), draw a gate labeled **"Distinction / Proportionality test"**. Between nodes (4) and (5), draw a gate labeled **"Civilian-harm assessment"**. Add a feedback arrow from node (5) back to node (1) labeled **"Lessons learned / targeting refinement."**

- **How to label it:** Label the center **"Targeted killing outside declared armed conflict"**. Label the outer ring **"Legal regimes in tension: IHL / IHRL / self-defense"**. Add small labels on the arrows: **"evidence quality," "command responsibility," "transparency,"** and **"remedy."**

- **Perspective overlay to annotate:** Place five short annotations around the circle: **African:** "civilian harm in Somalia/Yemen; accountability gaps"; **Chinese:** "territorial sovereignty; consent; non-intervention"; **Russian:** "double standards; Western exceptionalism"; **Western:** "self-defense; oversight; IHL compliance"; **UN:** "right to life; civilian protection; remedy."

Visual 3 — "LAWS Autonomy Spectrum" (hand-drawn horizontal spectrum)

- **What to draw:** Draw a horizontal line from left to right. On the left end, draw a box labeled **"Human-in-the-loop: human selects and engages target."** In the middle, draw a box labeled **"Human-on-the-loop: machine selects; human can intervene."** On the right end, draw a box labeled **"Human-out-of-the-loop: machine selects and engages without real-time human control."** Shade the left third green, the middle third yellow, and the right third red. Above the line, place threshold markers: **"Meaningful human control," "Distinction,"** and **"Proportionality."** Below the line, place three CCW position labels: **"Ban," "Regulate,"** and **"No new law."**

- **How to label it:** Title the visual **"Autonomy is a spectrum, not a switch."** Label the vertical axis **"Human control / accountability"** and the horizontal axis **"Machine autonomy."** Add a note:

"Legal status depends on use, context, and control, not hardware alone."

- **Perspective overlay to annotate:** Annotate with five short notes: **African:** "technology gap; coloniality of AI; unequal protection"; **Chinese:** "strategic competition; sovereignty; non-binding norms"; **Russian:** "opposition to binding prohibition; state autonomy"; **Western:** "ethical AI; military necessity; alliance interoperability"; **UN:** "human dignity; accountability gap; civilian protection."

SECTION 4 — CORNELL NOTES

Cue (prompt)	Notes (dense content + source log)
What is "lawfare"?	Lawfare is the use of law as a weapon or shield in conflict: legal claims, courts, tribunals, sanctions, and legal narratives shape coercion and legitimacy. Source log: Luban (2014); Kinsella (2011).
Jus ad bellum vs. jus in bello	Jus ad bellum governs resort to force (UN Charter Art. 2(4), Art. 51, Security Council authorization); jus in bello governs conduct in hostilities (distinction, proportionality, precautions). Key point: IHL applies independently of the legality of the war. Source log: Walzer (1977, 2015); Rome Statute; UN Charter.
Distinction	Combatants must distinguish between military objectives and civilians/civilian objects; attacks may be directed only at military objectives. Source log: Additional Protocol I (referenced in IHL doctrine); Walzer (1977, 2015).
Proportionality	Expected civilian harm must not be excessive in relation to the concrete and direct military advantage anticipated. Source log: IHL doctrine; Walzer (1977, 2015); Sagan and Valentino (2017).
Precautions	Parties must take feasible precautions in attack and against effects of attacks; includes verification, warnings, and choice of means/methods. Source log: IHL doctrine; UN commissions of inquiry.
Effects-based operations	Shift from destroying platforms to producing desired strategic effects; can blur target categories and complicate proportionality assessments. Source log: Luban (2014); Kinsella (2011).
ICC enforcement	ICC has jurisdiction over genocide, crimes against humanity, war crimes, aggression; enforcement depends on state cooperation, Security Council referrals, and complementarity. Source log: Rome Statute; Luban (2014).

Cue (prompt)	Notes (dense content + source log)
Universal jurisdiction	Domestic courts may prosecute certain international crimes regardless of where committed or nationality of perpetrator/victim; politically contested and unevenly applied. Source log: Kinsella (2011); Luban (2014).
LAWS debate	Debate over lethal autonomous weapons centers on meaningful human control, distinction, proportionality, accountability, and whether to ban, regulate, or permit. Source log: UN CCW LAWS reports; Sagan and Valentino (2017).
Humanitarianism securitized	Aid, access, and protection can be politicized, militarized, or made conditional; humanitarian space shrinks when relief is treated as security strategy. Source log: Kinsella (2011); Luban (2014).
African perspective (primary)	Critique of ICC selectivity, AU resistance, Malabo Protocol, and demand for accountability that is not geopolitically skewed; emphasizes African agency and historical asymmetry. Source log: Grovogui, Mbembe, Bayart, Mamdani, Rodney, Nkrumah, Nyerere, Cabral, Fanon, Aning, Danso, Tamale, Oyěwùmí (as named in the lesson's African-perspective mandate).
Adjudication rule	Do not infer violation from outcome alone; distinguish description, explanation, prediction, and prescription; test claims against scope conditions and counterarguments. Source log: Walzer (1977, 2015); Sagan and Valentino (2017).

Summary (3–5 sentences): Lawfare and the ethics of war require separating the legality of resorting to force from the legality of conducting hostilities, while recognizing that both are enforced through politically uneven institutions. Targeting law turns on distinction, proportionality, and precautions, but effects-based operations and algorithmic systems strain these standards. Accountability mechanisms such as the ICC, ICJ, and universal jurisdiction are powerful in principle and fragile in practice, especially where great-power interests are involved. The LAWS debate and the securitization of humanitarianism show that new technologies and relief practices can either protect civilians or erode human control. A rigorous analysis must therefore reconstruct all five perspectives, specify mechanisms and scope conditions, and avoid conflating description with prescription.

SECTION 5 — FEYNMAN COMPRESSION

Step 1 — Explain without jargon.
War is not just fighting; it is also law, language, and legitimacy. States and armed groups use legal rules

to justify force, restrict force, accuse enemies, and protect themselves from blame. The most important distinction is between deciding whether to go to war and deciding how to fight once war has started. Even an illegal war does not make every act in it legal or illegal by itself; the rules of fighting still apply. Those rules say do not target civilians, do not cause civilian harm that is clearly too large for the military gain, and take reasonable steps to avoid harm. But modern war makes this hard because cities are battlefields, intelligence is uncertain, and weapons can be precise in one sense while still killing many people. Courts and tribunals can punish atrocities, but they often lack power over strong states, so accountability is uneven. New weapons that choose targets with algorithms raise a deeper question: if a machine decides to kill, who is responsible? Humanitarian aid is also caught in this system because food, medicine, and access can be used as leverage or treated as security problems. The African critique is central here: international law often claims universality while enforcing accountability unevenly, especially against weaker states and actors.

Step 2 — Mark gaps.

- I am not yet certain how to distinguish a lawful proportionality judgment from an unlawful one when intelligence is incomplete.
- I need to clarify whether human rights law or IHL governs targeted killing outside declared armed conflict, and how the two interact.
- I have not fully resolved whether LAWS are best addressed by a total ban, regulation, or case-by-case review.
- I am unsure how to weigh AU/Malabo Protocol arguments against the claim that regional courts may weaken universal accountability.
- I need to test whether "effects-based operations" is a genuine legal problem or mainly a rhetorical critique of modern targeting.

Step 3 — Reread verification.

Reread Walzer (1977, 2015) on the moral equality of soldiers and the distinction between jus ad bellum and jus in bello; reread Kinsella (2011) and Luban (2014) on lawfare, humanitarianism, and legal responsibility; reread Sagan and Valentino (2017) on public attitudes toward civilian casualties and the ethics of war; consult the Rome Statute for ICC jurisdiction and complementarity; consult UN CCW LAWS reports for the status of autonomous-weapons diplomacy. Verify each claim against at least one named source before using it in an exam answer.

Step 4 — Analogy with explicit limits.

A useful analogy is a referee in a violent sport: the referee does not decide whether the teams should have played at all, but once play begins, the referee enforces rules about dangerous contact, protects players, and can eject violators. The analogy helps separate "should the game have happened?" from "was the tackle illegal?" But it has limits: war is not a consensual game, referees in war are weak or absent, teams may write their own rules, and the "players" include civilians who never consented. The analogy also fails for algorithmic weapons because there is no clear human referee at the moment of engagement.

Step 5 — Rewrite.

Lawfare and the ethics of war study how legal rules, institutions, and narratives shape the use of force and its legitimacy. The core architecture separates jus ad bellum from jus in bello, so the legality of war and the legality of conduct in war are analyzed independently. Targeting law requires distinction, proportionality, and precautions, but effects-based operations, urban warfare, and algorithmic decision-making strain these standards. Accountability through the ICC, ICJ, and universal jurisdiction is legally significant but politically uneven, which fuels African critiques of selectivity and broader debates about double standards. The LAWS

debate asks whether machines can lawfully kill, while the securitization of humanitarianism asks whether aid can remain neutral when it is embedded in conflict. A strong answer must specify mechanisms, scope conditions, counterarguments, and the distinct contributions and occlusions of the African, Chinese, Russian, Western, and UN perspectives.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L26	definition	What is *jus ad bellum*?	The legal and moral criteria governing the resort to force: necessity, last resort, proportionality of ends, legitimate authority, and right intention, codified in UN Charter Article 2(4) and Article 51 self-defence, and developed in Walzer (1977). It asks whether a war may be fought at all, not how it is fought.	Western legalism treats it as Charter law; African and Russian perspectives stress that the Charter's exceptions have been selectively invoked against weaker states.

Tag	Card Type	Front	Back	Perspective Note
L26	definition	What is *jus in bello*?	The body of rules regulating conduct during armed conflict: distinction between combatants and civilians, proportionality of incidental harm, and precautions in attack, codified in the Geneva Conventions and Additional Protocols. It applies equally to all parties regardless of the justice of their cause.	The UN perspective insists on equal application; Western self-critique (Guantánamo, drone strikes) tests whether powerful states accept symmetrical constraint.
L26	mechanism	State the three core IHL targeting rules.	Distinction requires parties to distinguish combatants from civilians and direct attacks only at military objectives; proportionality prohibits attacks where expected civilian harm is excessive relative to concrete military advantage; precautions require feasible measures to minimize civilian harm, including verification and choice of means.	African and Chinese perspectives note that “military advantage” and “feasible” are interpreted by the attacking state, creating asymmetry in practice.

Tag	Card Type	Front	Back	Perspective Note
L26	mechanism	What is an "effects-based operation" and why does it matter legally?	Effects-based operations shift targeting from destroying enemy forces to producing desired political or systemic effects, often via infrastructure or dual-use targets; this complicates proportionality because the "military advantage" becomes diffuse and long-term, expanding permissible harm.	Western militaries championed the concept; critics (Luban 2014) argue it erodes the civilian/combatant line by reclassifying civilian infrastructure as military objectives.
L26	application	What is the ICC and what is its jurisdiction?	The International Criminal Court, established by the 1998 Rome Statute, prosecutes individuals for genocide, crimes against humanity, war crimes, and aggression; it is complementary to national courts and has issued arrest warrants including for Vladimir Putin (2023) over alleged unlawful deportation of children.	African states critique selectivity and the AU has pushed the Malabo Protocol; Russia rejects the warrant as illegitimate; the UN supports accountability in principle.

Tag	Card Type	Front	Back	Perspective Note
L26	application	What is universal jurisdiction?	The principle that any state may prosecute individuals for certain international crimes (genocide, crimes against humanity, war crimes, torture) regardless of where the crime occurred or the nationality of perpetrator or victim, as exercised in cases such as Pinochet and various European prosecutions.	Western courts have been the main users; African and Russian perspectives see it as a tool of asymmetric accountability when powerful states are exempt.
L26	comparison	How do the ICC and ICJ differ?	The ICC is a criminal court prosecuting individuals for core international crimes under the Rome Statute; the ICJ is a civil court settling disputes between states and issuing advisory opinions, with no individual criminal jurisdiction and enforcement dependent on the Security Council.	The UN perspective treats both as complementary pillars; the African perspective notes that ICJ advisory opinions (e.g., on Palestine) lack enforcement while ICC warrants target weaker states.

Tag	Card Type	Front	Back	Perspective Note
L26	debate	What is the LAWS debate?	The debate over lethal autonomous weapons systems concerns whether machines may select and engage targets without meaningful human control; CCW discussions since 2014 have sought definitions and possible prohibitions, with no binding treaty yet.	African and Chinese positions stress human dignity and non-proliferation; Western states split between precautionary bans and capability development; Russia opposes new binding rules.
L26	reconstruction	Reconstruct the African perspective on international criminal justice.	African scholarship (Grovogui, Mamdani, Mbembe, Bayart) frames the ICC as an instrument of selective justice embedded in a colonial legal order; the AU's 2017 withdrawal strategy and the Malabo Protocol's proposed African Court with criminal jurisdiction reflect demands for regional ownership and equal application.	This perspective reveals how "universal" law can reproduce hierarchy; it is occluded by Western narratives of humanitarian progress.

Tag	Card Type	Front	Back	Perspective Note
L26	occlusion	What does the Chinese perspective occlude in IHL debates?	China's emphasis on sovereignty and non-interference (Five Principles of Peaceful Coexistence) occludes scrutiny of its own conduct and limits support for individual criminal accountability, even as it engages increasingly with IHL in UN forums and peacekeeping.	It contributes a statist, anti-interventionist check on Western humanitarianism but risks shielding perpetrators when the state is the violator.
L26	adjudication	How does the Russian perspective frame "lawfare"?	Russian discourse treats Western legal instruments (sanctions, ICC warrants, human-rights conditionality) as "lawfare"—the weaponization of law to constrain adversaries—while defending its own actions as lawful self-defence or protection of nationals.	This exposes the instrumental use of legal norms; it occludes Russia's own violations and its rejection of accountability for aggression.

Tag	Card Type	Front	Back	Perspective Note
L26	source	What is Walzer's contribution to just war theory?	Walzer (1977, 2015) distinguishes *jus ad bellum* from *jus in bello*, argues for the "moral equality of soldiers," and in later work (2015) revises proportionality and targeted killing in light of terrorism and precision warfare.	Western canonical text; African and Russian critics read it as culturally specific, embedding liberal assumptions about legitimate authority.
L26	source	What does Kinsella (2011) argue?	Kinsella's *The Image Before the Weapon* argues that the civilian/combatant distinction is not a natural fact but a constructed, gendered, and historically contingent category, challenging the apparent neutrality of IHL's foundational distinction.	Feminist/constructivist critique; it destabilizes Western legal formalism and opens space for African and post-colonial readings of who counts as a civilian.

Tag	Card Type	Front	Back	Perspective Note
L26	mechanism	How is humanitarian aid securitized?	Aid becomes securitized when relief is conditioned on security objectives, when access is negotiated with armed actors as a bargaining chip, or when humanitarian space is militarized (e.g., "hearts and minds" operations), blurring the line between relief and counter-insurgency.	African perspectives (Aning, Danso) highlight how aid dependency and access denial in conflicts like Sudan or Somalia reproduce external control; UN agencies struggle to maintain neutrality.
L26	visual	What are the four levels of analysis in lawfare?	Individual (perpetrator intent and command responsibility), state (policy, rules of engagement, legal advice), systemic (Security Council politics, ICC jurisdiction), and transnational (NGO advocacy, universal jurisdiction, media framing).	The African perspective insists that the systemic level—great-power politics—determines which individuals are prosecuted, a point Western legalism often brackets.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence Audit (score 0–100)

Topic	Confidence (0–100)	Evidence of Mastery	Gap to Close
Distinguishing *jus ad bellum* from *jus in bello*		Can state the separation principle and give one case where a just cause did not justify unjust means	Tendency to conflate legality of war with legality in war
The three IHL targeting rules (distinction, proportionality, precautions)		Can apply them to a novel strike scenario	Difficulty quantifying "excessive" civilian harm
ICC jurisdiction and complementarity		Can explain why the ICC issued the Putin warrant and its enforcement limits	Uncertainty about Article 16 deferral and state cooperation
Universal jurisdiction scope and limits		Can name two cases and one legal basis	Confusion about immunity of sitting heads of state
LAWS and "meaningful human control"		Can state the CCW debate positions	Vague on technical definitions of autonomy
African critique of ICC selectivity		Can name Malabo Protocol and AU withdrawal strategy	May overstate African unanimity
Chinese non-interference vs IHL engagement		Can contrast Five Principles with peacekeeping practice	Limited knowledge of China's CCW positions
Russian "lawfare" framing		Can define lawfare and give Russian examples	Risk of accepting the framing uncritically
Western self-critique (drones, Guantánamo)		Can cite Luban and Sagan & Valentino	May underweight institutional reform efforts
Securitization of humanitarian aid		Can give one case of aid militarization	Needs deeper knowledge of access negotiations

7.2 Three-Question Debrief

1. Which of the five perspectives did you find hardest to steel-man without caricature, and what specific claim within it most challenged your prior view?
2. Which mechanism did you most often conflate with an outcome—e.g., treating "ICC warrant issued" as equivalent to "accountability achieved"—and how would you now separate them?
3. What single piece of evidence would most strongly falsify your current view on whether international criminal law deters atrocities?

7.3 Error-Log

Common Misconception	Correction	Evidence
"A just cause makes any wartime conduct lawful."	*Jus ad bellum* and *jus in bello* are independent; even a defensive war must obey distinction and proportionality.	Walzer (1977); Geneva Conventions Common Article 3
"The ICC can arrest anyone it indicts."	The ICC has no police force; enforcement depends on state cooperation and Security Council referrals; the Putin warrant remains unexecuted.	Rome Statute Arts. 59, 89; ICC press releases 2023
"Universal jurisdiction means no immunity for leaders."	Sitting heads of state generally retain immunity before foreign national courts for official acts; the Pinochet case turned on loss of immunity after leaving office.	ICJ *Arrest Warrant* (2002)
"Autonomous weapons are already banned."	No binding treaty bans LAWS; CCW discussions continue; some states oppose new law.	UN CCW LAWS reports 2014–2023
"Humanitarian aid is always neutral."	Aid is frequently conditioned, militarized, or denied as a tactic of war; neutrality is an aspiration, not a default.	Kinsella (2011); UN OCHA access reports
"IHL applies only to state armies."	Non-state armed groups are bound by Common Article 3 and customary IHL; the challenge is enforcement, not applicability.	ICRC customary IHL study

SECTION 8 — CHEATSHEET

Core Concepts	Key Mechanisms	Theories and Authors	Cases and Evidence	Debates	Falsifiers	Cross-links
Jus ad bellum vs *jus in bello*; distinction; proportionality; precautions; effects-based operations	Legal separation of resort to force from conduct in war; targeting rules constrain means even for just causes; effects-based targeting expands "military advantage"	Walzer (1977, 2015); Kinsella (2011)	Geneva Conventions; Additional Protocols; NATO targeting manuals	Whether proportionality can be quantified; whether effects-based operations erode civilian protection	Evidence that proportionality assessments are consistently applied across parties	L2 Charter; L9 sovereignty; L20 coercion
ICC; ICJ; universal jurisdiction; complementarity	Individual criminal accountability; state dispute settlement; national prosecution of international crimes; Security Council referral/deferral	Rome Statute; Luban (2014)	Putin warrant (2023); Pinochet; ICJ advisory opinions	Selectivity; African withdrawal strategy; Malabo Protocol	Data showing equal prosecution rates across regions	L37 Ukraine lawfare; L44 Hormuz/Yemen
LAWS; meaningful human control; CCW	Algorithmic target selection; human-in-the-loop/out-of-the-loop; possible prohibition or regulation	Sagan and Valentino (2017); UN CCW LAWS reports	CCW meetings 2014–2023; national LAWS policies	Ban vs regulation; dignity; accountability gaps	Evidence of reliable, accountable autonomous systems in combat	L54 autonomous weapons

Core Concepts	Key Mechanisms	Theories and Authors	Cases and Evidence	Debates	Falsifiers	Cross-links
Securitization of humanitarian aid; access; neutrality	Aid conditioned on security goals; access denial as tactic; militarization of relief	Aning; Danso; UN OCHA	Sudan, Somalia, Yemen access reports	Whether humanitarianism can be neutral in politicized conflicts	Cases where aid delivery reduced violence without military embedding	L20 coercion; L44 Hormuz/Yemen
Five perspectives on lawfare	African critique of selectivity; Chinese non-interference; Russian lawfare framing; Western IHL + self-critique; UN civilian protection	Grovogui; Mamdani; Mbembe; Bayart; Nkrumah	AU withdrawal strategy; Malabo Protocol; CCW positions	Whether international law is universal or instrumental	Comparative data on enforcement across power asymmetries	L2 Charter; L9 sovereignty; L37; L44; L54

SECTION 9 — REVIEW SCHEDULE

- **R1 (Day 1, 30 min):** Immediate recall—run all 15 flashcards without notes; mark any card missed twice for priority review.
- **R2 (Day 3, 45 min):** Reconstruct the worked example (ICC Putin warrant) from memory using the four levels of analysis and all five perspectives; compare against the model.
- **R3 (Week 1, 60 min):** Complete the problem pair (US drone strikes) independently, then check against the model answer; log errors in the error-log table.
- **R4 (Week 2, 90 min):** Write the independent memo on a fresh case; verify you distinguished description, explanation, prediction, and prescription.
- **R5 (Month 1, 60 min):** Integrate with interleaved lessons (L37 Ukraine lawfare, L44 Hormuz/Yemen, L54 autonomous weapons); update the cheatsheet with new cases and re-score the confidence audit.

SECTION 10 — COMPLETION CHECKLIST

☐ I can define *jus ad bellum* and *jus in bello* and state why they are legally independent.
☐ I can list and apply the three IHL targeting rules to a novel scenario.
☐ I can explain effects-based operations and their proportionality implications.
☐ I can describe ICC jurisdiction, complementarity, and the enforcement gap.
☐ I can distinguish the ICC from the ICJ and explain universal jurisdiction's limits.
☐ I can state the LAWS debate positions and the status of CCW discussions.

- ☐ I can reconstruct the African perspective (ICC selectivity, AU pushback, Malabo Protocol) from within.
- ☐ I can steel-man the Chinese, Russian, Western, and UN perspectives.
- ☐ I can apply the four levels of analysis to a lawfare case.
- ☐ I can adjudicate between competing explanations using evidence.
- ☐ I have completed the confidence audit and identified my largest gap.
- ☐ I have logged at least two misconceptions in the error-log.
- ☐ I can explain the securitization of humanitarian aid with one case.
- ☐ I can state what would falsify my view on international criminal law's deterrent effect.
- ☐ I have scheduled R1–R5 reviews in my calendar.
- ☐ I can connect this lesson to L2, L9, L20, L37, L44, and L54.
- ☐ I can produce a one-paragraph Feynman compression of the lesson's central puzzle.

28. Colonial State Formation and the Coloniality of Borders

LESSON METADATA

Field	Value
Lesson number and title	Lesson 27 — Colonial State Formation and the Coloniality of Borders
Module	Module 5: African Geopolitical Architecture
Prerequisites	L8 (post-colonialism), L9 (Westphalian myth), L10 (Berlin Conference), L12 (decolonization)
Interleaved links	Forward to L28 (Pan-Africanism), L29 (conflict political economy), L30 (regional security complexes)

Field	Value
Reading load	7-9 hours
Content channels	Text, data lab, visuals, flashcards, worked example, problem pair
Bloom ceiling	Evaluate / Create
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

The central puzzle of this lesson is deceptively simple: why do African states still operate with borders, institutions, and economic structures inherited from colonial rule, and why has post-colonial sovereignty so often reproduced rather than dismantled the colonial order? The conventional answer — that European powers drew arbitrary lines at the Berlin Conference of 1884–85 and that these artificial borders cause contemporary conflict — is not wrong, but it is insufficient. It treats colonialism as an event rather than a process, borders as lines on a map rather than as embedded in institutions, economies, and identities, and it implies that "natural" or "correct" borders would resolve the problems that post-colonial states face. None of these implications survives scrutiny. African borders are not merely arbitrary; they are the spatial expression of a deeper colonial state formation that created extractive economies, ethnicized administrations, and hybrid political orders. Understanding why these structures persist requires moving beyond the artificiality thesis toward an account of coloniality — the durable, often invisible, reproduction of colonial logics after formal independence.

This lesson sits at the hinge of Module 5, African Geopolitical Architecture. It builds directly on four prerequisite lessons. From L8 on post-colonialism, it inherits the insight that formal independence did not end colonial power relations. From L9 on the Westphalian myth, it inherits the critique that the sovereign territorial state is a European norm projected globally, not a universal achievement. From L10 on the Berlin Conference, it inherits the specific history of the partition of Africa and the diplomatic fiction of effective occupation. From L12 on decolonization, it inherits the question of what was actually transferred at independence — flags and seats at the United Nations, or genuine sovereignty over territory, economy, and institutions. The lesson then feeds forward into L28 on Pan-Africanism, where the question of continental unity confronts the reality of inherited borders; into L29 on the political economy of conflict, where extractive institutions become drivers of war; and into L30 on regional security complexes, where the spatial logic of colonial state formation shapes contemporary security dynamics.

By the end of this lesson, the student will be able to do five things that go beyond recall. First, they will be able to distinguish the weak artificiality thesis from stronger accounts of colonial state formation, and to explain why the former fails as both explanation and prescription. Second, they will be able to reconstruct the institutional mechanisms — indirect rule, assimilation, native administration, and the institutionalization of ethnicity — through which colonial powers governed African territories, and to trace how these mechanisms survived decolonization. Third, they will be able to analyze the extractive economy as a structural feature of colonial state formation, linking infrastructure design, monoculture, and dependent trade to contemporary underdevelopment. Fourth, they will be able to evaluate the doctrine of uti possidetis juris and explain why African states accepted inherited borders at independence, including the costs and benefits of that choice. Fifth, they will be able to describe hybrid orders — the coexistence of formal state, traditional

authority, religious networks, militias, and informal economies — not as state failure but as a durable mode of governance produced by colonial history.

The theoretical lineage of the lesson runs through six canonical scholars, each of whom reframes the problem. Jean-François Bayart's 1989 work on the state in Africa argues that African states are not weak copies of European states but distinctive political formations shaped by extraversion — the orientation of political elites toward external resources and patrons. Achille Mbembe's 2001 analysis of post-colonial power emphasizes commandement, the arbitrary and violent exercise of authority, and the necropolitical dimensions of colonial and post-colonial rule. Siba N'Zatioula Grovogui's 1996 critique of sovereignty challenges the Westphalian framework itself, showing how international law has historically excluded African polities from full sovereignty. Frederick Cooper's 2002 reassessment of colonialism asks what colonial states actually did, avoiding both the myth of total control and the myth of African passivity. Jeffrey Herbst's 2000 study of state-making in Africa highlights the spatial and demographic challenges that distinguish African state formation from the European experience. Mahmood Mamdani's 1996 analysis of citizen and subject demonstrates how colonial rule institutionalized a bifurcated state that separated urban citizens from rural subjects, producing the ethnicized identities that fuel post-colonial conflict.

The African perspective is primary in this lesson, and for good reason. Western institutionalist accounts tend to treat African states as failed or incomplete versions of a European ideal, measuring them against a Westphalian benchmark they were never designed to meet. The African vantage point, reconstructed from within through the work of Bayart, Mbembe, Grovogui, Mamdani, and others, reveals that colonial state formation was not a failed attempt at European statehood but a successful project of extraction and control that produced its own durable logics. What Western accounts read as weakness — hybridity, informal authority, ethnic politics — is better understood as the operating system of a state form designed for different purposes. The African perspective thus reframes the central question: not why African states failed to become European states, but how colonial and post-colonial actors have continuously reproduced a distinctive, extractive, and hybrid political order, and what alternatives have been imagined and suppressed.

Methodologically, the lesson insists on mechanism over outcome. It is not enough to observe that borders are inherited or that economies are dependent; one must specify how colonial institutions produced these outcomes, through what causal chains, under what scope conditions, and with what observable implications. Each key idea is therefore presented with a bolded causal claim, a mechanism, scope conditions, observable implications, and a perspective note. The worked example of the Democratic Republic of Congo from Leopold II to Mobutu demonstrates how colonial violence, extractive institutions, and post-colonial reproduction operated across levels of analysis. The problem pair on Rwanda and Burundi shows how colonial identity classification produced post-colonial violence. The data lab provides quantitative grounding for claims about borders, infrastructure, and trade. Throughout, the student is asked to adjudicate between competing explanations on the basis of evidence rather than to accept any single account as settled truth.

SECTION 1 — Pre-Class Priming

1.1 Retrieval Warm-Up Answer the following questions from memory, drawing on Lessons 8, 9, 10, and 12. Do not consult notes. After attempting each, check your answer against the lesson materials.

1. **Westphalian myth (L9).** What is the "Westphalian myth," and why does the lesson argue that the 1648 Peace of Westphalia did not actually establish the sovereign territorial state system that international

relations theory attributes to it?

2. **Berlin Conference (L10).** What were the two core principles of the Berlin Act of 1884–85 regarding African territory, and how did the principle of "effective occupation" function in practice?
3. **Post-colonialism (L8).** Define post-colonialism as an analytical framework. How does it differ from the study of decolonization as a historical event?
4. **Decolonization and statehood (L12).** What did African states inherit at independence in the 1960s, and what did they not inherit? Distinguish formal sovereignty from substantive sovereignty.
5. **Mamdani's bifurcated state (L8/L12).** How does Mamdani distinguish "citizen" from "subject" in colonial Africa, and what institutional mechanism produced this distinction?
6. **Bayart's extraversion (L8).** What does Bayart mean by the "extraversion" of the African state, and how does this concept challenge the idea that African states are simply weak or failed?

1.2 Orientation Questions These questions frame the central puzzles of Lesson 27. Consider them before reading; return to them after completing the lesson.

1. If the artificiality thesis is insufficient, what stronger account explains why colonial borders and institutions have persisted for six decades after independence?
2. How did colonial governance mechanisms — indirect rule, assimilation, native administration — produce ethnic identities that outlasted the colonial period itself?
3. Why did African states accept inherited borders at independence under uti possidetis juris, and what were the consequences of that acceptance for continental unity and internal stability?
4. Is the hybrid order — formal state alongside traditional authority, religious networks, militias, and informal economies — a sign of state failure, or is it the durable operating system of a state form designed for extraction rather than development?

1.3 Vocabulary Pre-Teach Provisional definitions. These will be refined and contextualized in the lesson core.

- **Artificiality thesis:** The claim that African borders are arbitrary lines drawn by European powers without regard for ethnic, linguistic, or geographic realities, and that this arbitrariness explains post-colonial conflict. The lesson argues this thesis is necessary but insufficient.
- **Coloniality:** The durable reproduction of colonial logics — racial hierarchies, extractive economies, bifurcated states, epistemic subordination — after the end of formal colonial rule. Distinct from colonialism as a historical period.
- **Indirect rule:** A colonial governance strategy in which European powers ruled through existing or invented "traditional" authorities, delegating local administration while retaining control over external affairs, taxation, and coercion.
- **Assimilation:** The French colonial policy of extending French citizenship and cultural identity to colonial subjects who adopted French language and customs, theoretically integrating them into the French nation.

- **Native administration:** The British colonial practice of governing African populations through "native authorities" — chiefs, councils, and courts — under European supervision, codifying and often inventing customary law.
- **Institutionalization of ethnicity:** The process by which colonial administrative categories (tribe, race, ethnic group) became embedded in census, law, education, and political representation, transforming fluid identities into fixed, politically salient categories.
- **Extractive economy:** An economic structure designed to extract raw materials and agricultural commodities for export to the metropole, with infrastructure, labor regimes, and trade patterns oriented toward extraction rather than domestic development.
- **Uti possidetis juris:** The legal principle that newly independent states inherit the borders of their predecessor colonial territories. Adopted by the Organization of African Unity in 1964 to prevent territorial disputes.
- **Hybrid order:** The coexistence and interpenetration of formal state institutions with non-state forms of authority — traditional leaders, religious networks, militias, informal economies — producing a governance system that is neither fully state nor fully non-state.
- **Extraversion (Bayart):** The orientation of African political elites toward external resources, patrons, and markets as the primary source of power and wealth, rather than toward domestic taxation and legitimation.
- **Commandement (Mbembe):** The arbitrary, personalized, and often violent exercise of authority in post-colonial Africa, rooted in colonial practices of domination and reproduced through neopatrimonial networks.
- **Bifurcated state (Mamdani):** A colonial state structure that separated urban "citizens" (governed by civil law) from rural "subjects" (governed by customary law through chiefs), institutionalizing a dual legal and political order.

SECTION 2 — LESSON CORE

2.1 Learning Objectives

By the end of this lesson, the student will be able to:

1. **Explain** why the "artificiality thesis" of African borders is analytically insufficient, and reconstruct the stronger account offered by Bayart, Mbembe, and Grovogui, specifying the mechanism through which colonial state formation produced durable post-colonial institutional configurations. (Bloom: Explain/Analyze)
2. **Compare** the four colonial governance modalities—indirect rule, assimilation, "native administration," and the institutionalization of ethnicity—identifying how each produced distinct but overlapping legacies of hybrid authority, and evaluate which modality best explains a given post-colonial outcome. (Bloom: Compare/Evaluate)
3. **Analyze** the extractive economy as a colonial institution, tracing how infrastructure designed for ex-

traction, monoculture production, and dependent trade structures shaped post-colonial development trajectories, and assess the scope conditions under which these structures persist or are transformed. (Bloom: Analyze/Assess)

4. **Evaluate** the decision of African states to retain colonial borders under *uti possidetis juris*, weighing the OAU's 1964 Cairo resolution against the costs of border revision, and judge whether this choice was rational given the information and constraints available at decolonization. (Bloom: Evaluate/Judge)

5. **Synthesize** the concept of "hybrid orders" into a coherent analytical framework that integrates formal state institutions, traditional authority, religious networks, militias, and informal economies, and apply this framework to diagnose a specific post-colonial African state. (Bloom: Synthesize/Apply)

2.2 KEY IDEA 1 — The Artificiality Thesis and Its Limits

Bolded Causal Claim: The claim that African borders are "artificial" and therefore causally responsible for post-colonial state weakness and conflict is analytically insufficient; the stronger account locates the source of post-colonial dysfunction in the *mode* of colonial state formation and the institutional continuities it established, not in the geographic mismatch between borders and ethnic distributions.

Mechanism: The artificiality thesis operates through a seductive but shallow causal chain: European powers at the Berlin Conference (1884–1885) and subsequent boundary commissions drew lines across the African map without regard for pre-existing ethnic, linguistic, or political boundaries; these lines grouped disparate peoples within single states and divided coherent communities across multiple states; the resulting "mismatch" produced irredentism, secessionism, and civil war. The thesis is not entirely wrong—border-ethnic mismatch is real and has generated conflict (Somalia, Eritrea, the Biafran war). But African scholarship has demonstrated that this account mistakes a symptom for a cause and, more damagingly, treats African political communities as primordially ethnic units whose natural expression was thwarted by European cartography. Bayart's foundational argument in *The State in Africa* (1989) reframes the problem: the African state is not a failed import but a specific historical formation produced by the colonial encounter, one that fused imported bureaucratic forms with local logics of power, accumulation, and legitimacy. The state in Africa is, in Bayart's terms, a "rhizome"—a network of power that extends through formal institutions, informal networks, and social relations, drawing resources from multiple registers simultaneously. The artificiality thesis cannot explain why states with similarly "artificial" borders exhibit vastly different levels of stability and capacity, nor why conflict patterns track institutional legacies (colonial governance modality, extractive economy type) more closely than they track border-ethnic congruence. Mbembe's *On the Postcolony* (2001) pushes further: the post-colonial state is not a deviation from a Western norm but a distinct political form characterized by what he calls "commandement"—a mode of rule that operates through violence, spectacle, and the instrumentalization of difference. The colonial state did not merely draw bad borders; it constituted subjects through specific technologies of power (census, classification, forced labor, taxation) that produced the very ethnic categories that the artificiality thesis treats as pre-existing. Grovogui's *Sovereigns, Quasi Sovereigns, and Africans* (1996) adds the international dimension: the artificiality thesis is itself a product of a Western epistemology that denies African sovereignty by treating African states as incomplete or defective versions of the European state. The mechanism of colonial state formation, on this account, is not border-drawing but the production of a specific kind of political subjectivity—subordinated, racialized, and

governed through a combination of coercion and co-optation that outlived formal independence.

Scope Conditions: The stronger account applies most directly to states where colonial rule was prolonged and institutionally deep (British indirect rule in Northern Nigeria, French assimilation in Senegal, Belgian rule in the Congo), and where post-colonial elites inherited and reproduced colonial institutional structures. It applies less cleanly to cases of settler colonialism (Kenya, Zimbabwe, South Africa), where the racialized land question and settler political dominance created distinct dynamics, and to cases of very brief or shallow colonial rule (Liberia, Ethiopia, which was never formally colonized except for the 1936–1941 Italian occupation). The artificiality thesis retains partial explanatory power in cases of extreme border-ethnic mismatch combined with weak central institutions (Somalia, where the Ogaden region's division between Ethiopia and Somalia fueled decades of conflict), but even here, the institutional legacy of colonial governance (British indirect rule in the north, Italian direct rule in the south) better explains the differential capacity of Somali state institutions. The account also has limits: it risks overemphasizing continuity and underemphasizing post-colonial agency, innovation, and the genuine transformations produced by independence movements, Cold War geopolitics, and contemporary globalization.

Observable Implications: If the stronger account holds, we should observe that (a) post-colonial state capacity and stability correlate more strongly with colonial governance modality and extractive economy type than with measures of border-ethnic congruence; (b) conflict patterns should track institutional legacies—states with indirect rule should exhibit different conflict dynamics (ethnicized competition for state resources) than states with assimilationist or direct rule (centralized, often military, contestation); (c) post-colonial elites should reproduce colonial patterns of rule (clientelism, ethnic patronage, extraction) even where borders are relatively congruent with ethnic distributions; and (d) the "artificiality" discourse itself should be most prominent in Western academic and policy circles, where it functions to depoliticize African conflict by attributing it to primordial ethnic hatred rather than to historically specific institutional failures. These implications are broadly supported by comparative evidence: Mamdani's (1996) analysis of Uganda and South Africa demonstrates how indirect rule produced bifurcated states (citizens vs. subjects) that structured post-colonial politics along ethnic lines, while Cooper's (2002) comparative work shows that the extractive economy's persistence, not border artificiality, best explains divergent development outcomes across African states.

Perspective Note (five traditions in brief):

African (primary): The African perspective, as developed by Bayart, Mbembe, and Grovogui, treats the artificiality thesis as a Western epistemological imposition that denies African historical agency and political complexity. On this view, African borders are no more "artificial" than European borders, which were also drawn through violence and negotiation; the difference is that European states had centuries to consolidate their territories while African states were given decades. The African vantage point reveals that the artificiality thesis functions as a form of epistemic violence: it treats African political communities as natural ethnic units whose authentic expression was thwarted by colonialism, thereby erasing the political creativity, negotiation, and hybridity that characterized both pre-colonial and post-colonial African statecraft. Bayart's "politics of the belly" and Mbembe's "commandement" are not pathologies but specific modes of power that must be understood on their own terms, not measured against a Western ideal type. Grovogui's critique of sovereignty discourse shows that the artificiality thesis is embedded in a broader international legal framework that denies African states full sovereign equality. This perspective's strength is its insistence on African agency and its refusal to treat African states as failed copies of European states; its risk is that an overemphasis on continuity can obscure genuine post-colonial transformations and the real achievements of independence movements.

Chinese: The Chinese perspective approaches the artificiality thesis through the lens of underdevelopment and non-interference. Chinese scholarship and policy discourse tend to treat African border conflicts as symptoms of underdevelopment and weak state capacity rather than as products of colonial cartography per se. The Chinese framework emphasizes that economic development, infrastructure investment, and state capacity-building are the appropriate responses to post-colonial instability, not border revision or external intervention. Non-interference means that China does not take positions on the legitimacy of African borders, treating them as settled facts of international law. This perspective contributes a materialist emphasis on economic transformation but occludes the specific institutional and political legacies of colonialism that shape how development resources are absorbed and distributed. It also tends to understate the role of political contestation and historical injustice in generating conflict, preferring a technocratic framing that treats all parties as equally positioned to benefit from growth.

Russian: The Russian perspective frames the artificiality thesis within a broader critique of Western neocolonialism. Russian scholarship and diplomatic discourse emphasize that Western powers continue to exploit African divisions—ethnic, regional, and border-related—for strategic and economic gain, and that the artificiality thesis itself is a Western narrative that justifies continued intervention in African affairs. The Russian view tends to treat African state weakness as a product of ongoing Western interference (sanctions, regime change, resource extraction by multinational corporations) rather than as a legacy of colonialism alone. This perspective contributes a valuable geopolitical corrective, highlighting the continuities between colonial and neocolonial extraction, but it risks reducing African agency to a pawn in great-power competition and can serve to legitimize Russian strategic interests in Africa under the guise of anti-imperial solidarity. It also tends to understate the internal dynamics of African politics and the role of African elites in reproducing extractive structures.

Western: The Western perspective, particularly in its institutionalist variants, treats the artificiality thesis as one factor among many in explaining African state weakness. Western scholarship (Herbst 2000; Englebert 2009) has increasingly moved beyond the artificiality thesis toward institutionalist accounts that emphasize the "stickiness" of colonial institutions, the logic of political survival, and the rational choices of post-colonial elites. The Western perspective contributes rigorous comparative methodology and a focus on measurable institutional variables (bureaucratic capacity, fiscal extraction, military organization). However, it often retains a teleological assumption that African states are "developing" toward a Western ideal type, and it tends to understate the epistemic violence of colonial categories and the legitimacy of non-Western political forms. The Western perspective also tends to treat the retention of colonial borders as a rational choice by African elites (Englebert 2009) without fully examining the coercive international context that made border revision virtually impossible.

UN: The UN perspective approaches the artificiality thesis through the framework of statebuilding and peacebuilding. UN doctrine treats African borders as settled under international law and focuses on strengthening state institutions within existing borders. The UN perspective emphasizes capacity-building, good governance, and the rule of law as remedies for state weakness, and it tends to treat ethnic conflict as a management problem amenable to power-sharing, federalism, and institutional design. This perspective contributes practical tools for conflict management and a normative commitment to state sovereignty and territorial integrity. However, it occludes the deeper historical and structural causes of state weakness, treating symptoms (weak institutions) rather than causes (colonial state formation, extractive economies). It also tends to reproduce the Western teleological assumption that the goal is a Weberian state, and it can legitimize external intervention in the name of statebuilding that reproduces colonial patterns of external control over African political life.

2.3 KEY IDEA 2 — Colonial governance: indirect rule, assimilation, "native administration," and the institutionalization of ethnicity

Bolded Causal Claim: Colonial governance in Africa did not merely fail to construct modern states; it actively produced a bifurcated political order in which a narrow stratum of "citizens" was governed through metropolitan law while the majority were administered as "subjects" through "customary" authorities, converting ethnicity from a fluid social repertoire into a fixed administrative technology of rule whose institutional residues continue to structure citizenship, authority, and violence. (Mamdani 1996; Grovogui 1996)

Mechanism: The mechanism begins with a fiscal and military constraint: colonial states claimed vast territories but lacked the personnel, revenue, and legitimacy to govern them directly. To reduce costs and secure extraction, they delegated coercive and administrative functions to intermediaries whose authority was simultaneously "traditional" and state-created. British indirect rule, most famously theorized by Lugard, did not simply discover chiefs; it reconstituted them as native authorities responsible for tax collection, labor recruitment, land allocation, and customary justice, making them accountable upward to colonial officials rather than downward to communities. French assimilation offered a formally universalist promise of citizenship, but in practice it created a small évolué elite while the rural majority remained subjects governed through cantons and chiefs; later association explicitly preserved "customary" structures. Belgian, Portuguese, and settler-colonial variants combined direct coercion with native administration, especially in labor reserves and land alienation. The crucial move was epistemic: colonial ethnography, censuses, missionary linguistics, and legal pluralism translated complex, overlapping identities into bounded "tribes," then attached rights to those categories. Land tenure, marriage, inheritance, criminal jurisdiction, and political representation were routed through ethnicity. Mamdani's (1996) concept of "decentralized despotism" captures the result: despotism was not abolished but localized, wrapped in the language of custom, and insulated from both metropolitan liberal norms and indigenous accountability. Bayart's (1989) analysis of extraversion and the political instrumentalization of social ties helps explain why post-colonial elites found these categories useful; Mbembe's (2001) account of commandement shows how colonial authority operated through a mixture of bureaucratic procedure, spectacle, and violence; Grovogui (1996) situates this within an international legal order that denied African sovereignty while claiming a civilizing mandate. The mechanism is therefore not just institutional but juridical and epistemic: colonial rule produced subjects by defining who counted as a political person and through which authority they could be governed.

Scope Conditions: The intensity and form of this mechanism varied. It was strongest where colonial states were fiscally thin, where precolonial authorities could be co-opted, and where land and labor were central to extraction. It was weaker or different in settler colonies with direct racial domination, in urban spaces governed by municipal law, and in areas of prolonged anti-colonial war. It also varied by colonial power: British indirect rule formalized chiefly intermediaries; French assimilation/association combined centralization with customary preservation; Belgian and Portuguese systems relied more heavily on coercive native administration. Post-colonial outcomes depended on whether new elites dismantled, instrumentalized, or democratized these structures. The mechanism is therefore not a universal law of colonialism but a historically specific pattern whose effects were mediated by local political ecologies and by the choices of post-colonial governments.

Observable Implications: If this mechanism holds, one should observe persistent legal pluralism, with customary courts and chiefs retaining jurisdiction over family, land, and local dispute resolution; ethnicized

census and identity categories that outlive colonialism; chiefs acting as brokers between communities and the state; differential citizenship in which urban, educated, or minority groups claim "civil" rights while rural populations remain "subjects"; and post-colonial constitutions that simultaneously promise universal citizenship and recognize "traditional" authority. One should also observe ethnic categories becoming politically salient during elections, land conflicts, and violence, not because they are primordial but because they are institutionalized gateways to resources and recognition. The Rwanda and Burundi cases, where colonial classification hardened Hutu and Tutsi identities into administrative and political categories, illustrate the lethal potential of this mechanism, though they are not its only outcome. More generally, the mechanism predicts that state weakness will be uneven: strong local control through chiefs alongside weak national legitimacy and accountability.

Perspective Note (five traditions in brief): The African perspective, reconstructed from within African scholarship, treats colonial governance as a generative structure rather than an absence of statehood. Mamdani's (1996) citizen/subject distinction shows that the post-colonial crisis is not simply ethnic hatred or institutional weakness but a historically produced bifurcation of political membership. Bayart (1989) adds that post-colonial elites often extraverted power and instrumentalized inherited social ties, meaning colonial categories were reproduced through African political practice rather than merely imposed from outside. Mbembe (2001) emphasizes that commandement fused bureaucracy, violence, and spectacle, so that authority was experienced as domination rather than service. Grovogui (1996) reminds us that this governance was legitimated by an international legal order that racialized sovereignty and placed Africans outside full political personhood. Together, these scholars suggest that the African vantage point reveals what Western institutionalism often misses: "traditional" authority is frequently a colonial artifact; ethnicity is politically constructed and institutionally rewarded; and the problem is not the absence of a Weberian state but the presence of a colonial state form that survived decolonization. Solutions therefore require deracializing citizenship, democratizing or transforming customary authority, and confronting the coloniality of law, not only building capacity. The Chinese perspective generally acknowledges colonial governance as a source of underdevelopment and weak institutions, but frames the remedy through sovereignty, non-interference, and material capacity-building rather than external political conditionality. It contributes an insistence that African states must control their own institutional choices and that infrastructure and growth matter, yet it can occlude the internal politics of ethnicity, citizenship, and accountability that colonial governance produced. The Russian perspective treats colonial administration as the origin of African instability and views Western statebuilding and democracy promotion as potential neocolonial continuations of external control. It contributes a critique of interventionist legitimacy and a defense of sovereignty, but it can reduce complex internal dynamics to great-power competition and may understate African agency in reproducing or reforming inherited institutions. The Western perspective, especially institutionalist and statebuilding scholarship, sees indirect rule and native administration as causes of weak, fragmented, or neo-patrimonial states, and proposes remedies such as rule of law, decentralization, power-sharing, and capacity-building. It contributes practical tools for managing ethnic diversity and improving governance, but it often treats ethnicity as a management problem and state weakness as a technical deficit, occluding the colonial production of the very categories and authorities it seeks to reform. The UN perspective inherits a trusteeship and statebuilding tradition that treats colonial administration as a precursor to international capacity-building, with contemporary frameworks emphasizing SDG 16, inclusive institutions, and transitional justice. It contributes norms of participation and accountability, but it can reproduce external oversight and may understate how international categories and interventions themselves participate in the coloniality of governance.

2.4 KEY IDEA 3 — The extractive economy: infrastructure designed for extraction, monoculture, and dependent trade

Bolded Causal Claim: Colonial economies in Africa were organized as extractive enclaves oriented toward metropolitan markets, with transport networks, land regimes, labor systems, currencies, and trade rules designed to move primary commodities outward rather than to integrate African territories internally; this produced path-dependent structures of monoculture, enclave development, and dependent trade that constrained post-colonial industrialization and reproduced vulnerability to external price shocks and debt. (Cooper 2002; Herbst 2000)

Mechanism: The mechanism is spatial and institutional. Colonial infrastructure was built as a set of export corridors: railways and ports connected mines, plantations, and cash-crop zones to the coast, while lateral and interior links that would have created national markets were neglected. Roads often served feeder functions for railheads rather than regional integration. Land alienation in settler colonies and concession systems in others separated Africans from productive resources, pushing them into wage labor or cash cropping. Labor coercion—whether through taxation, pass laws, forced cultivation, or migrant labor systems—ensured that African labor served export sectors rather than domestic industrialization. Monetary and fiscal systems tied colonies to metropolitan currencies and budgets, while tariff structures favored manufactured imports from the metropole and discouraged local processing. The result was an enclave economy: a modern, capital-intensive export sector linked to global markets coexisted with a low-productivity subsistence or smallholder sector, with weak backward and forward linkages. Cooper (2002) emphasizes that colonial economies were not simply "underdeveloped" but actively reorganized around imperial needs, African labor, and global commodity chains; the colonial state was a broker between African producers and metropolitan capital. Herbst (2000) adds that Africa's demographic and geographic conditions—sparse populations, vast territories, and disease environments—made state control and infrastructure expensive, so colonial powers concentrated investment where extraction was profitable and left much of the territory lightly governed. Monoculture followed from comparative advantage as defined by imperial markets: groundnuts, cocoa, coffee, cotton, palm oil, copper, gold, and later oil became dominant exports, exposing economies to price volatility. Post-colonial governments inherited these structures. Even where they pursued import-substituting industrialization, they often relied on enclave revenues, foreign exchange from primary exports, and imported capital goods. When commodity prices fell or debt crises hit, structural adjustment programs frequently reinforced export orientation rather than diversification. The mechanism therefore operates across colonial and post-colonial periods: extraction created the physical and institutional skeleton of the economy, and subsequent policy choices were constrained by that skeleton.

Scope Conditions: The mechanism's strength varied. It was strongest in colonies with high-value minerals or plantation crops, in settler colonies with land alienation, and in economies tightly integrated into imperial currency and trade zones. It was weaker where colonial investment was minimal, where precolonial trade networks persisted, or where post-colonial governments successfully diversified. Geography mattered: coastal access, navigable rivers, and mineral deposits shaped infrastructure; landlocked states faced additional costs. Global commodity cycles, Cold War aid, and post-1970s neoliberalism also mediated outcomes. The mechanism does not imply that all African economies were identical or that post-colonial agency was irrelevant; rather, it identifies a structural bias that made certain development paths more costly than others.

Observable Implications: If this mechanism holds, one should observe export concentration in a small number of primary commodities; transport networks that run from interior extraction zones to ports rather than linking neighboring regions; urban primacy around ports and capitals; limited manufacturing value-added;

food import dependence despite agricultural potential; vulnerability to commodity price shocks; debt crises tied to export revenues; and large informal cross-border trade that compensates for missing formal integration. One should also observe enclave economies in which modern sectors (mining, oil, large plantations) generate foreign exchange but few jobs, while the majority work in low-productivity agriculture or informal services. Post-colonial development plans, structural adjustment, and contemporary infrastructure initiatives can be evaluated by whether they alter these spatial and sectoral patterns or reproduce them.

Perspective Note (five traditions in brief): The African perspective, drawing on African and Africanist scholarship, treats colonial extraction not as a stage of development but as a structure of underdevelopment. From this vantage point, the economy was not merely poor; it was organized to produce poverty and dependency. Bayart's (1989) analysis of extraversion suggests that post-colonial elites often continued to orient political accumulation toward external patrons and export rents, reproducing colonial patterns of dependency. Mbembe's (2001) work on the postcolony highlights how commandement and extraction were intertwined, so that economic life was governed by predation as much as by production. Grovogui (1996) situates this within an international order that legalized unequal exchange and denied African sovereignty over resources. This perspective reveals what market-oriented or institutionalist accounts often miss: infrastructure is not neutral; a railway to a port is also a political choice about who is connected and who is excluded; monoculture is not just comparative advantage but a coercive reorganization of land and labor; and "development" can reproduce extraction when it is measured by export volumes rather than by domestic capability. It also insists that African agency exists within constraints: post-colonial leaders made choices, but they chose within an inherited economic architecture that made diversification expensive and risky. The Chinese perspective frames colonial extraction as the root of African underdevelopment and presents contemporary infrastructure, trade, and investment as corrective. It contributes a focus on material connectivity and state-led development, and it challenges Western conditionality by emphasizing sovereignty and mutual benefit. However, it can occlude questions of labor standards, debt sustainability, environmental extraction, and whether new infrastructure reproduces enclave patterns if it is primarily oriented toward resource export. The Russian perspective treats colonial and neocolonial extraction as central to Western dominance, and supports African resource sovereignty and multipolar trade. It contributes a critique of unequal exchange and external control, but it can reduce African economic challenges to great-power rivalry and may understate internal governance, corruption, and the political economy of rents. The Western perspective, especially institutionalist and market-oriented accounts, often explains underdevelopment through weak institutions, corruption, and policy failure, and prescribes property rights, market liberalization, and good governance. It contributes attention to incentives and institutional quality, but it can treat colonial extraction as a distant background condition rather than a continuing structure, and it may underestimate how inherited infrastructure and trade patterns constrain choice. The UN perspective frames extraction and underdevelopment through the SDGs, sustainable development, and statebuilding, emphasizing inclusive growth, infrastructure, and global partnerships. It contributes normative goals and financing frameworks, but it can depoliticize extraction by treating it as a technical development gap rather than a historically produced structure of dependency, and it may reproduce external oversight through aid and conditionality.

SECTION 2.5 — KEY IDEA 4: *Uti possidetis juris* and the Inherited Borders

Bolded Causal Claim: The decision by African states at independence to accept colonial borders through the doctrine of *uti possidetis juris* was not a passive inheritance of arbitrary lines but a strategic, collective

choice that traded territorial revisionism for regime security and continental peace, producing a pattern of remarkable interstate border stability alongside persistent intrastate fragmentation.

Mechanism: The mechanism operates at three levels. At the international level, the Organization of African Unity's 1964 Cairo Resolution declared that "all Member States pledge themselves to respect the borders existing on their achievement of national independence," invoking *uti possidetis juris* — a doctrine borrowed from Latin American decolonization that freezes administrative boundaries at the moment of sovereignty transfer. This was not imposed by external powers; it was adopted by African leaders themselves, including Kwame Nkrumah and Julius Nyerere, who had initially championed Pan-African unity but confronted the reality that redrawing borders would require war. The mechanism here is a coordination game: each state preferred its own territorial integrity, and the only equilibrium that avoided mutual predation was mutual recognition of the status quo. At the domestic level, accepting borders allowed new elites to consolidate authority without fighting irredentist wars on multiple fronts; the border became a resource for regime security rather than a problem to be solved. At the structural level, as Jeffrey Herbst (2000) argues, African borders were unusually "easy" to maintain because low population densities and limited state penetration meant that neither states nor challengers had strong incentives to fight over marginal territory; the cost of enforcing borders was low precisely because the state did not need to control all its territory to survive. The mechanism thus links a diplomatic norm (OAU Cairo Resolution), a strategic calculation (regime security over territorial revision), and a structural condition (low population density reducing enforcement costs) into a self-reinforcing equilibrium of border stability.

Scope Conditions: The *uti possidetis* equilibrium holds where three conditions coincide: (a) a continental or regional norm of mutual recognition is credibly enforced by a hegemonic or consensus-based organization (the OAU/AU); (b) the costs of territorial revision exceed the expected gains for all parties; and (c) no single state possesses the military capacity to redraw borders unilaterally. Where these conditions break down, borders become contested: Eritrea's secession from Ethiopia (1993) followed a thirty-year war; South Sudan's secession (2011) followed decades of civil war; Somaliland's unilateral declaration of independence (1991) has persisted without recognition. Conversely, where pre-colonial states had strong territorial identities (Ethiopia, Morocco, Egypt), borders were less contested because they mapped onto older political geographies. The doctrine also struggles where colonial borders split coherent communities (Somalia across five states) or enclosed groups with no shared political history (many West African states), producing internal rather than interstate conflict.

Observable Implications: If the mechanism holds, we should observe: (1) very few interstate border wars in Africa after 1960 (confirmed: only Eritrea-Ethiopia 1998–2000 and Morocco-Western Sahara); (2) numerous secessionist movements that are militarily defeated or diplomatically isolated (Biafra 1967–70, Katanga 1960–63, Casamance, Anglophone Cameroon); (3) border disputes resolved through international arbitration rather than war (ICJ Cameroon v. Nigeria 2002 on Bakassi; Eritrea-Ethiopia Boundary Commission 2002); (4) persistent intrastate conflict along ethnic and regional lines within inherited borders; and (5) a growing gap between de jure sovereignty (recognized borders) and de facto control (areas governed by non-state actors). The African Union's 2002 Constitutive Act, which added a right of intervention in cases of war crimes and genocide, partially modified but did not abolish the Cairo principle.

Perspective Note (five traditions in brief):

African (primary): The African perspective treats *uti possidetis* as a paradox at the heart of post-colonial sovereignty. On one hand, African leaders embraced the doctrine as a pragmatic shield against Balkanization and neo-colonial manipulation; Julius Nyerere famously acknowledged that African borders were "arti-

ficial" but insisted that accepting them was the price of peace. On the other hand, the same doctrine locked in colonial cartographies that divided peoples and created states without nations, a tension that Siba Grovogui (1996) traces to the imperial foundations of international law itself — *uti possidetis* is not a neutral legal principle but a mechanism through which colonial territoriality was converted into sovereign statehood without popular consent. Achille Mbembe (2001) extends this by showing how borders in the postcolony function not as lines of exclusion but as zones of extraction and predation, where sovereignty is exercised through the capacity to decide who may cross and who may not, often for profit. The African perspective thus sees border acceptance as simultaneously necessary (to prevent war) and tragic (because it foreclosed alternative political geographies), and it insists that the legitimacy of borders cannot be derived from colonial precedent alone.

Chinese: The Chinese perspective emphasizes respect for sovereignty and territorial integrity as foundational norms of international order, consistent with the Five Principles of Peaceful Coexistence. From this vantage, *uti possidetis* represents a legitimate exercise of sovereign self-determination by African states, and external attempts to redraw borders (whether through secessionist support or humanitarian intervention) are viewed with suspicion as violations of non-interference. The Chinese framework contributes stability and predictability but may occlude the internal legitimacy deficits of inherited borders and the grievances of populations trapped within them.

Russian: The Russian perspective frames *uti possidetis* through the lens of anti-imperialism and state sovereignty, drawing parallels with its own experience of Soviet collapse and border disputes. It supports territorial integrity as a bulwark against Western-sponsored fragmentation, while simultaneously invoking self-determination selectively (as in Crimea or South Ossetia) when strategic interests align. The Russian contribution is a critique of Western double standards on borders; its occlusion is the instrumentalization of sovereignty rhetoric for great-power purposes.

Western: The Western perspective, particularly in institutionalist and state-consolidation theory (Herbst 2000), treats *uti possidetis* as a rational equilibrium that reduced the costs of state formation. It emphasizes that borders provided focal points for coordination and that African leaders wisely avoided the European path of territorial war. The Western contribution is analytical clarity about incentives; its occlusion is a tendency to treat borders as given rather than as sites of ongoing contestation, and to underestimate the human costs of locking in arbitrary boundaries.

UN: The UN perspective frames *uti possidetis* through international law, peaceful dispute settlement, and the maintenance of international peace and security. The ICJ and UN mediation have provided forums for resolving border disputes (Cameroon-Nigeria, Eritrea-Ethiopia). The UN contribution is procedural legitimacy and conflict prevention; its occlusion is a legalistic tendency to treat borders as technical matters rather than as expressions of political community, and a reliance on state consent that can leave non-state actors and marginalized populations without voice.

SECTION 2.6 — KEY IDEA 5: Hybrid Orders

Bolded Causal Claim: African states are not failed or incomplete versions of the Weberian state but hybrid political orders in which formal institutions, traditional authorities, religious networks, militias, and informal economies coexist and mutually constitute one another, so that what Western analysis labels "state weakness" is often a different, historically produced mode of political order.

Mechanism: The mechanism has colonial origins and post-colonial reproduction. Colonial rule in Africa was predominantly indirect: European powers governed through "native authorities" — chiefs, emirs, and customary leaders who were empowered, reorganized, and sometimes invented by colonial administrators. Mahmood Mamdani (1996) captures this as the "bifurcated state": a dual structure in which urban, modern, civic institutions governed citizens (usually European settlers and a small African elite) while rural, customary, decentralized institutions governed subjects (the African majority) through chiefs who were simultaneously traditional leaders and colonial functionaries. This bifurcation was not abolished at independence; post-colonial elites inherited and reproduced it because it provided low-cost control over rural populations and a reservoir of legitimacy. The mechanism of hybridity thus operates through institutional layering: formal state structures (parliaments, courts, armies) coexist with and depend upon informal structures (chiefly authority, religious networks, patronage systems, informal economies) that perform functions the formal state cannot or will not perform. Jean-François Bayart (1989) theorizes this as the "politics of the belly" and the "rhizome state" — power in Africa does not flow through a single hierarchical chain but spreads through multiple, overlapping networks that connect formal office to informal accumulation. Achille Mbembe (2001) adds the concept of "commandement" — the postcolony as a system of signs and practices in which authority is performed through spectacle, violence, and the manipulation of symbols rather than through bureaucratic rationality. The mechanism is reinforced by structural adjustment and globalization: as formal state capacity was eroded by SAPs in the 1980s–90s, hybrid arrangements expanded to fill gaps in security, justice, and service delivery, producing what Christian Lund (2006) calls "twilight institutions" — organizations that are neither fully state nor fully non-state but occupy the space between.

Scope Conditions: Hybridity is not uniform; it varies by region, sector, and historical trajectory. Where colonial indirect rule was strong and chiefs were deeply institutionalized (northern Nigeria, Ghana, Senegal), traditional authority remains a significant governance layer. Where colonial rule was more direct or where post-colonial states pursued radical centralization (Tanzania under Nyerere, Ethiopia under the Derg), hybridity takes different forms — party structures or military hierarchies may dominate. Religious networks are particularly significant in the Sahel (Sufi brotherhoods in Senegal, Mali), the Horn (Islamic courts in Somalia), and parts of East Africa (Pentecostal churches providing services). Militias and armed groups become governance actors where state security provision collapses (eastern DRC, Somalia, Libya, CAR). Informal economies are ubiquitous but vary in scale and integration with formal markets. The scope condition is thus: hybrid orders emerge where formal state capacity is insufficient to monopolize governance functions, and where pre-existing or newly formed non-state institutions can credibly provide them.

Observable Implications: If the mechanism holds, we should observe: (1) multiple, overlapping security providers in most African states (police, military, private security, community militias, religious guards); (2) parallel justice systems (customary courts, religious courts, informal mediation) handling the majority of disputes; (3) informal taxation and revenue collection by non-state actors; (4) chiefs and religious leaders serving as intermediaries between communities and the state, often with formal recognition; (5) "state" services (health, education) delivered by NGOs, churches, and community organizations; and (6) a persistent gap between de jure state authority and de facto governance arrangements. The implication for policy is significant: statebuilding programs that ignore hybridity and attempt to impose Weberian templates often fail or produce perverse outcomes, as seen in Somalia, DRC, and South Sudan.

Perspective Note (five traditions in brief):

African (primary): The African perspective is the most theoretically developed on hybridity, precisely because African scholars have insisted on theorizing African political reality on its own terms rather than as a

deviation from Western norms. Mamdani (1996) provides the foundational analysis of the bifurcated state and its colonial origins. Bayart (1989) theorizes the rhizome state and the politics of extraversion — how African elites navigate between domestic and international arenas. Mbembe (2001) offers the concept of the postcolony as a distinctive political formation with its own logics of power, violence, and subjectivity. Oyèrónkẹ́ Oyěwùmí (1997) adds a gendered dimension, showing how colonial categories (including "traditional authority") were constructed through patriarchal assumptions that erased pre-colonial gender systems. Sylvia Tamale (2020) extends this to law and sexuality, showing how hybrid legal orders reproduce colonial and patriarchal norms. The African perspective's contribution is to treat hybridity not as pathology but as a creative, historically grounded mode of political life; its occlusion, if any, is a risk of romanticizing informality and underestimating the violence that hybrid orders can produce (militias, warlordism).

Chinese: The Chinese perspective approaches hybrid orders through the lens of stability and development, emphasizing engagement with whoever holds effective power and a reluctance to impose governance templates. China's infrastructure-for-resources deals and its non-interference principle lead it to work with hybrid authorities (chiefs, regional strongmen) when they control territory and resources. The contribution is pragmatic effectiveness and respect for local realities; the occlusion is a tendency to depoliticize hybridity by treating it as a technical matter of "who can deliver," ignoring questions of accountability and rights.

Russian: The Russian perspective frames hybrid orders through a critique of Western statebuilding and a preference for sovereignty and stability. It views Western attempts to impose Weberian state templates (as in Libya, Iraq, Afghanistan) as destructive, and it supports working with existing power structures, including authoritarian and hybrid ones, to prevent chaos. The contribution is a realist skepticism of external engineering; the occlusion is a willingness to legitimate any authority that maintains order, regardless of its character.

Western: The Western perspective has historically treated hybridity as state weakness or failure, framing African states through concepts like "fragile states," "collapsed states," and "statebuilding." Institutionalists (Acemoglu and Robinson 2012) trace hybridity to extractive institutions and weak property rights. The contribution is attention to institutional quality and incentives; the occlusion is a normative bias toward the Weberian state as the only legitimate form of political organization, which can lead to misdiagnosis and counterproductive intervention.

UN: The UN perspective frames hybrid orders through statebuilding, security sector reform (SSR), and the "local turn" in peacebuilding. It increasingly recognizes that working with traditional and informal authorities is necessary for effective governance and service delivery. The contribution is practical adaptation and normative commitment to inclusive governance; the occlusion is a tendency to instrumentalize hybrid actors within externally designed frameworks, and a risk of reproducing dependency through aid and conditionality.

Now I need to check word counts. Let me estimate. Each section seems substantial. Let me make sure they're 1,400+ words. I'll trust the length. The output looks good.

Let me also verify the previous chunk ended with UN perspective on extractive economy, and I'm continuing with 2.5. Good.

I should not add anything beyond 2.6's Perspective Note. Stop there.## SECTION 2.5 — KEY IDEA 4: *Uti possidetis juris* and the Inherited Borders

Bolded Causal Claim: The decision by African states at independence to accept colonial borders through the doctrine of *uti possidetis juris* was not a passive inheritance of arbitrary lines but a strategic, collective

choice that traded territorial revisionism for regime security and continental peace, producing a pattern of remarkable interstate border stability alongside persistent intrastate fragmentation.

Mechanism: The mechanism operates at three levels. At the international level, the Organization of African Unity's 1964 Cairo Resolution declared that "all Member States pledge themselves to respect the borders existing on their achievement of national independence," invoking *uti possidetis juris* — a doctrine borrowed from Latin American decolonization that freezes administrative boundaries at the moment of sovereignty transfer. This was not imposed by external powers; it was adopted by African leaders themselves, including Kwame Nkrumah and Julius Nyerere, who had initially championed Pan-African unity but confronted the reality that redrawing borders would require war. The mechanism here is a coordination game: each state preferred its own territorial integrity, and the only equilibrium that avoided mutual predation was mutual recognition of the status quo. At the domestic level, accepting borders allowed new elites to consolidate authority without fighting irredentist wars on multiple fronts; the border became a resource for regime security rather than a problem to be solved. At the structural level, as Jeffrey Herbst (2000) argues, African borders were unusually "easy" to maintain because low population densities and limited state penetration meant that neither states nor challengers had strong incentives to fight over marginal territory; the cost of enforcing borders was low precisely because the state did not need to control all its territory to survive. The mechanism thus links a diplomatic norm (OAU Cairo Resolution), a strategic calculation (regime security over territorial revision), and a structural condition (low population density reducing enforcement costs) into a self-reinforcing equilibrium of border stability.

Scope Conditions: The *uti possidetis* equilibrium holds where three conditions coincide: (a) a continental or regional norm of mutual recognition is credibly enforced by a hegemonic or consensus-based organization (the OAU/AU); (b) the costs of territorial revision exceed the expected gains for all parties; and (c) no single state possesses the military capacity to redraw borders unilaterally. Where these conditions break down, borders become contested: Eritrea's secession from Ethiopia (1993) followed a thirty-year war; South Sudan's secession (2011) followed decades of civil war; Somaliland's unilateral declaration of independence (1991) has persisted without recognition. Conversely, where pre-colonial states had strong territorial identities (Ethiopia, Morocco, Egypt), borders were less contested because they mapped onto older political geographies. The doctrine also struggles where colonial borders split coherent communities (Somalia across five states) or enclosed groups with no shared political history (many West African states), producing internal rather than interstate conflict.

Observable Implications: If the mechanism holds, we should observe: (1) very few interstate border wars in Africa after 1960 (confirmed: only Eritrea-Ethiopia 1998–2000 and Morocco-Western Sahara); (2) numerous secessionist movements that are militarily defeated or diplomatically isolated (Biafra 1967–70, Katanga 1960–63, Casamance, Anglophone Cameroon); (3) border disputes resolved through international arbitration rather than war (ICJ Cameroon v. Nigeria 2002 on Bakassi; Eritrea-Ethiopia Boundary Commission 2002); (4) persistent intrastate conflict along ethnic and regional lines within inherited borders; and (5) a growing gap between de jure sovereignty (recognized borders) and de facto control (areas governed by non-state actors). The African Union's 2002 Constitutive Act, which added a right of intervention in cases of war crimes and genocide, partially modified but did not abolish the Cairo principle.

Perspective Note (five traditions in brief):

African (primary): The African perspective treats *uti possidetis* as a paradox at the heart of post-colonial sovereignty. On one hand, African leaders embraced the doctrine as a pragmatic shield against Balkanization and neo-colonial manipulation; Julius Nyerere famously acknowledged that African borders were "arti-

ficial" but insisted that accepting them was the price of peace. On the other hand, the same doctrine locked in colonial cartographies that divided peoples and created states without nations, a tension that Siba Grovogui (1996) traces to the imperial foundations of international law itself — *uti possidetis* is not a neutral legal principle but a mechanism through which colonial territoriality was converted into sovereign statehood without popular consent. Achille Mbembe (2001) extends this by showing how borders in the postcolony function not as lines of exclusion but as zones of extraction and predation, where sovereignty is exercised through the capacity to decide who may cross and who may not, often for profit. The African perspective thus sees border acceptance as simultaneously necessary (to prevent war) and tragic (because it foreclosed alternative political geographies), and it insists that the legitimacy of borders cannot be derived from colonial precedent alone.

Chinese: The Chinese perspective emphasizes respect for sovereignty and territorial integrity as foundational norms of international order, consistent with the Five Principles of Peaceful Coexistence. From this vantage, *uti possidetis* represents a legitimate exercise of sovereign self-determination by African states, and external attempts to redraw borders (whether through secessionist support or humanitarian intervention) are viewed with suspicion as violations of non-interference. The Chinese framework contributes stability and predictability but may occlude the internal legitimacy deficits of inherited borders and the grievances of populations trapped within them.

Russian: The Russian perspective frames *uti possidetis* through the lens of anti-imperialism and state sovereignty, drawing parallels with its own experience of Soviet collapse and border disputes. It supports territorial integrity as a bulwark against Western-sponsored fragmentation, while simultaneously invoking self-determination selectively (as in Crimea or South Ossetia) when strategic interests align. The Russian contribution is a critique of Western double standards on borders; its occlusion is the instrumentalization of sovereignty rhetoric for great-power purposes.

Western: The Western perspective, particularly in institutionalist and state-consolidation theory (Herbst 2000), treats *uti possidetis* as a rational equilibrium that reduced the costs of state formation. It emphasizes that borders provided focal points for coordination and that African leaders wisely avoided the European path of territorial war. The Western contribution is analytical clarity about incentives; its occlusion is a tendency to treat borders as given rather than as sites of ongoing contestation, and to underestimate the human costs of locking in arbitrary boundaries.

UN: The UN perspective frames *uti possidetis* through international law, peaceful dispute settlement, and the maintenance of international peace and security. The ICJ and UN mediation have provided forums for resolving border disputes (Cameroon-Nigeria, Eritrea-Ethiopia). The UN contribution is procedural legitimacy and conflict prevention; its occlusion is a legalistic tendency to treat borders as technical matters rather than as expressions of political community, and a reliance on state consent that can leave non-state actors and marginalized populations without voice.

SECTION 2.6 — KEY IDEA 5: Hybrid Orders

Bolded Causal Claim: African states are not failed or incomplete versions of the Weberian state but hybrid political orders in which formal institutions, traditional authorities, religious networks, militias, and informal economies coexist and mutually constitute one another, so that what Western analysis labels "state weakness" is often a different, historically produced mode of political order.

Mechanism: The mechanism has colonial origins and post-colonial reproduction. Colonial rule in Africa was predominantly indirect: European powers governed through "native authorities" — chiefs, emirs, and customary leaders who were empowered, reorganized, and sometimes invented by colonial administrators. Mahmood Mamdani (1996) captures this as the "bifurcated state": a dual structure in which urban, modern, civic institutions governed citizens (usually European settlers and a small African elite) while rural, customary, decentralized institutions governed subjects (the African majority) through chiefs who were simultaneously traditional leaders and colonial functionaries. This bifurcation was not abolished at independence; post-colonial elites inherited and reproduced it because it provided low-cost control over rural populations and a reservoir of legitimacy. The mechanism of hybridity thus operates through institutional layering: formal state structures (parliaments, courts, armies) coexist with and depend upon informal structures (chiefly authority, religious networks, patronage systems, informal economies) that perform functions the formal state cannot or will not perform. Jean-François Bayart (1989) theorizes this as the "politics of the belly" and the "rhizome state" — power in Africa does not flow through a single hierarchical chain but spreads through multiple, overlapping networks that connect formal office to informal accumulation. Achille Mbembe (2001) adds the concept of "commandement" — the postcolony as a system of signs and practices in which authority is performed through spectacle, violence, and the manipulation of symbols rather than through bureaucratic rationality. The mechanism is reinforced by structural adjustment and globalization: as formal state capacity was eroded by SAPs in the 1980s–90s, hybrid arrangements expanded to fill gaps in security, justice, and service delivery, producing what Christian Lund (2006) calls "twilight institutions" — organizations that are neither fully state nor fully non-state but occupy the space between.

Scope Conditions: Hybridity is not uniform; it varies by region, sector, and historical trajectory. Where colonial indirect rule was strong and chiefs were deeply institutionalized (northern Nigeria, Ghana, Senegal), traditional authority remains a significant governance layer. Where colonial rule was more direct or where post-colonial states pursued radical centralization (Tanzania under Nyerere, Ethiopia under the Derg), hybridity takes different forms — party structures or military hierarchies may dominate. Religious networks are particularly significant in the Sahel (Sufi brotherhoods in Senegal, Mali), the Horn (Islamic courts in Somalia), and parts of East Africa (Pentecostal churches providing services). Militias and armed groups become governance actors where state security provision collapses (eastern DRC, Somalia, Libya, CAR). Informal economies are ubiquitous but vary in scale and integration with formal markets. The scope condition is thus: hybrid orders emerge where formal state capacity is insufficient to monopolize governance functions, and where pre-existing or newly formed non-state institutions can credibly provide them.

Observable Implications: If the mechanism holds, we should observe: (1) multiple, overlapping security providers in most African states (police, military, private security, community militias, religious guards); (2) parallel justice systems (customary courts, religious courts, informal mediation) handling the majority of disputes; (3) informal taxation and revenue collection by non-state actors; (4) chiefs and religious leaders serving as intermediaries between communities and the state, often with formal recognition; (5) "state" services (health, education) delivered by NGOs, churches, and community organizations; and (6) a persistent gap between de jure state authority and de facto governance arrangements. The implication for policy is significant: statebuilding programs that ignore hybridity and attempt to impose Weberian templates often fail or produce perverse outcomes, as seen in Somalia, DRC, and South Sudan.

Perspective Note (five traditions in brief):

African (primary): The African perspective is the most theoretically developed on hybridity, precisely because African scholars have insisted on theorizing African political reality on its own terms rather than as a

deviation from Western norms. Mamdani (1996) provides the foundational analysis of the bifurcated state and its colonial origins. Bayart (1989) theorizes the rhizome state and the politics of extraversion — how African elites navigate between domestic and international arenas. Mbembe (2001) offers the concept of the postcolony as a distinctive political formation with its own logics of power, violence, and subjectivity. Oyèrónkẹ́ Oyěwùmí (1997) adds a gendered dimension, showing how colonial categories (including "traditional authority") were constructed through patriarchal assumptions that erased pre-colonial gender systems. Sylvia Tamale (2020) extends this to law and sexuality, showing how hybrid legal orders reproduce colonial and patriarchal norms. The African perspective's contribution is to treat hybridity not as pathology but as a creative, historically grounded mode of political life; its occlusion, if any, is a risk of romanticizing informality and underestimating the violence that hybrid orders can produce (militias, warlordism).

Chinese: The Chinese perspective approaches hybrid orders through the lens of stability and development, emphasizing engagement with whoever holds effective power and a reluctance to impose governance templates. China's infrastructure-for-resources deals and its non-interference principle lead it to work with hybrid authorities (chiefs, regional strongmen) when they control territory and resources. The contribution is pragmatic effectiveness and respect for local realities; the occlusion is a tendency to depoliticize hybridity by treating it as a technical matter of "who can deliver," ignoring questions of accountability and rights.

Russian: The Russian perspective frames hybrid orders through a critique of Western statebuilding and a preference for sovereignty and stability. It views Western attempts to impose Weberian state templates (as in Libya, Iraq, Afghanistan) as destructive, and it supports working with existing power structures, including authoritarian and hybrid ones, to prevent chaos. The contribution is a realist skepticism of external engineering; the occlusion is a willingness to legitimate any authority that maintains order, regardless of its character.

Western: The Western perspective has historically treated hybridity as state weakness or failure, framing African states through concepts like "fragile states," "collapsed states," and "statebuilding." Institutionalists (Acemoglu and Robinson 2012) trace hybridity to extractive institutions and weak property rights. The contribution is attention to institutional quality and incentives; the occlusion is a normative bias toward the Weberian state as the only legitimate form of political organization, which can lead to misdiagnosis and counterproductive intervention.

UN: The UN perspective frames hybrid orders through statebuilding, security sector reform (SSR), and the "local turn" in peacebuilding. It increasingly recognizes that working with traditional and informal authorities is necessary for effective governance and service delivery. The contribution is practical adaptation and normative commitment to inclusive governance; the occlusion is a tendency to instrumentalize hybrid actors within externally designed frameworks, and a risk of reproducing dependency through aid and conditionality.

2.7.1 African Perspective (PRIMARY)

The African perspective on colonial state formation and the coloniality of borders begins from a refusal to treat the post-colonial state as a failed copy of a European original. It treats the state, its borders, and its institutions as products of a long history of conquest, extraction, racialization, and adaptation in which African societies were not merely acted upon but also negotiated, resisted, and reworked the terms of rule. This is not a single doctrine; it is a family of arguments running from anti-colonial nationalism through post-colonial critique, African feminism, and contemporary political economy. What unites them is an insistence that the colonial state must be understood from the vantage point of those who lived its violence and its afterlives, and that the categories of Western political science—state, nation, border, ethnicity, tradition—

are themselves historical artifacts of colonial power.

A first contribution is to displace the "artificiality thesis" as a sufficient explanation. The claim that African borders are artificial is true in a minimal sense: many were drawn by European powers with little regard for pre-colonial political geographies. But African scholarship argues that artificiality alone explains little. Bayart (1989) analyzes the African state as a site of "politics of the belly" and, later, of "extraversion," suggesting that the state's weakness or strength cannot be read off from the geometry of its borders; rather, political elites have historically converted external resources—aid, rents, military support, diplomatic recognition—into domestic power. Mbembe (2001) pushes further: the postcolony is not a belated or incomplete version of the Western state but a distinctive political formation marked by "commandement," the theatricalization of power, and the routinization of violence. On this view, the problem is not that borders are artificial but that colonial rule created a particular kind of political subject and a particular kind of state whose logics persist after independence. Grovogui (1996) adds the international-legal dimension: African polities were incorporated into international society as "quasi-sovereigns," recognized formally but denied the substantive equality that sovereignty implies. The border, then, is not merely a line on a map; it is a legal and racial technology that distributed sovereignty unequally. The artificiality thesis is therefore not wrong, but it becomes analytically useful only when linked to institutions, resources, and the international order that made those borders enforceable.

Second, African scholarship reconstructs colonial governance as a system of differentiated rule rather than as a uniform imposition. Mamdani (1996) is central here. His argument that late colonialism created a "bifurcated state"—dividing citizens in urban, "civil" spaces from subjects in rural, "customary" spaces—shows how indirect rule and native administration did not simply preserve tradition but invented and froze it. Ethnicity was not a primordial residue that colonialism found; it was institutionalized through chiefs, customary courts, land tenure, and native authorities. This matters for borders because the same logic of classification and territorialization that produced "tribes" also produced the administrative units that became post-colonial states. The African perspective thus sees ethnicity and statehood as co-produced. It also resists the easy contrast between British indirect rule and French assimilation: both were technologies for making populations legible and governable, and both left durable institutional residues. Assimilation promised citizenship but often delivered a racialized hierarchy; indirect rule promised respect for custom but often empowered compliant intermediaries and hardened group boundaries. The French indigénat and British native administration were not opposites; they were variants of a shared colonial project of differentiated sovereignty.

Third, the extractive economy is understood not as a background condition but as the material foundation of the colonial state. Rodney (1972) argued that Europe's development and Africa's underdevelopment were two sides of the same historical process: colonialism reorganized African labor, land, and trade to serve metropolitan accumulation. Nkrumah (1965) extended this into the post-colonial period, warning that political independence without economic sovereignty would reproduce dependency through neo-colonialism. From this vantage point, colonial infrastructure—railways running from mines to ports, roads designed for extraction, monocultural export economies—was not a neutral legacy but a spatial expression of an extractive political economy. The post-colonial state inherited not only borders but also a position in the global division of labor. Cabral (1973) and Fanon (1961) add that colonialism was not only economic but cultural and psychological: it produced alienated elites, devalued indigenous knowledge, and normalized violence as a mode of governance. The African perspective therefore treats the coloniality of borders as inseparable from the coloniality of knowledge, economy, and subjectivity. A border that encloses an extractive economy is not merely a territorial artifact; it is a mechanism for reproducing dependency.

Fourth, the acceptance of inherited borders by African states is read as a historically situated political choice, not as passive submission. At independence, African leaders confronted a dilemma: redrawing borders risked endless conflict, while accepting them risked freezing colonial injustices. The Organization of African Unity's 1963 commitment to territorial integrity reflected a pragmatic judgment that stability and anti-colonial solidarity required respecting the borders inherited from colonialism, even when they were unjust. Nyerere's (1968) reflections on nation-building and ujamaa, for example, emphasized the need to build unity within inherited states rather than to pursue secession. The African perspective does not celebrate this choice as ideal; it recognizes its costs, including the entrenchment of minority grievances and the mismatch between state boundaries and social geographies. But it also warns against treating secession as a simple remedy, noting that new borders can reproduce the same logics of exclusion and that external powers often exploit fragmentation. The stronger claim is that borders must be understood in relation to the political projects that animate them: a border is not merely colonial or post-colonial; it is a site of ongoing contestation over citizenship, resources, and belonging.

Fifth, hybrid orders are not treated as pathologies of weak states but as the normal condition of political life in Africa. The formal state coexists with customary authorities, religious networks, militias, informal economies, and transnational diasporas. African scholarship has long insisted that this hybridity is not a deviation from the Weberian ideal but a historically produced and often functional arrangement. Mbembe's (2001) discussion of "private indirect government" and Bayart's (1989) image of the state as a "rhizome" capture the way power circulates through multiple, overlapping authorities. Mamdani (1996) shows how the bifurcated state made customary authority indispensable to colonial rule, and how that authority survived into the post-colonial period. More recent African feminist and decolonial scholarship extends this analysis. Oyěwùmí (1997) demonstrates that colonial categories such as "woman" and "gender" were not universal but were imposed through colonial epistemologies, reshaping how authority and kinship were understood. Tamale (2020) argues for an Afro-feminist decoloniality that takes seriously the knowledge and agency of African women in informal and customary spaces. From this perspective, hybrid orders are not simply gaps in state capacity; they are arenas in which citizenship, justice, and survival are negotiated, often by actors excluded from formal institutions.

The African perspective contributes what the other four cannot: a historically grounded account of how colonial power continues to structure the present, an insistence that African agency and knowledge are central rather than peripheral, and a critique of the normative assumption that the European state is the universal standard of political modernity. It reveals the racialized and legal dimensions of sovereignty, the co-production of ethnicity and statehood, the materiality of extraction, and the legitimacy of hybrid political orders. It also frames the central puzzle of this lesson not as "why African states are weak" but as "how colonial state formation produced durable forms of power, inequality, and hybridity that outlived formal empire."

Its occlusions are equally important. The African perspective can risk overemphasizing continuity at the expense of variation: post-colonial states have diverged significantly in their institutional trajectories, and not all outcomes can be explained by colonial legacies. It can also romanticize pre-colonial or customary authority, obscuring internal hierarchies of gender, age, class, and caste that predate and survive colonialism. The category "African perspective" itself is a simplification; African scholars disagree sharply about the relative weight of structure and agency, the value of the nation-state, and the possibilities of decolonization. Finally, by centering coloniality, it may understate the role of post-colonial elites, regional dynamics, and global economic shifts that are not reducible to colonial inheritance. A rigorous use of this perspective therefore requires holding together critique and differentiation: colonial state formation created powerful constraints, but it did not determine every outcome.

2.7.2 Chinese Perspective

The Chinese perspective on colonial state formation and borders is shaped by a historical experience of semi-colonialism, by a developmentalist state tradition, and by a contemporary foreign-policy commitment to sovereignty, non-interference, and South-South cooperation. It tends to read African colonial history through the lens of underdevelopment: colonialism disrupted autonomous development, imposed extractive structures, and created dependent economies. From this vantage point, the artificiality of borders is real but secondary to the deeper injury of economic subordination. The more important question is not whether borders were drawn arbitrarily but whether post-colonial states have gained the capacity to control their resources, infrastructure, and development trajectories.

This perspective strongly affirms the principle of territorial integrity and the acceptance of inherited borders. Chinese discourse treats uti possidetis not as a regrettable compromise but as a necessary condition for sovereignty and stability. Redrawing borders is seen as a recipe for fragmentation, external manipulation, and endless conflict. This aligns with China's own emphasis on national unity and its opposition to secessionism. The Chinese view therefore supports African states' post-independence decision to retain colonial borders, while criticizing external actors who exploit border disputes or support separatist movements. The mechanism is straightforward: sovereignty requires recognized territorial boundaries, and recognized boundaries require international restraint.

On colonial governance, the Chinese perspective is less attentive to the fine-grained institutional differences between indirect rule, assimilation, and native administration. It tends to group them under a broader category of imperial domination and racialized hierarchy. The contribution here is a focus on the material and geopolitical consequences of colonial rule: how colonial administrations reorganized land, labor, and trade to benefit metropolitan powers. The occlusion is a relative neglect of the internal politics of colonial rule—how African intermediaries, chiefs, and subjects negotiated, resisted, or were transformed by these systems. The Chinese perspective is stronger on structural inequality than on the micro-politics of colonial governance.

The extractive economy is central to this view. Chinese scholarship and policy discourse often frame African underdevelopment as the product of colonial and neo-colonial extraction, including unequal trade, debt, and control over strategic resources. Infrastructure is read politically: railways and ports built for extraction symbolize dependency, while new infrastructure can symbolize sovereignty and development. This is one reason Chinese engagement in Africa emphasizes large-scale infrastructure, industrial zones, and resource-backed development. The contribution is a materialist focus on connectivity, production, and state capacity; the occlusion is a tendency to treat infrastructure as inherently developmental without sufficient attention to debt sustainability, local labor conditions, or environmental costs.

Hybrid orders are viewed ambivalently. On one hand, China's own history of party-state penetration and local governance makes it attentive to the gap between formal institutions and informal power. On the other hand, its non-interference doctrine discourages deep engagement with internal political arrangements. Hybrid authorities—traditional leaders, religious networks, militias—are often treated as domestic matters unless they threaten stability or Chinese interests. The contribution is pragmatic flexibility and respect for sovereignty; the occlusion is a risk of working primarily with central governments while underestimating the role of local and informal actors in shaping outcomes. The Chinese perspective thus adds a developmental and sovereignty-centered lens, but it may flatten the political complexity of hybrid orders into a question of state capacity and investment climate.

2.7.3 Russian Perspective

The Russian perspective on colonial state formation and borders is shaped by the Soviet Union's anti-colonial legacy, by contemporary Russian critiques of Western hegemony, and by a geopolitical emphasis on multipolarity and sovereignty. It tends to treat colonialism as a foundational injustice of the modern international order and to view African borders as products of imperial partition that were subsequently stabilized by anti-colonial solidarity. The Russian view does not deny the artificiality of borders, but it emphasizes that their acceptance by African states was a legitimate expression of self-determination and anti-imperial unity. From this vantage point, the more serious threat to African sovereignty today is not colonial borders but neo-colonial intervention, external manipulation, and the selective application of international norms.

This perspective is strongly critical of Western accounts that attribute African instability primarily to weak institutions or artificial borders. Russian discourse often argues that such accounts obscure the role of external powers in undermining states, supporting insurgents, or imposing political and economic conditionalities. The mechanism is framed as a continuation of colonial power by other means: financial leverage, military intervention, NGO networks, and normative pressure. The contribution is a reminder that African state weakness cannot be separated from global power asymmetries and that external actors have repeatedly profited from fragmentation. The occlusion is a tendency to instrumentalize anti-colonial rhetoric in service of Russian geopolitical interests, and to understate the agency of African elites and the internal dynamics of conflict.

On colonial governance, the Russian perspective is more comfortable with structural and geopolitical explanations than with institutional micro-analysis. It emphasizes that colonial administrations used divide-and-rule tactics, racial hierarchies, and economic extraction to maintain control. The institutionalization of ethnicity is read as a deliberate strategy of imperial management rather than as an accidental byproduct of administrative convenience. This aligns with a broader Russian critique of Western liberal interventionism: if colonial powers invented and hardened ethnic categories, then contemporary Western actors cannot credibly present themselves as neutral arbiters of ethnic conflict. The contribution is attention to the political construction of identity; the occlusion is a relative lack of engagement with the specific differences between British, French, Belgian, and Portuguese colonial systems.

The extractive economy is understood as part of a long history of resource plunder. Russian discourse often highlights the role of Western corporations, financial institutions, and military actors in sustaining dependent economies. Infrastructure is read as an instrument of control when it serves extraction and as a potential instrument of sovereignty when it supports autonomous development. The Russian perspective is sympathetic to African demands for resource sovereignty and to critiques of unequal trade. Its contribution is a geopolitical framing of economic dependency; its occlusion is a tendency to reduce complex development challenges to great-power competition, thereby understating domestic governance, regional trade, and African entrepreneurial agency.

Hybrid orders are interpreted through a lens of sovereignty and stability. Russian discourse generally prefers strong central states and is skeptical of externally imposed statebuilding models that privilege liberal institutions over local authority. It may view hybrid arrangements as pragmatic adaptations to post-colonial realities, especially where formal institutions are weak. However, it is also wary of non-state armed actors and of Western support for civil society or opposition movements that bypass the state. The contribution is a defense of state sovereignty against external interference; the occlusion is a limited engagement with the normative and practical challenges of hybrid governance, including accountability, human rights, and the protection of minorities. Overall, the Russian perspective adds a multipolar and anti-hegemonic critique,

but it risks substituting one external master narrative for another.

2.7.4 Western Perspective

The Western perspective on colonial state formation and borders is rooted in comparative politics, historical institutionalism, and development economics. It tends to treat the state as a Weberian institution whose effectiveness depends on bureaucratic capacity, legitimacy, and the rule of law. Colonialism is understood as a critical juncture that shaped institutional trajectories, but the analytical focus is on how institutions persist, adapt, or fail. The artificiality of borders is acknowledged, yet it is often treated as less important than institutional quality, economic structure, and geopolitical context. From this vantage point, the central puzzle is why some post-colonial states consolidated while others fragmented or stagnated.

This perspective has a strong institutionalist account of colonial governance. It distinguishes between different colonial systems—direct versus indirect rule, settler versus non-settler colonies, extractive versus developmental states—and traces their long-term effects on property rights, education, and bureaucratic capacity. Mamdani (1996) is often read in this literature as a powerful account of how indirect rule institutionalized ethnicity and bifurcated citizenship. The Western contribution is comparative precision and attention to variation: not all colonial experiences were identical, and institutional legacies interact with post-independence choices. The occlusion is a tendency to treat the Weberian state as the implicit norm, which can make hybrid orders appear as deficiencies rather than as alternative forms of political organization.

On borders, the Western perspective generally supports the logic of uti possidetis. Scholars such as Herbst (2000) argue that African borders were not uniquely artificial and that the greater challenge was the low population density and limited infrastructural reach of many states. The acceptance of inherited borders is seen as a rational response to the risks of secession and border revision. The contribution is a sober assessment of the costs of redrawing boundaries; the occlusion is a tendency to understate the colonial violence embedded in those boundaries and the ways in which they continue to shape citizenship and resource access.

The extractive economy is analyzed through the lens of institutions and incentives. Acemoglu and Robinson's framework of extractive versus inclusive institutions, though not African-specific, is frequently applied to colonial Africa: colonial powers created institutions designed to extract resources rather than to protect broad-based property rights. Cooper (2002) adds historical nuance, showing that colonial economies were not simply extractive machines but also sites of negotiation, labor migration, and social change. The Western contribution is a clear causal mechanism linking institutions to development outcomes; the occlusion is a risk of economic reductionism, in which political legitimacy, cultural meaning, and racial hierarchy are treated as secondary to material incentives.

Hybrid orders are increasingly studied in Western scholarship under the rubric of "hybrid political orders," "informal institutions," and "twilight institutions." The contribution is empirical richness: detailed studies of how chiefs, militias, religious leaders, and informal economies interact with formal states. The occlusion is normative: hybridity is often framed as a problem to be solved through statebuilding, security sector reform, or institutional strengthening. This can lead to interventions that misunderstand local legitimacy and inadvertently undermine functional arrangements. The Western perspective thus provides powerful tools for comparing institutions and tracing causal effects, but its occlusion is a bias toward the Weberian state as the only legitimate form of political organization, which can produce misdiagnosis and counterproductive policy.

2.7.5 UN Perspective

The UN perspective on colonial state formation and borders is shaped by the organization's own history as

a forum for decolonization, by its legal commitment to self-determination, and by its contemporary roles in peacekeeping, statebuilding, and development. It treats colonialism as a violation of the right to self-determination and views the transition to independence as a process of transferring sovereignty to formerly colonized peoples. The UN's legal framework strongly supports territorial integrity and the acceptance of inherited borders, especially through the principle of uti possidetis juris as applied in decolonization. From this vantage point, colonial borders are not ideal, but their revision would threaten international stability and the rights of minorities.

This perspective emphasizes the trusteeship legacy. The UN's early involvement in colonial territories, particularly through the Trusteeship Council, framed decolonization as a staged process of preparation for self-government. The contribution is a normative commitment to self-determination and international oversight; the occlusion is a tendency to treat sovereignty as a transfer of authority rather than as a transformation of the colonial state's underlying structures. The UN perspective often focuses on the moment of independence and the legal recognition of new states, while paying less attention to the colonial continuities in economy, administration, and violence that persist after the flag changes.

On colonial governance, the UN perspective is more comfortable with broad principles than with detailed historical analysis. It recognizes that colonial rule often institutionalized inequality and that post-colonial states must build inclusive institutions. But it is less likely to engage deeply with the specific mechanisms of indirect rule, native administration, or the invention of ethnicity. The contribution is a normative framework of human rights, inclusive governance, and equality; the occlusion is a risk of abstracting from the historical specificity of colonial institutions and treating all states as if they begin from a similar baseline.

The extractive economy is addressed primarily through development frameworks rather than historical critique. The UN's Sustainable Development Goals, for example, frame poverty, inequality, and infrastructure deficits as problems to be solved through global partnership, capacity-building, and financing. The contribution is a practical and normative agenda for addressing material deprivation; the occlusion is a tendency to depoliticize extraction by treating it as a development gap rather than as a historically produced structure of dependency. The UN perspective can thus acknowledge colonial economic legacies while still operating within a framework that assumes incremental reform rather than structural transformation.

Hybrid orders are increasingly central to UN practice, especially in peacebuilding and statebuilding. The "local turn" has encouraged engagement with traditional authorities, religious leaders, and informal actors in service delivery, dispute resolution, and security. The UN perspective contributes practical adaptation and a normative commitment to inclusive governance. Its occlusion is a tendency to instrumentalize hybrid actors within externally designed frameworks, and a risk of reproducing dependency through aid, conditionality, and donor-driven priorities. The UN view is therefore valuable for its legal and developmental tools, but it often struggles to reconcile respect for sovereignty with the transformative ambitions of international intervention.

2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Reconstructs colonial state formation as continuous with post-colonial power, showing how extraction, hybridity, and extraversion reproduce domination rather than simply producing "weak states."	Can understate variation across African states and the weight of individual post-independence choices.	Anti-colonial sovereignty, historical justice, and critique of Eurocentric state norms.	Leopold's Congo Free State; Mobutu's patrimonial Zaire; indirect rule and ethnicized administration.	Western institutionalists argue it risks overemphasizing continuity and understating endogenous institutional failure.
Chinese	Links underdevelopment to colonial extraction, unequal trade, and external intervention; frames non-interference as a corrective to Western conditionality.	May understate domestic governance failures, human-rights abuses, and the possibility that sovereignty shields predation.	Development, sovereignty, non-interference, and state-led modernization.	Colonial infrastructure oriented to ports; commodity dependence; Cold War support for authoritarian rulers.	African and Western critics argue non-interference can legitimate authoritarian extraction and external resource deals.
Russian	Highlights Western neocolonialism, Cold War backing of dictators, and great-power resource plunder as drivers of post-colonial disorder.	May reduce African agency to victimhood and can obscure Russian or other great-power interests.	Anti-hegemony, multipolarity, sovereignty, and critique of Western intervention.	US and Belgian support for Mobutu; Katanga secession; Western mining interests in the Congo.	Western and African scholars argue it can externalize blame and understate local political dynamics.

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Western	Provides institutional analysis of state weakness, patrimonialism, fiscal incapacity, and the absence of Weberian bureaucracy.	Often treats colonialism as background rather than constitutive; can blame African institutions while ignoring historical violence.	Liberal institutionalism, good governance, market reform, and rule of law.	Mobutu's personalist rule; weak territorial administration; post-colonial economic collapse.	African scholars argue it treats an extractive colonial state as a neutral baseline and ignores colonial continuity.
UN	Emphasizes territorial integrity, peacekeeping, statebuilding, human rights, and development frameworks.	Tends to instrumentalize hybrid actors within donor-driven frameworks and struggles to address structural extraction.	International law, human security, inclusive governance, and SDG-oriented statebuilding.	ONUC in the Congo (1960–1964); later peacekeeping and statebuilding missions.	African critics argue it can reproduce dependency and externalize accountability while claiming neutrality.

2.8 WORKED EXAMPLE (I do)

Case: The Democratic Republic of the Congo from Leopold II to Mobutu

Levels of Analysis

At the individual level, the case turns on the agency of specific actors operating within coercive structures: Leopold II's personal sovereignty over the Congo Free State, Force Publique officers enforcing rubber quotas, concession-company agents, and later Mobutu's personalist rule, Zairianization, and patronage networks. At the state level, it involves the Congo Free State as a private colonial state, the Belgian Congo as an extractive territorial administration, the fragile post-independence state, and Mobutu's patrimonial state, all of which institutionalized violence, ethnicized categories, and rent-seeking. At the systemic level, the case is shaped by global demand for rubber and ivory, imperial competition, the Cold War, international commodity markets, and external financial support for authoritarian rule. At the transnational level, it includes missionary and humanitarian campaigns, concession companies, mining interests, Cold War alliances, and the circulation of ideas and resources across borders.

Mechanism

The central mechanism is the reproduction of extractive governance across the colonial–post-colonial divide. Under Leopold II, the Congo Free State made coercion routine through forced rubber collection, concession

companies, and the Force Publique, while infrastructure was oriented toward extraction and export rather than territorial integration. This did not merely weaken the state; it constituted a state form in which violence, rent extraction, and external dependence were normal. After independence, the new state inherited thin administrative capacity, extractive economic geography, and a coercive security apparatus. Mobutu then reproduced the colonial logic through personalist rule: he centralized patronage, used copper rents, aid, and Cold War support to maintain loyalty, and transferred assets through Zairianization to cronies rather than building fiscal capacity through domestic taxation. The result was not a simple collapse into anarchy but a durable patrimonial order in which the state remained an instrument for converting external rents into political loyalty, much as the colonial state had converted coerced labor into export wealth.

Perspective Reconstruction

The African perspective, which is primary here, treats the Congo not as a failed state but as a particular state form produced by colonial violence and reproduced through post-colonial extraversion. The Congo Free State and its Belgian successor were projects of violent extraction in which coercion became an ordinary technique of rule, while Bayart's notion of extraversion helps explain how Mobutu's Zaire governed through external rents, aid, and Cold War support rather than domestic accountability. Mbembe's analysis of the post-colonial state as an apparatus of predation captures the continuity between colonial violence and Mobutu's patrimonialism, while Mamdani's account of colonial indirect rule and the institutionalization of ethnicity illuminates how colonial categories became political resources in later conflicts. Herbst's emphasis on the difficulty of consolidating territory in low-population-density environments helps explain why the post-colonial state remained thin outside extractive corridors, and Cooper's insistence that colonial states were unfinished projects prevents treating Mobutu's Zaire as a deviation from a Weberian norm that never existed.

A Chinese reading would treat the Congo's underdevelopment as the cumulative result of colonial extraction and unequal integration into the world economy rather than as an indigenous institutional deficit. It would emphasize sovereignty and non-interference, noting that external powers repeatedly violated Congolese self-determination from Leopold through Cold War intervention. It would see Mobutu's rule as enabled by Western geopolitical priorities rather than as evidence of African incapacity. It would likely prescribe state-led development and infrastructure integration, while remaining cautious about political conditionality.

A Russian reading would frame Leopold's Congo and Mobutu's Zaire as episodes in a longer history of Western resource plunder and neocolonial domination. It would stress that Belgian colonial violence and subsequent Western support for Mobutu were geopolitical choices, not neutral development failures. It would interpret secessionist and regional conflicts as partly produced by external manipulation of Congolese sovereignty. It would advocate multipolarity and state sovereignty as safeguards against renewed extraction.

A Western institutionalist reading would focus on the absence of Weberian bureaucracy, fiscal capacity, and rule of law from the colonial period through Mobutu. It would treat the concession system and personalist rule as institutional pathologies that undermined state consolidation. It would emphasize Mobutu's patronage, corruption, and economic mismanagement as proximate causes of collapse. It would prescribe institutional reform, anti-corruption, and market liberalization, often understating the colonial origins of those weaknesses.

The UN perspective would emphasize territorial integrity and international responsibility, beginning with ONUC's effort to prevent Katanga's secession and preserve the new state. It would frame the Congo as a test of peacekeeping, statebuilding, and human-rights protection. It would highlight the gap between interna-

tional legal sovereignty and effective governance. It would prescribe inclusive institutions, security-sector reform, and development assistance, while struggling to reconcile external intervention with Congolese ownership.

Explicit Adjudication

The African perspective provides the strongest overall explanation because it connects colonial violence, extractive institutions, and post-colonial reproduction without treating Mobutu's rule as an aberration from a healthy state. It captures the mechanism by which coercion became governance and external rents replaced domestic accountability. However, it can understate the specific weight of Cold War geopolitics and Mobutu's individual agency, which the Russian and individual-level analyses respectively highlight. The Western institutionalist account is useful for describing state weakness but is weakest where it treats that weakness as endogenous and timeless. The UN perspective explains international responses but not the production of extractive power. A bounded verdict is that the Congo case is best explained as colonial state formation reproduced through post-colonial extraversion, with Cold War support and personalist agency as important amplifiers rather than root causes.

SECTION 2.9 PROBLEM PAIR (We do)

Tasks

1. Identify the specific colonial administrative mechanism — and the approximate date of its institutionalization — that transformed fluid, cross-cutting social categories in Rwanda and Burundi into fixed, mutually exclusive ethnic identities recorded on identity documents.
2. Explain how Belgian colonial practice (1916–1962) differed from German practice (1899–1916) in its treatment of Hutu and Tutsi, and why this difference matters for explaining the divergent trajectories of post-colonial violence in Rwanda and Burundi.
3. Trace the causal chain from colonial identity classification through the 1959 Hutu revolution to the 1994 genocide in Rwanda (and, comparatively, to the 1972 genocide of Hutu in Burundi), specifying at least two intermediate mechanisms that converted colonial categories into post-colonial political mobilization.
4. Apply the five perspectives: reconstruct in two to three sentences each how an African scholar working in Mamdani's tradition, a Western institutionalist, a Chinese analyst, a Russian analyst, and a UN practitioner would explain the Rwandan genocide differently.
5. Evaluate the counterfactual: would mass violence have occurred in the absence of colonial identity classification? State the strongest evidence for and against this claim, and give a bounded verdict.
6. Assess the role of hybrid orders — combining formal state institutions, traditional authority, party networks, and militias — in reproducing colonial ethnic categories after independence, with specific reference to the interahamwe and the 1993 Arusha peace process.

Model Answer

The colonial transformation of Hutu and Tutsi from flexible, cross-cutting social categories into rigid, mutually exclusive ethnic identities is best understood not as the discovery of pre-existing tribes but as an act of statecraft. Under German rule (1899–1916), the colonial administration relied on indirect rule through Tutsi chiefs, but the categories remained relatively fluid, with significant intermarriage, social mobility, and a

shared Kinyarwanda language and culture; the German presence was thin and largely extractive, leaving local social hierarchies largely intact. Belgian rule after 1916 intensified this process dramatically through a series of administrative reforms that culminated in the 1933–35 identity card system, which fixed every Rwandan and Burundian as Hutu, Tutsi, or Twa for census and administrative purposes. Mamdani's (1996) analysis of indirect rule is directly applicable: colonial states governed through "decentralized despotism," empowering "customary" authorities whose power was in fact a colonial invention, and in Rwanda the Belgians elevated Tutsi chiefs as the sole legitimate intermediaries, thereby converting a socio-economic distinction — cattle-keeping versus cultivation, with substantial overlap and mobility — into a racialized political hierarchy. The mechanism ran through three channels. First, the administrative fixation of identity via census and identity cards eliminated the possibility of social mobility between categories and made ethnicity a permanent, legally inscribed status. Second, the educational and ecclesiastical privileging of Tutsi, particularly through Catholic mission schools, created a literate elite identified with colonial power and generated Hutu resentment that would later be mobilized along the very ethnic lines the colonial state had created. Third, land and labor policies tied Hutu cultivators to chiefly extraction, generating grievance that post-colonial elites could channel into ethnic majoritarianism. The post-colonial violence of 1959 (the Hutu revolution in Rwanda), the 1972 genocide of Hutu in Burundi, and the 1994 genocide of Tutsi in Rwanda cannot be explained without this colonial institutionalization of ethnicity, yet neither can they be reduced to it. The African perspective, following Mamdani, insists that colonial categories were not simply imposed on passive subjects but were appropriated, reworked, and weaponized by post-colonial elites who found in ethnic majoritarianism a route to power; the "Hutu" and "Tutsi" that killed in 1994 were colonial constructs that had been politicized through decades of post-colonial competition, including the 1959 revolution's reversal of Tutsi dominance and the subsequent cycles of violence and refugee flows. The Western institutionalist account, by contrast, tends to treat the violence as a failure of state capacity, democratic institutions, and early-warning systems, underweighting the colonial production of the categories themselves; it emphasizes the weakness of post-colonial institutions and the absence of power-sharing rather than the genealogy of the identities being shared. The Chinese perspective frames the violence through the lens of underdevelopment and external interference, emphasizing that colonial powers created the conditions for conflict and that post-colonial reconciliation requires sovereignty-respecting development assistance rather than Western-imposed governance models. The Russian perspective converges on the critique of Western colonial responsibility while adding a geopolitical reading: the genocide occurred in a context of Western-backed regime change and the collapse of the Arusha process, and external actors bear responsibility for the failure to prevent it. The UN perspective frames the violence through the lens of genocide prevention, peacekeeping, and state-building, often abstracting from the colonial genealogy in favor of operational lessons about early warning and rapid deployment. The strongest objection to a purely colonial-determinist reading is that it risks denying African agency: the 1994 genocide was planned and executed by Rwandan actors with specific political calculations, including the Hutu Power elite's decision to eliminate Tutsi and moderate Hutu after the assassination of President Habyarimana, and many Hutu resisted or were killed for protecting Tutsi neighbors. The evidence supports a conjunctural explanation in which colonial identity classification was a necessary but not sufficient condition, requiring post-colonial political crisis, elite manipulation, the collapse of the Arusha peace process in April 1994, and the mobilization of militias through radio and party networks to produce mass violence. Uti possidetis juris, which preserved colonial borders, meant that the inherited administrative categories survived into independence, providing the institutional scaffolding for ethnic politics; hybrid orders — combining formal state institutions, traditional authority, party networks, and militias such as the interahamwe — then reproduced these categories at the local level, drawing on both colonial-era chiefly structures and post-colonial party organization. The lesson is that colonial state formation did not merely

draw borders; it produced the social categories through which post-colonial politics would be conducted, and understanding this requires holding both colonial determination and post-colonial agency in view without collapsing into either.

SECTION 2.10 INDEPENDENT MEMO (You do)

(a) Case description. The Anglophone crisis in Cameroon (2016–present) originates in the colonial partition of the territory between French and British mandates after World War I, formalized by the League of Nations and later the United Nations. Southern Cameroons was administered by Britain as part of Nigeria until a 1961 plebiscite led to reunification with the French-speaking Republic of Cameroon under a federal constitution. The federal arrangement was abolished in 1972, centralizing power in Yaoundé and marginalizing the Anglophone minority, which constitutes roughly one-fifth of the population. Protests by lawyers and teachers in 2016 escalated into armed conflict between separatist militias and state forces, producing mass displacement and humanitarian crisis. The case raises questions about colonial border-making, the institutionalization of linguistic identity, hybrid orders combining formal state and militia networks, and the limits of post-colonial statebuilding.

(b) Required memo headings (write 200–300 words under each):

- **Mechanism:** Identify the causal mechanism linking the colonial partition and post-colonial centralization to the 2016 escalation. Specify intermediate steps and scope conditions.
- **Perspective reconstruction:** Reconstruct how African, Chinese, Russian, Western, and UN perspectives would each explain the crisis, in three to five sentences per perspective.
- **Historical analogue:** Identify one historical analogue (e.g., Biafra, Eritrea, or another case) and specify what transfers and what does not.
- **Falsifiers:** State two or three observable implications that, if absent, would weaken your explanation.

(c) Self-check: Before submitting, verify that you have distinguished description (what happened), explanation (why it happened), prediction (what will happen next), and prescription (what should be done) — and that no single paragraph conflates more than one of these.

SECTION 2.11 HINGE QUESTION

Question: Which of the following best captures the central critique, advanced by Bayart, Mbembe, and Grovogui, of the "artificiality thesis" regarding African borders?

A. African borders are not artificial because they were drawn by African leaders at independence rather than by European colonial powers.

B. The artificiality thesis is insufficient because it treats colonial borders as the sole or primary cause of African state weakness, thereby ignoring the productive, hybrid, and contested character of post-colonial state formation and the agency of African actors in shaping their own political orders.

C. The artificiality thesis is fundamentally correct but needs to be supplemented with economic data on colonial extraction to become a complete explanation.

D. African borders are artificial, but this artificiality has no meaningful consequences for contemporary African politics or state capacity.

Distractor diagnoses:

- **Option A** is wrong because it misattributes the drawing of borders to African leaders; the borders in question were overwhelmingly drawn by European colonial powers at the Berlin Conference (1884–85) and subsequent agreements, and African leaders at independence generally accepted rather than redrew them under uti possidetis juris. The critique of the artificiality thesis does not rest on denying colonial authorship of borders.
- **Option C** is wrong because it concedes the artificiality thesis as "fundamentally correct" and merely calls for supplementation; the Bayart-Mbembe-Grovogui critique is stronger, arguing that the thesis itself is analytically insufficient and politically misleading because it reifies borders as the problem and obscures the productive politics of post-colonial state formation. Adding economic data does not address this theoretical objection.
- **Option D** is wrong because it claims artificiality has no consequences, which no serious scholar in this debate asserts; the critique is not that borders are inconsequential but that their consequences are mediated through post-colonial political processes, hybrid orders, and African agency, rather than flowing mechanically from colonial cartography.

SECTION 2A — DATA LAB

Table 1. African state borders: pre-colonial polities, colonial partition, and post-independence stability (illustrative, drawn from Herbst 2000; Mamdani 1996)

Period	Number of polities / states	Border regime	Key event
Pre-colonial (c. 1880)	Hundreds of polities, empires, chiefdoms, city-states	Fluid, overlapping, negotiated	No fixed territorial sovereignty in the Westphalian sense
Colonial partition (1884–1914)	~50 colonial territories	Imposed by European powers; Berlin Conference 1884–85	Scramble for Africa; no African representation
Independence wave (1957–1965)	~35 new states	Inherited colonial borders	Ghana 1957; "Year of Africa" 1960
Post-independence (1963–present)	54–55 AU member states	OAU Charter 1963 affirms *uti possidetis juris*	Only Eritrea (1993) and South Sudan (2011) as new states via secession; border wars (e.g., Ethiopia–Eritrea 1998–2000)

Present	54–55 states	Largely unchanged colonial borders	AU Border Programme (2007) on delimitation/demotion

Table 2. Colonial railway orientation vs. present African rail infrastructure (illustrative, drawn from Cooper 2002; Herbst 2000)

Feature	Colonial era (c. 1890–1960)	Post-independence (1960–present)
Primary orientation	Port-to-interior (extraction corridor)	Largely inherited; some rehabilitation and new lines
Inter-African east–west links	Minimal or absent	Still limited; most networks remain national or port-oriented
Gauge standardization	Multiple colonial gauges (British, French, Belgian, Portuguese)	Persistent incompatibility; few cross-border standardization projects
Ownership/control	Colonial companies and metropolitan states	National railways; some privatization and foreign (Chinese) financed new lines
Documented pattern	Railways built to move cash crops and minerals to coast	Deterioration of many lines; selective new investment (e.g., Kenya SGR, Ethiopia–Djibouti)

Table 3. Agricultural export specialization by colonial power (illustrative, drawn from Cooper 2002; Rodney 1972)

Colonial power / zone	Dominant export commodities	Structural feature
British (West & East Africa)	Cocoa, cotton, tea, coffee, groundnuts	Peasant export agriculture; marketing boards
French (West & Equatorial Africa)	Cocoa, coffee, cotton, groundnuts, timber	Concession companies; forced labor (early); later peasant production
Belgian (Congo)	Rubber, copper, cobalt, palm oil, cotton	Concession/extraction; later state mining (Gécamines)
Portuguese (Angola, Mozambique)	Coffee, cotton, sisal, sugar	Settler agriculture; forced cultivation (*cultura obrigatória*)
German (Tanganyika, Cameroon, Togo, Namibia)	Cotton, sisal, coffee, diamonds	Short-lived; infrastructure for extraction

Five numbered analysis questions

1. **Trend.** Looking across Tables 1–3, what is the single most striking long-run pattern in African state formation and economic structure between 1884 and the present, and which table provides the strongest evidence for it? State the trend in one sentence and justify with two data points.

2. **Level of analysis.** The border stability shown in Table 1 and the rail orientation shown in Table 2 can each be explained at the individual, state, systemic, or transnational level. Assign the *primary* explanatory level to each pattern and defend your assignment in two to three sentences, noting which alternative level is most tempting and why it is insufficient on its own.

3. **Perspective reconstruction (all five).** Reconstruct how each of the five perspectives would read Tables 1–3: (a) African (hybridity, colonial continuity, post-colonial critique); (b) Chinese (underdevelopment plus non-interference); (c) Russian (colonial legacy plus critique of Western neocolonialism); (d) Western (state weakness plus institutionalist accounts); (e) UN (trusteeship legacy, SDG and state-building frameworks). For each, state in two sentences what the data *support* and what they *occlude*.

4. **Interpretation.** What causal mechanism links the colonial infrastructure design documented in Table 2 to the post-colonial economic dependence implied by Table 3? Specify the mechanism in three to four sentences, name the theoretical tradition it belongs to (e.g., dependency, world-systems, or institutionalist), and identify one scope condition under which the mechanism would *not* hold.

5. **Limitation.** Identify the most important data limitation in Tables 1–3 for answering the lesson's central puzzle (why colonial borders and institutions persisted after independence). Explain in three to four sentences what is missing, why it matters, and what kind of evidence would be needed to overcome it.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — "The Partition Overlay: Colonial Borders on Pre-Colonial Africa"

- **What to draw:** Outline the continent of Africa. Inside the outline, lightly sketch (dashed lines) the approximate boundaries of major pre-colonial polities and empires (e.g., Sokoto Caliphate, Asante, Kongo, Zulu, Ethiopia, Buganda, Mali/Songhai legacy zones). Over this, draw bold solid lines for the colonial borders as fixed by c. 1914, and shade each colonial territory with a different hatching or color keyed to the colonizing power (British, French, Belgian, Portuguese, German, Italian, Spanish).
- **Labels to place:** Title at top: "Colonial Borders Imposed on Pre-Colonial Political Geography (c. 1884–1914)." Legend box: colonizing powers with color key. Annotation arrows pointing to (a) a border that splits a pre-colonial polity, (b) a border that joins previously separate polities, (c) a border following a river or latitude line with no pre-colonial political meaning.
- **Perspective overlay to annotate:** In the margin, write four short notes: "African: borders are colonial artifacts but became lived political realities (Mamdani 1996)." "Western: borders as institutional containers; weakness is governance, not lines (Herbst 2000)." "UN: borders as framework for sovereignty and development (SDG 16)." "Chinese/Russian: borders as evidence of imperial partition; non-interference protects them."

Visual 2 — "The Extraction Spoke: Colonial Railways and the Missing Web"

- **What to draw:** Draw a simplified map of a representative African region (e.g., West Africa or Central Africa). Mark the coastline with several port cities. From each port, draw thick arrows (rail lines) running inland to a single resource or cash-crop zone (mines, plantations). Show no east–west or inter-territorial connections. Add a second, lighter layer showing a few post-independence additions (dashed lines) and note where lines have been abandoned (broken lines).

- **Labels to place:** Title: "Colonial Rail as Extraction Corridor, Not Development Network." Label each spoke with commodity (e.g., "cocoa," "copper," "rubber"). Label ports. Add a small inset legend: solid thick = colonial rail; dashed = post-independence addition; broken = abandoned.
- **Perspective overlay to annotate:** Margin notes: "African: infrastructure as colonial continuity; post-colonial state inherits extractive skeleton (Bayart 1989; Mbembe 2001)." "Western: infrastructure gap as development constraint; institutionalist fix (property rights, regulation)." "Chinese: infrastructure as underdevelopment remedy; non-interference in internal affairs." "Russian: infrastructure as neocolonial dependency; critique of Western conditionality." "UN: infrastructure as SDG 9 (industry, innovation, infrastructure) and statebuilding."

Visual 3 — "The Hybrid Order: Layered Sovereignty in the Post-Colonial State"

- **What to draw:** Draw five overlapping, semi-transparent circles (Venn-style) labeled: (1) Formal state (bureaucracy, military, courts), (2) Traditional authority (chiefs, elders, customary law), (3) Religious networks (churches, mosques, Sufi orders, Pentecostal movements), (4) Militias / armed groups (rebel armies, warlords, private security), (5) Informal economy (smuggling, artisanal mining, street vending, remittances). Place a small central zone where all five overlap, labeled "Everyday governance / actual sovereignty." Add arrows showing flows of resources, legitimacy, and coercion between circles.
- **Labels to place:** Title: "Hybrid Political Order: Where Sovereignty Actually Resides." Label each circle. Label the central overlap. Add a side note: "Formal state is one node among several, not the container of all authority."
- **Perspective overlay to annotate:** Margin notes: "African: hybridity is the norm, not failure; colonial state was always layered (Mamdani 1996; Mbembe 2001)." "Western: hybridity as 'state weakness' or 'fragility' to be fixed by institution-building." "UN: hybridity as challenge to SDG 16 and peacebuilding; engage non-state actors." "Chinese: hybridity as internal affair; stability through non-interference." "Russian: hybridity as consequence of Western-imposed state models; critique of liberal peacebuilding."

SECTION 4 — CORNELL NOTES

Cue (question / prompt)	Notes (with source log)
What is the "artificiality thesis" and why is it insufficient?	Claims African states are "artificial" because borders were imposed; insufficient because it treats borders as mere lines and ignores how colonial and post-colonial actors made them politically real. Sources: Mamdani (1996); Herbst (2000); Mbembe (2001).
What stronger account replaces the artificiality thesis?	Colonial state formation as a *process* of institutionalizing ethnicity, extracting resources, and creating hybrid orders; borders became lived through administration, war, and citizenship. Sources: Bayart (1989); Grovogui (1996); Cooper (2002).

Cue (question / prompt)	Notes (with source log)
What were the main colonial governance modes?	Indirect rule (British), assimilation (French), "native administration" (Belgian/Portuguese variants); each produced different ethnic institutionalizations. Source: Mamdani (1996).
How did colonial rule institutionalize ethnicity?	Through customary law, native authorities, censuses, and identity cards; ethnicity became an administrative category with political stakes. Sources: Mamdani (1996); Bayart (1989).
What was the extractive economy?	Infrastructure (rail, ports) built for export; monoculture cash crops; dependent trade with metropole; limited industrialization. Sources: Rodney (1972); Cooper (2002); Herbst (2000).
Why did African states accept inherited borders (*uti possidetis*)?	OAU 1963: fear of endless war, need for sovereignty recognition, elite interest in territorial control; borders as political resource. Sources: Herbst (2000); Mamdani (1996).
What is a "hybrid order"?	Coexistence of formal state, traditional authority, religious networks, militias, informal economy; sovereignty is layered and negotiated. Sources: Mbembe (2001); Bayart (1989); Grovogui (1996).
What does the African perspective emphasize?	Colonial continuity, hybridity as norm, post-colonial critique of Western state models; African agency in making and remaking institutions. Sources: Grovogui (1996); Mbembe (2001); Bayart (1989).
What does the Western perspective emphasize?	State weakness, institutional deficits, "fragile states"; solutions via institution-building, good governance, aid conditionality. Sources: Herbst (2000); Cooper (2002).
What do Chinese and Russian perspectives emphasize?	Chinese: underdevelopment, non-interference, infrastructure-led development. Russian: colonial legacy, critique of Western neocolonialism, multipolarity. Sources: (general IR literature; no specific canonical citation required).
What is the UN perspective?	Trusteeship legacy, SDG/statebuilding frameworks, peacekeeping, border delimitation programs; sovereignty plus development. Sources: UN Charter; AU Border Programme.
What is the DRC case's lesson?	Leopold's Congo Free State → Belgian Congo → Mobutu: colonial violence and extractive institutions reproduced post-independently; state as predator. Sources: Mbembe (2001); Cooper (2002).

Summary (3–5 sentences): Colonial state formation in Africa cannot be reduced to the "artificiality" of

borders; it was a process of institutionalizing ethnicity, building extractive infrastructure, and creating hybrid political orders that outlived formal decolonization. African states accepted inherited borders through *uti possidetis* because borders had become political resources and because the alternative was endless territorial war. The DRC exemplifies how colonial violence and extraction were reproduced under Mobutu, while Rwanda and Burundi show how colonial identity classification could generate post-colonial catastrophe. Across the five perspectives, the African vantage point insists that hybridity is the norm and that colonial continuity, not just state weakness, explains contemporary outcomes.

SECTION 5 — FEYNMAN COMPRESSION

Step 1 — Explain without jargon. Imagine someone drew lines across a continent they did not live in, built railways that only ran from mines to ports, and created identity cards that turned flexible groups into fixed tribes. After independence, the new governments kept those lines, those railways, and those categories because changing them seemed more dangerous than keeping them. The state that resulted was never just the government in the capital; it was also chiefs, religious leaders, militias, and market traders all sharing power in messy, overlapping ways. That is the story of colonial state formation: not a single event, but a set of institutions that were inherited and then remade by Africans themselves.

Step 2 — Mark gaps. (a) I have not yet explained *why* elites accepted borders they did not draw — is it fear, interest, or international pressure? (b) I have not distinguished indirect rule from assimilation sharply enough to show how each produced different ethnic outcomes. (c) I have not specified the mechanism by which colonial railways caused post-colonial dependence rather than merely correlating with it. (d) I have not addressed the strongest Western counterargument: that post-colonial governance failures are better explained by leadership choices than by colonial inheritance.

Step 3 — Reread verification. Re-reading Mamdani (1996) confirms that colonial governance modes (indirect rule vs. assimilation) produced structurally different ethnic institutionalizations, and that *uti possidetis* was accepted because borders had become the framework for sovereignty and elite competition. Re-reading Herbst (2000) confirms that low population density and the cost of extending state authority, not just colonial design, shaped where states could reach. Re-reading Mbembe (2001) confirms that post-colonial states often reproduced colonial violence through new idioms, and that sovereignty was performed as much as exercised. These checks fill gaps (a) and (b); gaps (c) and (d) remain partially open and require the dependency-theory and institutionalist literatures.

Step 4 — Analogy with explicit limits. *Analogy:* Colonial state formation is like inheriting a house built by someone else for a different purpose — the rooms are in the wrong places, the plumbing runs to the street not the garden, and the locks are on the wrong doors — but you keep living in it because rebuilding is costly and the neighbors recognize your address. *Limits of the analogy:* It overstates passivity (Africans remade institutions, not just inhabited them); it understates violence (the "house" was built through coercion and extraction, not mere poor design); and it implies a single owner where sovereignty was actually shared among multiple actors (hybrid order).

Step 5 — Rewrite. Colonial state formation in Africa was a process, not an event: European powers partitioned the continent, imposed borders, built extractive infrastructure, and institutionalized ethnicity through differentiated governance modes, but these structures became politically real only through African agency, elite competition, and everyday practice. African states accepted inherited borders under *uti possidetis* be-

cause borders had become the currency of sovereignty and the alternative was territorial chaos, not because the borders were just. The resulting states were hybrid orders in which formal government shared authority with chiefs, religious networks, militias, and informal economies. The DRC shows colonial violence and extraction reproduced under Mobutu; Rwanda and Burundi show colonial identity classification converted into post-colonial catastrophe. The African perspective insists this is colonial continuity and hybridity, not mere state weakness; the Western perspective sees institutional deficits; the Chinese and Russian perspectives frame underdevelopment and neocolonialism; the UN frames trusteeship and statebuilding. The strongest account integrates all five while centering African agency and the mechanisms by which inherited structures were remade.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L27	definition	What is the "artificiality thesis" in African border studies?	It claims colonial borders were arbitrary lines drawn without regard to African societies. The thesis is insufficient because it treats borders as merely geometric and ignores how colonial rule, extraction, and post-colonial statecraft made them socially and politically consequential.	African scholars such as Bayart and Mbembe stress that borders became lived institutions, not just lines.

Tag	Card Type	Front	Back	Perspective Note
L27	mechanism	How did indirect rule institutionalize ethnicity?	Colonial administrators governed through "customary" chiefs and classified populations into ethnic categories, making fluid identities administratively fixed and politically consequential. This created a machinery of rule that post-colonial states often inherited.	Mamdani's citizen/subject distinction is central here.
L27	mechanism	What is the extractive economy's spatial logic?	Railways, ports, and roads were built to move commodities from interior to coast, not to integrate African economies. Monoculture and dependent trade locked regions into external markets and weak industrial linkages.	Cooper's colonial political economy highlights uneven connection rather than simple underdevelopment.

Tag	Card Type	Front	Back	Perspective Note
L27	definition	What is *uti possidetis juris* in the African context?	It is the principle that colonial administrative boundaries become international borders upon independence. African states largely accepted it to avoid territorial wars, trading revision for stability.	Herbst frames this as a state-survival strategy, not merely external imposition.
L27	comparison	Artificiality thesis versus institutionalist account?	The artificiality thesis blames borders' geometry; institutionalism asks how states, economies, and identities were built around them. The latter better explains why borders persisted and became politically productive.	Western institutionalism and African critique converge on institutions but differ on agency.
L27	source	What does Mamdani (1996) argue about the colonial state?	Mamdani argues colonial rule created a bifurcated state: citizens in urban/civil arenas and subjects under customary authority. This dualism shaped post-colonial governance and conflict.	This is a foundational African critical-theory account.

Tag	Card Type	Front	Back	Perspective Note
L27	source	What does Mbembe (2001) add?	Mbembe analyzes post-colonial power as *commandement* and the "banality of power," showing colonial violence and extraction were reproduced through everyday state practices rather than only formal institutions.	This shifts attention from institutions to lived power.
L27	source	What does Grovogui (1996) contribute?	Grovogui critiques international law's complicity in imperial ordering and shows how sovereignty doctrines legitimized unequal global hierarchies. This frames borders as legal-political constructions, not neutral facts.	This is an African international-legal critique.
L27	source	What does Bayart (1989) argue?	Bayart's "politics of the belly" emphasizes extraversion, elite strategies, and the social logics of African states, resisting both culturalist and purely institutional explanations.	This foregrounds African political agency.

Tag	Card Type	Front	Back	Perspective Note
L27	source	What does Cooper (2002) argue?	Cooper examines colonialism's uneven transformations, showing how labor, infrastructure, and governance created connected but unequal worlds rather than a simple before/after.	This is Western historiography with an African focus.
L27	source	What does Herbst (2000) argue?	Herbst argues African state borders were often accepted because sparse populations and weak infrastructure made territorial control difficult; states prioritized survival over border revision.	This is Western state-building theory applied to Africa.
L27	application	DRC case: what reproduced colonial extraction?	From Leopold's concessionary violence to Mobutu's patrimonial rule, extractive institutions, weak territorial control, and elite predation reproduced colonial patterns. The state became a vehicle for resource extraction rather than public goods.	African hybridity and post-colonial critique are central.

Tag	Card Type	Front	Back	Perspective Note
L27	application	Rwanda/Burundi case: colonial identity classification?	Belgian administrative categories hardened Hutu/Tutsi distinctions and linked them to political privilege. Post-colonial elites mobilized these categories, contributing to violence; the mechanism is institutionalized identity, not ancient tribal hatred.	Mamdani's institutional analysis is key.
L27	comparison	Chinese versus Western perspectives on African borders?	China emphasizes sovereignty, non-interference, and development cooperation; Western accounts often stress state weakness and institutional reform. The former foregrounds external non-interference; the latter foregrounds internal capacity.	Both can occlude African hybrid governance.

Tag	Card Type	Front	Back	Perspective Note
L27	reconstruction	What does the African perspective reveal that others miss?	It reveals colonial continuity in everyday governance, hybrid authority, and the political productivity of borders. It challenges both Western state-weakness narratives and external frameworks that ignore African agency.	This is the primary perspective of the lesson.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence audit table (scored 0-100).

Skill or concept	Confidence (0-100)	Evidence of mastery	Next action
Artificiality thesis and its critique		Can explain why geometry alone is insufficient	Re-read Bayart and Mbembe notes
Indirect rule and ethnicity		Can trace classification into post-colonial politics	Map Mamdani's citizen/subject distinction
Extractive economy		Can link railway maps to export dependence	Compare colonial and present infrastructure
Uti possidetis juris		Can explain African acceptance of inherited borders	Review Herbst and OAU 1963 context
Hybrid orders		Can identify formal, traditional, religious, militia, informal layers	Apply to DRC or Rwanda/Burundi
DRC worked example		Can narrate Leopold to Mobutu at four levels	Practice levels-of-analysis answer
Rwanda/Burundi problem pair		Can distinguish classification from primordial hatred	Reconstruct Mamdani's argument

Skill or concept	Confidence (0-100)	Evidence of mastery	Next action
Five-perspective reconstruction		Can steel-man all five perspectives	Fill comparison matrix from memory
Data lab interpretation		Can move from trend to mechanism to limitation	Re-answer all five data-lab questions
Falsifier design		Can state evidence that would weaken each claim	Add one falsifier per key idea

7.2 Three-question debrief.

1. Which of the five perspectives was hardest to steel-man without caricature, and what evidence would make that perspective stronger?

2. Which mechanism did I initially describe as an outcome rather than explain causally, and how can I repair that explanation?

3. If I had to adjudicate between the African and Western perspectives on one case, what single piece of evidence would most change my conclusion?

7.3 Error-log table: Common Misconception | Correction | Evidence.

Common Misconception	Correction	Evidence
African borders are merely artificial lines with no political effects.	Borders became institutionalized through colonial administration, post-colonial acceptance, and everyday governance; their effects are political, not just geometric.	Bayart (1989); Mbembe (2001); Herbst (2000)
Ethnic violence in Rwanda and Burundi reflects ancient tribal hatred.	Colonial identity classification and political mobilization institutionalized categories that later elites exploited.	Mamdani (1996, 2001)
Colonial infrastructure was primarily developmental.	Much infrastructure was spatially biased toward extraction, connecting interiors to ports rather than integrating domestic economies.	Cooper (2002); colonial railway maps
Uti possidetis was imposed on Africa only by outsiders.	African states and the OAU largely accepted inherited borders to reduce territorial conflict and prioritize state survival.	Herbst (2000)

Common Misconception	Correction	Evidence
Hybrid orders are simply state failure.	They are layered modes of governance in which formal, traditional, religious, militia, and informal authorities coexist and compete.	Bayart (1989); Mbembe (2001)

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Artificiality thesis; coloniality of borders; hybrid orders	Borders become lived institutions through rule, extraction, and acceptance	Bayart (1989); Mbembe (2001); Grovogui (1996)	Post-1960 border persistence; OAU acceptance	Artificiality versus institutionalization	Evidence that pre-colonial societies treated borders as irrelevant and post-colonial states ignored them	L9, L10
Indirect rule; bifurcated state; institutionalized ethnicity	Customary authority; administrative classification; citizen/subject dualism	Mamdani (1996)	Rwanda/Burundi identity categories; chiefly authority	Primordialism versus institutionalism	No colonial administrative ethnic records or no post-colonial mobilization of categories	L12, L29
Extractive economy; monoculture; dependent trade	Infrastructure to coast; commodity specialization; weak industrial linkages	Cooper (2002)	Colonial railway maps; agricultural export shares by colonial power	Development versus extraction	Balanced internal rail networks and diversified exports under colonial rule	L29

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Uti possidetis juris; inherited borders	Boundary inheritance; stability over revision; state survival	Herbst (2000)	African state borders pre/post-1960	Revisionism versus stability	Frequent successful post-independence border changes without major war	L9
Hybrid orders; formal state; traditional authority; militias; informal economies	Layered governance; coexistence and competition among authorities	Bayart (1989); Mbembe (2001)	DRC; militias; informal economies	State failure versus hybrid governance	Effective monopoly of violence and no non-state authority in practice	L28, L30

SECTION 9 — REVIEW SCHEDULE

- **R1 — 24 hours:** Re-read all fifteen flashcards and the error-log table; rewrite any back that you cannot reproduce from memory.
- **R2 — 3 days:** Reconstruct the DRC worked example at the individual, state, systemic, and transnational levels in continuous prose.
- **R3 — 1 week:** Rebuild the five-perspective comparison matrix from memory, then compare it with Section 2.7.6.
- **R4 — 2 weeks:** Re-answer all five data-lab questions, especially the limitation question, using one new piece of evidence.
- **R5 — 1 month:** Write the independent memo from scratch, including mechanism, perspective reconstruction, historical analogue, and falsifiers, then check that description, explanation, prediction, and prescription are separated.

SECTION 10 — COMPLETION CHECKLIST

☐ I can explain why the artificiality thesis is insufficient.

☐ I can define indirect rule and its ethnic institutionalization.

☐ I can explain the extractive spatial logic of colonial infrastructure.

☐ I can define *uti possidetis juris* and explain African acceptance.

☐ I can describe hybrid orders without reducing them to state failure.

☐ I can reconstruct the DRC case from Leopold II to Mobutu.

☐ I can explain Rwanda/Burundi through institutionalized identity.

☐ I can steel-man all five perspectives.

☐ I can identify what the African perspective reveals that others miss.

☐ I can use the four levels of analysis correctly.

☐ I can distinguish description, explanation, prediction, and prescription.

☐ I can design at least one falsifier for each key idea.

☐ I can interpret the data-lab tables without overclaiming.

☐ I can complete the Cornell notes cue column from memory.

☐ I can deliver the Feynman compression without jargon.

☐ I can identify my lowest-confidence concept and schedule repair.

☐ I can connect this lesson to L8, L9, L10, and L12.

☐ I can connect this lesson forward to L28, L29, and L30.

FURTHER READING (Optional)

- **Colonial state formation:** Mamdani, M. (1996) *Citizen and Subject*; Cooper, F. (2002) *Africa since 1940*.

- **African post-colonial critique:** Bayart, J.-F. (1989) *The State in Africa*; Mbembe, A. (2001) *On the Postcolony*; Grovogui, S. N. (1996) *Sovereigns, Quasi Sovereigns, and Africans*.

- **Borders, territory, and state survival:** Herbst, J. (2000) *States and Power in Africa*; Jackson, R. H., and Rosberg, C. G. (1982) *Personal Rule in Black Africa*; Englebert, P. (2009) *Africa: Unity, Sovereignty and Sorrow*.

- **Extractive economies and underdevelopment:** Rodney, W. (1972) *How Europe Underdeveloped Africa*; Amin, S. (1976) *Unequal Development*.

- **Rwanda and Burundi:** Mamdani, M. (2001) *When Victims Become Killers*.

- **Congo case studies:** Hochschild, A. (1998) *King Leopold's Ghost*; Wrong, M. (2000) *In the Footsteps of Mr. Kurtz*.

End of Lesson 27. Say **Next** when you are ready.

29. Post-Colonial Sovereignty and Pan-Africanism

LESSON METADATA

Field	Value
Lesson number and title	Lesson 28: Post-Colonial Sovereignty and Pan-Africanism
Module	Module 5: African Geopolitical Architecture
Prerequisites	L9 (sovereignty), L12 (decolonization), L27 (colonial state formation)
Interleaved links	Forward to L32 (African agency), L34 (Sahel), L49 (Global South)
Reading load	7-9 hours
Content channels	Text, data tables, visuals, flashcards, worked example, problem pair, memo
Bloom ceiling	Evaluate / Create
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

The central puzzle of this lesson is a paradox that sits at the heart of African international relations: the same states that fought hardest to win sovereignty from colonial rule have repeatedly built institutions that both sacralize that sovereignty and, in moments of crisis, claim the right to override it. The Organization of African Unity (OAU), founded in 1963, elevated non-interference into a quasi-constitutional principle; the African Union (AU), launched in 2002, inserted into its Constitutive Act a right to intervene in member states in cases of war crimes, genocide, and crimes against humanity (Article 4(h)), alongside a prohibition on unconstitutional changes of government (Article 4(p)). This is not merely institutional renovation. It is a normative rupture whose meaning remains contested: is Article 4(h) the logical completion of Pan-Africanism, or is it an elite bargain that preserves the sovereign shell while licensing selective intervention? Understanding that rupture requires tracing how sovereignty was constructed in Africa—not as an abstract legal status but as a hard-won political achievement against colonialism, neo-colonialism, and Cold War manipulation—and how that construction continues to constrain and enable collective action today.

This lesson sits in Module 5, African Geopolitical Architecture, and it builds directly on three earlier lessons. From L9 (sovereignty) you bring the distinction between legal sovereignty and empirical state capacity, and the recognition that sovereignty is always performed and contested. From L12 (decolonization) you bring the

historical experience of anti-colonial struggle, the Bandung moment, and the way newly independent states used international law to lock in territorial integrity. From L27 (colonial state formation) you bring the understanding that African states inherited extractive, externally oriented institutions whose borders were drawn without reference to social geography. The lesson therefore does not treat sovereignty as a given; it treats sovereignty as a political project whose African variant was forged in the crucible of anti-colonial nationalism and then institutionalized in the OAU. The forward links to L32 (African agency), L34 (Sahel), and L49 (Global South) mean that what you learn here about institutional path dependence and multi-alignment will reappear when you analyze how African states navigate great-power competition, regional security crises, and South-South cooperation.

The intellectual project of Pan-Africanism is older than the OAU and broader than the AU. W.E.B. Du Bois convened the Pan-African Congresses from 1900 onward, framing the "problem of the color line" as a global structure. Kwame Nkrumah, in *Africa Must Unite* (1963), argued that political unification was the only defense against neo-colonialism, proposing a continental government with a common market, currency, and defense force. Julius Nyerere, in the Arusha Declaration (1967) and his writings on ujamaa, advanced a more gradualist, socialist, and village-centered vision of African socialism that emphasized self-reliance over rapid political merger. These two visions—Nkrumah's continental state versus Nyerere's community of sovereign states cooperating functionally—have structured every subsequent debate about African unity. The OAU Charter (1963) represented a victory for the Nyerere-Monrovia group over Nkrumah's Casablanca bloc: sovereignty was preserved, non-interference was codified, and unity was deferred to functional cooperation. The AU Constitutive Act (2000) can be read as a partial, belated vindication of Nkrumah's insistence that sovereignty without collective capacity is hollow, but it stopped well short of continental government.

The Non-Aligned Movement and the Afro-Asian solidarity project provided the global context in which African sovereignty was asserted. The Bandung Conference of 1955 articulated a shared anti-colonial and anti-racist platform that linked African and Asian struggles, and the Belgrade summit of 1961 formalized non-alignment as a diplomatic strategy. For African states, non-alignment was never neutrality in the abstract; it was a positive project of preserving decision-making autonomy in a bipolar world. This matters for the lesson because it establishes that African sovereignty claims were always relational and strategic, not merely juridical. The Afro-Asian solidarity project also bequeathed a vocabulary—self-determination, neo-colonialism, solidarity—that continues to structure African diplomatic discourse, including contemporary critiques of conditionality and of great-power competition on the continent.

Institutional path dependence explains why the AU's normative ambitions have not been matched by enforcement capacity. The OAU's sovereignty norms were not accidental; they were functional responses to a continent of weak states facing internal and external threats. Once codified, they created constituencies—military elites, ruling parties, regional hegemons—that benefited from non-interference. The AU inherited this architecture: the Peace and Security Council (PSC) operates by consensus, suspensions for unconstitutional changes of government are the primary enforcement tool, and there is no supranational executive with independent coercive capacity. Murithi (2014) captures this tension by analyzing the AU's normative framework as ambitious but structurally under-resourced. The result is a pattern of inconsistent responses to crises—Mali (2020), Guinea (2021), Burkina Faso (2022), Niger (2023), Gabon (2023)—where the AU suspends governments but struggles to restore constitutional order, and where regional economic communities (RECs) often act first and the AU follows.

Contemporary Pan-Africanism is being reconstituted through economic and normative projects rather than political unification. The African Continental Free Trade Area (AfCFTA), launched in 2019, represents the

most ambitious functional integration effort since the Lagos Plan of Action (1980) and the Abuja Treaty (1991). Agenda 2063, adopted in 2015, frames a fifty-year vision of "an integrated, prosperous and peaceful Africa, driven by its own citizens." At the same time, African states are practicing multi-alignment—engaging China, Russia, the West, and the UN simultaneously without exclusive bloc membership. This is not a return to Cold War non-alignment but a strategic hedging in a multipolar order. The lesson asks you to evaluate whether AfCFTA and Agenda 2063 constitute a new phase of Pan-Africanism or a technocratic rebranding of old aspirations, and whether multi-alignment strengthens or dilutes African agency.

By the end of this lesson you will be able to reconstruct the OAU-to-AU transition as a case of normative innovation under structural constraint; to trace the intellectual lineage of Pan-Africanism through Du Bois, Nkrumah, and Nyerere; to explain the Afro-Asian solidarity project and its legacy; to analyze institutional path dependence in the AU's enforcement architecture; and to assess contemporary Pan-Africanism through AfCFTA, Agenda 2063, and multi-alignment. You will also be able to reconstruct five perspectives—African, Chinese, Russian, Western, and UN—on the lesson's central topic, to adjudicate between competing explanations using evidence, and to produce a policy memo that distinguishes description, explanation, prediction, and prescription. The worked example walks through the OAU-to-AU transformation; the problem pair asks you to analyze the AU's inconsistent responses to unconstitutional changes of government; the data lab gives you suspension decisions, PSC communiqués, trade shares, and AfCFTA timelines to interpret.

SECTION 1 — Pre-Class Priming

1.1 Retrieval Warm-Up Answer these questions from memory before reading further. They draw on Lessons 9, 12, and 27.

1. From L9 (sovereignty): What is the difference between internal and external sovereignty, and why does the Montevideo Convention (1933) matter for post-colonial states that inherited colonial borders?
2. From L9 (sovereignty): Distinguish sovereignty as a legal status from sovereignty as empirical state capacity. Which of these two is more frequently invoked by African governments in diplomatic forums, and why?
3. From L12 (decolonization): How did the UN Charter's Article 2(7) non-intervention principle interact with decolonization movements, and what tension did it create for newly independent states facing internal conflict?
4. From L12 (decolonization): What role did the Bandung Conference (1955) play in articulating Afro-Asian solidarity, and how did it shape the diplomatic vocabulary of non-alignment?
5. From L27 (colonial state formation): What is the "gatekeeper state" concept, and how did colonial fiscal extraction and border-making shape post-colonial state capacity and interstate relations?
6. From L27 (colonial state formation): How did arbitrary colonial borders contribute to the "tragedy of the commons" in African interstate relations, particularly regarding cross-border ethnic groups and resource disputes?

1.2 Orientation Questions These questions frame the puzzle you will work through in this lesson. Do not answer them fully yet; use them to guide your reading.

1. How can the AU claim a right to intervene in member states under Article 4(h) of the Constitutive Act while those same member states fiercely guard sovereignty and resist external scrutiny of their internal

affairs?
2. Does Pan-Africanism require political unification into a continental state, as Nkrumah argued, or can it be achieved through functional economic integration and normative solidarity, as Nyerere suggested?
3. Why did the OAU's non-interference norm persist for nearly four decades despite repeated coups, civil wars, and humanitarian crises, and what changed by 2000 to make normative innovation possible?
4. What does "multi-alignment" mean for African agency in a multipolar world, and does it strengthen continental bargaining power or fragment it across competing external partnerships?

1.3 Vocabulary Pre-Teach Provisional definitions to anchor your reading. Each term will be developed and contested in the lesson core.

- **Pan-Africanism**: A political and intellectual project asserting shared identity, solidarity, and collective action among peoples of African descent, ranging from anti-colonial nationalism to continental political unification and, in contemporary usage, to functional economic integration and normative solidarity.
- **Sovereignty**: The supreme authority of a state within its territory and its equality with other states in international law; in the African context, sovereignty is also a hard-won anti-colonial achievement and a shield against neo-colonial interference.
- **Non-interference**: The principle that states should not intervene in the internal affairs of other states; codified in the OAU Charter (1963) and retained in modified form in the AU Constitutive Act (2000).
- **Article 4(h)**: A provision of the AU Constitutive Act (2000) granting the Union the right to intervene in a member state in cases of war crimes, genocide, and crimes against humanity, representing a normative break with OAU-era non-interference.
- **Unconstitutional change of government (UCG)**: The seizure of power by means other than constitutional processes; the AU's primary trigger for suspension of membership and diplomatic sanctions under Article 4(p) and the Lomé Declaration (2000).
- **AfCFTA (African Continental Free Trade Area)**: A trade agreement launched in 2019 to create a single continental market for goods and services, representing the most ambitious functional integration project in African history.
- **Agenda 2063**: The AU's fifty-year strategic framework, adopted in 2015, envisioning "an integrated, prosperous and peaceful Africa, driven by its own citizens."
- **Multi-alignment**: The practice of engaging multiple external partners—China, Russia, Western states, and multilateral institutions—simultaneously without exclusive bloc membership, as a strategy of preserving agency in a multipolar order.
- **Institutional path dependence**: The process by which early institutional choices constrain later options; in the AU context, the OAU's sovereignty norms created constituencies and procedures that persist despite normative innovation.
- **Normative innovation**: The introduction of new principles or standards into an institutional framework; exemplified by the shift from OAU non-interference to AU intervention rights and UCG prohibitions.
- **Afro-Asian solidarity**: The political and diplomatic project linking African and Asian anti-colonial movements, crystallized at Bandung (1955) and formalized through the Non-Aligned Movement, which provided a shared vocabulary of self-determination and non-interference.
- **Ujamaa**: Julius Nyerere's concept of African socialism, emphasizing communal ownership, self-reliance, and rural development; a key variant of Pan-Africanist thought that prioritized social trans-

formation over rapid political unification.

SECTION 2 — LESSON CORE

2.1 Learning objectives

By the end of this lesson, students will be able to:

1. **Analyze** the institutional transition from the Organization of African Unity (OAU) to the African Union (AU), identifying the specific normative innovations encoded in the Constitutive Act of 2000—particularly Articles 4(h) and 4(p)—and explaining the causal mechanisms through which a sovereignty-bound organization acquired interventionist language without acquiring matching enforcement capacity.
2. **Evaluate** the scope conditions under which Article 4(h) (intervention in grave circumstances) and Article 4(p) (rejection of unconstitutional changes of government) have been invoked, withheld, or selectively applied, using comparative evidence from AU Peace and Security Council communiqués and suspension decisions.
3. **Explain** the path-dependent constraints—budgetary dependence on external partners, reliance on Regional Economic Communities, consensus-based Assembly decision-making, and the diplomatic culture of non-interference inherited from the OAU—that limit the AU's enforcement capacity despite its normative ambition.
4. **Compare** the five perspectives (African, Chinese, Russian, Western, UN) on the OAU-AU transition, identifying what each reveals about sovereignty, intervention, and institutional legitimacy, and what each systematically occludes.
5. **Apply** the framework to novel cases, distinguishing whether a given crisis triggers Article 4(h) (mass atrocities), Article 4(p) (unconstitutional change of government), both, or neither, and predicting the likely AU response based on observable indicators of political will and capacity. Students will also be able to reconstruct the intellectual lineage of Pan-African institutionalism from Nkrumah's 1963 vision through the Sirte Declaration of 1999, and to adjudicate between competing explanations of AU weakness—capacity deficit versus political will deficit—on the basis of evidence.

2.2 KEY IDEA 1 — OAU to AU: institutional transition, sovereignty norms, and normative evolution (Art 4(h), 4(p))

Bolded Causal Claim: The transformation of the OAU into the AU was not a mere institutional rebranding but a normative rupture: the Constitutive Act of 2000 replaced the OAU's doctrine of absolute, non-derogable sovereignty with a regime of conditional sovereignty in which grave human-rights violations and unconstitutional changes of government became legitimate grounds for collective intervention—yet this normative innovation was structurally coupled to weak enforcement mechanisms, producing a persistent and predictable gap between proclaimed norms and practiced restraint.

Mechanism: The causal chain runs through four linked stages. First, the catalyst: the 1994 Rwandan genocide and the OAU's paralysis during it generated a crisis of legitimacy for the non-interference doctrine codified in Article III of the 1963 OAU Charter; African leaders concluded that sovereignty could no longer func-

tion as an absolute shield against mass atrocity. Second, the political entrepreneurship: Muammar Gaddafi's 1999 Sirte Declaration and the subsequent Lomé summit (July 2000) provided the institutional venue; the Constitutive Act was drafted in months, not decades, because a coalition of states—South Africa, Nigeria, Senegal, and others—pushed for a break with the OAU's "club of heads of state" model. Third, the codification: Article 4(h) granted the AU the right to intervene in a member state "pursuant to a decision of the Assembly in respect of grave circumstances, namely: war crimes, genocide and crimes against humanity," while Article 4(p) condemned and rejected unconstitutional changes of government; Article 30 barred governments that seized power unconstitutionally from participating in AU activities. Fourth, the enforcement deficit: the same states that wrote interventionist language refused to fund it. The Peace and Security Council (PSC), established in 2004, depends on member-state contributions and external financing (notably the European Union and the UN); the African Standby Force (ASF) has never reached full operational capacity; and Assembly decisions require consensus or a two-thirds majority, giving any determined minority a veto. Murithi (2014) captures this as a shift from "non-interference" to "non-indifference"—a normative advance that outran institutional capacity. The mechanism is therefore not hypocrisy but structural coupling: normative innovation was cheap (textual), while enforcement was expensive (military, financial, political), and the AU inherited the OAU's budgetary dependence and diplomatic culture. Path dependence compounded the problem: the OAU's non-interference norm had become embedded in the professional socialization of African diplomats, in the headquarters culture in Addis Ababa, and in the expectation that the AU would not challenge sitting heads of state. The result is that Article 4(p) (coups) is enforced more readily than Article 4(h) (atrocities), because coups are discrete, observable events with clear triggers, whereas "grave circumstances" require political judgment that sitting leaders are reluctant to make against peers.

Scope Conditions: Article 4(h) applies only when (a) the situation involves war crimes, genocide, or crimes against humanity; (b) the AU Assembly decides to intervene; and (c) the target is a member state. It has never been invoked for a unilateral AU military intervention without host-state consent or UN authorization: the AU's missions in Somalia (AMISOM/ATMIS), Sudan (Darfur, via the hybrid UNAMID), and the Central African Republic operated under Chapter VII UN mandates or host consent. Article 4(p) applies to unconstitutional changes of government—coups, refusals to relinquish power after elections, or constitutional manipulations to extend tenure—and triggers suspension under Article 30. Its scope is broader in practice because the trigger is less contested, but it is also politicized: the AU has been slower to condemn "constitutional coups" (term-limit extensions) than military coups, and has struggled to define the boundary between legitimate constitutional amendment and unconstitutional change. Both articles are further scoped by the AU's dependence on Regional Economic Communities (RECs) for operational capacity; the AU often delegates crisis response to RECs (ECOWAS in West Africa, SADC in Southern Africa), creating variable geometry in which enforcement depends on the political will of the relevant regional hegemon.

Observable Implications: If the causal claim holds, we should observe: (1) rapid AU suspension of member states after military coups (Mali 2020, Guinea 2021, Burkina Faso 2022, Niger 2023, Gabon 2023) but prolonged timelines for restoration and inconsistent pressure for return to civilian rule; (2) rhetorical invocation of Article 4(h) in crises (Darfur, Libya, South Sudan) without corresponding unilateral military action; (3) AU PSC communiqués that escalate in language but rarely authorize coercive measures beyond suspension and mediation; (4) member states invoking sovereignty to resist AU mediation or fact-finding missions; (5) persistent low intra-African trade (roughly 15–17 percent of total African trade) despite normative commitments to integration, indicating that institutional ambition has not translated into economic interdependence; and (6) a pattern in which the AU's strongest enforcement occurs where regional hegemons (Nigeria, South Africa, Kenya) have independent interests in stabilization, suggesting that capacity follows power rather than

norms.

Perspective Note (five traditions in brief):

African (primary): From within the African vantage point, the OAU-AU transition is best understood as a maturation of sovereignty rather than its abandonment. The OAU's non-interference doctrine was not naivety but a hard-won shield: newly independent states, many of them artificial colonial creations with fragile legitimacy, required protection from external—especially Western—intervention masquerading as humanitarianism. The shift to conditional sovereignty in 2000 reflected African agency responding to African trauma (Rwanda 1994) and African political entrepreneurship (the Sirte Declaration), not external imposition. Murithi (2014) and the broader African scholarly tradition (Grovogui on the international as imperial; Mbembe on necropolitics; Mamdani on the colonial state) insist that the AU's enforcement gaps must be read against the structural constraints of post-colonial statehood—weak fiscal capacity, externally imposed economic adjustment, and a global order that funds African institutions conditionally. On this view, judging the AU by the enforcement standards of the European Union or NATO is a category error: the AU is an anti-colonial sovereignty project that has cautiously added interventionist tools, not a liberal security community. What this perspective reveals is the African authorship of normative innovation; what it risks occluding is the degree to which sitting heads of state have instrumentalized sovereignty rhetoric to protect themselves from accountability.

Chinese: Beijing's perspective emphasizes non-interference and sovereign equality as foundational principles, consistent with the Five Principles of Peaceful Coexistence. China supports the AU as the premier continental institution and has funded its headquarters and operations, framing cooperation through FOCAC and Agenda 2063 as "win-win" development. Chinese officials generally welcome Article 4(p) (anti-coup) as stabilizing but are cautious about Article 4(h), which could legitimate intervention precedents that might one day be turned against China or its partners. The Chinese perspective reveals the material basis of AU capacity (infrastructure, funding) but occludes human-rights conditionality and the political uses of sovereignty by African incumbents.

Russian: Moscow frames the AU as a partner in constructing a multipolar order and emphasizes sovereign choice, non-interference, and resistance to Western conditionality. Russia has cultivated bilateral security relationships (including in the Sahel) and presents itself as an alternative to Western institutional templates. The Russian perspective reveals the geopolitical competition embedded in AU politics but occludes its own interventions and the authoritarian implications of its "sovereign choice" framing.

Western: Western institutionalist assessments typically praise the AU's normative ambition (4(h), 4(p)) while criticizing enforcement gaps, treating the AU as a "failing" or "underperforming" institution measured against liberal governance standards. Conditionality debates—linking aid and partnership to democratic governance—are central. This perspective reveals institutional design flaws but occludes the colonial origins of African state weakness and the external funding dependencies that constrain AU autonomy.

UN: The UN perspective treats the AU as a regional arrangement under Chapter VIII of the UN Charter, emphasizing AU-UN partnership in peacekeeping (hybrid missions, UN support to AMISOM/ATMIS). The UN supports AU normative frameworks but insists on Security Council primacy in authorizing force. This perspective reveals the legal architecture of collective security but occludes African agency in defining which crises count as "grave circumstances."

SECTION 2.3 KEY IDEA 2 — Pan-Africanism: Du Bois, Nkrumah, Nyerere, and the intellectual project of continental unity

Bolded Causal Claim: Pan-Africanism's most consequential causal contribution was to make continental unity a condition of sovereignty rather than an optional aggregation of already-sovereign states; by treating colonial partition as the original violence and racial capitalism as the continuing structure, it redefined legitimate authority as that which could secure collective self-determination across the continent and its diaspora.

Mechanism: The mechanism runs through three linked translations. First, W.E.B. Du Bois's Pan-African congresses, beginning in 1900 and continuing through the 1945 Manchester congress, converted dispersed anti-racist grievance into an organized transnational claim: the "problem of the color line" was not merely domestic discrimination but a global imperial order, and its remedy required coordinated political action by Africans and people of African descent. This created the discursive infrastructure—shared categories of race, empire, and self-determination—without which later continental projects would have lacked a common language. Second, Kwame Nkrumah translated that diasporic and intellectual Pan-Africanism into statecraft. In "Africa Must Unite" (1963) and "Neo-Colonialism" (1965), he argued that formal independence without continental political unification would reproduce subordination through economic dependence, military pacts, and elite collaboration; the mechanism here is structural: fragmented post-colonial states, with small markets and inherited colonial economies, could not bargain effectively with multinational capital or former metropoles, so sovereignty remained "flag independence" rather than substantive self-rule. Nkrumah's proposed remedy—a Union Government with a continental high command, common market, and unified foreign policy—was defeated at the 1963 Addis Ababa conference, but the argument survived as a normative standard against which later institutions were judged. Third, Julius Nyerere supplied a mediating mechanism: rather than immediate federal union, he proposed voluntary regional association and "Ujamaa" socialism, in which sovereignty could be pooled incrementally through consent and shared development goals. The Arusha Declaration (1967) framed freedom as inseparable from equality and from the dismantling of exploitative class structures; unity was thus not only geopolitical but socio-economic. The resulting institutional compromise—the OAU's loose association of sovereign states—preserved the radical vocabulary of Pan-Africanism while emptying it of federal compulsion. That compromise is itself a mechanism: it allowed anti-colonial solidarity to be institutionalized without threatening incumbent elites, but it also locked in a sovereignty-first architecture that later reformers had to work around. Theoretical lineage matters here: Fanon's analysis of national consciousness in "The Wretched of the Earth" (1961) warned that without social revolution, national liberation could produce a comprador elite; Cabral's "return to the source" insisted that culture and class, not only race, must anchor liberation; Rodney's "How Europe Underdeveloped Africa" (1972) supplied the historical-materialist account of why unity was economically necessary; Mamdani's later work on the bifurcated state showed how colonial legal distinctions between citizens and subjects survived independence, complicating any simple appeal to "the African people." Pan-Africanism therefore operated as a contested tradition, not a single doctrine: its federalist, socialist, liberal, and culturalist strands disagreed about whether sovereignty should be pooled, socialized, or merely coordinated.

Scope Conditions: The claim holds where colonial partition created economically unviable and ethnically cross-cutting states, where anti-colonial movements shared a racialized experience of imperial rule, and where leaders could plausibly present unity as protection against neo-colonialism. It is strongest in the 1950s–1960s, when decolonization was incomplete and Cold War pressures made collective bargaining attractive. It weakens where state elites fear loss of power, where regional hegemons are suspected of domination, where economic disparities make redistribution politically costly, and where internal conflicts make "continental" identity less salient than ethnic, national, or religious identities. It also differs across sites: Du Bois's Pan-

Africanism was diasporic and global, centered on racial solidarity and civil rights; Nkrumah's was state-led and continental; Nyerere's was regional and developmental. Treating these as one doctrine obscures their different scope conditions. Moreover, as Oyěwùmí's critique of gendered colonial categories and Tamale's Afro-feminist scholarship remind us, early Pan-Africanism often assumed a masculinized "African man" as the subject of liberation, occluding women's agency and the gendered distribution of sovereignty. The claim therefore applies unevenly: it explains elite diplomatic projects better than grassroots emancipation, and continental rhetoric better than local power relations.

Observable Implications: If Pan-Africanism genuinely shaped sovereignty norms, one should observe its vocabulary in foundational texts: the OAU Charter's references to African solidarity and liberation; the AU Constitutive Act's commitment to "greater unity and solidarity"; Agenda 2063's "Pan-African vision" and its emphasis on an integrated continent; and AfCFTA's economic logic of continental market-building. One should also observe the recurring gap between rhetorical unity and institutional capacity: the defeat of Nkrumah's union government, the OAU's non-interference, the AU's limited enforcement, and the persistence of bilateral deals over continental coordination. Another implication is generational: Pan-African language is invoked both by integrationists and by sovereignty hard-liners, because it can mean either pooled authority or collective defense of state independence. The concept is therefore not self-executing; its institutional effects depend on which strand—federalist, socialist, or sovereigntist—dominates at a given moment. Finally, one should see Pan-Africanism's afterlife in contemporary debates over reparations, racial justice, and Global South solidarity, where the diasporic strand remains active even when continental institutions are weak.

Perspective Note (five traditions in brief):

African (primary): From within, Pan-Africanism is not a regional variant of Western internationalism but a response to racial capitalism, colonial partition, and the denial of African agency. It treats sovereignty as historically won and collectively fragile: Nkrumah's warning that political independence without economic and continental power becomes neo-colonialism, Nyerere's insistence that freedom must be social as well as political, and Du Bois's global color line all frame unity as emancipatory rather than merely administrative. African scholarship—Rodney on underdevelopment, Fanon on the pitfalls of national consciousness, Cabral on culture and class, Mamdani on the inherited state, Grovogui on quasi-sovereignty—shows that Pan-Africanism's power lies in naming structures that liberal state theory naturalizes. Its occlusion is internal: early formulations often centered male elites, understated gendered and ethnic hierarchies, and could convert solidarity into a disciplining discourse against dissent. The African vantage point reveals what Western institutionalism misses: that unity was a survival strategy against an international order built on racialized extraction, not a technocratic preference.

Chinese: China tends to read Pan-Africanism through the lens of South-South solidarity and mutual respect among developing nations. It supports AU and regional integration rhetorically, often framing its engagement as non-interfering partnership rather than conditionality. This perspective contributes a developmental and infrastructure-oriented reading of unity, but it can occlude the internal political contestation within Pan-Africanism and the asymmetries of China-Africa economic relations. It also risks treating "Africa" as a single counterpart, flattening the very diversity Pan-Africanists debated.

Russian: Russia frames Pan-Africanism as part of an anti-hegemonic, multipolar order in which sovereign equality and non-interference protect states from Western dominance. It emphasizes AU legitimacy and opposes external intervention, often aligning with African sovereignty rhetoric. This perspective highlights great-power contestation but occludes Russia's own strategic interests, its arms and security engagements,

and the possibility that multipolarity can reproduce rather than dissolve hierarchy.

Western: Western scholarship often treats Pan-Africanism as a normative aspiration or institutional project, assessing it by governance standards, economic integration metrics, and liberal peace criteria. It contributes comparative institutional analysis and attention to implementation gaps, but it frequently occludes the colonial and racial foundations of African state weakness and may measure Pan-Africanism against an idealized European integration model. Conditionality debates—linking partnership to democratic governance—are central, sometimes reducing Pan-Africanism to a performance indicator.

UN: The UN perspective treats Pan-Africanism as a regional identity that can support Chapter VIII cooperation, peacekeeping, and development agendas. It emphasizes AU-UN partnership and the legitimacy of regional organizations in addressing African crises. This perspective reveals the legal and operational architecture of collective security but occludes the radical anti-imperial content of Pan-Africanism and African agency in defining the terms of unity.

SECTION 2.4 KEY IDEA 3 — The Non-Aligned Movement and the Afro-Asian solidarity project

Bolded Causal Claim: The Non-Aligned Movement converted Afro-Asian solidarity from a diplomatic posture into a structural claim about international order, producing a sovereignty doctrine in which non-interference and collective bargaining were mutually reinforcing defenses against superpower domination.

Mechanism: The mechanism begins with the 1955 Bandung Conference, where twenty-nine Asian and African states articulated shared opposition to colonialism, racism, and great-power domination. Bandung did not create a military alliance; its mechanism was normative and diplomatic: by defining a "Third World" or "non-aligned" identity, it gave newly independent states a collective vocabulary that reduced the cost of resisting bloc pressure. The 1961 Belgrade conference formalized the Non-Aligned Movement, and subsequent summits institutionalized principles—sovereign equality, non-intervention, peaceful coexistence, disarmament, and economic justice—that were later echoed in the OAU Charter and in UN General Assembly resolutions. The causal chain runs from shared colonial experience to common diplomatic identity, from identity to coordinated voting and bargaining, and from bargaining to a normative environment in which sovereignty was understood not merely as non-interference but as freedom from structural dependence. Afro-Asian solidarity mattered because it expanded the coalition beyond Africa, giving African states leverage in forums where they were individually weak; the Group of 77, formed in 1964, carried this logic into trade and development negotiations, including demands for a New International Economic Order. For African sovereignty specifically, NAM reinforced the OAU's non-interference norm by framing external criticism or intervention as neo-colonial; it also provided diplomatic cover for states that were militarily or economically vulnerable. Yet the mechanism contained an ambiguity: non-alignment was defined negatively (not aligned with either bloc) rather than positively, allowing states with very different regimes and interests to claim the label. This ambiguity made the movement broad but shallow, and it meant that "sovereignty" could be invoked both to resist imperialism and to shield authoritarian rule. Theoretical lineage: Nkrumah's "Neo-Colonialism" (1965) treated non-alignment as insufficient without economic unification; Nyerere's "Ujamaa" linked sovereignty to self-reliance; Fanon warned that formal non-alignment without social transformation could leave colonial structures intact; Rodney's underdevelopment thesis explained why Afro-Asian states needed collective economic bargaining; Mamdani's later analysis of the bifurcated state showed that sovereignty claims often masked internal domination. Thus NAM's mechanism was not simply diplomatic solidarity but a contest over whether sovereignty meant state autonomy, popular emancipation, or both.

Scope Conditions: The claim is strongest during decolonization and Cold War bipolarity, when superpower competition made non-alignment a credible strategy and when newly independent states shared an anti-colonial identity. It weakens when bipolarity fades, when states become dependent on one patron, or when internal conflicts make collective identity less salient than regime survival. It also depends on the capacity to coordinate: NAM's effectiveness required at least minimal consensus on principles, which was repeatedly strained by the Sino-Soviet split, regional rivalries, and divergent development levels. Afro-Asian solidarity was further complicated by the fact that Asian and African states had different geopolitical positions; "Afro-Asian" could obscure African particularities, including the specific legacies of settler colonialism and racialized partition. The claim applies less well to cases where sovereignty is primarily threatened by internal collapse rather than external domination, and where non-interference norms protect incumbents at the expense of populations. In the contemporary multipolar era, non-alignment reappears as "multi-alignment," but the structural conditions—superpower blocs, colonial empires, and a clear Third World identity—are not identical, so analogies must be cautious.

Observable Implications: If the NAM/Afro-Asian solidarity thesis holds, one should observe Bandung principles in the OAU Charter's emphasis on sovereign equality and non-interference; in African diplomatic behavior, such as bloc voting in the UN General Assembly and collective positions on decolonization, apartheid, and Palestinian self-determination; and in the persistence of sovereignty-first language in AU responses to crises. One should also observe the movement's economic afterlife in demands for fair trade, debt relief, and reform of global financial institutions. Another implication is institutional: NAM's loose, summit-based structure prefigured the OAU/AU's preference for consensus and weak enforcement, because both were designed to accommodate sovereignty-sensitive states. Conversely, if NAM had been a deeply institutionalized alliance, one might expect stronger enforcement; its weakness is therefore consistent with its design. Finally, one should see contemporary invocations of non-alignment in African responses to great-power competition, where states seek to avoid choosing between China, Russia, and Western partners—though this "multi-alignment" is a descendant, not a replica, of Cold War non-alignment.

Perspective Note (five traditions in brief):

African (primary): From within, NAM and Afro-Asian solidarity are best understood as strategies of survival in an international order that racialized and economically subordinated Africa. They gave newly independent states a collective voice and a normative shield against intervention, and they linked sovereignty to anti-racism and economic justice. African thinkers such as Nkrumah, Nyerere, Fanon, Rodney, and Cabral treated non-alignment not as neutrality but as refusal of subordination; Grovogui's work on quasi-sovereignty shows how international law itself encoded African inferiority, making solidarity a necessary corrective. The occlusion is that non-interference could protect authoritarian regimes and that "African" or "Afro-Asian" unity could flatten internal hierarchies of class, gender, and ethnicity. The African vantage point reveals that sovereignty was not an abstract legal status but a hard-won, continuously contested defense against renewed domination.

Chinese: China views NAM and Afro-Asian solidarity as part of the historical struggle against imperialism and as a foundation for contemporary South-South cooperation. It emphasizes mutual respect, non-interference, and development partnership, often presenting itself as a fellow developing country. This perspective contributes a narrative of shared anti-colonial legitimacy but can occlude power asymmetries in China-Africa relations and the fact that China's rise has transformed the very multipolar order NAM once contested. It may also instrumentalize solidarity for bilateral economic goals.

Russian: Russia frames NAM as an anti-hegemonic project and invokes multipolarity, sovereign equality,

and non-interference to contest Western dominance. It supports African positions in international forums and opposes unilateral sanctions and intervention. This perspective highlights great-power contestation and the demand for a more representative order, but it occludes Russia's own interventions, its security footprint, and the possibility that its multipolarity narrative serves state interests rather than African emancipation.

Western: Western analysis often treats NAM as a Cold War diplomatic coalition or a relic of bipolarity, assessing it by institutional effectiveness, economic outcomes, and governance standards. It contributes comparative diplomacy and attention to coordination problems, but it frequently occludes the colonial and racial dimensions of global inequality and may reduce Afro-Asian solidarity to tactical voting. Conditionality debates are central: Western actors often ask whether solidarity norms impede accountability and human rights.

UN: The UN perspective treats NAM as a member-state caucus operating within the Charter framework, emphasizing sovereign equality, peaceful settlement of disputes, and development cooperation. It supports regional and cross-regional solidarity as long as it respects Security Council primacy and international law. This perspective reveals the legal architecture of collective security but occludes the radical redistribution demands of the Afro-Asian project and African agency in defining which solidarities matter.

SECTION 2.5 — KEY IDEA 4: Institutional path dependence: why the AU retains weak enforcement and strong sovereignty norms

Bolded Causal Claim: The African Union's persistent combination of ambitious normative rhetoric and weak enforcement capacity is a path-dependent outcome of the Organisation of African Unity's founding sovereignty bargain, in which newly independent states exchanged supranational authority for mutual legitimation of territorial borders and non-interference, so that later reforms layered new norms atop an inherited architecture without redistributing power.

Mechanism: The theoretical lineage runs through historical institutionalism. Pierson's (2000) analysis of increasing returns and Mahoney's (2000) account of path dependence both predict that early institutional choices create self-reinforcing equilibria: actors invest in skills, expectations, and coalitions around existing rules, raising the cost of deviation. March and Olsen's (1989) "logic of appropriateness" adds that institutions shape what actors consider legitimate, so that sovereignty norms become taken-for-granted scripts rather than calculated preferences. Applied to Africa, the founding moment is the OAU Charter of 1963, adopted in Addis Ababa by thirty-two newly independent states. Its core principles—sovereign equality, non-interference in internal affairs, respect for territorial integrity inherited from colonial boundaries, and the peaceful settlement of disputes—were not incidental. They were the price of continental solidarity among regimes that had just emerged from colonial rule and feared both external intervention and internal secession. The OAU was designed as a club of governments, not of peoples: its legitimacy derived from recognizing states, not from holding them accountable.

This founding bargain generated increasing returns across four decades. Diplomatic habitus, staffing patterns, budget procedures, and legal vocabularies all accumulated around sovereignty protection. When the 1990s brought democratization pressures and the shock of the Rwandan genocide, a reform window opened, but elites channeled it into declaratory innovation rather than enforcement. The AU Constitutive Act of 2000 introduced genuinely novel norms—Article 4(h)'s right to intervene in grave circumstances (war crimes, genocide, crimes against humanity) and Article 4(p)'s condemnation of unconstitutional changes of

government—alongside commitments to human rights, democracy, and good governance. Yet the Act preserved the Assembly of Heads of State and Government as the supreme organ, left the Commission as a secretariat with limited autonomous authority, and made the Peace and Security Council dependent on Assembly endorsement for sanctions. The African Standby Force was conceived as a rapid-response capacity but remains dependent on regional economic communities and member-state troop contributions. In other words, the reform layered new norms onto the old sovereignty architecture: the language changed, the power distribution did not.

Murithi (2014) captures this as "normative overreach"—the AU declares principles it cannot enforce, producing a credibility gap between promise and practice. Tieku's (2019) work on the AU Commission shows how member states deliberately constrain the Commission's autonomy through budget control, staffing politics, and the requirement that key decisions pass through intergovernmental bodies. The result is an institution that can suspend a member state from its own activities but cannot compel a junta to hold elections, cannot fund its own peace operations, and cannot prevent member states from ignoring its rulings. External funding reinforces the pattern: donors finance programs (peacekeeping, health, agriculture) but not coercive capacity, so the AU's operational dependence on partners deepens without a corresponding increase in autonomous enforcement. The mechanism is therefore not incompetence but rational institutional reproduction: sovereignty norms serve the interests of incumbent elites, and reform that threatened those interests was designed to be unenforceable.

Scope Conditions: Path dependence of this kind is strongest where (a) the founding coalition retains veto power over reform, as the Assembly does; (b) no hegemonic member state is willing to fund and staff autonomous enforcement; and (c) member states face high domestic insecurity and therefore value non-interference as insurance. It is weaker where regional hegemons can mobilize coalitions with stronger enforcement traditions—ECOWAS in West Africa has historically been more interventionist than the AU continental level, and the AU often defers to such sub-regional bodies. The argument also assumes that institutional culture is sticky; it would not apply to a scenario in which a critical juncture produced a genuine redistribution of power, such as a funded, supranational executive with independent revenue. No such juncture has occurred. The scope condition fails, finally, if external actors condition large-scale funding on enforcement reform in ways that alter domestic incentives; to date, donor conditionality has targeted policy areas (governance benchmarks, economic reform) rather than institutional power redistribution.

Observable Implications: If this mechanism holds, several patterns should be visible. First, AU suspensions of member states after coups should be temporary and frequently lifted after nominal transitions rather than full restoration of constitutional order—consistent with the record in Mali (2020–2022), Burkina Faso (2022), and Guinea (2021). Second, Peace and Security Council communiqués should call for restoration of constitutional order while rarely imposing material sanctions beyond suspension from AU activities; financial or trade sanctions should be exceptional. Third, AU peace operations should depend on member-state troop contributions and external funding, as with ATMIS in Somalia. Fourth, member states should be able to ignore AU Commission rulings without consequence, as seen in debates over International Criminal Court withdrawals and in the sidelining of the AU's Libya peace plan in 2011. Fifth, the AU budget should remain heavily dependent on partner funding, limiting autonomous action. Each of these is observable in the record and is predicted by path dependence rather than by a simple capacity-gap explanation.

Perspective Note (five traditions in brief): *African (primary):* Sovereignty is treated as a hard-won achievement of decolonization, and non-interference protects postcolonial states from external—especially Western—intervention. From this vantage, the AU's weakness is not a failure but a deliberate preservation

of state autonomy and collective legitimation; reformers such as Murithi and Tieku argue for "responsible sovereignty" but acknowledge elite resistance. This perspective reveals African agency in designing norms and the political rationality of sovereignty protection; it occludes internal accountability and the costs borne by citizens under authoritarian or military rule. *Chinese:* Non-interference aligns with Beijing's Five Principles of Peaceful Coexistence; AU weakness is acceptable because the partnership model favors state-to-state relations, and stronger enforcement would threaten Chinese investments and access. This reveals a stability preference and respect for formal sovereignty; it occludes human rights and democratic accountability. *Russian:* The sovereign-choice narrative treats weak enforcement as a bulwark against Western-style interventionism and supports a multipolar order in which African states retain decision-making autonomy. This reveals an anti-hegemonic logic; it occludes democratic backsliding and the instrumental use of sovereignty by elites. *Western:* Institutionalist assessments frame the problem as capacity gaps and governance deficits, with conditionality debates over whether aid should be tied to reform benchmarks. This reveals organizational and resource constraints; it occludes the colonial and racial dimensions of global inequality and African normative agency. *UN:* The UN treats the AU as a regional partner under Chapter VIII, supporting capacity building while respecting sovereignty; AU weakness creates burden-sharing gaps in peace and security. This reveals the legal architecture of collective security; it occludes African-defined priorities and the political economy of enforcement.

SECTION 2.6 — KEY IDEA 5: Contemporary Pan-Africanism: AfCFTA, Agenda 2063, and the politics of multi-alignment

Bolded Causal Claim: Contemporary Pan-Africanism has shifted from Nkrumah's political federation to economic integration and multi-alignment, with the African Continental Free Trade Area and Agenda 2063 representing a pragmatic, sovereignty-compatible reimagining of continental unity that trades federalist urgency for incremental, market-mediated cooperation among states that retain full autonomy.

Mechanism: The theoretical lineage combines functionalist integration theory (Mitrany 1943; Haas 1958) with African political economy. Functionalism predicts that cooperation in technical, economic domains generates spillover into political integration; neo-functionalism adds that supranational institutions and interest groups drive the process. In the African case, however, the mechanism has been deliberately "intergovernmental functionalism": states cooperate where gains are clear and sovereignty costs are low, while reserving political authority. The shift was driven by three structural changes. First, the end of the Cold War removed the superpower competition that had subsidized ideological Pan-Africanism and exposed the fiscal unsustainability of federalist projects. Second, structural adjustment programs in the 1980s and 1990s weakened state capacity and redirected African governments toward market-led growth and regional economic communities as survival strategies. Third, the rise of China, India, Brazil, and the Gulf states diversified Africa's external partnerships, making multi-alignment—engaging multiple partners simultaneously to maximize bargaining power and avoid conditionality—a rational strategy.

Agenda 2063, adopted by the AU in 2015, frames a fifty-year vision of "an integrated, prosperous and peaceful Africa, driven by its own citizens." It is aspirational and indicator-based, with flagship projects including the AfCFTA, the African passport, high-speed rail, and the Grand Inga Dam. The AfCFTA, signed in 2018 and commencing trade in January 2021, is the most concrete mechanism: it aims to create a single market for goods and services across fifty-four countries, with protocols on trade in goods, services, dispute settlement, and (in progress) digital trade and women and youth. The economic logic is that intra-African

trade—roughly fifteen to seventeen percent of total African trade, compared to roughly sixty percent within Europe—can be raised by reducing tariffs and non-tariff barriers, thereby diversifying economies away from commodity dependence and external markets. The political logic is that economic interdependence creates constituencies for cooperation without requiring sovereignty pooling.

Yet the mechanism faces well-documented constraints. Tariff liberalization is the easy part; non-tariff barriers, rules of origin, customs capacity, and infrastructure deficits are harder. The Protocol on Free Movement of Persons, adopted in 2018, has been ratified by only a minority of states. Implementation depends on regional economic communities, which have uneven capacity and overlapping memberships that create confusion. Multi-alignment, meanwhile, generates its own tensions: African states negotiate simultaneously with the EU (Economic Partnership Agreements), China (Belt and Road Initiative), Russia (arms and security), and Gulf states (investment and ports), which can fragment continental bargaining positions and create debt and dependency risks. The mechanism therefore produces integration in rhetoric and partial, uneven integration in practice, with sovereignty fully preserved.

Scope Conditions: This model works where (a) regional economic communities have functional institutions and political commitment; (b) infrastructure and customs capacity exist or are financed; (c) domestic political economies can absorb competitive pressures from liberalization; and (d) external partners do not impose exclusive arrangements that undermine continental coherence. It fails where conflict disrupts trade corridors, where protectionist lobbies dominate, where rules of origin are too complex for small firms, and where multi-alignment tips into dependency on a single partner. The model also assumes that economic integration can proceed without political federation; if security crises or great-power competition intensify, the absence of political authority may limit crisis response. The scope condition is therefore contingent on a relatively stable geopolitical environment, which the Sahel crises and great-power rivalry increasingly challenge.

Observable Implications: If this mechanism holds, several patterns should be visible. First, AfCFTA trading should begin with limited actual shipments, concentrated in a few corridors and large firms, with intra-African trade shares rising only slowly—consistent with the modest initial volumes reported since January 2021. Second, Agenda 2063 flagship projects should show uneven progress, with some (AfCFTA) advancing and others (African passport, high-speed rail) stalled. Third, African states should maintain multiple, sometimes contradictory, external partnerships simultaneously, as seen in the coexistence of EU EPAs, Chinese infrastructure finance, Russian security cooperation, and Gulf investment. Fourth, sovereignty norms should remain intact: no transfer of tariff-setting or border control to supranational bodies. Fifth, implementation gaps should correlate with REC capacity and conflict exposure, with the Sahel and Horn of Africa lagging. These patterns are observable and distinguish the contemporary model from both Nkrumah's federalism and from genuine supranational integration.

Perspective Note (five traditions in brief): *African (primary):* Contemporary Pan-Africanism is read as a pragmatic adaptation to post-Cold War realities: unity through commerce and diplomacy rather than federation, preserving sovereignty while building collective bargaining power. African scholars and policymakers emphasize "African solutions" and multi-alignment as agency, not dependency. This perspective reveals the rationality of incrementalism and the diversity of African strategies; it occludes the risk that economic integration without political authority may reproduce inequality and that multi-alignment may fragment continental coherence. *Chinese:* AfCFTA and Agenda 2063 are welcomed as frameworks for partnership and market access; China positions itself as a supporter of African integration through infrastructure finance and the Belt and Road Initiative. This reveals an economic opportunity framing; it occludes concerns about debt sustainability and asymmetric dependence. *Russian:* Multi-alignment is endorsed as evidence of a

multipolar world in which African states exercise sovereign choice; Russia offers security and energy partnerships as alternatives to Western conditionality. This reveals an anti-hegemonic narrative; it occludes the limited scale of Russian economic engagement and the risks of security dependency. *Western:* Institutionalists assess AfCFTA as a positive but implementation-challenged project, with conditionality debates over governance, labor, and environmental standards in trade agreements. This reveals technical and regulatory concerns; it occludes the historical role of Western trade policy in fragmenting African markets and the political economy of conditionality. *UN:* The UN supports Agenda 2063 and AfCFTA as contributions to the Sustainable Development Goals, emphasizing trade facilitation, peace and security, and development cooperation. This reveals a multilateral development framing; it occludes the geopolitical competition embedded in multi-alignment and African agency in defining integration priorities.

SECTION 2.7 FIVE PERSPECTIVES IN DEPTH

2.7.1 African Perspective (PRIMARY)

The African perspective on post-colonial sovereignty and Pan-Africanism begins from a premise that the other four perspectives often treat as background: sovereignty in Africa was not a natural inheritance of statehood but a hard-won, historically contingent, and deeply contested achievement. From this vantage point, the OAU Charter of 1963 was not merely a regional treaty; it was a defensive settlement against recolonization, neo-colonial penetration, and the fragmentation of newly independent states. Its core norms—sovereign equality, territorial integrity, non-interference, and the inviolability of borders—were not abstract legal preferences. They were political shields forged in the immediate aftermath of colonial rule, when external powers retained economic leverage, military bases, and covert influence, and when secessionist movements threatened to reproduce the balkanization that colonialism had already imposed. The African perspective therefore treats sovereignty as both emancipatory and protective: it is the legal and political condition under which African states could claim agency in an international system that had historically denied them standing.

This perspective is not monolithic, and it must be reconstructed from within rather than reduced to a single official position. One strand, associated with Nkrumah's Pan-Africanism, treats sovereignty at the level of the colonial state as insufficient and even dangerous. Nkrumah's argument in *Africa Must Unite* was that political independence without continental unity would leave African states vulnerable to neo-colonial manipulation, economic dependency, and external military intervention. For this strand, the nation-state is a colonial artifact whose borders divide peoples, markets, and security communities; true sovereignty requires the pooling of sovereignty into continental institutions. A second strand, associated with Nyerere's gradualism, accepts the nation-state as the immediate arena of liberation and development while insisting that African solidarity should be built through practical cooperation, non-alignment, and regional economic integration rather than immediate political federation. Nyerere's Ujamaa vision linked sovereignty to self-reliance and social equality, but it also recognized that premature continental union could become a vehicle for domination by stronger states. A third strand, statist and defensive, treats sovereignty as non-negotiable and views supranational authority with suspicion. This strand dominated the OAU's early decades and continues to shape the AU's enforcement gaps. The African perspective is therefore internally plural: it contains federalists, gradualists, sovereigntists, and feminists who do not agree on whether sovereignty should be pooled, protected, or transformed.

The intellectual lineage of this perspective extends well beyond the founding fathers. Du Bois's Pan-African

congresses established the idea that African liberation was a global racial and anti-imperial project, not merely a diplomatic rearrangement among states. Cabral's insistence that national liberation required a "return to the source" and a theory of the concrete conditions of each society challenged both romantic nationalism and imported ideology. Fanon's analysis of colonial violence and the postcolonial state warned that formal independence could reproduce colonial hierarchies under new elites. Rodney's historical materialist account of underdevelopment showed that African poverty was not a pre-modern residue but a product of the Atlantic slave trade, colonial extraction, and unequal exchange. Mamdani's work on the bifurcated colonial state explained how colonial rule created "citizens" and "subjects," leaving postcolonial states with authoritarian administrative inheritances. Bayart's analysis of the "politics of the belly" highlighted the informal and clientelist logics that often substituted for formal institutional capacity. Mbembe's postcolonial theory emphasized the "banality of power" and the ways in which sovereignty in Africa has been performed, contested, and hollowed out by both internal and external forces. Grovogui's argument that Africans have been treated as "quasi-sovereigns" in international law captures the structural inequality that makes sovereignty claims in Africa simultaneously legal and aspirational. Tamale and Oyěwùmí, among others, have shown that the postcolonial state and its sovereignty claims are gendered: the "African state" often rests on patriarchal authority, and Pan-African unity has historically marginalized women's political agency. These scholars do not merely add African examples to Western theory; they reframe the basic categories of sovereignty, statehood, and international order.

From this perspective, the transition from the OAU to the AU is best understood as normative innovation under constraint. The OAU's sovereignty norms were effective at protecting states from external intervention, but they also shielded regimes from accountability and limited collective responses to mass atrocities, unconstitutional changes, and cross-border crises. The AU Constitutive Act of 2000 introduced a significant shift: Article 4(h) asserts the Union's right to intervene in grave circumstances such as war crimes, genocide, and crimes against humanity, while Article 4(p) condemns and rejects unconstitutional changes of government. These provisions represent an African attempt to redefine sovereignty as responsibility rather than mere non-interference. They also reflect a continental judgment that the OAU's strict non-intervention norm had become morally and politically untenable in the face of Rwanda, Somalia, and other crises. Yet the African perspective insists that this innovation must be read against its historical context. Article 4(h) has remained largely dormant as a coercive military tool, and Article 4(p) has been applied unevenly. The gap between norm and practice is not simply hypocrisy; it is the product of institutional path dependence, member-state resistance, funding limitations, and the AU's dependence on the political will of the very states it is meant to discipline.

The African perspective also reframes the Non-Aligned Movement and Afro-Asian solidarity. Non-alignment was not neutrality or passivity; it was a strategy of strategic autonomy in a bipolar world. African states used the Bandung moment and subsequent NAM forums to resist superpower proxy conflicts, demand economic justice, and assert a collective voice in international institutions. The Afro-Asian project contributed to the delegitimation of colonialism and helped create diplomatic space for African sovereignty claims. However, the African perspective is also critical of NAM's limitations: it lacked enforcement mechanisms, was often captured by elite diplomacy, and could not prevent economic dependency or Cold War interventions. Non-alignment provided rhetorical autonomy but not always material autonomy. This is why contemporary African discourse increasingly speaks of multi-alignment rather than non-alignment: the goal is not to stand between blocs but to engage multiple partners—China, Russia, Western states, and multilateral institutions—on terms that preserve African agency.

Contemporary Pan-Africanism, expressed through Agenda 2063 and the African Continental Free Trade

Area, is understood from this perspective as an attempt to convert political sovereignty into economic and strategic sovereignty. AfCFTA is not merely a trade agreement; it is a response to the colonial fragmentation of African markets and to the external imposition of economic structures that have kept intra-African trade low. Agenda 2063 frames integration as a long-term political project of "The Africa We Want," linking peace, governance, infrastructure, and industrialization. Multi-alignment is similarly framed as agency: African states seek to avoid exclusive dependence on any single external power and to leverage competition among partners for developmental gains. Yet the African perspective also recognizes the risks: multi-alignment can become incoherent if it lacks continental coordination; external partners may exploit divisions; and integration can reproduce inequalities if it is driven by elites without popular accountability.

What the African vantage point contributes that the other four cannot is a historically grounded theory of sovereignty as both shield and project. It reveals that international norms are not neutral standards applied to Africa; they are products of colonial hierarchies, anti-colonial struggle, and postcolonial negotiation. It shows that the AU's weaknesses are not simply technical failures but the institutional residue of a sovereignty consensus that was necessary for survival. It also reveals the gendered, class-based, and ethnic dimensions of sovereignty: the state that claims sovereignty often excludes large segments of its own population, and Pan-African unity has sometimes been pursued at the expense of democratic participation. The African perspective therefore offers a double critique: it defends African sovereignty against external paternalism while insisting that sovereignty must be democratized, gendered, and made accountable to African peoples rather than only to states.

What this perspective occludes is equally important. Because it is rooted in anti-colonial defense, it can understate the ways in which sovereignty norms protect authoritarian regimes and obstruct humanitarian protection. It can romanticize continental unity and obscure power asymmetries among African states, such as the influence of regional hegemons or the marginalization of smaller states. It can treat "Africa" as a coherent actor when African interests are in fact fragmented by regime type, economic structure, and geopolitical alignment. It may also underemphasize the agency of non-state actors—women's movements, labor, civil society, and diaspora communities—in shaping sovereignty and integration. Finally, by foregrounding historical injustice, it can sometimes treat contemporary governance failures as primarily externally caused, thereby deflecting responsibility from African elites. A rigorous African perspective must therefore be self-critical: it must defend sovereignty without sacralizing the state, and it must pursue Pan-Africanism without erasing internal contestation.

2.7.2 Chinese Perspective

The Chinese perspective on post-colonial sovereignty and Pan-Africanism is anchored in a normative vocabulary of sovereignty equality, non-interference, mutual benefit, and development-centered partnership. From this vantage point, the African state is the legitimate bearer of sovereignty, and external actors should not use human rights, governance, or security concerns as pretexts for intervention. This position draws on the Five Principles of Peaceful Coexistence and on China's own historical experience of colonial and semi-colonial subjugation. It resonates strongly with the defensive strand of African sovereignty: many African governments welcome a partner that does not impose political conditionality and that frames cooperation in terms of infrastructure, trade, and state capacity. The Chinese perspective therefore treats the OAU-AU transition not as a story of Western-style normative convergence but as an African-led institutional evolution in which sovereignty remains central.

In practice, this perspective is expressed through state-to-state engagement, the Forum on China-Africa Cooperation, infrastructure finance, and support for African integration initiatives such as Agenda 2063 and

AfCFTA. China's construction of the AU headquarters in Addis Ababa is often cited as a material symbol of partnership, while Chinese officials routinely emphasize respect for African choices and opposition to external interference. The normative claim is that development, not conditionality, is the foundation of stability: poverty and underdevelopment are treated as root causes of conflict, and economic cooperation is presented as a contribution to peace. This reveals something the Western perspective often underestimates: the demand among many African elites for partners who deliver tangible infrastructure and financing without requiring domestic political reform as a precondition.

The Chinese perspective also contributes a multipolar framing. It presents China-Africa relations as part of a broader shift away from Western-dominated global governance and toward a more equitable international order. In this framing, African multi-alignment is not a problem to be managed but a legitimate expression of sovereignty in a multipolar world. China's support for AU positions in multilateral forums, its emphasis on the UN Charter, and its opposition to unilateral sanctions are read by some African governments as evidence of a partner that amplifies African voice rather than constraining it. The perspective thus aligns with contemporary Pan-Africanism's desire to diversify partnerships and reduce dependency on any single external actor.

What this perspective occludes is equally significant. Its emphasis on non-interference can function as a shield for authoritarian governance and can limit scrutiny of debt sustainability, labor practices, environmental impacts, and transparency in large-scale projects. Critics argue that state-to-state deals may bypass African civil society, legislatures, and local communities, reproducing the very exclusion that African feminist and democratic scholars have identified as a problem of sovereignty. The "no conditionality" stance can also obscure asymmetries: African states may gain infrastructure but lose bargaining power in opaque contracts, while Chinese firms and financiers may secure long-term resource and market access. The debt-trap narrative is contested and often overstated, but concerns about debt distress, collateralization, and refinancing dependence are real and cannot be dismissed as mere Western propaganda. Moreover, China's own strategic interests—including access to minerals, markets, and maritime routes—are not absent from the partnership, even when framed as mutual benefit.

The Chinese perspective is therefore best understood as a partial but important lens. It reveals the material and diplomatic value of a non-conditionality partnership and the legitimacy of African demands for infrastructure and financing. It occludes the internal governance, accountability, and distributional questions that African scholars have raised about both the state and external engagement. A balanced assessment must recognize that Chinese engagement has expanded African options while also creating new dependencies that require stronger African institutional capacity to manage.

2.7.3 Russian Perspective

The Russian perspective on post-colonial sovereignty and Pan-Africanism is framed through the language of sovereign choice, anti-hegemony, and multipolarity. From this vantage point, the international system is characterized by Western dominance, unilateral sanctions, and interventionist norms that undermine the sovereignty of states in the Global South. Russia presents itself as a partner that respects state sovereignty, opposes regime change, and supports a multipolar order in which African states can pursue independent foreign policies. This framing resonates with African grievances about Western double standards, especially where Western governments have supported or tolerated unconstitutional changes in allied states while condemning others. The Russian perspective thus treats the AU's sovereignty norms not as obstacles to progress but as legitimate defenses against external interference.

Historically, the Soviet Union supported African liberation movements and anti-colonial struggles, creating a reservoir of goodwill that contemporary Russian diplomacy invokes. Today, Russia's engagement is concentrated in security cooperation, arms sales, grain and energy diplomacy, and political support in multilateral forums. Russian officials frequently emphasize that African states have the right to choose their partners without Western pressure. This aligns with the African perspective's insistence on agency and with contemporary multi-alignment strategies. In crisis contexts, Russia has often opposed or diluted Western-backed resolutions, framing them as violations of sovereignty or as disguised regime-change efforts. For some African governments, this provides diplomatic cover and an alternative source of security assistance.

The Russian perspective also contributes a critique of Western institutionalism. It highlights the inconsistencies of conditionality, the selectivity of human rights advocacy, and the securitization of African crises. It reveals that Western support for democracy and governance is often subordinated to strategic interests, and that African states have legitimate reasons to diversify security partnerships. In this sense, the Russian lens exposes the geopolitical content of norms that are sometimes presented as neutral or universal.

What this perspective occludes is substantial. Its emphasis on sovereign choice can be used to legitimize authoritarian consolidation and to deflect attention from domestic accountability. Security partnerships, including the activities of Russian security contractors reported in several African contexts, have been associated with human rights concerns, resource extraction, and the entrenchment of regimes facing internal opposition. The Russian perspective tends to treat all external criticism of African governments as neo-colonial interference, which can obscure legitimate African civil society demands for accountability. It also offers limited economic depth compared to other partners: trade and investment volumes are smaller, and the relationship is often concentrated in commodities, arms, and security services. Furthermore, Russia's own great-power interests—including access to strategic minerals, naval facilities, and diplomatic support—are not absent from its Africa policy, even when framed as solidarity.

The Russian perspective is therefore a useful but incomplete lens. It reveals the legitimacy of African demands for sovereign choice and the hypocrisy of selective Western interventionism. It occludes the risks of security dependency, the accountability deficits of opaque security arrangements, and the possibility that anti-Western framing can be instrumentalized by African elites to resist democratic reform. A rigorous assessment must distinguish between the valid critique of Western double standards and the instrumental use of sovereignty rhetoric to shield repression.

2.7.4 Western Perspective

The Western perspective on post-colonial sovereignty and Pan-Africanism is rooted in institutionalism, liberal internationalism, and conditionality. From this vantage point, the AU's normative evolution—from non-interference to intervention rights and the rejection of unconstitutional changes—is a positive development that aligns African institutions with global norms of human rights, democracy, and the rule of law. Western governments and institutions have supported the AU's Peace and Security Architecture, capacity building, election observation, and peacekeeping missions, often providing substantial funding. The Western perspective treats sovereignty as responsibility: states that commit atrocities or seize power unconstitutionally forfeit the protection of non-interference. This is the logic behind support for Article 4(h) and Article 4(p), and behind sanctions, diplomatic pressure, and aid conditionality in response to coups.

This perspective contributes a strong emphasis on accountability and institutional quality. It reveals governance deficits, corruption, and the weaknesses of AU enforcement mechanisms. It also highlights the importance of civil society, independent media, and judicial institutions in making sovereignty meaningful

for citizens rather than only for states. Western trade and development policies—such as preferential market access, development assistance, and technical cooperation—are framed as supporting African integration and growth. The institutionalist strand of this perspective sees the AU as a partner in regional stability and treats African integration as compatible with global economic governance.

However, the Western perspective is not a single viewpoint. European and American approaches differ on trade, migration, security, and development. The European Union's Economic Partnership Agreements, for example, have been criticized for fragmenting African markets and undermining regional integration, while the United States has combined security assistance with democracy promotion in inconsistent ways. Western conditionality can also be applied selectively: governments that are strategically important may face less pressure than those that are not. This selectivity weakens the credibility of the normative claims and fuels African perceptions of hypocrisy.

What the Western perspective occludes is its own historical role in producing the conditions it now seeks to manage. Colonialism created the fragmented state system, arbitrary borders, and extractive economies that continue to shape African politics. Postcolonial Western policies—including support for authoritarian allies during the Cold War, structural adjustment programs, and trade rules that disadvantage African producers—contributed to state weakness and economic dependency. The Western perspective often treats these as past events rather than as ongoing structures, and it can frame African governance failures as primarily domestic without acknowledging external complicity. It also tends to underestimate the legitimacy of African demands for policy space, industrial policy, and sovereign control over resources. Conditionality, even when well-intentioned, can be experienced as an infringement on sovereignty and can provoke nationalist backlash.

The Western perspective is therefore both indispensable and limited. It contributes technical expertise, funding, and normative pressure for accountability. It occludes the historical and structural dimensions of African underdevelopment and can reproduce paternalistic assumptions about African capacity. A balanced assessment must recognize that Western institutional support has strengthened the AU in important ways while also acknowledging that conditionality and selectivity have often undermined the legitimacy of those same norms.

2.7.5 UN Perspective

The UN perspective on post-colonial sovereignty and Pan-Africanism is organized around Chapter VIII of the UN Charter, which recognizes regional arrangements as instruments for peace and security, and around the broader UN agenda of development, human rights, and multilateral cooperation. From this vantage point, the AU is a regional partner whose normative evolution—from non-interference to intervention and anti-coup norms—must be reconciled with the UN Charter's principles of sovereignty, non-use of force, and Security Council primacy. The UN perspective treats the OAU-AU transition as a case of regional normative innovation that requires coordination with global institutions to be effective and legitimate. It emphasizes partnership, burden-sharing, and the division of labor between the UN and regional organizations.

In practice, this perspective is expressed through AU-UN cooperation in peacekeeping and peacebuilding, joint missions, technical assistance, and development frameworks. The UN supports Agenda 2063 and AfCFTA as contributions to the Sustainable Development Goals, and it frames African integration as a means of reducing conflict, improving governance, and fostering inclusive growth. The UN perspective also values the AU's role in early warning, mediation, and regional legitimacy: AU missions and positions often provide political cover and local knowledge that the UN lacks. In this sense, the UN perspective reveals the practical necessity of regional ownership in African security and development.

The UN perspective contributes a multilateral and legal framing. It insists that regional intervention norms must operate within the UN Charter, and that the Security Council retains primary responsibility for international peace and security. This can be a source of tension: AU Article 4(h) asserts a right to intervene that may not align with UN authorization requirements, and AU suspensions of member states raise questions about due process and collective legitimacy. The UN perspective therefore seeks to harmonize regional and global norms, emphasizing consultation, joint planning, and respect for international law. It also highlights the resource dimension: AU missions often depend on UN funding, logistics, and authorization, creating an asymmetry in which African agency is constrained by global financial and political structures.

What this perspective occludes is the extent to which UN primacy can reproduce global hierarchies. The Security Council's composition and veto power mean that African security concerns are filtered through the interests of permanent members. Funding asymmetries mean that the AU's ambitions often exceed its capacity, and partnership can become dependency. The UN perspective also tends to frame African integration in developmental terms, which can understate its political and sovereignty dimensions. Agenda 2063 and AfCFTA are not merely technical projects; they are claims about African self-determination and the reordering of global economic relations. By emphasizing cooperation and development, the UN perspective can depoliticize these claims and treat African agency as implementation rather than authorship.

Moreover, the UN perspective can obscure the geopolitical competition embedded in multi-alignment. When the UN supports AU initiatives, it does so within a framework that assumes multilateral consensus, but contemporary African foreign policy is increasingly shaped by competition among China, Russia, Western states, and regional powers. The UN's emphasis on partnership may not fully capture the strategic choices African states are making among competing external actors. Finally, the UN perspective can understate the gendered and social dimensions of sovereignty and integration, even though UN frameworks on women, peace, and security exist; the translation of these frameworks into African institutional practice remains uneven.

The UN perspective is therefore essential but incomplete. It provides legitimacy, resources, and a global legal framework for AU action. It occludes the power asymmetries of the UN system itself and can reduce African political projects to developmental partnerships. A rigorous assessment must recognize that AU-UN cooperation strengthens both institutions while also revealing the limits of global multilateralism in accommodating African sovereignty claims.

2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Reconstructs sovereignty as hard-won and normative innovation as endogenous; centers African agency in creating AU intervention and democracy norms	Can understate external normative pressure and donor influence on institutional design; risks romanticizing continental unity	Sovereignty as achievement; solidarity as obligation; unity as unfinished project	AU Constitutive Act Art. 4(h), 4(p); Sirte Declaration (1999); Mbeki's African Renaissance	Western: overstates autonomy; ignores conditionality and funding dependence
Chinese	Non-interference plus partnership framing; treats AU as sovereign equal and vehicle for multipolarity	Understates internal African debates about intervention; conflates state sovereignty with regime security	Sovereign equality; non-interference; development through partnership	FOCAC; China-AU strategic partnership; support for AU Agenda 2063	African: non-interference can shield authoritarian regimes; partnership may create debt dependence
Russian	Sovereign choice plus multipolarity narrative; frames AU as counterweight to Western unilateralism	Treats African states as instruments of great-power competition; understates African normative innovation	Multipolarity; anti-hegemonism; respect for sovereign choice	Russia-AU dialogue; BRICS expansion; UN voting alignment	Western: multipolarity rhetoric masks transactional interests; undermines human rights norms
Western	Institutionalist assessments; conditionality debates; funding and technical support for AU bodies	Reduces African projects to developmental partnerships; can treat sovereignty as obstacle to governance	Liberal internationalism; democratic governance; human rights; institutional capacity	Donor funding of AU Commission; APRM; PSC support programs	African: conditionality undermines sovereignty; institutionalism ignores power asymmetries

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
UN	AU-UN partnership; Chapter VIII cooperation; legitimacy and global legal framework	Understates power asymmetries of UN system; can reduce African political projects to developmental partnerships	Collective security; subsidiarity; multilateral legitimacy	AU-UN Joint Task Force; UN Security Council resolutions on AU missions; Agenda 2063-SDG alignment	African: UN system itself embodies inequality; partnership can be paternalistic

2.8 WORKED EXAMPLE (I do)

Case: The transformation of the OAU (1963) into the AU (2000-2002) — the politics of normative innovation

Levels of Analysis

The transformation of the Organization of African Unity into the African Union can be analyzed at four levels. At the individual level, the process was driven by specific leaders whose visions and rivalries shaped the outcome: Kwame Nkrumah's earlier continental-government advocacy provided the ideological backdrop; Julius Nyerere's defense of sovereignty and the nation-state set the sovereigntist baseline; Thabo Mbeki's "African Renaissance" supplied the reformist intellectual framework; Muammar Gaddafi's push for a "United States of Africa" forced the federalist question onto the agenda; Olusegun Obasanjo of Nigeria and Abdelaziz Bouteflika of Algeria brokered the compromise. Legal drafters and AU Commission officials also mattered as institutional entrepreneurs. At the state level, the transformation reflected the interests of member states in preserving sovereignty while gaining collective capacity: no state wished to surrender the hard-won sovereignty of the post-colonial order, yet all faced the costs of continental instability. At the systemic level, the end of the Cold War removed superpower patronage that had sustained authoritarian regimes and proxy conflicts; the unipolar moment and the rise of liberal internationalism created both pressure and opportunity for normative change; globalization intensified economic interdependence and the costs of fragmentation. At the transnational level, Pan-African civil society, diaspora networks, regional economic communities (ECOWAS, SADC, EAC), and transnational norms such as the emerging responsibility to protect and democratic governance standards created a normative environment in which the OAU's non-interference principle became increasingly untenable.

Mechanism

The mechanism of normative innovation combined five elements. First, crisis as catalyst: the 1994 Rwandan genocide exposed the OAU's paralysis—its Secretary-General Salim Ahmed Salim acknowledged the organization's failure—and the subsequent wars in the Democratic Republic of Congo, Sierra Leone, and

Liberia demonstrated that sovereignty-as-non-interference could not prevent mass atrocities or state collapse. Second, leadership agency: Mbeki articulated the African Renaissance and NEPAD, framing integration as self-directed development rather than external imposition; Gaddafi convened the Sirte Declaration of September 9, 1999, calling for an African Union; Obasanjo and Bouteflika mediated between federalist and sovereigntist camps. Third, institutional entrepreneurship: the Lomé Summit of July 2000 adopted the Constitutive Act, drafted by legal experts who encoded compromise—stronger norms without supranational authority. Fourth, external normative pressure: post-Cold War liberal internationalism, donor conditionality, and the emerging R2P discourse created an environment favoring intervention and democracy norms, though African leaders insisted on African ownership. Fifth, the resulting hybrid: the Constitutive Act's Article 4(h) granted the Union the right to intervene in grave circumstances (war crimes, genocide, crimes against humanity), Article 4(p) condemned unconstitutional changes of government, and Article 30 excluded coup regimes from participation—yet enforcement remained dependent on Assembly consensus and member-state contributions, preserving sovereignty in practice.

Perspective Reconstruction

The African perspective, which is primary, reconstructs the transformation as endogenous normative innovation. On this view, the AU was not a donor project but an African response to African crises, driven by African leaders and legitimized by African ownership. Sovereignty is understood as hard-won through anti-colonial struggle, and the Constitutive Act's intervention clause represents not an abandonment of sovereignty but its redefinition: sovereignty now includes the responsibility to protect populations, a normative shift that Grovogui's analysis of sovereignty as constructed and contested helps illuminate. Mamdani's work on the bifurcated post-colonial state explains why the OAU's non-interference norm protected regimes rather than peoples, and why the AU's new norms aimed at reconstituting the state-citizen relationship. Nkrumah's continental-government vision, though not realized, provided the ideological horizon; Nyerere's insistence on the nation-state as the unit of liberation set the sovereigntist constraint that the AU had to accommodate. Murithi's analysis of the AU's normative framework treats the Constitutive Act as a deliberate, African-authored innovation. The African perspective's strength is its recovery of agency; its risk is understating the extent to which external normative pressure and donor funding shaped institutional design.

The Chinese perspective frames the transformation through non-interference plus partnership. Beijing supported the AU's formation as a sovereign equal and vehicle for multipolarity, consistent with its Five Principles of Peaceful Coexistence. China's engagement deepened through FOCAC and the China-AU strategic partnership, treating the AU as a partner in a post-Western order. This perspective contributes an emphasis on sovereign equality and development through partnership, but it occludes internal African debates about intervention and can conflate state sovereignty with regime security.

The Russian perspective reads the transformation as sovereign choice within a multipolar narrative. Moscow framed the AU as a counterweight to Western unilateralism and supported African self-determination in institutional design. Russia's later engagement with the AU emphasized anti-hegemonism and respect for sovereign choice. This perspective contributes a critique of Western dominance, but it treats African states as instruments of great-power competition and understates African normative innovation.

The Western perspective offers an institutionalist assessment. Donors funded AU bodies and technical capacity; conditionality debates shaped expectations about governance and human rights. Western analysts often viewed the AU as a democratization vehicle and were skeptical of enforcement capacity. This perspective contributes resources and institutional expertise, but it reduces African projects to developmental

partnerships and can treat sovereignty as an obstacle to governance.

The UN perspective situates the transformation within Chapter VIII cooperation. The UN supported AU formation as a regional arrangement under the UN Charter, and the AU-UN partnership framework provided legitimacy and resources. This perspective contributes a global legal framework and multilateral legitimacy, but it can understate the power asymmetries of the UN system and reduce African political projects to developmental partnerships.

Explicit Adjudication

The African perspective best explains the case. The normative innovations of the Constitutive Act—intervention in grave circumstances, condemnation of unconstitutional changes of government, democratic governance objectives—emerged from African crises and African leadership, not from external imposition. The Sirte Declaration, the Lomé process, and the Mbeki-Obasanjo-Bouteflika compromise were African initiatives. However, the African perspective alone misses the systemic opportunity structure: the end of the Cold War and the rise of liberal internationalism created the conditions under which sovereignty-as-non-interference became delegitimized, and donor funding shaped institutional capacity. The Western perspective correctly identifies resource dependence and conditionality but overstates their causal role in normative content. The Chinese and Russian perspectives are more relevant to post-2002 AU diplomacy than to the 2000-2002 transformation itself. The UN perspective captures the legal framework but not the political dynamics. The best explanation is therefore African agency operating within a transformed systemic context: African leaders seized a post-Cold War moment to redefine sovereignty, producing a hybrid institution that innovated norms while preserving state autonomy in enforcement.

2.9 PROBLEM PAIR (We do)

1. **Mechanism.** The AU's formal rule against unconstitutional changes of government is triggered by coups, yet Mali (2020), Guinea (2021), Burkina Faso (2022), Niger (2023), and Gabon (2023) produced different combinations of suspension, sanctions, regional military threats, and eventual re-engagement. Identify the intervening variables that best explain this variation, and distinguish the legal trigger from the political discretion exercised by the AU Peace and Security Council.

2. **Levels of analysis.** Analyze the five cases at the individual, state, systemic, and transnational levels. Which level carries the greatest explanatory weight for why Niger attracted sharper external pressure than Gabon, and why Mali's transition became more prolonged than Guinea's?

3. **Perspective reconstruction.** Reconstruct how African, Chinese, Russian, Western, and UN actors would each justify or criticize the AU's uneven practice. For each perspective, identify what it foregrounds and what it occludes.

4. **Historical analogue.** Compare the AU's post-2000 anti-coup practice with the OAU's 1963 non-interference norm. Does the variation across the five cases show normative evolution, institutional path dependence, or a hybrid of the two?

5. **Falsifiers.** Specify two pieces of evidence that would falsify the claim that AU inconsistency is primarily driven by sovereignty-preserving path dependence rather than by pragmatic security calculations.

6. **Adjudication.** Render a bounded verdict: is the AU's inconsistency better understood as adaptive

multilateralism under constraint, or as selective sovereignty protection by powerful member states?

MODEL ANSWER

The AU's formal architecture clearly condemns unconstitutional changes of government. The Lomé Declaration of 2000, the AU Constitutive Act's Article 4(p) commitment to democratic principles, and the African Charter on Democracy, Elections and Governance together create a normative expectation that coups will be suspended, sanctioned, and reversed. Yet the five cases show that the legal trigger is only the beginning of the causal chain. Mali in 2020 was suspended and subjected to regional pressure, but its transition was later accepted with extended timelines; Guinea in 2021 was suspended while its junta negotiated a longer transition; Burkina Faso in 2022 was suspended amid a deteriorating security environment; Niger in 2023 was suspended and became the focus of ECOWAS sanctions and a threatened regional military intervention; Gabon in 2023 was also suspended, but with less coercive regional pressure and a quicker movement toward a transitional roadmap. The variation is best explained by the interaction of regional hegemon preferences, counter-terrorism imperatives, and institutional path dependence. At the transnational level, ECOWAS under Nigerian leadership treated Niger as a more direct threat to regional order, while Central African dynamics around Gabon produced a less militarized response. At the state level, juntas in Mali and Burkina Faso could invoke security crises to justify prolonged transitions, whereas Gabon's coup occurred in a different political context with less regional spillover. At the systemic level, the AU lacks supranational enforcement capacity and depends on member-state consent, which means the PSC can announce norms but cannot independently impose them. At the individual level, coup leaders' willingness to negotiate, their international recognition strategies, and their domestic coalitions shape how quickly the AU moves from suspension to re-engagement.

The African perspective treats this pattern as evidence of normative innovation constrained by hard-won sovereignty. From this vantage point, the AU has moved decisively beyond the OAU's 1963 non-interference doctrine, but it cannot override member states without risking institutional fracture; inconsistency is therefore a political price of continental ownership, not proof of hypocrisy. The Chinese perspective emphasizes non-interference, stability, and partnership, supporting AU-led processes while resisting external coercion; it would read the Niger case as dangerous escalation and would prefer negotiated transitions over sanctions. The Russian perspective frames the issue through sovereign choice and multipolarity, often portraying regional pressure as Western-aligned overreach, especially where ECOWAS sanctions are involved. The Western perspective stresses institutionalism, conditionality, and democratic accountability, and would likely criticize the AU for accepting extended transitions that dilute the anti-coup norm. The UN perspective emphasizes Chapter VIII cooperation and regional ownership, supporting AU leadership while worrying that inconsistent enforcement undermines civilian protection and democratic legitimacy.

Historically, the OAU Charter of 1963 entrenched non-interference as a shield against neo-colonial intervention, reflecting the African experience of externally imposed regime change. The AU Constitutive Act of 2000 and subsequent instruments introduced Article 4(h) and 4(p) innovations, allowing intervention in grave circumstances and affirming democratic governance. The five cases therefore show a hybrid: genuine normative evolution in the formal rules, but institutional path dependence in enforcement. The AU can suspend, but it cannot easily coerce; it can condemn, but it must negotiate with juntas and regional powers. This is not a simple abandonment of the anti-coup norm, because suspensions remain frequent and rhetorically central. Nor is it a fully effective enforcement regime, because transitions are often prolonged and sanctions unevenly applied.

The claim that inconsistency is driven primarily by sovereignty-preserving path dependence would be falsified if the AU consistently imposed identical sanctions and transition deadlines across all five cases regard-

less of security context, regional hegemon preferences, or junta cooperation. It would also be weakened if evidence showed that AU decisions tracked a transparent, rules-based algorithm rather than PSC discretion and bilateral bargaining. Conversely, the claim that inconsistency is purely pragmatic would be falsified if the AU refused to suspend any coup regime, or if it suspended all five without variation in sanctions or re-engagement. The observed middle pattern supports a bounded verdict: the AU's inconsistency is best understood as adaptive multilateralism under constraint, in which formal democratic norms are filtered through regional power politics, security imperatives, and the institutional legacy of sovereignty. It is neither a coherent strategy of multipolar non-interference nor a fully institutionalized enforcement regime; rather, it is a transitional form of continental governance in which normative ambition and political limitation remain in tension.

2.10 INDEPENDENT MEMO (You do)

Case description. In 2023, Niger experienced a military takeover that removed an elected president, prompting the AU Peace and Security Council to condemn the unconstitutional change, suspend Niger from AU activities, and endorse ECOWAS sanctions and a threatened regional military intervention. In the same year, Gabon's military takeover also produced AU suspension, but with less coercive regional pressure and a quicker acceptance of a transitional roadmap. Compare these cases with Mali (2020), Guinea (2021), and Burkina Faso (2022), where suspensions were followed by prolonged transitions, partial sanctions relief, and eventual AU re-engagement. Your memo should explain why the AU's formal anti-coup norm produces uneven enforcement, reconstruct the five perspectives, identify the closest historical analogue, and state what evidence would falsify your explanation.

Mechanism: Explain the causal chain from the legal trigger (unconstitutional change) through AU PSC discretion, regional hegemon preferences, security imperatives, and recognition politics to the observed variation in suspension, sanctions, and re-engagement.

Perspective reconstruction: Steel-man African, Chinese, Russian, Western, and UN readings of the same pattern, identifying what each foregrounds and what it occludes.

Historical analogue: Compare the case to an earlier episode of OAU/AU normative change or non-interference, specifying what is similar, what differs, and why the analogy holds or fails.

Falsifiers: List observable evidence that would weaken or refute your mechanism, including at least one quantitative indicator and one counterfactual condition.

Self-check: Did you separate description of what happened, explanation of why it happened, prediction of what follows, and prescription of what should happen?

2.11 HINGE QUESTION

Question: Which explanation best accounts for the AU's inconsistent responses to unconstitutional changes of government in Mali, Guinea, Burkina Faso, Niger, and Gabon between 2020 and 2023?

A. The AU has abandoned its anti-coup norm and now accepts military rule whenever it is regionally popular.
B. Variation is driven mainly by the legal clarity of each coup: only clearly unconstitutional seizures trigger suspension.
C. The AU's formal norm is filtered through regional hegemon interests, security imperatives, and institu-

tional path dependence, producing selective enforcement.
D. Inconsistency reflects a deliberate AU strategy to replace democracy promotion with multipolar non-interference.

Correct answer: C.

Distractor diagnoses:
- **A** conflates uneven enforcement with norm abandonment; it ignores repeated suspensions, sanctions, and the continued centrality of the anti-coup norm in AU rhetoric.
- **B** treats the legal trigger as sufficient; all five cases involved unconstitutional changes, yet responses varied, so legal clarity alone cannot explain the pattern.
- **D** attributes a coherent strategic shift to the AU that is not evidenced; it conflates member-state multi-alignment with institutional doctrine and overlooks the AU's continued formal commitment to democratic governance norms.

SECTION 2A — DATA LAB

Table 1: AU Suspension Decisions for Unconstitutional Changes of Government (selected, 2010–2023)

Country	Year of UCG	AU Response	Reinstatement / Status
Mali	2012	Suspended	Reinstated 2013 after elections
Mali	2020	Suspended	Partially lifted 2022; elections delayed
Mali	2021	Suspended	Remains suspended; transition extended
Guinea	2021	Suspended	Remains suspended; transition timeline contested
Burkina Faso	2022	Suspended	Remains suspended; transition extended
Niger	2023	Suspended	Remains suspended; ECOWAS sanctions lifted Feb 2024
Gabon	2023	Suspended	Remains suspended; transition announced

Note: Table is illustrative; exact dates and statuses drawn from AU PSC communiqués and secondary reporting. Suspensions are the AU's primary enforcement tool under Art. 30 of the Constitutive Act.

Table 2: Intra-African Trade as Share of Total Trade (indicative, ~2022)

Grouping	Intra-regional trade share (%)
Africa (continental)	~15–17

Grouping	Intra-regional trade share (%)
European Union	~60
USMCA (North America)	~40
ASEAN	~25
ECOWAS	~10–12
SADC	~20–25

Source: UNCTAD/AfCFTA Secretariat estimates; figures are approximate and vary by year and methodology.

Table 3: AfCFTA and Agenda 2063 Implementation Timeline

Milestone	Date	Status
AfCFTA Agreement signed (Kigali)	March 2018	44 countries signed
Entered into force	May 2019	22 ratifications achieved
Trading under AfCFTA begins (Guided Trade Initiative)	January 2021	Operational
Phase II protocols (IP, investment, competition)	2022–2024	Negotiations ongoing
Agenda 2063 First Ten-Year Implementation Plan	2014–2023	Completed
Agenda 2063 Second Ten-Year Plan	2024–2033	Launched
Target: intra-African trade doubled	2035	Projected

Analysis Questions

1. **Trend.** The AU suspension data show a sharp increase in UCG cases after 2020 (Mali, Guinea, Burkina Faso, Niger, Gabon) compared to the 2010–2019 period. What does this trend suggest about the relationship between the AU's normative framework (Art. 4(h), 4(p)) and the actual incidence of coups? Does the framework deter, or does it merely document?

2. **Level of analysis.** The AU's weak enforcement is often explained at the systemic level (lack of great-power backing) or the state level (member-state sovereignty). Which level of analysis best explains why suspensions are imposed but rarely followed by restoration of constitutional order? Defend your choice with evidence from the table.

3. **Perspective reconstruction (all five).** Reconstruct how each perspective would read Table 1: (a) African: suspension as normative innovation but sovereignty-constrained; (b) Chinese: non-interference plus partnership stability; (c) Russian: sovereign choice and multipolarity; (d) Western: institutionalist assessment plus conditionality; (e) UN: Chapter VIII cooperation and AU-UN partnership.

4. **Interpretation.** The gap between suspension rhetoric and reinstatement practice (e.g., Mali's transition extended repeatedly) implies that the AU's sovereignty norm (Art. 4(b)) functions as a veto on deeper intervention. Is this a failure of institutional design or a deliberate feature of post-colonial sovereignty?

5. **Limitation.** What are the key limitations of using AU suspension decisions as a proxy for AU enforcement capacity? Consider selection bias (only UCG cases), omitted variables (economic sanctions, diplomatic pressure), and the difference between suspension and restoration.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1: OAU-to-AU Normative Transition Timeline (1963–2002)

- **What to draw:** A horizontal timeline arrow from 1963 to 2002, with vertical markers at key dates. At 1963, draw a small shield labeled "OAU Charter: sovereignty, non-interference (Art. III)." At the 1990s, draw a dashed line labeled "Post-Cold War normative opening." At 2000, draw a larger shield labeled "AU Constitutive Act: Art. 4(h) intervention, 4(p) unconstitutional change." At 2002, draw a star labeled "AU launched, Durban."
- **How to label it:** Title at top: "From Sovereignty to Responsibility? OAU→AU Normative Shift." Label the arrow "Time." Add a legend: solid line = binding norm; dashed line = emerging norm.
- **Perspective overlay:** Annotate in the margin: "African: hard-won sovereignty; Western: institutionalist progress; UN: Chapter VIII partner." Use color: green for African, blue for Western, purple for UN.

Visual 2: Map of Africa — AU Suspension Cases (2010–2023)

- **What to draw:** Outline map of Africa. Shade countries with UCG suspensions in red (Mali, Guinea, Burkina Faso, Niger, Gabon, Sudan, etc.). Use a darker red for cases with repeated suspensions (Mali). Add a small icon (gavel) in the capital of each. Draw a legend box: red = suspended; dark red = repeatedly suspended; white = not suspended.
- **How to label it:** Title: "AU Suspensions for Unconstitutional Change of Government, 2010–2023." Label each country. Add a note: "Suspension = primary enforcement tool; reinstatement varies."
- **Perspective overlay:** Annotate: "African: sovereignty-constrained enforcement; Chinese: stability concern; Russian: sovereign choice; Western: conditionality gap; UN: peacekeeping nexus." Use small colored dots in a legend.

Visual 3: AfCFTA Trade Integration Diagram

- **What to draw:** A circle representing Africa. Inside, draw thick arrows between regional blocs (ECOWAS, SADC, EAC, COMESA) labeled "intra-African trade ~15-17%." Outside the circle, draw thinner arrows to Europe, China, US labeled "extra-African trade ~83-85%." Add a dashed arrow labeled "AfCFTA target: double intra-African trade by 2035."
- **How to label it:** Title: "Intra- vs. Extra-African Trade Flows." Label percentages. Add a small box: "Agenda 2063: continental integration."
- **Perspective overlay:** Annotate: "African: economic sovereignty; Chinese: partnership market; Russian: multipolar trade; Western: liberalization; UN: SDG alignment." Use color-coded margin notes.

SECTION 4 — CORNELL NOTES

Cue	Notes (with source log)
OAU Charter 1963 — core norms	Sovereignty, non-interference, territorial integrity (Art. III). Source: OAU Charter (1963).
AU Constitutive Act 2000 — innovations	Art. 4(h) right to intervene in grave circumstances; Art. 4(p) condemnation of unconstitutional change of government. Source: AU Constitutive Act (2000).
Nkrumah's pan-Africanism	Continental unity, political federation, "Africa must unite." Source: Nkrumah (1963).
Nyerere's ujamaa and regionalism	African socialism, regional cooperation, gradualism. Source: Nyerere (1967).
Du Bois and pan-African congresses	Intellectual origins, diaspora, anti-racism. Source: general pan-African scholarship.
Non-Aligned Movement	Afro-Asian solidarity, Bandung 1955, sovereignty, anti-colonialism. Source: general IR scholarship.
Institutional path dependence	OAU norms persist in AU; weak enforcement; sovereignty as hard-won. Source: Murithi (2014).
AU PSC and suspension mechanism	Art. 30 suspension; PSC communiqués; inconsistent reinstatement. Source: AU Constitutive Act (2000); AU PSC records.
AfCFTA	Continental free trade area; intra-African trade target; implementation timeline. Source: AU Agenda 2063; AfCFTA Secretariat.
Agenda 2063	Long-term vision; First/Second Ten-Year Plans; flagship projects. Source: AU Agenda 2063.
Multi-alignment	African states engaging multiple powers; non-exclusive partnerships. Source: contemporary IR scholarship.
Five perspectives	African (primary), Chinese, Russian, Western, UN — each with distinct normative stance. Source: lesson framework.

Summary (3-5 sentences): Post-colonial sovereignty in Africa is hard-won and institutionally entrenched, shaping the OAU-to-AU transition as normative innovation within sovereignty constraints. Pan-Africanism evolved from intellectual project to institutional architecture, yet the AU retains weak enforcement due to path dependence. Contemporary initiatives like AfCFTA and Agenda 2063 reflect multi-alignment and economic sovereignty ambitions, while suspension decisions reveal the tension between normative ambition and state sovereignty.

SECTION 5 — FEYNMAN COMPRESSION

1. **Explain without jargon.** The African Union replaced the old Organization of African Unity to add new rules—like the right to intervene in grave crises and to suspend governments that take power unconstitutionally—but it kept the old rule that member states are sovereign and cannot be forced. So the AU can name and shame, but rarely can it make a country change course. Pan-Africanism is the idea that Africa should work together as one, from early thinkers like Du Bois and Nkrumah to today's free-trade area. The Non-Aligned Movement was about African and Asian countries refusing to pick sides in the Cold War. The AU is weak at enforcing its rules because the old sovereignty habits are deeply built in. Today, Africa tries to trade more with itself and engage many partners at once.

2. **Mark gaps.** I am unsure about the exact number of AU suspensions since 2000; I need to verify the reinstatement timelines for Mali 2020/2021 and Niger 2023. I also need to check whether Art. 4(h) has ever been invoked in practice. I should verify the precise intra-African trade percentage and the AfCFTA ratification count.

3. **Reread verification.** After rereading: Art. 4(h) of the AU Constitutive Act provides for intervention in grave circumstances (war crimes, genocide, crimes against humanity); Art. 4(p) condemns unconstitutional changes of government. The AU has suspended members under Art. 30 but has not invoked Art. 4(h) for military intervention. Nkrumah (1963) called for continental unity; Nyerere (1967) emphasized gradual regionalism. Murithi (2014) documents the OAU-to-AU normative shift and its limits. Agenda 2063 sets out long-term continental goals including AfCFTA.

4. **Analogy with explicit limits.** The AU is like a homeowners' association that can fine a member for breaking rules but cannot evict them or enter their house—because every member helped write the rules to protect their own property. This captures the sovereignty constraint but misses the pan-African solidarity aspiration and the external (UN, donor) pressures that also shape behavior.

5. **Rewrite.** The AU embodies a post-colonial compromise: it innovated norms (intervention, anti-coup) that the OAU lacked, yet it remains bound by the sovereignty principle that African states fought to win. Enforcement is therefore symbolic and diplomatic rather than coercive. Pan-Africanism persists as both ideology and institutional project, now expressed through AfCFTA and Agenda 2063, while multi-alignment lets African states engage China, Russia, the West, and the UN without exclusive commitment. The African perspective sees this as sovereignty-preserving agency; other perspectives read it as institutional weakness or strategic hedging.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L28	Definition	What is Article 4(h) of the AU Constitutive Act?	Article 4(h) grants the AU the right to intervene in a member state pursuant to a decision of the Assembly in respect of grave circumstances: war crimes, genocide, and crimes against humanity. It is the most significant normative innovation over the OAU Charter, which contained no such provision.	African perspective: read as a hard-won sovereign concession, not an external imposition; the AU asserts the right to intervene, not a duty imposed by outsiders.
L28	Definition	What is Article 4(p) of the AU Constitutive Act?	Article 4(p) commits member states to condemn and reject unconstitutional changes of government. It is the legal basis for AU suspension of states following coups, as applied to Mali (2020), Guinea (2021), Burkina Faso (2022), Niger (2023), and Gabon (2023).	African perspective: the clause reflects an internal African normative consensus; Western readings often treat it as a conditionality tool, occluding its endogenous origins.

Tag	Card Type	Front	Back	Perspective Note
L28	Mechanism	How did the OAU Charter (1963) constrain collective action?	The OAU Charter enshrined non-interference in internal affairs (Article III(2)) and required consensus for decisions, giving each state an effective veto. This institutional design made the OAU a forum for sovereign equality but paralyzed it during crises such as Rwanda (1994).	African perspective: the constraint was deliberate, protecting newly independent states from external intervention; it was not merely dysfunction.
L28	Mechanism	What institutional mechanism explains the AU's weak enforcement of its own norms?	Path dependence: the AU inherited the OAU's member-state-centric structure, consensus decision rules, and dependence on member contributions. The Peace and Security Council (PSC) can authorize intervention but lacks independent funding and troops, relying on Regional Economic Communities and ad hoc coalitions.	African perspective: weak enforcement is a rational adaptation to sovereignty concerns and fiscal constraints, not a failure of will.

Tag	Card Type	Front	Back	Perspective Note
L28	Application	How does the AU respond to an unconstitutional change of government under Article 4(p)?	The AU typically suspends the member state from participation in AU organs, demands a transition timeline, and may impose sanctions. In practice, responses vary: Mali (2020) was suspended and later readmitted after elections; Niger (2023) faced suspension plus ECOWAS sanctions, producing a protracted standoff.	African perspective: suspension is a diplomatic instrument, not a military one; its effectiveness depends on regional alignment, not AU capacity alone.
L28	Comparison	How did Nkrumah's and Nyerere's visions of Pan-Africanism differ?	Nkrumah advocated a continental union government with supranational authority, arguing that political unity was a prerequisite for economic development. Nyerere favored a looser federation of sovereign states cooperating through regional communities, prioritizing national self-determination and gradual integration.	African perspective: both positions are internal African debates; neither is a Western import, and the AU's design reflects a Nyererean compromise.

Tag	Card Type	Front	Back	Perspective Note
L28	Source	What is the core argument of Nkrumah's "Africa Must Unite" (1963)?	Nkrumah argued that political fragmentation inherited from colonialism made African states vulnerable to neo-colonialism and that only a continental union government could secure genuine sovereignty and economic development.	African perspective: Nkrumah's argument is a theory of sovereignty-through-unity, not a rejection of sovereignty; it redefines sovereignty as collective.
L28	Source	What does Murithi (2014) identify as the AU's central tension?	Murithi identifies a tension between the AU's ambitious normative framework (intervention, human rights, democratic governance) and its institutional capacity, which remains dependent on member states and external donors.	African perspective: Murithi frames this as a sovereignty-capacity gap, not a legitimacy deficit; the norms are African-owned even where enforcement is weak.

Tag	Card Type	Front	Back	Perspective Note
L28	Debate	What is the debate over AfCFTA's implementation?	AfCFTA aims to create a single continental market, but implementation is slowed by tariff phase-in delays, non-tariff barriers, infrastructure gaps, and the persistence of colonial-era trade patterns oriented toward external markets.	African perspective: AfCFTA is read as economic Pan-Africanism; its success is measured by intra-African trade growth, not by external benchmarks.
L28	Reconstruction	How does the Chinese perspective frame AU partnership?	China frames its relationship with the AU through the Forum on China-Africa Cooperation (FOCAC) and the Belt and Road Initiative, emphasizing non-interference, mutual benefit, and infrastructure investment, while avoiding conditionality on governance.	Chinese perspective: sovereignty-respecting partnership; occludes questions of debt sustainability and labor standards.

Tag	Card Type	Front	Back	Perspective Note
L28	Reconstruction	How does the Russian perspective frame AU partnership?	Russia frames its engagement through sovereign equality and multipolarity, offering security cooperation (Wagner/Africa Corps in the Sahel) and diplomatic support at the UN, while criticizing Western conditionality.	Russian perspective: anti-hegemonic solidarity; occludes the destabilizing effects of private military company deployments.
L28	Reconstruction	How does the Western perspective assess the AU?	Western governments and institutions assess the AU through institutionalist and conditionality lenses, praising normative innovation (Art 4(h), 4(p)) while criticizing weak enforcement, funding dependence, and inconsistent application of suspension norms.	Western perspective: reform-oriented engagement; occludes the endogenous origins of AU norms and the sovereignty concerns behind weak enforcement.

Tag	Card Type	Front	Back	Perspective Note
L28	Reconstruction	How does the UN perspective frame AU partnership?	The UN frames the AU as a Chapter VIII regional arrangement, cooperating on peacekeeping (AMISOM/ATMIS in Somalia), mediation, and the "Silencing the Guns" initiative, while navigating questions of AU autonomy and UN Security Council authority.	UN perspective: partnership and subsidiarity; occludes power asymmetries in funding and decision-making.
L28	Adjudication	When does the AU suspend a member state versus tolerate an unconstitutional change?	Suspension follows when a coup is clear-cut and regional consensus exists (Mali 2020, Gabon 2023). Tolerance or delay occurs when the coup leader retains regional support, when strategic interests are at stake (Chad 2021, where Idriss Déby's son took power without suspension), or when enforcement capacity is lacking (Sudan 2021).	African perspective: inconsistency reflects political realism and sovereignty bargains, not normative hypocrisy; adjudication requires weighing regional consensus against normative purity.

Tag	Card Type	Front	Back	Perspective Note
L28	Visual	What does the "sovereignty ladder" visual capture?	The ladder depicts the OAU's absolute sovereignty norm (bottom rung) giving way to the AU's qualified sovereignty (Art 4(h) intervention, Art 4(p) anti-coup norm) at the top, with institutional capacity as the missing rung that prevents full ascent.	African perspective: the ladder is not a climb toward Western standards but an internal evolution; the missing rung is capacity, not will.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence Audit

Competency	Confidence (0-100)	Evidence of Mastery	Gap to Close
Define Article 4(h) and 4(p) and distinguish them	0-100	Can state both provisions and their legal effects without notes	If below 80: re-read AU Constitutive Act (2000), Articles 4(h) and 4(p)
Explain OAU-to-AU institutional transition	0-100	Can narrate the 1999 Sirte Declaration to 2002 Durban launch with dates	If below 80: review Murithi (2014) and OAU Charter (1963)
Reconstruct Nkrumah vs. Nyerere debate	0-100	Can state each position and identify which the AU reflects	If below 80: re-read Nkrumah (1963) and Nyerere (1967)
Analyze AU suspension decisions (Mali, Guinea, Burkina Faso, Niger, Gabon)	0-100	Can explain variation in AU response across the five cases	If below 80: review AU PSC communiqués and ECOWAS statements
Apply five-perspective reconstruction to AU governance	0-100	Can produce all five perspectives on a given AU crisis in 3-5 sentences each	If below 80: re-read Section 2.7 of this lesson

Competency	Confidence (0-100)	Evidence of Mastery	Gap to Close
Explain institutional path dependence in AU enforcement	0-100	Can identify three structural constraints and their origins	If below 80: review Section 2.4 and Murithi (2014)
Assess AfCFTA and Agenda 2063 as contemporary Pan-Africanism	0-100	Can state three implementation barriers and one success metric	If below 80: review AU Agenda 2063 and AfCFTA protocol texts

7.2 Three-Question Debrief

1. **Which perspective did you find hardest to steel-man, and why?** Identify whether the difficulty was empirical (lack of evidence), normative (disagreement with premises), or rhetorical (unfamiliar vocabulary). Name the specific perspective and the specific claim that resisted reconstruction.
2. **Where did you conflate description with explanation?** Point to one moment in your analysis where you described what happened (e.g., "the AU suspended Mali") without specifying the causal mechanism (e.g., "because regional consensus existed and the coup was unambiguous"). Rewrite that sentence with the mechanism explicit.
3. **What would falsify your current view of AU effectiveness?** State one observable development that, if it occurred, would force you to revise your assessment of whether the AU's normative framework is substantively meaningful or merely rhetorical.

7.3 Error-Log Table

Common Misconception	Correction	Evidence
The AU is simply a renamed OAU with no meaningful change	The AU Constitutive Act (2000) introduced Article 4(h) (right to intervene) and Article 4(p) (rejection of unconstitutional changes), neither of which existed in the OAU Charter (1963)	AU Constitutive Act (2000), Articles 4(h), 4(p); OAU Charter (1963), Article III
Nkrumah and Nyerere agreed on Pan-Africanism	They disagreed fundamentally: Nkrumah wanted a continental union government; Nyerere wanted a federation of sovereign states with gradual integration	Nkrumah (1963), "Africa Must Unite"; Nyerere (1967), "The Arusha Declaration"

Common Misconception	Correction	Evidence
The AU's weak enforcement proves African states do not want strong institutions	Weak enforcement reflects path dependence, fiscal constraints, and sovereignty bargains, not lack of commitment; the norms themselves are endogenously generated	Murithi (2014); AU Constitutive Act (2000)
AU suspension of coup states is automatic and uniform	Responses vary significantly: Chad (2021) was not suspended; Sudan's suspension was delayed; Niger's triggered a regional military standoff	AU PSC communiqués 2020-2023; ECOWAS statements on Niger (2023)
AfCFTA has already created a single African market	AfCFTA is a framework agreement with phased tariff reductions; intra-African trade remains below 20% of total African trade, and non-tariff barriers persist	AU Agenda 2063; AfCFTA Secretariat implementation reports
The Non-Aligned Movement was a Soviet proxy	NAM was founded at Bandung (1955) by Asian and African states seeking independence from both blocs; its African members pursued sovereign foreign policy, not Soviet alignment	Bandung Conference (1955); Nkrumah and Nyerere speeches on non-alignment
Western conditionality is the main driver of AU democratic norms	AU democratic norms (Art 4(p)) emerged from African debates post-1990s; external pressure reinforced but did not originate them	Murithi (2014); AU Constitutive Act (2000)

SECTION 8 — CHEATSHEET

Core Concepts	Key Mechanisms	Theories and Authors	Cases and Evidence	Debates	Falsifiers	Cross-links
Post-colonial sovereignty; qualified sovereignty; Pan-Africanism; non-alignment; multi-alignment	Institutional path dependence (OAU→AU); consensus decision rules; PSC suspension mechanism; AfCFTA tariff phase-in	Nkrumah (1963) union government; Nyerere (1967) federation; Murithi (2014) sovereignty-capacity gap; Grovogui on sovereignty as practice	OAU Charter (1963); AU Constitutive Act (2000); Mali 2020, Guinea 2021, Burkina Faso 2022, Niger 2023, Gabon 2023; AfCFTA 2018	Nkrumah vs. Nyerere on unity; intervention vs. sovereignty; conditionality vs. ownership; multipolarity vs. non-alignment	If AU suspends all coup states uniformly including Chad-type cases; if intra-African trade exceeds 50% by 2035; if AU PSC gains independent funding and troops	L9 (sovereignty); L12 (decolonization); L27 (colonial state formation); L32 (African agency); L34 (Sahel); L49 (Global South)

SECTION 9 — REVIEW SCHEDULE

Interval	Timing	Action
R1	Day 1 (immediately after first read)	Re-read Section 2.7 (Five Perspectives in Depth) and write a one-paragraph reconstruction of the African perspective from memory; check against the text
R2	Day 3	Complete the Independent Memo (Section 2.10) on a fresh case (e.g., Sudan 2021 or Chad 2021) using all four required headings; self-check the description/explanation/prediction/prescription distinction
R3	Day 7	Re-attempt the Hinge Question (Section 2.11) without notes; then review the distractor diagnosis for each wrong option

Interval	Timing	Action
R4	Day 14	Reconstruct the Nkrumah vs. Nyerere debate aloud in under two minutes, including which vision the AU reflects and why; then review flashcards tagged "Debate" and "Source"
R5	Day 30	Write a one-page adjudication of whether the AU's normative framework is substantively meaningful, citing at least two of the five coup cases and one falsifier; compare with your Day 1 position

SECTION 10 — COMPLETION CHECKLIST

- ☐ I can define Article 4(h) and Article 4(p) of the AU Constitutive Act and distinguish their legal effects
- ☐ I can narrate the OAU-to-AU transition with key dates (Sirte 1999, Lomé 2000, Durban 2002)
- ☐ I can reconstruct Nkrumah's and Nyerere's positions on Pan-Africanism and identify which the AU reflects
- ☐ I can explain three mechanisms of institutional path dependence in AU enforcement
- ☐ I can analyze variation in AU suspension decisions across Mali, Guinea, Burkina Faso, Niger, and Gabon
- ☐ I can steel-man all five perspectives (African, Chinese, Russian, Western, UN) on AU governance
- ☐ I can identify what the African perspective reveals that the other four occlude
- ☐ I can distinguish description, explanation, prediction, and prescription in my own analysis
- ☐ I can state three barriers to AfCFTA implementation and one success metric
- ☐ I can explain the Non-Aligned Movement's origins and its African dimensions
- ☐ I can identify the strongest counterargument to the claim that AU norms are merely rhetorical
- ☐ I can apply the four levels of analysis (individual, state, systemic, transnational) to an AU crisis
- ☐ I can state one falsifier for my view of AU effectiveness
- ☐ I have completed the Independent Memo with all four required headings
- ☐ I have reviewed the flashcards and scored at least 80% on self-test
- ☐ I have completed the confidence audit and identified my largest gap
- ☐ I have scheduled R1 through R5 review intervals in my calendar

30. Political Economy of African Conflict

LESSON METADATA

Field	Value
Lesson number and title	Lesson 29: Political Economy of African Conflict
Module	Module 5: African Geopolitical Architecture
Prerequisites	L17 (world-systems), L23 (asymmetric warfare), L27 (colonial state formation)
Interleaved links	Forward to L33 (critical minerals), L34 (Sahel), L46 (hydrocarbons)
Reading load	7-9 hours
Content channels	Text, data tables, visual anchors, flashcards, memo practice
Bloom ceiling	Evaluate
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

The central puzzle of this lesson is one of the most consequential paradoxes in contemporary international relations: the African continent holds a disproportionate share of the world's strategic minerals, hydrocarbons, and arable land, yet many of the states sitting atop these endowments have experienced recurrent armed conflict, authoritarian consolidation, and developmental stagnation rather than broad-based prosperity. The

"resource curse" is the shorthand for this paradox, but the shorthand is dangerous if it is treated as an explanation. The lesson exists to move the student from the observation that resources and conflict correlate to a disciplined account of *how* they are linked, *for whom*, *under what conditions*, and *with what agency* on the part of African states, societies, and external actors. The puzzle is not merely empirical; it is theoretical and political. Does oil cause war, or does war capture oil? Are rebels motivated by greed or by grievance? Does extraction strengthen the state by filling its coffers, or fragment it by creating parallel economies of violence? Does the global market in minerals discipline African governance, or does it reward opacity and predation? These questions cannot be answered by a single theory, and the lesson is built to make the student hold multiple, partially incompatible explanations in tension and adjudicate among them on evidence.

The lesson sits at a specific point in the curriculum's architecture. It presupposes three earlier lessons. From L17 on world-systems theory, the student brings the understanding that the global economy is structured by a core-periphery division of labor in which surplus is extracted from commodity-producing regions and that terms of trade systematically disadvantage primary exporters. From L23 on asymmetric warfare, the student brings the understanding that materially weaker actors can sustain violence through terrain, popular support, external patronage, and the exploitation of state vulnerabilities. From L27 on colonial state formation, the student brings the understanding that African states inherited arbitrary borders, extractive institutions, and "divide and rule" legacies that shaped postcolonial political order. This lesson synthesizes those three streams: the political economy of conflict is precisely the site where global market structures, military asymmetries, and inherited state pathologies intersect. It also looks forward. L33 on critical minerals, L34 on the Sahel, and L46 on hydrocarbons will each return to the mechanisms developed here, applying them to specific commodity chains and regional theaters. Mastering this lesson therefore means acquiring a portable analytical toolkit rather than a catalogue of cases.

Five key ideas organize the core. The first is the resource curse itself, disaggregated into its mechanisms: rentierism, in which states live off external rents rather than domestic taxation and thereby weaken accountability; Dutch disease, in which resource booms appreciate the currency and hollow out tradable sectors; weakened institutions, in which windfall revenues reduce the incentive to build capable bureaucracies; and conflict financing, in which lootable commodities fund armed groups. The second is neo-extractivism: the contemporary "new scramble" for African minerals, distinguished from colonial extraction by the multiplicity of external actors, the role of infrastructure-for-resources deals, and the renegotiation of terms of trade. The third is rentier state dynamics: how oil, minerals, and even aid reshape state-society relations, producing particular forms of authoritarianism, clientelism, and social contract. The fourth is the privatization of violence: warlordism, private military companies, and the market for force, theorized by Reno and Collier, in which violence becomes an economic activity with its own supply chains and profit motives. The fifth is the "greed versus grievance" debate, associated with Collier and Hoeffler, and its limits: the attempt to quantify the relative weight of economic motive and political injustice in civil war onset, and the critiques that this binary flattens history, agency, and structure.

The African perspective is the primary lens of the lesson, not a regional illustration of Western theory. Reconstructed from within, drawing on African scholarship from Rodney's underdevelopment thesis through Nkrumah's neo-colonialism, Fanon's analysis of the comprador class, Mamdani's citizen/subject distinction, Bayart's politics of the belly, and contemporary voices such as Aning and Danso, the African vantage point treats resource conflict as a continuation of extractive global order by other means. It insists that the relevant unit of analysis is not the "failed state" but the *successful* extraction of value from African societies by coalitions of external capital and domestic elites. From this vantage, the "greed" of rebels is inseparable from the greed of the global system that prices their minerals cheaply and their lives cheaply; "grievance" is not

a sentiment but a structural position. This perspective reveals what the Western governance frame occludes: the historical depth of dispossession, the agency of African actors in negotiating and resisting extraction, and the possibility that resource sovereignty rather than transparency is the operative demand. It also complicates the Chinese and Russian narratives by refusing to treat any external power as a neutral partner.

The lesson also requires the student to become fluent in five perspectives as analytical instruments rather than as opinions. The African structural critique plus resource sovereignty; the Chinese "win-win" plus developmental partnership narrative; the Russian emphasis on Western responsibility plus sovereign choice; the Western "greed" framework plus governance conditionality; and the UN's Panel of Experts reports, sanctions regimes, and the Extractive Industries Transparency Initiative. Each perspective contributes something the others miss and occludes something the others see. The comparison is not a relativist exercise; it is a method for locating the blind spots of any single account and for recognizing that policy prescriptions flow from prior theoretical commitments.

By the end of the lesson, the student should be able to do several things that are genuinely difficult. First, reconstruct a causal mechanism in full: specify the independent variable, the intervening process, the scope conditions under which it operates, and the observable implications that would confirm or falsify it. Second, evaluate the Collier-Hoeffler greed-grievance findings against their strongest critiques, including the endogeneity of resource dependence and the coding of "greed." Third, apply the full toolkit to two cases: Sierra Leone's blood diamonds conflict of 1991-2002, including the Kimberley Process response, and Nigeria's Delta insurgency of 2004-2009, including oil, federalism, and the politics of grievance. Fourth, interpret data: World Bank resource rents as a share of GDP, estimates of conflict financing, EITI membership and compliance, and sanctions on conflict minerals. Fifth, produce an independent memo with four required components—mechanism, perspective reconstruction, historical analogue, and falsifiers—and distinguish description from explanation, prediction, and prescription. Sixth, recognize the methodological hazards: correlation versus causation, endogeneity of resource dependence, the political construction of categories like "conflict mineral," and the risk that transparency initiatives become legitimizing rituals rather than accountability mechanisms.

A final caution frames the entire lesson. The political economy of African conflict is a field in which evidence is scarce, contested, and politically consequential. Estimates of illicit financial flows, conflict financing, and resource rents vary by orders of magnitude depending on methodology. Sanctions regimes are evaluated by their architects and their targets with incompatible metrics. The "greed" of rebels and the "grievance" of communities are not directly observable; they are inferred from behavior that is itself shaped by the categories used to describe it. The lesson therefore insists on epistemic humility: every claim must carry its scope conditions, every theory its strongest counterargument, and every policy prescription its falsifiers. The student who masters this lesson will not emerge with a single answer to why Africa's resources have so often funded violence. They will emerge with the capacity to ask better questions, to recognize which questions are being asked by whom, and to judge when an answer is warranted by evidence rather than by the convenience of the asker.

SECTION 1 — Pre-Class Priming

1.1 Retrieval Warm-Up (from earlier lessons)

Answer each in two to three sentences, drawing on L17, L23, and L27.

1. In world-systems theory, how does the core-periphery structure shape the terms of trade and the direction of surplus extraction?
2. What is "unequal exchange," and how does it connect to commodity dependence in African economies?
3. Distinguish asymmetric warfare from conventional interstate war, and give one African example of the former.
4. How does a materially weaker actor offset its inferiority in asymmetric conflict (tactics, terrain, external support, or state vulnerabilities)?
5. What institutional legacies of colonial state formation—borders, extractive institutions, indirect rule—continue to shape postcolonial conflict?
6. How did colonial "divide and rule" strategies affect ethnic, regional, and religious cleavages that later became fault lines of violence?

1.2 Orientation Questions (this lesson)

1. What are the principal mechanisms through which natural resource abundance is hypothesized to increase the risk of armed conflict, and do they operate differently for oil than for minerals?
2. How does neo-extractivism differ from colonial extraction in terms of actors, contractual terms, infrastructure, and the role of African states?
3. Is the "greed versus grievance" framing a false binary? What evidence would be needed to adjudicate between economic motive and political injustice in a given conflict?
4. How do rentier dynamics alter the social contract between state and society, and what does this imply for accountability and conflict risk?

1.3 Vocabulary Pre-Teach (provisional definitions)

- **Resource curse**: The observed association between high natural-resource dependence and poor developmental or conflict outcomes; a correlation whose causal mechanisms are contested.
- **Rentier state / rentierism**: A state that derives a large share of revenue from external rents (oil, minerals, aid) rather than domestic taxation, weakening accountability to citizens.
- **Dutch disease**: The appreciation of a resource-exporting country's currency and the consequent contraction of its tradable (especially manufacturing) sectors.
- **Conflict financing**: The use of lootable or extractable commodities to fund armed groups, militias, or insurgencies.
- **Neo-extractivism**: Contemporary large-scale extraction, often by diverse external actors, characterized by infrastructure-for-resources deals and renegotiated but still unequal terms.
- **Resource rents**: The surplus revenue derived from natural resources above extraction costs, often measured as a share of GDP.
- **Warlordism**: The fragmentation of authority in which armed leaders control territory and resources and extract revenue from populations outside state institutions.
- **Private military company (PMC)**: A corporate entity providing armed security, logistics, or combat services for profit, operating in a market for force.
- **Greed versus grievance**: A debate over whether civil wars are driven primarily by economic opportunity (greed) or by political injustice and identity (grievance).
- **Kimberley Process**: A multilateral certification scheme intended to prevent the trade in conflict diamonds.

- **EITI (Extractive Industries Transparency Initiative)**: A global standard requiring disclosure of payments from extractive companies to governments.
- **Blood diamonds / conflict minerals**: Commodities whose extraction and trade are linked to armed conflict and human-rights abuses.

SECTION 2 — LESSON CORE

2.1 Learning objectives

After mastering this lesson, the student will be able to:

1. **Explain** the causal mechanisms through which natural resource abundance produces the "resource curse" — rentierism, Dutch disease, institutional decay, and conflict financing — and specify the scope conditions under which each mechanism operates, including the institutional threshold below which rents become destructive rather than developmental. (Bloom: Explain/Analyze)
2. **Analyze** the political economy of neo-extractivism in contemporary Africa, distinguishing the terms of the bargain offered by Chinese, Western, and Russian actors and evaluating the scope for African agency, renegotiation, and value-addition within these arrangements. (Bloom: Analyze/Evaluate)
3. **Compare** rentier state dynamics across commodity types — hydrocarbons, hard minerals, and external aid — and assess how each shapes taxation, state-society bargaining, and the accountability of rulers to ruled. (Bloom: Compare/Analyze)
4. **Evaluate** the privatization of violence — warlordism, private military companies, and the market for force — using Reno's framework of shadow states and Collier's economic model of civil war, and identify the conditions under which violence becomes a profitable enterprise rather than a political project. (Bloom: Evaluate)
5. **Adjudicate** the "greed versus grievance" debate on the basis of evidence from African cases, identifying where each framework succeeds, where it fails, and what a synthetic account that incorporates both opportunity and motivation requires. (Bloom: Evaluate/Create)

2.2 KEY IDEA 1 — The resource curse: mechanisms (rentierism, Dutch disease, weakened institutions, conflict financing)

Bolded Causal Claim: Abundant, easily appropriable natural resource rents tend to depress long-run economic growth, erode state institutions, and raise the probability of armed conflict in developing states, but only where pre-existing institutional quality is low and commodity prices are volatile; the curse is conditional, not automatic, and resource wealth has historically produced development where states possessed the capacity to manage it.

Mechanism: The resource curse is not a single causal process but a family of four interlocking mechanisms that convert geological endowment into political and economic pathology. The first is rentierism. Where the state derives a large share of its revenue from resource rents rather than from taxing its citizens, the fiscal contract between ruler and ruled is severed. Terry Karl's foundational work on petro-states argues that rentier states need not bargain with society for revenue, and therefore need not deliver representation, accountability, or public goods in exchange. The state becomes an allocator of rents rather than a producer

of welfare, and politics collapses into a contest over access to the rent stream. The second mechanism is Dutch disease. A resource boom drives up the real exchange rate, making non-resource tradables — agriculture, manufacturing, services — uncompetitive on world markets. The economy narrows around the extractive sector, employment in tradable sectors shrinks, and the state loses the diversified tax base that would otherwise sustain institutional development. The third mechanism is institutional weakening through rent-seeking. Where rents are large and institutions weak, rational actors invest in capturing the state rather than in productive enterprise. Corruption, patronage, and clientelism become the dominant modes of political competition, and the formal institutions of the state — courts, legislatures, regulatory agencies — are hollowed out or repurposed as instruments of rent distribution. The fourth mechanism is conflict financing. Resources provide both the motive and the means for armed conflict: they raise the stakes of controlling territory, fund rebel organizations, and create lootable wealth that can sustain violence independently of popular support. Philippe Le Billon's work on the political economy of war emphasizes that resources do not merely motivate conflict but structure it — determining who fights, how long they fight, and what bargains become possible at war's end. These four mechanisms interact: rentierism weakens the institutions that might manage Dutch disease; institutional decay lowers the cost of capturing rents by force; and conflict financing feeds back into further institutional destruction.

Scope Conditions: The curse operates only under identifiable conditions, and the literature has moved steadily toward specifying them. The most important scope condition is institutional quality at the time of the boom. States with strong pre-existing institutions — Norway, Botswana, Chile — have converted resource wealth into sustained development, while states with weak institutions — Nigeria, Angola, Sierra Leone — have experienced the curse. A second scope condition is commodity type. Point-source resources such as oil and diamonds, which are geographically concentrated and easily controlled by small groups, produce stronger curse effects than diffuse resources such as agricultural commodities. A third is price volatility: boom-bust cycles disrupt planning, encourage pro-cyclical spending, and create windows of vulnerability during price collapses. A fourth is the degree of state ownership and the transparency of revenue management. Where contracts are secret, revenues off-budget, and state-owned enterprises opaque, rents are more easily captured. A fifth is the presence of external actors — multinational corporations, trading networks, and consuming states — whose demand and complicity shape the terms of extraction. The curse is therefore not a property of geology but of the political and institutional context in which geology is exploited.

Observable Implications: If the resource curse thesis holds, several patterns should be visible in cross-national and case-study evidence. Resource-dependent economies should exhibit lower per capita GDP growth over the long run than non-resource economies with similar initial conditions, controlling for other factors. They should score lower on governance indicators — corruption, rule of law, voice and accountability. They should exhibit higher rates of civil war onset, particularly in the years following commodity price booms. They should show narrower export bases and higher exchange-rate volatility. They should display lower tax effort relative to GDP, since rents substitute for taxation. They should exhibit higher military spending and larger security sectors, as rulers use rents to fund coercion. And they should show distinctive patterns of inequality: resource rents concentrate in the hands of state elites and connected firms, producing high inequality alongside low median welfare. The evidence broadly supports these implications, though with important qualifications. Sachs and Warner's early cross-national work found a robust negative relationship between resource dependence and growth; subsequent research has shown this relationship to be mediated by institutional quality, and some studies find no curse or even a blessing where institutions are strong. The conflict literature, following Collier and Hoeffler, finds that resource dependence raises civil war risk, but the mechanism — whether through financing, motivation, or state weakness — remains contested.

Perspective Note (five traditions in brief):

African (primary): The African perspective treats the resource curse not as a natural consequence of geology but as a historically produced condition rooted in colonial extraction and its post-colonial reproduction. African scholars from Walter Rodney to Claude Ake to Thandika Mkandawire have argued that resource wealth became a curse because the institutional architecture of extraction — enclave economies, foreign ownership, weak linkages to domestic production — was inherited from colonialism and never dismantled. The curse is therefore not a failure of African states to manage wealth but a continuation of a global division of labor in which Africa supplies raw materials and imports manufactured goods. From this vantage point, the relevant question is not why Africa failed to develop its resources but why the terms of extraction were structured to prevent development. Resource sovereignty — the demand that African states control their resources, set their own terms, and capture value through processing and industrialization — is the central political project. The African perspective also insists that the curse framework risks blaming victims: it locates pathology in African states while obscuring the role of multinational corporations, consuming states, and international financial institutions in structuring extraction. The strongest African contribution is to show that the curse is a relational phenomenon, produced by the interaction between African elites and external actors, not an internal African failure.

Chinese: The Chinese perspective does not deny the existence of resource curse dynamics but frames them as manageable through state capacity and developmental partnership. Drawing on China's own experience of resource-led development and its model of state-led industrialization, Chinese analysts argue that the curse reflects weak state capacity rather than resource abundance per se, and that the solution lies in building infrastructure, transferring technology, and creating linkages between extractive and non-extractive sectors. The "win-win" narrative holds that Chinese investment in African resources, when accompanied by infrastructure development and employment creation, can convert curse into blessing. This perspective contributes the insight that external partners can be developmentally constructive rather than purely extractive, and that the terms of engagement matter more than the fact of engagement. Its occlusion is the tendency to treat state capacity as a technical problem solvable by investment, while underestimating the political dynamics of rent capture and elite bargaining that Karl and others identify as central. The Chinese perspective also has limited engagement with the conflict-financing dimension of the curse, since China's strategic interest lies in stable supply rather than in the governance of extraction.

Russian: The Russian perspective frames the resource curse as partly a Western construct used to delegitimize African sovereignty over resources and to justify external intervention in resource-rich states. Russian analysts emphasize that Western powers have historically extracted African resources on favorable terms and that the "curse" narrative serves to obscure Western responsibility for underdevelopment. The Russian view stresses sovereign choice: African states have the right to determine how their resources are exploited, with whom they partner, and on what terms, without external conditionality. This perspective contributes a necessary corrective to the tendency of Western frameworks to treat African resource governance as a technical problem requiring external oversight. Its occlusion is the tendency to treat sovereignty as an end in itself, without engaging seriously with the institutional mechanisms through which rents are captured by elites rather than deployed for public welfare. The Russian perspective also has limited purchase on the conflict-financing dimension, since its emphasis on non-interference can shield abusive extraction from scrutiny.

Western: The Western perspective, dominant in the academic and policy literature, treats the resource curse as a problem of governance and institutions, amenable to reform through transparency, conditionality, and

capacity building. The framework emphasizes rentierism, Dutch disease, and institutional decay as the core mechanisms, and prescribes remedies such as the Extractive Industries Transparency Initiative (EITI), revenue management funds, and diversification policies. This perspective has generated the most extensive empirical research and the most detailed policy prescriptions. Its contribution is the identification of specific, tractable mechanisms and the development of metrics and indicators for tracking them. Its occlusion is the tendency to treat the curse as an internal governance failure, underweighting the structural and historical dimensions that African scholars emphasize, and the role of Western consumers, corporations, and financial systems in sustaining extractive arrangements. The Western perspective also risks conflating correlation with causation, attributing to resources what may be caused by the institutional weakness that preceded resource discovery.

UN: The UN perspective treats the resource curse primarily through the lens of conflict and sanctions, emphasizing the role of resources in financing armed conflict and the need for international regulatory responses. UN Panel of Experts reports on Angola, Sierra Leone, and the Democratic Republic of Congo documented how diamonds, coltan, and other resources funded rebel movements and sustained violence, leading to sanctions regimes, certification schemes such as the Kimberley Process, and the broader framework of "conflict minerals" regulation. The UN contribution is the documentation of specific conflict-financing networks and the development of international regulatory tools. Its occlusion is the tendency to focus on the conflict dimension while underweighting the slower, structural dimensions of the curse — rentierism, Dutch disease, and institutional decay — that operate in peacetime as well as in war. The UN perspective also struggles with enforcement, since sanctions and certification schemes depend on state capacity and political will that are often absent in the very states they target.

SECTION 2.3 KEY IDEA 2 — Neo-extractivism: the new scramble for African minerals and the terms of the bargain

Bolded Causal Claim: Neo-extractivism in Africa is not simply colonial extraction under new flags; it is a mode of accumulation in which the state facilitates large-scale, export-oriented mineral extraction by external capital in exchange for fiscal rents, infrastructure, and limited local benefits, while higher-value stages of processing, technology, finance, and commodity trading remain outside the continent. The causal claim is that this bargain structurally reproduces dependency: it can generate growth without development, concentrate risk in host states, and convert mineral abundance into a source of political and conflict vulnerability rather than broad-based transformation.

Mechanism: The mechanism operates through six linked channels. First, global value-chain positioning: African states typically export ores, concentrates, or unprocessed minerals, while refining, smelting, component manufacturing, and final assembly occur in industrial centers in China, Europe, North America, or the Gulf. Even where processing exists, it is often enclave-based and foreign-owned, with limited backward linkages to domestic suppliers. Second, fiscal and contractual architecture: production-sharing agreements, royalty regimes, tax holidays, stabilization clauses, and transfer-pricing opportunities allow investors to capture a disproportionate share of rent, especially where geological data, legal capacity, and bargaining power are asymmetric. Contracts are frequently stabilized against future policy change and arbitrated in foreign jurisdictions, which constrains later governments that wish to renegotiate terms. Third, infrastructure as corridor rather than network: railways, ports, and power lines are built to move minerals from mine to coast, not to integrate domestic markets; this creates extractive corridors that bypass rural populations and reinforce

spatial inequality. Fourth, labor and social relations: capital-intensive mining generates relatively few jobs per unit of output, while artisanal and small-scale mining absorbs surplus labor under hazardous conditions; the coexistence of industrial and artisanal sectors produces competition over access, often mediated by local elites, security forces, and armed actors. Fifth, financialization and illicit flows: commodity trading, offshore registration, misinvoicing, and treaty shopping move value out of the fiscal reach of host states; even where EITI disclosures exist, the gap between disclosed payments and actual value capture can remain large. Sixth, security arrangements: mining zones are frequently protected by state forces, private military or security companies, or hybrid local militias, which can militarize resource frontiers and entangle extraction with coercion. The "terms of the bargain" therefore include not only headline royalty rates but also infrastructure packages, security provision, market access, diplomatic support, and long-term offtake agreements, all of which can obscure the underlying distribution of value. In the African variant, neo-extractivism is often state-led in rhetoric but market-mediated in practice: governments market resource sovereignty while depending on external capital, technology, and markets.

Scope Conditions: This mechanism is strongest where four conditions coincide: (i) deposits are large, capital-intensive, and export-oriented; (ii) global demand is high and concentrated, as in energy-transition minerals such as cobalt, lithium, copper, nickel, and rare earths; (iii) host-state institutions lack the technical, legal, and fiscal capacity to negotiate, monitor, and enforce contracts; and (iv) global commodity markets and finance are dominated by a small number of buyers, traders, and lenders. It is weaker where states have diversified economies, strong geological and legal capacity, robust local content requirements, or regional bargaining power. Botswana's diamond management is often cited as a partial counterexample, though even it remains dependent on De Beers technology and global demand. The scope condition also includes time and cycles: neo-extractivism intensifies during commodity booms, when investor interest and state revenue expectations rise, and contracts signed in boom periods may become liabilities during busts. Geopolitical competition among China, the European Union, the United States, and other actors can improve African bargaining power in some cases, but it can also fragment standards and encourage competitive deregulation. The mechanism does not imply that all foreign investment is harmful; rather, it predicts that without deliberate industrial policy, value capture will remain skewed toward external actors.

Observable Implications: If neo-extractivism operates as described, one should observe high export concentration in a small number of minerals; low manufacturing value added relative to GDP; infrastructure oriented toward ports rather than internal integration; volatile fiscal revenues; recurrent contract renegotiations or disputes; community protests around land, water, and compensation; militarization of mining zones; and persistent illicit financial flows despite transparency initiatives. One should also observe a gap between official narratives of "partnership" and local experiences of dispossession, as well as repeated cycles of boom, debt, and renegotiation. Additional indicators include the share of exports in raw or semi-processed form, the ratio of value-added exports to total exports, the implementation record of community benefit agreements, the frequency of investor-state arbitration, and EITI reconciliation gaps. Data sources such as World Bank resource rents, EITI reports, UNCTAD trade data, and national accounts can be used to test these implications, though each has measurement limits, especially for informal and illicit flows. The "new scramble" is visible in the geography of new mining frontiers—cobalt and copper in the Democratic Republic of Congo and Zambia, lithium in Zimbabwe and Namibia, bauxite in Guinea, uranium in Namibia, and platinum-group metals in South Africa and Zimbabwe—where external capital and state elites negotiate access to minerals critical to the global energy transition.

Perspective Note (five traditions in brief): African (primary): From an African structural perspective, neo-extractivism is the latest phase of a long history of unequal exchange in which the continent supplies raw

materials to industrial centers while importing manufactured goods and debt. Scholars in the tradition of Rodney, Nkrumah, and Fanon, and later African political economists, emphasize that the problem is not simply bad contracts but the global division of labor, finance, and knowledge. The African vantage point insists on resource sovereignty, beneficiation, local content, regional value chains, and environmental justice; it treats the "terms of the bargain" as a question of historical repair as well as current negotiation. It also highlights that African elites are not passive victims but active brokers who may benefit from rent streams, which complicates simple anti-foreign narratives and directs attention to domestic class and elite politics. Chinese: The Chinese perspective frames mineral partnerships as "win-win" development cooperation: infrastructure, employment, and market access in exchange for resources, without the political conditionality associated with Western donors. It emphasizes mutual benefit, non-interference, and the developmental role of state-backed capital. Its occlusion is the tendency to understate debt sustainability, labor and environmental standards, opacity in contracts, and the enclave nature of many projects. Russian: The Russian perspective emphasizes sovereign choice and Western hypocrisy: African states have the right to choose partners, and Western criticism of non-Western investment is often framed as an attempt to preserve monopolies established during colonial and post-colonial periods. Russia presents itself as an alternative partner in mining, energy, and security, particularly where Western sanctions or conditionality create openings. Its occlusion is the limited transparency of many deals, the role of security actors in protecting extractive assets, and the risk that "sovereignty" rhetoric can legitimate elite capture. Western: The Western perspective typically combines market-liberal and governance frameworks: foreign direct investment, EITI, transparency, rule of law, and anti-corruption conditionality are seen as the path to better bargains. It often attributes poor outcomes to weak governance, corruption, and "resource curse" dynamics rather than to the structure of global markets. Its occlusion is the historical and ongoing role of Western corporations, financial centers, and consumption patterns in shaping extractive terms, as well as the asymmetry of technological and market power. UN: The UN perspective focuses on regulatory and normative tools—Panel of Experts reports, sanctions on conflict minerals, EITI support, and the Sustainable Development Goals—aimed at making extraction more transparent and less conflict-prone. It contributes documentation of networks and standards for due diligence. Its occlusion is the tendency to treat extraction as a governance problem to be managed rather than a structural feature of the global economy, and the difficulty of enforcing standards where state capacity is weak.

SECTION 2.4 KEY IDEA 3 — Rentier state dynamics: how oil, minerals, and aid shape state-society relations

Bolded Causal Claim: Rentierism transforms the state from a taxing institution into a distributing institution: when governments derive a large share of revenue from oil, minerals, or aid rather than from domestic taxation, the fiscal contract between rulers and citizens weakens, accountability declines, and politics becomes a contest over access to rent streams rather than over public goods and productive investment.

Mechanism: The rentier mechanism, developed in the study of oil states and extended to mineral and aid-dependent economies, works through several channels. First, fiscal delinking: the state's budget is financed by external rents—export revenues, royalties, or donor transfers—rather than by taxes on citizens and firms. Because citizens are not the primary source of revenue, the classic "no taxation without representation" logic is inverted: rulers face weaker pressure to justify spending or to build institutions that extract and manage domestic revenue. Second, distributive politics: rents are allocated through subsidies, public employment, patronage networks, and regional or ethnic bargains. This can produce short-term stability but also creates constituencies dependent on continued rent flows and vulnerable to shocks. Third, institutional atrophy: tax administration, statistical capacity, and legislative oversight weaken because they are not needed to raise rev-

enue; ministries become channels for rent distribution rather than service delivery. Fourth, Dutch disease: large rent inflows appreciate the real exchange rate, raising the cost of non-resource tradables and discouraging manufacturing and agriculture; the economy becomes more import-dependent and less diversified. Fifth, security and coercion: rents fund militaries, police, and intelligence services that protect rent streams and regime survival, sometimes at the expense of civilian accountability. Sixth, aid as rent: in aid-dependent states, donor funding can substitute for domestic revenue, creating a rentier dynamic in which governments negotiate with donors rather than citizens; conditionality may alter policy but does not necessarily rebuild the fiscal contract. Seventh, fiscal illusion and moral hazard: because rents appear as "free" revenue, governments may borrow against future flows, overcommit to spending, and underinvest in tax capacity, making adjustment painful when prices fall. Karl's analysis of the "paradox of plenty" emphasizes that resource wealth can undermine the very institutions needed to manage it, especially where pre-existing state capacity is low. The mechanism is not automatic: it depends on the concentration of rents, the opacity of revenue management, and the absence of countervailing institutions such as independent legislatures, courts, civil society, and free media.

Scope Conditions: Rentier dynamics are most likely where resource rents constitute a large share of government revenue and GDP, where resources are geographically concentrated and easily appropriable, where population is small relative to rent volume, and where institutions are weak or personalized. They are less likely where states have diversified tax bases, strong bureaucratic capacity, transparent sovereign wealth funds, and political systems that require broad consent. Botswana and Norway are frequently cited as cases where resource wealth did not produce classic rentier pathologies, though both had distinctive institutional starting points and, in Botswana's case, a particular diamond governance arrangement. The mechanism also applies, with modifications, to aid-dependent states: high aid-to-GDP ratios can create "aid rentierism," especially in post-conflict or fragile settings where donors fund large shares of the budget. Federal systems, such as Nigeria's, can mitigate rentier centralization by distributing rents across subnational units, but they can also intensify competition over rent shares and encourage subnational rentierism. It does not imply that all resource-rich states are rentier states; rather, it identifies a tendency whose strength varies with institutional and political context.

Observable Implications: If rentier dynamics are present, one should observe low tax revenue as a share of GDP; high dependence on a small number of commodities or donors; large public-sector wage bills and subsidy programs; currency appreciation and manufacturing decline; weak legislative oversight of budgets; high military and security spending; frequent protests when subsidies are removed; and elite competition over control of rent-generating institutions such as national oil companies, mining parastatals, and central banks. One should also observe a gap between formal democratic institutions and substantive accountability: elections may occur, but the fiscal contract remains thin. In conflict settings, rent streams may finance both state repression and rebel mobilization, linking rentierism to the "resource curse" in civil war. Additional indicators include non-resource tax effort, public investment efficiency, subsidy incidence, exchange-rate misalignment, manufacturing share, aid dependency, and the frequency and intensity of protests following fiscal adjustment. Data sources include World Bank resource rents, IMF fiscal data, aid statistics, and national accounts, though measurement of informal and illicit rents remains difficult.

Perspective Note (five traditions in brief): African (primary): The African perspective treats rentierism not as a technical fiscal problem but as a political and historical condition shaped by colonial state formation, external dependency, and elite brokerage. African scholars such as Bayart, with his analysis of the "politics of the belly," and Mamdani, with his distinction between citizens and subjects, help explain how rent distribution interacts with fragmented sovereignty and authoritarian rule. From this vantage point, oil

and mineral rents are not merely revenues; they are instruments through which states manage populations, reward clients, and suppress dissent. The African perspective also emphasizes that aid can function as a rent, creating donor-driven states whose accountability is oriented outward. It demands fiscal sovereignty, domestic resource mobilization, and the rebuilding of the social contract through taxation and public goods. Its occlusion, if any, is the risk of underestimating the stabilizing function of rent distribution in deeply divided societies, where abrupt removal of subsidies or patronage can trigger violence. Chinese: The Chinese perspective tends to view resource rents as a developmental opportunity if channeled into infrastructure and industrialization; it emphasizes state capacity, long-term planning, and the role of state-owned enterprises. It may understate the accountability problems created by rentier finance and the political risks of concentrated revenue. Russian: The Russian perspective frames rentier dynamics partly as a consequence of Western-imposed economic structures and sanctions; it emphasizes sovereign control over resources and the right to use rents for state priorities, including security. It may occlude the domestic institutional decay associated with rent dependence. Western: The Western perspective often treats rentierism as a governance failure amenable to conditionality, transparency initiatives, and fiscal reform; it emphasizes taxation, EITI, and institutional strengthening. Its occlusion is the historical role of Western consumption, corporations, and financial systems in creating and sustaining rentier economies, as well as the limits of external conditionality. UN: The UN perspective links rentierism to peacebuilding and state-building: aid, resource governance, and fiscal reform are tools for post-conflict recovery. It contributes norms around transparency and revenue management. Its occlusion is the difficulty of transforming fiscal contracts in fragile states where donors themselves become rent providers and where enforcement capacity is limited.

2.5 KEY IDEA 4 — The privatization of violence: warlordism, PMCs, and the market for force (Reno, Collier)

Bolded Causal Claim: In institutionally thin, resource-rich settings, coercion is converted into a privately traded commodity; armed actors finance themselves through resource extraction and protection rents, so violence persists not as an instrument of state policy but as a self-sustaining market activity.

Mechanism: The mechanism begins with the erosion or collapse of the central state's monopoly on legitimate force, which Reno (1998) analyzes as "warlord politics": rulers and regional strongmen govern through personal networks rather than bureaucratic institutions, and resource sites become fiefdoms whose revenue is captured by armed patrons. Where minerals are lootable, high-value, and easily transportable—such as alluvial diamonds, coltan, or timber—armed groups can tax miners, control trade routes, and use violence to exclude rivals, transforming coercion into a revenue-generating asset. Collier and Hoeffler (2004) add the economic feasibility logic: rebellion becomes more likely when fighters can be paid from resource rents, reducing dependence on popular support and making violence an investment with expected returns. Private military companies (PMCs) extend the same market logic by selling coercive capacity to states, corporations, or factions, creating enclave security arrangements that may protect extraction without rebuilding public authority. The result is a shadow political economy in which armed actors, brokers, and external buyers are linked by contracts, smuggling, and protection payments; peace agreements are fragile because disarmament threatens established revenue streams, and violence can be restarted when market conditions favor it.

Scope Conditions: This mechanism is strongest where central authority is weak or fragmented, where resources are lootable and accessible, where borders are porous, and where external demand creates reliable buyers. It is weaker where resources require large fixed capital and state coordination, where institutions

can tax and regulate extraction, or where armed movements are driven by strong ideological or secessionist programs that subordinate economic gain to political goals. PMCs are not automatically conflict-generating; their effects depend on whether they are accountable to public law, whether they displace state forces, and whether their contracts create enclave economies. The mechanism also does not imply that all warlords are purely economic actors; many combine coercion with ethnic, regional, or religious claims, and violence may be legitimated through local idioms of authority.

Observable Implications: Analysts should expect armed groups to control or tax specific resource sites rather than merely hold territory; fragmented command structures competing for rents; cross-border smuggling networks; and negotiations in which resource access is an implicit or explicit bargaining chip. Post-conflict settings may show persistent insecurity around mines, continued PMC or militia presence, and "conflict entrepreneurs" who move between war and business. Another implication is the decoupling of violence from public service provision: groups may provide localized order to protect extraction while neglecting broader governance. Data patterns may include spikes in violence near resource corridors, discrepancies between official export figures and estimated production, and the survival of armed networks after formal disarmament.

Perspective Note (five traditions in brief):

African (primary): From an African vantage point, the privatization of violence is not an aberration produced by "failed states" but a political order shaped by the colonial state's externally oriented coercion, postcolonial elite bargains, and the conversion of public office into private accumulation. African scholarship—Bayart's "politics of the belly," Mamdani's analysis of decentralized despotism, and Mbembe's work on necropolitics—suggests that warlordism and militia economies are intelligible as forms of extraverted power in which local strongmen mediate between global markets and fragmented populations. PMCs can be read as neo-colonial coercive infrastructure that secures extraction without restoring citizenship, while resource sovereignty remains a central normative demand. The African perspective's distinctive contribution is to show that violence markets are embedded in social relations, patronage, and historical dispossession; its occlusion, when ignored, is the tendency to treat African conflicts as criminal or anarchic rather than as structured political economies.

Chinese: The Chinese perspective typically frames privatized violence as a symptom of weak governance and insecurity that threatens development, investment, and regional stability. It emphasizes state capacity, infrastructure, and economic cooperation as antidotes, while generally supporting non-interference and host-state authority. Chinese firms operating in resource sectors often rely on local state security rather than foreign PMCs, and Beijing's official discourse stresses mutual benefit and opposition to mercenary intervention. The occlusion is that this narrative can understate how Chinese demand and investment reshape local power relations, and how enclave security arrangements may reproduce inequality without addressing grievance.

Russian: The Russian perspective often attributes the market for force to Western interventionism, sanctions, and the collapse of state structures following externally driven regime change, while defending sovereign choice in security partnerships. It tends to treat Western condemnation of private military activity as hypocritical given the historical and contemporary use of Western PMCs, and to emphasize state-to-state security cooperation. The occlusion is that this framing can deflect scrutiny from Russian-linked private military activity and from the ways in which external security assistance may empower particular factions rather than rebuild accountable institutions.

Western: The Western perspective commonly interprets warlordism and PMCs through governance failure, criminal networks, and the need for institutional reform, transparency, and conditionality. It contributes

regulatory frameworks, sanctions, and peacebuilding tools, and often treats PMCs as pragmatic instruments when state capacity is limited. Its occlusion is the historical role of Western consumption, corporations, and financial systems in sustaining resource-driven violence, as well as the limits of external conditionality in transforming local coercive markets.
UN: The UN perspective links privatized violence to peacekeeping, disarmament, demobilization and reintegration, arms embargoes, and the regulation of PMCs. It contributes norms around civilian protection, sanctions, and post-conflict security sector reform. Its occlusion is the difficulty of enforcing arms embargoes and controlling illicit markets in fragile states, and the risk that peace operations become another source of rent or dependency.

2.6 KEY IDEA 5 — The 'greed vs grievance' debate (Collier-Hoeffler) and its limits

Bolded Causal Claim: Collier and Hoeffler (2004) argue that civil war risk is driven more by economic opportunity—especially primary commodity dependence and lootable resources—than by grievance, but the thesis is bounded by measurement problems, omitted political variables, and cases where identity, exclusion, and state violence are central.

Mechanism: The Collier-Hoeffler model uses cross-national statistical analysis to show that the risk of civil war rises with primary commodity exports as a share of GDP and with the availability of lootable resources, while conventional grievance variables—such as income inequality, ethnic fractionalization, and political rights—often appear weak or insignificant. The proposed mechanism is economic feasibility: rebellion requires finance, and resource rents lower the cost of recruiting fighters, purchasing arms, and sustaining operations; where opportunity costs of participation are low and lootable wealth is available, armed groups can form and persist without broad popular support. Grievance may provide rhetoric or recruitment narratives, but in this framework it is not the principal cause of war onset. Critics have challenged the model on several grounds: endogeneity, since conflict itself can depress or distort commodity exports; the difficulty of measuring grievance, especially horizontal inequalities and political exclusion; aggregation that masks subnational dynamics; and the possibility that resource dependence proxies for state weakness rather than greed. Subsequent scholarship has emphasized that grievance and greed interact: resource rents can fund rebellion, while political exclusion, land dispossession, and identity-based marginalization determine who rebels, against whom, and with what legitimacy. The debate's enduring contribution is to force attention to rebel financing and economic incentives; its risk is to depoliticize conflicts by reducing them to criminal opportunity.

Scope Conditions: The thesis is most persuasive for large-N analyses of post-Cold War civil wars in resource-dependent economies, particularly where rebels can extract rents from alluvial minerals or agricultural commodities. It is less persuasive for secessionist wars, ideological insurgencies, externally sponsored conflicts, and cases where state repression or systematic exclusion is well documented. It also struggles to explain variation in rebel governance, civilian support, and war termination, which often depend on political claims rather than economic opportunity alone. The model's predictions are probabilistic, not deterministic: many resource-rich states avoid civil war, and many poor, non-resource states experience it.

Observable Implications: If the greed thesis holds, one should observe higher conflict risk in commodity-dependent states, longer wars where lootable resources are present, rebel taxation of extraction, and recruitment driven by material incentives. If grievance and political exclusion are central, one should observe mobilization along identity or regional lines, protests preceding violence, state repression, and demands for recognition, autonomy, or redistribution. In practice, both patterns often appear together: resource rents

finance armed groups, while grievance narratives legitimize them and shape their constituencies. Policy implications include economic diversification and transparency initiatives, but also political inclusion, land reform, and accountability for state violence. A one-sided emphasis on greed may produce security-heavy responses that ignore root causes.

Perspective Note (five traditions in brief):
African (primary): The African perspective often critiques the "greed" framework as depoliticizing African conflicts and reducing complex struggles over citizenship, land, and sovereignty to criminal opportunity. African scholars and political thinkers—from Mamdani's work on colonial political identities to Fanon's analysis of violence and liberation—emphasize that grievance is structured by colonial borders, indirect rule, and postcolonial exclusion, not merely by poverty or inequality. Resource sovereignty is central: control over minerals and oil is tied to self-determination, and foreign extraction can be experienced as a continuation of colonial dispossession. The African vantage point insists that rebels and communities are political actors with claims, not just economic agents, and that peace requires addressing historical injustice and representation. Its occlusion, when Westernized, is the tendency to treat African violence as a management problem rather than a political crisis.
Chinese: The Chinese perspective tends to emphasize development, poverty reduction, and state capacity as the primary remedies for conflict, treating grievance as partly a function of underdevelopment. It generally supports non-interference and economic cooperation, and may view the greed-grievance debate as less important than growth and stability. The occlusion is that this framing can understate political exclusion, identity-based marginalization, and the distributional conflicts generated by rapid resource extraction, while presenting economic growth as a substitute for political reform.
Russian: The Russian perspective often frames the greed-grievance debate as a Western academic and policy construct that blames African actors while obscuring Western responsibility for resource exploitation, sanctions, and intervention. It emphasizes sovereignty, state authority, and resistance to external conditionality. The occlusion is that this framing can minimize internal governance failures, elite predation, and the ways in which resource rents are captured by domestic actors as well as foreign ones.
Western: The Western perspective has been shaped by Collier and Hoeffler's quantitative research and by governance-focused policy agendas. It emphasizes economic incentives, institutional quality, transparency, and conditionality, and often treats grievance as difficult to measure or secondary to feasibility. Its occlusion is the historical role of Western consumption, corporations, and financial systems in creating resource-dependent economies, as well as the limits of external conditionality in addressing political exclusion and identity-based claims.
UN: The UN perspective integrates the debate into peacebuilding, conflict prevention, and the Sustainable Development Goals, emphasizing root causes, inclusive governance, and resource management. It contributes norms around transparency, revenue sharing, and post-conflict recovery. Its occlusion is the difficulty of operationalizing grievance in programming and the risk that technocratic peacebuilding frameworks underweight political contestation and historical injustice.

SECTION 2.7 — FIVE PERSPECTIVES IN DEPTH

2.7.1 African Perspective (PRIMARY)

The African perspective on the political economy of African conflict begins from a historical-structural premise that is not reducible to any of the other four perspectives: resource wealth is not an exogenous

windfall that distorts otherwise normal states, but a continuation of an extractive political economy whose institutional forms were forged under colonial rule and reproduced through neo-colonial bargains. On this view, the resource curse, neo-extractivism, rentierism, the privatization of violence, and the greed-versus-grievance debate are not separate puzzles to be solved by better governance or better markets; they are surface expressions of a deeper structure in which African sovereignty has been systematically hollowed out by the global demand for minerals, hydrocarbons, and strategic commodities. The African vantage point therefore treats conflict not as a failure of development but as a mode of accumulation and political ordering within a world economy that has long rewarded extraction over production.

This perspective has a clear theoretical lineage. Walter Rodney's argument that Europe underdeveloped Africa by extracting surplus and constraining autonomous industrialization provides the foundational claim that resource wealth and poverty are not opposites but co-produced. Kwame Nkrumah's analysis of neo-colonialism adds the crucial point that formal political independence did not end external control; it changed its form, allowing foreign capital, multinational corporations, and great-power interests to operate through local intermediaries. Amílcar Cabral's insistence that national liberation must include control over the productive base, and Frantz Fanon's analysis of colonial violence, comprador elites, and the psychological and institutional deformations of settler and extractive rule, extend the argument from economics to political subjectivity and state formation. Mahmood Mamdani's work on the bifurcated colonial state, with its distinction between citizens and subjects, explains why postcolonial states often inherit coercive capacity without developmental legitimacy, making resource rents especially dangerous: they finance the coercive side of the state while bypassing the fiscal contract that might otherwise bind rulers to citizens. Jean-François Bayart's analysis of the politics of the belly and extraversion shows how African political elites have historically converted external dependence into domestic power, while Achille Mbembe's work on the postcolony illuminates the theatrical, violent, and commandist character of authority in states where sovereignty is performed rather than substantively exercised. Siba Grovogui's critique of unequal sovereignty in international law adds the juridical dimension: African states have often been recognized as sovereign in form while denied the substantive capacity to control resources, borders, and security arrangements. Oyèrónkẹ́ Oyěwùmí's feminist critique of colonial categories and Sylvia Tamale's decolonial feminist scholarship remind the analysis that extraction is gendered, that women's labor and land rights are frequently erased in both resource bargains and conflict narratives, and that "community" is not a homogeneous unit. African security scholars such as Aning and Danso have similarly emphasized that security governance in Africa cannot be separated from the political economy of extraction and from the external actors who profit from instability.

Applied to the five key ideas, this perspective reworks each one. The resource curse is not denied; rentierism, Dutch disease, weakened institutions, and conflict financing are all recognized as real mechanisms. But they are not treated as technical failures of resource management. They are understood as the predictable outcome of an economy organized around export of primary commodities to external markets, with limited downstream processing, weak labor absorption, and state budgets dependent on rents rather than taxation. Rentier state dynamics are therefore not merely about oil or minerals; they are about the social contract. Where rulers derive revenue from external rents rather than from citizens, accountability is weakened, and the state becomes an arena for elite competition over distributive shares. Bayart's extraversion is central here: the state's orientation toward external patrons and commodity markets can matter more than its orientation toward domestic society. Neo-extractivism is read as a new scramble, not because all foreign investment is illegitimate, but because the terms of the bargain often reproduce dependency: raw materials leave, value is added elsewhere, infrastructure is built to serve export corridors, and debt or offtake agreements constrain future policy space. The African perspective does not reject partnership; it rejects partnership on terms that

foreclose sovereignty over processing, pricing, environmental standards, and community consent.

The privatization of violence is also reinterpreted. William Reno's analysis of warlord politics and shadow states is not treated as a description of African pathology but as an account of how political order adapts to rentier and extractive environments. Where the formal state lacks legitimacy or capacity, armed actors become entrepreneurs in violence, taxing trade, controlling mines, and negotiating with external buyers. This is not simply "greed"; it is a rational response to a political economy in which violence is one of the few available routes to accumulation and protection. The African perspective therefore sees warlordism, private military companies, and militia economies as symptoms of a broader crisis of sovereignty, not as isolated criminal phenomena. It also notes that external actors—buyers, financiers, arms suppliers, and corporate intermediaries—often benefit from the fragmentation of authority, even when they formally condemn it.

The greed-versus-grievance debate is where the African perspective is most sharply critical of Western frameworks. Collier and Hoeffler's emphasis on feasibility and economic opportunity is not dismissed; armed groups do need finance, and resource rents can lower the cost of rebellion. But the African perspective insists that grievance is not a residual variable or a difficult-to-measure sentiment. It is structured by dispossession, environmental degradation, regional exclusion, ethnicized citizenship, and the historical experience of extraction. Grievance and greed are not alternatives; they are fused. A rebel movement may be financed by diamonds and still articulate a genuine political claim; a state may invoke sovereignty while functioning as a rentier machine. The African perspective therefore rejects the moral sorting of actors into "greedy rebels" and "legitimate states," because both may be embedded in the same extractive order. It also challenges the tendency to treat African conflicts as local or tribal, arguing that global commodity chains, financial centers, and consumer markets are constitutive of the violence.

What the African perspective contributes that the other four cannot is a refusal to separate the local from the global, the economic from the political, and the present from the colonial past. It centers resource sovereignty as a normative and analytical category: not merely national ownership of minerals, but community rights, free prior and informed consent, local value addition, regional industrialization, and reparative claims for historical extraction. It also foregrounds the agency of African societies, including social movements, women's organizations, artisanal miners, and regional institutions, rather than treating Africa only as a site of intervention. This is the perspective's greatest strength: it explains why reforms that look rational from outside—transparency, conditionality, sanctions—often fail to transform the underlying structure, because they leave the terms of global extraction intact.

Its occlusions, however, must be taken seriously. The structural critique can become totalizing, understating variation among African states, regions, and communities. It can obscure the genuine agency and responsibility of African elites, armed actors, and local power brokers, sometimes attributing too much explanatory weight to external forces. It can also romanticize precolonial or community-based resource governance, ignoring internal hierarchies of gender, age, ethnicity, and class. The emphasis on sovereignty can, in some formulations, be used to shield authoritarian governments from accountability, especially when "anti-imperialism" becomes a rhetorical cover for elite predation. Finally, the perspective's normative commitment to resource sovereignty does not by itself resolve the practical problems of revenue management, institutional capacity, and post-conflict security. A rigorous African perspective must therefore be self-critical: it must hold external powers accountable without absolving internal actors, and it must treat sovereignty as a project to be built rather than a slogan to be invoked.

2.7.2 Chinese Perspective

The Chinese perspective on the political economy of African conflict is organized around a developmental and sovereignty-centered narrative that challenges Western conditionality while presenting China's engagement as mutually beneficial. It begins from the premise that African underdevelopment is not primarily a governance failure but a problem of capital scarcity, infrastructure deficit, and unequal integration into the global economy. From this standpoint, the resource curse is real but not inevitable: resource wealth can become developmental if it is linked to infrastructure, industrialization, and state capacity. China's own experience of using resource-backed development, state-led investment, and gradual institutional reform is often invoked, implicitly or explicitly, as a model of pragmatic transformation rather than liberal conditionality.

On neo-extractivism, the Chinese narrative emphasizes partnership rather than scramble. Resource-backed loans, infrastructure-for-resources arrangements, and Forum on China-Africa Cooperation frameworks are presented as instruments that address Africa's binding constraints: roads, ports, power, and connectivity. The terms of the bargain are defended as sovereign choices made by African governments, not impositions by external powers. Non-interference is a core norm: China does not predicate economic engagement on political reform, human rights benchmarks, or governance conditionality, and it frames this as respect for African sovereignty. In the context of conflict, this means that China is more likely to support incumbent governments, emphasize stability, and avoid taking sides in internal disputes unless its own nationals or investments are directly threatened. The Chinese perspective therefore contributes a powerful critique of Western hypocrisy: it points to the long history of Western extraction, intervention, and conditional aid, and argues that African states should have the right to choose partners without external veto.

Applied to rentier state dynamics, the Chinese perspective tends to emphasize state capacity and developmental sequencing. It is less likely to frame oil or minerals as inherently corrosive and more likely to argue that weak institutions can be strengthened through growth, infrastructure, and administrative learning. The privatization of violence is treated as a security and development problem: armed groups threaten investment and stability, and the response should combine state capacity-building, economic opportunity, and, where necessary, support for government forces. The greed-versus-grievance debate is often subordinated to a development-first logic: grievances are acknowledged, but they are seen as best addressed through growth, employment, and infrastructure rather than through political restructuring or historical redress. This perspective thus contributes an alternative to the Western governance paradigm, one that privileges material transformation and sovereign equality over normative conditionality.

Its occlusions, however, are substantial. The "win-win" narrative can obscure asymmetries in bargaining power, opacity in contracts, and the concentration of benefits among political and corporate elites. It often underweights local community grievances, environmental degradation, labor conditions, and the gendered impacts of extractive projects. The emphasis on non-interference can become a shield against accountability, particularly when Chinese companies or financiers are implicated in harmful practices. The debt implications of resource-backed financing are contested, but the Chinese perspective has sometimes been slow to acknowledge the fiscal risks and sovereignty constraints that such arrangements can create. It also tends to treat African states as unitary actors, underplaying internal contestation, regional inequality, and the role of non-state actors. Finally, while it criticizes Western intervention, it can understate the ways in which Chinese security, commercial, and diplomatic interests are themselves becoming entangled in African conflicts. A rigorous reconstruction of this perspective must therefore take seriously its developmental contributions while recognizing that its normative language of partnership can mask uneven power and limited transparency.

2.7.3 Russian Perspective

The Russian perspective on the political economy of African conflict is shaped by a geopolitical narrative of multipolarity, sovereignty, and historical Western responsibility. It treats many African conflicts as legacies of colonial partition, Cold War intervention, and post-Cold War Western dominance, rather than as primarily internal failures. From this standpoint, the resource curse is not a neutral economic concept but a discourse that blames African states for structures created by external powers. The emphasis falls on the right of African governments to manage their resources without Western interference, sanctions, or normative conditionality. Sovereignty is the central value, and any external attempt to regulate resource extraction, finance, or security is read as a continuation of imperial practice under new legal and institutional forms.

On neo-extractivism, the Russian perspective is ambivalent but strategically critical. It often portrays Western corporations and financial institutions as the primary beneficiaries of unequal extraction, while presenting Russia as an alternative partner that does not impose political conditions. The terms of the bargain are framed as a matter of sovereign choice: African states may diversify partnerships, and Russia's role is to provide security, energy, or diplomatic support without lecturing on governance. In practice, this perspective has been associated with support for incumbent governments, opposition to Western sanctions, and criticism of international criminal justice mechanisms when they target African leaders. It contributes a geopolitical counterweight to Western normative hegemony and insists that African agency includes the right to reject Western frameworks.

Applied to rentier state dynamics, the Russian perspective tends to externalize causation. Oil and mineral dependence are acknowledged, but they are linked to global market structures and Western consumption rather than to domestic institutional failure alone. The privatization of violence is often interpreted through the lens of state sovereignty: non-state armed actors are threats to legitimate authority, and external support for governments is justified as stabilization. The greed-versus-grievance debate is treated with suspicion; Western frameworks that emphasize rebel greed are seen as delegitimizing political opposition, while grievance-based claims may be acknowledged only when they align with anti-Western or pro-sovereignty narratives. This perspective therefore contributes a sharp critique of selective Western moralism and a defense of African self-determination, but it often does so by flattening internal political complexity.

Its occlusions are significant. The sovereignty-centered narrative can obscure the role of Russian actors themselves in extractive and security arrangements, including private military companies and opaque resource deals. It may understate the accountability deficits of partner governments and the ways in which external support can entrench authoritarianism. The critique of Western responsibility, while historically grounded, can become a blanket exoneration of non-Western external actors, including Russia, China, and regional powers. It also tends to treat African civil society, opposition movements, and marginalized communities as secondary to state-to-state relations. A rigorous reconstruction must therefore acknowledge the Russian perspective's valid critique of Western double standards while recognizing that its own emphasis on sovereignty can be used to shield predatory arrangements from scrutiny. The perspective is most useful when it exposes the geopolitical selectivity of international norms, but least useful when it substitutes one external patronage for another.

2.7.4 Western Perspective

The Western perspective on the political economy of African conflict is most closely associated with the institutionalist and economic frameworks that emerged in the 1990s and 2000s, especially the greed-versus-grievance debate. Its central claim is that resource wealth increases the risk of civil conflict primarily through

economic incentives rather than through structural injustice alone. Collier and Hoeffler's work argues that rebellion is feasible where resources provide finance, that grievance is difficult to measure and often secondary, and that economic variables such as commodity dependence, low income, and slow growth are stronger predictors of conflict than measures of political grievance. This framework has been enormously influential in shaping policy, and it is not without empirical support: resource rents can lower the cost of rebellion, fund armed groups, and create incentives for state capture.

From this perspective, the resource curse is a problem of institutions and incentives. Rentierism weakens the fiscal contract, Dutch disease distorts the economy, and weak institutions fail to convert wealth into public goods. The solution is therefore institutional reform: transparency, accountability, diversification, and good governance. Neo-extractivism is evaluated through the lens of market efficiency and regulatory quality; foreign investment is welcomed if it is governed by clear rules, competitive bidding, and anti-corruption frameworks. Rentier state dynamics are addressed through fiscal reform, sovereign wealth funds, and revenue management. The privatization of violence is treated as a security and governance failure: warlords and private military companies thrive where the state cannot enforce contracts or protect property, and the response is state-building, security sector reform, and, in some cases, international intervention or sanctions. The greed-versus-grievance debate is resolved, in this perspective, in favor of greed as the more tractable and measurable variable, with grievance treated as a complicating factor that is difficult to operationalize.

The Western perspective has contributed concrete policy instruments. The Kimberley Process Certification Scheme for diamonds, the Extractive Industries Transparency Initiative, conflict-minerals due diligence, targeted sanctions, and Panel of Experts investigations all reflect its emphasis on transparency, traceability, and accountability. These instruments have sometimes reduced the flow of conflict resources and increased the cost of predation. The perspective also contributes a strong focus on measurement, comparison, and policy evaluation, which can discipline more impressionistic accounts.

Its occlusions, however, are well documented. By foregrounding greed and feasibility, it can understate the historical and structural conditions that make resource extraction conflict-prone in the first place. It often treats African states as containers of bad institutions rather than as products of colonial and neo-colonial political economies. It can ignore the role of Western consumption, corporations, and financial systems in creating and sustaining resource-dependent economies. Conditionality and transparency initiatives may improve information without altering power, especially when local communities lack the capacity to use disclosed data. The framework can also be culturally and racially inflected, portraying African conflicts as driven by primitive accumulation or tribal greed while obscuring the global networks that finance and profit from them. Finally, the emphasis on governance can slide into a form of external tutelage that treats African sovereignty as contingent on Western approval. A rigorous Western perspective must therefore retain its institutional insights while acknowledging that institutions are embedded in history, that transparency is not the same as justice, and that external conditionality has limits.

2.7.5 UN Perspective

The UN perspective on the political economy of African conflict is institutional, normative, and multilateral. It does not offer a single theory of resource conflict; rather, it integrates the issue into peacebuilding, conflict prevention, sanctions, and sustainable development. Its starting point is that resource exploitation can fuel conflict, undermine peace processes, and weaken state capacity, but that resources can also finance recovery if governed transparently and inclusively. This perspective is shaped by the UN's dual role as a normative body and an operational actor, and by its experience in Angola, Sierra Leone, the Democratic Republic of

the Congo, and other cases where Panel of Experts reports documented the links between natural resources, armed groups, and external networks.

On the resource curse, the UN perspective emphasizes governance, transparency, and the management of rents for public benefit. It supports initiatives such as the Extractive Industries Transparency Initiative and promotes revenue sharing, benefit-sharing agreements, and post-conflict economic recovery. Rentier state dynamics are addressed through state-building, public financial management, and inclusive institutions. Neo-extractivism is treated less as a geopolitical scramble and more as a question of whether investment contributes to sustainable development, local value addition, and the Sustainable Development Goals. The UN perspective is therefore more comfortable with partnership and investment than with blanket anti-extractivism, but it insists that such engagement must be governed by norms of accountability and human rights.

The privatization of violence is a central concern. UN Panel of Experts reports have documented how armed groups, militias, and external actors profit from minerals, timber, and other commodities, and how these profits sustain conflict even after formal peace agreements. Sanctions regimes, arms embargoes, and due-diligence guidelines are the main instruments, aimed at raising the cost of conflict financing and disrupting illicit networks. The greed-versus-grievance debate is integrated into peacebuilding practice: the UN acknowledges both economic incentives and political grievances, and its frameworks emphasize root causes, inclusive governance, and resource management as part of conflict prevention. It contributes a multilateral vocabulary of transparency, accountability, and post-conflict recovery that can bridge otherwise opposed perspectives.

Its occlusions, however, are also significant. The UN perspective can become technocratic, treating political conflict as a problem of resource management and institutional design. It often struggles to operationalize grievance, historical injustice, and identity-based claims in programming. Sanctions and due diligence can have unintended consequences, including harm to artisanal miners and local communities, and enforcement is often uneven. The emphasis on state-building can privilege incumbent governments and underplay non-state actors, civil society, and marginalized groups. The UN perspective also depends on member-state consensus, which can dilute accountability, especially when powerful states or their allies are implicated. Finally, while it documents external networks, it is constrained by the political limits of the Security Council and by the difficulty of holding multinational corporations and financial centers accountable. A rigorous UN perspective must therefore be understood as a normative and operational framework whose effectiveness depends on political will, enforcement capacity, and the willingness to confront both state and non-state predation.

2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Reframes resource conflict as a continuation of extractive political economy; centers colonial state legacies, resource sovereignty, and the grievances of marginalized groups; shows how certification and conditionality can reproduce external control.	Can under-specify micro-level rebel incentives, individual coercion, and variation in local agency; risks romanticizing community resistance if not empirically grounded.	Justice through structural transformation, redistribution, and sovereign control over resources.	Le Billon (2001) on Sierra Leone diamond rents; Mamdani (1996) on the colonial state; Rodney (1972) on underdevelopment.	Western/UN: without tracing commodity chains and rebel financing, structural critique alone cannot explain timing, escalation, or cross-border variation in violence.
Chinese	Emphasizes state capacity, infrastructure, and development deficits; treats certification as trade governance; supports non-interference and sovereign consent.	Downplays political exclusion, human-rights abuses, and accountability of partner states; "win-win" rhetoric can obscure asymmetrical bargaining power.	Sovereignty plus developmental partnership.	Documented resource-for-infrastructure agreements; Chinese support for African Union and UN peacekeeping frameworks.	African: partnership can reproduce extractivism if contract terms, debt, and local labor conditions remain unequal.

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Russian	Stresses Western colonial responsibility and double standards; defends sovereign resource choices; critiques sanctions as geopolitical instruments.	May deflect from arms flows, mercenary activity, and authoritarian partners; underplays local predation and rebel agency.	Multipolarity and non-interference.	Russian diplomatic critiques of Western sanctions regimes; support for incumbent state authority in multilateral forums.	UN: sovereign-choice rhetoric can shield perpetrators and weaken accountability for cross-border predation.
Western	Identifies rebel financing and "greed" mechanisms; builds governance conditionality, transparency initiatives, and certification regimes such as the Kimberley Process.	Reduces conflict to economic incentives; underplays grievance, colonial legacies, global market complicity, and social reproduction of violence.	Liberal peace through market regulation, transparency, and good governance.	Collier and Hoeffler (2004); Le Billon (2001).	African: governance conditionality can reproduce external control without delivering resource sovereignty or redistribution.

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
UN	Documents cross-border networks through Panels of Experts; creates sanctions, embargoes, and certification frameworks; links security to resource governance.	Depends on member-state consensus; can privilege incumbent governments; enforcement is uneven, especially against multinational traders and financial centers.	Collective security and multilateral regulation.	UN Panel of Experts reports on Angola, the DRC, and Sierra Leone.	Russian/Chinese: sanctions and panels can be politicized, infringe sovereignty, and reflect great-power interests rather than neutral law.

2.8 WORKED EXAMPLE (I do)

Case: Sierra Leone's "blood diamonds" conflict, 1991–2002

Sierra Leone's civil war is the canonical case of resource-financed rebellion in post-Cold War Africa. The Revolutionary United Front (RUF), led by Foday Sankoh and supported by Charles Taylor's Liberia, seized alluvial diamond fields and converted mineral rents into arms, logistics, and rebel survival. The war killed tens of thousands, displaced large populations, and devastated the state's already fragile institutions. The international response included UN sanctions, arms embargoes, and the Kimberley Process Certification Scheme, which sought to separate "conflict diamonds" from legitimate trade. The case is useful because it forces together four levels of analysis and all five perspectives: it is simultaneously a story of marginalized youth, a collapsed postcolonial state, a regional war economy, and a global commodity chain.

Levels of analysis

At the **individual** level, the war cannot be explained solely by either greed or grievance. Many combatants were marginalized young men and women with limited access to education, employment, or political voice; recruitment combined coercion, abduction, survival, and the promise of material gain. Commanders and diamond traders profited from rents, while miners and civilians bore the costs. Individual incentives mattered, but they were structured by poverty, exclusion, and the availability of lootable wealth. The case therefore supports a conjunctural reading: grievance created a recruitable population, while diamond rents made sustained violence affordable.

At the **state** level, Sierra Leone's postcolonial state lacked the capacity to monopolize force, regulate alluvial mining, or convert mineral wealth into public goods. Patrimonial politics, military coups, and the fragmentation of authority weakened the fiscal and coercive foundations of governance. Once the RUF controlled diamond-producing areas, the state lost both revenue and territorial control. The war was not simply an attack on the state from outside; it exposed the hollowness of a state that had long failed to build a social

contract around resource wealth.

At the **systemic** level, Sierra Leone's diamonds were embedded in a global market that valued small, high-quality stones and could absorb illicit supply. The end of the Cold War reduced superpower patronage for African states, but it did not end external involvement; it shifted it toward markets, private actors, and regional networks. The systemic level also includes the normative shift toward certification, sanctions, and "good governance" as tools of international order. In this sense, the war was shaped by both the demand side of the global diamond economy and the regulatory ambitions of the post-Cold War international system.

At the **transnational** level, the conflict was irreducibly regional and global. Diamonds moved from Sierra Leone into Liberia and Guinea; arms moved in the opposite direction through Charles Taylor's network. International NGOs, journalists, UN panels, and diamond traders all became part of the conflict's political economy. The Kimberley Process later attempted to regulate this transnational chain through certification, export controls, and multilateral monitoring. The case thus shows that resource wars are not contained within state borders; they are produced by cross-border circuits of extraction, violence, and commerce.

Mechanism

The central mechanism is the conversion of lootable natural wealth into rebel capacity. Alluvial diamonds are relatively easy to extract with low capital and high value, making them ideal for financing insurgency. The RUF's control of diamond fields generated revenue that was exchanged for weapons and supplies, often through Liberian intermediaries. This revenue reduced the rebels' dependence on popular support and allowed the war to persist even when the RUF lacked broad legitimacy. At the same time, the state's inability to tax or regulate mining eroded its capacity to respond. The result was a self-sustaining war economy in which violence became both a means of extraction and a form of livelihood.

The Kimberley Process responded to this mechanism by targeting the trade rather than the battlefield. It introduced certification requirements, chain-of-custody documentation, and export controls intended to prevent conflict diamonds from entering legitimate markets. UN Panels of Experts, including reports on Sierra Leone, documented diamond flows and recommended sanctions. The Process had real effects: it raised the cost of laundering conflict diamonds and created a multilateral norm against their trade. But it also had limits. Smuggling, weak state capacity, artisanal mining, and porous borders allowed continued leakage. More fundamentally, certification addressed the symptom—illicit commodity flows—without fully transforming the underlying conditions of state weakness, inequality, and regional predation.

Perspective reconstruction

From an African structural vantage, Sierra Leone's war was not an aberration but a continuation of extractive political economy in which colonial and postcolonial states failed to convert mineral wealth into a social contract. The RUF's violence drew on marginalized youth and rural exclusion, so "greed" alone misreads recruitment as purely economic calculation. Diamond rents were captured by a narrow elite and rebel commanders, while communities bore the costs, revealing a crisis of resource sovereignty. The Kimberley Process, though useful, is an externally designed market fix that certifies stones without transforming local power or redistributing rents. African agency appears in regional mediation and postwar demands for accountability, but external frameworks often set the terms of "recovery."

The Chinese perspective treats the war as a failure of state capacity and development, emphasizing that weak institutions and poverty made diamond fields vulnerable to predation. It supports multilateral certification such as the Kimberley Process as a trade-governance tool while privileging non-interference and sovereign consent. Postwar reconstruction is best served by infrastructure, investment, and state-building rather than

punitive conditionality. This view can underplay political exclusion and the accountability of both rebel and government elites.

The Russian perspective attributes primary responsibility to colonial extraction and Western-supported regional strongmen, including Taylor's network. It views sanctions and certification as potentially politicized instruments that can infringe sovereign resource management. Support for incumbent state authority and multipolar diplomacy is preferred to externally imposed governance templates. This stance risks deflecting from arms flows and from accountability for local perpetrators.

The Western perspective, especially in the Collier-Hoeffler tradition, emphasizes that lootable diamonds financed rebellion and prolonged war beyond grievance-based mobilization. It treats the Kimberley Process as a market-based solution that separates legitimate from conflict diamonds through certification and chain-of-custody rules. Governance conditionality and transparency initiatives are seen as necessary to prevent resource rents from funding violence. The framework's weakness is its tendency to reduce a complex war to economic incentives and to understate colonial and social causes.

The UN perspective is anchored in Panel of Experts investigations that traced Sierra Leone diamonds through Liberia and identified sanctions evasion. It combines coercive measures, such as arms embargoes and diamond sanctions, with normative frameworks like the Kimberley Process and postwar state-building. The UN emphasizes documentation, multilateral consensus, and civilian protection, but enforcement depends on member states. Its approach can privilege incumbent governments and struggle to hold multinational traders and financial centers accountable.

Explicit adjudication

No single perspective fully explains Sierra Leone. The African structural critique best explains why the state was vulnerable and why marginalized youth became recruitable; the Western greed framework best explains how diamond rents financed and prolonged rebellion; the UN perspective provides the strongest documentary evidence of transnational flows and sanctions evasion. The Chinese and Russian perspectives add important cautions about sovereignty, development, and the politicization of regulation, but they are less persuasive as primary explanations of the war's financing. The strongest adjudication is conjunctural: colonial and postcolonial state weakness, lootable alluvial diamonds, regional war economies, and global market demand combined to produce a self-sustaining conflict. The Kimberley Process was a partial success because it raised costs for illicit trade, but it did not resolve the deeper problems of state capacity, inequality, and regional predation. What this perspective combination still misses is the lived experience of coercion, gendered violence, child soldiering, local peacebuilding, and postwar reintegration—dimensions that require individual- and community-level evidence beyond macro-level political economy.

SECTION 2.9 PROBLEM PAIR (We do)

1. **Mechanism:** Explain how oil rents, federal revenue sharing, and the derivation principle combined to make violence a rational strategy for Niger Delta militants between 2004 and 2009. Specify at least two transmission channels from rent to armed capacity.

2. **Levels of analysis:** Analyze the insurgency at the individual, state, systemic, and transnational levels, identifying the key actor and causal variable at each level.

3. **Perspective reconstruction:** Reconstruct how the African structural critique and the Western "greed" framework would each explain the same 2006 pipeline attacks; identify one piece of evidence each would treat as decisive.

4. **Greed vs. grievance:** Evaluate whether the 2009 amnesty program supports Collier and Hoeffler's feasibility thesis or a grievance-based account; state what evidence would falsify your conclusion.

5. **Policy:** Design a bounded intervention that addresses rentier federalism without assuming that transparency alone changes power relations; include one major risk.

6. **Data:** Using resource rents as a percentage of GDP and EITI compliance, explain what these indicators can and cannot tell us about the Delta conflict.

MODEL ANSWER (continuous prose): The Niger Delta insurgency between 2004 and 2009 is best explained not by a single grievance or a single profit motive but by a rentier-federalist mechanism in which oil rents were converted into political violence through three channels. First, the federal revenue-sharing system concentrated rents at the center and returned only a small derivation share to producing communities, creating a fiscal structure in which the state's survival depended on oil rather than taxation; following Karl's analysis of petro-states, this weakened horizontal accountability and made local claims appear as threats to national fiscal stability. Second, environmental and livelihood losses from extraction were not compensated through credible regulatory or judicial channels, so grievance became organized around territorial control and sabotage capacity rather than conventional politics. Third, the same infrastructure that carried rents—pipelines, flow stations, export terminals—became a lootable and coercible asset: militants could interrupt production, extract rents through bunkering and kidnapping, and bargain with both the state and oil companies. This is the Collier-Hoeffler feasibility logic: rebellion is more likely where lootable resources and weak state capacity lower the cost of organized violence, but in the Delta the "loot" was not merely mineral wealth; it was the rent stream itself, mediated by federal institutions. At the individual level, recruitment drew on unemployed youth and ex-militants whose opportunity costs were shaped by the collapse of fishing and farming livelihoods and by the visible wealth of oil enclaves. At the state level, Nigerian federalism created a competitive arena in which governors, militants, and intermediaries bargained over derivation, security contracts, and amnesty payments; violence was therefore partly an instrument of political market participation, consistent with Reno's argument that warlordism and militia politics can be modes of state access rather than state destruction. At the systemic level, global oil prices and corporate risk calculations determined how much disruption the market would tolerate and how quickly companies would relocate or negotiate. At the transnational level, diaspora networks, international NGOs, and the reputational concerns of multinational oil firms shaped both the framing of the conflict and the pressure for settlement. The five perspectives reconstruct the same events differently. An African structural critique, drawing on Rodney and Nkrumah, treats the Delta as a continuation of extractive colonial political economy: oil wealth leaves the region while ecological costs remain, and federalism reproduces internal colonialism by subordinating minority regions to a rentier center. It foregrounds resource sovereignty and environmental justice but can understate the agency of local elites who also captured rents. The Chinese perspective emphasizes non-interference and developmental partnership: instability is a governance problem to be addressed through infrastructure and investment, not a reason to abandon commercial engagement; it contributes a focus on state capacity and growth but occludes accountability for environmental harm. The Russian perspective stresses Western responsibility, noting the historical role of Western oil majors and conditionalities; it supports sovereign choice but risks excusing

domestic elite predation. The Western perspective, especially the Collier-Hoeffler framework, foregrounds feasibility and greed, treating grievance as epiphenomenal; it generates testable predictions about resource dependence and conflict onset but can reduce political claims to criminality. The UN perspective, reflected in sanctions debates and EITI-style transparency initiatives, treats the problem as one of illicit financing and governance gaps; it contributes monitoring and normative standards but often lacks enforcement leverage over sovereign producers. Adjudication requires separating description from explanation. Descriptively, the Delta insurgency involved both grievance and rent-seeking; the evidence does not force a choice between them. Explanatorily, the stronger claim is that grievance created the recruitment pool and legitimacy, while rentier federalism and lootable infrastructure made sustained violence feasible and profitable. A useful falsifier would be evidence that increased derivation shares and environmental remediation reduced violence without changing oil prices or militant capacity; conversely, if violence persisted solely because of criminal profit after grievances were addressed, the greed framework would gain support. The 2009 amnesty reduced attacks partly through payments and reintegration, suggesting that both grievance and incentive structures mattered, but it did not resolve the underlying federal and environmental questions, leaving the conflict's political economy intact.

SECTION 2.10 INDEPENDENT MEMO (You do)

(a) Case description: Since the late 1990s, armed groups in eastern Democratic Republic of Congo have financed operations through taxation and control of artisanal mining sites producing coltan, cassiterite, wolframite, and cobalt, while state authority has remained fragmented across North and South Kivu. The 1998–2003 Congo wars drew in neighboring states and transformed mineral extraction into a transnational political economy involving militias, army units, traders, and regional networks. UN Panel of Experts reports documented links between mineral revenues and armed groups, contributing to sanctions and the 2010 US Dodd-Frank conflict minerals provision. Despite traceability initiatives, armed taxation persists, and the 2021–2023 resurgence of M23 has renewed debate over whether mineral rents cause rebellion or merely finance groups whose origins lie in security dilemmas and regional intervention. The case asks whether conflict-mineral governance can alter violence without addressing army reform, regional diplomacy, and local land and citizenship grievances.

(b) Required memo headings as prompts:

- **Mechanism:** Identify the causal chain from mineral rents to armed group capacity, specifying the level of analysis and the mediating institution.
- **Perspective reconstruction:** Reconstruct African, Chinese, Russian, Western, and UN readings of the case in 3–5 sentences each, noting what each occludes.
- **Historical analogue:** Compare with one earlier case (e.g., Sierra Leone 1991–2002 or Angola 1992–2002) and state whether the analogy holds at the mechanism or only at the surface.
- **Falsifiers:** List two observable implications that would weaken your explanation and one that would strengthen it.

(c) Self-check line: Did you distinguish description (what happened), explanation (why it happened), prediction (what should follow), and prescription (what should be done), and avoid presenting prescription as explanation?

SECTION 2.11 HINGE QUESTION

Question: In the Niger Delta insurgency of 2004–2009, which claim best captures the relationship between grievance and greed in explaining sustained violence?

A. Grievance was sufficient; oil rents merely provided incidental funding.
B. Greed was sufficient; environmental grievance was elite-manufactured rhetoric.
C. Grievance created recruitment and legitimacy, while rentier federalism and lootable infrastructure made sustained violence feasible and profitable; neither alone is sufficient.
D. The conflict is best explained by external manipulation, with local actors serving mainly as instruments.

Correct answer: C.

Distractor diagnoses:
- **A** conflates the presence of grievance with sufficiency; it ignores the federal rent structure, militant bargaining capacity, and the profitability of sabotage and bunkering.
- **B** overstates the Collier-Hoeffler feasibility thesis; it dismisses documented environmental harm, livelihood loss, and community claims that shaped recruitment and legitimacy.
- **D** reduces African agency to external manipulation; it is not supported by evidence of local elite bargaining, militant organization, and regionally specific claims over derivation and environment.

SECTION 2A — DATA LAB

Data note: The tables below are analytical scaffolds, not a single harmonized dataset. Figures are indicative ranges and qualitative assessments drawn from World Bank resource-rent estimates, UN Panel of Experts and Group of Experts reporting, EITI disclosures, and secondary scholarship. Exact values vary by year, commodity price cycle, and measurement method; the pedagogical purpose is to compare patterns, mechanisms, and blind spots rather than to treat any cell as a precise estimate.

Table 1 — Resource rents as a share of GDP (indicative, selected African economies)

Country	Dominant rent source	Resource rents (% of GDP, indicative range)	Conflict exposure, 1990–2020	Analytical reading
Angola	Oil	Very high (often above 20%)	Prolonged civil war; militarized post-war politics	High rents with weak horizontal accountability; oil financed both state and rebels
Nigeria	Oil and gas	High (often 10–20%+)	Niger Delta insurgency; communal and electoral violence	Federal rent distribution creates regional grievance and elite capture

Country	Dominant rent source	Resource rents (% of GDP, indicative range)	Conflict exposure, 1990–2020	Analytical reading
DRC	Minerals (copper, cobalt, coltan, gold, tin, tungsten)	High but volatile	Multiple overlapping conflicts	Mineral rents fragment sovereignty; armed groups tax extraction
Sierra Leone	Diamonds	Moderate to high historically	Civil war, 1991–2002	Lootable diamonds lowered the cost of rebellion
Botswana	Diamonds	High	No major civil war	Strong institutions, developmental state, and negotiated rent management
Ghana	Gold and oil	Moderate	Localized disputes; no state collapse	Diversified economy and stronger institutional buffers

Table 2 — Conflict financing estimates and mechanisms (selected cases)

Case	Commodity	Armed-group revenue (order of magnitude)	Financing channel	Key evidentiary source
Sierra Leone, RUF, 1991–2002	Diamonds	Tens of millions of USD over the war	Mining, smuggling, cross-border networks, external patrons	UN Panel of Experts on Sierra Leone
Angola, UNITA, 1990s	Diamonds	Hundreds of millions of USD cumulatively (estimates vary)	Control of mining areas, illicit trade, regional intermediaries	UN Panel of Experts on Angola
Eastern DRC, 2000s–present	Coltan, gold, tin, tungsten	Millions of USD annually to armed groups	Mine taxation, smuggling, regional supply chains	UN Group of Experts on the DRC

Case	Commodity	Armed-group revenue (order of magnitude)	Financing channel	Key evidentiary source
Niger Delta, 2004–2009	Crude oil	Large but diffuse; not a single rebel treasury	Illegal tapping, artisanal refining, bunkering, patronage networks	National, journalistic, and academic estimates
Liberia/Sierra Leone regional diamond trade	Diamonds	Significant but poorly quantified	Cross-border smuggling, weak customs, warlord intermediaries	UN Panel of Experts reports

Table 3 — Governance and market instruments: EITI, Kimberley Process, sanctions, and due diligence

Instrument	Type	African coverage / issue area	Observed strength	Key limitation
EITI	Voluntary transparency standard	Multiple African implementing countries; extractive revenue disclosure	Publishes company-government payments; multi-stakeholder forums	Compliance does not guarantee accountability, redistribution, or peace
Kimberley Process	Certification scheme	Diamond-producing and exporting states	Reduced legal trade in conflict diamonds; created traceability norm	Narrow scope; smuggling; weak human-rights and labor criteria
UN sanctions on conflict minerals / arms	Coercive multilateral measures	DRC, Liberia, Sierra Leone, and related regional networks	Targets specific actors and networks; signals international norms	Enforcement gaps; humanitarian side effects; adaptive smuggling
OECD Due Diligence Guidance	Private-sector standard	Mineral supply chains linked to African extraction	Encourages company reporting and risk assessment	Voluntary; audit weaknesses; downstream opacity
National mining/oil codes and local-content rules	Domestic regulation	Varies by state	Can increase fiscal take and local employment	Often captured by elites; uneven enforcement

Five numbered analysis questions

1. **Trend.** Table 1 shows that several high-rent economies experienced major conflict, while Botswana and Ghana did not. What does this pattern imply about the causal status of resource rents: are they a sufficient cause, a necessary condition, a risk amplifier, or a context-dependent mechanism? In your answer, distinguish rent level from institutional mediation and from the lootability of the commodity.
2. **Level of analysis.** Match each table to the level of analysis it primarily illuminates—individual, state, systemic, or transnational. Then explain one causal claim that can only be made by combining at least two tables rather than by reading any one table alone.
3. **Perspective reconstruction (all five).** Using Table 3, reconstruct how each perspective would read the same EITI compliance score for a high-rent African state: (a) African structural critique, (b) Chinese developmental partnership, (c) Russian sovereign-choice, (d) Western governance conditionality, and (e) UN technocratic norm-building. For each, state what the perspective would count as success and what it would treat as occluded.
4. **Interpretation.** Do the combined data suggest that transparency initiatives and sanctions can substitute for a political settlement? Or do they function as complements that reduce the profitability of violence without resolving grievance, federal imbalance, or elite capture? Use at least one case from Table 2.
5. **Limitation.** Identify three major gaps in these datasets: for example, informal and artisanal extraction, gendered and racialized labor regimes, environmental degradation, downstream consumer opacity, or the difference between legal revenue and politically usable rent. Explain how each gap could bias a conclusion about "resource curse" or "greed."

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — "Rentier Funnel and the Social Contract" (hand-drawn on A4, landscape)

- **Shapes to draw:** Draw a large inverted funnel or trapezoid. At the top, draw a wide rectangle labeled "Resource rents (oil, diamonds, minerals, aid-linked rents)." Draw downward arrows into a middle box labeled "State treasury / elite and security networks." From the middle box, draw one thick arrow to a narrow bottom box labeled "Public goods (health, education, infrastructure, local development)." Draw a side branch from the middle box to a jagged box labeled "Off-budget security spending, patronage, and conflict financing."
- **Labels to place:** "High rents, low taxation," "Weak horizontal accountability," "Rentier bargaining," "Possible leakage to armed actors," "Botswana/Ghana counterexample: institutions mediate rents."
- **Perspective overlay to annotate:** In the margin, write five short tags: African: "extraction without development"; Chinese: "infrastructure-for-resources partnership"; Russian: "sovereign control over strategic resources"; Western: "governance failure and conditionality"; UN: "transparency, EITI, and sanctions." Draw a small bracket linking the side branch to the UN tag and a small bracket linking the bottom box to the African tag.

Visual 2 — "Conflict Commodity Circuit" (hand-drawn map sketch)

- **Shapes to draw:** Sketch a simplified outline of West and Central Africa. Mark nodes for Sierra Leone, Liberia, Guinea, the Niger Delta, and eastern DRC. From each node, draw arrows to coastal ports, then

from ports to global market nodes labeled "Antwerp," "Dubai," "Asian manufacturing," and "Western consumer markets." Draw dashed arrows for smuggling routes and solid arrows for legal export routes. Add barrier symbols (small "X" or fence icons) along some routes labeled "Kimberley Process," "UN sanctions," "OECD due diligence."

- **Labels to place:** "Lootable diamonds," "Oil bunkering," "Coltan/tin/tungsten," "Armed-group taxation," "Regional intermediaries," "Downstream opacity."
- **Perspective overlay to annotate:** Place a legend in the corner: African: "structural position in global extraction"; Chinese: "supply-chain and development narrative"; Russian: "Western responsibility and selective enforcement"; Western: "greed, criminal networks, and governance gaps"; UN: "sanctions, panels of experts, and traceability." Draw a red circle around the DRC node and a blue circle around the Sierra Leone node to mark the two worked-example cases.

Visual 3 — "Greed–Grievance Matrix" (hand-drawn 2x2 grid)

- **Shapes to draw:** Draw a square divided into four quadrants. Horizontal axis: "Grievance (political exclusion, environmental harm, regional inequality)" from low to high. Vertical axis: "Economic feasibility of rebellion (lootable resources, weak state capacity, external market access)" from low to high. Plot labeled dots: Sierra Leone (high/high), eastern DRC (high/high), Niger Delta militancy (high/high), non-resource ideological civil war (high grievance/low feasibility), Botswana (low grievance/high feasibility but stable), and a hypothetical "resource-rich but inclusive state" (high feasibility/low grievance).
- **Labels to place:** "Collier-Hoeffler feasibility," "Le Billon commodity specificity," "Mamdani political community," "Reno warlord markets," "Scope condition: lootability."
- **Perspective overlay to annotate:** Write along the top: "Western: greed/feasibility dominates." Write along the left: "African: grievance and structure are primary; greed is endogenous to extraction." Write along the bottom: "UN: sanctions target feasibility; peacebuilding must address grievance." Write along the right: "Chinese/Russian: sovereignty and development; external conditionality is suspect." Add a note: "Matrix is heuristic, not a predictive model."

SECTION 4 — CORNELL NOTES

Cue	Notes (source log embedded)
Resource curse: definition	Wealth in natural resources can be associated with slower growth, weaker institutions, and conflict; not an automatic law. Sources: Karl (1997); Collier and Hoeffler (2004).
Dutch disease	Resource booms can appreciate currency, shrink tradable sectors, and increase import dependence. Source: Karl (1997).
Rentier state	State relies on external rents rather than domestic taxation, weakening accountability and bargaining with citizens. Sources: Karl (1997); Reno (1998).

Cue	Notes (source log embedded)
Neo-extractivism	New scramble for minerals under global demand; bargain often favors external capital and local elites over communities. Sources: Le Billon (2001); African structural critique.
Privatization of violence	Warlords, PMCs, and armed groups commodify force; violence becomes a market activity. Source: Reno (1998).
Greed vs grievance	Collier-Hoeffler emphasize economic feasibility and rebel financing; critics emphasize political exclusion, identity, and structure. Source: Collier and Hoeffler (2004).
Sierra Leone blood diamonds	RUF rebellion financed by diamonds; Kimberley Process emerged as certification response. Sources: UN Panel of Experts (Sierra Leone); Le Billon (2001).
Nigeria Delta	Oil, federalism, environmental harm, and regional grievance shaped insurgency and amnesty politics. Sources: African and Western scholarship on petro-violence; national estimates.
EITI	Voluntary revenue transparency standard; useful but not sufficient for accountability. Source: EITI reporting and compliance data.
Kimberley Process	Diamond certification; reduced legal conflict-diamond trade but narrow scope. Source: Kimberley Process and UN reporting.
UN Panel of Experts	Investigates commodity networks, sanctions evasion, and armed-group financing. Sources: UN Panel of Experts reports (Angola, DRC, Sierra Leone).
African structural critique	Conflict is embedded in colonial state formation, global extraction, and unequal sovereignty; resource sovereignty is central. Sources: Grovogui, Mbembe, Bayart, Mamdani, Rodney, Nkrumah, and related African scholarship.

Summary (3–5 sentences): The political economy of African conflict cannot be reduced to either "greed" or "grievance" alone; resource rents, commodity lootability, institutional weakness, and global market demand interact to finance and prolong violence. African structural scholarship insists that these dynamics are rooted in colonial state formation and unequal global extraction, not merely in local corruption or rebel criminality. Transparency and sanctions instruments such as EITI, the Kimberley Process, and UN panels can constrain conflict financing, but they do not by themselves resolve political exclusion, federal imbalance, or elite capture. Cases such as Sierra Leone and the Niger Delta show that durable peace requires both interrupting commodity circuits and renegotiating the social contract around resource sovereignty.

SECTION 5 — FEYNMAN COMPRESSION

1. **Explain without jargon.** Some countries are rich in oil, diamonds, or minerals, but that wealth can make politics more violent and less accountable. When a government can fund itself from resources rather than taxes, it may ignore citizens; when rebels can fund themselves from lootable commodities, war becomes easier to sustain. The problem is not the resource itself, but the way extraction, power, and global markets are organized.

2. **Mark gaps.** I am not yet sure how to separate correlation from causation: high resource rents often appear alongside conflict, but Botswana and Ghana show that institutions and diversification matter. I also need to avoid treating "greed" as an individual moral failing rather than a structural incentive created by lootable commodities and weak regulation. My explanation currently underweights gendered labor, environmental harm, and downstream consumer responsibility.

3. **Reread verification.** Reread Collier and Hoeffler (2004) for the feasibility mechanism; Reno (1998) for warlord markets and rentier politics; Le Billon (2001) for commodity specificity; Karl (1997) for rentier states and Dutch disease; and UN Panel of Experts reports on Angola, DRC, and Sierra Leone for conflict-financing evidence. Check whether each source supports the claim I am making or only a narrower version of it.

4. **Analogy with explicit limits.** A useful analogy is an ATM in the ground: if armed actors can withdraw value from mines or pipelines with limited state resistance, violence becomes financeable. The analogy helps explain lootability and weak enforcement, but it is limited because it hides colonial history, global demand, community grievance, elite bargaining, and the fact that some resource-rich states avoid civil war through strong institutions.

5. **Rewrite.** Resource wealth becomes conflict-prone when three conditions align: the commodity is lootable or easily taxed by armed actors; state institutions are too weak or too captured to convert rents into public goods; and global markets provide buyers with limited due diligence. Transparency and sanctions can raise the cost of violent extraction, but lasting peace requires renegotiating political inclusion, resource sovereignty, and the distribution of rents.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L29	Definition	What is the resource curse?	The resource curse refers to the tendency of resource-rich states to experience slower growth, weaker institutions, and higher conflict risk than comparable resource-poor states. It is not an automatic outcome; it operates through rentierism, Dutch disease, institutional weakening, and conflict financing.	African scholarship treats it as a structural condition produced by colonial extraction and unequal global markets, not merely domestic mismanagement.
L29	Mechanism	How does Dutch disease weaken non-resource sectors?	Resource exports raise the real exchange rate, making agriculture and manufacturing less competitive internationally. The economy then narrows around extractive rents, reducing employment diversity and fiscal resilience.	Chinese and Western analysts often read this as a policy failure; African analysts often read it as a inherited structural position in the global division of labor.

Tag	Card Type	Front	Back	Perspective Note
L29	Mechanism	What is rentierism in a conflict setting?	Rentierism occurs when the state or armed actors derive revenue from external rents rather than domestic taxation, weakening accountability and making violence financeable. Rents can come from oil, minerals, aid, or illicit extraction.	This is central to African structural critiques of the post-colonial state, especially where taxation and representation were historically disconnected.
L29	Application	How did Sierra Leone's conflict illustrate resource-financed rebellion?	The Revolutionary United Front used diamond extraction and trade to fund insurgency, while state collapse and regional networks enabled illicit commodity flows. The Kimberley Process later attempted to certify rough diamonds and restrict conflict financing.	The African perspective emphasizes local grievances and state failure; the Western perspective often foregrounds rebel greed and commodity certification.

Tag	Card Type	Front	Back	Perspective Note
L29	Source	What is Reno's (1998) core claim about warlord politics?	Reno argues that in weak states, armed actors may become embedded in transnational commerce, using violence to protect market access rather than to seize the central state. Warlordism is thus a form of political economy, not merely anarchy.	This supports African and critical readings that see violence as organized extraction, not only breakdown.
L29	Source	What do Collier and Hoeffler (2004) emphasize?	They argue that economic motives, especially primary commodity dependence and lootable resources, are strong predictors of civil war onset. Their model foregrounds feasibility and financing over purely ideological grievance.	Western policy often adopted this "greed" framing; African critics argue it underweights historical injustice, state violence, and political exclusion.
L29	Debate	What is the main critique of the greed-versus-grievance binary?	The binary is analytically useful but empirically blurred: grievances can create recruitment pools, while resource rents provide feasibility and sustain violence. Many conflicts involve both, sequenced over time.	African perspectives often reject the binary as a Western abstraction that separates justice claims from material structures.

Tag	Card Type	Front	Back	Perspective Note
L29	Reconstruction	How does China frame its African mineral partnerships?	China typically presents resource and infrastructure deals as "win-win" developmental partnerships based on non-interference and mutual benefit. Critics question opacity, debt exposure, and local value capture.	This narrative challenges Western conditionality but may occlude labor, environmental, and sovereignty concerns raised by African civil society.
L29	Reconstruction	How does Russia frame African resource politics?	Russia often emphasizes Western responsibility for instability and presents sovereign choice and security cooperation as alternatives to Western governance conditionality.	This can resonate with anti-imperial African narratives while potentially obscuring accountability for private military and extractive arrangements.
L29	Occlusion	What does the Western "greed" framework often occlude?	It can occlude colonial legacies, state predation, racialized extraction, and the role of international buyers and financiers in sustaining conflict economies.	African structural critiques insist that external demand and historical inequality are part of the causal chain.

Tag	Card Type	Front	Back	Perspective Note
L29	Adjudication	When should grievance be treated as primary rather than secondary?	Grievance is primary when violence is preceded by documented exclusion, repression, or distributive injustice and when resource rents mainly sustain rather than initiate mobilization.	This requires case-level evidence rather than cross-national correlation alone.
L29	Visual	What should a rentier-state diagram show?	It should show rents flowing from extractive sectors and external actors to state elites, with weak tax links to citizens and feedback loops into patronage and coercion.	The diagram should also show African agency: civil society, regional organizations, and reform coalitions contesting rent capture.
L29	Comparison	How do EITI and sanctions differ as responses?	EITI targets transparency and revenue disclosure, while sanctions target specific actors, commodities, or networks. EITI is preventive and institutional; sanctions are coercive and often retrospective.	African governments may support EITI as sovereignty-compatible reform, while viewing sanctions as externally imposed and unevenly enforced.

Tag	Card Type	Front	Back	Perspective Note
L29	Source	What do UN Panel of Experts reports contribute?	They document illicit resource flows, sanctions evasion, and networks linking armed groups, companies, and states. They are evidentiary and accusatory but depend on access, politics, and enforcement capacity.	They often validate African claims about external complicity while also risking securitized framing of African conflicts.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence Audit

Skill or Concept	Confidence (0-100)	Evidence of Mastery	Remaining Gap
Defining resource curse mechanisms		Can name rentierism, Dutch disease, institutional weakening, conflict financing	Need to specify scope conditions and counterexamples
Explaining rentier state dynamics		Can link rents to taxation, accountability, and patronage	Need to distinguish oil, minerals, and aid rents
Applying greed-grievance debate		Can summarize Collier-Hoeffler and critique	Need to adjudicate with case-level evidence
Reconstructing five perspectives		Can identify African, Chinese, Russian, Western, UN stances	Need to avoid caricature and steel-man each
Using Sierra Leone and Nigeria cases		Can describe resource financing and grievance	Need to connect to levels of analysis

7.2 Three-Question Debrief

1. Which of the five perspectives most changed your initial view of African conflict, and what evidence would be needed to sustain that revision?

2. Can you explain one mechanism from this lesson without using the words “corruption,” “greed,” or “failed state”?
3. What is one prediction this lesson generates, and what observation would falsify it?

7.3 Error Log

Common Misconception	Correction	Evidence
Resource wealth automatically causes war.	Resource wealth raises risk only under conditions such as weak institutions, lootable commodities, and accessible financing networks.	Collier and Hoeffler (2004) treat commodity dependence as a risk factor, not a deterministic trigger.
African conflicts are mainly about rebel greed.	Grievance, exclusion, and state violence often shape mobilization; resources may finance and prolong violence rather than originate it.	Le Billon (2001) and Reno (1998) emphasize political economy and market embeddedness.
Rentier states are simply corrupt states.	Rentierism is a structural relation between revenue source, state capacity, and citizen accountability, not only individual malfeasance.	Karl (1997) links oil rents to state-society bargains and institutional paths.
Sanctions always stop conflict financing.	Sanctions can displace trade, create smuggling networks, and harm civilians unless paired with enforcement and alternative livelihoods.	UN Panel of Experts reports on Angola, DRC, and Sierra Leone document evasion and enforcement gaps.
Transparency initiatives alone transform resource governance.	EITI improves disclosure but does not by itself redistribute power, enforce contracts, or resolve historical grievances.	EITI membership and compliance data must be read alongside political and institutional context.

SECTION 8 — CHEATSHEET

Core Concepts	Key Mechanisms	Theories and Authors	Cases and Evidence	Debates	Falsifiers	Cross-links
Resource curse; rentier state; neo-extractivism; privatization of violence; greed vs grievance	Rentierism; Dutch disease; institutional weakening; conflict financing; warlord market embeddedness; transparency and sanctions	Karl (1997); Reno (1998); Le Billon (2001); Collier and Hoeffler (2004); UN Panel of Experts reports	Sierra Leone blood diamonds; Nigeria Delta insurgency; Angola, DRC, Sierra Leone panels; EITI compliance data	Greed vs grievance; sovereignty vs conditionality; transparency vs enforcement; external complicity vs domestic agency	No conflict despite high rents; conflict without lootable resources; sustained reform under rentierism; sanctions with no displacement	L17 world-systems; L23 asymmetric warfare; L27 colonial state formation; L33 critical minerals; L34 Sahel; L46 hydrocarbons

SECTION 9 — REVIEW SCHEDULE

Interval	Timing	Concrete Action	Output
R1	Day 1, 20 minutes	Re-read Key Ideas 1-2 and redraw the rentier-state diagram from memory	One-page mechanism sketch
R2	Day 3, 30 minutes	Reconstruct all five perspectives on Sierra Leone without notes	Five short paragraphs
R3	Day 7, 45 minutes	Apply the greed-grievance adjudication test to Nigeria's Delta case	Memo-style argument with falsifiers
R4	Day 14, 60 minutes	Compare EITI and sanctions using data-lab tables	Table with trend, level, perspective, limitation
R5	Day 30, 90 minutes	Write a timed essay answering the hinge question and grade it against the rubric	Self-graded essay plus error-log update

SECTION 10 — COMPLETION CHECKLIST

☐ I can define the resource curse and name its four mechanisms.
☐ I can explain Dutch disease and rentierism with causal steps.

- ☐ I can distinguish oil rents, mineral rents, and aid rents.
- ☐ I can summarize Reno (1998) on warlord politics.
- ☐ I can summarize Collier and Hoeffler (2004) and identify its limits.
- ☐ I can adjudicate greed versus grievance using case-level evidence.
- ☐ I can reconstruct the African perspective as primary and structural.
- ☐ I can reconstruct Chinese, Russian, Western, and UN perspectives without caricature.
- ☐ I can apply individual, state, systemic, and transnational levels of analysis.
- ☐ I can use Sierra Leone as a worked example.
- ☐ I can use Nigeria's Delta as a problem-pair case.
- ☐ I can interpret resource rents as a percentage of GDP.
- ☐ I can explain EITI membership and compliance.
- ☐ I can explain conflict-mineral sanctions and their limits.
- ☐ I can identify at least two falsifiers for a resource-conflict claim.
- ☐ I can complete the independent memo headings.
- ☐ I can answer the hinge question and diagnose distractors.

FURTHER READING (Optional)

Resource curse and rentierism - Karl, T. L. (1997). *The Paradox of Plenty: Oil Booms and Petro-States*. - Collier, P. and Hoeffler, A. (2004). Greed and Grievance in Civil War.

Privatization of violence and conflict economies - Reno, W. (1998). *Warlord Politics and African States*. - Le Billon, P. (2001). The political ecology of war: Natural resources and armed conflicts.

UN evidence and sanctions - UN Panel of Experts reports on Angola, the Democratic Republic of the Congo, and Sierra Leone.

Data and institutional sources - World Bank data on resource rents as a percentage of GDP. - Extractive Industries Transparency Initiative (EITI) membership and compliance records. - Kimberley Process Certification Scheme documentation.

End of Lesson 29. Say **Next** when you are ready.

31. Regional Security Complexes: Sahel, Horn, and Great Lakes

LESSON METADATA

Field	Value
Lesson number and title	30 — Regional Security Complexes: Sahel, Horn, and Great Lakes
Module	Module 5: African Geopolitical Architecture
Prerequisites	L23 (asymmetric warfare), L29 (conflict political economy), L27 (colonial state formation)
Interleaved links	Forward to L31 (great power competition), L34 (Sahel synthesis), L44 (proxy warfare)

Field	Value
Reading load	7-9 hours
Content channels	Text, Data Lab, Visual Anchor, Cornell Notes, Flashcards, Feynman Compression, Spaced Repetition
Bloom ceiling	Evaluate / Create
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

The central puzzle of this lesson is why large parts of Africa are governed not by the tidy Westphalian map that appears in atlases but by overlapping, transnational fields of violence, alliance, and extraction that repeatedly defeat both state-centric and great-power-centric explanation. Since 2012 the Sahel has seen jihadist insurgencies expand from northern Mali across Burkina Faso and into Niger, while state forces, Russian paramilitaries, and Western missions have competed for control of territory and legitimacy. The Horn of Africa has moved from the Ethiopia-Eritrea rapprochement of 2018 through the Tigray war, the Sudanese civil war, and the militarization of the Red Sea, with Gulf states now operating as security patrons. The Great Lakes region has seen the resurgence of the M23 rebellion in eastern Democratic Republic of Congo, with documented Rwandan and Ugandan involvement, layered over a mineral economy that funds armed groups and shapes state behavior. These are not three separate civil wars. They are three regional security complexes: clusters of states and non-state actors whose security is so interdependent that no single unit can be understood in isolation. The lesson exists to teach you how to see, explain, and evaluate such complexes rather than to narrate their headlines.

This lesson sits at a deliberate junction in the curriculum. You have already studied asymmetric warfare in L23, which gave you the tactical and organizational logic of insurgencies such as JNIM and ISSP but not the regional architecture that lets them move, recruit, and survive across borders. You have studied conflict political economy in L29, which explained how war becomes self-financing through minerals, smuggling, and taxation, but not how those economies are embedded in cross-border networks of patrons and proxies. You have studied colonial state formation in L27, which traced the arbitrary borders, weak institutions, and extractive legacies that make African states vulnerable, but not how those weaknesses interact across frontiers to produce regional, rather than merely national, disorder. This lesson synthesizes those three streams. It asks you to hold tactical, economic, and historical explanations in the same frame and to decide which mechanism dominates in which case and at which level of analysis.

What is at stake is both intellectual and practical. Intellectually, the lesson tests whether Regional Security Complex Theory, developed by Buzan and Wæver (2003) in a largely Euro-Atlantic and Cold War register, can travel to Africa without being distorted by the very state-centrism it was meant to overcome. The theory's core claim is that security interdependence is regionally clustered because threats travel more easily over short distances and among neighbors with shared histories. Africa is the hardest case for this claim because colonial borders cut across ethnic and economic zones, postcolonial states are often weak, and external powers penetrate deeply. Practically, the stakes are visible in policy failures: the withdrawal of MINUSMA from Mali in 2023, the collapse of the G5 Sahel joint force, the uncertain transition from AMISOM to ATMIS in Somalia, and the repeated inability of the African Union Peace and Security Council to enforce its own decisions. If you cannot distinguish a regional complex from a collection of national crises, you will

misdiagnose the lever of intervention and overestimate what external force can achieve.

The method you will learn is deliberately multi-layered. You will work with four levels of analysis carried forward from Lesson 1: individual, state, systemic, and transnational. You will identify mechanisms rather than outcomes, because describing that JNIM controls territory is not the same as explaining how it governs, taxes, and recruits. You will reconstruct five perspectives on every case—African, Chinese, Russian, Western, and UN—steel-manning each from within, because the same event reads differently from Bamako, Beijing, Moscow, Paris, and New York, and because policy failure often follows from perspective blindness rather than from lack of information. You will also learn to specify falsifiers: what evidence would make you abandon a favored explanation. This is the difference between analysis and advocacy, and it is the skill that separates a graduate-level security assessment from a briefing note.

By the end of the lesson you will be able to do four things that you could not do before. First, you will be able to map a regional security complex by identifying its units, its patterns of amity and enmity, its penetration by external powers, and its overlay of transnational threats such as jihadist networks or mineral supply chains. Second, you will be able to adjudicate between competing explanations of the same violence—state fragility versus regional interdependence versus great-power competition—on the basis of evidence rather than ideological preference. Third, you will be able to evaluate the operational efficacy of African regional security institutions such as ECOWAS, IGAD, SADC, and the APSA framework, specifying when they have worked, when they have failed, and why. Fourth, you will be able to produce an independent memo that distinguishes description, explanation, prediction, and prescription, and that tests its own claims against explicit falsifiers. These capacities are the building blocks for the later lessons on great power competition, Sahel synthesis, and proxy warfare, which assume that you can already see the regional substrate on which those processes operate.

The lesson is organized to move from theory to case to institution to judgment. Key Idea 1 introduces Regional Security Complex Theory and its African application, including the modifications that African scholarship demands. Key Idea 2 dissects the Sahel insurgency ecosystem, treating JNIM, ISSP, state forces, and Russian paramilitaries as parts of one field rather than as separate actors. Key Idea 3 examines Horn of Africa fragmentation, including the roles of Ethiopia, Eritrea, Somalia, Sudan, and Gulf states. Key Idea 4 turns to the Great Lakes and the politics of minerals in the DRC, Rwanda, and Uganda. Key Idea 5 evaluates the operational efficacy of APSA, ECOWAS, IGAD, and SADC. Section 2.7 then reconstructs all five perspectives in depth on the lesson's central topic as a whole, with the African perspective primary and longest. The worked example traces the Sahel from the 2012 Tuareg rebellion to contemporary JNIM and ISSP control of territory. The problem pair asks you to treat the Tigray war, the Sudan civil war, and the Red Sea crisis as a single complex. The data lab grounds all of this in ACLED event data, fatality trends, AU PSC interventions, and external military presence. You should approach the lesson not as a survey of African conflicts but as a training in structural seeing: the ability to look at a map of violence and ask not only who is fighting but what kind of interdependent system makes the fighting possible, durable, and resistant to the solutions that outsiders prefer.

SECTION 1 — Pre-Class Priming

1.1 Retrieval warm-up Answer each question from memory before checking your notes. The purpose is to activate the conceptual vocabulary you will need in this lesson.

1. From L23 (asymmetric warfare): Define asymmetric warfare and identify one African case in which a

weaker non-state actor has used mobility, local knowledge, and population support to offset a stronger state's conventional advantage.
2. From L29 (conflict political economy): Explain how the "greed versus grievance" debate reframes civil war as an economic enterprise, and give one mechanism by which war becomes self-financing in an African setting.
3. From L27 (colonial state formation): What institutional legacy of colonial rule most weakens post-colonial state capacity, and how does that legacy shape the state's ability to monopolize legitimate force?
4. From Lesson 1 (levels of analysis): Name the four levels of analysis used throughout this curriculum and give one example of a claim that belongs at the transnational level rather than the state level.
5. From L23 (counterinsurgency): What is the logic of population-centric counterinsurgency, and what is the strongest critique of applying that logic in contexts where the state itself is perceived as predatory?
6. From L29 (resource wars): Distinguish "point resources" from "diffuse resources" in the political economy of conflict, and explain why the distinction matters for the duration and termination of war.

1.2 Orientation questions These questions frame the puzzles you should carry into the lesson. You are not expected to answer them fully before reading; they are prompts for the analysis to come.

1. Regional Security Complex Theory was developed primarily with reference to Cold War Europe and post-Cold War regions such as the Middle East. What modifications are required for it to describe African realities in which state capacity is uneven, borders are porous, and external powers are deeply embedded?
2. Is the Sahel best understood as a single regional security complex stretching from Mauritania to Sudan, or as several overlapping complexes with distinct centers of gravity? What evidence would decide between these readings?
3. How has the entry of Gulf states—Qatar, the United Arab Emirates, Saudi Arabia, and Turkey—into Horn of Africa security politics changed the structure of that complex, and does their involvement make it more or less amenable to African institutional management?
4. What would constitute convincing evidence that an African regional security institution such as ECOWAS or IGAD is operationally effective, as opposed to merely active? Conversely, what evidence would falsify the claim that such institutions are systematically ineffective?

1.3 Vocabulary pre-teach Provisional definitions to be refined as you read. These are working meanings, not final authorities.

- **Regional Security Complex (RSC):** A set of states and other actors whose security concerns are so interlinked that they cannot be analyzed or resolved in isolation; threats and alliances cluster regionally rather than globally.
- **Security interdependence:** The condition in which the security of one unit is affected by the actions, capabilities, or vulnerabilities of others in the same region, whether through direct threat, alliance obligation, or shared exposure to transnational risks.
- **Insurgency ecosystem:** The network of armed groups, financiers, smugglers, local elites, and state defectors that sustains an insurgency beyond its initial grievance, including taxation, recruitment, and governance functions.
- **JNIM (Jama'at Nasr al-Islam wal Muslimin):** An al-Qaeda-affiliated coalition formed in 2017 in

the Sahel, uniting several jihadist groups and operating across Mali, Burkina Faso, and Niger with a strategy of embedding in local conflicts.

- **ISSP (Islamic State in the Greater Sahara / Sahel Province):** An Islamic State-affiliated group operating in the Sahel, competing and sometimes cooperating with JNIM, and distinguished by more spectacular violence and transnational framing.
- **APSA (African Peace and Security Architecture):** The AU's framework for conflict prevention, management, and resolution, comprising the Peace and Security Council, the Continental Early Warning System, the African Standby Force, and related mechanisms.
- **ECOWAS (Economic Community of West African States):** A regional economic and political community that has developed security roles, including mediation, sanctions, and military intervention, most visibly in West Africa.
- **IGAD (Intergovernmental Authority on Development):** A regional body in the Horn of Africa with mandates covering drought, development, and peace and security, including mediation in Sudan and Somalia.
- **SADC (Southern African Development Community):** A regional organization whose security organ has intervened in conflicts such as those in the DRC and Lesotho, with mixed results.
- **AU PSC (African Union Peace and Security Council):** The AU's standing decision-making body on peace and security, with authority to authorize interventions, impose sanctions, and deploy missions, though its enforcement capacity is limited.
- **Proxy warfare:** Conflict in which external actors support local armed groups or states to advance their interests while avoiding direct engagement, often obscuring lines of accountability.
- **State fragility:** A condition in which a state lacks the capacity or legitimacy to perform core functions such as security provision, revenue collection, and service delivery, creating space for non-state actors.

SECTION 2 — LESSON CORE

2.1 Learning objectives

By the end of this lesson, the student will be able to: (1) **Define** Regional Security Complex Theory (RSCT) as formulated by Buzan and Wæver, identifying its constitutive variables—geographic proximity, security interdependence, patterns of amity and enmity, polarity, and great-power penetration—and explain why the theory treats regional, not global, security as the primary unit of analysis. (2) **Apply** RSCT to three African sub-regional complexes (Sahel, Horn of Africa, Great Lakes), specifying in each case the dominant securitization moves, the principal state and non-state actors, and the direction of security externalities across borders. (3) **Evaluate** the operational efficacy of African regional security institutions—APSA, ECOWAS, IGAD, SADC—against the standard of whether they have reduced violence or merely managed its symptoms, using ACLED-derived fatality trends and AU PSC intervention records as evidence. (4) **Analyze** the Sahel insurgency ecosystem (JNIM, ISSP, state forces, Russian paramilitaries) as a case of complex-level securitization failure, distinguishing structural causes (colonial state formation, political economy of conflict) from proximate triggers (Tuareg rebellion, coup cycles). (5) **Adjudicate** between competing explanations of regional insecurity—state-centric, regime-security, transnational jihadist, and great-power-competition accounts—by specifying the falsifying evidence for each and identifying which perspective (African, Chinese, Russian, Western, UN) each explanation privileges. Each objective is assessable through short-answer, case-application, or adjudication tasks; the Bloom ceiling for this lesson is evaluation-level synthesis across

levels of analysis.

2.2 KEY IDEA 1 — Regional Security Complex Theory (Buzan and Wæver) applied to Africa

Bolded Causal Claim: Regional security complexes are not merely geographic clusters of conflict; they are *constituted* by patterns of security interdependence among proximate states, such that the security of each member becomes inseparable from the security of the others, and African complexes are distinctive because their interdependence is produced as much by state weakness and non-state violence as by interstate rivalry.

Mechanism: The theoretical lineage runs from Barry Buzan's *People, States and Fear* (1983, revised 1991), which argued that security studies had been captured by a state-centric, military, and superpower-centric agenda, through to Buzan and Ole Wæver's *Regions and Powers: The Structure of International Security* (2003), which systematized the regional level as an autonomous analytic plane between the state and the global system. The core mechanism is *securitization*—the speech-act process by which an issue is constructed as an existential threat requiring emergency measures beyond normal politics—combined with *regionalization*: because threats travel more easily across short distances and because states interact most intensely with neighbors, security concerns cluster geographically into complexes. A regional security complex (RSC) is defined by Buzan and Wæver as a set of states whose major security concerns are so interlinked that their national securities cannot reasonably be considered apart from one another. Within an RSC, the pattern of amity and enmity among members, the distribution of power (unipolar, bipolar, multipolar), and the degree of great-power penetration together determine the complex's structure. The African application is where the theory becomes most contested. Buzan and Wæver classify much of Africa as a "supercomplex"—a loose, weakly integrated aggregate of subcomplexes characterized by low state capacity, high internal conflict, and extensive external penetration—rather than as a set of mature, self-contained regional complexes. The mechanism producing African complexes is therefore not primarily interstate security dilemmas among capable states, as in Cold War Europe, but rather the *spillover of internal disorder*: refugee flows, arms trafficking, insurgent mobility, and the contagion of coups and rebellions across porous borders. In the Sahel, a Tuareg rebellion in northern Mali (2012) cascaded into state collapse, jihadist territorial control, and the displacement of populations into Burkina Faso and Niger; in the Horn, the Tigray war (2020–2022) drew in Eritrea and reshaped Red Sea geopolitics; in the Great Lakes, the 1994 Rwandan genocide and subsequent Congo wars created a regional system of proxy militias and mineral economies that persists three decades later. The mechanism is thus *transnationalization of internal conflict*: weak states cannot contain violence, so violence becomes regional, and regional actors—states, militias, external powers—then securitize the resulting threats, deepening interdependence. This is why RSCT's African application must be read alongside the literature on state fragility and political economy of conflict (de Waal 2015; Williams 2018), not as a standalone theory of interstate relations.

Scope Conditions: RSCT applies most cleanly where (a) states possess sufficient capacity to be the primary security actors, (b) geographic proximity generates regular interaction, and (c) threats are predominantly military or political-military. In Africa, condition (a) is frequently violated: non-state actors—jihadist insurgencies (JNIM, ISSP, al-Shabaab), militias, and private military companies—often outperform states in territorial control and coercion. Where state capacity collapses, the complex is better described as a *security vacuum* or *hybrid complex* in which non-state actors are co-constitutive. Condition (b) holds but is complicated by overlapping complexes: the Sahel complex bleeds into the West African coastal complex and the North African complex; the Horn complex intersects with the Red Sea and Gulf complexes; the Great Lakes complex is entangled with Central and East African systems. Condition (c) is violated insofar

as African security threats are routinely securitized as development, humanitarian, or criminal issues, blurring the military-political boundary that RSCT assumes. The theory also struggles with *penetration*: Buzan and Wæver acknowledge that external powers penetrate African complexes, but their framework treats penetration as a modifier of an existing complex rather than as a constitutive force. In contemporary Africa, external actors—France, Russia, the UAE, Turkey, the United States—are not merely modifiers; they are active participants in shaping security outcomes, sometimes as the dominant coercive actors. Finally, RSCT's Eurocentric lineage means its categories (amity/enmity, polarity) presuppose a Weberian state system that much of Africa does not approximate; applying it uncritically risks misreading African politics as failed European politics rather than as a distinct political form.

Observable Implications: If RSCT holds for Africa, we should observe: (i) conflict diffusion along geographic contiguity—violence in one state predicts violence in neighbors within 2–5 years, controlling for domestic factors; (ii) regional institution-building as a securitization response—ECOWAS, IGAD, SADC, and the AU Peace and Security Council emerging precisely where complexes are densest; (iii) external power basing and intervention clustering in the same regions (French Barkhane in the Sahel, Russian Africa Corps in Mali/CAR, Turkish and Emirati involvement in the Horn); (iv) refugee and arms corridors tracing complex boundaries; (v) the failure of "African solutions to African problems" rhetoric where penetration is high, because external actors have divergent interests. ACLED data (2010–2025) show fatality concentration in precisely these three complexes, with the Sahel overtaking other regions after 2015 and the Horn spiking during the Tigray war and Sudan civil war. The implication is testable: if regional security complexes are real, then regional (not national) variables should explain more variance in conflict onset than country-level variables alone. Williams (2018) and de Waal (2015) both suggest this is partially true but that regime-level and political-economy variables often dominate.

Perspective Note (five traditions in brief):

African (primary): African scholarship treats regional security complexes not as neutral analytic categories but as historically produced structures of domination and solidarity. Grovogui (2006) argues that African regionalism is rooted in anti-colonial solidarity and the Pan-African project, not in the European balance-of-power logic that RSCT presupposes; the African perspective thus reads RSCT as a theory that *describes* interdependence but *occludes* the colonial origins of African statehood and the Pan-African aspiration to transcend it. Mamdani (1996) and Mbembe (2001) remind us that the "state" in African complexes is often a bifurcated institution—citizen and subject—so that security interdependence is experienced differently by elites and populations. From this vantage, the relevant question is not whether Africa has regional security complexes but whether African regional institutions (APSA, ECOWAS, IGAD) can convert complex-level interdependence into collective security rather than into shared vulnerability. The African perspective privileges sovereignty, regional ownership, and the norm of "African solutions to African problems," while critiquing both Western interventionism and the theory's tendency to treat Africa as an immature or failed version of Europe. It is the longest and most developed perspective in this lesson because it frames the central puzzle: why do African regional complexes persistently generate insecurity despite dense institutional architecture?

Chinese: Beijing's perspective treats RSCT as a useful descriptive map but rejects its normative implications. China's non-interference principle means it does not securitize African conflicts as existential threats to itself; instead, it frames security cooperation as technical assistance—training, equipment, peacekeeping contributions—within bilateral and FOCAC frameworks. The Chinese view sees regional complexes as arenas where economic interdependence (Belt and Road, resource extraction) creates stakes in stability without

requiring political-military integration. It occludes the political drivers of conflict and the possibility that economic engagement itself reshapes security dynamics.

Russian: Moscow's perspective instrumentalizes RSCT for great-power competition. Russian analysts and officials frame African complexes as spaces where Western (especially French and American) dominance is eroding, creating openings for Russian penetration via Africa Corps and arms sales. The anti-Western framing treats regional insecurity as partly produced by Western interventionism (Libya 2011, Sahel counterterrorism failures) and positions Russia as a sovereignty-respecting alternative. This perspective occludes Russian commercial and extractive interests and the documented abuses by Russian paramilitaries.

Western: Western perspectives (US, EU, France) treat RSCT as a planning tool for regional stabilization and counterterrorism. The emphasis is on building partner capacity, supporting regional institutions, and managing spillover. Since the Sahel and Afghanistan failures, there is significant self-critique: stabilization is now seen as over-militarized, under-political, and insufficiently attentive to governance. This perspective occludes the colonial and neo-colonial dimensions of Western presence and the ways in which Western securitization (e.g., "war on terror") may have amplified threats.

UN: The UN perspective treats regional complexes as the appropriate scale for peacekeeping and peacebuilding mandates. MINUSMA in Mali, AMISOM/ATMIS in Somalia, and MONUSCO in the DRC are all designed around complex-level logics. The UN emphasizes regionalization of mandates, partnerships with AU and regional organizations, and the protection of civilians. It occludes, however, the political constraints on mandate design (Security Council politics, host-state consent) and the gap between mandate ambition and resource provision. The UN view is that regional complexes require regional solutions, but that the international community must underwrite them—a tension central to the lesson's puzzle.

SECTION 2.3 KEY IDEA 2 — The Sahel insurgency ecosystem: JNIM, ISSP, state forces, Russian paramilitaries, and the failure of counterterrorism

Bolded Causal Claim: In the Sahel, a counterterrorism-first security order has helped produce an insurgency ecosystem in which JNIM, ISSP, state forces, and Russian paramilitaries are not separate actors but mutually constitutive parts of a regional violence market; insurgent expansion is driven less by ideology alone than by the political economy of protection, predation, and state absence, while external military interventions have repeatedly treated symptoms without altering the social contracts that make violence profitable.

Mechanism: Regional Security Complex Theory (Buzan and Wæver 2003) is useful here because the Sahel is not a collection of national insurgencies but a transnational security complex in which Mali, Burkina Faso, and Niger share threat perceptions, armed-group mobility, and intervention spillovers. JNIM operates as a coalition of jihadist groups with local grievances and transnational affiliations, while ISSP represents a rival Islamic State franchise; their competition can intensify violence even where one group is weakened. The mechanism is not simply "terrorists exploit weak states." Rather, armed groups embed in local political economies: they tax trade, regulate artisanal mining, adjudicate disputes, and offer protection in areas where the state is absent, predatory, or abusive. State forces, often undertrained and under-resourced, may respond through collective punishment, ethnic profiling, or militarized sweeps that alienate communities and create recruitment pools. Coups in Mali (2020, 2021), Burkina Faso (2022), and Niger (2023) then reconfigure the security architecture, replacing civilian oversight with military regimes that prioritize regime survival. External actors enter this ecosystem through different logics: France and its partners framed the Sahel as

a counterterrorism theater; Russia, through Wagner and later Africa Corps, frames itself as an anti-Western security provider; regional organizations attempt coordination but face sovereignty and capacity constraints. The result is a feedback loop: counterterrorism operations displace fighters across borders; displacement creates new grievances; new grievances legitimate further militarization; and militarization deepens the political marketplace in which violence is exchanged for resources and authority. De Waal's (2015) analysis of the political marketplace is relevant because Sahelian violence can be understood as a system in which armed actors, state elites, and external patrons bargain over protection and predation rather than over public goods. Williams (2018) on African peace and security institutions also helps explain why regional mechanisms struggle when member states are themselves parties to the conflict or when mandates are under-resourced. ACLED reporting on the Sahel (2023–2025) documents the scale of this ecosystem through rising fatalities, expanding territorial contestation, and the diffusion of violence from northern Mali into central Mali, Burkina Faso, and western Niger.

Scope Conditions: This mechanism is strongest where four conditions coincide: (1) state capacity is thin in rural and borderland areas; (2) communal grievances—especially between pastoralist and farming communities, or between ethnic groups—are politicized by armed actors; (3) external intervention is organized around counterterrorism rather than political settlement; and (4) post-coup regimes depend on military and paramilitary partners for survival. It is weaker where states maintain inclusive local governance, where regional organizations have enforcement capacity, or where armed groups lack access to cross-border sanctuaries and revenue streams. The mechanism also has temporal scope: it explains the post-2012 escalation and the post-2020 coup period better than the earlier Tuareg rebellions, which were more narrowly ethno-regional. It does not imply that all Sahelian violence is jihadist; banditry, communal militias, and state abuses are distinct but interacting components of the same ecosystem.

Observable Implications: If this mechanism holds, one should observe (a) territorial control or at least freedom of movement by JNIM and ISSP in rural zones despite national capitals remaining under state control; (b) rising civilian fatalities associated with both insurgent attacks and state/paramilitary operations; (c) displacement and food insecurity concentrated in borderlands; (d) coups justified by security failure; (e) French and European withdrawal alongside expanded Russian paramilitary presence; (f) ECOWAS and AU difficulty in enforcing norms against coup regimes; and (g) a shift in external rhetoric from "stabilization" to "regime security." ACLED data and Crisis Group reporting on the Sahel are consistent with these implications, particularly the geographic spread of violence and the increasing role of non-state armed actors. One should also observe that counterterrorism successes—such as the killing of senior jihadist leaders—do not necessarily reduce violence, because leadership decapitation can fragment groups into more predatory local factions.

Perspective Note (five traditions in brief):

African (primary): The African perspective begins from the premise that Sahelian insecurity is not an external terrorist threat imported into an otherwise stable region but a crisis of state-society relations, regional order, and post-colonial sovereignty. African scholars such as Mamdani (on the bifurcated state and citizen/subject distinction), Bayart (on the politics of the belly and extraversion), Mbembe (on necropolitics and the commandement), and Grovogui (on sovereignty and international order) provide tools for seeing how colonial administrative legacies, authoritarian centralization, and externally driven security agendas have hollowed out legitimate authority. From this vantage, JNIM and ISSP are not merely terrorist organizations; they are symptoms of a broader collapse in the social contract, especially in peripheral regions where the state has historically extracted rather than protected. African perspectives also emphasize regional ownership:

ECOWAS, the AU, and Sahelian states themselves should define threats and responses, rather than having priorities set by Paris, Washington, or Moscow. Nkrumah's and Nyerere's visions of pan-African solidarity and non-alignment are invoked to argue that external military bases and paramilitary deployments reproduce dependency. Cabral's and Fanon's analyses of liberation and violence are used more cautiously: they warn that anti-colonial or anti-Western rhetoric can mask new forms of domination, including by African military elites. Aning and Danso's work on African security governance highlights the gap between institutional design and political will, while Tamale and Oyěwùmí remind us that security is gendered and that women's bodies and labor are often the terrain on which "stability" is negotiated. The African perspective's strength is that it centers legitimacy, sovereignty, and local political economy; its risk is that "African solutions" can be invoked by authoritarian regimes to deflect accountability.

Chinese: China's perspective is shaped by non-interference, economic interests, and a preference for state-to-state security cooperation. Beijing generally supports Sahelian governments, including post-coup regimes, through diplomatic recognition, infrastructure, and limited security assistance, while avoiding large-scale military intervention. It frames terrorism as a threat to development and Belt and Road projects, but its rhetoric emphasizes sovereignty and non-interference more than counterterrorism. This perspective contributes a critique of Western interventionism and an alternative model of security-development linkage; it occludes, however, the ways in which Chinese economic engagement can reinforce extractive state practices and the limited transparency of security cooperation.

Russian: Russia's perspective, articulated through Wagner and Africa Corps, frames the Sahel as a theater of anti-Western realignment. It offers regime protection, counterinsurgency support, and disinformation capacity in exchange for political alignment and resource access. The Russian narrative presents itself as respecting sovereignty and opposing neo-colonialism, while Western actors are depicted as failed interveners. This perspective contributes a challenge to Western monopoly over security assistance; it occludes the documented abuses by paramilitaries, the lack of accountability, and the possibility that Russian support deepens authoritarianism without reducing insurgent capacity.

Western: The Western perspective, especially French and U.S., has been dominated by counterterrorism, stabilization, and partner-capacity building. It emphasizes the transnational threat of jihadist groups, the need to protect civilians, and the importance of governance and development. Its self-critique—especially after the failures of Operation Barkhane and MINUSMA—acknowledges that military solutions without political reform were insufficient and that local legitimacy matters. This perspective contributes operational capacity and intelligence; it occludes, however, the ways in which securitization can militarize politics and how Western threat framings may have amplified the very insurgencies they sought to contain.

UN: The UN perspective treats the Sahel as a complex requiring integrated peacekeeping, peacebuilding, and humanitarian action. MINUSMA's mandate combined security, political, and human-rights tasks, reflecting the UN view that counterterrorism alone cannot resolve insurgency. The UN emphasizes civilian protection, regional partnerships, and the limits of military force. It occludes, however, Security Council politics, host-state consent constraints, and the gap between mandate ambition and resources. The UN view is that regional complexes require regional solutions underwritten by international support—a tension central to the Sahel case.

SECTION 2.4 KEY IDEA 3 — Horn of Africa fragmentation: Ethiopia, Eritrea, Somalia, Sudan, and Gulf state involvement

Bolded Causal Claim: The Horn of Africa is a regional security complex in which state fragmentation, interstate rivalry, and Gulf-state proxy competition are mutually reinforcing; the Tigray war, Sudan's civil war, and Red Sea insecurity are not separate crises but linked manifestations of a regional order in which sovereignty is contested, maritime chokepoints are securitized, and external patrons convert local conflicts into geopolitical assets.

Mechanism: Buzan and Wæver's (2003) framework helps explain why the Horn functions as a tightly coupled security complex: threats, alliances, and interventions travel quickly across Ethiopia, Eritrea, Somalia, Sudan, Djibouti, and the Red Sea littoral. The mechanism begins with contested sovereignty. Ethiopia's ethnic federal system, Eritrea's militarized state, Somalia's incomplete state-building, and Sudan's post-Bashir transition all create arenas in which armed actors can mobilize around identity, territory, and resources. The Tigray war (2020–2022) demonstrated how federal-regional tensions, historical grievances, and external alliances can escalate into mass violence; Eritrea's involvement showed that interstate rivalries can override formal sovereignty. Sudan's civil war (from 2023) illustrates a different but related mechanism: a power struggle between the Sudanese Armed Forces and the Rapid Support Forces became a regionalized conflict involving Egypt, the UAE, Saudi Arabia, Chad, and others, with gold, logistics, and Red Sea access as stakes. Somalia remains a third node: Al-Shabaab's insurgency, federal-regional tensions, and the transition from AMISOM to ATMIS reveal the difficulty of building state capacity under external security dependence. Gulf states add a maritime-geopolitical layer. The UAE, Saudi Arabia, Qatar, and Turkey have invested in ports, military bases, and political alliances around the Red Sea and Gulf of Aden, treating the Horn as a strategic corridor linking Africa, the Middle East, and global trade. This creates a proxy-competition mechanism: local actors gain resources and legitimacy by aligning with external patrons, while patrons gain influence without direct occupation. The Red Sea crisis—whether through Houthi attacks, piracy, or militarization—then feeds back into Horn politics by increasing the value of ports, bases, and naval access. The result is a regional complex with no single hegemon, multiple overlapping rivalries, and weak institutional mediation. IGAD, the AU, and the UN can convene, but they lack the coercive capacity or political unity to impose settlements when member states and external patrons have divergent interests.

Scope Conditions: This mechanism is strongest where (1) states have unresolved center-periphery or federal-regional conflicts; (2) maritime chokepoints raise the strategic value of territory; (3) Gulf and Middle Eastern states compete for influence; and (4) regional institutions are fragmented or captured by member-state rivalries. It is weaker where a dominant regional hegemon can enforce order, where maritime routes are less salient, or where local conflicts remain insulated from external patronage. The mechanism also depends on the post-2011 regional environment: the Arab Spring, Gulf rivalries, and Red Sea militarization intensified external involvement in ways that earlier decades did not. It does not imply that all Horn conflicts are externally manufactured; local grievances, state-building failures, and historical animosities remain primary, but external actors amplify and prolong them.

Observable Implications: If this mechanism holds, one should observe (a) cross-border military involvement in civil wars, as in Eritrea's role in Tigray and the regionalization of Sudan's conflict; (b) port and base competition among Gulf and other external actors in Djibouti, Berbera, Assab, and Sudanese Red Sea ports; (c) shifting alliances that cut across formal regional organizations; (d) humanitarian crises and displacement that spill across borders; (e) maritime insecurity affecting global shipping; (f) AU/IGAD mediation efforts that are repeatedly undermined by member-state interests; and (g) a gap between peace agreements and im-

plementation, as seen in the Pretoria agreement's uneven follow-through and Sudan's stalled political process. ACLED data and Crisis Group reporting on the Horn are consistent with these implications, particularly the geographic spread of violence and the increasing role of external actors.

Perspective Note (five traditions in brief):

African (primary): The African perspective on the Horn begins from the recognition that the region's crises are rooted in the unfinished business of state formation, decolonization, and regional order-making. African scholars such as Mamdani (on the colonial state and political identity), Bayart (on extraversion and the politics of the belly), Mbembe (on necropolitics and the postcolony), and Grovogui (on sovereignty and international hierarchy) help explain how externally imposed borders, authoritarian centralization, and Cold War interventions produced states that are simultaneously overcentralized and fragile. From this vantage, Ethiopia's federal experiment, Eritrea's militarized sovereignty, Somalia's collapse, and Sudan's repeated transitions are not anomalies but variations on a post-colonial condition in which the state has often been an instrument of domination rather than citizenship. The African perspective also emphasizes regional ownership: IGAD, the AU, and the Intergovernmental Authority on Development should be the primary mediators, and external actors should support rather than supplant African-led processes. Nkrumah's pan-Africanism and Nyerere's ujamaa are invoked not as nostalgic programs but as reminders that regional solidarity and non-alignment are normative resources against proxy competition. Cabral's and Fanon's analyses of liberation warn that external patrons can capture local struggles, while Aning and Danso highlight the institutional weaknesses that make African mediation difficult. Tamale and Oyěwùmí add that the Horn's conflicts are gendered: women's bodies, labor, and political participation are central to both war-making and peacebuilding. The African perspective's strength is that it centers sovereignty, legitimacy, and regional self-determination; its risk is that "African solutions" can be invoked by states to resist accountability or by regional hegemons to justify dominance.

Chinese: China's perspective emphasizes non-interference, development, and state-to-state relations. Beijing has significant economic interests in the Horn—ports, railways, and energy corridors—and generally supports recognized governments while avoiding military intervention. It frames stability as a precondition for development and prefers quiet diplomacy over public mediation. This perspective contributes an alternative to Western conditionality and a focus on infrastructure; it occludes, however, the ways in which Chinese projects can reinforce state power without addressing local grievances, and the limited transparency of security cooperation.

Russian: Russia's perspective in the Horn is less institutionally entrenched than in the Sahel but follows similar anti-Western and sovereignty-respecting themes. Moscow has sought naval access, arms sales, and diplomatic alignment, particularly with Sudan and Eritrea, while framing Western and Gulf interventions as destabilizing. This perspective contributes a challenge to Western and Gulf dominance; it occludes the risks of militarized partnerships and the lack of accountability in Russian security cooperation.

Western: The Western perspective emphasizes counterterrorism (especially against Al-Shabaab), maritime security, and state-building. The U.S. and European actors have supported AMISOM/ATMIS, Somali federal institutions, and Red Sea security initiatives, while also engaging in diplomacy around Ethiopia and Sudan. This perspective contributes operational capacity and humanitarian resources; it occludes, however, the ways in which Western security priorities can distort local politics and how great-power competition can undermine multilateral mediation.

UN: The UN perspective treats the Horn as a complex requiring peacekeeping, humanitarian protection, and

political mediation. AMISOM/ATMIS in Somalia, UNISFA in Abyei, and various mediation efforts reflect the UN view that regional complexes require integrated mandates. The UN emphasizes civilian protection, human rights, and regional partnerships; it occludes, however, Security Council divisions, host-state consent constraints, and the gap between mandate ambition and resources. The UN view is that regional complexes require regional solutions underwritten by international support—a tension central to the Horn case.

2.5 KEY IDEA 4 — Great Lakes rivalries: DRC, Rwanda, Uganda, and the politics of minerals

Bolded Causal Claim: The Great Lakes regional security complex is structured by a self-reinforcing security dilemma in which the Democratic Republic of Congo's territorial fragmentation and mineral wealth, combined with the unresolved security fears of Rwanda and Uganda, generate recurring cycles of proxy warfare that neither bilateral diplomacy nor African regional institutions have been able to break.

Mechanism: The mechanism operates through five linked stages that repeat across decades. First, the collapse of the Mobutu Sese Seko regime in 1997 and the subsequent Congo wars of 1998–2003 destroyed the DRC's monopoly on legitimate force, creating a durable security vacuum across the eastern provinces of North Kivu, South Kivu, and Ituri. The state's absence was not merely administrative; it was coercive: the Forces Armées de la République Démocratique du Congo (FARDC) became one armed actor among many, often predatory rather than protective. Second, Rwanda and Uganda, having intervened initially to topple Mobutu and then to remove Laurent-Désiré Kabila, developed enduring security interests in eastern Congo. Rwanda's core fear was the Forces démocratiques de libération du Rwanda (FDLR), the armed successor to the ex-FAR and Interahamwe militias that had participated in the 1994 genocide; Uganda sought to contain the Allied Democratic Forces (ADF) and secure its western frontier. These fears were not fabricated: cross-border attacks occurred, and rebel sanctuaries persisted. Third, the vacuum created opportunities for mineral extraction—coltan, cassiterite, wolframite, and gold—that financed armed groups and, according to successive UN Group of Experts reports, benefited networks linked to regional military and political elites. The coltan boom of 2000–2001 illustrated how global demand could rapidly monetize local violence. Fourth, the security dilemma intensified through interaction: each state's defensive measures—supporting proxy forces, conducting cross-border operations, backing local militias—were interpreted by neighbors as offensive threats, producing reciprocal arming and repeated interventions. The 1998–2003 war, involving up to nine African states, was the extreme expression of this dilemma. Fifth, peace agreements—the Lusaka Ceasefire Agreement (1999), the Sun City accords (2002), the Nairobi and Goma processes—formalized withdrawals and created transitional institutions but failed to disarm militias or reform the FARDC, allowing the cycle to resume. The M23 rebellions of 2012–2013 and again from 2021 demonstrated this recurrence: the Congrès national pour la défense du peuple (CNDP) rebranded as M23, and allegations of Rwandan support resurfaced, denied by Kigali but documented by UN experts. The mechanism is thus not merely resource predation but a security dilemma amplified by state weakness, cross-border ethnic ties, and regional power asymmetry.

Scope Conditions: This mechanism applies where a large, resource-rich but institutionally weak state borders smaller states with acute security fears and cross-border ethnic communities; where rebel groups enjoy sanctuary across borders; where regional organizations lack coercive enforcement capacity; and where global commodity demand provides financing for non-state armed actors. It does not apply where the weak state has consolidated territorial control, where a hegemon imposes order, or where resource rents are effectively captured by a capable state. The Great Lakes case is distinctive because the DRC's size and mineral endowment

make it simultaneously a prize and a threat, while Rwanda and Uganda's post-conflict consolidation gave them both the capacity and the incentive to project force. The mechanism also requires a permissive international environment: the relative tolerance of proxy warfare in the 1990s and 2000s, and the prioritization of counterterrorism over governance in later years, lowered the costs of intervention.

Observable Implications: The mechanism implies recurring spikes in violence in eastern DRC following periods of apparent stabilization; the persistence of armed groups despite peace agreements and disarmament programs; mineral smuggling routes through Rwanda and Uganda documented by UN panels of experts; the rebranding of rebel movements rather than their dissolution; and the limited impact of MONUSCO despite its status as the largest UN peacekeeping mission. It also implies that external military pressure alone—such as the Force Intervention Brigade's 2013 defeat of M23—produces temporary lulls rather than structural change, because the underlying security dilemma and resource incentives remain. Further implications include the militarization of local politics, the proliferation of Mai-Mai militias as community defense forces, and the humanitarian consequences: millions of internally displaced persons and recurrent epidemics.

Perspective Note (five traditions in brief):

African (primary): The African perspective frames the Great Lakes crisis as a failure of regional ownership and a legacy of colonial borders that divided communities and created artificial states. Scholars such as Mamdani (2001) and Prunier (2009) emphasize that the 1994 genocide and its aftermath were not merely ethnic but political, rooted in colonial racial categories and post-colonial state failure. The African Union and regional bodies—the International Conference on the Great Lakes Region (ICGLR), the Southern African Development Community (SADC)—have attempted mediation, but the African perspective stresses that durable peace requires addressing root causes: land tenure, citizenship, and state legitimacy. It highlights African agency in peace processes while acknowledging that regional states have been both mediators and perpetrators. It occludes, however, the extent to which African elites have benefited from the conflict economy and the difficulty of holding member states accountable within consensus-based institutions.

Chinese: China's perspective emphasizes non-interference and economic engagement. Chinese firms have invested in DRC mining, and Beijing has generally supported the DRC government while avoiding entanglement in eastern Congo's conflicts. China contributes to MONUSCO and supports AU mediation, framing stability as a precondition for investment. It occludes, however, the ways in which resource extraction by Chinese and other firms can fuel local grievances, the absence of Chinese security leverage over regional actors, and the tension between commercial interests and conflict-sensitive development.

Russian: Russia's perspective is less directly engaged in the Great Lakes than in the Sahel, but Moscow has increasingly framed African conflicts as products of Western intervention and neo-colonialism. Russia supports the DRC government rhetorically and has explored security cooperation, while criticizing Western peacekeeping as ineffective. It occludes, however, Russia's limited operational footprint in the region, its tendency to instrumentalize anti-Western framing without offering concrete security solutions, and the absence of Russian leverage over Rwanda or Uganda.

Western: The Western perspective has shifted from humanitarian intervention in the immediate post-1994 period to stabilization and state-building, with significant investment in MONUSCO and the 2013 Peace, Security and Cooperation Framework for the DRC and the region. Western actors emphasize human rights, sexual violence, and mineral supply chains, exemplified by conflict minerals legislation such as the Dodd-Frank Act's Section 1502. It occludes, however, the ways in which Western demand for minerals and support for authoritarian allies have contributed to the conflict, the limits of conditionality, and the gap between

normative commitments and strategic interests.

UN: The UN perspective treats the Great Lakes as a peacekeeping and protection challenge. MONUSCO, the largest UN mission, has evolved from stabilization to protection of civilians and support for state authority. The UN emphasizes the PSC Framework and regional cooperation through the ICGLR. It occludes, however, the mission's inability to address root causes, host-state resistance to reform, the gap between mandate and resources, and the political constraints of Security Council consensus. The UN view is that regional complexes require sustained multilateral engagement—a lesson drawn from repeated failures in eastern Congo.

2.6 KEY IDEA 5 — APSA, ECOWAS, IGAD, SADC — the operational efficacy of African regional security institutions

Bolded Causal Claim: African regional security institutions possess significant normative authority and operational experience but remain structurally constrained by member-state sovereignty, funding dependence, and the gap between mandate ambition and enforcement capacity, producing a pattern of rapid deployment without durable resolution.

Mechanism: The mechanism operates through a cycle of institutional creation, normative commitment, operational deployment, and structural constraint. First, the African Union's Constitutive Act (2000) established the principle of non-indifference—permitting intervention in grave circumstances—and the African Peace and Security Architecture (APSA) was designed with five pillars: the Peace and Security Council (PSC), the African Standby Force (ASF), the Panel of the Wise, the Continental Early Warning System, and the Peace Fund. The Regional Economic Communities (RECs)—ECOWAS, IGAD, SADC, ECCAS, EAC—were designated as building blocks, reflecting the view that security is regional. Second, normative innovation followed: the AU's 2002 Protocol on the PSC, the 2004 Solemn Declaration on a Common African Defence and Security Policy, and the Ezulwini Consensus (2005) on UN reform asserted African ownership of security governance. Third, operational deployment demonstrated capacity: ECOWAS intervened in Liberia (1990), Sierra Leone (1997), Côte d'Ivoire (2011), Mali (2013), and The Gambia (2017); IGAD mediated the Sudan and Somalia peace processes; SADC deployed in the DRC and Lesotho. The African Union Mission in Somalia (AMISOM, later ATMIS) and the African-led International Support Mission to Mali (AFISMA) showed willingness to deploy into high-risk environments. Fourth, structural constraints repeatedly limited efficacy. The ASF, conceived as a standing force, never became fully operational; deployments relied on ad hoc coalitions and member-state contributions. Funding dependence on external donors—the European Union, United Nations, and bilateral partners—created accountability gaps and conditionality. Consensus decision-making within the PSC and RECs allowed member states to block action against peers. Sovereignty concerns meant that interventions required host-state consent or regional consensus, limiting enforcement. Fifth, the result is a pattern of rapid deployment without durable resolution: ECOWAS could remove Yahya Jammeh in 2017 but struggles to sustain pressure on juntas in Mali, Burkina Faso, and Niger; the AU PSC can authorize missions but cannot guarantee funding or troop contributions; and the gap between mandate ambition and resources produces mission creep and fatigue. The mechanism is thus one of institutional aspiration constrained by political economy.

Scope Conditions: This mechanism applies to African regional security governance broadly but varies significantly by REC. ECOWAS has the strongest record of enforcement, partly due to Nigerian hegemony and a tradition of intervention. IGAD has mediation capacity but limited enforcement, reflecting the interests of its member states. SADC has military capacity but political divisions. The mechanism is strongest where a hegemon is willing to bear costs and weakest where consensus is required among rivals. It also depends

on external funding: without donor support, most missions are unsustainable. The mechanism does not apply to contexts where a single state dominates regionally or where external powers provide direct security guarantees.

Observable Implications: The mechanism implies that African regional institutions can deploy quickly in crises of regime change or acute violence but struggle with sustained counterinsurgency and state-building. It implies that AU PSC decisions are frequently not implemented due to resource gaps. It implies that the ASF remains a paper force despite decades of planning. It implies that external military presence—French in the Sahel, Russian via Africa Corps, Turkish in Somalia—often fills gaps left by African institutions. It implies that regional bodies compete for authority, as seen in tensions between the AU and RECs over mandates. And it implies that African security governance is characterized by a normative-practical gap: strong principles of non-indifference and responsibility to protect, but weak enforcement.

Perspective Note (five traditions in brief):

African (primary): The African perspective treats APSA and the RECs as expressions of sovereignty and ownership, reflecting the principle that African problems require African solutions. Scholars such as Williams (2018) and de Waal (2015) emphasize that African institutions have developed genuine capacity and normative innovation, including the non-indifference principle, but remain constrained by the political economy of member states and external dependence. The African perspective stresses the legitimacy of regional ownership while acknowledging the gap between aspiration and capacity. It highlights the role of hegemons—Nigeria, South Africa, Kenya—in driving or blocking action. It occludes, however, the extent to which African elites have used regional institutions to legitimize national interests and the difficulty of accountability within consensus-based bodies.

Chinese: China's perspective supports African regional institutions rhetorically and through funding, including contributions to the AU Peace Fund and support for APSA. Beijing emphasizes non-interference and capacity-building, framing security cooperation as part of its broader development partnership. It occludes, however, the limited Chinese operational role in African security and the tension between supporting state sovereignty and engaging with non-state actors. China's support for regional institutions is consistent with its preference for multilateral frameworks that do not challenge state authority.

Russian: Russia's perspective has become more assertive, framing African security institutions as weakened by Western influence and promoting bilateral security partnerships as alternatives. Moscow criticizes Western peacekeeping and supports African states' right to choose partners, including Russian paramilitaries. It occludes, however, Russia's limited contribution to multilateral African security architecture and its tendency to undermine regional consensus by backing specific regimes. Russia's approach favors bilateralism over institutional multilateralism.

Western: The Western perspective has supported APSA financially and technically while expressing frustration with its limitations. Western actors emphasize capacity-building, training, and funding, but also condition support on governance and human rights. It occludes, however, the ways in which Western funding creates dependence and how Western security priorities—counterterrorism, migration control—can distort African institutional agendas. The Western view has shifted from direct intervention to "African solutions to African problems" while retaining significant influence.

UN: The UN perspective treats African regional institutions as essential partners under Chapter VIII of the UN Charter. The UN emphasizes burden-sharing, with African missions (AMISOM/ATMIS, AFISMA) often transitioning to or supported by UN frameworks. It occludes, however, the tension between UN standards

and African operational realities, the difficulty of funding African-led missions, and the Security Council's control over mandates. The UN view is that regional complexes require regional solutions underwritten by international support—a principle tested repeatedly in Africa.

2.7.1 African Perspective (PRIMARY)

The African vantage point on regional security complexes begins from a fundamentally different ontological premise than the one embedded in Buzan and Wæver's Regional Security Complex Theory (RSCT). Where RSCT treats the state as the primary referent object of security and defines regions by patterns of security interdependence among states, African scholarship has long insisted that the state in Africa is itself a contested, layered, and historically specific formation whose sovereignty is neither given nor evenly distributed across territory. This is not a peripheral qualification; it is the central analytical move that reorganizes the entire study of regional security in Africa. From this starting point, the African perspective does not merely add African cases to a Western theoretical framework—it reconstructs the framework's foundational categories.

The theoretical lineage runs through several distinct but converging traditions. Mamdani's analysis of the bifurcated state (Mamdani 1996) distinguishes between the "civil" sphere of urban, modern, rights-bearing citizenship and the "customary" sphere of rural, ethnic, subject populations governed through decentralized despotism. This bifurcation means that the African state is not a unitary actor with a monopoly on legitimate violence; it is a dual structure in which authority is fragmented between modern institutions and customary authorities, and in which the state's reach into peripheral territories is historically thin. Applied to regional security complexes, this implies that the "state" that enters into security interdependence with its neighbors is not a coherent entity but a composite of competing centers of power, some of which may have stronger ties to armed groups, commercial networks, or foreign patrons than to the capital. The Sahel, the Horn, and the Great Lakes are not regions of state-to-state security interdependence in the RSCT sense; they are regions of fragmented sovereignty in which the boundaries between state and non-state violence are permeable.

Mbembe's concept of necropolitics (Mbembe 2003) extends this analysis by examining how sovereignty in postcolonial Africa operates through the power to dictate who may live and who must die. In the context of regional security complexes, necropolitics illuminates how state and non-state actors alike exercise sovereignty not through the provision of security but through the management of death—through militias, paramilitaries, and the instrumentalization of ethnic and communal violence. The African perspective thus reframes regional security complexes not as systems of mutual deterrence or alliance but as fields of necropolitical competition in which the distinction between "security provider" and "security threat" is often blurred. This is particularly evident in the Great Lakes, where state armies and rebel movements have historically been intertwined, and in the Horn, where the Ethiopian state's military campaigns in Tigray demonstrated the lethal consequences of a sovereignty that defines itself through the exclusion of populations deemed threats.

Bayart's analysis of the "politics of the belly" (Bayart 1993) and the "criminalization of the state" (Bayart, Ellis, and Hibou 1999) adds a political-economy dimension. Regional security complexes in Africa are not driven solely by security dilemmas or ideological competition; they are shaped by the instrumentalization of violence for economic accumulation. The mineral economies of the Great Lakes, the smuggling networks of the Sahel, and the rentier economies of the Horn all create incentives for the perpetuation of conflict that are not reducible to state security interests. The African perspective thus insists that any analysis of regional security complexes must account for the political economy of violence—the ways in which war economies

sustain armed actors and undermine peace. This connects directly to the conflict political economy analyzed in Lesson 29 and to the colonial state formation processes examined in Lesson 27.

Rodney's underdevelopment thesis (Rodney 1972) and Nkrumah's analysis of neo-colonialism (Nkrumah 1965) provide the historical-structural frame. African regional security complexes are not natural formations; they are products of colonial partition that created states with arbitrary borders, weak institutions, and economies oriented toward external extraction. The colonial state was designed for control, not development, and its postcolonial successor inherited this orientation. Regional security complexes in Africa are therefore shaped by the legacy of colonial state formation: borders that divide communities, economies that depend on external markets, and security forces that are oriented toward internal repression rather than external defense. Nkrumah's warning that political independence without economic independence is meaningless applies with particular force to security: African states that depend on external powers for military equipment, training, and intelligence are not fully sovereign in the security domain, and their regional security complexes are penetrated by external interests.

Fanon's analysis of colonial violence and its psychological aftermath (Fanon 1961) contributes a dimension that RSCT cannot accommodate: the role of violence in the constitution of political subjectivity. In the African perspective, regional security complexes are not merely systems of state interaction; they are arenas in which identities are forged through violence, in which the experience of war shapes political consciousness, and in which the memory of colonial and postcolonial violence informs contemporary security practices. This is particularly relevant to the Sahel, where the Tuareg rebellions and the subsequent jihadist insurgency have been shaped by decades of marginalization, and to the Horn, where the Eritrean independence war and the Ethiopian civil war have left deep scars that continue to structure regional relations.

Nyerere's vision of regionalism, articulated through the East African Community and his broader philosophy of ujamaa, represents an alternative African approach to regional security: one based on solidarity, shared development, and the transcendence of colonial borders through integration rather than through the security dilemma. Nyerere's insistence that African unity is a precondition for genuine sovereignty (Nyerere 1966) frames regional security complexes not as problems to be managed but as opportunities for collective self-determination. This vision, though largely unrealized, continues to inform African institutional design and provides a normative benchmark against which contemporary regional security arrangements are measured.

Cabral's analysis of national liberation and the role of culture (Cabral 1973) adds the dimension of cultural resistance and the importance of understanding security from the perspective of the oppressed. In the African perspective, regional security complexes must be analyzed from the standpoint of those who bear the costs of insecurity—the displaced, the marginalized, the communities caught between state forces and armed groups. This standpoint epistemology, which insists that knowledge about security is situated and partial, challenges the view from above that dominates much Western security analysis.

The institutional expression of the African perspective is the African Peace and Security Architecture (APSA), established under the AU's Protocol Relating to the Establishment of the Peace and Security Council (2002). APSA represents an ambitious attempt to create an African-owned framework for conflict prevention, management, and resolution, encompassing the Peace and Security Council, the Continental Early Warning System, the African Standby Force, the Panel of the Wise, and regional mechanisms. The African perspective treats APSA not as a technical instrument but as an expression of sovereignty and agency—a claim that Africans can and must manage their own security. This is the principle of "African solutions to African problems," which, while often criticized as rhetoric, reflects a genuine commitment to self-determination in the security domain.

However, the African perspective must also confront its own limitations. The gap between APSA's institutional design and its operational capacity is substantial. The African Standby Force, conceived as a rapid-deployment capability, has never been fully operationalized. The Peace and Security Council's decisions depend on the political will of member states, which is often constrained by competing interests and sovereignty concerns. The financing of African-led missions remains dependent on external donors, creating a dependency that undermines the very sovereignty APSA is meant to express. Williams (2018) has documented these challenges extensively, noting that the AU's peace and security efforts are often hampered by inadequate resources, weak coordination with regional economic communities, and the reluctance of member states to cede authority to supranational bodies.

The African perspective also occludes certain dynamics. By emphasizing external interference and colonial legacy, it can underplay the agency of African elites in perpetuating conflict and the role of internal power struggles in driving regional insecurity. The "African solutions" framing can sometimes serve to shield governments from accountability, particularly when those governments are themselves sources of insecurity. Moreover, the African perspective's emphasis on sovereignty can conflict with the protection of human rights, as seen in the AU's reluctance to intervene in cases of mass atrocities when the offending state invokes sovereignty. Tamale's feminist critique (Tamale 2020) reminds us that the African security discourse, like its Western counterpart, has historically been gendered, treating security as a masculine domain of statecraft and military affairs while marginalizing the security concerns of women and the gendered dimensions of conflict.

Oyěwùmí's analysis of gender and colonial categories (Oyěwùmí 1997) challenges the very categories through which security is analyzed, arguing that Western concepts of gender and hierarchy were imposed on African societies through colonialism. This has implications for regional security complex theory: if the categories of "state," "nation," and "region" are themselves colonial impositions, then RSCT's application to Africa may be fundamentally mis-specified. The African perspective thus raises the question of whether regional security complexes as theorized by Buzan and Wæver are adequate to capture the realities of African security, or whether they need to be supplemented or replaced by frameworks that take seriously the specificity of African political formations.

Grovogui's work on sovereignty and international law (Grovogui 1996, 2006) provides a critical bridge between the African perspective and international relations theory. Grovogui argues that the international order is structured by a racialized hierarchy in which African sovereignty is systematically devalued. This means that African regional security complexes are not merely regional phenomena; they are embedded in a global order that constrains African agency and legitimizes external intervention. The African perspective thus insists on situating regional security complexes within the broader context of global power asymmetries, a move that RSCT's regional focus tends to obscure.

De Waal's analysis of the political marketplace (de Waal 2015) adds a further dimension that is particularly relevant to the Horn of Africa but applicable more broadly. De Waal argues that political systems in the Horn are organized around the monetization of violence and the commercialization of loyalty, creating a "political marketplace" in which armed actors compete for resources and influence. This framework challenges both the state-centric assumptions of RSCT and the normative assumptions of Western peacebuilding, suggesting that regional security complexes in Africa are better understood as political economies of violence than as systems of state interaction. The African perspective, drawing on de Waal, insists that any analysis of regional security must account for the material incentives that sustain conflict and the ways in which violence is integrated into political and economic life.

What the African vantage point contributes that the other four cannot is a fundamental reorientation of the security referent: from the state to the human, from the territory to the community, from the present to the historical. It insists that regional security complexes in Africa cannot be understood without reference to colonialism, neo-colonialism, and the ongoing struggle for genuine sovereignty. It reveals that the apparent "failure" of African regional institutions is often a failure of the international system to support African agency, not a failure of Africans themselves. And it demonstrates that security in Africa is not merely a technical problem of conflict management but a political problem of justice, development, and self-determination. Crisis Group Africa reports consistently document how local grievances, governance deficits, and economic marginalization drive insecurity in the Sahel, Horn, and Great Lakes—findings that align with the African perspective's insistence on root-cause analysis rather than symptom management.

What it occludes is the extent to which African elites themselves are implicated in the production of insecurity, the internal dynamics of power that drive conflict, and the practical challenges of building effective regional institutions in a context of resource scarcity and political fragmentation. The African perspective's emphasis on external causation can sometimes obscure internal agency, and its normative commitment to sovereignty can conflict with the protection of vulnerable populations. These tensions are not resolvable within the perspective itself; they require engagement with the other four perspectives.

2.7.2 Chinese Perspective

China's approach to African regional security complexes is shaped by a distinctive combination of principles: non-interference in internal affairs, respect for sovereignty, economic engagement as the foundation of security, and selective security cooperation. This approach reflects China's own historical experience of foreign intervention and its strategic interest in stable access to African resources and markets. In the context of the Sahel, the Horn, and the Great Lakes, China's perspective emphasizes that security is ultimately a function of development, and that external military intervention is both illegitimate and counterproductive.

The principle of non-interference, articulated in China's Five Principles of Peaceful Coexistence and reiterated in the Forum on China-Africa Cooperation (FOCAC) declarations, is the cornerstone of China's approach. China does not condition its engagement on governance standards, human rights performance, or democratic credentials. This means that China engages with all governments in a region regardless of their legitimacy or behavior, and it does not support sanctions, interventions, or regime change. In the Sahel, where Western-backed governments have been overthrown by military coups, China has maintained relations with the new authorities, emphasizing continuity and stability. In the Horn, China has maintained close ties with Ethiopia throughout the Tigray war, providing diplomatic support and economic engagement. In the Great Lakes, China's economic interests in Congolese minerals have led it to engage with all parties, including those accused of human rights abuses.

China's security cooperation with African states has expanded significantly in recent years. This includes arms sales, military training, joint exercises, and the establishment of China's first overseas military base in Djibouti (2017). China participates in UN peacekeeping missions in Africa, contributing troops to missions in Mali, South Sudan, and the Democratic Republic of Congo. Chinese peacekeepers have been involved in combat operations, and China has suffered casualties, demonstrating a level of commitment that goes beyond purely economic engagement. China also provides security assistance to African states through bilateral channels, including police training, intelligence sharing, and counterterrorism cooperation.

The Chinese perspective on regional security complexes emphasizes the role of economic development in addressing the root causes of insecurity. China's infrastructure investments—ports, roads, railways, and

energy projects—are framed as contributions to stability, on the theory that economic opportunity reduces the appeal of armed mobilization. In the Horn, China's investments in Ethiopian infrastructure and its role in the Djibouti port are seen as stabilizing factors. In the Great Lakes, Chinese mining investments are framed as development opportunities, though they have also been criticized for contributing to conflict dynamics. ACLED data on conflict fatalities in the Sahel show a dramatic increase in violence since 2012, a trend that China attributes in part to the failure of Western counterterrorism and the absence of development-focused approaches.

What the Chinese perspective contributes is a model of engagement that respects African sovereignty and prioritizes economic development over military intervention. It challenges the Western assumption that security requires political conditionality and demonstrates that non-Western powers can play a significant role in African security. China's willingness to engage with all governments, regardless of their human rights record, provides an alternative to Western selectivity and can be seen as more consistent with the principle of sovereign equality. For African states seeking to diversify their partnerships and reduce dependence on Western powers, China offers a valuable counterweight.

What it occludes is the extent to which China's economic interests drive its security engagement, the lack of transparency in Chinese arms deals and security assistance, and the potential for Chinese engagement to reinforce authoritarian governance. China's non-interference principle, while rhetorically appealing, can amount to indifference to human rights abuses and can provide cover for governments that are themselves sources of insecurity. The Chinese perspective also tends to treat regional security complexes as collections of bilateral relationships rather than as integrated systems, underestimating the transnational dynamics that connect conflicts across borders. Moreover, China's growing military presence in Africa, including the Djibouti base, raises questions about whether China's approach is as non-interventionist as its rhetoric suggests. The Chinese perspective's emphasis on development as a security strategy, while valuable, can overlook the political and institutional dimensions of conflict that are not addressable through infrastructure alone.

2.7.3 Russian Perspective

Russia's approach to African regional security complexes is shaped by a combination of historical legacy, strategic competition with the West, and a distinctive model of security provision through private military companies. Russia presents itself as an anti-colonial power and an alternative to Western intervention, drawing on Soviet-era relationships and a narrative of solidarity with African states against Western imperialism. In the Sahel, the Horn, and the Great Lakes, Russia's perspective emphasizes sovereignty, non-interference, and the provision of security assistance without political conditionality.

The historical foundation of Russia's African engagement lies in Soviet support for African liberation movements during the Cold War. The Soviet Union provided military training, weapons, and ideological support to anti-colonial movements across the continent, and many African leaders were educated in the Soviet Union. This legacy provides Russia with a reservoir of goodwill and a narrative of anti-imperialist solidarity that it has actively cultivated in recent years. Russia's framing of its African engagement as a continuation of this anti-colonial tradition resonates with African audiences who are critical of Western interventionism, particularly in the Sahel, where anti-French sentiment has been a powerful political force.

The contemporary expression of Russia's security engagement in Africa is the Africa Corps, formerly known as the Wagner Group. The Africa Corps operates in several African countries, providing security services, training, and combat support to governments in exchange for resource concessions and political influence. In the Sahel, the Africa Corps has been particularly active in Mali, Burkina Faso, and the Central African

Republic, where it has replaced French forces and provided security support to military governments. In the Horn, Russia has sought to expand its influence through arms sales and security cooperation, particularly with Sudan and Eritrea. In the Great Lakes, Russia's engagement has been more limited but includes arms sales and diplomatic support.

Russia's perspective on regional security complexes emphasizes the failure of Western intervention and the need for alternative security partnerships. Russian officials and media frame Western counterterrorism efforts as neocolonialism and argue that Western military presence has destabilized rather than stabilized the region. The coups in Mali, Burkina Faso, and Niger are presented as expressions of popular sovereignty against Western-backed governments, and Russia positions itself as a partner that respects African agency. This narrative has been effective in countries where anti-French sentiment is strong and where governments are seeking alternatives to Western security partnerships. Crisis Group Africa reports have documented the deteriorating security situation in the Sahel following the withdrawal of French forces and the arrival of Russian paramilitaries, noting that violence has continued to escalate despite the change in security partners.

What the Russian perspective contributes is a challenge to Western hegemony in African security and a demonstration that alternative security partnerships are available. Russia's willingness to engage with military governments and its lack of political conditionality provide options for African states that are dissatisfied with Western approaches. The Africa Corps model, while controversial, has provided security support to governments that Western powers have abandoned or sanctioned, and it has allowed some African states to assert greater independence from Western security frameworks.

What it occludes is the extractive nature of Russia's engagement, the human rights abuses associated with the Africa Corps, and the destabilizing effects of Russian security provision. The Africa Corps has been implicated in massacres, torture, and the targeting of civilians in Mali and the Central African Republic. Its operations are opaque, and its accountability mechanisms are nonexistent. Russia's engagement is driven by strategic competition with the West and by economic interests in African resources, not by a genuine commitment to African security or development. The anti-colonial rhetoric masks a relationship that is in many respects more extractive and less accountable than the Western partnerships it criticizes. Moreover, Russia's support for military governments undermines democratic governance and can deepen the very insecurity it claims to address. The Russian perspective's framing of regional security complexes as arenas of great-power competition obscures the local dynamics and African agency that are central to understanding these conflicts.

2.7.4 Western Perspective

The Western perspective on African regional security complexes is shaped by a combination of strategic interests, normative commitments, and a growing recognition of the limits of external intervention. Western engagement with African security has evolved significantly over the past two decades, from a focus on counterterrorism and stabilization to a more nuanced approach that emphasizes African ownership, governance, and development. This evolution reflects both the failures of earlier interventions and a changing geopolitical environment in which Western powers face competition from China and Russia.

The Western perspective treats regional security complexes in Africa as threats to international security, particularly through the lenses of terrorism, migration, and state failure. The Sahel has been framed as a "terrorist haven" and a source of migration to Europe, driving significant Western military and development engagement. The Horn is seen as a critical node in global shipping routes and a source of regional instability with global implications. The Great Lakes are viewed through the lens of resource conflict and humanitarian

crisis. These framings reflect Western strategic interests and threat perceptions, which are not always aligned with African priorities. ACLED data showing a steady increase in conflict fatalities across the Sahel since 2012 have been cited in Western policy documents as evidence of the need for sustained engagement, though the effectiveness of that engagement remains contested.

Western security engagement in Africa has taken multiple forms. The United States has maintained a military presence through AFRICOM, with bases and training programs across the continent. France has been the most active Western military power in the Sahel, conducting Operation Barkhane (2014-2022) and its predecessor Operation Serval. The European Union has deployed military and civilian missions, and individual European states have contributed to peacekeeping and training. Western powers have also provided significant development and humanitarian assistance, framed as addressing the root causes of insecurity.

The Western perspective has undergone significant self-critique in recent years. The failure of Operation Barkhane to stabilize the Sahel, the coups in Mali, Burkina Faso, and Niger, and the withdrawal of French forces have prompted a reassessment of Western military engagement. There is growing recognition that counterterrorism-focused approaches have been insufficient and that military solutions cannot address the political and economic drivers of conflict. The Western perspective increasingly emphasizes governance, development, and African ownership, though the gap between rhetoric and practice remains significant. This self-critique is a genuine feature of the Western perspective, distinguishing it from more triumphalist accounts of Western intervention.

What the Western perspective contributes is a wealth of resources, institutional capacity, and experience in conflict management. Western powers have funded peacekeeping missions, supported African regional institutions, and provided humanitarian assistance on a scale that no other external actor matches. The Western emphasis on human rights, democratic governance, and accountability, while often inconsistently applied, provides a normative framework that challenges authoritarianism and impunity. Western self-critique, particularly the recognition of the limits of military intervention, represents a genuine learning process that can inform more effective engagement. The UN's MINUSMA mission in Mali, though ultimately withdrawn, represented an unprecedented multilateral effort to stabilize a complex conflict environment.

What it occludes is the extent to which Western engagement is driven by strategic and economic interests rather than African needs, the securitization of migration and its distortion of African institutional agendas, and the historical legacy of colonialism that shapes contemporary Western-African relations. The Western perspective tends to treat African states as objects of intervention rather than as agents of their own security, and its emphasis on "capacity building" can mask a relationship of dependency. The conditionality attached to Western assistance—governance standards, human rights requirements—can be seen as a form of neocolonialism that undermines African sovereignty. Moreover, the Western perspective's focus on terrorism and migration reflects Western threat perceptions that may not correspond to African priorities, which are more likely to center on development, governance, and human security. The Western perspective's self-critique, while genuine, has not always translated into fundamental changes in policy, and the underlying power asymmetries between Western and African actors remain largely intact.

2.7.5 UN Perspective

The United Nations perspective on African regional security complexes is shaped by the UN Charter's framework for collective security, particularly Chapter VIII, which recognizes the role of regional arrangements in maintaining international peace and security. The UN treats African regional institutions as essential partners and emphasizes burden-sharing, with African-led missions often transitioning to or being supported by

UN frameworks. This perspective reflects both the UN's institutional mandate and its practical dependence on regional actors for the implementation of peacekeeping and peacebuilding efforts.

The UN's engagement with African regional security complexes has been extensive. In the Sahel, the UN deployed MINUSMA (Multidimensional Integrated Stabilization Mission in Mali) from 2013 to 2023, one of the most complex and dangerous peacekeeping missions in UN history. MINUSMA was mandated to support the political process, protect civilians, and stabilize key population centers, but it faced significant challenges including asymmetric attacks, limited freedom of movement, and the withdrawal of the host government's consent. In the Horn, the UN has supported AMISOM/ATMIS in Somalia, a hybrid mission that has been critical in pushing back Al-Shabaab but has struggled with funding, troop contributions, and the challenge of transitioning to Somali security forces. In the Great Lakes, the UN has deployed MONUSCO in the DRC, one of the largest and longest-running peacekeeping missions, which has faced criticism for its inability to protect civilians and its entanglement in local conflict dynamics.

The UN perspective emphasizes the principle of "African solutions to African problems" while insisting on international support and standards. The UN recognizes that regional organizations have comparative advantages in understanding local dynamics and deploying rapidly, but it also insists on adherence to international humanitarian law, human rights standards, and the principles of impartiality and consent. This creates a tension between UN standards and African operational realities, particularly when African-led missions are deployed in contexts where the host government's consent is contested or where the mission's mandate conflicts with the interests of powerful member states. Williams (2018) has noted that the relationship between the UN and African regional organizations is characterized by both cooperation and competition, with overlapping mandates and competing claims to authority.

The UN perspective also highlights the challenge of funding African-led missions. The AU's Peace Fund, established to provide predictable funding for African peace operations, has been underfunded, and African missions have historically depended on external donors, particularly the EU and individual member states. The UN has sought to address this through mechanisms such as the UN Support Office for AMISOM (UNSOA) and through the broader debate on UN-assessed contributions for African-led missions. This debate reflects a fundamental tension: African states want ownership and control of their security, but they lack the resources to fully fund their operations, while external funders want accountability and alignment with their priorities. The UN's role in this debate is to mediate between African aspirations and international constraints, a role that is often frustrating for all parties.

What the UN perspective contributes is a framework for multilateral cooperation that legitimizes regional action and provides institutional support. The UN's emphasis on human rights, civilian protection, and the rule of law provides a normative benchmark that challenges both state and non-state violence. UN peacekeeping missions, despite their limitations, have provided critical stabilization in contexts where no other actor was willing or able to intervene. The UN's role in convening international support and coordinating humanitarian assistance is indispensable. In the Sahel, MINUSMA's presence, despite its ultimate withdrawal, provided a degree of stabilization and protection that would not have existed otherwise. In Somalia, AMISOM/ATMIS has been essential in preventing the complete collapse of the Somali state.

What it occludes is the tension between UN standards and African operational realities, the difficulty of funding African-led missions, and the Security Council's control over mandates. The UN perspective can be overly focused on institutional processes and legal frameworks, underestimating the political dynamics that drive conflict. The Security Council's composition and decision-making processes reflect power asymmetries that can marginalize African voices. Moreover, the UN's emphasis on consent and impartiality can

constrain its ability to act decisively in situations where the host government is itself a party to the conflict. The UN perspective also tends to treat regional security complexes as collections of national crises rather than as integrated systems, underestimating the transnational dynamics that connect conflicts across borders. The withdrawal of MINUSMA from Mali in 2023, following the Malian government's request, illustrates the limits of UN engagement when host-state consent is withdrawn, and raises questions about the future of UN peacekeeping in contexts where governments prefer alternative security partners.

2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Centers regional ownership and the sovereignty of African states in defining security threats; reveals how external interventions displace African agency and how predatory postcolonial governance creates the vacuums that armed groups exploit	Underestimates the material and intelligence dependence of African forces on external partners; can romanticize regional solidarity that fractures under national interest and elite calculations	Security must be African-led, with external actors in supporting roles; sovereignty is non-negotiable; political solutions must precede military ones	AU PSC communiqués on Mali and the Sahel; ECOWAS interventions in Gambia (2017) and Mali (2012); APSA framework documents; African Union (2020) Silencing the Guns initiative	Western: African regional institutions lack enforcement capacity, funding, and intelligence, making "ownership" aspirational rather than operational in the short term

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Chinese	Provides infrastructure investment and a non-interference framework that builds state capacity without political conditionality; insists on development as the foundation of security	Treats security as derivative of development, underestimating the autonomous logic of armed conflict and the political drivers of insurgency; security cooperation remains bilateral and opaque	Non-interference in internal affairs; development as the foundation of security; mutual benefit and sovereignty respect	FOCAC security cooperation pledges; Chinese peacekeeping contributions to UNAMID and UNMISS; bilateral military training and equipment programs in the Sahel	Western: Chinese non-interference enables authoritarian consolidation, ignores human rights abuses by partner governments, and provides no conflict mediation capacity
Russian	Exploits gaps left by Western withdrawal; provides rapid military support without governance conditionality; frames engagement as anti-imperialist solidarity that resonates with governments frustrated by Western conditionality	Ignores or enables predatory extraction by paramilitaries; human rights abuses by Africa Corps/Wagner undermine long-term stability; no development or governance component; substitutes one external dependency for another	Anti-Western multipolarity; sovereignty respected without interference; military support as partnership rather than tutelage	Wagner/Africa Corps deployments in Mali, CAR, and Libya; Russian arms sales; UN voting alignment with African states on Ukraine-related resolutions	African: Russian paramilitaries replicate extractive colonial patterns under anti-imperialist rhetoric, violating African sovereignty in practice while claiming to defend it

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Western	Provides the bulk of counterterrorism funding, intelligence, and training; generates extensive conflict data and analysis; self-critique has produced doctrinal evolution toward stabilization approaches	Over-securitizes African conflicts; conflates counterterrorism with state-building; interventions often lack political strategy and exit plans; empowers abusive state forces	Liberal international order; human rights and democratic governance as security prerequisites; counterterrorism as global public good	French Barkhane operation (2014–2022); US AFRICOM programs; EU training missions (EUTM Mali); ACLED and Crisis Group reporting; French strategic reviews acknowledging military-first failures	African: Western counterterrorism militarizes the Sahel, treats African conflicts as extensions of global jihad rather than local political crises, and has repeatedly prioritized short-term tactical gains over long-term political solutions
UN	Provides multilateral legitimacy; deploys large-scale peacekeeping with civilian protection mandates; generates normative frameworks (R2P, protection of civilians); produces extensive human rights documentation	Peacekeeping depends on host-state consent, which can be withdrawn; treats regional complexes as collections of national crises; Security Council power asymmetries marginalize African voices; too slow and too expensive for rapid response	Multilateralism; consent-based peacekeeping; civilian protection; impartiality; host-state partnership	MINUSMA (2013–2023) in Mali; AMISOM/ATMIS in Somalia; UN peacekeeping budget and troop contributions; UN human rights monitoring reports	African: UN peacekeeping is too dependent on Western funding and host-state consent; withdrawal of MINUSMA shows limits of consent-based models when governments prefer alternative security partners

2.8 WORKED EXAMPLE (I do)

Case: The Sahel, 2012–2025 — From Tuareg Rebellion to JNIM and ISSP Territorial Control

Levels of Analysis

Individual. The Sahel crisis was shaped by specific leaders whose decisions cascaded across the region. Iyad Ag Ghaly, a Tuareg leader who founded Ansar Dine and later JNIM, transformed a separatist rebellion into a jihadist insurgency that exploited local grievances over land, justice, and state predation. Amadou Toumani Touré, Mali's president in 2012, presided over a hollowed-out state that could not respond to the Tuareg advance, and his overthrow by junior officers in March 2012 accelerated state collapse. Colonel Assimi Goïta, who led two coups in Mali (August 2020 and May 2021), redirected the state's security partnerships from France to Russia, fundamentally altering the regional security architecture. In Burkina Faso, the 2022 coups similarly reoriented security policy toward Russian paramilitaries. At the operational level, jihadist commanders such as Amadou Koufa of JNIM's Katiba Macina exploited ethnic tensions and state predation to recruit fighters in central Mali and northern Burkina Faso. These individual decisions were not merely epiphenomenal; they altered alliance structures, military doctrines, and the territorial reach of armed groups.

State. The Malian state's failure was structural before it was military. Decades of predatory governance, underinvestment in the north, and the co-optation of local elites left the state without legitimacy or capacity in peripheral regions. When the MNLA launched its 2012 offensive, the Malian army collapsed not because of inferior firepower but because of institutional rot: unpaid soldiers, absent command structures, and a political class that treated the military as a patronage tool. Burkina Faso and Niger exhibited similar patterns—centralized capitals disconnected from borderlands, security forces that preyed on civilians, and political systems that alternated between electoral authoritarianism and military rule. The 2020–2023 coup wave in Mali, Burkina Faso, and Niger was both a symptom and an accelerator of state failure: each coup disrupted counterterrorism coordination, invited external realignment, and further eroded institutional capacity. The state level thus reveals a feedback loop in which insecurity produces coups, coups produce policy discontinuity, and discontinuity produces further insecurity.

Systemic. The Sahel constitutes a regional security complex in Buzan and Wæver's (2003) sense: the security of each state is interdependent with its neighbors, and threats are not easily externalized. The collapse of Libya in 2011 flooded the Sahel with weapons, fighters, and Tuareg returnees, directly enabling the 2012 Mali rebellion. France's Operation Serval (2013) and subsequent Barkhane mission (2014–2022) represented an external power's attempt to manage a regional complex through military force, but without a corresponding political strategy. ECOWAS attempted regional coordination but was constrained by member-state rivalries and, after 2020, by the withdrawal of Mali, Burkina Faso, and Niger from the organization. The African Union's Peace and Security Council issued communiqués but lacked enforcement capacity. The systemic level thus shows a regional complex in which state failure, external intervention, and institutional weakness reinforced one another, producing a security vacuum that armed groups exploited.

Transnational. The Sahel insurgency is irreducibly transnational. JNIM and ISSP operate across the Mali-Burkina Faso-Niger tri-border area, exploiting porous borders, shared ethnic networks, and weak state presence. Arms flows from Libya, smuggling routes connecting to the Mediterranean, and the movement of fighters between conflict zones create a transnational ecosystem that no single state can contain. The Global Terrorism Index has consistently ranked the Sahel among the world's deadliest regions for terrorism since 2019, with fatalities concentrated in the tri-border area. External actors—France, the United States, Russia, Turkey, and Gulf states—project power into the region, each pursuing distinct interests that reshape local

conflict dynamics. The transnational level reveals that the Sahel crisis cannot be resolved by any single state or external power; it requires coordinated regional and international action that has so far proven elusive.

Mechanism

The core mechanism driving the Sahel crisis is a **predatory-state vacuum loop**: weak and predatory state institutions in peripheral regions create governance vacuums; jihadist groups fill these vacuums by offering alternative dispute resolution, protection, and ideological framing; state forces respond with indiscriminate violence that alienates local populations and drives recruitment; the resulting insecurity justifies further militarization and external intervention; intervention without political strategy further weakens state legitimacy; and the cycle repeats at expanded scale. This mechanism operated in Mali from 2012 onward, spread to Burkina Faso after 2015, and reached Niger by 2021. A secondary mechanism is **external-intervention displacement**: each major external military intervention (French Serval 2013, Barkhane 2014–2022, Russian Africa Corps 2022–present) temporarily displaced armed groups from urban centers but failed to address underlying grievances, pushing violence into rural areas and across borders. A third mechanism is **coup-counterterrorism disruption**: military coups in Mali (2020, 2021), Burkina Faso (2022), and Niger (2023) severed security partnerships, expelled foreign forces, and redirected military resources toward regime survival rather than counterinsurgency, creating windows of opportunity for JNIM and ISSP expansion. By 2024, JNIM and ISSP controlled significant territories across the Sahel, with ACLED data showing a sustained increase in political violence events and fatalities in the tri-border region.

Perspective Reconstruction

African perspective (primary). The African perspective centers the Sahel crisis as a failure of regional ownership and a consequence of externally imposed security frameworks. From this vantage, the crisis originated not in global jihadism but in the structural marginalization of Sahelian populations by postcolonial states that inherited colonial administrative boundaries and extractive governance patterns. The African Union and ECOWAS possessed the institutional architecture—APSA, the African Standby Force, the Peace and Security Council—to respond, but lacked the funding, intelligence, and logistical capacity to operationalize their mandates. France's unilateral intervention in 2013, while militarily effective in the short term, displaced African agency and created a dependency that collapsed when France withdrew in 2022. The coups of 2020–2023, from this perspective, reflect popular frustration with both incumbent governments and their external backers, and the turn to Russia represents a search for sovereignty rather than ideological alignment. The African perspective's strongest claim is that sustainable security requires African-led political solutions—addressing Tuareg grievances, reforming predatory state institutions, and investing in peripheral development—rather than externally driven counterterrorism. Its limitation is that it can underestimate the material constraints on African regional institutions and the genuine appeal of jihadist ideology among marginalized youth.

Chinese perspective. China views the Sahel crisis primarily through the lens of development and state capacity. Beijing's engagement emphasizes infrastructure investment, economic cooperation, and non-interference in internal affairs. Chinese officials have consistently argued that poverty and underdevelopment are root causes of instability, and that security follows from economic growth. China's security cooperation in the Sahel has been limited to bilateral military training, equipment sales, and participation in UN peacekeeping missions. Beijing has avoided direct military intervention, positioning itself as a neutral partner that respects sovereignty. The Chinese perspective contributes an important corrective to the securitization of the Sahel by insisting on development dimensions, but it occludes the immediate security vacuum that armed groups exploit and underestimates the political drivers of conflict. Its non-interference

stance also means China has little to offer in terms of conflict mediation or governance reform.

Russian perspective. Russia frames its Sahel engagement as anti-imperialist solidarity and a corrective to Western failure. Following France's withdrawal from Mali in 2022, Russian paramilitaries—first Wagner, then Africa Corps—deployed to support the Malian junta, providing military training, equipment, and direct combat support. Moscow's narrative emphasizes sovereignty, non-interference, and the right of African states to choose their security partners. Russian officials have criticized French and American counterterrorism as neocolonial and ineffective. The Russian perspective contributes a geopolitical alternative that resonates with Sahelian governments frustrated by Western conditionality, but it occludes the extractive and abusive practices of Russian paramilitaries, the absence of any development or governance component in Russian engagement, and the long-term risks of substituting one external dependency for another. Its anti-Western framing also oversimplifies the Sahel crisis by reducing it to great-power competition rather than local political dynamics.

Western perspective. The Western perspective has dominated Sahel policy since 2012, framing the crisis as a counterterrorism challenge requiring military intervention, capacity-building, and stabilization. France's Operation Serval and Barkhane, the US Trans-Sahara Counterterrorism Partnership, and EU training missions represented substantial investments in military capacity. Western analysts and policymakers have produced extensive documentation of jihadist networks, conflict dynamics, and human rights abuses. The Western perspective's self-critique—evident in French strategic reviews and US Africa Command assessments—acknowledges that military-first approaches failed to address governance deficits and may have exacerbated conflict. The Western perspective contributes unmatched intelligence, funding, and analytical capacity, but it occludes the political and economic roots of the crisis, over-securitizes local grievances, and has repeatedly prioritized short-term tactical gains over long-term political solutions. Its interventions have also empowered abusive state forces and alienated local populations.

UN perspective. The UN perspective is embodied in MINUSMA, deployed to Mali in 2013 with a mandate encompassing security, civilian protection, and political support. MINUSMA represented the UN's attempt to stabilize a regional complex through multilateral peacekeeping, and it contributed to civilian protection, human rights monitoring, and electoral support. However, the UN perspective's dependence on host-state consent proved fatal: when Mali's junta requested MINUSMA's withdrawal in 2023, the mission ended, removing a key source of civilian protection and international oversight. The UN perspective contributes multilateral legitimacy and normative frameworks, but it occludes the transnational dynamics of the Sahel complex, treats the crisis as a national problem amenable to peacekeeping, and lacks the enforcement capacity to act when host governments turn against it. The withdrawal of MINUSMA illustrates the broader limits of consent-based peacekeeping in contexts where governments prefer alternative security partners.

Adjudication

The African perspective best explains the Sahel case, but with significant qualifications. Its central claim—that the crisis is rooted in predatory state governance and the marginalization of peripheral populations, and that sustainable security requires African-led political solutions—aligns with the evidence: the 2012 rebellion originated in Tuareg grievances over state neglect; jihadist recruitment exploited local disputes over land and justice; and external military interventions consistently failed to address these underlying dynamics. The African perspective also correctly identifies the coup wave as a symptom of state failure and popular frustration rather than merely a security setback. However, this perspective misses or underestimates three critical factors. First, it underestimates the autonomous appeal of jihadist ideology and the organizational capacity of JNIM and ISSP, which cannot be reduced to grievances alone. Second, it overestimates the

capacity of African regional institutions to deliver security in the absence of external funding and intelligence. Third, it does not fully account for the agency of Sahelian governments in choosing Russian paramilitaries over African regional frameworks—a choice that reflects elite calculations as much as popular sovereignty. The Western perspective, by contrast, best explains the military dynamics and the failure of counterterrorism, but it systematically underestimates the political roots of the crisis. The Russian perspective explains the geopolitical realignment but not the conflict's origins. The Chinese perspective is largely irrelevant to the security dynamics. The UN perspective explains the limits of multilateral engagement but not the drivers of conflict. A synthetic explanation would combine the African perspective's structural diagnosis with the Western perspective's military analysis and the transnational level's emphasis on cross-border dynamics, while acknowledging that no single perspective fully captures the Sahel's complexity.

SECTION 2.9 PROBLEM PAIR (We do)

Tasks

1. Define the Horn of Africa as a regional security complex using Buzan and Wæver: identify the principal state units, the security interdependence among them, and the external powers that penetrate the complex without constituting its core logic.

2. Explain how the Tigray war (2020–2022) altered the regional balance among Ethiopia, Eritrea, Sudan, and Somalia, and why the Pretoria agreement reduced large-scale fighting without resolving the complex.

3. Analyze the Sudan civil war (from April 2023) as both a domestic contest over state control and a node in the wider Horn complex, including Egyptian, Gulf, Chadian, and South Sudanese interests.

4. Assess the Red Sea crisis as an external shock that revalues Horn territory, especially ports, basing rights, and maritime chokepoints, and trace the feedback loop between internal fragmentation and external penetration.

5. Compare African (AU/IGAD), Chinese, Russian, Western, and UN readings of the same complex; for each, identify one genuine contribution and one significant occlusion.

6. Formulate a falsifiable claim about whether regional institutions can de-escalate the complex, specifying the evidence that would refute it.

MODEL ANSWER

The Horn of Africa between 2020 and 2024 is best understood not as three separate crises but as a single regional security complex in which state survival, border legitimacy, maritime access, and external patronage are tightly coupled. Buzan and Wæver's framework directs attention to security interdependence: the security of each principal unit is significantly affected by others, and the complex has a distinct regional logic that cannot be reduced to global great-power competition. Ethiopia is the demographic and military core, but its internal federal crisis spilled across borders. Eritrea's security is bound to Ethiopia's; Sudan's transition and then civil war altered the western flank; Somalia's federal fragility and Al-Shabaab insurgency created

a persistent eastern vulnerability; and Djibouti, though small, sits at the maritime chokepoint that gives the complex global salience. External powers—Gulf states, Egypt, Turkey, China, Russia, Western actors, and the UN—penetrate the complex through ports, bases, arms, mediation, and humanitarian access, but they do not create its internal logic.

The Tigray war transformed this logic. Ethiopia's federal government, Eritrea, and Amhara forces aligned against the TPLF, while Sudan's transitional authorities initially faced refugee flows and border tensions. The war weakened Ethiopia's military, strained its economy, and deepened ethnic federal grievances. Eritrea gained temporary alignment with Addis Ababa but remained insecure about Ethiopian access to the sea and about Tigrayan remnants. Somalia watched Ethiopia's internal crisis while facing its own insurgency and contested federal relations. The Pretoria agreement ended large-scale fighting but left unresolved questions of disarmament, transitional justice, and regional power sharing; thus the war's main effect was to redistribute insecurity rather than resolve it.

Sudan's April 2023 civil war between the SAF and RSF then became a second shock. It is domestic in origin—rooted in the 2019 revolution, the 2021 coup, and the failure to integrate militias—but regional in consequence. Egypt has interests in Nile water and Red Sea stability; the UAE and Saudi Arabia have competed for influence and port access; Chad and South Sudan face refugee and border pressures; and Eritrea and Ethiopia calculate risks from Sudanese fragmentation. The war also created a vacuum in which external actors can arm proxies, making Sudan a node through which the Horn complex connects to Sahelian and Red Sea dynamics. From an African perspective, the tragedy is that regional ownership claims by IGAD and the AU have been weakened by member-state divisions and by the tendency of external powers to broker parallel tracks.

The Red Sea crisis adds a maritime layer. Attacks on shipping and the militarization of the Bab el-Mandeb and Gulf of Aden have increased the strategic value of ports in Djibouti, Berbera, Massawa, Port Sudan, and Assab. This external shock does not originate in the Horn, but it revalues Horn territory: coastal access, basing rights, and maritime security become bargaining chips in domestic and regional conflicts. Ethiopia's landlocked status, Eritrea's control of Assab, Somaliland's Berbera port, and Sudan's Port Sudan all become more consequential. The result is a feedback loop in which internal fragmentation invites external penetration, and external competition hardens internal factions.

Perspective reconstruction clarifies both contributions and blind spots. The African perspective, rooted in regional ownership and APSA, correctly identifies that sustainable security must be anchored in African institutions and sovereignty; its occlusion is that AU and IGAD capacity has often lagged behind political will, and member states have pursued unilateral or bilateral deals. The Chinese perspective emphasizes non-interference and development-security linkages; it contributes infrastructure and a norm against regime change, but occludes how Chinese economic interests and arms relationships shape local balances. The Russian perspective frames the West as destabilizing and presents security partnerships as sovereign choices; it contributes an anti-hegemonic vocabulary, but occludes the coercive and extractive dimensions of paramilitary and mercenary involvement. The Western perspective foregrounds counterterrorism, humanitarian protection, and liberal order; it contributes resources and early-warning capacity, but occludes how Western interventions and conditionalities have sometimes delegitimized local actors. The UN perspective emphasizes peacekeeping, mediation, and humanitarian access; it contributes legitimacy and operational scale, but occludes the political limits of missions when host-state consent fractures or great powers divide.

A falsifiable claim would be: if IGAD and the AU can establish a single, inclusive mediation architecture for Sudan and Ethiopia-Eritrea maritime issues, with verifiable ceasefire monitoring and a shared port-access

framework, then cross-border proxy arming and Red Sea militarization should measurably decline within two years. Evidence refuting this would include continued bilateral arms flows, new basing agreements outside the regional framework, and an increase in ACLED-recorded cross-border incidents despite institutional mediation. The broader lesson is that the Horn complex is not merely a collection of civil wars; it is a system in which sovereignty claims, maritime chokepoints, and external patronage interact. Any analysis that treats Tigray, Sudan, and the Red Sea as separate files will overestimate the efficacy of localized solutions and underestimate the regional feedback that sustains violence.

SECTION 2.10 INDEPENDENT MEMO (You do)

(a) Case description (150–200 words)

In 2022, the M23 rebel movement re-emerged in eastern Democratic Republic of the Congo after years of dormancy, capturing territory in North Kivu and displacing large populations. Kinshasa accused Rwanda of backing M23; Kigali denied direct support while framing its actions as security concerns linked to FDLR remnants and cross-border threats. Uganda deployed troops under bilateral and regional arrangements, while Burundi, Tanzania, and the East African Community Regional Force attempted stabilization with uneven mandates and timelines. The crisis unfolded alongside global demand for cobalt, coltan, tin, and gold, with artisanal mining and armed-group taxation embedded in transnational supply chains. By 2024–2025, diplomatic initiatives, including Luanda and Nairobi processes, had produced partial ceasefires but not durable demobilization. The case asks whether the Great Lakes is best explained as a mineral-driven proxy war, a post-colonial state-formation crisis, a regional security dilemma, or an interaction of all three.

(b) Required memo headings (prompts)

- **Mechanism:** Identify the causal chain linking state weakness, armed-group financing, regional military intervention, and mineral extraction; specify scope conditions and observable implications.
- **Perspective reconstruction:** Reconstruct African, Chinese, Russian, Western, and UN readings of the crisis, steel-manning each and noting one occlusion.
- **Historical analogue:** Compare with one earlier Great Lakes crisis (for example, the 1998–2003 Congo wars or the 2012 M23 episode) and state what is similar, what differs, and why the analogy may fail.
- **Falsifiers:** List two or three observations that would refute your preferred explanation.

(c) Self-check line

Self-check: Did you distinguish description (what happened), explanation (why it happened), prediction (what should follow), and prescription (what should be done), and avoid letting prescription masquerade as analysis?

SECTION 2.11 HINGE QUESTION

Question: Which statement best captures the central analytical claim of Regional Security Complex Theory as applied to Africa in this lesson?

A. African conflicts are primarily caused by global great-power competition, and regional institutions are epiphenomenal.
B. Regional security complexes are defined by security interdependence among proximate states; external powers penetrate but do not constitute the complex's core logic.
C. The most important unit of analysis is the individual rebel commander, because insurgencies are driven by personal ambition.

D. Regional institutions such as ECOWAS and IGAD are always effective because they possess legal mandates.

Answer: B

Distractor diagnoses:
- **A** conflates systemic penetration with causation; it ignores the theory's claim that regional dynamics possess an autonomous logic that external powers influence but do not create.
- **C** reduces a regional-systemic process to individual-level agency; while commanders matter, they do not define the security interdependence among states.
- **D** confuses institutional mandate with operational efficacy; legal authority does not guarantee capacity, political will, or member-state compliance.

SECTION 2A — DATA LAB

Data note. All figures below are approximate, drawn from ACLED public summaries, AU Peace and Security Council communiqués, and open-source military-presence trackers (2023–2025). ACLED systematically undercounts state violence, sexual violence, and events in inaccessible areas; treat every number as an order of magnitude, not a census. The purpose of the lab is to train trend-reading, level-of-analysis discipline, and perspective reconstruction — not to produce a definitive dataset.

Table 1 — Conflict fatalities by region, 2010–2025 (approximate ACLED-derived bands)

Period	Sahel (Mali, Burkina Faso, Niger)	Horn (Ethiopia, Somalia, Sudan, Eritrea, South Sudan)	Great Lakes (DRC, Rwanda, Uganda, Burundi)
2010–2012	Low (<1,000/yr)	Moderate–High (Somalia AMISOM; Sudan)	Moderate (eastern DRC militias)
2013–2015	Rising (Mali intervention; MINUSMA)	High (Somalia; South Sudan civil war)	Moderate–High (ADF, M23)
2016–2018	Rising (Burkina Faso emergence)	Moderate–High	Moderate (ADF persistence)
2019–2021	Sharp rise (Burkina, central Mali)	Very high (Tigray war 2020–22)	Moderate (ADF resurgence)
2022–2025	Very high (JNIM/ISSP territorial control)	Very high (Sudan civil war 2023–)	High (M23 resurgence 2022–)

Table 2 — External military presence by actor, 2024–2025 (approximate)

Actor	Primary theaters	Approx. footprint	Stated mandate
France	Sahel (withdrawn 2022–24)	Peak ~5,100 (Barkhane); residual bilateral	Counterterrorism

Actor	Primary theaters	Approx. footprint	Stated mandate
Russia / Africa Corps (ex-Wagner)	Mali, CAR, Libya, Sudan	1,000–2,500 (Mali est.)	Regime support, CT
US (AFRICOM)	Djibouti, Niger (withdrawn 2024), Kenya	~6,000–7,000 continent-wide; Camp Lemonnier ~4,000	CT, great-power competition
Turkey	Somalia, Libya	Largest overseas base (Mogadishu)	Training, CT, influence
UAE	Horn ports, Sudan (alleged)	Port investments; alleged RSF support	Economic, strategic
Egypt	Sudan, Somalia	Diplomatic/military	Nile security, Red Sea
Gulf (Saudi, Qatar)	Sudan, Somalia	Diplomatic/financial	Mediation, influence

Table 3 — AU PSC and regional security mechanisms (selected)

Mechanism	Region	Period	Status
AMISOM / ATMIS	Somalia	2007–present (transition)	Drawdown; Somali transition
MINUSMA	Mali	2013–2023	Withdrawn at junta request
G5 Sahel Joint Force	Sahel	2017–present	Largely inactive
SADC SAMIM	Mozambique (Cabo Delgado)	2021–present	Drawdown
ECOWAS (Niger episode)	West Africa	2023	Threatened intervention; not executed
IGAD mediation	Sudan, South Sudan	2023–present	Ongoing, limited
AU PSC sessions on Sudan	Horn	2023–2025	Multiple; limited enforcement

Analysis questions

1. **Trend.** Describe the trajectory of fatalities 2010–2025 across the three complexes. Which region shows the steepest *relative* increase, and which shows the largest *absolute* level? Identify three inflection points (e.g., 2012 Mali rebellion, 2019 Burkina escalation, 2020 Tigray, 2023 Sudan) and state whether each corresponds to a political rupture (coup, state collapse, external intervention) rather than a purely military dynamic. What does the lag between political rupture and fatality spike suggest about the mechanism?

2. **Level of analysis.** The Sahel shows escalation while the Great Lakes shows persistence-without-escalation. Which level of analysis — individual, state, systemic, or transnational — best explains this divergence? Argue whether state collapse (state level) or transnational jihadist diffusion (transnational level) is the dominant driver in the Sahel, and specify what evidence would distinguish the two (e.g., whether fatalities track border porosity or regime fragility).

3. **Perspective reconstruction (all five).** How would each perspective read Tables 1–3? (a) African: regional ownership and APSA gaps; (b) Chinese: non-interference plus security cooperation; (c) Russian: Africa Corps and anti-Western framing; (d) Western: stabilization, CT, and self-critique; (e) UN: MINUSMA, AMISOM/ATMIS, peacekeeping effectiveness. Which perspective best accounts for the external military presence data, and which is most challenged by the AU PSC's limited enforcement record in Table 3?
4. **Interpretation.** Do the data support or challenge Buzan and Wæver's (2003) claim that regional security complexes are durable structures? Consider whether the Sahel complex is "regionalizing" (spilling across borders into coastal states) or "internationalizing" (great-power entry displacing regional actors). Propose one metric that would decide between these two readings, and state what value of that metric would falsify the regional-complex thesis.
5. **Limitation.** What do ACLED data not capture that matters for this lesson? Name at least three omissions (e.g., sexual violence, displacement, state repression, underreporting in inaccessible areas, definitional exclusion of riots/protests). For each, state how the omission biases conclusions about which region is "most violent" and about whether external intervention "worked."

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — Regional Security Complex Map of Africa (hand-drawn)

- **What to draw:** Outline of the African continent in black ink. Shade three complexes: the Sahel belt (Mali–Burkina Faso–Niger) in orange; the Horn (Ethiopia–Somalia–Sudan–Eritrea–South Sudan) in red; the Great Lakes (DRC–Rwanda–Uganda–Burundi) in purple. Leave coastal West Africa and southern Africa unshaded but bordered.
- **Labels to place:** Capitals (Bamako, Ouagadougou, Niamey, Addis Ababa, Mogadishu, Khartoum, Kinshasa, Kigali, Kampala); key bases (Camp Lemonnier, Agadez, Gao, Mogadishu port); maritime chokepoints (Bab el-Mandeb, Strait of Hormuz approaches).
- **Arrows:** Dashed orange arrows from Sahel into Benin, Togo, Ghana, Côte d'Ivoire (spillover); red arrows from Horn into Red Sea shipping lanes; purple arrows from eastern DRC mineral zones to Kigali/Kampala (resource flows).
- **Perspective overlay (margin annotations):** "African: regional ownership & APSA"; "Western: CT corridors & stabilization"; "Russian: anti-Western opportunity"; "Chinese: non-interference + BRI ports"; "UN: mission footprints (MINUSMA, AMISOM/ATMIS)."

Visual 2 — Sahel Insurgency Ecosystem (network diagram)

- **What to draw:** A node-and-edge diagram on a white background. Nodes as circles of varying size (size = territorial control). Central large node: "JNIM (Al-Qaeda-aligned)" in green; adjacent large node: "ISSP (ISIS-aligned)" in black; state nodes: "Mali," "Burkina Faso," "Niger" in blue; external nodes: "Africa Corps (Russia)" in red, "France (withdrawn)" in grey dashed, "ECOWAS" in yellow.
- **Edges:** Solid red lines = active combat; dashed grey lines = rivalry/competition between JNIM and ISSP; thick black lines = territorial control by insurgents; dotted blue lines = state–external military cooperation.
- **Labels to place:** "JNIM: local embeddedness, taxation, courts"; "ISSP: more indiscriminate, anti-

civilian"; "Africa Corps: regime protection, extractive concessions"; "MINUSMA 2013–23: withdrawn."
- **Perspective overlay (margin):** "Western: CT failure & self-critique"; "African: sovereignty vs. external dependency"; "Russian: anti-Western framing"; "UN: peacekeeping limits"; "Chinese: non-interference."

Visual 3 — Horn of Africa Fragmentation and Red Sea Crisis (map)

- **What to draw:** Map of the Horn coastline plus the Red Sea and Gulf of Aden. Mark: Tigray region (shaded), Khartoum, Port Sudan, Mogadishu, Djibouti, Berbera, Hargeisa. Mark Red Sea shipping lane as a blue corridor; annotate Houthi attack zones (2023–24) with red stars.
- **Arrows:** Gulf-state influence flows (UAE, Saudi, Qatar) as green arrows into ports; refugee flows as grey arrows into Sudan/Chad; arms flows as black arrows into Sudan and Somalia.
- **Labels to place:** "SAF vs RSF (Sudan 2023–)"; "Tigray war 2020–22"; "ATMIS drawdown"; "Turkey base (Mogadishu)"; "UAE ports (Berbera, Bosaso)."
- **Perspective overlay (margin):** "African: regional ownership (IGAD, AU)"; "UN: peacekeeping limits"; "Western: maritime security"; "Chinese: BRI ports & non-interference"; "Russian: naval interest."

SECTION 4 — CORNELL NOTES

Cue column

Cue	Notes (with source log)
Define Regional Security Complex (Buzan & Wæver)	A set of states whose major security concerns are so interlinked that they cannot be resolved apart from one another; complexes are durable, regionally bounded, and anarchic at the regional level. *Source: Buzan & Wæver (2003), Regions and Powers.*
What makes a complex "regional"?	Geographic proximity + security interdependence + absence of a global hegemon that fully subordinates regional dynamics. African complexes are "weakly institutionalized" — regional organizations exist but lack enforcement.
Sahel: key actors and timeline	2012 Tuareg rebellion (MNLA) + jihadist takeover (AQIM, MUJAO); French intervention (Serval, 2013); MINUSMA (2013–23); 2020–21 coups (Mali, Burkina, Niger); JNIM/ISSP expansion; Africa Corps entry. *Sources: ACLED Sahel reports 2023–25; Crisis Group Africa reports.*

Cue	Notes (with source log)
Why did MINUSMA fail?	Mandate–capacity mismatch; host-state consent erosion; junta expulsion (2023); inability to protect civilians; treated symptoms not causes. *Source: Williams (2018) on peacekeeping challenges; Crisis Group.*
Horn: Tigray war drivers	Federal–regional power struggle; Eritrea's role; ethnic federalism tensions; Abiy Ahmed's centralization. *Source: de Waal (2015), The Real Politics of the Horn of Africa.*
Sudan 2023 civil war: SAF vs RSF	Power struggle between Burhan (SAF) and Hemedti (RSF); collapse of transition; external backing (Egypt/UAE, etc.); humanitarian catastrophe.
Great Lakes: mineral–conflict link	Coltan, cobalt, gold in eastern DRC; armed groups tax extraction; Rwanda/Uganda interventions (1996–, 1998–) and proxy militias. *Source: Mamdani (2009); Rodney (1972) on extractive structures.*
Rwanda–Uganda interventions in DRC	First Congo War (1996), Second (1998–2003); ongoing M23 (2012–13, 2022–) with alleged Rwandan support.
APSA: pillars and gaps	African Peace and Security Architecture: PSC, ASF, Continental Early Warning, Panel of the Wise. Gaps: funding, rapid deployment, political will, member-state sovereignty. *Source: Williams (2018).*
ECOWAS: Niger 2023 episode	Threatened military intervention after coup; not executed; revealed limits of regional enforcement vs. sovereignty norms.
IGAD: Sudan mediation	IGAD-led process; limited leverage; competing Gulf/Egyptian interests; AU PSC parallel tracks.
SADC: SAMIM	SADC mission in Mozambique (Cabo Delgado); drawdown; shows regional capacity but also dependency on South Africa.

Summary (3–5 sentences). Regional security complexes in Africa — Sahel, Horn, Great Lakes — are durable but weakly institutionalized structures in which security interdependence outpaces regional capacity. External actors (France, Russia, US, Gulf states, Turkey) have increasingly penetrated these complexes, often displacing African ownership without resolving root causes. ACLED data show escalating fatalities in the Sahel and Horn since 2019, while the Great Lakes persists at high levels without comparable escalation. African regional institutions (APSA, ECOWAS, IGAD, SADC) possess normative frameworks but lack enforcement and funding, leaving a gap that external powers fill. The central puzzle is whether regional ownership can be rebuilt without either sovereignty absolutism or external dependency.

SECTION 5 — FEYNMAN COMPRESSION

Step 1 — Explain without jargon. A regional security complex is a neighborhood where countries' security problems are so tangled that you cannot fix one without affecting the others. In Africa, three such neighborhoods — the Sahel, the Horn, and the Great Lakes — keep producing violence that spills across borders. Outside powers keep stepping in (France, Russia, the US, Gulf states), but they treat symptoms and often make things worse. African regional bodies have good rules on paper but rarely enforce them. The result: more deaths, weaker states, and a cycle where each intervention invites the next.

Step 2 — Mark gaps. I could not cleanly explain why the Great Lakes has not escalated like the Sahel despite similar state weakness; the mineral–conflict mechanism is clear but the *containment* mechanism is not. I also could not specify the threshold at which a complex stops being "regional" and becomes "internationalized" — this needs the metric from Analysis Question 4. I am unsure whether APSA's failure is primarily financial or political; the sources point both ways.

Step 3 — Reread verification. Re-checking Buzan and Wæver (2003): complexes are defined by security interdependence, not by institutional density, so weak APSA does not falsify the theory — it confirms that complexes can exist without strong institutions. Re-checking de Waal (2015): the Horn's politics are driven by "political markets" and elite bargains, which explains why external intervention often reinforces rather than resolves conflict. Re-checking ACLED-derived bands: the Sahel's relative increase is the steepest; the Horn's absolute level remains highest. Williams (2018) confirms that AMISOM/ATMIS succeeded partially through troop-contributing countries' own interests, not pure altruism.

Step 4 — Analogy with explicit limits. *Analogy:* A regional security complex is like a shared apartment building with thin walls — a fire in one flat (Mali 2012) spreads to neighbors (Burkina, Niger) because the walls (borders) are porous and the landlord (regional institution) has no fire brigade. *Limits:* The analogy implies passive spread; it misses that actors *choose* to intervene (France, Russia) and that some "fires" are deliberately lit (proxy warfare). It also implies a single building; in reality the three complexes interact (Sudan's collapse affects Sahel arms flows). Do not push the analogy to "just call the fire department" — there is no neutral fire department; every responder has interests.

Step 5 — Rewrite (compressed final). Regional security complexes in Africa are durable, interdependent security neighborhoods (Sahel, Horn, Great Lakes) whose violence escalates or persists according to state capacity and transnational diffusion, not merely local grievances. External powers penetrate these complexes with counterterrorism and geopolitical agendas, while African regional institutions (APSA, ECOWAS, IGAD, SADC) lack enforcement, producing a sovereignty–dependency dilemma. ACLED trends show the Sahel's steepest relative escalation since 2019 and the Horn's highest absolute levels, with the Great Lakes persisting at high but stable levels. The central analytical task is to distinguish regionalization (cross-border spillover) from internationalization (great-power displacement of regional actors) and to specify falsifiers for each.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L30	definition	What is a regional security complex?	A regional security complex is a set of states and other actors whose security concerns are so interlinked that they cannot be analyzed separately from their regional neighborhood. Buzan and Wæver (2003) treat regional complexes as the middle level between the global system and individual states.	African perspective stresses that regional complexes are also arenas of sovereignty bargaining, not just threat interaction.
L30	mechanism	How does RSC theory explain African conflicts?	It explains conflict by tracing how threats, alliances, and interventions circulate within a bounded region rather than by treating each state as an isolated unit. The mechanism is regional interdependence: violence in one node reshapes incentives, borders, and external alignments across the complex.	African scholars add that colonial borders and postcolonial state weakness make regional interdependence unusually dense.

Tag	Card Type	Front	Back	Perspective Note
L30	application	Which three African regional security complexes are central in this lesson?	The Sahel, the Horn of Africa, and the Great Lakes. Each has distinct conflict drivers, but all show cross-border insurgency, state fragility, and external military involvement.	African perspective treats these as overlapping sovereignty spaces rather than fixed regional boxes.
L30	mechanism	What is the Sahel insurgency ecosystem?	It is a network of jihadist groups, state forces, militias, and external actors competing for territory, revenue, and legitimacy across Mali, Burkina Faso, and Niger. JNIM and ISSP are central armed actors, while state forces and Russian paramilitaries add further layers of violence and bargaining.	African perspective highlights that local grievances and state absence often matter more than global jihadist ideology.

Tag	Card Type	Front	Back	Perspective Note
L30	application	Why did counterterrorism fail to stabilize the Sahel?	Counterterrorism often prioritized kinetic strikes and external partnerships over political inclusion, state legitimacy, and local protection. The result was tactical disruption of groups without durable reduction in territorial control or civilian insecurity.	Western self-critique acknowledges over-militarization; African perspective stresses missing local ownership.
L30	comparison	How does the Horn differ from the Sahel as a security complex?	The Horn combines interstate rivalry, civil war, Red Sea geopolitics, and Gulf state involvement, whereas the Sahel is more dominated by non-state insurgency and weak state control. Both, however, show how regional and external actors become entangled in local conflicts.	African perspective sees the Horn as a sovereignty crisis with multiple competing state projects.

Tag	Card Type	Front	Back	Perspective Note
L30	mechanism	What drives Great Lakes conflict around minerals?	Armed groups, state forces, and regional powers compete over mineral-rich territory, especially in eastern DRC, while political and ethnic narratives legitimate extraction and violence. Rwanda and Uganda have been repeatedly accused of supporting armed actors, which they deny or frame as security necessities.	African perspective emphasizes Congolese sovereignty and the regionalization of extraction.
L30	application	What is APSA and why does its efficacy matter?	The African Peace and Security Architecture is the AU framework for conflict prevention, mediation, and peace support operations. Its efficacy matters because regional institutions are supposed to translate African ownership into operational capacity, but they face funding, political, and coordination gaps.	African perspective treats APSA as a sovereignty project, not merely a technical mechanism.

Tag	Card Type	Front	Back	Perspective Note
L30	source	What do ACLED data contribute to this lesson?	ACLED data help track conflict events, fatalities, and geographic diffusion across the Sahel, Horn, and Great Lakes. They are useful for identifying trends and intensity, but they do not by themselves explain motives, legitimacy, or political outcomes.	Data are strongest when read alongside African political analysis rather than as neutral truth.
L30	reconstruction	How does the African perspective frame regional ownership?	It argues that durable security requires African-led institutions, local legitimacy, and respect for sovereignty, while recognizing that sovereignty is often fragmented in practice. Regional ownership is therefore both a normative claim and a political struggle.	This is the primary perspective: it asks who controls security decisions and whose suffering counts.

Tag	Card Type	Front	Back	Perspective Note
L30	occlusion	What does Western counterterrorism framing often occlude?	It can occlude local political grievances, state violence, civilian harm, and the ways external military presence reshapes local power. It may also reduce complex conflicts to terrorist threats.	African and UN perspectives highlight protection failures and legitimacy deficits.
L30	adjudication	How should one adjudicate between RSC theory and state-centric explanations?	RSC theory is stronger when cross-border dynamics dominate; state-centric explanations are stronger when domestic bargains, regime survival, or local grievances are primary. The best analysis specifies which level is doing the causal work in a given period.	African perspective often requires both, because weak states and dense regions interact.
L30	visual	What is the core visual anchor for this lesson?	The visual anchor maps three regional complexes, their armed actors, external forces, and institutional responders, showing how local violence scales into regional and global security concerns.	The overlay should mark African ownership, Chinese non-interference, Russian paramilitary presence, Western CT, and UN missions.

Tag	Card Type	Front	Back	Perspective Note
L30	debate	What is the central debate over external military presence?	One side argues external forces can contain insurgents and protect civilians; the other argues they undermine sovereignty, fuel backlash, and create dependency. The debate turns on legitimacy, mandate design, and whether force is tied to political settlement.	African perspective asks whether intervention strengthens or weakens regional self-determination.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence audit table

Competency	Self-score (0-100)	Evidence of mastery	Next action
Define and apply RSC theory	0-100	Can explain Buzan and Wæver (2003) and identify scope conditions	Re-explain without notes
Reconstruct the Sahel case 2012-2025	0-100	Can trace Tuareg rebellion to JNIM/ISSP territorial control	Draw timeline from memory
Reconstruct the Horn case 2020-2024	0-100	Can link Tigray, Sudan, and Red Sea dynamics	Write one-paragraph complex map
Reconstruct Great Lakes mineral politics	0-100	Can connect DRC, Rwanda, Uganda, and extraction	Identify one falsifier
Evaluate APSA and regional institutions	0-100	Can compare ECOWAS, IGAD, SADC, and AU roles	Score one institution against criteria
Interpret ACLED conflict data	0-100	Can distinguish trend from causal explanation	Re-run one table reading

Competency	Self-score (0-100)	Evidence of mastery	Next action
Reconstruct all five perspectives	0-100	Can state each perspective's contribution and occlusion	Complete comparison matrix
Adjudicate competing explanations	0-100	Can specify evidence that would change conclusion	Write three falsifiers

7.2 Three-question debrief

1. Which part of the lesson most changed your prior view: the African perspective on sovereignty, the failure of Sahel counterterrorism, or the entanglement of Gulf states in the Horn?
2. Which claim are you least able to defend with evidence right now, and what source or data would you need to strengthen it?
3. If you had to advise a regional organization, which mechanism would you prioritize first: force generation, political mediation, civilian protection, or data-driven early warning?

7.3 Error-log table

Common Misconception	Correction	Evidence
Regional security complexes are just geographic neighborhoods.	They are relational systems defined by security interdependence, not proximity alone.	Buzan and Wæver (2003)
JNIM and ISSP are identical movements with identical goals.	They are rival jihadist networks with overlapping but distinct structures, alliances, and territorial strategies.	ACLED Sahel reports (2023-2025); Crisis Group Africa reports
The Horn crisis is only a set of separate national civil wars.	It is a regional complex linking Ethiopia, Eritrea, Somalia, Sudan, and external Gulf actors.	de Waal (2015); Crisis Group Africa reports
Mineral wealth alone causes Great Lakes violence.	Minerals interact with state weakness, regional intervention, identity politics, and armed group governance.	Crisis Group Africa reports
Strong AU mandates guarantee effective operations.	Mandates must be matched by funding, troop contributions, logistics, and political consensus.	Williams (2018)

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Regional security complex; sovereignty; insurgency ecosystem; mineralized conflict	Regional interdependence; cross-border diffusion; state absence; external intervention; extraction networks	Buzan and Wæver (2003) RSC theory; African ownership arguments	Sahel 2012-2025; Horn 2020-2024; Great Lakes DRC-Rwanda-Uganda	Counterterrorism vs political settlement; intervention vs sovereignty; data vs interpretation	Decline in cross-border attacks; durable territorial control by states; reduced external military presence; improved civilian protection	L23 asymmetric warfare; L27 colonial state formation; L29 conflict political economy; L31 great power competition; L34 Sahel synthesis; L44 proxy warfare
APSA; ECOWAS; IGAD; SADC; AU PSC	Mandate design; force generation; mediation; early warning; coordination	Williams (2018) on AU peace operations; African institutionalism	AU PSC interventions; AMISOM/ATMIS; MINUSMA	Effectiveness vs legitimacy; African ownership vs donor dependence	Sustained funding; troop rotations; civilian harm reduction; political settlement	L29 conflict political economy; L31 great power competition; L44 proxy warfare

SECTION 9 — REVIEW SCHEDULE

- **R1 — Same day, 25 minutes:** Re-read the five key ideas, then recite the three regional complexes and their central actors without notes.
- **R2 — 48 hours, 40 minutes:** Reconstruct the Sahel 2012-2025 worked example and the Horn 2020-2024 problem pair, marking where each perspective changes the explanation.
- **R3 — 1 week, 45 minutes:** Re-analyze one ACLED-style table, separating trend description from causal interpretation and identifying one limitation.
- **R4 — 2 weeks, 50 minutes:** Rebuild the five-perspective comparison matrix from memory and add one falsifier for each perspective.
- **R5 — 1 month, 60 minutes:** Write a full independent memo on a new regional case using the required headings and test it against the completion checklist.

SECTION 10 — COMPLETION CHECKLIST

☐ I can define a regional security complex using Buzan and Wæver (2003).
☐ I can identify the Sahel, Horn, and Great Lakes as distinct but comparable complexes.

- ☐ I can explain the Sahel insurgency ecosystem without reducing it to terrorism.
- ☐ I can trace the Sahel from the 2012 Tuareg rebellion to JNIM and ISSP territorial control.
- ☐ I can explain Horn fragmentation as a regional complex involving Gulf states.
- ☐ I can connect Great Lakes violence to minerals, state weakness, and regional intervention.
- ☐ I can evaluate APSA, ECOWAS, IGAD, and SADC using evidence rather than labels.
- ☐ I can read ACLED-style data as trend evidence without overclaiming causation.
- ☐ I can reconstruct the African perspective as primary, not as a regional example.
- ☐ I can steel-man the Chinese, Russian, Western, and UN perspectives.
- ☐ I can identify what each of the five perspectives occludes.
- ☐ I can adjudicate between RSC theory and state-centric explanations.
- ☐ I can specify falsifiers for at least three major claims.
- ☐ I can distinguish description, explanation, prediction, and prescription.
- ☐ I can apply the four levels of analysis to a regional case.
- ☐ I can complete the independent memo using the required headings.
- ☐ I can explain why regional ownership is both normative and political.

32. Great Power Competition on the Continent

LESSON METADATA

Field	Value
Lesson number and title	Lesson 31 — Great Power Competition on the Continent
Module	Module 5: African Geopolitical Architecture
Prerequisites	L12 (Cold War), L18 (weaponized interdependence), L30 (regional security complexes)

Field	Value
Interleaved links	Forward to L32 (African agency), L33 (critical minerals), L47–49 (systemic rivalry)
Reading load	7–9 hours
Content channels	Text, data lab, worked example, problem pair, flashcards, visuals
Bloom ceiling	Evaluate / create
Estimated study time	7–9 hours

SECTION 0 — Why This Lesson Exists

The central puzzle of this lesson is whether Africa is best understood as a passive object of renewed great-power competition or as an active arena in which African states, societies, and regional institutions bargain, select, and recombine external offers. The phrase "new scramble" captures a real anxiety: external powers are again competing for ports, minerals, military access, votes, and influence across the continent. Yet the phrase also risks reproducing an older colonial grammar in which Africa appears as territory to be divided rather than as a field of political agency. The lesson therefore begins not with a catalogue of foreign powers but with a theoretical question: under what conditions does external competition constrain African choice, and under what conditions does it expand it? This is not a semantic dispute. It shapes how one reads trade data, security agreements, debt contracts, and diplomatic communiqués. If Africa is treated as an object, then the story is about Washington, Beijing, Moscow, Brussels, Ankara, Riyadh, and New Delhi. If Africa is treated as an arena, then the story is about how African governments and publics use rivalry among outsiders to secure infrastructure, security, market access, and diplomatic room for manoeuvre. The lesson's task is to hold both possibilities in tension and to adjudicate between them using mechanisms, evidence, and scope conditions rather than slogans.

This lesson sits at a junction in the curriculum. Lesson 12 on the Cold War established that Africa was not merely a backdrop to superpower rivalry but a site where proxy wars, ideological competition, and post-colonial state formation interacted. Lesson 18 on weaponized interdependence showed that trade, finance, technology, and supply chains can be converted into instruments of coercion, which means that economic partnership is never politically innocent. Lesson 30 on regional security complexes argued that threats and security dynamics cluster regionally, so that a crisis in the Sahel, the Horn, or the Great Lakes cannot be understood solely through bilateral great-power rivalry. Lesson 31 brings these threads together by asking how systemic competition interacts with regional security structures and African bargaining. It also prepares the ground for Lesson 32 on African agency, Lesson 33 on critical minerals, and Lessons 47–49 on systemic rivalry. The student should therefore read this lesson as a bridge between historical international relations, political economy, and contemporary security studies, not as a current-events briefing.

The contemporary landscape is genuinely multipolar in a way that differs from the Cold War. China's engagement is anchored in FOCAC, state-backed finance, infrastructure, and a discourse of "win-win" development and non-interference. Russia's engagement combines arms sales, security partnerships, information operations, and an anti-Western narrative that presents Moscow as a defender of sovereignty against conditional Western power. Western engagement remains significant through trade preferences such as AGOA, development finance, military assistance, and diplomatic conditionality, but it is also marked by strategic retrenchment, fatigue, and competing priorities. Meanwhile, Gulf states, Turkey, India, and other middle

powers have multiplied the number of suitors, sometimes offering faster, less conditional, or more security-focused deals. This multiplication matters theoretically: in a bipolar system, African states often faced a stark choice; in a multipolar or fragmented system, they may be able to play suitors against one another, though only within constraints set by debt, conflict, institutional weakness, and elite politics.

The lesson also insists on distinguishing levels of analysis. At the individual level, leaders, diplomats, military officers, business elites, and civil-society actors make choices shaped by domestic incentives and transnational networks. At the state level, governments pursue security, revenue, legitimacy, and regime survival. At the systemic level, the distribution of power, alliance structures, and global economic cycles shape what is possible. At the transnational level, diasporas, multinational firms, armed groups, religious networks, and illicit markets cross borders and complicate state control. A common error is to infer African passivity from systemic power asymmetry. Another common error is to infer African omnipotence from the mere presence of multiple external partners. The correct analytical move is to specify the mechanism through which an external offer becomes a domestic political resource, a security dependency, a debt obligation, or a bargaining chip. Without that mechanism, one cannot distinguish partnership from penetration, or agency from improvisation under constraint.

The theoretical lineage is plural. Realist traditions emphasize power politics, spheres of influence, and the security dilemma; they help explain military basing, arms transfers, and strategic competition over chokepoints and minerals. Liberal and institutionalist traditions emphasize interdependence, trade regimes, and the possibility that economic ties create mutual gains and restraint. Constructivist traditions emphasize norms, identity, and the social construction of partnership, including the language of "win-win," sovereignty, and non-interference. Critical and decolonial traditions, drawing on scholars such as Grovogui, Mbembe, Bayart, Mamdani, Rodney, Nkrumah, Nyerere, Cabral, and Fanon, warn that formal sovereignty can coexist with structural dependence and that external powers often reproduce hierarchies through finance, knowledge, and security practices. African agency scholarship, including work by Aning, Danso, and Tamale, pushes back against both Afro-pessimism and romanticism by examining how African actors negotiate, resist, adapt, and sometimes capture external projects. The lesson does not ask the student to choose one tradition as the truth. It asks the student to identify which tradition best explains a given case, where its scope conditions end, and what evidence would falsify it.

By the end of the lesson, the student should be able to reconstruct the "new scramble" thesis and its critics; compare Chinese, Russian, Western, Gulf, Turkish, Indian, and other middle-power engagements through their mechanisms rather than their rhetoric; read FOCAC commitments and Sahel security outcomes as bargains with terms; use trade, FDI, arms, and voting data without overclaiming; and produce a memo that distinguishes description, explanation, prediction, and prescription. The student should also be able to steelman all five perspectives—African, Chinese, Russian, Western, and UN—and identify what each reveals and what it occludes. The final test is not whether the student can name the largest investor or the most recent summit, but whether they can explain why a particular external relationship produces a particular outcome in a particular African context, and what would have to be true for that explanation to fail.

SECTION 1 — Pre-Class Priming

1.1 Retrieval warm-up

1. From Lesson 12: How did Cold War proxy competition in Africa combine superpower rivalry with local political struggles, and why does that history caution against treating African actors as mere

instruments?
2. From Lesson 12: What is the difference between a proxy war and a civil war with external intervention, and which African cases illustrate the boundary problem?
3. From Lesson 18: Define weaponized interdependence and give one example of how trade, finance, or technology can be converted into coercive leverage.
4. From Lesson 18: Why does economic interdependence sometimes produce restraint and sometimes produce vulnerability, and what domestic or institutional variables mediate that difference?
5. From Lesson 30: What is a regional security complex, and how does the Sahel or Horn of Africa demonstrate clustering of threats across borders?
6. From Lesson 30: How can an external power's bilateral security partnership inadvertently reshape a regional security complex?

1.2 Orientation questions

1. Is the "new scramble" thesis a useful analytical framework, a misleading metaphor, or both—and what evidence would distinguish these possibilities?
2. How do African governments convert the presence of multiple external suitors into bargaining power, and what limits that conversion?
3. Which external engagement model—Chinese infrastructure finance, Russian security partnership, Western conditionality, or middle-power pragmatism—best explains a given outcome in a specific African case, and on what mechanism?
4. What would falsify the claim that a particular external power's engagement is primarily developmental rather than strategic?

1.3 Vocabulary pre-teach

- **Multi-alignment**: A state's practice of maintaining productive relationships with several competing powers simultaneously rather than joining a single bloc; provisional definition: strategic diversification without formal alliance.
- **New scramble thesis**: The argument that contemporary great-power competition in Africa resembles colonial-era partition in its extractive and competitive logic; provisional definition: a critical frame treating Africa as an object of external rivalry.
- **FOCAC**: The Forum on China–Africa Cooperation, a multilateral platform for China–Africa political, economic, and development coordination; provisional definition: the institutional anchor of China's Africa policy.
- **Belt and Road Initiative (BRI)**: China's global infrastructure and connectivity initiative, including projects in Africa; provisional definition: a state-backed framework for financing and building cross-border infrastructure.
- **Debt-trap diplomacy**: The allegation that creditors deliberately lend to create unsustainable debt and thereby extract strategic concessions; provisional definition: a contested causal claim about creditor intent and debtor vulnerability.
- **Africa Corps**: Russia's state-linked security formation operating in parts of Africa, especially the Sahel; provisional definition: a Russian military instrument combining force projection, regime support, and influence operations.
- **AGOA**: The African Growth and Opportunity Act, a U.S. trade preference program for eligible African countries; provisional definition: market access conditioned on statutory eligibility criteria.

- **Conditionality**: The practice of attaching political, economic, or governance requirements to aid, loans, or trade preferences; provisional definition: external leverage exercised through rule-based access.
- **Weaponized interdependence**: The use of network centrality in trade, finance, or technology to coerce or constrain other actors; provisional definition: interdependence converted into power.
- **Regional security complex**: A cluster of states whose security concerns are so interlinked that they cannot be analysed separately; provisional definition: the regionalisation of threat and response.
- **Strategic retrenchment**: The reduction or reordering of a power's overseas commitments; provisional definition: withdrawal or reprioritisation driven by cost, fatigue, or competing demands.
- **Middle-power suitor**: A state outside the top-tier great powers that offers security, economic, or diplomatic partnerships in Africa; provisional definition: an additional competitor that expands African choice while adding complexity.

SECTION 2 — LESSON CORE

2.1 Learning objectives

By the end of this lesson, the student will be able to: (1) **Analyze** the "new scramble" thesis and its critics, distinguishing structural-determinist accounts that treat Africa as passive terrain from agency-centered accounts that emphasize African bargaining, multi-alignment, and elite instrumentalization of external competition; (2) **Evaluate** Chinese engagement through FOCAC, the Belt and Road Initiative, and state-backed investment, adjudicating the "debt-trap" debate with reference to Brautigam's (2009) and Taylor's (2014) arguments and to the FOCAC Dakar Action Plan (2021); (3) **Compare** Russian, Western, and middle-power strategies across security, economic, and diplomatic domains, using SIPRI arms-transfer data and UNSC voting alignment as empirical anchors; (4) **Reconstruct** five perspectives—African, Chinese, Russian, Western, and UN—on great-power competition as a whole, identifying what each contributes and what it occludes; and (5) **Apply** four levels of analysis (individual, state, systemic, transnational) to a concrete case, producing a memo that distinguishes description, explanation, prediction, and prescription and that states explicit falsifiers. The Bloom ceiling is *evaluate/create*: students are expected not merely to describe competing engagements but to adjudicate among them on evidence and to design a test that could falsify their preferred interpretation. Prerequisites (L12 Cold War, L18 weaponized interdependence, L30 regional security complexes) supply the historical and structural scaffolding; forward links (L32 African agency, L33 critical minerals, L47–49 systemic rivalry) extend the analysis into agency, resources, and systemic competition.

2.2 KEY IDEA 1 — The "new scramble" thesis and its critics: is Africa a passive object of great-power competition?

Bolded Causal Claim: The "new scramble" thesis asserts that post-Cold War Africa has become the object of a renewed great-power competition structurally analogous to the late-nineteenth-century partition, driven by resource demand, strategic rivalry, and institutional asymmetry; its critics counter that African states are not passive terrain but active bargainers who leverage multiplicity of suitors through multi-alignment, so that competition produces leverage as often as subordination.

Mechanism: The thesis operates through three linked mechanisms that must be specified rather than assumed. First, *structural demand*: industrialization in China and India and energy-security concerns in West-

ern and Gulf capitals increased demand for African hydrocarbons, critical minerals, and agricultural land, raising the expected returns to securing long-term supply contracts, infrastructure corridors, and port access. This demand shock is not new in kind—colonial extraction followed similar logics—but its post-Cold War scale and its multiplicity of buyers are. Second, *institutional asymmetry*: many African states possess limited fiscal capacity, thin regulatory institutions, and high debt vulnerability, which lowers the transaction costs for external actors to negotiate bilateral deals outside multilateral frameworks and makes state-backed finance (Chinese policy banks, Gulf sovereign wealth funds, Russian state credit) comparatively attractive to governments that cannot access affordable private capital. The mechanism here is not conspiracy but a market for sovereignty in which weak states trade access for infrastructure and rents. Third, *competitive signaling*: as the unipolar moment faded after 2008, great powers began to treat African diplomatic alignment, basing access, and resource access as positional goods in a broader rivalry, producing bidding dynamics that resemble the scramble in form if not in legal status. The critics' counter-mechanism is *strategic multiplicity*: when several external powers compete, African elites gain room to maneuver, extract better terms, select partners, and resist conditionality. The mechanism of agency is not the absence of asymmetry but the exploitation of it—playing suitors against one another, using regional organizations (the AU, RECs) to set collective terms, and renegotiating contracts when leverage shifts. The debate thus turns on whether competition produces subordination (divide-and-rule, debt dependency, operational control of ports and mines ceded to creditors) or leverage (better infrastructure, diversified partnerships, policy space). Evidence is mixed and state-specific: some governments secured renegotiated terms and diversified partners; others accumulated unsustainable debt and ceded operational control. The mechanism is therefore conditional on state capacity, elite cohesion, and the structure of the external offer.

Scope Conditions: The "new scramble" framing applies best where (a) resource rents are high and state capacity low; (b) external powers have security interests (bases, counterterrorism, maritime chokepoints); and (c) regional institutions are weak, underfunded, or captured by national elites. It applies poorly where African states have diversified economies, strong regulatory capacity, or cohesive regional blocs capable of collective bargaining. It also assumes a degree of great-power substitutability that may not hold: Chinese infrastructure finance is not easily replaced by Western private capital, and Western security guarantees are not easily replaced by Russian arms, so "scramble" metaphors can obscure complementarity and lock-in. Temporally, the thesis fits the commodity boom (roughly 2000–2014) and the post-2015 security turn in the Sahel and Horn; it fits less well the 1990s, when Africa was marginal to great-power strategy and Western donors dominated through conditionality. The thesis also struggles to explain cases where African states initiated engagement (e.g., soliciting Chinese infrastructure finance) rather than being targeted, which is why agency-centered scholars insist on reversing the causal arrow in at least some cases.

Observable Implications: If the thesis holds, we should observe: rising and concentrated FDI and trade with a few external partners; debt distress correlated with non-concessional bilateral lending; military basing and arms transfers tracking rivalry rather than African threat profiles; and African voting alignment in multilateral forums shifting with patronage. If the agency critique holds, we should observe: diversification of partners over time; renegotiation of contracts and debt restructuring; regional institutional pushback (AU common positions, REC-level negotiation); and variation in outcomes across states with similar resource profiles. Data from Comtrade (trade flows by partner), UNCTAD (FDI by source), SIPRI (arms transfers), and World Bank/IMF debt statistics can adjudicate between these implications. The FOCAC Dakar Action Plan (2021) is a useful test case: its promise of reduced lending, more trade promotion, and green development suggests Chinese adaptation to African debt concerns—consistent with bargaining pressure rather than pure extraction—though the gap between promise and disbursement remains a live question.

Perspective Note (five traditions in brief):

African (primary): From within African scholarship, the "new scramble" metaphor is double-edged. It captures real external predation—echoing Rodney's (1972) argument that external engagement underdeveloped the continent and Nkrumah's (1965) warning about neo-colonialism—but risks reproducing the very passivity it describes. African scholars such as Bayart (2009) and Mbembe (2001) emphasize that African states are not empty vessels; they are political orders in which elites instrumentalize external resources for domestic survival, producing what Bayart calls the "politics of the belly." Mamdani (1996) reminds us that the colonial state form was bifurcated, and postcolonial states inherit constraints that shape how external engagement lands—so that "scramble" outcomes are mediated by domestic state form, not just external appetite. The African vantage point thus reframes the central question: not "are great powers scrambling?" but "how do African political economies convert external competition into rents, and at what cost to citizens?" Multialignment is not naivety; it is a strategy born of structural weakness and historical experience of betrayal by single patrons. The strongest African critique of the "scramble" thesis is that it lets African elites off the hook by attributing outcomes solely to external actors, obscuring the domestic distribution of gains and losses. Grovogui (2006) and Oyěwùmí (1997) add that the very categories of "state" and "sovereignty" deployed in scramble debates are Eurocentric, and that African political thought offers alternative vocabularies of authority and obligation that the thesis ignores.

Chinese: Chinese official and scholarly discourse rejects the "scramble" framing as Cold War residue. Engagement is framed as "win-win" developmental partnership, non-interference, and mutual benefit, with FOCAC as a multilateral (Africa-wide) platform rather than bilateral extraction. The mechanism emphasized is infrastructure-led growth and industrialization support, decoupled from political conditionality. This perspective contributes the claim that development finance can be offered without governance conditionality; it occludes debt sustainability, labor and environmental standards, and the political effects of opaque contracting. Alden and Large (2019) and Taylor (2014) document both the scale of Chinese engagement and the recurring gap between "win-win" rhetoric and African perceptions of asymmetry.

Russian: Russian discourse frames engagement as sovereign choice and multipolarity: African states have the right to choose partners, and Russian presence (arms, nuclear energy, grain) offers an alternative to Western conditionality. The "scramble" is read as Western anxiety about losing monopoly. This perspective contributes anti-hegemonic legitimacy and a critique of Western double standards; it occludes the security externalities of proxy forces and the transactional nature of much engagement.

Western: Western analysis often treats great-power competition as a strategic problem: China and Russia are rivals whose gains in Africa reduce Western influence and threaten access to critical minerals and bases. Conditionality and governance promotion are framed as normative goods; retrenchment (e.g., French drawdown) is debated as either prudent or abandonment. This perspective contributes attention to governance, human rights, and transparency; it occludes its own historical record of intervention and extraction, and can overstate African passivity by treating African choices as symptoms of external manipulation.

UN: The UN perspective centers on Charter principles—sovereign equality, non-use of force, self-determination—and on peace and security. Great-power competition is assessed by its effects on conflict, humanitarian access, and multilateral cooperation. The UN contributes normative guardrails and data (SIPRI, Comtrade via member states, UNSC records) but is constrained by great-power veto politics and by the gap between norms and enforcement. It tends to treat African states as member states with equal voice while underweighting the structural inequality of that voice.

SECTION 2.3 KEY IDEA 2 — Chinese engagement: FOCAC, BRI, state-backed investment, and the 'debt trap' debate

Bolded Causal Claim: China's state-backed, infrastructure-first engagement in Africa creates a distinctive bargaining structure in which African governments gain rapid, large-scale financing and physical connectivity, but become locked into opaque, project-tied debt and procurement arrangements that shift commercial risk to African public balance sheets while concentrating leverage in Chinese state-owned banks and contractors; the resulting relationship is neither purely predatory nor purely developmental but a contingent, negotiated dependency whose terms vary by sector, borrower capacity, and African institutional strength.

Mechanism: China's African engagement is best understood as a state-coordinated development-finance and infrastructure system rather than a single aid program or a market-driven investment wave. The Forum on China-Africa Cooperation (FOCAC), created in 2000, provides the diplomatic and planning architecture; triennial summits and action plans convert political commitments into sectoral priorities. The Belt and Road Initiative (BRI) supplies the project pipeline and corridor logic, while Chinese policy banks—especially the Export-Import Bank of China and the China Development Bank—provide large-scale, often concessional or semi-concessional finance. State-owned enterprises and construction firms then execute projects, frequently under tied procurement arrangements that bundle finance, engineering, and equipment. This bundling lowers transaction costs for African governments facing urgent infrastructure deficits and limited access to long-term capital, but it also compresses competition, weakens price discovery, and can obscure lifecycle costs. Brautigam's research on Chinese aid and finance challenges the crudest versions of the "debt-trap" thesis by showing that Chinese lending is heterogeneous, that asset seizures are not the typical outcome of distress, and that African governments are active participants in project selection and borrowing. Yet the same literature and subsequent debt restructurings show that opacity, collateralization, escrow mechanisms, and confidentiality clauses can create real bargaining asymmetries. The mechanism is therefore not a simple trap but a negotiated dependency: African elites gain rapid, visible infrastructure and diplomatic diversification; Chinese actors gain markets, resources, diplomatic support, and outlets for industrial overcapacity; and the distribution of risk depends on contract design, revenue forecasting, and the borrower's institutional capacity. Taylor's and Alden and Large's work on Africa-China relations emphasizes that the relationship has moved from a narrow resource-for-infrastructure logic toward a broader, more contested agenda including manufacturing, digital infrastructure, green energy, and security cooperation, which multiplies both opportunities and friction points.

Scope Conditions: The developmental benefits of Chinese engagement are most likely where African states have strong debt-management offices, transparent procurement, independent audit capacity, and diversified revenue streams; where projects have demonstrable economic returns and are integrated into national development plans; and where governments can credibly threaten to diversify partners. Vulnerability is higher where borrowing is driven by short-term political cycles, where projects are selected for visibility rather than productivity, where revenue depends on a narrow commodity base, and where contract terms are opaque. China's own constraints matter too: domestic economic slowdown, property-sector stress, and risk aversion after high-profile defaults have pushed Chinese lenders toward smaller, greener, and more commercially cautious projects, reducing the availability of the large, unconditional packages that characterized the 2010s. The "debt-trap" narrative is most accurate as a warning about opacity and bargaining asymmetry, not as a description of a uniform Chinese strategy; its weakest form assumes African passivity and ignores the agency

of African borrowers, while its strongest form identifies real risks in collateralized, non-transparent lending.

Observable Implications: If this mechanism holds, one should observe rising Chinese construction and finance in transport, power, and digital infrastructure; a shift in African debt composition toward Chinese policy banks and commercial creditors; frequent renegotiation or rescheduling rather than asset seizure; and African governments using Chinese offers as leverage in negotiations with Western, Gulf, and multilateral creditors. One should also observe variation: some projects become productive assets and trade corridors, while others become fiscal burdens or "white elephants." Data from Comtrade should show deepening China-Africa trade, often with African deficits in manufactured goods; FDI data should show Chinese investment concentrated in extractives, construction, and increasingly services and manufacturing; and debt data should show that distress is usually multicausal, involving global interest-rate shocks, commodity-price swings, and domestic fiscal choices as well as Chinese lending. The FOCAC Dakar Action Plan (2021) is a useful test case because it frames cooperation around trade, infrastructure, digital economy, green development, health, and peace and security, suggesting an attempt to broaden the relationship beyond hard infrastructure. Whether that breadth produces structural transformation depends less on Chinese intent than on African industrial policy, regulatory capacity, and the ability to enforce local content and technology transfer.

Perspective Note (five traditions in brief):

African (primary): African perspectives, reconstructed from within, treat Chinese engagement as a strategic opportunity and a risk simultaneously. The relevant question is not whether China is a benevolent partner but whether African states can convert external finance into structural transformation. African scholarship and political thought—from Nkrumah's and Nyerere's insistence on economic sovereignty to contemporary analysts of "multi-alignment"—emphasize bargaining, agency, and the dangers of replacing one external dependency with another. African governments often welcome Chinese finance because it is fast, large-scale, and less conditional on governance reforms than Western aid; civil society and parliamentary actors, however, raise concerns about debt sustainability, labor standards, environmental harm, and elite capture. The African vantage point reveals what Western "debt-trap" discourse often occludes: African actors choose, negotiate, and sometimes misuse these resources, and the problem is frequently not Chinese predation alone but weak domestic accountability and the absence of credible alternatives. It also reveals that "non-interference" can be attractive to governments seeking policy space, even when it weakens human-rights and transparency norms.

Chinese: The Chinese perspective frames engagement as "win-win" developmental partnership, mutual benefit, and South-South cooperation. It emphasizes infrastructure gaps, non-interference, respect for sovereignty, and the export of development experience. This perspective contributes a focus on material capacity-building and on the legitimacy of state-led development, but it occludes labor and environmental abuses, contract opacity, and the power asymmetry between a large creditor and smaller borrowers. It also tends to treat African governments as the sole legitimate voice, underweighting African civil society and affected communities.

Russian: Russia generally welcomes Chinese engagement as part of a multipolar order that dilutes Western dominance, while remaining a minor economic actor itself. Its perspective emphasizes sovereign choice and anti-hegemony, but it can instrumentalize African grievances without offering comparable development finance. It occludes its own limited economic footprint and its tendency to free-ride on China's infrastructural presence.

Western: Western perspectives often frame Chinese engagement through strategic competition, debt sustain-

ability, and governance conditionality. They contribute useful scrutiny of opacity and risk, but they can overstate African passivity, understate Western historical extraction, and treat African alignment choices as symptoms of external manipulation rather than sovereign strategy.

UN: The UN perspective centers on Charter principles, debt sustainability, and the Sustainable Development Goals. It contributes normative guardrails, data, and multilateral frameworks, but is constrained by creditor politics and by the gap between norms and enforcement. It tends to treat African states as equal members while underweighting structural inequality in global finance.

SECTION 2.4 KEY IDEA 3 — Russian engagement: Africa Corps, arms sales, UNSC voting, and the anti-Western narrative

Bolded Causal Claim: Russia's contemporary African engagement converts a comparatively small economic footprint into disproportionate political-military influence by offering security assistance, arms, and diplomatic cover to fragile or contested regimes in exchange for resource access, strategic positioning, and international support, producing a transactional security dependency that can bolster incumbents in the short term while eroding accountability and complicating regional security cooperation over time.

Mechanism: The mechanism begins with security vacuums. In parts of the Sahel and Central Africa, jihadist insurgencies, weak state capacity, and popular frustration with incumbent governments have created demand for rapid, unconditional security support. France's drawdown and the deterioration of Western military partnerships in Mali, Burkina Faso, and Niger opened space for alternative providers. Russia's Africa Corps—the state-controlled successor structure to Wagner's African operations—has been associated with deployments in the Sahel and Central Africa, offering regime protection, training, and information operations with fewer governance conditions than Western partners. Arms transfers are the material backbone: SIPRI arms transfer data show Russia among the leading suppliers of major conventional weapons to Africa in the 2010s and early 2020s, even as sanctions, production demands from the Ukraine war, and competition have altered volumes and delivery timelines. The political mechanism is narrative: Russian officials and aligned media frame the West as neocolonial, emphasize sovereignty and non-interference, and present Russia as an anti-hegemonic partner. This narrative resonates in contexts where French military presence is remembered through colonial history and where Western conditionality is seen as intrusive. In exchange, Russia seeks mineral concessions, basing or transit access, and diplomatic support, including abstentions or opposition to Western-sponsored resolutions at the United Nations. The mechanism is therefore not primarily developmental; it is security-for-resources and security-for-legitimacy, mediated by information politics and by the willingness of African juntas to trade long-term institutional reform for short-term regime survival.

Scope Conditions: This strategy works best where state institutions are fragile, where insurgencies threaten capital cities or ruling elites, where Western forces have withdrawn or lost legitimacy, and where regional organizations lack enforcement capacity. It is less effective where professional militaries resist politicization, where civil society and parliaments can scrutinize contracts, where ECOWAS or the African Union impose credible costs, or where alternative security partners offer more sustainable capacity-building. Russia's own constraints are significant: the war in Ukraine strains its defense-industrial base, sanctions complicate logistics and payments, and its economic offer remains narrow compared with China's or the West's. The anti-Western narrative is powerful but not infinitely transferable; it depends on local histories of intervention and on the perceived failures of previous partners. Where Russian-backed forces are associated with civilian harm or where security outcomes do not improve, the narrative's credibility erodes.

Observable Implications: If this mechanism holds, one should observe coups or transitional governments

followed by Russian security contracts; the expulsion or restriction of French and American forces; Russian flags and pro-Russian messaging in urban protests; arms deliveries and training missions; and shifts in UNSC voting, particularly abstentions on resolutions concerning Ukraine or human rights. One should also observe contested security outcomes: some governments may claim territorial gains or regime stabilization, while independent analysts and local communities may report continued violence, civilian casualties, or the fragmentation of security governance. Resource concessions and opaque contracts may follow security partnerships, though their terms are often difficult to verify. The problem-pair comparison with French Operation Barkhane is instructive: Barkhane represented a large-scale, conditionality-linked counterterrorism partnership that achieved tactical successes but faced legitimacy deficits, mission creep, and eventual political rejection; Russian engagement offers fewer conditions and faster regime support but risks substituting one external security dependency for another without addressing the governance drivers of insurgency. Neither model should be treated as a settled success; the relevant metric is not only battlefield outcomes but accountability, civilian protection, and the sustainability of local security institutions.

Perspective Note (five traditions in brief):

African (primary): African perspectives on Russian engagement are shaped by a long history of anti-colonial solidarity, suspicion of Western conditionality, and frustration with security partnerships that failed to deliver stability. From this vantage point, Russia's appeal lies less in its economic capacity than in its willingness to treat African governments as sovereign equals and to avoid lectures on governance. African analysts and publics often distinguish between the desire for strategic diversification and the risks of mercenary or opaque security arrangements. The African perspective reveals that Russian influence is not simply imposed; it is invited by regimes facing existential threats and by publics alienated from Western-led interventions. It also reveals the limits of that invitation: replacing French or American forces with Russian contractors does not automatically resolve the political and social roots of insurgency, and it may weaken regional mechanisms such as ECOWAS or the African Union by privileging bilateral, regime-centered deals. African scholarship on sovereignty and postcolonial statehood—whether in Fanon's critique of comprador elites, Mamdani's analysis of the bifurcated state, or contemporary work on "multi-alignment"—suggests that the deeper issue is whether African states can build security institutions accountable to citizens rather than to external patrons.

Russian: The Russian perspective frames engagement as support for sovereign choice, multipolarity, and resistance to Western hegemony. It emphasizes non-interference, arms sales as legitimate commerce, and the right of African states to choose partners. This perspective contributes a critique of Western double standards and of interventionist conditionality, but it occludes the coercive aspects of mercenary deployment, the opacity of resource deals, and the human-rights costs of regime protection. It also tends to overstate Russia's capacity to deliver development or durable security.

Chinese: China generally prefers stability and non-interference, and it benefits from Russian challenges to Western dominance while avoiding direct security entanglement. The Chinese perspective may view Russian engagement as complementary to its own economic presence, but it occludes the risk that instability and mercenary politics could threaten Chinese investments and citizens. It underweights the possibility that Russian security partnerships could fragment African security architectures.

Western: Western perspectives frame Russian engagement as malign influence, disinformation, and exploitation of instability. They contribute documentation of abuses and of the erosion of democratic norms, but they can understate the legitimacy deficits of prior Western interventions and can treat African alignment with Russia as manipulation rather than strategic choice. They also risk conflating all Russian activity with a centrally directed grand strategy.

UN: The UN perspective centers on Charter principles, peace and security, and the protection of civilians. It contributes legal frameworks, peacekeeping data, and humanitarian monitoring, but is constrained by great-power veto politics and by the difficulty of enforcing norms against powerful or protected actors. It tends to treat African states as member states with equal voice while underweighting the structural inequality of that voice and the practical limits of multilateral enforcement.

2.5 KEY IDEA 4 — Western engagement: conditionality, trade preferences (AGOA), military assistance, and strategic retrenchment

Bolded Causal Claim: Western engagement with Africa has operated less as a stable partnership than as a variable geometry of conditional access—trade preferences, aid, and security assistance are extended in exchange for governance, economic, and strategic concessions—so that strategic retrenchment has not removed Western power but has made it more selective, transactional, and securitized, thereby encouraging African multi-alignment rather than durable alignment.

Mechanism: The first mechanism is financial and developmental conditionality. From structural adjustment programs through debt-relief frameworks and budget-support arrangements, Western governments and the international financial institutions they dominate have used access to finance as leverage over fiscal, monetary, and regulatory policy. The mechanism assumes that African governments facing balance-of-payments constraints, debt distress, or limited domestic revenue will accept policy conditions in exchange for liquidity, debt relief, or concessional finance. Conditionality has ranged from macroeconomic stabilization and privatization to governance reforms, anti-corruption measures, and human-rights benchmarks. Its effectiveness depends on the credibility of the threat to withhold funds, the availability of alternative financiers, and the domestic political cost of compliance for African leaders. Where governments can access Chinese, Gulf, or domestic resource rents, conditionality weakens; where debt distress is acute and alternatives are scarce, it can still shape policy. A second mechanism is trade preference conditionality. The African Growth and Opportunity Act, enacted in 2000, grants eligible sub-Saharan African countries duty-free access to the United States market for a wide range of products, but eligibility is tied to criteria including a market-based economy, rule of law, political pluralism, human rights, and the elimination of barriers to United States trade and investment. The mechanism is intended to stimulate export-led growth, attract investment into manufacturing and agribusiness, and reward reform. In practice, utilization has been uneven: a small number of countries and sectors, especially apparel and, in earlier periods, petroleum, have captured much of the benefit, while many eligible countries have struggled with supply-side constraints, rules-of-origin complexity, and infrastructure deficits. Eligibility suspensions and reinstatements have also made AGOA a visible instrument of political leverage, as governments weigh reform costs against market access. European trade arrangements, including Economic Partnership Agreements and preferential schemes for least-developed countries, operate through a similar logic of market access in exchange for reciprocal or conditional liberalization, though with different sectoral sensitivities and regional configurations. A third mechanism is military assistance and security cooperation. The establishment of United States Africa Command in 2007, alongside bilateral training programs, equipment transfers, counterterrorism partnerships, maritime security initiatives, and intelligence cooperation, created a security-assistance architecture that links African force development to Western threat perceptions and operational priorities. The mechanism works through capacity building, interoperability, access arrangements, and the socialization of military elites, but it can also militarize domestic politics, strengthen security institutions relative to civilian oversight, and align African threat agendas with

external priorities such as counterterrorism or migration control. SIPRI arms-transfer data are useful here not as a simple measure of influence but as an indicator of dependency, diversification, and the geographic concentration of external security relationships. A fourth mechanism is strategic retrenchment itself. After the Cold War, Western aid to Africa declined in relative and sometimes absolute terms as strategic competition receded; after the attacks of September 11, 2001, engagement became more securitized; during the 2010s, United States attention shifted toward the Indo-Pacific; and in subsequent years aid budgets, diplomatic bandwidth, and military footprints were repeatedly reassessed. Retrenchment does not mean disappearance. It means that Western engagement becomes more selective: fewer universal development commitments, more targeted security partnerships, more commercial diplomacy, and more explicit competition with China and Russia. This selectivity creates openings for African governments to diversify partners, but it also means that Western leverage is concentrated in fewer domains and often exercised through conditionality rather than through broad-based developmental presence.

Scope Conditions: Western conditionality is strongest where African states depend heavily on Western finance, export markets, or security guarantees, and where domestic coalitions cannot easily absorb the cost of noncompliance. It is weaker where states possess resource rents, alternative partners, or strategic value that makes them indispensable to Western security agendas. The scope conditions vary by sector: AGOA matters most for countries with export capacity in eligible sectors; military assistance matters most in high-threat environments where external logistics and training are scarce; financial conditionality matters most during debt distress or fiscal crisis. They also vary by regime type. Governments seeking international legitimacy, investment-grade credibility, or donor budget support may comply more readily than insulated elites with secure domestic revenue. Temporal scope matters as well. During the Cold War, Western powers often tolerated authoritarian allies in exchange for strategic alignment; in the post-Cold War period, governance conditionality became more prominent; after 2001, counterterrorism frequently overrode governance concerns; and in the current period of multipolar competition, strategic value can again dilute conditionality. Finally, the mechanism is conditioned by African agency: governments can comply partially, delay reforms, forum-shop among donors, or use Western pressure as a domestic political tool, so conditionality is always mediated by local political economy.

Observable Implications: If this causal claim holds, one should observe a pattern of conditional access rather than uniform partnership. AGOA eligibility should be suspended or restored in ways that track political and governance disputes, while utilization rates should remain concentrated in a few countries and sectors. Aid and budget support should fluctuate with debt cycles and strategic priorities, with greater emphasis on security and migration in some periods. Military assistance should correlate with threat environments and access needs, producing training programs, equipment transfers, and operational cooperation that may not be matched by equivalent civilian institutional support. Strategic retrenchment should appear not as total withdrawal but as base closures, aid reductions, diplomatic downsizing, or re-prioritization alongside continued engagement in high-value arenas. African responses should include diversification of partners, rhetorical emphasis on sovereignty and non-interference, and selective compliance with Western conditions. One should also observe a gap between Western normative language and practice: human-rights or governance conditionality may be waived where counterterrorism, migration, or great-power competition is at stake. SIPRI data on arms transfers, Comtrade data on export composition, and FDI source data would help distinguish dependency from diversification, while UNSC voting patterns would indicate whether conditional engagement produces alignment or hedging.

Perspective Note (five traditions in brief):
African (primary): From an African vantage point, Western engagement is historically associated with ex-

traction, asymmetry, and external control over policy space, yet it is also a source of markets, finance, technology, and security resources that African governments can leverage. Conditionality is often experienced as sovereignty erosion, especially when macroeconomic or governance benchmarks are designed externally and applied unevenly. At the same time, AGOA and aid programs create real opportunities for exporters, workers, and reformist coalitions, and military assistance can fill capability gaps that African states cannot finance alone. The central African insight is that Western engagement is neither purely benevolent nor purely coercive; it is a bargaining environment in which African agency is exercised through compliance, resistance, diversification, and the strategic use of competing suitors. Retrenchment is read not simply as abandonment but as a shift in Western priorities that increases African room for maneuver while also removing some predictable resources.

Chinese: The Chinese perspective typically contrasts its own non-interference and developmental partnership with Western conditionality, presenting the latter as politicized and inconsistent. It argues that Western retrenchment creates space for more pragmatic, infrastructure-focused engagement, while also warning that Western competition may be driven by geopolitical anxiety rather than African development. Chinese analysts may understate the extent to which Chinese finance also creates dependency and conditionality through collateral, escrow, or project-linked arrangements.

Russian: The Russian perspective frames Western conditionality as neo-colonial interference and Western retrenchment as evidence of declining hegemony. It emphasizes sovereign choice, multipolarity, and the legitimacy of African governments to select partners without external approval. This perspective can illuminate the hypocrisy of selective Western enforcement, but it risks excusing authoritarian practices and conflating all Western activity with imperialism.

Western: The Western perspective presents conditionality as a mechanism for promoting governance, human rights, market reform, and security, while retrenchment is justified by fiscal constraints, strategic rebalancing, and the need to focus on core interests. It contributes legal frameworks, market access, and security capacity, but can understate the coercive effects of conditionality and the legitimacy deficits of prior interventions. It also risks treating African alignment with rivals as manipulation rather than strategic choice.

UN: The UN perspective centers on Charter principles, peace and security, development, and human rights. It values Western contributions to peacekeeping, humanitarian assistance, and normative frameworks, but is constrained by great-power politics and by the difficulty of enforcing standards against powerful actors. It tends to treat African states as equal members while underweighting structural inequality in voice and the practical limits of multilateral enforcement.

2.6 KEY IDEA 5 — Gulf, Turkish, Indian, and other middle-power engagement: the multiplication of suitors

Bolded Causal Claim: The proliferation of Gulf, Turkish, Indian, and other middle-power actors has turned Africa into a competitive, multi-polar marketplace of ports, drones, capital, and diplomatic recognition, increasing African bargaining power and reducing any single power's monopoly, while also fragmenting accountability and creating new, often opaque, dependencies.

Mechanism: The first mechanism is Gulf capital and logistics competition. The United Arab Emirates, Saudi Arabia, and Qatar have expanded their African footprints through sovereign wealth funds, port concessions, logistics hubs, agricultural investments, mining finance, and diplomatic mediation. The mechanism is not merely financial; it is spatial and infrastructural. Control or influence over ports, free zones, and logistics corridors can shape trade routes, customs revenue, and strategic access, particularly around the Red Sea, the Horn of Africa, and the western Indian Ocean. Gulf actors often move quickly, offer large capital

commitments, and combine commercial, security, and diplomatic tools. Their rivalries can also be exported: competition between Gulf states may create opportunities for African governments to extract better terms, but it can also import external conflicts into African arenas. A second mechanism is Turkish security and construction engagement. Turkey has combined drone sales, military training, base access, construction contracts, humanitarian assistance, and religious-cultural diplomacy into a distinctive package. The mechanism is speed and bundled delivery: Turkish firms and state institutions can move rapidly from agreement to implementation, offering equipment and training with fewer governance conditions than many Western partners. This has been especially visible in the Horn of Africa and the Sahel, where Turkish drones and training have become part of security calculations. The effect is to diversify African security suppliers and to create new dependencies on maintenance, ammunition, training pipelines, and diplomatic alignment. A third mechanism is Indian trade, diaspora, and maritime engagement. India's African strategy combines pharmaceuticals, information technology, education, lines of credit, trade in commodities, and maritime security cooperation, often framed through Global South solidarity and historical anti-colonial rhetoric. The mechanism is niche complementarity: India does not attempt to match Chinese infrastructure finance at scale, but it offers specific goods, services, and diplomatic support that matter to African consumers and governments. Its diaspora networks, naval presence, and interest in Indian Ocean security add a maritime dimension, particularly for East African and island states. A fourth mechanism is the broader multiplication of suitors, including Japan, South Korea, Brazil, Israel, and European middle powers, each with specialized offerings such as development finance, technology, agribusiness, or security cooperation. The aggregate mechanism is competitive pluralism: more bidders reduce monopoly rents, improve African governments' outside options, and allow forum shopping across finance, security, and diplomatic domains. Yet pluralism also fragments standards. When many actors offer capital or security assistance with varying transparency, conditionality, and accountability, African institutions may be overwhelmed, and deals may be negotiated bilaterally in ways that weaken regional coordination or public oversight. The multiplication of suitors therefore increases bargaining power in the short term but can create a complex web of opaque obligations, overlapping dependencies, and competing external agendas.

Scope Conditions: The impact of middle-power engagement is strongest in geographic and sectoral niches where these actors have comparative advantages and strategic interests. Gulf engagement is most consequential in coastal, port, and logistics nodes, in food-security and agricultural investments, and in states where Gulf rivalries or Red Sea security concerns are salient. Turkish engagement is most consequential where rapid security assistance, drones, and construction are in demand, particularly in the Horn of Africa and parts of the Sahel. Indian engagement is most consequential in pharmaceuticals, digital services, education, maritime security, and trade with East and Southern Africa. Other middle powers matter most where their specialized finance or technology aligns with African priorities. State capacity is a critical scope condition: governments with strong procurement systems, legal frameworks, and regional coordination can leverage competition; governments with weak institutions may be captured by opaque deals or by external rivalries. The mechanism is also conditioned by African domestic politics, since middle-power engagement often flows through elite networks, security institutions, and sectoral ministries rather than through broad public processes. Temporally, the post-2010 period, the aftermath of the Arab Spring, the 2015-2020 Gulf assertiveness, and the post-2022 geopolitical shock have all expanded middle-power activism. Finally, the mechanism depends on the degree of coordination among African states: regional bodies can aggregate bargaining power, while fragmented bilateralism can dissipate it.

Observable Implications: If this causal claim holds, one should observe a diversification of African partners across capital, security, and infrastructure, with no single external power dominating all domains. Port

concessions and logistics investments should show growing Gulf participation; drone and military training deals should show Turkish and other non-Western suppliers; pharmaceutical, digital, and maritime cooperation should show Indian and Asian participation. Trade and FDI data should reveal a broadening source base rather than a simple China-or-West binary. Diplomatic patterns should include more high-level visits, mediation roles, and bilateral agreements from middle powers. Security outcomes should reflect a wider array of suppliers, with implications for interoperability, maintenance, and accountability. One should also observe risks: opaque contracts, overlapping debt obligations, competing external agendas, and potential militarization of commercial infrastructure. African governments should display multi-alignment in voting and diplomacy, while regional organizations may struggle to harmonize standards across a crowded field. Data from Comtrade, FDI registries, SIPRI arms transfers, and port concession records would be needed to distinguish genuine diversification from concentration in new forms.

Perspective Note (five traditions in brief):

African (primary): From an African perspective, the multiplication of suitors is both an opportunity and a hazard. It reduces dependence on any single power, validates multi-alignment, and gives African governments more room to negotiate terms, sequence projects, and resist conditionality. It also aligns with a long-standing aspiration for sovereign choice and diversified partnerships. Yet the same plurality can fragment accountability, overwhelm regulatory capacity, and create new dependencies on maintenance, finance, and security ecosystems that are less transparent than traditional donor frameworks. African agency is therefore not simply the ability to choose among suitors, but the capacity to set terms, disclose contracts, coordinate regionally, and prevent external rivalries from being imported into African politics. The African vantage point reveals that diversification is not automatically empowerment; it must be governed.

Chinese: The Chinese perspective sees middle-power engagement as both validation and competition. It validates the broader shift away from Western monopoly and supports the idea that development partnerships can be plural, but it also challenges Chinese commercial and strategic primacy in ports, infrastructure, and security. Chinese analysts may frame some middle-power activity as opportunistic or as aligned with Western containment, while presenting Chinese engagement as more comprehensive and long-term. They may understate the competitive pressure that Gulf, Turkish, and Indian actors place on Chinese firms and financiers.

Russian: The Russian perspective welcomes the multiplication of suitors as evidence of multipolarity and the erosion of Western hegemony. It emphasizes sovereign choice and the legitimacy of African governments to partner with any actor, including Russia, without Western approval. This perspective can highlight the hypocrisy of Western complaints about non-Western influence, but it risks treating all diversification as inherently anti-Western and may understate the risks of opaque security deals or external rivalry.

Western: The Western perspective is ambivalent. It may welcome diversification as reducing over-dependence on China, but it also worries about the erosion of governance standards, transparency, and security interoperability. Western actors may seek to coordinate with middle powers or to reassert conditionality through new frameworks, while also recognizing that retrenchment has created vacuums. The perspective contributes market access, normative frameworks, and security capacity, but can treat African multi-alignment as a problem to be managed rather than a legitimate strategy.

UN: The UN perspective emphasizes Charter principles, sovereign equality, peace and security, and inclusive multilateralism. It can view the multiplication of suitors as consistent with a more multipolar and representative international order, but it also raises concerns about fragmented accountability, opaque security arrangements, and the difficulty of enforcing norms across many actors. The UN contributes legal

frameworks and peacekeeping data, but is constrained by great-power and middle-power politics and by the limited enforceability of multilateral standards.

SECTION 2.7 — FIVE PERSPECTIVES IN DEPTH

2.7.1 African Perspective (PRIMARY)

The African vantage point on great-power competition begins from a premise that the other four perspectives tend to treat as a conclusion: that Africa is not a passive object of external rivalry but a field of strategic action in which African states, elites, and publics exercise agency under constraint. This is not a romantic claim. It is an analytical starting point grounded in a specific theoretical tradition—African political thought from Nkrumah through Fanon, Cabral, Nyerere, Rodney, and their contemporary successors—that insists on reading international hierarchy from the position of the subordinated rather than from the center of power. The African perspective does not deny that structural asymmetry exists; it denies that asymmetry exhausts the story.

The theoretical lineage runs through several distinct but converging arguments. Nkrumah's *Neo-Colonialism: The Last Stage of Imperialism* (1965) established the foundational claim that formal independence without economic sovereignty reproduces subordination through new mechanisms—debt, aid conditionality, multinational corporate penetration, and military basing agreements. For Nkrumah, the "scramble" never ended; it merely changed form. Rodney's *How Europe Underdeveloped Africa* (1972) added the historical-materialist mechanism: underdevelopment is not a stage but a produced condition, the mirror image of European development, operating through unequal exchange in the world market. Fanon's *The Wretched of the Earth* (1961) supplied the psychological and political dimension: colonialism dehumanizes, and genuine liberation requires not only institutional transfer but a transformation of consciousness and social structure. Cabral's writings on Guinea-Bissau emphasized that liberation must be rooted in the material conditions and cultural specificity of the colonized, not imported wholesale. Nyerere's ujamaa socialism and his advocacy of non-alignment offered a positive program: African states could refuse the binary of the Cold War and construct autonomous development paths, however imperfectly realized.

These thinkers share a common mechanism: **extraversion**. Bayart's *The State in Africa: The Politics of the Belly* (1993) formalized this concept, arguing that African political elites have historically consolidated domestic authority by strategically engaging external powers—colonial, Cold War, and post-Cold War. The African state is not simply a victim of external penetration; it is an active broker of its own subordination, converting external resources into domestic political capital. This is a double-edged insight. It restores agency to African actors, but it also implicates African elites in the reproduction of dependency. Mbembe's *On the Postcolony* (2001) extended this analysis, describing the postcolonial state as operating through "commandement"—a mode of power that is theatrical, violent, and deeply entangled with external forces, yet irreducible to them. The postcolonial subject is not a passive recipient of history but an agent navigating a field of constrained possibilities.

Grovogui's *Sovereigns, Quasi Sovereigns, and Africans* (1996) provides the international-theory anchor. Grovogui argues that the Westphalian sovereignty norm was never applied equally: African states were granted "quasi-sovereignty," a conditional, supervised form of statehood that legitimized external intervention. The African perspective thus reveals that the very framework of "sovereign equality" in the UN Charter masks a hierarchy of sovereignty. When great powers compete on the continent, they do so within a struc-

ture that already presumes African states are less than fully sovereign. This is a contribution the other four perspectives cannot make, because they take sovereignty as a given rather than as a contested, historically produced category.

Applied to contemporary great-power competition, the African perspective generates several distinctive analytical moves. First, it reframes the "new scramble" thesis. The scramble metaphor, popularized in journalism and policy discourse, implies a passive Africa being carved up by external powers. African scholars have been sharply critical of this framing. It reproduces the colonial episteme by denying African agency and by treating the continent as an object rather than a subject of international politics. The more accurate analytical frame, from this vantage, is not scramble but **multi-alignment**: African states actively court multiple partners—China, Russia, the West, Gulf states, Turkey, India—to maximize bargaining leverage, diversify dependency, and extract concessions. This is not naivety about power asymmetry; it is a rational strategy of the weak in an anarchic system, consistent with realist small-state theory but rooted in a distinctively African historical experience of non-alignment.

Second, the African perspective re-reads the "debt trap" debate. The Western narrative, amplified by some policy analysts, frames Chinese lending as a deliberate strategy to ensnare African states in unsustainable debt and extract strategic assets. Brautigam's *The Dragon's Gift* (2009) and subsequent empirical work have challenged this narrative, showing that Chinese lending terms are often comparable to or better than Western alternatives, that debt distress has multiple causes (including commodity price shocks and domestic governance failures), and that asset seizures are rare. The African vantage adds a further layer: the relevant question is not whether China "traps" Africa but whether African finance ministries and parliaments have the capacity to evaluate, negotiate, and manage complex credit arrangements. The problem is as much domestic institutional capacity as external predation. This shifts the analytical focus from Chinese intentions to African bargaining capacity—a move the Western perspective, with its emphasis on great-power rivalry, systematically underweights.

Third, the African perspective illuminates the security dimension. The withdrawal of French forces from the Sahel (Operation Barkhane ended in 2022) and the subsequent invitation of Russian Africa Corps (formerly Wagner) by Mali, Burkina Faso, and Niger are often framed in Western discourse as a Russian "win" and a Western "loss." The African vantage reveals a more complex picture. Popular anti-French sentiment in the Sahel is genuine and rooted in decades of perceived French neo-colonialism—what Nkrumah would have recognized as neo-colonialism's military dimension. The invitation of Russian forces is a sovereign choice, however constrained, by governments responding to domestic political pressures and security failures. To treat this as mere Russian manipulation is to deny African agency and to reproduce the quasi-sovereignty framework Grovogui identified. At the same time, the African perspective does not romanticize these choices: the record of Russian security provision in the Central African Republic and Mali shows mixed results, and the displacement of one external security provider by another does not resolve the underlying crisis of state capacity.

Fourth, the African perspective centers the question of **who benefits** from great-power competition within Africa. Bayart's extraversion thesis implies that external engagement is mediated by domestic elites who may capture rents rather than deliver public goods. The multiplication of suitors—China, Russia, Turkey, Gulf states, India, the West—expands the menu of external partners but also multiplies the opportunities for elite capture and rent-seeking. Tamale's *Decolonization and Afro-Feminism* (2020) and Oyěwùmí's *The Invention of Women* (1997) remind us that "African agency" is not monolithic: gender, class, and regional hierarchies mean that the benefits of multi-alignment are unevenly distributed. The African perspective thus

contains an internal critique: agency is real but stratified, and the celebration of multi-alignment can obscure the ways in which external competition reinforces domestic inequality.

What the African vantage contributes that the other four cannot is, first, a theory of **subjectivity**: it treats African states and peoples as agents with interests, strategies, and histories, not as arenas. Second, it provides a **historical depth** that contextualizes contemporary competition within the longer arc of colonialism, neo-colonialism, and non-alignment. Third, it offers a **normative critique of sovereignty** that exposes the hypocrisy of great-power invocations of the principle. Fourth, it supplies a **mechanism—extraversion**—that explains why African elites engage external powers in ways that may appear irrational or self-defeating from a Western perspective but are rational within domestic political logics.

What the African perspective occludes is equally important. It can romanticize agency, understating the genuine constraints of debt, military asymmetry, and technological dependence. It can treat "Africa" as a more unified actor than it is, obscuring the vast differences between, say, Nigeria and Eritrea, or between the African Union's institutional ambitions and its operational limitations. It can be insufficiently attentive to the ways in which African states' multi-alignment strategies may undermine collective bargaining—African states negotiating bilaterally with China or Russia may secure better individual deals but weaken continental frameworks like the African Continental Free Trade Area (AfCFTA) or the AU's Agenda 2063. And it can underweight the agency of non-state actors—armed groups, civil society, diaspora communities—who are also shaped by and shape great-power competition.

The strongest counterargument from within the African tradition itself comes from the structuralist wing: Rodney's dependency theory and its contemporary successors argue that agency, while real, operates within constraints so severe that the language of "choice" and "bargaining" misleads. From this vantage, inviting Africa Corps or signing a BRI memorandum is not a free choice but a choice among structurally determined options, all of which reproduce subordination. The tension between agency and structure is internal to African scholarship and is not resolved by either pole. The most productive African analyses—Mamdani's work on the bifurcated state, Mbembe's on the postcolony—hold both in suspension, recognizing that African actors are neither fully autonomous nor fully determined.

Scope conditions: the African perspective is most powerful when analyzing state-level bargaining, elite strategies, and the discursive framing of competition. It is less adequate for analyzing systemic-level dynamics (the distribution of power among great powers) or for generating predictions about specific policy outcomes. Its normative force is greatest when it exposes hypocrisy and demands consistency; its analytical force is greatest when it recovers the agency that other perspectives erase.

2.7.2 Chinese Perspective

The Chinese perspective on engagement with Africa is organized around three core concepts: "win-win" cooperation, non-interference in internal affairs, and developmental partnership. These are not merely rhetorical devices; they constitute a coherent foreign-policy doctrine with deep roots in Chinese diplomatic history and are presented as a genuine alternative to Western models of engagement. Steel-manning this perspective requires taking its internal logic seriously rather than dismissing it as propaganda.

The "win-win" framework posits that Chinese engagement with Africa is mutually beneficial: China gains resources, markets, and diplomatic support; Africa gains infrastructure, investment, and development finance. The mechanism is straightforward: Chinese state-backed enterprises and policy banks (China Exim Bank, China Development Bank) finance and construct infrastructure projects that Western donors and private cap-

ital have been unwilling to fund, while African states provide resources and market access. The FOCAC Dakar Action Plan (2021) exemplifies this: it pledged $40 billion in financing, including $10 billion in investment promotion, $10 billion in credit facilities, and support for African industrialization and agricultural modernization. The Chinese perspective treats these commitments as evidence of a developmental partnership qualitatively different from Western aid, which it characterizes as conditional, paternalistic, and oriented toward governance reform rather than material development.

Non-interference is the second pillar. Rooted in the Five Principles of Peaceful Coexistence (1954) and consistently invoked in FOCAC declarations, it holds that China does not impose political conditions, does not interfere in domestic affairs, and respects African sovereignty. From the Chinese vantage, this is a principled stance against Western neo-colonialism: Western engagement, with its conditionality on governance, human rights, and economic reform, is seen as a continuation of imperial control by other means. Chinese non-interference is presented as the genuine respect for sovereignty that Western powers profess but do not practice. The mechanism here is relational: by not conditioning engagement on political reform, China builds trust and long-term partnerships that Western conditionality undermines.

The third pillar, developmental partnership, frames the relationship as South-South cooperation among developing countries with shared historical experiences of colonialism and underdevelopment. This is not merely rhetorical; it shapes institutional design. FOCAC, established in 2000, is a multilateral forum co-chaired by China and an African co-chair, with African states participating as equals in agenda-setting. The Chinese perspective contrasts this with Western-dominated institutions (IMF, World Bank) where African states have limited voting power. The BRI, launched in 2013, extends this logic: African states are invited to participate in a global infrastructure network on terms they negotiate bilaterally.

The Chinese perspective contributes several things the others miss. It takes seriously the infrastructure deficit as the binding constraint on African development—a point Western donors, focused on governance, have historically underweighted. It provides an empirical challenge to the "debt trap" narrative: Brautigam's research and Chinese government data show that Chinese lending is a minority share of African external debt, that terms are often concessional, and that debt distress correlates more strongly with commodity prices and domestic governance than with Chinese lending. It also reveals the hypocrisy of Western criticism: Western powers themselves engage in strategic competition for resources and influence, and their conditionality has often served Western commercial and strategic interests.

What the Chinese perspective occludes is significant. Non-interference, while principled, can function as a shield for authoritarian governance: by refusing to condition engagement on human rights or democratic standards, China may inadvertently (or deliberately) reinforce repressive regimes. The "win-win" framing assumes symmetry that does not exist: China is a great power with vast state capacity; most African states are small, indebted, and institutionally constrained. The bargaining is not between equals. The Chinese perspective also tends to understate the environmental and social costs of Chinese-funded projects, and to treat African civil society and labor concerns as internal matters beyond the scope of partnership. Finally, the claim that China does not interfere is empirically contestable: Chinese diplomatic pressure on African states regarding Taiwan recognition, UNSC voting, and human-rights resolutions constitutes a form of political conditionality, even if less overt than Western variants.

The strongest counterargument from within the Chinese perspective's own logic: if non-interference is genuinely principled, it should apply consistently, including to Chinese commercial actors whose labor practices or environmental impacts generate local backlash. The gap between state-level non-interference and corporate-level behavior is a tension the Chinese perspective has not fully resolved.

2.7.3 Russian Perspective

The Russian perspective on Africa is organized around three claims: sovereign choice, multipolarity, and anti-Western solidarity. These are presented not as a comprehensive development model (as China offers) but as a security and diplomatic partnership that respects African agency and challenges Western hegemony. Steel-manning this perspective requires recognizing its genuine appeal to certain African governments and publics while not overstating its coherence or capacity.

Sovereign choice is the first pillar. Russia presents itself as a partner that does not impose political conditions, does not lecture on governance, and respects the decisions of African governments—including decisions to invite Russian security forces. This resonates in contexts where Western conditionality is perceived as neo-colonial interference. The mechanism is straightforward: Russia offers security assistance (arms, training, private military contractors) with fewer strings attached than Western alternatives, and African governments facing insurgencies or political instability accept. The Africa Corps (formerly Wagner Group) presence in Mali, Burkina Faso, the Central African Republic, and Sudan exemplifies this: governments invited Russian forces after concluding that French and Western security provision had failed. From the Russian vantage, this is sovereign choice in action, and Western criticism is hypocrisy from powers that themselves maintain military bases across the continent.

Multipolarity is the second pillar. Russia frames its African engagement as part of a broader project to build a multipolar world order in which no single power dominates. This aligns with African non-alignment traditions and with the AU's aspiration for a more representative global order. The mechanism operates through diplomatic support: Russia backs African positions in international forums, opposes Western sanctions regimes, and provides an alternative to Western-dominated institutions. UNSC voting alignment is a key metric: Russia has consistently supported African positions on issues like the reform of the Security Council, the principle of non-interference, and opposition to unilateral sanctions. The Russian perspective treats this as evidence of genuine partnership rather than transactional manipulation.

Anti-Western narrative is the third pillar. Russia leverages historical memory—Soviet support for African liberation movements during the Cold War—to position itself as a friend of African independence against Western neo-colonialism. This narrative has genuine resonance in parts of Africa where French and Western military presence is associated with continued subordination. The mechanism is discursive: Russian state media and diplomatic messaging frame Western engagement as neo-colonial and Russian engagement as anti-imperialist, tapping into legitimate grievances about Western double standards.

The Russian perspective contributes several things. It exposes the gap between Western rhetoric of partnership and the reality of conditionality and strategic retrenchment. It provides a security alternative for states that have lost confidence in Western security provision. It amplifies African demands for Security Council reform and a more equitable international order. And it reveals that "sovereign choice" is not merely a Russian talking point but a genuine African demand: African states want the freedom to choose partners without Western veto.

What the Russian perspective occludes is substantial. The claim of non-interference is belied by the reality of Russian security operations: Africa Corps personnel have been implicated in human-rights abuses, resource extraction, and political interference in the Central African Republic and Mali. The "sovereign choice" framing ignores the asymmetry of power: a state facing insurgency and political instability may have little genuine choice but to accept whatever security assistance is available. The anti-Western narrative, while tapping legitimate grievances, can serve to deflect attention from Russian strategic interests—securing mineral

access, UNSC votes, and geopolitical positioning against the West. The Russian perspective also tends to treat African states as instruments in a great-power rivalry rather than as partners with independent interests, a tension visible in the gap between Russian rhetoric and the transactional nature of many arrangements.

The strongest counterargument from within the Russian perspective's own logic: if Russia genuinely supports African sovereignty and multipolarity, it should support African-led security frameworks (like the AU's African Standby Force) rather than bilateral security arrangements that bypass continental institutions. The preference for bilateral deals over multilateral frameworks suggests that Russian engagement, like Western engagement, prioritizes strategic access over African institutional development.

Scope conditions: the Russian perspective is most persuasive as a critique of Western hypocrisy and as an account of why certain African governments seek alternatives. It is least persuasive as a positive development model or as a claim about Russian disinterestedness. Its predictive power is limited by Russia's constrained economic capacity relative to China and the West.

2.7.4 Western Perspective

The Western perspective on great-power competition in Africa is organized around three themes: strategic competition, conditionality, and retrenchment. These are not a unified doctrine—US, EU, and individual European state approaches differ—but they share a common framing: Africa is a arena of great-power competition in which Western interests (security, economic access, normative influence) are challenged by China and Russia, and in which Western engagement has been characterized by conditionality, market access, and, increasingly, strategic withdrawal.

Strategic competition is the first theme. From the Western vantage, China's economic engagement and Russia's security engagement are not neutral development partnerships but strategic moves in a global rivalry. The mechanism is competitive: Chinese infrastructure investment creates dependency and strategic leverage; Russian security provision displaces Western influence and undermines democratic governance. The US National Security Strategy and EU strategic documents increasingly frame Africa through this lens, treating the continent as a theater of great-power competition. The Western perspective contributes a systemic-level analysis that the African perspective, focused on state-level agency, tends to underweight: the distribution of power among great powers shapes the menu of options available to African states, and the rise of China and Russia genuinely constrains Western influence.

Conditionality is the second theme. Western engagement has historically been conditioned on governance standards, human rights, economic reform, and democratic accountability. The mechanism is normative leverage: by tying aid, trade preferences (AGOA), and military assistance to governance standards, Western powers seek to shape African political trajectories. The Western perspective treats this as a principled commitment to universal values and as a contribution to African development: good governance, it argues, is a prerequisite for sustainable growth, and conditionality is a tool to promote it. AGOA (2000) exemplifies the trade-preference approach: duty-free access to US markets in exchange for progress on governance, labor rights, and market openness.

Strategic retrenchment is the third theme. Western powers, particularly the US and France, have reduced their military and economic footprint in Africa over the past decade. The mechanism is resource reallocation: as strategic priorities shift (to the Indo-Pacific, to Ukraine, to domestic politics), Africa receives less attention and resources. French withdrawal from the Sahel, US base reductions, and declining aid budgets reflect this. The Western perspective treats retrenchment as a strategic choice with consequences: vacuums created by

Western withdrawal are filled by China, Russia, and middle powers, potentially to Western disadvantage.

The Western perspective contributes several things. It provides a framework for understanding how great-power competition shapes African options at the systemic level. It supplies normative standards—human rights, democratic governance, transparency—that, however imperfectly applied, create benchmarks for accountability. It offers market access and security capacity that remain significant, even if declining. And it generates data and analysis (SIPRI arms data, World Bank governance indicators, Comtrade flows) that enable empirical assessment of engagement patterns.

What the Western perspective occludes is significant. It tends to treat African multi-alignment as a problem to be managed rather than a legitimate strategy, reproducing the quasi-sovereignty framework. It underweights the genuine grievances that drive African states toward non-Western partners: the history of Western intervention, the perceived hypocrisy of conditionality (applied to Africa but not to strategic allies elsewhere), and the failure of Western security provision in the Sahel. It can conflate Western interests with African interests, assuming that what is good for the West is good for Africa. And it tends to frame the competition in zero-sum terms, obscuring the possibility that African states can benefit from multiple partnerships.

The strongest counterargument from within the Western perspective's own logic: if conditionality is genuinely about promoting good governance, it should be applied consistently across partners, including strategic allies. The selective application of conditionality undermines its credibility and fuels the anti-Western narrative that Russia and China exploit. A more consistent and less instrumental approach to conditionality would strengthen Western influence more than strategic competition framing.

Scope conditions: the Western perspective is most powerful at the systemic level and in analyzing institutional and normative frameworks. It is least powerful in accounting for African agency and in explaining why African states choose non-Western partners. Its normative claims are strongest when applied consistently; its analytical claims are strongest when they acknowledge the legitimacy of African multi-alignment.

2.7.5 UN Perspective

The UN perspective on great-power competition in Africa is organized around Charter principles: sovereign equality, non-interference, peaceful settlement of disputes, and collective security through the Security Council. It is not a single actor's perspective but an institutional vantage that aggregates member-state positions, Secretariat analysis, and the normative framework of international law. Steel-manning it requires recognizing both its normative authority and its structural constraints.

Sovereign equality and non-interference are the first pillars. The UN Charter (Article 2) establishes sovereign equality as a foundational principle, and the UN perspective treats any great-power competition that undermines African sovereignty as a violation of Charter principles. The mechanism is legal-normative: by invoking sovereignty, the UN provides a framework within which African states can resist external pressure and assert their right to choose partners. This aligns with the African perspective's critique of quasi-sovereignty, though the UN's enforcement capacity is limited by the very great-power politics it seeks to constrain.

Peace and security is the second pillar. The UN maintains significant peacekeeping and peacebuilding operations in Africa (MINUSMA in Mali, MONUSCO in DRC, UNMISS in South Sudan, among others), and the UN perspective treats great-power competition as a potential threat to these operations. The mechanism is institutional: when great powers compete for influence, they may undermine UN mediation, support rival factions, or bypass UN frameworks. The UN perspective thus has a stake in managing competition to preserve space for multilateral conflict resolution. The withdrawal of MINUSMA from Mali in 2023, following

the government's invitation of Russian forces, exemplifies this tension.

Inclusive multilateralism is the third pillar. The UN perspective treats the multiplication of suitors as potentially consistent with a more multipolar and representative international order, but raises concerns about fragmented accountability. The mechanism is governance: when many actors engage bilaterally, there is no single framework for ensuring transparency, human-rights compliance, or coordination. The UN's role is to provide such a framework—through the Security Council, through peacekeeping mandates, through human-rights mechanisms—but its effectiveness depends on great-power consensus that is increasingly absent.

The UN perspective contributes several things. It provides a legal-normative framework that all parties invoke, creating a common language even when interests diverge. It generates data—peacekeeping statistics, humanitarian assessments, human-rights reports—that enables empirical analysis. It offers a forum for African states to articulate collective positions (through the AU's observer status and the African Group in the General Assembly). And it maintains a focus on human security and civilian protection that great-power competition can obscure.

What the UN perspective occludes is significant. It is constrained by great-power politics: the Security Council's structure gives permanent members veto power, meaning that UN action on great-power competition in Africa is often blocked or diluted. It can be overly focused on conflict and security, underweighting economic and developmental dimensions. It tends to treat African states as a bloc rather than recognizing their diversity. And its normative framework, while authoritative, lacks enforcement capacity: Charter principles are invoked by all parties, including those whose actions violate them, reducing their constraining force.

The strongest counterargument from within the UN perspective's own logic: if the UN is to remain relevant in a multipolar world, it must reform its institutions—particularly the Security Council—to reflect contemporary power distributions, including African representation. Without such reform, the UN risks being sidelined by bilateral and minilateral arrangements that bypass it entirely. The African demand for Security Council reform (the "Ezulwini Consensus") is thus not merely an African interest but a UN interest: a more representative Council would strengthen the UN's legitimacy and capacity to manage great-power competition.

Scope conditions: the UN perspective is most powerful as a normative and legal framework and as a source of data and institutional capacity. It is least powerful as an independent actor, given its dependence on member-state consensus. Its effectiveness in managing great-power competition in Africa depends on the willingness of great powers to work through rather than around UN frameworks.

2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Centers African agency, multi-alignment, and bargaining; reveals that African states are not passive objects but active negotiators who have learned to play suitors against each other; shows structural constraints (debt, commodity dependence) without reducing Africa to victimhood	Can understate intra-African variation and elite capture; may romanticize state capacity; sometimes treats "Africa" as a unitary actor; can understate the transnational financial constraints (IMF, Eurobond markets) that limit bargaining power from outside the bilateral relationship	Sovereign equality, non-interference, developmental autonomy, reform of global governance (Ezulwini Consensus), multi-alignment as deliberate strategy	FOCAC Dakar Action Plan terms reflecting African demands for value addition and local content; AU Agenda 2063; African states' simultaneous engagement with China, the West, Russia, and Gulf states	Western: multi-alignment can mask elite rent-seeking and bargaining power is structurally limited by debt and commodity dependence

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Chinese	Demonstrates that large-scale infrastructure finance and non-conditional engagement can accelerate development; challenges Western monopoly on development finance; provides empirical counter to "debt trap" narrative; institutionalizes relationship through FOCAC's triennial cycle	Obscures environmental and social costs, labor practices, and asymmetry of bargaining power; underplays geopolitical motivations (resource access, diplomatic support, market access); "win-win" rhetoric masks unequal terms	"Win-win" cooperation, non-interference, mutual benefit, South-South solidarity, developmental partnership	Brautigam's research showing no systematic asset seizures; FOCAC Dakar Action Plan commitments ($40 billion); BRI project portfolio; absence of conditionality	African: "win-win" rhetoric masks unequal terms and Chinese finance has sometimes reinforced commodity dependence and debt vulnerability

2.8 WORKED EXAMPLE (I do)

Case: The FOCAC Dakar Action Plan (2021) and the Sino-African Economic Relationship — The Terms of the Bargain

The Forum on China-Africa Cooperation (FOCAC) held its eighth ministerial conference in Dakar, Senegal, in November 2021, producing the Dakar Action Plan (2022–2024) and the Dakar Declaration. The plan committed approximately $40 billion in total Chinese support, structured across nine programs spanning medical and health, poverty reduction and agricultural development, trade promotion, investment promotion, digital innovation, green development, capacity building, cultural and people-to-people exchange, and peace and security. It also reflected a notable inflection in Chinese financing: a shift away from large-scale sovereign loans for mega-infrastructure toward "small and beautiful" projects, trade finance, and private investment, partly in response to African debt distress and partly to Xi Jinping's September 2021 pledge at the UN General Assembly to halt new overseas coal power projects. The Dakar plan thus sits at a renegotiation moment

in a two-decade relationship — a moment when both sides were recalibrating the terms of a bargain struck in a different era of global economics and geopolitics.

Levels of analysis. At the *individual* level, the Dakar negotiations were shaped by the personal diplomacy of Senegalese President Macky Sall (then AU chair), Chinese Foreign Minister Wang Yi, and the individual African trade and finance ministers who pressed for concrete commitments on value addition, local content, and technology transfer. Chinese provincial officials and state-owned enterprise (SOE) managers, operating with considerable autonomy from Beijing's central planners, also shaped project pipelines and investment decisions. At the *state* level, the bargain reflects the interests of African governments seeking infrastructure and financing without Western conditionality, and of China seeking resource security, market access, and diplomatic support in multilateral forums. At the *systemic* level, the Dakar plan unfolded against the backdrop of intensifying US-China strategic competition, the COVID-19 pandemic's disruption of global supply chains, and a commodity price cycle that directly affected African bargaining power. At the *transnational* level, the relationship is mediated by Chinese diaspora communities in Africa, African students and professionals trained in China, global financial markets that price African sovereign risk, and civil society networks that monitor labor and environmental standards.

Mechanism. The core mechanism is *bargained interdependence institutionalized through FOCAC cycles*. Every three years, FOCAC ministerial conferences produce action plans that create path dependence: prior commitments shape future negotiations, and the institutional rhythm generates expectations on both sides. African states bargain for infrastructure finance, technology transfer, and market access; China bargains for resource access, diplomatic alignment (including on Taiwan and human rights votes in UN forums), and commercial opportunities for its firms. The mechanism is not a simple "debt trap" — as Brautigam's research demonstrates, Chinese lending has not systematically resulted in asset seizures, and African negotiators have often secured favorable terms, including debt restructurings and grace periods. Nor is it a "win-win" partnership of equals: the structural asymmetry between a roughly $18 trillion economy and individual African economies of $10–50 billion means that bargaining power is uneven, and the terms of the bargain reflect this. The Dakar plan's shift toward trade finance and private investment represents an adaptation of the mechanism to changed circumstances — African debt distress, Chinese domestic economic slowdown, and Western criticism — rather than a fundamental renegotiation of the underlying power asymmetry.

The mechanism operates through several channels. First, *resource-for-infrastructure arrangements* and commodity-backed loans, though declining in share of total Chinese finance, remain important in specific sectors (mining, energy, transport corridors). Second, *diplomatic reciprocity*: African support for China's positions in the UN — on Taiwan, Xinjiang, Hong Kong, and South China Sea — is an implicit but well-understood component of the bargain, and FOCAC declarations routinely include language affirming the "one China" principle. Third, *institutional lock-in*: FOCAC's triennial cycle, the Forum's secretariat, and the growing density of bilateral agreements create sunk costs that make exit costly for both sides. Fourth, *financial market mediation*: African sovereigns' access to Eurobond markets and IMF programs constrains their ability to accept Chinese terms that might trigger debt-sustainability concerns, giving African negotiators both leverage (China wants deals that do not default) and constraint (IMF conditionality may limit Chinese project finance, as seen in Zambia's debt restructuring negotiations).

Perspective reconstruction. *African (primary, longest):* The African perspective, articulated by scholars such as Alden and Large and by policymakers across the continent, frames the Dakar plan as evidence of African agency in a multipolar world. African states are not passive recipients but active bargainers who have learned to play Chinese, Western, Russian, and Gulf suitors against each other. The Dakar plan's

emphasis on value addition, local content, and "small and beautiful" projects reflects African demands, not just Chinese preferences. Multi-alignment — maintaining relationships with China, the West, and others simultaneously — is a deliberate strategy, not a default. However, this perspective must also acknowledge internal variation: some African states (e.g., Senegal, Rwanda, Kenya) have negotiated more effectively than others (e.g., Zambia, Angola), and elite capture can divert benefits from public to private hands. The African vantage point reveals what Western "debt trap" narratives obscure: that African governments have agency, that Chinese finance has built real infrastructure (roads, ports, power plants, digital networks), and that the relationship is a bargain with terms that can be renegotiated. What it can understate is the structural constraint imposed by commodity dependence and debt, which limits how far bargaining can go, and the transnational financial architecture (IMF, credit rating agencies, Eurobond markets) that constrains African fiscal space from outside the bilateral relationship.

Chinese: The Chinese perspective frames FOCAC as a model of South-South cooperation and "win-win" development. The Dakar plan's nine programs demonstrate a comprehensive, long-term commitment to African development, not merely resource extraction. Non-interference in domestic affairs is a core principle, distinguishing Chinese engagement from Western conditionality. Brautigam's research is cited to rebut "debt trap" accusations, showing that Chinese lending is smaller than perceived and that no systematic asset seizures have occurred. The perspective emphasizes mutual benefit: African infrastructure and development, Chinese markets and resources. What it occludes is the asymmetry of bargaining power, the environmental and social costs of some projects, and the geopolitical motivations (diplomatic support, market access) that drive Chinese engagement.

Russian: The Russian perspective views the Sino-African relationship through the lens of multipolarity and anti-hegemonism. China's growing role in Africa is welcomed as a counterweight to Western dominance, and the Dakar plan is seen as evidence that the unipolar moment is ending. Russia's own engagement (arms sales, Africa Corps) is framed as complementary — providing security where China provides economics. The perspective emphasizes sovereign choice: African states should be free to partner with whom they choose without Western pressure. What it occludes is the predatory economics of Russian engagement and the fact that "sovereign choice" often means elite choice, not popular choice.

Western: The Western perspective is ambivalent. On one hand, it acknowledges that Chinese finance has built infrastructure that Western donors neglected; on the other, it warns of debt distress, opacity, and geopolitical risk. The Dakar plan's shift away from mega-loans is read as evidence that the "debt trap" critique had some effect, or that Chinese finance was becoming unsustainable. AGOA and Western conditionality are presented as superior because they promote governance and human rights, though their effectiveness is debated. The perspective's strongest contribution is data on debt sustainability and governance; its occlusion is the historical complicity in underdevelopment and the unreliability of Western commitment (e.g., retrenchment in the Sahel).

UN: The UN perspective frames the Dakar plan within the Sustainable Development Goals and the UN Charter. It emphasizes multilateralism, data provision (UNCTAD, Comtrade), and institutional capacity (peacekeeping, development programs). The UN welcomes South-South cooperation but stresses transparency, debt sustainability, and human rights. Its contribution is normative framing and data; its limitation is dependence on member-state consensus and inability to enforce against great powers.

Adjudication. The African perspective best explains the Dakar case because it captures the central dynamic: a bargain negotiated between African states and China, with terms that reflect both African demands and structural asymmetry. The Chinese institutional perspective is necessary to understand the supply side

— why China offers what it offers and how FOCAC institutionalizes the relationship. The Western debt-sustainability perspective is necessary to understand the constraints — why the bargain shifted in 2021. What the African perspective alone misses is the transnational financial architecture (IMF, Eurobond markets, credit rating agencies) that constrains African bargaining power from outside the bilateral relationship. The best explanation is thus a synthesis: African agency operating within structural constraints, mediated by Chinese institutional frameworks, and shaped by Western-dominated global financial architecture. The case does not support either the "debt trap" narrative (which denies African agency) or the "win-win" narrative (which denies structural asymmetry); it supports a "bargained interdependence" account in which both sides gain but on unequal terms that are periodically renegotiated.

SECTION 2.9 PROBLEM PAIR (We do)

1. Define the comparison precisely: choose one security outcome (regime survival, territorial control, or civilian protection) for the Sahel under French Operation Barkhane (2014–2022) and under Russia's Africa Corps (2023–2025), and identify at least two indicators plus their sources.

2. Reconstruct the Russian and Malian official narratives: what causal claims do they make about why Barkhane failed and why Africa Corps is preferable?

3. Reconstruct the Western and UN counter-narratives: what mechanisms (civilian harm, sovereignty, human rights, Charter principles) do they invoke?

4. Apply the four levels of analysis: explain how individual (commanders, communities), state (junta legitimacy), systemic (multipolarity), and transnational (jihadist networks, arms flows, mercenary markets) factors interact.

5. Adjudicate: state which mechanism best explains the observed differences and what evidence would falsify it.

6. Produce a bounded verdict: under what scope conditions is each security model more effective?

MODEL ANSWER

The comparison between French Operation Barkhane and Russia's Africa Corps in the Sahel should begin by separating three distinct dependent variables: regime survival, territorial control, and civilian security. Barkhane was a large multinational counterterrorism operation with air assets, intelligence, and training missions; its stated aim was to degrade jihadist networks and support Sahelian states. Africa Corps, by contrast, appears optimized for regime protection, elite bargaining, and political signaling in a multipolar environment. If the metric is regime survival for post-coup authorities, Russian support may look effective because it is less conditional and more directly tied to the ruling coalition's immediate needs. If the metric is civilian protection or long-term state capacity, the verdict is less favorable, because paramilitary models that prioritize regime security can externalize violence onto communities and blur accountability. The African perspective is central here: Malian authorities did not simply receive Russian power; they used it to renegotiate a security hierarchy that had become politically unsustainable after repeated coups and popular resentment of French presence. Multi-alignment is not neutrality; it is a strategy of extracting options from competition.

Yet agency is constrained by fiscal weakness, fragmented authority, and insurgent pressure, so the choice of partner can improve bargaining position without resolving structural insecurity.

At the mechanism level, Barkhane's failure was not merely military. It combined a counterterrorism logic with a political project that many Sahelians experienced as externally imposed, and it struggled to convert tactical gains into legitimate local governance. The French withdrawal after coups in Mali and Burkina Faso illustrates a scope condition of Western assistance: conditionality and democratic norms can become liabilities when partner regimes prioritize survival over liberal reform. Russia's Africa Corps enters this gap by offering a less conditional bargain—security support, political backing, and anti-Western narrative capital in exchange for access, resources, and diplomatic alignment. The mechanism is regime consolidation through externalized coercion, not necessarily population-centric counterinsurgency. This is why the two models should not be judged by the same metric. Barkhane's theory of change required host-state legitimacy and local consent; Africa Corps's theory of change requires only that the ruling coalition remain in power and that external patrons tolerate the arrangement.

The Western perspective reads this as strategic retrenchment and competitive loss: withdrawal created a vacuum that Russia and other actors filled, while conditionality preserved normative standards but reduced leverage. The UN perspective emphasizes Charter principles, civilian protection, and the risks of unaccountable armed actors, regardless of their nationality. The Chinese perspective, though less directly involved in Sahelian security, generally stresses non-interference and developmental partnership, and would likely view external military competition as secondary to infrastructure and sovereignty. The Russian perspective frames Africa Corps as an instrument of sovereign choice and multipolarity, arguing that African states are rejecting neocolonial security dependence. Each perspective captures part of the mechanism but occludes another: Western analysis often understates African bargaining; Russian analysis understates civilian harm and accountability; UN analysis can understate the political demand for rapid regime security; Chinese analysis can understate security externalities.

Levels of analysis clarify the adjudication. At the individual level, commanders, local militias, and community leaders mediate how any external force is experienced. At the state level, junta legitimacy and elite cohesion determine whether foreign support stabilizes or merely postpones crisis. At the systemic level, multipolarity gives African governments more suitors and therefore more bargaining room, but also exposes them to proxy competition. At the transnational level, jihadist networks, arms flows, and mercenary markets mean that security outcomes are not contained within state borders. Therefore, a fair comparison must ask not which power "won" the Sahel, but which configuration of external support, local authority, and regional order best reduces violence over time.

The evidence required to adjudicate is demanding. One would need disaggregated data on civilian casualties, displacement, territorial control, and state service delivery, alongside arms transfer records and the legal status of foreign forces. SIPRI data can illuminate the material dimension of external support, but they do not by themselves establish battlefield or political effects. If civilian harm rises and insurgent recruitment expands under Africa Corps, the Russian claim of stabilizing sovereignty is weakened. If, conversely, violence declines and state authority consolidates without the democratic conditionality that accompanied Barkhane, the Western claim that only liberal counterinsurgency can succeed is weakened. The most defensible conclusion is conditional: Barkhane failed politically before it failed militarily, while Africa Corps may succeed in regime protection while failing in civilian protection. African agency consists in choosing among these imperfect bargains, not in escaping great-power competition.

SECTION 2.10 INDEPENDENT MEMO (You do)

(a) Case description: In 2023–2024, South Africa hosted the BRICS summit, abstained or voted against Western-backed resolutions on Russia's invasion of Ukraine, and faced US allegations concerning a sanctioned Russian vessel, while remaining a major AGOA beneficiary and a focal point of US diplomatic pressure. Pretoria described its posture as non-alignment and sovereign decision-making; Washington treated it as strategic drift with potential trade consequences; Beijing and Moscow treated it as legitimate multipolarity. The episode is useful because it compresses several mechanisms of great-power competition: trade preferences as leverage, diplomatic alignment as signaling, and African multi-alignment as both bargaining strategy and vulnerability. It also raises a forward-looking question: can a middle-income African state convert geopolitical ambiguity into material concessions without triggering retaliation from any major partner? The case does not require assuming that South Africa is representative of all African states; rather, it tests how agency operates under asymmetric dependence. Pretoria's choices also affected its credibility with smaller African partners and with the African Union.

(b) Required memo headings as prompts:

- **Mechanism:** Identify the causal mechanism linking South Africa's diplomatic positioning to changes in trade, investment, or security outcomes; specify scope conditions and the level of analysis at which it operates.

- **Perspective reconstruction:** Reconstruct African, Chinese, Russian, Western, and UN readings of the episode in 3–5 sentences each, stating what each contributes and what it occludes.

- **Historical analogue:** Compare the episode with a prior case (for example, Cold War non-alignment or post-apartheid transition diplomacy) and state precisely what is similar and what is different.

- **Falsifiers:** List 2–3 observable developments that would weaken your argument, and state what evidence would be required to detect them.

(c) Self-check: Did you distinguish description (what happened), explanation (why), prediction (what follows), and prescription (what should be done)?

SECTION 2.11 HINGE QUESTION

Question: Which statement best captures the relationship between African agency and great-power competition on the continent?

A. African states are largely passive objects because FOCAC, BRI, and Western security partnerships determine outcomes.
B. African multi-alignment is best explained as elite bargaining that uses competition to extract concessions, but its success depends on state capacity, issue-linkage, and the ability to manage asymmetric dependence.
C. Russian Africa Corps has replaced Western influence because it avoids conditionality and therefore delivers superior security outcomes.
D. UN Charter principles are sufficient to regulate great-power competition in Africa without additional regional or African agency.

Distractor diagnosis:

- **A** is wrong because it conflates external engagement with determinism; it ignores African bargaining, multi-alignment, and the documented use of competition by African elites, and it treats FOCAC/BRI as unilateral imposition rather than negotiated bargains.
- **C** is wrong because it overstates Russian replacement of Western influence and assumes that avoiding conditionality equals superior security outcomes; it ignores civilian-harm concerns, accountability gaps, and the possibility that regime protection differs from population security.
- **D** is wrong because it treats normative Charter principles as self-enforcing; the UN lacks independent enforcement capacity, and African agency plus regional bargaining are necessary to translate principles into outcomes.

SECTION 2A — DATA LAB

Table 1 — Africa's Merchandise Trade by Partner (approximate, 2022–2023, US$ billions)

Partner / bloc	Approx. annual trade with Africa	Direction of trend (2000→2023)	Notes
European Union	300–350	Stable-to-rising in value; share of Africa's total trade declining	Largest single bloc; EPA/FTA negotiations ongoing; agricultural market access contested
China	250–285	Rapid rise; peaked ~2022, slight dip 2023	Largest single country partner; commodity-heavy (oil, copper, cobalt, iron ore)
India	90–100	Steady rise	Energy (crude), pharmaceuticals, vehicles; diaspora-linked networks
United States	70–80	Relative decline in share; AGOA preferences	Energy (LNG, crude), aircraft; AGOA utilization uneven
UAE	60–70	Rapid rise	Re-export hub (gold, electronics); growing FDI and port stakes
United Kingdom	40–50	Post-Brexit bilateral deals	Mining, services, financial; historical ties
Turkey	35–45	Rapid rise from low base	Construction, textiles, defense; Erdogan-era commercial diplomacy
Japan	25–30	Flat-to-declining share	Vehicles, machinery; TICAD framework

Partner / bloc	Approx. annual trade with Africa	Direction of trend (2000→2023)	Notes
Russia	18–22	Low base; grain/wheat dominant	Wheat exports to North/East Africa; arms separate from trade
South Korea	20–25	Rising	Vehicles, electronics, shipbuilding
Intra-African (AfCFTA zone)	150–170	Rising but still ~15–17% of total	Low relative to other regions; tariff and non-tariff barriers persist

Sources: UN Comtrade aggregates; national customs data; African Development Bank trade briefs. Figures are indicative ranges, not precise point estimates; informal cross-border trade is undercounted.

Table 2 — Foreign Direct Investment Stock in Africa by Source (approximate cumulative stock, US$ billions, recent)

Source	Approx. FDI stock	Dominant sectors	Character
European Union (bloc)	300–350	Energy, telecoms, finance, manufacturing	Largest historical stock; fragmented by member state
United Kingdom	50–65	Mining, finance, services	Concentrated in Anglophone Africa and extractives
United States	45–55	Energy, tech, consumer goods	Declining relative share; Prosper Africa initiative
China	40–50	Infrastructure, mining, manufacturing, ICT	State-backed; BRI-linked; often project finance not pure equity
UAE	30–40	Ports, logistics, real estate, renewables	Sovereign-wealth and private capital; rapid growth
France	25–35 (within EU)	Telecoms, energy, retail	Concentrated in Francophone Africa
India	15–20	Pharmaceuticals, ICT, energy	Private-sector led; diaspora networks
Turkey	10–15	Construction, textiles, defense	SME and state-backed hybrid
Russia	5–10	Mining, energy	Small; Wagner/Africa Corps-linked in some cases

Source	Approx. FDI stock	Dominant sectors	Character
Japan	10–15	Manufacturing, autos	TICAD-linked; cautious

Sources: UNCTAD World Investment Report; national investment authorities; fDi Markets. Stock figures conflate greenfield FDI, M&A, and state-backed project finance; Chinese figures are especially sensitive to definition (equity vs. loans).

Table 3a — Major Arms Suppliers to Africa (SIPRI, share of African imports, 2019–2023, approximate)

Supplier	Approx. share of imports	Trend	Notes
Russia	35–45%	Declining from ~50%+ in 2010s	Legacy Soviet-era platforms; Africa Corps-linked sales; sanctions pressure
France	10–15%	Stable	Francophone Africa; legacy platforms; Rafale sales
United States	8–12%	Stable-to-rising	AFRICOM-linked; drones, transport; conditionality attached
China	8–12%	Rising	Cost-competitive; drones, armored vehicles; no conditionality
Turkey	5–8%	Rapid rise	Bayraktar drones; competitive pricing; no political conditionality
UAE	3–6%	Rising	Re-exports and direct sales; Gulf competition
Germany / Italy / UK / Israel / South Africa	10–15% combined	Mixed	Niche platforms; South Africa as regional producer

Sources: SIPRI Trends in International Arms Transfers; SIPRI Arms Transfers Database. Shares are approximate and vary sharply by sub-period and by recipient country.

Table 3b — UNSC Voting Alignment of African States (qualitative, selected issue areas, 2019–2024)

Issue area	African bloc tendency	Alignment pattern
Sovereignty / non-interference resolutions (e.g., sanctions on states)	Strongly opposed to unilateral sanctions	Aligns with China/Russia; diverges from West
Ukraine (2022–)	Divided: ~half abstained or voted with West; some with Russia	No unified African position; economic ties (wheat) shape votes
Palestinian statehood / Gaza	Near-unanimous support for ceasefire resolutions	Aligns with Global South; diverges from US
Peacekeeping mandates (MINUSMA, MONUSCO)	Supportive of mandates, critical of exit timelines	Aligns with UN Secretariat and France historically; shifting
Human rights country-specific resolutions	Mixed; many abstentions	Sovereignty concerns; selective Western sponsorship perceived
Climate / development finance	Unified demands for loss-and-damage funding	Aligns with G77/China; demands on West

Sources: UN General Assembly and Security Council voting records; ISS Africa analyses. Voting is a crude proxy for alignment; abstentions often signal strategic ambiguity rather than opposition.

Analysis Questions

1. Trend. Looking at Table 1, describe the shift in Africa's trade partners between 2000 and 2023. Which partner gained the most share, which lost the most, and what does the intra-African figure suggest about the AfCFTA agenda? Answer in 4–6 sentences with specific figures.

2. Level of analysis. Table 3a (arms) and Table 3b (UNSC voting) operate at different levels of analysis. Identify which of the four levels (individual, state, systemic, transnational) each table primarily reflects, and explain what each table cannot tell you about African agency. Include one concrete example of a finding that would be invisible at the systemic level but visible at the state level.

3. Perspective reconstruction (all five). Take the FDI stock figures in Table 2 and reconstruct how each of the five perspectives would read them: (a) African (primary) — agency, bargaining, and the "terms of the bargain"; (b) Chinese — "win-win" and developmental partnership; (c) Russian — sovereign choice and multipolarity; (d) Western — competition, conditionality, and strategic retrenchment; (e) UN — charter principles and peace and security. For each, state one thing the perspective reveals and one thing it occludes. Lead with the African reading.

4. Interpretation. Do Tables 1–3 support the "new scramble" thesis (Africa as passive object of great-power competition) or the "multi-alignment" thesis (African states as active bargainers among multiple suitors)? Adjudicate using at least two specific data points, and state the scope conditions under which each thesis would hold.

5. Limitation. Identify three specific data limitations across these tables and explain how each limitation would bias a conclusion about African agency. For each, propose one corrective (a different data source, a different level of analysis, or a qualitative supplement).

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — "The Multi-Suitor Wheel" (hand-drawn on A4 landscape)

What to draw. Draw a large circle in the center of the page labeled "AFRICAN STATE / REGIONAL BLOC" (write "e.g., Nigeria, Kenya, Sahel states, AU" underneath). Around it, draw 8–10 spokes radiating outward like a wheel, each ending in a labeled box. Spokes (clockwise from top): China (FOCAC/BRI), Russia (Africa Corps/arms), US (AFRICOM/AGOA), EU (EPAs/Global Gateway), Turkey (defense/commerce), UAE (ports/capital), India (trade/pharma), France (legacy/security), UK (finance/mining), Japan (TICAD). On each spoke, write 2–3 small tags: the instrument (e.g., "trade + FDI + no conditionality" for China; "arms + anti-Western narrative" for Russia; "conditionality + retrenchment" for US). Draw a second, thinner concentric ring just outside the center circle labeled "AFRICAN AGENCY ZONE" with arrows pointing both inward (bargaining) and outward (multi-alignment). In the four corners, place small perspective icons: top-left "African: bargaining/multi-alignment"; top-right "Chinese: win-win"; bottom-left "Russian: multipolarity"; bottom-right "Western: competition/conditionality"; and a small UN flag icon at the bottom center labeled "Charter principles."

How to label it. Use thick black for the center and spokes; use color (red for arms/security, blue for trade, green for FDI, purple for votes/diplomacy) for the tags. Label the wheel's outer rim "GREAT POWER COMPETITION ON THE CONTINENT (L31)."

Perspective overlay to annotate. Draw a dashed oval around the whole wheel labeled "Systemic level (L1)" and a second dashed oval around only the center circle labeled "State level (L2)." Add a note: "The wheel shows structure; the center shows agency. Neither alone is sufficient (L12 Cold War precedent)."

Visual 2 — "The FOCAC Dakar Bargain: Terms of the Bargain" (hand-drawn flow diagram)

What to draw. Draw two large vertical columns. Left column header: "CHINA (FOCAC Dakar, 2021)". Right column header: "AFRICAN PARTNERS". In the left column, list 6 boxes top-to-bottom: (1) Infrastructure (roads, ports, rail); (2) Green development (solar, hydro); (3) Digital economy (5G, e-commerce); (4) Health (vaccines, hospitals); (5) Peace & security (training, equipment); (6) Trade facilitation (tariff lines, e-commerce). In the right column, list 6 corresponding boxes: (1) Market access & resources (minerals, oil, agricultural commodities); (2) Diplomatic support (One China, UNSC votes); (3) Debt servicing & repayment; (4) Labor & local content (variable); (5) Regulatory facilitation (SEZs, customs); (6) Long-term offtake agreements. Draw horizontal double-headed arrows between paired boxes, labeled "terms of bargain." In the middle, draw a central box labeled "THE BARGAIN" with four sub-labels: "Volume (scale of commitments)", "Conditionality (none stated, implicit via debt)", "Transparency (partial)", "Reciprocity (asymmetric but negotiated)." Below the columns, draw a timeline arrow: "FOCAC 2000 → 2006 → 2015 → 2018 → 2021 (Dakar) → 2024 (Beijing)."

How to label it. Use blue for Chinese commitments, green for African commitments, black for the central bargain box. Add small flags: China flag on left column header, AU flag on right.

Perspective overlay to annotate. Top banner: "African reading: bargaining within asymmetry (Grovogui, Mbembe)." Left margin note: "Chinese reading: win-win, non-interference (Brautigam 2009)." Right margin note: "Western reading: debt-trap / conditionality gap (Taylor 2014)." Bottom note: "UN reading:

charter principles, development as right."

Visual 3 — "Sahel Security Comparator: Barkhane vs. Africa Corps" (hand-drawn comparison matrix)

What to draw. Draw a large table with 3 columns: "Dimension" (left), "French Operation Barkhane (2014–2022)" (middle), "Africa Corps / Wagner (2023–2025)" (right). Rows (8–9): (1) Force size & footprint; (2) Mandate & legal basis; (3) Host-state relationship; (4) Civilian protection record; (5) Territorial control outcomes; (6) Exit / transition; (7) Cost to host state; (8) International legitimacy; (9) Coups during deployment. Fill each cell with 2–4 word descriptors (e.g., Barkhane: "5,000+ troops; UN-authorized"; Africa Corps: "smaller footprint; bilateral deals"). Below the table, draw two arrows: left arrow "Barkhane → withdrawal 2022" and right arrow "Africa Corps → expanding 2023–25." Add a small map sketch of the Sahel (Mali, Burkina Faso, Niger) with dots marking capitals and a legend: blue dots = Barkhane bases (closed), red dots = Africa Corps presence.

How to label it. Use blue header for Barkhane column, red header for Africa Corps column. Bold the "Coups during deployment" row. Add a footnote line: "Outcomes are contested; data on civilian casualties is incomplete (SIPRI, ACLED)."

Perspective overlay to annotate. Left margin: "Western reading: counterterrorism, state capacity, exit." Right margin: "Russian reading: sovereign choice, anti-Western, multipolarity." Top: "African reading: security as bargaining chip; coup regimes as new clients (Mamdani, Aning)." Bottom: "UN reading: charter Art. 2(4), human rights, peacekeeping transition."

SECTION 4 — CORNELL NOTES

Cue (prompt)	Notes (with source log)
What is the "new scramble" thesis?	Claim that Africa is again a passive object of great-power competition, echoing 1884–85 Berlin Conference. Critics (Grovogui, Mbembe, Bayart) argue African states bargain, multi-align, and extract rents; agency is constrained but real. Source: Grovogui (1996); Mbembe (2001); Bayart (2000).
What is multi-alignment?	African states maintaining simultaneous ties with China, Russia, West, Gulf, Turkey, India; using competition among suitors to maximize bargaining leverage. Not non-alignment (Cold War) but active portfolio management. Source: Aning & Danso (2019); Nkrumah (1965) on neo-colonialism as warning.

Cue (prompt)	Notes (with source log)
FOCAC: what is it?	Forum on China-Africa Cooperation, founded 2000; triennial summits; Dakar Action Plan 2021 set commitments on infrastructure, green, digital, health, peace & security, trade. Source: FOCAC Dakar Action Plan (2021).
"Debt trap" debate	Brautigam (2009): Chinese lending is not uniquely predatory; debt distress is real but driven by multiple creditors and domestic factors. Taylor (2014): structural asymmetry in Sino-African trade (raw materials out, manufactures in). Alden & Large (2019): relationship is negotiated, not imposed.
Russia's instruments	Africa Corps (rebranded Wagner, 2023–), arms sales (SIPRI: ~35–45% of African imports), UNSC votes, grain diplomacy, anti-Western narrative. Targets coup regimes in Sahel. Source: SIPRI; Marten (2019) on Wagner.
Western instruments	Conditionality (governance, human rights), AGOA trade preferences (2000, renewed), military assistance (AFRICOM), sanctions. Strategic retrenchment post-2010s; France's Barkhane withdrawal (2022). Source: Taylor (2014); AFRICOM posture statements.
Middle powers	Turkey (drones, construction), UAE (ports, capital), India (pharma, trade), Gulf states, Japan (TICAD), South Korea. Multiplication of suitors increases African bargaining space. Source: Alden & Large (2019).
Levels of analysis (L1)	Individual (leaders), state (regimes), systemic (polarity, great-power competition), transnational (corporations, diaspora, armed groups). Each level reveals and occludes.
African agency mechanisms	Bargaining (extracting rents), multi-alignment (portfolio), forum shopping (AU, FOCAC, TICAD), norm entrepreneurship (Agenda 2063, Silencing the Guns). Source: Grovogui; Tamale (2020); Oyěwùmí (1997) on epistemic agency.
What data shows	Trade: China ~250–285B, EU ~300–350B (2022–23); FDI stock EU largest; arms Russia largest share; UNSC votes divided. Supports multi-alignment over pure scramble. Source: Comtrade; UNCTAD; SIPRI.

Cue (prompt)	Notes (with source log)
Key critique of data	Comtrade undercounts informal trade; FDI stock conflates equity and loans; SIPRI values at production cost not market; UNSC votes are crude alignment proxy.
Historical analogue	Cold War (L12): Africa as proxy battleground; non-alignment movement; superpower conditionality. Today's multipolarity offers more suitors but similar risks of instrumentalization. Source: Nkrumah (1965); Nyerere (1960s speeches).

Summary (3–5 sentences). Great power competition on the continent is best understood not as a "new scramble" in which Africa is a passive object, but as a multi-alignment environment in which African states bargain among an expanded set of suitors—China, Russia, the West, and middle powers—using trade, FDI, arms, and diplomatic votes as leverage. The FOCAC Dakar Action Plan (2021) exemplifies the terms of the Sino-African bargain: large-scale commitments without stated political conditionality, exchanged for market access, resources, and diplomatic support. Russia's Africa Corps in the Sahel illustrates a security-for-legitimacy bargain with coup regimes, contrasting with France's withdrawn Operation Barkhane. Data on trade, FDI, arms, and UNSC voting support the multi-alignment reading but remain limited by under-counting, definitional ambiguity, and the coarseness of voting proxies. The African perspective—agency within asymmetry—reveals what both the "scramble" and "win-win" narratives occlude: that African states are constrained but not merely acted upon.

SECTION 5 — FEYNMAN COMPRESSION

Step 1 — Explain without jargon. Imagine a country in Africa that needs roads, weapons, and trade partners. Twenty years ago it mainly dealt with Europe and the US. Today it can also go to China for infrastructure money, Russia for weapons, Turkey for drones, the UAE for port investment, and India for medicine. That country is not just being fought over; it is playing these suitors against each other to get better deals. The "new scramble" idea says Africa is just the prize in a game others play. The better idea is that African governments are players too—constrained by debt and power imbalances, but actively bargaining. China's FOCAC meetings promise big projects without demanding political reforms; Russia's Africa Corps offers security help to new military governments in exchange for access and anti-Western alignment; the West still offers trade deals like AGOA but has pulled back militarily in places like the Sahel. The data—trade volumes, investment stocks, arms sales, UN votes—shows many partners, not one master, which fits the bargaining story better than the scramble story.

Step 2 — Mark gaps. (a) I have not explained *how* bargaining power is actually exercised—whether through AU coordination, bilateral deals, or elite capture—and the data cannot distinguish these. (b) I treated "African agency" as unitary; I have not addressed internal divisions (civil society vs. state, regional blocs vs. capitals) or the Mamdani critique that the post-colonial state itself is a bifurcated structure. (c) I have not specified the mechanism by which arms sales translate into political alignment—whether through dependency, train-

ing, or elite co-optation. (d) I asserted that multi-alignment is "better" than scramble without fully testing the scramble thesis against cases where African states had little room to maneuver (e.g., debt-distressed states). (e) I have not addressed the UN perspective's concern that multi-alignment may erode charter norms (sovereignty, human rights) when security is outsourced to non-state actors like Africa Corps.

Step 3 — Reread verification. Re-reading the key claims: Brautigam (2009) supports the claim that Chinese lending is not uniquely predatory but does not deny debt distress; Taylor (2014) supports structural asymmetry in trade but is about trade patterns, not agency; Alden and Large (2019) support negotiated relationship; SIPRI data supports Russia's leading arms share; FOCAC Dakar Action Plan (2021) supports the six commitment areas listed. The claim that "multi-alignment is better supported by data" is an interpretation, not a datum—acceptable if labeled as adjudication. The claim about France's Barkhane withdrawal in 2022 is accurate. The claim that Turkey's drone sales rose rapidly is supported by SIPRI trend data. No invented quotations used; all attributions are to general arguments.

Step 4 — Analogy with explicit limits. *Analogy:* Great power competition in Africa today is like a bazaar where multiple merchants (China, Russia, Turkey, UAE, India, the West) compete for the same customer (an African state), and the customer can walk between stalls, compare prices, and play merchants off each other—unlike a monopoly market where one merchant sets terms. *Limits of the analogy:* (1) The "customer" is not a single rational actor but a fragmented state with elites, militaries, and civil societies pulling in different directions; (2) some "merchants" (especially in arms and security) create lock-in through training, spare parts, and intelligence sharing that a bazaar customer can avoid; (3) debt creates asymmetric dependency that a cash customer does not face; (4) the analogy ignores the systemic level—global polarity, commodity prices, and climate shocks—that constrains all parties; (5) the bazaar metaphor risks overstating African agency by implying equal footing, which the data on FDI stock and debt do not support.

Step 5 — Rewrite. Great power competition on the African continent is not a replay of the nineteenth-century scramble in which Africa was merely territory to be divided; it is a multi-alignment environment in which African states, regional blocs, and elites bargain among an expanded set of external suitors—China, Russia, the Western powers, and middle powers such as Turkey, the UAE, and India—using trade access, mineral and energy resources, diplomatic votes, and security partnerships as leverage. The evidence supports this reading: China-Africa trade of roughly $250–285 billion and EU-Africa trade of $300–350 billion in 2022–2023 show no single dominant partner; Russia's ~35–45% share of African arms imports and Turkey's rapid rise show a diversifying security market; and divided UNSC voting on Ukraine shows strategic ambiguity rather than bloc discipline. Yet agency is bounded: FDI stock remains concentrated in Western and Chinese hands, debt distress constrains choice, and security outsourcing to actors like Africa Corps raises charter and human-rights concerns that the UN perspective foregrounds. The FOCAC Dakar Action Plan (2021) captures the terms of the Sino-African bargain—scale without stated conditionality, exchanged for resources and diplomatic support—while the Sahel comparison of France's withdrawn Operation Barkhane with Russia's expanding Africa Corps shows how security partnerships have become a currency of regime survival. The African vantage point, reconstructed from within through scholars such as Grovogui, Mbembe, and Bayart, reveals what both the "scramble" and "win-win" narratives occlude: African states are neither passive objects nor equal partners, but constrained bargainers operating in a multipolar marketplace whose rules they did not write.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L31	Definition	What is the “new scramble” thesis?	It argues that Africa is being re-divided by external powers competing for resources, markets, and strategic position. Critics counter that African states bargain, select partners, and shape terms, so the continent is not a passive object. The thesis is strongest when it describes competitive pressure and weakest when it erases agency.	African view: warns against objectification; Western view: frames rivalry.

Tag	Card Type	Front	Back	Perspective Note
L31	Mechanism	What mechanism links FOCAC to Sino-African bargaining?	FOCAC institutionalizes periodic negotiation over trade, infrastructure, finance, and political commitments, creating a forum where African governments can aggregate demands. The Dakar Action Plan (2021) set priority areas and financing pledges, but implementation depends on project pipelines and state capacity. Bargaining power varies by state size, resource endowment, and debt position.	Chinese view: partnership; African view: forum for agency.

Tag	Card Type	Front	Back	Perspective Note
L31	Debate	How does the "debt trap" debate frame Chinese lending?	Critics argue that opaque, collateralized, or commercially priced loans can create dependency and asset risk. Defenders, including Brautigam, emphasize that debt distress has multiple creditors and that Chinese finance is often project-linked rather than predatory by design. The evidence requires case-level debt composition, not aggregate suspicion.	Western view: risk; Chinese view: development finance.

Tag	Card Type	Front	Back	Perspective Note
L31	Definition	What is multi-alignment in African foreign policy?	Multi-alignment means maintaining simultaneous relationships with competing powers to maximize options, avoid exclusive dependence, and extract concessions. It is not neutrality; states may vote differently across issues and institutions. Its success depends on credible exit options and domestic capacity to manage multiple bargains.	African view: sovereignty strategy; UN view: charter equality.

Tag	Card Type	Front	Back	Perspective Note
L31	Source	What does SIPRI arms-transfer data show about great-power competition?	SIPRI data track supplier concentration, volume trends, and recipient patterns, revealing which powers gain military influence and where. Rising Russian or Turkish deliveries in the Sahel can indicate shifting security partnerships, but transfers alone do not prove operational effectiveness. They must be read with training, maintenance, and doctrine.	Russian view: sovereign choice; Western view: competition.

Tag	Card Type	Front	Back	Perspective Note
L31	Comparison	How did French Operation Barkhane and Russia's Africa Corps differ in the Sahel?	Barkhane was a large, multinational counterterrorism operation with formal host-state agreements and a significant logistical footprint. Africa Corps represents a more transactional, state-backed security model with fewer transparency obligations. Comparing them requires separating security outcomes from sovereignty costs and political legitimacy.	African view: sovereignty trade-offs; Russian view: anti-Western alternative.
L31	Mechanism	What is the Western conditionality mechanism?	Western aid, trade preferences such as AGOA, and military assistance often attach governance, human-rights, or economic-policy conditions. This can incentivize reform but may also be perceived as sovereignty infringement or strategic inconsistency. Retrenchment reduces leverage while creating openings for rivals.	Western view: norms; African view: external constraint.

Tag	Card Type	Front	Back	Perspective Note
L31	Application	What does UNSC voting alignment measure?	It measures how often states vote with a given power on resolutions, indicating diplomatic alignment or tactical convergence. It is a proxy for influence, not proof of control, because votes may reflect issue-specific interests, bloc politics, or abstention strategies. African voting often varies by resolution and regional position.	UN view: multilateralism; Russian view: multipolarity.

Tag	Card Type	Front	Back	Perspective Note
L31	Reconstruction	What is the Russian anti-Western narrative in Africa?	It frames Western intervention as neo-colonial and presents Russia as a partner that respects sovereignty and offers security without political conditionality. This narrative can resonate where Western missions are seen as ineffective or intrusive. Its credibility depends on whether Russian support produces durable security and accountable governance.	Russian view: multipolarity; Western view: disinformation risk.

Tag	Card Type	Front	Back	Perspective Note
L31	Mechanism	What is the Gulf/Turkish/Indian engagement mechanism?	Middle powers multiply suitors by offering niche advantages: Turkish drones and construction, Gulf finance and ports, Indian pharmaceuticals and training. This diversifies African options and can reduce dependence on any single great power. It also fragments accountability and may create competing patronage networks.	African view: bargaining leverage; UN view: complex peacebuilding.

Tag	Card Type	Front	Back	Perspective Note
L31	Source	How does Brautigam (2009) challenge the “debt trap” narrative?	Brautigam argues that Chinese engagement is more varied and project-specific than predatory stereotypes suggest, and that debt problems require examining all creditors and domestic borrowing decisions. The claim is not that risks are absent, but that evidence must be case-based. This shifts analysis from moral panic to institutional capacity.	Chinese view: development partnership; Western view: strategic caution.

Tag	Card Type	Front	Back	Perspective Note
L31	Source	What does Taylor (2014) add to great-power competition analysis?	Taylor situates Africa within BRICS and divergent development paths, emphasizing that external partnerships interact with domestic political economies. The lesson is that outcomes depend on how African elites negotiate, allocate, and legitimize resources. External power alone does not determine development trajectories.	African view: elite bargaining; Western view: order competition.
L31	Source	What do Alden and Large (2019) contribute?	They highlight new directions in Africa-China studies, moving beyond binary "colonialism versus partnership" debates toward granular, field-based research. Their work stresses institutional, social, and local dimensions of Chinese presence. This supports more precise causal claims about impact and agency.	Chinese view: partnership nuance; African view: local agency.

Tag	Card Type	Front	Back	Perspective Note
L31	Application	What is the FOCAC Dakar Action Plan (2021) as a bargain?	It is a negotiated framework setting cooperation priorities and commitments between China and African states. Its value lies in agenda-setting and signaling, but its effects depend on financing follow-through, project selection, and African coordination. It exemplifies institutionalized rather than ad hoc engagement.	Chinese view: win-win; African view: collective bargaining.
L31	Adjudication	What is the strongest objection to the "new scramble" thesis?	The strongest objection is that it treats African states as terrain rather than actors, ignoring multi-alignment, institutional bargaining, and differentiated national strategies. It also risks conflating competition with control. A better framework measures both external pressure and African agency.	African view: primary; Western view: rivalry lens.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence audit table (scored 0-100)

Competency	Self-score (0-100)	Evidence from this lesson	Next action
Distinguish description, explanation, prediction, and prescription		Can state what happened, why, what may follow, and what should be done without conflating them	Rewrite one memo paragraph labeling each sentence type
Reconstruct all five perspectives on great-power competition		Can identify each perspective's core normative stance and occlusion	Produce a one-sentence steel-man for the weakest perspective
Apply the four levels of analysis to a case		Can separate individual, state, systemic, and transnational mechanisms	Map one Sahel event across all four levels
Interpret SIPRI and Comtrade data without overclaiming		Can describe trends while noting proxy limits	Add one caveat to a data-based claim
Adjudicate the "debt trap" debate using evidence		Can compare Brautigam's critique with risk-based arguments	List three case-level falsifiers
Compare Barkhane and Africa Corps by outcomes and sovereignty costs		Can separate security effects from legitimacy effects	Build a two-column comparison table
Specify scope conditions for a causal claim		Can state when a mechanism should and should not operate	Add scope conditions to one flashcard back
Recognize what each perspective occludes		Can name one blind spot per perspective	Add occlusion notes to Cornell notes

7.2 Three-question debrief

1. Which perspective did I treat as the default, and what did that perspective make invisible?
2. Which causal claim did I state without specifying its mechanism, scope conditions, or observable implications?
3. Which piece of evidence would most seriously weaken my conclusion, and did I record it as a falsifier rather than an afterthought?

7.3 Error-log table

Common Misconception	Correction	Evidence
Africa is a passive object of a "new scramble."	African states exercise agency through multi-alignment, forum bargaining, and differentiated partnerships.	FOCAC negotiations, AU positions, and varied national strategies
Chinese loans are inherently predatory.	Debt distress is multi-creditor and case-specific; Chinese finance is often project-linked.	Brautigam (2009); debt-composition analysis
Russian security support automatically improves stability.	Outcomes depend on legitimacy, capacity, accountability, and local acceptance.	Sahel comparisons between Barkhane and Africa Corps
Western retrenchment means Western influence has ended.	Conditionality, markets, military assistance, and norms still shape choices.	AGOA uptake; security cooperation patterns
UNSC voting alignment proves external control.	Voting is a proxy for diplomatic convergence, not proof of control.	Variation by resolution and regional position
More external suitors always increase African leverage.	Multiplication can fragment accountability and create competing patronage networks.	Middle-power port, drone, and finance competition

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
New scramble thesis; African agency; multi-alignment	External competition for resources, markets, and strategic position; African bargaining and forum diplomacy	Realist rivalry; dependency critique; African agency scholarship	Trade, FDI, and arms data; FOCAC negotiations	Object versus agent	Evidence of African bargaining, differenti-ated national strategies	L12, L30, L32

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Chinese engagement; FOCAC; debt trap debate	Institutionalized negotiation; project finance; debt composition	Brautigam (2009); Alden and Large (2019)	FOCAC Dakar Action Plan (2021); Comtrade flows	Debt trap versus development partnership	Debt composition by creditor; project completion and utilization	L33, L47-49
Russian engagement; Africa Corps; anti-Western narrative	Security provision; arms transfers; sovereignty-respecting rhetoric	Multipolarity; sovereign choice	SIPRI arms data; Sahel security transitions	Security versus legitimacy	Casualty, territory, and governance trends	L18, L47-49
Western engagement; conditionality; retrenchment	Aid, trade preferences, military assistance, and governance conditions	Liberal institutionalism; strategic competition	AGOA; Operation Barkhane	Norms versus sovereignty	Preference uptake; reform indicators; mission outcomes	L12, L18
Middle-power engagement; multiplication of suitors	Niche advantages in drones, ports, finance, pharmaceuticals, and training	Multi-alignment; bargaining theory	Turkish, Gulf, and Indian projects in Africa	Leverage versus fragmentation	Supplier concentration; debt and patronage indicators	L32, L33
Five perspectives on great-power competition	Competing normative frames and occlusions	African, Chinese, Russian, Western, and UN traditions	UNSC voting; FOCAC; SIPRI; Comtrade	Agency versus structure	Perspective-specific evidence that contradicts each frame	L1-L5, L30

SECTION 9 — REVIEW SCHEDULE

- **R1 (same day, 20 minutes):** Reconstruct the five perspectives from memory, then check each against its occlusion. Mark any perspective you defaulted to.
- **R2 (24 hours, 30 minutes):** Redraw the visual anchor from memory, label the trade, FDI, arms, and UNSC-voting trends, and annotate one perspective overlay per visual.

- **R3 (72 hours, 45 minutes):** Write a 300-word memo on the FOCAC Dakar Action Plan using the four levels of analysis and all five perspectives.
- **R4 (1 week, 45 minutes):** Compare Barkhane and Africa Corps using security outcomes, sovereignty costs, and falsifiers; state which evidence would change your verdict.
- **R5 (2 weeks, 60 minutes):** Teach the lesson to a peer or record a five-minute explanation, then answer the hinge question without notes.

SECTION 10 — COMPLETION CHECKLIST

☐ I can define the "new scramble" thesis and state its strongest criticism.
☐ I can explain FOCAC as an institutionalized bargaining forum.
☐ I can distinguish the "debt trap" claim from Brautigam's critique.
☐ I can define multi-alignment and identify its scope conditions.
☐ I can interpret SIPRI arms data without treating transfers as proof of control.
☐ I can compare Barkhane and Africa Corps across security and sovereignty dimensions.
☐ I can explain Western conditionality and strategic retrenchment.
☐ I can explain how middle powers multiply African options and risks.
☐ I can reconstruct all five perspectives in their own terms.
☐ I can identify at least one occlusion for each perspective.
☐ I can apply the four levels of analysis to the worked example.
☐ I can distinguish description, explanation, prediction, and prescription.
☐ I can state falsifiers for my preferred conclusion.
☐ I have completed the confidence audit honestly.
☐ I have recorded at least one error in the error log.
☐ I can answer the hinge question and diagnose each distractor.
☐ I can use the cheatsheet to reconstruct the lesson's core mechanisms.
☐ I can explain why the African perspective is primary in this lesson.

33. African Agency and Strategic Autonomy

LESSON METADATA

Field	Value
Lesson number and title	Lesson 32: African Agency and Strategic Autonomy
Module	Module 5: African Geopolitical Architecture
Prerequisites	L28 (Pan-Africanism); L31 (Great Power Competition)
Interleaved links	Forward: L33 (Critical Minerals), L34 (Sahel Synthesis), L49 (Global South)
Reading load	7-9 hours
Content channels	Text, data lab, worked example, problem pair, independent memo, flashcards, Cornell notes
Bloom ceiling	Evaluate / Create
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

The central puzzle of this lesson is deceptively simple to state and extraordinarily difficult to resolve: in a world where the United States, China, Russia, the European Union, and the Gulf states are all simultaneously courting African governments with trade deals, security partnerships, infrastructure finance, and diplomatic attention, do African states possess more agency than they did during the unipolar 1990s, or have they merely inherited a more crowded and more competitive form of dependency? The question matters because the answer determines whether the current multipolar moment represents a genuine expansion of African bargaining space or a sophisticated reconfiguration of the same structural constraints that have limited African sovereignty since independence. This lesson does not assume either answer. It builds the analytical machinery needed to adjudicate between them case by case, metric by metric, and perspective by perspective.

The puzzle is not new, but its contemporary form is. Kwame Nkrumah's *Neo-Colonialism: The Last Stage of Imperialism* (1965) argued that political independence without economic control was a hollow achievement, and Walter Rodney's *How Europe Underdeveloped Africa* (1972) traced the mechanisms through which colonial and post-colonial extraction produced structural dependence. The Organisation of African Unity's 1963 charter enshrined sovereignty and non-interference as foundational principles, yet the same principles often shielded authoritarian regimes and limited collective action. The end of the Cold War removed superpower competition as a source of leverage for African states, and the 1990s structural adjustment era compressed policy space dramatically. The 2000s commodity boom and China's entry into African markets reopened some space, but on terms that often reinforced raw-material export dependence. The 2020s, with their overlapping crises—COVID-19, the Russia-Ukraine war, great power competition, climate stress, and debt distress—have produced a new vocabulary of "strategic autonomy" and "multi-alignment" that this lesson subjects to critical scrutiny rather than accepting at face value.

The theoretical stakes are high and they cut across the discipline. International Relations theory has historically treated African states as objects of great power politics rather than as agents within it. Realism predicts that weak states in a competitive system will bandwagon with the strongest power or balance against threats, but it struggles to explain why so many African governments simultaneously court Washington, Beijing, Moscow, and Riyadh without fully committing to any. Liberal institutionalism predicts that trade integration and institutional membership generate autonomy through interdependence, yet the African Continental Free Trade Area (AfCFTA) remains under-implemented and its sovereignty dividends are prospective rather than realized. Constructivism highlights the role of norms, identity, and diplomatic framing, but risks overstating the material consequences of normative assertion. African IR scholarship—Jean-François Bayart's analysis of "extraversion," Mahmood Mamdani's work on the bifurcated state, Siba Grovogui's theorization of sovereignty as practice rather than status, and Achille Mbembe's reflections on the postcolony—insists that African political actors are strategic, creative, and historically situated, not merely reactive. This lesson takes that insistence seriously while refusing to romanticize it.

The lesson is positioned within Module 5, African Geopolitical Architecture, and builds directly on Lesson 28 (Pan-Africanism) and Lesson 31 (Great Power Competition). From L28 it inherits the question of whether continental institutions can convert shared identity into collective bargaining power. From L31 it inherits the empirical reality of intensified external competition and the analytical tools for mapping great power strategies. It also looks forward: to Lesson 33 on critical minerals, where resource sovereignty becomes concrete; to Lesson 34 on the Sahel, where security dependence and sovereignty collide; and to Lesson 49 on the Global South, where African agency is situated in a broader coalition politics. The student who masters this lesson will be able to move between these scales—individual state, regional hegemon, continental institution, global system—without losing analytical coherence.

What the student will be able to do after mastering this lesson is specific and assessable. First, evaluate competing claims about African agency using evidence rather than assertion, distinguishing rhetorical sovereignty from material capacity. Second, analyze multi-alignment as a strategic logic with identifiable mechanisms, scope conditions, and failure modes, rather than treating it as either wisdom or opportunism. Third, assess the AfCFTA not as a slogan but as a project with a theory of change, implementation gaps, and distributional consequences. Fourth, examine resource sovereignty initiatives—such as the DRC-Zambia battery value chain memorandum and Indonesia-style export bans—on their own terms, including their industrial policy requirements and their risks of elite capture. Fifth, identify the structural limits on agency—debt, aid dependence, weak state capacity, commodity dependence, security outsourcing—and specify how they interact rather than treating them as a single undifferentiated constraint. Sixth, reconstruct and adjudicate among five perspectives (African, Chinese, Russian, Western, UN) on the same empirical phenomena, recognizing what each reveals and what each occludes.

A methodological commitment runs through the entire lesson and deserves explicit statement. Agency is treated as a variable, not a binary. States possess more or less agency in different domains (diplomatic, economic, security, normative) at different times, and the same state may be highly agentic in one arena and deeply constrained in another. The lesson therefore resists both the Afro-pessimist narrative that treats African states as perpetual victims of structure and the Afro-optimist narrative that celebrates every diplomatic gesture as evidence of empowerment. It demands evidence of bargaining outcomes—concessions extracted, terms improved, alternatives created—not merely of diplomatic activity. It also insists on distinguishing four analytical operations that students frequently conflate: description (what states do), explanation (why they do it), prediction (what will follow), and prescription (what they should do). Conflating these produces the common error of inferring strategic wisdom from observed behavior, or of prescribing autonomy

without specifying the material preconditions for achieving it. The worked example and problem pair are designed to train precisely this discrimination.

SECTION 1 — Pre-Class Priming

1.1 Retrieval Warm-Up Answer each question in two to four sentences, drawing on earlier lessons. Do not consult notes until after attempting all six.

1. **From L28 (Pan-Africanism):** What did Kwame Nkrumah mean by "neo-colonialism," and how does his concept differ from formal colonialism in its implications for African sovereignty?
2. **From L28 (Pan-Africanism):** How did the OAU's 1963 principle of non-interference simultaneously protect newly independent states and constrain collective African action?
3. **From L31 (Great Power Competition):** Which external powers are most active in Africa in the 2020s, and what distinguishes their modes of engagement (trade, security, infrastructure, diplomacy)?
4. **From L31 (Great Power Competition):** How did China's Belt and Road Initiative and the US Prosper Africa initiative differ in their underlying theories of how economic engagement produces influence?
5. **From L1 (Levels of Analysis):** At which level of analysis would you situate a state's decision to abstain on a UN General Assembly resolution, and what would change if you analyzed the same decision at the individual-leader level?
6. **From L28 (Pan-Africanism):** What is the difference between Pan-Africanism as an ideological movement and Pan-Africanism as an institutional practice (AU, RECs), and why does the gap between them matter for agency?

1.2 Orientation Questions These questions frame the lesson's central puzzle. You will return to them after completing the lesson and should be able to answer each with evidence and mechanism.

1. Is African "strategic autonomy" in the 2020s best understood as a genuinely new capacity created by multipolarity, or as a rebranding of older patterns of dependency under more favorable diplomatic conditions?
2. Does multi-alignment strengthen African bargaining power by playing suitors against each other, or does it dilute leverage by preventing any single partner from investing deeply in a committed relationship?
3. Can the AfCFTA deliver economic sovereignty without complementary industrial policy, or does trade integration without production capacity risk locking in existing comparative advantage in raw materials?
4. Where does agency end and structure begin for a state like Nigeria or South Africa—what would have to change in the evidence for you to revise your assessment of either state's autonomy?

1.3 Vocabulary Pre-Teach Provisional definitions for terms that recur throughout the lesson. Refine these as you encounter each term in context.

- **Strategic autonomy:** The capacity of a state to make and implement decisions in its perceived national interest without being compelled by external actors; in the African context, typically understood as bounded and domain-specific rather than absolute.

- **Multi-alignment:** A diplomatic strategy in which a state maintains active, simultaneous relationships with multiple great powers without exclusive commitment to any, seeking to extract concessions and preserve optionality.
- **Extraversion (Bayart):** The thesis that African political systems have historically oriented themselves outward toward external patrons and resources as a strategy of domestic power accumulation, complicating simple narratives of either sovereignty or subordination.
- **Regional hegemon:** A state with disproportionate economic, military, and diplomatic weight within its region, whose preferences shape regional order; in Africa, Nigeria, South Africa, and Ethiopia occupy this role with markedly different resource bases.
- **AfCFTA (African Continental Free Trade Area):** The AU's flagship trade integration project, operational since 2021, aiming to create a single continental market; its sovereignty potential depends on implementation depth, rules of origin, and industrial policy.
- **Resource sovereignty:** State efforts to increase control over extractive sectors through ownership, taxation, local content requirements, export restrictions, or value-chain upgrading; includes initiatives like the DRC-Zambia battery MOU.
- **Conditionality:** The practice of attaching policy requirements to financial assistance, trade preferences, or debt relief; a primary instrument of Western and multilateral leverage over African policy space.
- **Non-alignment:** The Cold War-era doctrine of refusing military alliances with either superpower bloc; distinct from multi-alignment, which is transactional and non-ideological rather than principled.
- **Structural dependence:** Persistent constraints on policy autonomy arising from debt burdens, aid dependence, commodity export concentration, weak industrial bases, and security outsourcing.
- **State capacity:** The ability of a state to implement its decisions effectively across its territory; a binding constraint on agency that operates independently of diplomatic skill or normative assertion.
- **Bargaining space:** The range of outcomes a state can realistically achieve in negotiation with external actors, determined by its alternatives, its assets, and the competitive environment among suitors.
- **Neo-colonialism:** Nkrumah's term for a system in which former colonies remain economically subordinated to former metropoles through control of finance, trade, and resources despite formal political independence.

SECTION 2 — LESSON CORE

2.1 Learning objectives

After mastering this lesson, the student will be able to:

1. **Analyze** the distinct resource bases, institutional embeddedness, and normative authority that allow Nigeria, South Africa, and Ethiopia to exercise regional hegemony in qualitatively different ways, and explain why these differences resist ranking on a single hierarchy of power. (Analyze)
2. **Evaluate** the African Continental Free Trade Area as a project of economic sovereignty, weighing its tariff-reduction and rules-of-origin mechanisms against the structural limits of state capacity, infrastructure deficits, and the political economy of protection. (Evaluate)
3. **Explain** multi-alignment as a rational strategy rather than incoherence, identifying the mechanisms through which African states play external suitors against one another to extract concessions and preserve autonomy. (Explain)

4. **Assess** resource-sovereignty initiatives — including the DRC-Zambia battery value-chain memorandum and Indonesia-style export bans — in terms of their capacity to alter the terms of extraction and their vulnerability to retaliation, smuggling, and capital flight. (Assess)
5. **Critique** the limits of African agency by tracing how structural constraints, weak state capacity, and dependence on external finance bound the feasible set of autonomous action even for the continent's most powerful states. (Critique)

Each objective is assessable through the worked example (Nigeria's multi-alignment), the problem pair (South Africa's Russia-Ukraine balancing), and the independent memo; the student should be able to move between description, explanation, prediction, and prescription without conflating them. The objectives are sequenced so that the first establishes the material and institutional foundations of power, the second and third examine the economic and diplomatic instruments of autonomy, the fourth tests whether resource endowments can be converted into bargaining leverage, and the fifth imposes the structural constraints that bound all four.

2.2 KEY IDEA 1 — Regional hegemons: Nigeria, South Africa, Ethiopia — distinct strategies, different resources

Bolded Causal Claim: Regional hegemony in Africa is not a scalar property of aggregate national power but a relational achievement produced by the conversion of specific, non-fungible resource endowments — oil rent and demographic mass in Nigeria, industrial depth and post-apartheid moral authority in South Africa, military capacity and developmental-state infrastructure in Ethiopia — into regional public goods and institutional leadership; consequently, the three hegemons pursue qualitatively different strategies of order-building that cannot be ranked on a single hierarchy and that rise and fall with the convertibility of their distinctive assets.

Mechanism: Regional hegemony operates through three channels. First, material provision: the hegemon supplies security (peacekeeping, mediation, counter-terrorism), economic opportunity (market access, investment, aid), and diplomatic representation (speaking for the region in global forums). Second, institutional embeddedness: hegemony is exercised through and legitimated by regional economic communities — ECOWAS for Nigeria, SADC for South Africa, IGAD and the AU for Ethiopia — which convert bilateral power into multilateral authority. Third, normative authority: the hegemon's claim to leadership must be recognized by smaller states, which depends on perceived impartiality, shared identity, and a record of delivering public goods. The mechanism is therefore not simply "power over" but "power to" — the capacity to set agendas, define threats, and allocate resources within a regional institutional framework. Nigeria's oil rents fund ECOWAS interventions (Ecomog in Liberia and Sierra Leone, the 2017 Gambia intervention) but also make Abuja vulnerable to price shocks and to Western conditionality attached to oil-sector finance. South Africa's industrial base and financial sector give it leverage in SADC and the AU, while its post-apartheid moral authority — the "rainbow nation" legitimacy — provides normative capital that has eroded with domestic inequality, xenophobic violence, and the Zimbabwe policy controversies. Ethiopia's military capacity, built during the EPRDF period, made it the anchor of IGAD and the AU's security architecture (AMISOM/ATMIS in Somalia), while its developmental-state infrastructure (Grand Ethiopian Renaissance Dam, industrial parks) promised economic leadership; the 2020-2022 Tigray war demonstrated how quickly military capacity converts into liability when turned inward. The mechanism implies that hegemony is path-dependent and reversible: each hegemon's strategy is shaped by which assets are most convertible in its regional context, and by the domestic political coalitions that control those assets.

Scope Conditions: Regional hegemony functions where (a) the hegemon possesses at least one asset convertible into regional public goods; (b) regional institutions exist to mediate and legitimate leadership; (c) smaller states perceive net benefit from hegemonic order relative to alternatives (including external great-power patronage); and (d) the hegemon's domestic politics permit sustained external commitment. It weakens when asset convertibility declines (Nigeria's oil-price collapses of 2014-2016 and 2020), when domestic instability consumes capacity (Ethiopia 2020-2022), or when normative authority is contested (South Africa's 2008 and 2019 xenophobic violence, its equivocation on Zimbabwe). It also fails where a rival hegemon or external power offers smaller states a better deal — France in the Sahel, China's infrastructure finance, or Gulf states' port investments. The scope condition is therefore not "power" but "convertible power under institutionalized consent."

Observable Implications: If the causal claim holds, we should observe: (i) Nigeria leading ECOWAS military and diplomatic interventions when oil rents are high and retreating when they fall; (ii) South Africa dominating SADC economic and security agendas while its moral authority fluctuates with domestic politics; (iii) Ethiopia anchoring Horn security and AU diplomacy during stable periods and ceding space during internal conflict; (iv) smaller states forum-shopping between hegemons and external powers; (v) regional institutions (ECOWAS, SADC, IGAD) rising and falling with hegemonic capacity. Evidence: Nigeria's Ecomog operations (1990-1999) and the 2017 Gambia intervention; South Africa's mediation in DRC (2002 Sun City) and Zimbabwe (2008-2009); Ethiopia's role in AMISOM and the 2018 Eritrea peace; the 2021-2023 erosion of Ethiopian diplomatic capital during the Tigray war.

Perspective Note (five traditions in brief):

African (primary): The African perspective, reconstructed from within, treats regional hegemons not as natural leaders but as contested political projects whose legitimacy must be continually earned. Adebajo's characterization of Nigeria as a "reluctant hegemon" captures the central tension: Abuja possesses the material capacity for regional leadership but lacks the domestic political consensus and institutional follow-through to sustain it, oscillating between interventionism and withdrawal. This is not a failure of will but a structural feature of oil-dependent states whose fiscal capacity tracks commodity prices and whose foreign policy is captured by rent-seeking elites — a dynamic Bayart's "politics of the belly" illuminates. South Africa's hegemony is read differently: as "hegemony by consent" built on the moral capital of the anti-apartheid struggle, but increasingly strained by the contradiction between its liberation narrative and its domestic inequality, labor-market exclusion of migrants, and its equivocation on Zimbabwe's 2008 crisis. Mamdani's analysis of the post-colonial state — "decentralized despotism" — suggests that South African regional leadership reproduces at the continental level the same bifurcated authority that characterizes the domestic state: formal democratic institutions layered over coercive and patrimonial practices. Ethiopia presents a third variant: the developmental state as hegemon, where the EPRDF's vanguard-party model generated rapid growth and military capacity but also ethnic federalism's fragilities, culminating in the Tigray war that destroyed both its domestic legitimacy and its regional standing. The African vantage reveals what external perspectives miss: that regional hegemony in Africa is inseparable from the post-colonial state's internal contradictions — the gap between sovereignty as legal status and sovereignty as effective capacity. Nkrumah's warning about "neo-colonialism" and Nyerere's insistence on collective self-reliance (the Arusha Declaration, the Lagos Plan of Action) frame the hegemon's dilemma: it must be strong enough to resist external domination yet not so strong as to dominate its neighbors. The African perspective thus sees hegemons as necessary but dangerous — necessary for collective agency in a multipolar world, dangerous because their power can reproduce sub-imperial hierarchies. Grovogui's critique of the "standard of civilization" and the racialized hierarchies of international order adds that African hegemons operate within a global system that recognizes

their sovereignty formally while constraining their autonomy materially, so that even "successful" hegemony is hegemony within limits. The longest and most developed reading is therefore not of power but of constraint: African regional hegemons are simultaneously the continent's best instruments of strategic autonomy and the sites where that autonomy is most visibly incomplete.

Chinese: China's perspective treats regional hegemons as "anchor states" and "gateways" for its Africa engagement, mapping distinct roles onto each: Nigeria as oil and consumer market, South Africa as industrial and financial hub and BRICS partner, Ethiopia as infrastructure corridor and AU host. Beijing's relational framing — "partnership" rather than "leadership" — avoids adjudicating African hierarchies, consistent with non-interference. The Chinese vantage contributes recognition that hegemons provide institutional platforms (AU, ECOWAS) that China can engage multilaterally, reducing transaction costs. It occludes, however, the internal fragility of each hegemon and the possibility that Chinese finance deepens rather than resolves their structural vulnerabilities — for example, debt distress in Ethiopia or Nigeria's oil-sector dependence.

Russian: Russia's perspective frames regional hegemons as sovereign poles in a multipolar order, emphasizing their resistance to Western conditionality. Moscow cultivates Nigeria (arms, nuclear cooperation, oil), South Africa (BRICS, historical anti-apartheid solidarity, the 2014 nuclear framework), and Ethiopia (arms, historical ties) as partners in "sovereign choice." The Russian vantage contributes a vocabulary of anti-hegemonic solidarity and supports African claims to non-alignment. It occludes Russia's limited economic footprint relative to China or the West, and its tendency to treat African hegemons as instruments of great-power competition rather than autonomous actors — a framing that can undermine the very sovereignty it rhetorically champions.

Western: The Western perspective, particularly US and EU, treats regional hegemons as "anchor states" for stability, counter-terrorism, and market access. Nigeria is valued for ECOWAS leadership and counter-Boko Haram cooperation; South Africa for SADC stability and peacekeeping; Ethiopia for Horn security and AU diplomacy. The Western vantage contributes resources — aid, security assistance, market access (AGOA) — and institutional support. It occludes African agency by framing hegemony through Western security priorities, and its conditionality (human rights, governance) is read in Africa as sovereignty infringement. Frustration with non-alignment — Nigeria's and South Africa's abstentions on Ukraine — reveals the Western assumption that partnership entails alignment.

UN: The UN perspective treats regional hegemons as "sub-regional leaders" operating under the principle of subsidiarity, with the AU as the continental anchor. Nigeria's ECOWAS interventions, South Africa's SADC mediation, and Ethiopia's AU hosting are valued as African solutions to African problems, reducing UN deployment burdens (AMISOM/ATMIS, UNMIL). The UN vantage contributes legitimacy, funding, and a multilateral framework. It occludes power asymmetries within Africa — the risk that hegemony becomes sub-imperialism — and its emphasis on state-centric peacekeeping can sideline non-state and civil-society actors. The UN also struggles to hold hegemons accountable when they are simultaneously indispensable partners.

SECTION 2.3 KEY IDEA 2 — AfCFTA as a Project of Economic Sovereignty: Potential and Limits

Bolded Causal Claim: The African Continental Free Trade Area (AfCFTA) is best understood not as a conventional tariff-cutting agreement but as a sovereignty-building project: by pooling market access, rules of origin, standards, and dispute settlement across the continent, African states seek to convert fragmented

national economies into a collective bargaining unit capable of shaping the terms of global trade, investment, and industrialization; yet its sovereignty gains are contingent on implementation capacity and are constrained by the very asymmetries among member states that the agreement is meant to overcome.

Mechanism: The causal chain begins with tariff liberalization—ninety percent of tariff lines are to be liberalized over agreed transition periods—but tariffs are only the visible layer. The deeper mechanism is institutional: the AfCFTA protocols on trade in goods, services, investment, intellectual property, competition, digital trade, and dispute settlement create a continental rule-making space that did not previously exist. Rules of origin determine which products count as "African," thereby creating incentives for regional value chains rather than simple re-export of externally manufactured goods. The Guided Trade Initiative and similar pilot mechanisms test whether customs administrations, standards bodies, and private firms can actually move goods under the new rules. If these mechanisms function, the continental market—roughly 1.4 billion people—becomes a source of bargaining power: external partners must negotiate with a larger bloc rather than with individual states whose markets are too small to command concessions. The sovereignty effect is therefore not autarky but "capacity to set terms": African states gain leverage to demand technology transfer, local content, and industrial upgrading rather than accepting extractive terms. At the same time, the mechanism contains internal frictions. Non-tariff barriers—customs delays, divergent standards, sanitary and phytosanitary rules, roadblocks, and informal payments—often impose higher costs than tariffs. Infrastructure deficits, especially in transport corridors and energy, mean that tariff preferences may be unusable. Industrial concentration in a few economies (notably South Africa, Nigeria, Egypt, and Kenya) risks turning AfCFTA into a hub-and-spoke system in which smaller states become markets for a few regional manufacturers rather than co-producers. Revenue loss is also material: states that depend heavily on customs duties face fiscal shocks before alternative tax bases mature. Finally, external trade agreements—European Partnership Agreements, bilateral deals with China, the United States, and others—can erode AfCFTA preferences if rules of origin and cumulation are not carefully aligned. Sovereignty, in this sense, is pooled rather than absolute: member states accept constraints on unilateral tariff policy in exchange for collective market power, but the exchange only pays off if implementation is credible.

Scope Conditions: AfCFTA's sovereignty-building logic works under a specific set of conditions. First, legal domestication must occur: ratification alone is insufficient unless tariff schedules, rules of origin, and customs procedures are incorporated into national law and administered by trained officials. Second, customs and standards institutions must be capable of certifying origin, testing products, and resolving disputes without prohibitive delay. Third, physical and digital infrastructure—ports, corridors, one-stop border posts, payment systems, and data frameworks—must reduce the cost of moving goods across borders. Fourth, industrial policy must be complementary: AfCFTA creates market access, but it does not by itself create firms, skills, or technological capacity. Fifth, political commitment must extend beyond summit declarations to the removal of non-tariff barriers that protect politically connected importers or domestic monopolies. Sixth, adjustment mechanisms must compensate or support states and sectors that lose tariff revenue or face new competition, especially least-developed and landlocked countries. The logic fails or weakens where these conditions are absent: in conflict-affected regions, where borders are militarized or closed; in states with very narrow export bases; in economies where informal cross-border trade dominates and formal rules are bypassed; and where elite incentives favor rent extraction from import licensing rather than production. It also weakens if external powers use bilateral agreements to divide African negotiating positions, or if African states treat AfCFTA as a diplomatic symbol rather than an economic discipline.

Observable Implications: If the mechanism is working, one should observe a rising share of intra-African trade in total African trade, and—more importantly—a shift in composition toward manufactured and in-

termediate goods rather than raw commodities. One should see expansion of the Guided Trade Initiative, increased use of AfCFTA certificates of origin, growth in regional value chains (for example in automotive components, pharmaceuticals, agro-processing, and light manufacturing), and a measurable reduction in reported non-tariff barriers. One should also see the AfCFTA Secretariat and dispute-settlement bodies becoming active, with cases or consultations that clarify rules rather than merely ceremonial meetings. Fiscal data should show states experimenting with alternative revenue instruments as tariff dependence declines. If the limits dominate, the observable pattern will be different: intra-African trade will remain stagnant, informal trade will continue to dwarf formal flows, tariff schedules will exist on paper but not at the border, and external partners will continue to capture most value-added. One would also observe "forum shopping," where states sign AfCFTA commitments while simultaneously deepening bilateral deals that undermine continental rules of origin. The key diagnostic is not the number of ratifications but the cost, time, and predictability of moving a container or a digital service across an African border.

Perspective Note (five traditions in brief):

African (primary): From an African vantage point, AfCFTA is the economic counterpart to political Pan-Africanism: it attempts to reverse the fragmentation imposed by colonial borders and to build the continental market that earlier generations envisioned in the Lagos Plan of Action and the Abuja Treaty. African scholarship frames the problem not as a lack of trade but as a structure of extraversion—Bayart's term for economies oriented outward toward external patrons rather than inward toward regional production. Rodney's analysis of underdevelopment and Nkrumah's critique of neo-colonialism remain relevant because AfCFTA's promise is not simply more trade but trade on terms that permit industrialization. Mamdani's work on the bifurcated state reminds us that colonial administrative legacies can weaken the very institutions required to implement continental rules. The African perspective therefore treats sovereignty as capacity: a state or region is sovereign not merely when it has legal independence but when it can feed, employ, and industrialize its population without perpetual external permission. AfCFTA is thus a project of "decolonizing trade," but African feminist and social scholarship also insists that its success must be measured by whether informal traders—disproportionately women—gain recognition, credit, and protection rather than being displaced by formalization. The African vantage contributes a historical and structural diagnosis that Western trade theory often misses: low intra-African trade is not a natural market failure but a colonial inheritance. It also contributes a normative insistence that integration must not reproduce internal hierarchies, where a few regional hegemons dominate continental markets. Its occlusion, however, can be a tendency to treat continental unity as an unqualified good, underestimating the real distributional conflicts among member states and the possibility that pooled sovereignty may weaken democratic accountability if decisions are made in technocratic spaces far from citizens.

Chinese: The Chinese perspective frames AfCFTA as compatible with, and potentially amplifying, China-Africa partnership. It emphasizes infrastructure connectivity, industrial parks, and "win-win" cooperation, often presenting the Belt and Road Initiative and AfCFTA as mutually reinforcing. The relational framing stresses long-term partnership rather than conditionality, and Chinese actors may see a continental market as an opportunity for Chinese firms to scale production and for African states to accelerate industrialization. What this perspective contributes is a willingness to finance large-scale infrastructure that many Western actors have avoided. What it occludes is the risk that Chinese firms capture value-added segments while African economies remain suppliers of raw materials or low-margin assembly; it also tends to understate concerns about debt sustainability, procurement transparency, and competition with African manufacturers.

Russian: The Russian perspective generally welcomes African economic integration as part of a multipolar

order and frames AfCFTA as a step away from Western-dominated trade structures. Russian rhetoric emphasizes sovereign choice and non-interference, but Russia's actual trade and investment footprint in Africa is comparatively small, and its comparative advantages lie more in arms, energy, and diplomatic support than in consumer markets or manufacturing supply chains. The perspective contributes a geopolitical counterweight to Western pressure, but it occludes the limited complementarity between Russian and African economies and the constraints imposed by sanctions and logistical distance.

Western: The Western perspective tends to support AfCFTA rhetorically as a market-opening, rules-based initiative aligned with global trade norms. It emphasizes standards, intellectual property, competition policy, procurement transparency, and the compatibility of AfCFTA with existing European Partnership Agreements. Western actors often see AfCFTA as an opportunity for their firms to access a larger African market. What this perspective contributes is technical expertise, financing for trade facilitation, and pressure for regulatory predictability. What it occludes is the historical role of colonial trade structures and asymmetric agreements in producing Africa's external orientation; it can also treat African industrial policy—such as local content requirements or export bans—as distortions rather than sovereignty tools.

UN: The UN perspective treats AfCFTA as a development instrument aligned with the Sustainable Development Goals and with AU Agenda 2063. UN agencies, especially the Economic Commission for Africa and UNCTAD, provide technical support, modeling, and advocacy for trade as a driver of inclusive growth. The perspective emphasizes multilateralism, gender inclusion, and the special needs of least-developed countries. What it contributes is legitimacy, data, and a normative framework for inclusive integration. What it occludes is the hard politics of power asymmetry within Africa and the possibility that technocratic integration may proceed without sufficient democratic accountability or redistribution.

SECTION 2.4 KEY IDEA 3 — Multi-Alignment as Rational Strategy: The Logic of Playing Suitors Against Each Other

Bolded Causal Claim: Multi-alignment is a rational, interest-maximizing strategy for African states with sufficient market size, strategic location, or diplomatic weight: by maintaining simultaneous and non-exclusive partnerships with competing external powers, they convert great-power rivalry into bargaining leverage, diversify risk, and preserve decision-making autonomy; but the strategy is not costless, because credibility, state capacity, and domestic coherence determine whether courting multiple suitors yields concessions or merely multiplies dependencies.

Mechanism: Multi-alignment should be distinguished from both non-alignment and bandwagoning. Non-alignment, in its classic Cold War form, often implied neutrality or equidistance; bandwagoning implies choosing a patron. Multi-alignment, by contrast, is active and transactional: a state deliberately cultivates overlapping relationships with the United States, China, Russia, the European Union, Gulf states, and others across security, finance, trade, and diplomacy, while refusing to grant any single partner exclusive access. The mechanism is "competitive courting." When external powers perceive that a state has credible alternatives, they bid against one another with infrastructure finance, arms, market access, debt relief, diplomatic support, and technology. The African state can then extract better terms, avoid overdependence on one creditor, and preserve room for maneuver. A second mechanism is "omni-enmeshment": by embedding different partners in different sectors—ports, telecoms, energy, defense, agriculture—the state prevents any one actor from dominating the whole economy. A third mechanism is diplomatic: simultaneous membership in competing forums (the African Union, BRICS, the G20, the Commonwealth, the Francophonie, or sub-regional blocs) allows the state to shift venues when one forum becomes constraining. The strategy also

has a domestic dimension. Multi-alignment can serve elite coalition management by distributing rents and contracts across factions aligned with different external patrons, thereby reducing the risk that any single faction captures the state. But this same mechanism can become pathological: if elite competition is managed through external rents rather than domestic accountability, multi-alignment reinforces "gatekeeper" politics rather than development. The strategy can also fail when signals become incoherent. If a state accepts incompatible obligations—exclusive basing rights, conflicting data regimes, or contradictory sanctions exposure—partners may impose costs, withdraw support, or treat the state as unreliable. Thus the core mechanism is leverage through credible alternatives, and its success depends on the state's ability to manage complexity without losing coherence.

Scope Conditions: Multi-alignment works best for states with structural assets that make them worth courting: large populations and markets (Nigeria, South Africa, Ethiopia, Egypt, Kenya), strategic geography (the Horn of Africa, the Sahel, the Gulf of Guinea, the Red Sea), critical minerals, or diplomatic centrality (AU host, regional hegemon, aspirant global-governance voice). It also requires institutional capacity: a professional foreign service, coherent national-security and economic planning, and the ability to negotiate complex contracts. Domestic political conditions matter as well. A degree of elite consensus on core interests is necessary; otherwise, multi-alignment becomes a battlefield among factions, each selling access to a different patron. The strategy is more viable during periods of intense great-power competition, when suitors are motivated and alternatives are abundant; it is less effective when major powers retrench or when global liquidity tightens. It fails or degrades where states are small, highly aid-dependent, conflict-affected, or lacking credible exit options. In such cases, "multi-alignment" may be merely "multi-dependence": the state accumulates obligations to several patrons without gaining leverage over any. It also fails when external powers coordinate to punish non-alignment, or when a state's strategic assets are so vital that one patron is willing to coerce rather than compete.

Observable Implications: If multi-alignment is functioning as a rational strategy, one should observe simultaneous high-level engagement with competing powers without exclusive commitments; diversified arms procurement and training relationships; parallel infrastructure, energy, and telecom deals with different financiers; and voting patterns that avoid automatic alignment with any bloc, including abstentions or split positions in the United Nations General Assembly. One should also observe improved terms—better financing conditions, technology transfer, or diplomatic support—following competitive bidding. If the strategy is failing, the observable signs include rising debt to multiple creditors with incompatible conditions; conflicting contractual obligations; sanctions exposure; reputational incoherence; and domestic polarization over foreign policy. Another diagnostic is whether the state can say "no" to a major partner without catastrophic retaliation. A state that cannot refuse is not multi-aligned; it is dependent. The most important observable implication is therefore not the number of partnerships but the terms on which they are conducted and the state's retained freedom to choose among them.

Perspective Note (five traditions in brief):

African (primary): The African perspective frames multi-alignment as an expression of strategic autonomy and agency, not as opportunism. It draws on the non-alignment tradition of Nkrumah, Nyerere, and the Bandung spirit, but adapts it to a multipolar world in which African states are no longer merely choosing between two blocs. African scholars such as Adebajo and Alden emphasize that African states have historically been treated as objects of great-power competition; multi-alignment is an attempt to become subjects. The logic of "playing suitors" is therefore a reversal of extraversion: instead of accepting the terms offered by a single patron, the state uses competition to improve its position. Yet the African perspective

also contains a sharp internal critique. Bayart's analysis of the "gatekeeper state" warns that external rents can strengthen elites who mediate between foreign patrons and domestic populations, producing sovereignty without development. Mamdani's work on political identity and state form suggests that multi-alignment may be used to manage internal coalitions rather than to serve citizens. The African vantage thus insists that strategic autonomy must be measured not only by diplomatic freedom but by whether it expands domestic capacity, accountability, and material welfare. It contributes a historically grounded suspicion of external conditionality and a normative commitment to African agency; it occludes, at times, the possibility that some external partnerships may be genuinely developmental and that refusing all conditionality can protect predatory elites.

Chinese: The Chinese perspective generally accepts multi-alignment as legitimate and even natural, consistent with its emphasis on non-interference and "win-win" cooperation. China benefits from being one suitor among many, but it also prefers bilateral, relational engagement that builds long-term trust. The relational framing presents partnership as mutual benefit rather than transactional leverage. What this perspective contributes is a refusal to demand exclusive alignment and a willingness to compete on infrastructure and finance. What it occludes is the possibility that African multi-alignment is partly a hedge against overdependence on China itself; Chinese actors may underestimate how diversification reduces their leverage and may frame African agency as ingratitude or instability.

Russian: The Russian perspective supports African multi-alignment rhetorically as part of an anti-hegemonic, multipolar vision. It presents Russia as an alternative to Western conditionality and emphasizes sovereign choice. In practice, however, Russia's economic offer is limited, and its appeal often rests on security cooperation, arms, and diplomatic backing rather than broad-based development. The perspective contributes a geopolitical counterweight and a vocabulary of sovereignty, but it occludes the asymmetry between its rhetoric and its material capacity, as well as the risks that security partnerships can deepen authoritarianism or conflict.

Western: The Western perspective often interprets multi-alignment as hedging or non-alignment, and it can generate frustration when African states abstain from Western-led initiatives or refuse to condemn adversaries. Conditionality—on governance, human rights, or sanctions compliance—reflects an assumption that partnership should entail political alignment. What this perspective contributes is a rules-based framework, institutional funding, and pressure for accountability. What it occludes is the historical experience of coercion and the rationality of African states' desire to avoid overdependence; it can mistake strategic autonomy for unreliability or moral failure.

UN: The UN perspective values multilateral engagement and dialogue among competing powers, and it supports African voice in global governance. It tends to frame multi-alignment as compatible with the UN Charter and with multilateralism, while emphasizing rules, norms, and collective security. What it contributes is a forum for de-escalation and a normative commitment to sovereign equality. What it occludes is the reality that great-power competition often bypasses multilateral institutions, and that the UN's state-centric framework may not capture the domestic and transnational dimensions of multi-alignment, including elite capture and non-state actors.

2.5 KEY IDEA 4 — Resource sovereignty: DRC-Zambia battery initiative, Indonesia-style export bans, and the terms of extraction

Bolded Causal Claim: African states' capacity to convert critical mineral endowments into structural transformation depends not on geological abundance but on sovereign control over the terms of extraction, processing, and value-chain positioning; where states assert such control through export restrictions, joint ventures, and regional coordination, they can shift from price-taker to price-maker in strategic commodity markets, but only where state capacity and regional market depth make enforcement credible.

Mechanism: The mechanism runs through three linked channels, each with a distinct theoretical lineage. First, the "terms of extraction" channel: mining contracts, royalty regimes, local-content requirements, and environmental standards determine how much value is captured domestically versus repatriated. Rodney's (1972) analysis of underdevelopment as a relational process—where Africa's integration into global capitalism as a raw-material periphery systematically transferred surplus to metropolitan centers—remains the foundational African scholarly framing. Nkrumah's (1965) neo-colonialism thesis extends this: formal political independence without economic control reproduces subordination through unequal exchange. Bayart's (2009) concept of "extraversion" adds that African states are oriented toward external patrons, making resource governance a site of elite capture and rent-seeking rather than developmental accumulation. Second, the "value-addition" channel: exporting unprocessed ores captures minimal value; processing—smelting, refining, battery precursor production—captures more. Indonesia's 2020 nickel export ban and subsequent 2023 bauxite ban demonstrated that a state with concentrated supply and some processing capacity could force foreign firms to invest in domestic processing, attracting billions in FDI and moving Indonesia up the value chain. The DRC-Zambia battery initiative, formalized through a memorandum of understanding in April 2022, aims to create a joint special economic zone for battery precursor production, leveraging the DRC's cobalt and Zambia's copper. Third, the "regional coordination" channel: individual African states lack market power; collective action through the AfCFTA or regional economic communities can aggregate bargaining power. The mechanism is not automatic: export bans without processing capacity simply divert trade; bans without enforcement capacity invite smuggling and capital flight; bans without regional coordination invite competitive undercutting by neighbors. Mamdani's (1996) analysis of "decentralized despotism" is relevant here—states whose institutional reach is fragmented cannot enforce resource sovereignty even where the legal framework exists.

Scope Conditions: The causal claim holds under specific conditions. (a) Supply concentration: the state or region must control a significant share of global supply of a commodity with inelastic demand—cobalt, where the DRC supplies roughly seventy percent; copper; lithium. (b) Processing capacity or credible commitment to build it: Indonesia had existing nickel processing; DRC-Zambia are building from a lower base. (c) State capacity to enforce: customs, monitoring, contract negotiation expertise. (d) Regional market depth: AfCFTA implementation must reduce intra-African trade barriers. (e) Geopolitical demand: the energy transition must sustain demand for battery minerals. Where these fail—in states with fragmented sovereignty, weak customs, or commodities with elastic supply—the export-ban strategy fails or backfires, producing revenue loss and investor flight. The claim also does not imply that resource sovereignty alone produces development; it is a necessary but not sufficient condition, and without complementary industrial policy, education, and infrastructure, value-addition can become an enclave. Ake's (1996) warning that African states are often "disarticulated" from their societies applies: resource sovereignty without social embeddedness risks becoming elite enrichment.

Observable Implications: We should observe: (i) adoption of export restrictions on unprocessed minerals—

DRC cobalt export quotas, Zimbabwe's 2022 lithium ban, Namibia's 2023 critical minerals export restrictions; (ii) renegotiation of mining contracts and royalty increases, as in the DRC's 2018 mining code revision; (iii) joint ventures and special economic zones for processing—the DRC-Zambia battery zone, Tanzania's graphite processing ambitions; (iv) local-content and technology-transfer requirements; (v) increased state equity in mining; (vi) regional coordination mechanisms; (vii) pushback from consuming states and firms—WTO disputes, supply-chain diversification, "friend-shoring." The observable pattern should show variation: states with higher capacity achieve more; fragile states achieve less. Botswana's diamond beneficiation, though in a different commodity, illustrates the high-capacity pathway; the DRC's persistent struggle to enforce its 2018 code illustrates the low-capacity pathway.

Perspective Note (five traditions in brief):

African (primary): The African perspective frames resource sovereignty as the unfinished business of decolonization. Rodney (1972) and Nkrumah (1965) established that Africa's underdevelopment is not a natural condition but a produced one, through centuries of extraction. Mbembe (2001) extends this to the postcolony, where sovereignty is exercised as a "commandement" over bodies and resources, often through violent extraction. Bayart (2009) notes that African states are "extraverted"—oriented toward external patrons—making resource governance a site of elite capture and rent-seeking. Yet African scholarship also insists on agency: Aning and Danso (2013) emphasize that African states are not merely victims but strategic actors; Grovogui (2006) argues sovereignty is a practice, not a possession, and African states exercise it through diplomatic and legal maneuvering. Tamale (2020) and Oyěwùmí (1997) add that extraction is gendered: mining economies disrupt women's land rights and social reproduction, and resource sovereignty must include feminist political economy. The DRC-Zambia initiative is read as pan-African industrialization, a concrete attempt to break the "pit-to-port" model. The strongest African claim: without control over resources, political sovereignty is hollow; the strongest internal critique: elite capture and weak capacity may convert sovereignty rhetoric into new forms of extraction benefiting narrow coalitions.

Chinese: China's perspective emphasizes partnership and relational framing: resource cooperation is embedded in broader infrastructure and development packages, with rhetoric of "win-win" and non-interference. Chinese firms dominate cobalt processing and have invested heavily in DRC mining. The perspective contributes capital and infrastructure that Western firms often withhold, and it does not impose governance conditionality. What it occludes: concerns about labor standards, environmental degradation, debt sustainability, and the concentration of processing capacity in China, which can reproduce dependence even as it shifts the patron. Chinese policy discourse tends to frame resource cooperation as mutual benefit, but African critics note asymmetric bargaining power.

Russian: Russia's perspective emphasizes sovereign choice and anti-Western rhetoric: African states have the right to choose partners, and Western criticism of resource deals is hypocritical given Western extraction histories. Russia's actual economic footprint in African mining is smaller but includes security-for-resources arrangements and nuclear/energy deals. What it contributes is a geopolitical counterweight and rhetorical support for sovereignty; what it occludes is that Russian engagement often prioritizes regime security and elite deals over broad-based development, and its capacity to deliver large-scale processing investment is limited.

Western: The Western perspective emphasizes conditionality, ESG standards, supply-chain security, and market efficiency. It supports value addition in principle but worries that export bans distort markets, invite retaliation, and may not build capacity. It contributes technology, capital, and governance frameworks—EITI, OECD guidelines—and "friend-shoring" initiatives. What it occludes: historical extraction patterns,

asymmetric power in contract negotiation, and the possibility that Western firms' reluctance to process in Africa reflects risk aversion rather than African incapacity. Western frustration with non-alignment sometimes conflates commercial interest with normative concern.

UN: The UN perspective emphasizes sustainable development, the SDGs, multilateral frameworks such as EITI and the UN Guiding Principles on Business and Human Rights, and African voice in global governance. It supports resource sovereignty as compatible with development but stresses environmental and social safeguards. What it contributes is normative frameworks and technical assistance; what it occludes is enforcement weakness and the reality that great-power competition often bypasses multilateral resource governance.

2.6 KEY IDEA 5 — The limits of agency: structural constraints, weak state capacity, and dependence on external finance

Bolded Causal Claim: African strategic autonomy is structurally bounded by weak state capacity, dependence on external finance, and asymmetric integration into global capitalism; agency is real but exercised within narrow margins, and its expansion requires not just diplomatic maneuvering but domestic institutional strengthening and regional collective action.

Mechanism: The mechanism operates through four channels, each grounded in a distinct scholarly tradition. First, the "finance dependence" channel: many African states rely on external borrowing—Eurobonds, IMF and World Bank programs, Chinese loans—that carries conditionality and constrains fiscal space. Mkandawire's (2001) concept of "choiceless democracies"—states that hold elections but lack policy autonomy due to structural adjustment and donor dependence—captures this dynamic. Debt distress, as in Zambia's 2020 default and Ghana's 2022 restructuring, illustrates how finance dependence narrows options. Adebajo (2016) notes that African states' foreign policies are frequently shaped by the need to maintain access to external finance and security guarantees. Second, the "state capacity" channel: weak tax administration, limited industrial policy expertise, fragile infrastructure, and security deficits constrain what states can implement. Ake (1996) argued that African states are often "disarticulated" from their societies, lacking the bureaucratic and infrastructural power to execute developmental projects. Mamdani's (1996) "decentralized despotism" thesis shows how colonial institutional legacies constrain democratic and developmental capacity. Third, the "extraversion" channel: Bayart (2009) shows African states are oriented toward external patrons, with elites capturing rents from external flows rather than taxing domestic production, weakening accountability and developmental orientation. Fourth, the "security dependence" channel: reliance on external security providers—French operations in the Sahel, Russian PMCs, US AFRICOM—constrains strategic choices. The mechanism is not deterministic: agency exists—Clapham (1996) and Brown (2012) document how African states maneuver within constraints—but the margin of maneuver varies sharply with capacity, resource endowment, and geopolitical position. Tshabalala and Ndzendze (2022) argue that African agency is best understood as "agency within constraints," a formulation that avoids both fatalism and voluntarism.

Scope Conditions: The claim holds most strongly for states with low fiscal autonomy, high debt, weak institutions, and high aid dependence. It holds less for states with diversified economies, stronger institutions, and regional leadership—Nigeria, South Africa, Ethiopia historically, Rwanda, Botswana. The claim also does not imply zero agency; even weak states exercise agency through diplomatic positioning, alliance choices, and normative entrepreneurship. The limits are contingent and can be expanded through regional integration (AfCFTA), domestic reform, and diversification of partnerships. The claim is falsified if states with weak capacity consistently achieve autonomous industrial policy outcomes comparable to strong-capacity states.

Alden (2019) emphasizes that African agency is not a fixed quantity but a variable shaped by the density of external engagement and the quality of domestic institutions.

Observable Implications: We should observe: (i) continued IMF programs and conditionality in many states; (ii) debt distress and restructuring; (iii) limited industrial policy implementation despite rhetorical commitments; (iv) reliance on external security; (v) variation in capacity across states; (vi) elite capture of external rents; (vii) AfCFTA implementation gaps; (viii) "policy space" debates in AU and UN forums. The observable pattern should show that agency is uneven: Nigeria can multi-align; fragile Sahelian states cannot. The AU Agenda 2063's emphasis on "domestic resource mobilization" and "capable institutions" implicitly acknowledges these limits.

Perspective Note (five traditions in brief):

African (primary): The African perspective on limits of agency is internally contested, and this contestation is itself a scholarly strength. One strand—Rodney (1972), Nkrumah (1965), Fanon (1961)—emphasizes structural constraint: colonialism and neo-colonialism created dependencies that cannot be overcome by will alone. Mamdani (1996) shows how colonial institutional legacies constrain democratic and developmental capacity. Another strand—Nyerere (1968), Cabral (1979), and contemporary scholars like Mkandawire (2001)—insists on agency within constraints: African states and movements have historically exercised remarkable agency (liberation struggles, non-alignment, pan-Africanism) and can do so again. Grovogui (2006) argues sovereignty is practiced, not given. The tension between these strands is productive: it prevents both fatalism and voluntarism. Mbembe (2001) adds that postcolonial sovereignty is often exercised through violence and extraction, complicating celebratory narratives. Tamale (2020) and Oyěwùmí (1997) insist that limits are gendered: women's exclusion from state institutions limits the range of agency. The strongest African claim: agency is real but must be understood as practice within structure, not as autonomy from it; the strongest internal critique: some African scholarship risks overemphasizing structure (fatalism) or overemphasizing agency (voluntarism), and the balance is empirical.

Chinese: China's perspective tends to emphasize partnership and capacity-building, offering infrastructure and finance with less conditionality than Western donors. It contributes an alternative to Western conditionality and supports African agency rhetorically. What it occludes: new dependencies (debt, infrastructure lock-in, technology dependence) and the possibility that Chinese engagement reproduces extraversion in new forms. Chinese discourse frames limits as temporary and solvable through cooperation.

Russian: Russia's perspective emphasizes sovereign choice and anti-Western solidarity, framing limits as imposed by Western hegemony. It contributes rhetorical and diplomatic support. What it occludes: limited capacity to address structural constraints (finance, infrastructure, capacity-building) and the risk that security partnerships deepen dependence.

Western: The Western perspective emphasizes governance, institutions, and conditionality as paths to expanded agency. It contributes aid, technical assistance, and normative frameworks. What it occludes: historical responsibility for creating constraints, the possibility that conditionality undermines rather than builds capacity, and the tendency to blame African states for structural problems. Western frustration with non-alignment sometimes reflects impatience with the slow pace of change.

UN: The UN perspective emphasizes multilateral support, capacity-building, and the SDGs. It contributes normative frameworks and technical assistance. What it occludes: the state-centric framework may miss transnational constraints (illicit flows, climate), and UN programs are often donor-driven, reproducing dependence. The UN's emphasis on "good governance" can individualize structural problems.

SECTION 2.7 — FIVE PERSPECTIVES IN DEPTH

2.7.1 African Perspective (PRIMARY)

The African perspective on strategic autonomy begins from a historical sociology of power rather than from a static map of alliances. It treats agency as a practice exercised under constraint, not as the absence of constraint. This is the first contribution that the other four perspectives systematically understate: African states and societies are not merely arenas in which external powers compete; they are actors with their own strategic grammars, shaped by colonial partition, the Cold War's proxy wars, structural adjustment, and the contemporary scramble for minerals, markets, and military access. Rodney's analysis of how Africa's underdevelopment was historically produced, Nkrumah's warning against neo-colonialism, and Cabral's insistence that liberation requires both political and economic transformation all frame autonomy as a long-duration struggle rather than a diplomatic posture. From this vantage, multi-alignment is not opportunism or incoherence; it is a rational response to an international order in which no single partner can be trusted to deliver security, capital, and market access simultaneously. The African perspective therefore reconstructs non-alignment and hedging as forms of statecraft that preserve optionality.

This perspective also insists that sovereignty is relational and unevenly distributed within states. Bayart's notion of extraversion captures how African elites have historically used external connections to consolidate domestic power, while Mamdani's distinction between citizen and subject reminds us that the postcolonial state inherited authoritarian forms that complicate any simple equation of state agency with popular sovereignty. Mbembe's work on the postcolony and necropolitics adds that power operates through the management of life and death, especially in zones of extraction and conflict. Grovogui's critique of international law's civilizing mission shows how legal and normative frameworks that present themselves as universal often encode hierarchical assumptions about who is capable of self-rule. Taken together, these scholars suggest that strategic autonomy must be evaluated not only by whether a state can choose among Washington, Beijing, Moscow, Brussels, or Gulf capitals, but by whether its choices expand or contract the political and economic space available to its own citizens.

The regional hegemons illustrate this complexity. Nigeria, South Africa, and Ethiopia each possess different resources and face different vulnerabilities, and the African perspective resists treating them as interchangeable "regional powers." Nigeria's demographic weight, hydrocarbon revenues, and ECOWAS leadership give it diplomatic centrality, but its internal insecurity, fiscal dependence on oil, and uneven state capacity constrain its ability to convert size into sustained influence. South Africa's industrial base, financial sector, and constitutional democracy make it a normative and economic anchor, yet its growth stagnation, inequality, and energy crises limit the credibility of its leadership. Ethiopia's demographic scale and strategic location have made it a pivotal Horn of Africa actor, but recent conflict and humanitarian catastrophe demonstrate how quickly internal fragility can erode external autonomy. The African perspective sees hegemony not as a status to be celebrated but as a burden: regional leadership can amplify collective bargaining in the AU or AfCFTA negotiations, yet it can also reproduce hierarchy, justify intervention, and mask domestic legitimacy deficits. Aning and Danso's work on African security governance is useful here because it highlights how regional organizations are simultaneously instruments of self-determination and arenas in which stronger states project power.

AfCFTA is central to this perspective because it reframes economic sovereignty as a collective project rather than a purely national one. The logic is straightforward: a larger internal market reduces dependence on ex-

ternal demand, increases bargaining power in trade negotiations, and creates incentives for industrialization and value addition. AU Agenda 2063's emphasis on continental integration provides the normative backdrop. Yet the African perspective is not triumphalist. It recognizes that tariff schedules, rules of origin, and non-tariff barriers are technical instruments whose effectiveness depends on state capacity, infrastructure, and political will. It also recognizes that integration can reproduce inequalities: larger economies may capture disproportionate gains, while smaller or landlocked states may face adjustment costs. The perspective therefore treats AfCFTA as a necessary but insufficient condition for autonomy. Without complementary investments in energy, transport, digital infrastructure, and industrial policy, the agreement risks becoming a legal framework that ratifies existing patterns of extraversion rather than transforming them.

Multi-alignment, in this view, is not a moral failure to choose sides but a strategic grammar of survival and advancement. African governments have learned from the Cold War that exclusive alignment can convert domestic politics into proxy battlegrounds, and from structural adjustment that dependence on a single creditor or market can foreclose policy space. Playing suitors against one another can yield infrastructure finance, diplomatic support, technology transfer, and market access. It can also create room for maneuver in multilateral forums, as seen when African states coordinate positions in the UN General Assembly or AU. The African perspective does not deny that this strategy has costs: overlapping commitments can produce incoherence, external partners may retaliate, and domestic institutions may be overwhelmed by competing demands. But it insists that the alternative—automatic alignment with any single power—has historically delivered less autonomy, not more. The key question is not whether African states should align, but on what terms, with what safeguards, and with what domestic accountability.

Resource sovereignty sharpens the argument. The DRC-Zambia battery initiative and debates over Indonesia-style export bans are not merely industrial policy experiments; they are attempts to renegotiate the terms of extraction in a global economy that has long rewarded raw-material export and penalized value addition. The African perspective sees mineral wealth as both opportunity and trap. Without processing capacity, skills, energy, and infrastructure, export bans can reduce revenues without generating industrialization. With them, they can begin to shift rents from extraction to manufacturing and create fiscal space for public investment. The terms of extraction—taxation, local content, environmental standards, community consent, and transparency—are therefore central to autonomy. This perspective also warns against a new form of resource nationalism that benefits elites while displacing communities, a concern that connects to Tamale's and Oyěwùmí's insistence that gendered and local dimensions of power must be included in any serious account of sovereignty. Women's informal cross-border trade, land rights, and participation in extractive economies are not peripheral to strategic autonomy; they are constitutive of it.

The limits of agency are not denied; they are theorized. Structural constraints—debt burdens, commodity price volatility, climate vulnerability, illicit financial flows, and security dependencies—narrow the space for autonomous choice. Weak state capacity means that even well-designed policies may fail in implementation. Dependence on external finance, whether through aid, loans, or private capital, can reintroduce conditionality through the back door. The African perspective's distinctive contribution is to locate these limits historically and relationally rather than morally. It asks how colonial infrastructures, Cold War interventions, and contemporary financial architectures produced the very constraints that are now invoked to justify continued external guidance. It also asks who benefits from narratives of African incapacity. At the same time, this perspective must avoid romanticizing resistance. Not every act of non-alignment is emancipatory; some elite bargains use anti-Western or anti-colonial rhetoric to deflect accountability. The strongest version of the African perspective therefore combines a defense of agency with a critical examination of how that agency is exercised, by whom, and for whose benefit.

What this perspective contributes that the other four cannot is a historically grounded, internally differentiated account of power that treats autonomy as a contested political project rather than a diplomatic label. It reveals that strategic autonomy is not simply the freedom to choose among external partners, but the capacity to transform the structures that make some choices costly and others impossible. Adebajo (2016) and Alden (2019) illustrate, from different angles, how African states navigate great-power competition without reducing that navigation to either submission or heroic resistance. The perspective's occlusions are also real: it can overstate the coherence of "Africa" as a political subject, underplay the diversity of interests among states, classes, genders, and generations, and under-theorize the role of non-state actors such as firms, civil society, diaspora networks, and armed groups. It may also insufficiently address the ways in which African states themselves generate constraints through corruption, repression, or policy incoherence. Yet its central insight remains indispensable: strategic autonomy is not a gift from external partners but a contested political project, and its evaluation requires attention to history, structure, and the distribution of power within as well as between states.

2.7.2 Chinese Perspective

China's perspective on African agency is shaped by its own historical experience of semi-colonialism, its development trajectory, and its contemporary ambition to reshape global governance. It frames the relationship through partnership, mutual benefit, and non-interference, often invoking South-South solidarity. From Beijing's vantage, African strategic autonomy is not a threat but a precondition for a more multipolar and legitimate international order. A stronger Africa reduces unipolar dependence and creates markets, resources, and diplomatic partners for China. This perspective therefore supports, at least rhetorically, African multialignment and regional integration, including AfCFTA, because a larger and more integrated African market aligns with Chinese commercial interests and with the narrative of collective development.

The Chinese contribution is substantial in material terms: infrastructure finance, trade expansion, technology transfer, and diplomatic backing in multilateral forums. The FOCAC process and Belt and Road Initiative have made China a central development partner, often filling gaps left by Western donors and private investors. China's model emphasizes state-led development, infrastructure, and non-conditionality, which many African governments find attractive because it preserves formal policy space. Alden's analysis of China-Africa relations highlights how Beijing's engagement has shifted from resource extraction toward a broader portfolio of trade, finance, and security cooperation, though asymmetries remain. China also presents itself as a champion of sovereignty: it generally avoids public criticism of domestic governance and frames its engagement as respect for African choices.

Yet the Chinese perspective occludes several tensions. Its emphasis on non-interference can shield authoritarian practices and weaken accountability, especially where Chinese finance supports projects with limited transparency. Debt sustainability concerns, labor standards, and environmental impacts are often treated as bilateral technical matters rather than structural issues. The "win-win" framing can obscure bargaining asymmetries: African states may lack the technical capacity to negotiate complex contracts, and Chinese firms may benefit from state-backed financing and long-term supply arrangements. In resource sectors, China's demand for minerals can reinforce extractive patterns even when accompanied by infrastructure investment. The perspective also tends to personalize diplomacy around state elites, sometimes underestimating the importance of civil society, parliaments, and local communities in determining whether partnerships are legitimate.

On resource sovereignty, China's position is pragmatic. It generally accepts state ownership and regulatory authority but seeks secure, long-term supply and competitive access. Export bans and local-processing re-

quirements are viewed as negotiable constraints rather than existential threats, provided Chinese firms can participate in downstream industries. This creates potential convergence with African value-addition goals, but also risks a new division of labor in which China controls technology and markets while Africa supplies processed inputs. The Chinese perspective is therefore best understood as supportive of African agency in form while seeking to shape its content through commercial and diplomatic leverage. It contributes capital and an alternative to Western conditionality, but its occlusions around transparency, debt, and elite capture require critical scrutiny.

2.7.3 Russian Perspective

Russia's perspective on African agency is filtered through its confrontation with the West and its pursuit of multipolarity. Moscow frames African states as sovereign actors entitled to choose their partners without Western interference, and it presents its own engagement as anti-colonial solidarity rather than great-power competition. This rhetorical stance resonates in contexts where Western conditionality is perceived as intrusive or hypocritical. Russia contributes security cooperation, arms sales, nuclear energy partnerships, grain and fertilizer diplomacy, and diplomatic support in multilateral forums. Its veto power in the UN Security Council and its willingness to challenge Western resolutions give African states additional leverage, particularly on issues such as sanctions or conflict classification.

The Russian perspective treats multi-alignment as legitimate and even necessary. It argues that African states should not be forced to choose between Russia and the West, and it criticizes Western pressure on states that maintain ties with Moscow. In this sense, Russia positions itself as a defender of sovereign choice. Its security partnerships in the Sahel and elsewhere are framed as responses to African requests and as alternatives to Western or UN missions that are seen as ineffective or neo-colonial. The perspective also draws on historical memory: Soviet support for anti-colonial movements and opposition to apartheid provide a reservoir of legitimacy, even though contemporary Russia is not the Soviet Union.

The occlusions are significant. Russia's economic footprint in Africa is comparatively limited, and its engagement is often concentrated in security, energy, and extractive sectors. The use of private military companies and opaque security arrangements raises questions about accountability, human rights, and state sovereignty. Sanctions and the war in Ukraine constrain Russia's capacity to deliver sustained economic benefits, making its partnerships more rhetorical than material in many cases. The anti-Western framing can also obscure Russia's own authoritarianism and its interest in accessing minerals, markets, and diplomatic support. On resource sovereignty, Russia may support state control when it serves its firms' access, but it is not a consistent advocate of African industrialization or value addition. Its perspective contributes a counterweight to Western dominance and validates sovereign choice, but it risks substituting one form of dependence for another, particularly in security domains where African states may lack oversight capacity.

2.7.4 Western Perspective

The Western perspective on African agency is rooted in a liberal internationalist framework that emphasizes governance, markets, human rights, and institutional capacity. It views strategic autonomy as desirable but often conditional on reforms that align with Western norms and economic models. Western governments and institutions contribute development finance, security assistance, technical expertise, and normative frameworks such as the SDGs, EITI, and various governance indicators. They also provide market access through trade preferences and investment. From this vantage, African multi-alignment is understandable but potentially problematic: hedging can dilute collective responses to aggression, undermine sanctions regimes, and create security risks when partners such as Russia or China gain influence in sensitive sectors.

The Western perspective's central mechanism is conditionality. Aid, loans, and market access are linked to governance standards, fiscal transparency, and human rights. The argument is that external support should build capacity and accountability, not merely sustain incumbent elites. This perspective also emphasizes the rules-based international order and sees African agency as most effective when exercised through multilateral institutions and legal frameworks. On AfCFTA, Western actors generally support integration but stress implementation, regulatory harmonization, and private-sector participation. On resource sovereignty, they may support value addition and local processing in principle while worrying about export bans, contract sanctity, and supply-chain security.

The occlusions are equally important. The Western perspective often underestimates the historical and structural constraints that limit African policy space, including debt, commodity dependence, and the legacy of colonial economic structures. It can individualize systemic problems by attributing underdevelopment primarily to domestic governance failures. Its frustration with non-alignment sometimes reflects impatience with the slow pace of change or with African refusal to adopt Western geopolitical priorities. Conditionality, while intended to build capacity, can undermine sovereignty and create resentment, particularly when standards are applied inconsistently. The perspective also tends to treat "the West" as a coherent actor, obscuring differences among the US, EU, UK, and other partners. Its strongest contribution is the insistence that agency without accountability can become elite self-enrichment; its weakest is the assumption that Western models are universally transferable.

2.7.5 UN Perspective

The UN perspective frames African agency within multilateralism, sustainable development, and international law. It emphasizes African voice in global governance, capacity-building, peace operations, and the SDGs. The UN contributes normative frameworks, technical assistance, humanitarian support, and forums for collective deliberation. It sees AfCFTA as aligned with SDG 8 and SDG 9, and it treats regional integration as a pathway to resilience and inclusive growth. On multi-alignment, the UN perspective is generally permissive as long as state conduct remains within the Charter framework; it values sovereignty but also stresses human rights, peace, and development as interdependent goals.

The UN's distinctive contribution is its claim to universality and its institutional capacity to convene diverse actors. It can amplify African positions on climate finance, debt relief, and Security Council reform, and it provides legitimacy to peace processes and development initiatives. The UN also supports resource governance through frameworks such as EITI and the SDGs, encouraging transparency and domestic resource mobilization. In this view, strategic autonomy is not opposed to multilateralism; rather, effective multilateralism requires stronger African capacity to shape agendas and implement commitments.

The occlusions stem from the UN's own structure and funding. Programs are often donor-driven, which can reproduce dependence and prioritize donor preferences over African-defined priorities. The state-centric framework may miss transnational constraints such as illicit financial flows, climate change, and cross-border insecurity. The emphasis on "good governance" can individualize structural problems, while peacekeeping mandates may stabilize situations without addressing root causes. The UN's reform agenda, including Security Council expansion, has been slow, limiting its credibility as a champion of African voice. Nevertheless, the UN perspective remains important because it provides a forum in which African agency can be articulated in universal terms and because it insists that autonomy and interdependence are not mutually exclusive.

2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Reframes strategic autonomy as relational agency: African states can choose, sequence, and bargain among partners rather than accept a single patron. It foregrounds sovereignty, African-defined priorities, and the possibility of converting great-power competition into development gains.	It can understate internal constraints—weak state capacity, elite fragmentation, corruption, and uneven regional power—that make "agency" unevenly distributed within and across African states.	Strategic autonomy, equitable partnership, and African voice in global governance.	AU Agenda 2063; AfCFTA documentation; Nigeria's and South Africa's diplomatic balancing across US, China, Russia, and Gulf partners.	Western/UN: autonomy without capacity can become fragmented dependence; non-alignment can shield governments from accountability.

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Chinese	Provides infrastructure finance, market access, and a non-interference framing that many African governments find attractive; treats development through connectivity as a legitimate path to sovereignty.	Obscures debt exposure, asymmetry in bargaining power, local labor and environmental costs, and the possibility that state-to-state deals bypass African publics.	Partnership, mutual benefit, sovereignty, and development through connectivity.	Belt and Road-linked rail, port, and energy projects; expanding China-Africa trade.	African: partnership can become extractive if terms are opaque; Western: lacks transparency and conditionality.
Russian	Offers anti-Western solidarity, security cooperation, and rhetorical support for sovereign choice; exploits grievances about double standards and unipolar dominance.	Its economic footprint is comparatively small; its engagement often prioritizes geopolitical disruption, diplomatic support, or security rents over broad-based African development.	Multipolarity, sovereign choice, and anti-hegemony.	UN voting alignments; arms, security, and energy engagements with selected African states.	Western/UN: undermines norms and can empower authoritarian or coercive actors; African: rhetoric is not matched by development finance.

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Western	Promotes conditionality, governance norms, aid, trade preferences, and security frameworks; insists that autonomy must be compatible with accountability and rules-based order.	Can treat non-alignment as defection, underestimate historical asymmetry, and individualize structural problems through "good governance" discourse.	Liberal internationalism, accountability, human rights, and rules-based order.	Aid programs, sanctions regimes, trade preferences, and security assistance.	African/Russian: conditionality infringes sovereignty; Chinese: hypocrisy given Western historical extraction.
UN	Provides a multilateral forum, universal norms, peacekeeping, development frameworks, and a language in which African agency can be articulated globally.	State-centric and often donor-driven; may stabilize situations without addressing root causes; reform of global governance, including Security Council expansion, has been slow.	Multilateralism, interdependence, human security, and African voice in global governance.	UNGA resolutions; AU-UN cooperation; peacekeeping and development programs.	African: reform is too slow to match multipolarity; Western: too accommodating to sovereignty claims.

2.8 WORKED EXAMPLE (I do)

Case: Nigeria's multi-alignment strategy across the United States, China, Russia, and Gulf partners. Nigeria is Africa's most populous state and one of its largest economies, with a federal structure, an oil-dependent revenue base, severe internal security pressures, and a long-standing claim to regional leadership in West Africa. Its foreign policy has not been a choice between Washington and Beijing, or between the West and an anti-Western bloc, but a portfolio strategy: simultaneous engagement with multiple external powers in order to secure security assistance, infrastructure finance, market access, diplomatic room, and domestic political resources. The puzzle is how a regional hegemon with significant assets but uneven capacity can

navigate external pressure without becoming a client of any single power.

Levels of analysis

Individual. Leadership matters, but it is not sovereign. Successive Nigerian administrations have weighted partners differently: some have emphasized security cooperation and counterterrorism with the United States; others have prioritized infrastructure and commercial ties with China; still others have sought Gulf capital, energy partnerships, or selective diplomatic engagement with Russia. Individual presidents, foreign ministers, and senior officials shape the tone and sequencing of these relationships, and personal networks can accelerate deals or create policy incoherence. Yet individual choice is constrained by bureaucratic capacity, fiscal stress, elite bargains, and the need to manage domestic constituencies. A president may announce a strategic pivot, but implementation depends on ministries, state governments, security agencies, and commercial actors whose interests are not identical. The individual level therefore explains variation in emphasis and rhetoric, but not the deeper continuity of multi-alignment.

State. At the state level, Nigeria's multi-alignment reflects the structure of its needs. No single external partner can simultaneously provide counterterrorism support, infrastructure finance, refined petroleum capacity, agricultural investment, diplomatic backing in regional crises, and macroeconomic stabilization. The Nigerian state faces Boko Haram and Islamic State West Africa Province in the northeast, banditry and kidnapping in the northwest, separatist pressures in the southeast, and recurrent fiscal and foreign-exchange stress. Its regional hegemon role in ECOWAS also creates obligations, as seen in its responses to coups and constitutional crises in West Africa. Multi-alignment is thus a state-level adaptation to a mismatch between domestic demands and the limited supply of any one patron. It also reflects the federal and commercial character of the state: foreign policy is not only a diplomatic project but a channel for contracts, credit, and elite access.

Systemic. The international system has shifted from post-Cold War unipolarity toward sharper great-power competition, and Nigeria operates inside that transition. During the unipolar moment, the United States could more easily set terms for security cooperation and governance reform. China's rise created an alternative source of finance and infrastructure, often with fewer political conditions. Russia's invasion of Ukraine intensified pressure on African states to take sides, while Gulf states expanded their diplomatic and investment footprints. Nigeria's size, population, energy resources, and regional weight make it a prize in this competition. Systemically, its non-exclusive posture is tolerated because partners fear that excessive pressure will push Abuja toward rivals. Multi-alignment is therefore not merely a national preference; it is enabled by a multipolarizing system in which external powers compete for access and Nigeria can exploit that competition.

Transnational. Nigeria's foreign policy is also shaped by forces that cross borders. Oil and gas production involves multinational firms, global price cycles, and international shipping and refining networks. Infrastructure projects depend on foreign contractors, imported equipment, and external credit. The Nigerian diaspora sends remittances, influences domestic politics, and connects Abuja to Western capitals. Illicit financial flows, capital flight, and informal trade networks weaken state control over resources. Regional migration, cross-border insecurity, and ECOWAS market integration tie Nigeria to neighbors whose crises become Nigerian problems. These transnational structures mean that autonomy is never purely diplomatic: it is constrained by who owns assets, who finances projects, who moves capital, and who controls information.

Mechanism. The core mechanism is competitive courtship, or portfolio diplomacy. Nigeria maintains credible relationships with several external powers so that each suitor believes it must offer better terms to avoid

losing influence to the others. The mechanism works through three channels. First, diversification reduces vulnerability: if Washington conditions security assistance on governance reforms, Abuja can seek alternative training, equipment, or diplomatic cover elsewhere; if Beijing's lending terms tighten, Gulf or Western finance may become more attractive. Second, competitive courtship generates concessions: infrastructure packages, refinery investments, security cooperation, and diplomatic support become bargaining chips in a market for access. Third, it preserves decision-making space by preventing any single partner from acquiring a veto over Nigerian policy. The mechanism is conditional, however. It requires assets that external powers value—market size, energy resources, regional leadership, and UN or regional votes. It also requires enough domestic coherence to implement agreements; otherwise, partners discount Nigerian commitments and withhold their best offers. The risk is that multi-alignment becomes not strategic autonomy but fragmented dependence: many small dependencies rather than one large one, with debt, contract opacity, and elite capture replacing overt clientelism.

Perspective reconstruction

African (primary, longest). From an African vantage, Nigeria's multi-alignment is best understood as an exercise of agency within structural constraint. African scholarship and diplomacy have long rejected the idea that sovereignty requires isolation; instead, sovereignty is the capacity to choose partners, sequence engagements, and define the terms of cooperation. Nigeria's size and regional role allow it to resist binary choices imposed by great powers and to convert geopolitical competition into development gains. This reflects a broader African tradition of non-alignment updated for a multipolar era, in which the goal is not neutrality but strategic flexibility. Yet the African perspective also insists that agency is uneven and politically contested. Adebajo's work on African agency and Alden's analysis of China-Africa relations caution that external partnerships can reproduce dependence when state capacity is weak or elite bargains dominate. AU Agenda 2063 frames autonomy as part of a long-term project of self-reliance, not as a slogan for diplomatic hedging. Thus, Nigeria's strategy is promising but contingent: it is autonomy only if it strengthens domestic capacity, regional integration, and accountability rather than merely multiplying external patrons.

Chinese. China is likely to view Nigeria's multi-alignment as normal and acceptable so long as economic ties deepen and project continuity is preserved. Beijing's framing emphasizes mutual benefit, infrastructure, and non-interference; it does not require exclusive alignment and may see Nigeria's engagement with the United States or Gulf states as compatible with Chinese commercial interests. The Chinese perspective contributes a materialist account of why Nigeria courts Beijing: rail, ports, power, and trade matter. Its occlusion is to treat state-to-state deals as sufficient evidence of partnership, downplaying debt exposure, local costs, and the possibility that Nigerian publics do not experience these projects as mutually beneficial.

Russian. Russia is likely to frame Nigeria's refusal to join an anti-Russian bloc as sovereign choice and evidence of a multipolar world. Moscow can offer rhetorical support, security cooperation, and energy or mining interests, and it may seek Nigerian diplomatic backing in multilateral forums. The Russian perspective explains why anti-Western language resonates in parts of Africa, including Nigeria, especially where Western conditionality is seen as hypocritical. Its occlusion is that Russia's economic footprint in Nigeria is comparatively limited, and its engagement may prioritize geopolitical positioning over Nigerian development. It risks overstating shared interests and understating the asymmetry between Moscow's global ambitions and Abuja's domestic needs.

Western. The United States and European partners are likely to see Nigeria as indispensable but frustrating. They contribute security assistance, governance programs, trade preferences, and diplomatic support, and they expect cooperation on terrorism, maritime security, human rights, and great-power competition.

From this perspective, multi-alignment can look like hedging that weakens collective action, especially when Nigeria does not align with Western positions on Russia or China. The Western perspective contributes an accountability lens: autonomy should not become a shield for corruption or repression. Its occlusion is to misread non-alignment as defection rather than as a rational strategy by a state with multiple needs, and to underestimate how Western conditionality can push Nigeria toward alternative partners.

UN. The UN perspective is likely to treat Nigeria's multi-alignment as compatible with the Charter if it remains peaceful and respects sovereignty. It emphasizes multilateralism, development, African voice, and the idea that autonomy and interdependence are not mutually exclusive. The UN contributes a normative framework in which Nigeria can pursue diverse partnerships while remaining embedded in global institutions. Its occlusion is state-centrism: it may miss transnational constraints such as illicit financial flows, private capital, and cross-border insecurity, and its reform agenda has been too slow to give African states the institutional voice that multipolarity demands.

Explicit adjudication. The African perspective best explains Nigeria's multi-alignment because it captures the strategic logic of agency: Nigeria is not passive, not neutral, and not merely a battleground, but an actor seeking to convert external competition into domestic and regional gains. It also correctly identifies the normative stakes: autonomy is about capacity and choice, not isolation. However, the African perspective can overstate coherence if it treats "Nigeria" as a unitary actor with a unified interest. The state, systemic, and transnational levels show that multi-alignment is also driven by fiscal stress, security fragmentation, elite incentives, and external market structures. The Chinese perspective best explains the material incentives behind engagement with Beijing, but it understates asymmetry. The Russian perspective explains rhetorical anti-Westernism but not the economic core of the strategy. The Western perspective explains frustration and conditionality but misreads non-alignment as defection. The UN perspective supplies the normative vocabulary but not the power-political mechanism. The strongest overall explanation is therefore African agency operating under systemic and transnational constraint: Nigeria's multi-alignment is rational and often effective, but its success depends on state capacity, domestic accountability, and the ability to turn diplomatic access into developmental outcomes. Without those conditions, the strategy risks becoming a portfolio of dependencies rather than a project of autonomy.

SECTION 2.9 PROBLEM PAIR (We do)

Tasks

1. Identify the levels of analysis at which South Africa's abstention on the March 2022 UNGA resolution condemning Russia's invasion of Ukraine can be explained, and state which level you think carries the greatest explanatory weight.
2. Reconstruct the African perspective: how does Pretoria's position draw on anti-colonial solidarity, the Non-Aligned Movement legacy, and BRICS membership, and what does this perspective reveal that a purely Western framing misses?
3. Explain the mechanism by which abstention functions as a strategic signal rather than mere neutrality: what audience is it signaling to, and what cost is it absorbing?
4. Compare South Africa's Russia-Ukraine balancing with its December 2023 ICJ genocide case against Israel: what changed in the strategic calculus, and what remained constant?

5. Steel-man the strongest Western counterargument—that South Africa's non-alignment is incoherent or morally compromised—and then answer it.
6. Evaluate the limits of agency: which structural constraints (energy, fiscal, trade, institutional) most tightly bound Pretoria's room for maneuver between 2022 and 2025?

MODEL ANSWER

South Africa's abstention on the March 2022 UNGA resolution condemning Russia's invasion of Ukraine is best explained at the intersection of the state and systemic levels, with the transnational level supplying the normative vocabulary. At the state level, the ANC's historical memory of Soviet support during the anti-apartheid struggle created a durable elite affinity that outlived the Cold War; this is not merely sentiment but a structured relationship embedded in party networks and diplomatic habit. At the systemic level, Pretoria's abstention registered a refusal to be conscripted into a binary great-power alignment at a moment when the unipolar order was visibly fraying. The transnational level supplied the language: non-alignment, sovereignty, and anti-colonial solidarity. The individual level—President Ramaphosa's personal diplomacy—mattered at the margin, particularly in the June 2023 African peace mission, but it operated within constraints set by party and system. The greatest explanatory weight belongs to the state level, because without the ANC's historical relationship with Moscow the systemic incentive to hedge would not have produced abstention specifically on Russia's behalf; a different governing party might have voted differently while still hedging.

The African perspective reconstructs this position from within as an exercise in strategic autonomy rather than moral indifference. From Pretoria's vantage, the war is a European security crisis whose framing as a universal moral emergency serves Western interests; the demand that African states choose sides reproduces the very paternalism that non-alignment was designed to resist. BRICS membership is not an ideological commitment to Moscow but a platform for diversifying partnerships and amplifying African voice in global governance. What this perspective reveals is that abstention is a positive strategy—preserving optionality, protecting energy and trade relationships, and asserting sovereign judgment—rather than an absence of position. What it occludes is the cost to Ukraine of great-power aggression and the risk that non-alignment, however principled, can be read by aggressors as license.

The mechanism by which abstention functions as a strategic signal operates through audience differentiation. The primary audience is domestic and continental: the ANC base and African peers, for whom principled non-alignment is a marker of sovereign dignity. The secondary audience is Moscow, to whom abstention signals that South Africa will not join sanctions coalitions. The tertiary audience is Washington and Brussels, to whom it signals that conditionality has limits. The cost absorbed is reputational: Western governments read abstention as alignment with Russia, and Pretoria pays in strained diplomatic capital, delayed trade negotiations, and heightened scrutiny of its financial system. The signal is thus costly, which is precisely what makes it credible.

The December 2023 ICJ genocide case against Israel marks both continuity and change. Continuity lies in the underlying principle: South Africa again refused to defer to Western framing of a conflict and asserted an independent legal-moral judgment rooted in anti-colonial solidarity—this time with Palestinians. Change lies in the strategic calculus: whereas abstention on Ukraine was defensive and preservative, the ICJ case was offensive and normative, deploying international law as a weapon rather than merely withholding endorsement. Pretoria could afford the latter because the domestic and continental audiences rewarded it, because the legal venue insulated it from direct economic retaliation, and because the case aligned with a

broad Global South coalition. What remained constant was the core commitment to sovereign judgment over alignment.

The strongest Western counterargument holds that South Africa's non-alignment is incoherent: it abstains on Russian aggression while prosecuting Israeli aggression, revealing not principle but opportunism, and that by refusing to condemn Moscow it undermines the very international legal order it invokes at The Hague. This argument has force but overstates its case. Incoherence would require that the two positions share no common principle; they do—opposition to great-power impunity and solidarity with the colonized. The apparent asymmetry reflects different strategic contexts, not different values: Russia is a BRICS partner with whom Pretoria has historical ties; Israel is a Western ally whose conduct Pretoria has long criticized. The counterargument also underestimates the constraint: a middle-income state with high unemployment and an energy crisis cannot afford the economic rupture that full alignment with either side would require. Non-alignment is not costless, but it is not incoherent.

The limits of agency were severe and structural. The energy crisis—persistent load shedding—made South Africa dependent on imported fuels and vulnerable to any disruption in trade finance. Fiscal constraints, including a debt-to-GDP ratio near 75 percent and a narrow tax base, limited the state's capacity to absorb sanctions or retaliation. Trade exposure to the EU, the US, and China meant that any decisive alignment would have imposed immediate economic costs that the state could not absorb. Institutional capacity constraints—corruption, state-owned enterprise dysfunction, and a fragmented security apparatus—further narrowed the space for bold initiative. The ICJ case was feasible precisely because it operated in a legal register that did not require economic rupture. Agency, in this case, was real but heavily bounded: Pretoria could choose its posture, but not its constraints.

SECTION 2.10 INDEPENDENT MEMO (You do)

(a) Case description

In January 2024, Ethiopia formally joined BRICS, becoming one of the bloc's first African expansions beyond South Africa. The move followed the November 2022 Pretoria Agreement that ended the Tigray war, a conflict that had strained Addis Ababa's relations with Western donors and multilateral lenders. Ethiopia's accession came alongside its pursuit of a memorandum of understanding with Somaliland for Red Sea port access, which triggered a diplomatic crisis with Somalia and drew in Turkey and Egypt. Meanwhile, Ethiopia remained heavily indebted to Chinese creditors, dependent on IMF program negotiations, and reliant on Gulf states for budget support. The case asks how a post-conflict, landlocked regional hegemon with weak state capacity and multiple external dependencies can convert BRICS membership into genuine strategic autonomy rather than merely adding another patron.

(b) Required memo headings (prompts)

- **Mechanism:** Identify the causal mechanism linking Ethiopia's BRICS accession to a change (or non-change) in its strategic autonomy. Specify the level(s) of analysis, the intervening variables, and the scope conditions under which the mechanism would operate.
- **Perspective reconstruction:** Reconstruct how each of the five perspectives (African, Chinese, Russian, Western, UN) would interpret Ethiopia's BRICS accession and Red Sea port pursuit. Steel-man each; note what each occludes.
- **Historical analogue:** Identify one historical case of a post-conflict African state attempting to convert

multilateral membership into strategic autonomy. State the analogy's limits.

- **Falsifiers:** List three observable developments that would falsify your central claim about whether Ethiopia's BRICS accession increases its strategic autonomy.

(c) Self-check

Before submitting, verify that you have distinguished description (what happened), explanation (why it happened), prediction (what will happen next), and prescription (what should be done), and that no single paragraph conflates two of these.

SECTION 2.11 HINGE QUESTION

Question: South Africa's abstention on UNGA resolutions condemning Russia's 2022 invasion of Ukraine is best explained by which of the following?

A. A purely ideological commitment to Russia rooted in ANC-Soviet solidarity, with no strategic calculation.

B. A rational multi-alignment strategy preserving optionality across great-power blocs, constrained by energy, fiscal, and trade dependencies.

C. Western diplomatic pressure that inadvertently pushed Pretoria toward Moscow.

D. A legal obligation under the Non-Aligned Movement charter to abstain on great-power conflicts.

Correct answer: B.

Distractor diagnoses:

- **A** overstates ideology and understates strategy: ANC-Soviet historical affinity is real and structures elite preferences, but it does not by itself explain the specific choice of abstention, which also served systemic hedging and domestic legitimation. This option confuses elite affinity with determinism and ignores the cost-absorbing signal mechanism.
- **C** reverses causality: Western pressure was largely a response to Pretoria's abstention, not its cause. It also overstates Western leverage, given South Africa's demonstrated willingness to absorb reputational costs. The mechanism runs from sovereign choice to Western reaction, not the reverse.
- **D** invents a legal obligation: the Non-Aligned Movement has no binding charter requiring abstention on great-power conflicts. This option confuses a normative tradition with a legal duty and misidentifies the source of Pretoria's position, which is political-strategic rather than juridical.

SECTION 2A — DATA LAB

Table 1 — Nigeria: trade and FDI partners, selected years (approximate shares of total merchandise trade; FDI stock ranking)

Partner	Share of total trade, 2005 (%)	Share of total trade, 2015 (%)	Share of total trade, 2024 (%)	FDI stock rank, 2024	Principal flow
China	6	18	24	2	Imports of manufactures; infrastructure finance
European Union (aggregate)	34	26	19	1	Oil exports; manufactures imports
United States	16	9	6	3	Oil exports; security cooperation
India	4	9	11	5	Oil exports; pharmaceuti-cals
United Kingdom	9	5	4	4	Financial services; legacy FDI
Intra-African (ECOWAS + AU)	11	9	8	6	Informal cross-border trade; re-exports
Gulf states (UAE, Saudi Arabia)	2	4	6	7	Oil-market diplomacy; sovereign investment
Other	18	20	22	—	Residual

Note: figures are illustrative approximations compiled from trade-statistics conventions and secondary reporting; they are intended for analytical training, not for citation as official data. Source lineage: Adebajo (2016) on Nigeria's external bargaining; Alden (2019) on China–Africa economic relations.

Table 2 — South Africa: trade and FDI partners, selected years (approximate shares of total merchandise trade; FDI stock ranking)

Partner	Share of total trade, 2005 (%)	Share of total trade, 2015 (%)	Share of total trade, 2024 (%)	FDI stock rank, 2024	Principal flow
China	7	15	21	3	Manufactures imports; minerals exports
European Union (aggregate)	33	27	24	1	Manufactures; automotive; wine

Partner	Share of total trade, 2005 (%)	Share of total trade, 2015 (%)	Share of total trade, 2024 (%)	FDI stock rank, 2024	Principal flow
United States	10	8	7	4	AGOA exports; investment
Intra-African (SADC + AU)	14	16	19	2	Regional value chains; re-exports
India	4	5	6	6	Pharmaceuticals; minerals
United Kingdom	8	6	5	5	Financial services; mining FDI
Russia	1	1	2	8	Fertilizer; arms legacy; limited trade
Other	23	22	16	—	Residual

Note: illustrative approximations. South Africa's intra-African share is structurally higher than Nigeria's because of SADC integration and the SACU customs union. Source lineage: Tshabalala and Ndzendze (2022) on South Africa's foreign-policy positioning; AU Agenda 2063 on continental integration.

Table 3 — AfCFTA tariff liberalization categories and the DRC–Zambia battery value-chain initiative

Instrument / Milestone	Category / Status	Content	Implication for sovereignty
AfCFTA Category A	90% of tariff lines	Liberalized over 5 years (developed) / 10 years (LDCs)	Expands intra-African market access; exposes infant industry
AfCFTA Category B	7% of tariff lines	Sensitive products; longer phase-down (10/13 years)	Protects politically sensitive sectors (e.g., autos, textiles)
AfCFTA Category C	3% of tariff lines	Excluded from liberalization	Preserves revenue and strategic sectors
AfCFTA Protocol on Women and Youth	Adopted 2023	Targets informal cross-border traders	Recognizes gendered structure of African trade
DRC–Zambia MOU (battery value chain)	Signed 2022 (COP27 context)	Joint special economic zone for battery precursors (cobalt, copper, lithium)	Moves from raw export to precursor processing
DRC cobalt export regime	Partial processing incentives; no full raw-export ban	Royalties and local-content rules	Weaker than Indonesia's nickel ban; revenue-first logic

Instrument / Milestone	Category / Status	Content	Implication for sovereignty
Indonesia nickel export ban (comparator)	Full raw-export ban since 2020	Forced domestic smelting; FDI inflow to processing	Demonstrates leverage of resource control; higher state capacity required

Note: AfCFTA tariff categories per AfCFTA documentation; DRC–Zambia milestones per reported MOU texts. Figures are structural, not quantitative trade flows.

Analysis Questions

1. **Trend.** Looking at Tables 1 and 2 together, describe the directional shift in Nigeria's and South Africa's top trade partners between 2005 and 2024. What does the simultaneous rise of China and the relative decline of the EU and US imply about the geography of African economic dependence, and does the data support the claim that Africa has "decoupled" from Western markets?

2. **Level of analysis.** Using the four levels from Lesson 1 (individual, state, systemic, transnational), explain why Nigeria's multi-alignment (rising China share, persistent EU/US ties, Gulf engagement) is best analyzed at the *state* and *systemic* levels rather than the *individual* or *transnational* levels. What would an analysis at the transnational level add that the state level misses?

3. **Perspective reconstruction (all five).** Reconstruct how each of the five perspectives would read Table 1 and Table 3:

    - *African:* agency, sovereignty, and the politics of strategic autonomy;
    - *Chinese:* partnership plus relational framing;
    - *Russian:* sovereign choice plus anti-Western rhetoric;
    - *Western:* conditionality plus frustration with non-alignment;
    - *UN:* multilateralism and African voice in global governance. Which perspective best explains the DRC–Zambia battery initiative, and which best explains the persistence of raw cobalt exports?

4. **Interpretation.** Table 3 shows AfCFTA Category A covering 90% of tariff lines but with a 5/10-year phase-down, and Category C excluding 3%. Does this structure imply that AfCFTA is primarily a *liberalization* project or a *sovereignty* project? Use the mechanism of "policy space preservation" to adjudicate, and connect to the DRC–Zambia battery initiative.

5. **Limitation.** What do these tables *not* show? Identify at least three gaps (e.g., informal trade, services, debt, illicit financial flows, intra-firm pricing, environmental externalities) and explain how each gap would change the conclusion about African agency drawn from the tables alone.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — "Multi-Alignment Compass" (Nigeria at the center)

What to draw: A large circle in the center labeled "NIGERIA (regional hegemon, 220m population, oil + gas + market size)". Draw four thick arrows radiating outward to four labeled boxes arranged like compass points: NORTH = "UNITED STATES (security, AGOA, dollar finance)"; EAST = "CHINA (infrastructure, trade, FDI, BRI)"; SOUTH = "GULF STATES (oil-market diplomacy, sovereign wealth, Islamic finance)"; WEST = "RUSSIA (arms, nuclear, anti-Western solidarity)". Add a fifth smaller arrow pointing inward from "EU" labeled "legacy trade + conditionality". Inside the central circle, draw a smaller inner circle labeled "Domestic constraints: FX shortage, fuel subsidy, insecurity, elections".

Labels to place: On each arrow, write the *exchange*: what Nigeria gives (oil, votes, market access, diplomatic cover) and what it receives (finance, arms, infrastructure, market access). Label the arrows with "bargaining chip" tags.

Perspective overlay to annotate: Color-code the arrows: green = African agency (Nigeria plays suitors against each other); red = Western frustration (non-alignment read as hedging); blue = Chinese relational framing (win-win, no conditionality); black = Russian sovereign-choice rhetoric; grey = UN multilateralism (Nigeria as African voice in UNSC reform debates). Add a legend in the corner.

Visual 2 — "AfCFTA Tariff Phase-Down Staircase"

What to draw: A staircase with three steps rising left to right. Step 1 (lowest, widest) labeled "CATEGORY A — 90% of tariff lines — liberalized 5 yrs (developed) / 10 yrs (LDCs)". Step 2 labeled "CATEGORY B — 7% — sensitive products — 10/13 yrs". Step 3 (highest, narrowest) labeled "CATEGORY C — 3% — excluded". Above the staircase, draw a horizontal arrow labeled "Intra-African trade share: ~15% → target 25%+". Below the staircase, draw a dashed line labeled "Revenue loss risk for LDCs (tariff revenue = 30-50% of fiscal revenue in some states)". Add a side box labeled "Rules of origin: 40% value addition threshold" with a question mark.

Labels to place: On each step, list example sectors: A = manufactures, food; B = autos, textiles, sugar; C = arms, strategic minerals, revenue-critical goods. Label the vertical axis "Policy space preserved" and the horizontal axis "Time (years from ratification)".

Perspective overlay to annotate: Annotate with five small flags/icons: African = "sovereignty through scale"; Chinese = "market access for Chinese firms via African integration"; Russian = "anti-Western bloc-building"; Western = "conditionality via rules of origin and standards"; UN = "SDG 17 partnerships and Agenda 2063 alignment". Place these as marginal notes, not as the main structure.

Visual 3 — "Resource Sovereignty Ladder: From Raw Cobalt to Battery Pack"

What to draw: A vertical ladder with five rungs from bottom to top: Rung 1 "RAW ORE (DRC cobalt, 70% of global supply)"; Rung 2 "CONCENTRATE / INTERMEDIATE (exported to China for refining)"; Rung 3 "REFINED METAL / PRECURSOR (DRC-Zambia SEZ ambition)"; Rung 4 "CELL / MODULE (Indonesia-style processing FDI)"; Rung 5 "BATTERY PACK / EV (value capture, jobs, technology transfer)". Draw a thick arrow on the left labeled "Value added (% of final price)" rising from ~5% at Rung 1 to ~60% at Rung 5. Draw a second arrow on the right labeled "State capacity required" rising similarly. Add a horizontal bar across Rung 2 labeled "INDONESIA COMPARATOR: raw nickel export ban (2020) → forced climb to Rung 4".

Labels to place: At each rung, note who currently captures value: Rung 1 = mining firms + state royalties; Rung 2 = Chinese refiners; Rung 3-5 = aspirational (DRC-Zambia MOU, 2022). Label the gap between Rung 2 and Rung 3 "THE SOVEREIGNTY GAP".

Perspective overlay to annotate: African = "resource sovereignty and value-chain climbing"; Chinese = "partnership plus relational framing (processing FDI as mutual gain)"; Russian = "sovereign choice (anti-Western resource nationalism)"; Western = "conditionality (ESG, traceability, due diligence)"; UN = "just transition and Agenda 2063 industrialization". Place as a vertical sidebar with five colored bands.

SECTION 4 — CORNELL NOTES

Cue (Question / Prompt)	Notes (with source log)
What is "strategic autonomy" in the African context?	Not non-alignment as neutrality, but the capacity to choose among partners without coercion; Adebajo (2016) frames it as "African agency" in a multipolar order; distinct from Cold War non-alignment.
Who are the three regional hegemons and how do they differ?	Nigeria (demographic/market/oil, ECOWAS anchor), South Africa (industrial/financial, SADC/SACU anchor), Ethiopia (demographic, AU host, Horn anchor). Different resource bases → different strategies. Alden (2019).
What is multi-alignment and why is it rational?	Playing suitors against each other to extract concessions; Nigeria's simultaneous US/China/Russia/Gulf ties. Logic: no single patron dominates; maximize bargaining leverage. Tshabalala and Ndzendze (2022).
What does AfCFTA aim to achieve?	Continental free trade area; 90/7/3 tariff categories; rules of origin; protocols on women/youth. Potential: intra-African trade 15% → 25%+. Limits: infrastructure, non-tariff barriers, state capacity. AU Agenda 2063.
What is resource sovereignty and the DRC-Zambia initiative?	2022 MOU for battery precursor SEZ (cobalt, copper, lithium); aims to climb value chain from raw ore to precursors. Comparator: Indonesia nickel export ban (2020) forced domestic processing.
What are Indonesia-style export bans and why do they matter?	Full raw-export bans to force domestic smelting; require state capacity and FDI absorption. DRC has partial incentives only; "sovereignty gap" between Rung 2 and 3.
What limits African agency?	Structural constraints (debt, commodity dependence, weak manufacturing), weak state capacity, dependence on external finance, conditionality, illicit financial flows. Agency is bounded, not absent.

Cue (Question / Prompt)	Notes (with source log)
How does the African perspective differ from the Western one?	African: sovereignty, voice, non-conditionality, historical redress. Western: conditionality, governance standards, frustration with non-alignment. Both describe same behavior differently.
What is the Chinese perspective on African agency?	"Partnership" and relational framing (guanxi-style); no political conditionality; infrastructure-for-resources; "win-win"; occludes debt sustainability and local labor concerns. Alden (2019).
What is the Russian perspective?	Sovereign choice + anti-Western rhetoric; arms, nuclear, Wagner/Africa Corps; frames African non-alignment as anti-hegemonic; occludes mercenary economics and regime support.
What is the UN perspective?	Multilateralism, African voice in global governance (UNSC reform, SDGs, Agenda 2063); supports AfCFTA and integration; limited enforcement; occludes power asymmetries.
How should one adjudicate between perspectives?	Match mechanism to evidence; specify scope conditions; avoid conflating description with prescription; check falsifiers (e.g., if multi-alignment produces no concessions, rationality claim weakens).

Source log: Adebajo (2016); Alden (2019); Tshabalala and Ndzendze (2022); AU Agenda 2063; AfCFTA documentation; reported DRC–Zambia MOU texts; Indonesia nickel policy (public record).

Summary (3–5 sentences): African agency in a multipolar order is exercised through multi-alignment, regional hegemony, and projects like AfCFTA and the DRC–Zambia battery initiative, but it is structurally bounded by weak state capacity, commodity dependence, and external finance. The five perspectives reconstruct the same behavior through different normative lenses—sovereignty, partnership, sovereign choice, conditionality, and multilateralism—each illuminating and occluding different mechanisms. Adjudication requires matching mechanisms to evidence and specifying scope conditions rather than treating any single perspective as settled truth.

SECTION 5 — FEYNMAN COMPRESSION

1. **Explain without jargon.** African countries are not just pawns in a new Cold War. Big African states like Nigeria and South Africa deliberately play the US, China, Russia, and Gulf states against each other to get better deals. They also try to trade more with each other through AfCFTA and to process their own minerals instead of just exporting raw ore, as in the DRC–Zambia battery plan. But they are held back by debt, weak governments, and lack of factories and skills. So agency is real but limited.

2. **Mark gaps.** I am unsure how much multi-alignment actually delivers concessions versus just rhetoric; I conflated "sovereignty" with "capacity"; I did not specify the mechanism by which AfCFTA would raise intra-African trade beyond tariff cuts; I treated the DRC–Zambia MOU as progress without evidence of implementation; I did not distinguish description (what states do) from prescription (what they should do).
3. **Reread verification.** Re-reading Adebajo (2016) and Alden (2019) confirms that agency is framed as bargaining within constraint, not autonomy from structure; Tshabalala and Ndzendze (2022) show South Africa's balancing as cost-bearing, not costless; AfCFTA documentation confirms the 90/7/3 categories and the 5/10-year phase-down; the DRC–Zambia MOU is a 2022 commitment, not an operational plant. The gap between commitment and capacity is the key limit.
4. **Analogy with explicit limits.** Multi-alignment is like a shopper comparing prices at several stores: the shopper has real choice, but only if they have money, transport, and information. The analogy breaks down because states are not unitary shoppers—domestic factions, debt obligations, and security dependence constrain the "choice," and the "stores" (great powers) also shape the menu.
5. **Rewrite.** African strategic autonomy is a bounded, mechanism-driven practice: regional hegemons leverage multipolarity through multi-alignment; AfCFTA expands policy space through phased liberalization; resource-sovereignty projects like the DRC–Zambia battery initiative attempt value-chain climbing. Each is constrained by structural dependence, weak state capacity, and external finance. The five perspectives reconstruct these practices differently—African (sovereignty), Chinese (partnership), Russian (sovereign choice), Western (conditionality), UN (multilateralism)—and adjudication requires evidence on mechanisms, scope conditions, and falsifiers rather than normative assertion.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L32	Definition	What is "strategic autonomy" in the African IR context?	The capacity of an African state or the AU to set its own priorities, choose partners, and sequence reforms without external veto, while remaining embedded in global markets and institutions. It is not autarky; it is negotiated interdependence.	African perspective treats autonomy as relational and historically earned, not as isolation.

Tag	Card Type	Front	Back	Perspective Note
L32	Mechanism	How does multi-alignment differ from non-alignment?	Non-alignment (Cold War NAM) refused blocs; multi-alignment actively courts multiple suitors simultaneously to extract concessions, diversify risk, and avoid dependence on any single power.	African strategists frame multi-alignment as rational hedging, not ideological neutrality.
L32	Application	Name the three regional hegemons and their distinct resource bases.	Nigeria (hydrocarbons, demographic weight, ECOWAS leadership), South Africa (industrial base, financial depth, SADC/BRICS role), Ethiopia (demographic scale, AU host, Nile geopolitics). Each converts a different asset into regional influence.	African perspective stresses that hegemony is contested and resource-specific, not uniform.
L32	Comparison	What does AfCFTA promise and what limits it?	It promises a continental market, tariff reduction, and rules of origin to boost intra-African trade; limits include weak infrastructure, non-tariff barriers, uneven state capacity, and political will gaps.	African perspective sees AfCFTA as sovereignty project, not just trade liberalization.

Tag	Card Type	Front	Back	Perspective Note
L32	Source	What is Adebajo's (2016) core argument about African agency?	African states exercise agency through regional institutions and bargaining, but agency is constrained by external dependence and internal governance deficits.	African perspective: agency is real but bounded; not romanticized.
L32	Debate	What is the "limits of agency" thesis?	Structural constraints—debt, weak capacity, commodity dependence, external finance—mean African governments often cannot convert diplomatic autonomy into economic transformation.	African scholars (Bayart, Mamdani) insist on naming both agency and structure.
L32	Reconstruction	How does China frame its Africa engagement?	As partnership, mutual benefit, and relational development (FOCAC), emphasizing non-interference and infrastructure finance.	Chinese perspective occludes conditionality and debt-sustainability concerns.

Tag	Card Type	Front	Back	Perspective Note
L32	Occlusion	What does the Western perspective typically occlude about African non-alignment?	It often reads non-alignment as free-riding or hedging against Western interests, underestimating its roots in colonial experience and sovereign equality claims.	Western perspective privileges alliance loyalty over sovereign choice.
L32	Adjudication	How did South Africa balance Russia-Ukraine (2022-2025)?	Abstention at the UN, BRICS solidarity, then the ICJ genocide case against Israel—signaling autonomy from Western pressure while invoking international law.	African perspective: law as tool of the weak; Western reads inconsistency.
L32	Visual	What does the DRC-Zambia battery initiative illustrate?	An attempt to move up the value chain from raw cobalt/copper to battery precursors, using regional industrial policy to capture rents.	African perspective: resource sovereignty requires regional, not just national, scale.
L32	Mechanism	What is an Indonesia-style export ban and why does it matter?	A ban on raw mineral exports to force domestic processing; it raises state revenue and industrialization but risks investor flight and WTO disputes.	African perspective: sovereignty over terms of extraction, not just ownership.

Tag	Card Type	Front	Back	Perspective Note
L32	Source	What do Tshabalala and Ndzendze (2022) contribute?	They analyze South Africa's foreign policy choices and the tension between principled multilateralism and great-power pressure.	African perspective: documents the costs of autonomy.
L32	Comparison	How does Russia frame African sovereign choice?	As legitimate anti-Western self-determination, often paired with arms, grain, and Wagner/Africa Corps support.	Russian perspective occludes its own extractive and security interests.
L32	Debate	What is the UN perspective on African agency?	Multilateralism and African voice in global governance (e.g., Security Council reform, Agenda 2063 alignment) as the legitimate channel for autonomy.	UN perspective risks substituting procedural voice for material power.
L32	Application	What falsifies the claim that multi-alignment always increases African leverage?	Cases where suitors coordinate (e.g., joint IMF/World Bank conditionality) or where internal fragmentation lets external actors play factions against each other.	African perspective: agency is contingent on internal cohesion.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence Audit (score 0–100)

Competency	Score	Evidence of mastery
Define strategic autonomy and distinguish it from autarky		
Explain multi-alignment as rational strategy with mechanisms		
Compare the three regional hegemons' resource bases		
Assess AfCFTA's potential and limits		
Reconstruct all five perspectives on African agency		
Apply levels of analysis to Nigeria's multi-alignment		
Identify falsifiers for agency claims		
Use canonical sources (Adebajo, Alden, Tshabalala & Ndzendze) accurately		

7.2 Three-Question Debrief

1. Which perspective did you find hardest to steel-man from within, and what does that difficulty reveal about your own analytical defaults?
2. Where did you conflate description (what African states do) with explanation (why) or prescription (what they should do)?
3. Which falsifier would most seriously weaken your current view of African agency, and have you tested it against a case?

7.3 Error-Log

Common Misconception	Correction	Evidence
"African non-alignment is just fence-sitting or free-riding."	It is a historically grounded strategy of sovereign equality and hedging; abstention can be a deliberate bargaining tool.	South Africa's UN abstentions and ICJ case; Adebajo (2016) on regional bargaining.
"AfCFTA will automatically transform intra-African trade."	Tariff cuts are necessary but insufficient; non-tariff barriers, infrastructure gaps, and capacity constraints dominate.	AfCFTA documentation on rules of origin and implementation gaps.

Common Misconception	Correction	Evidence
"Multi-alignment always increases leverage."	Leverage fails when suitors coordinate or when internal fragmentation invites divide-and-rule.	Nigeria's experience with coordinated conditionality; Bayart on extraversion.
"Resource sovereignty means nationalizing extraction."	It can mean value-chain upgrading and regional industrial policy, not just ownership.	DRC-Zambia battery MOU; Indonesia-style export bans.
"Western conditionality is the only constraint on agency."	Structural constraints (debt, capacity, commodity dependence) and internal governance also bind.	Alden (2019) on external dependence; Mamdani on state form.

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Strategic autonomy; multi-alignment; regional hegemony; resource sovereignty; AfCFTA; limits of agency	Hedging across suitors; value-chain upgrading; export bans; tariff reduction; rules of origin; institutional bargaining	Adebajo (2016) on agency; Alden (2019) on external dependence; Tshabalala & Ndzendze (2022) on SA foreign policy; Bayart on extraversion; Mamdani on state form; Nkrumah on neo-colonialism	Nigeria multi-alignment; SA Russia-Ukraine balancing and ICJ case; DRC-Zambia battery MOU; AfCFTA tariff schedules; Nigeria/SA trade-FDI data 2000-2024	Agency vs. structure; sovereignty vs. interdependence; multilateralism vs. bilateralism; conditionality vs. non-interference	Coordinated suitor pressure; internal fragmentation; infrastructure gaps; debt distress; investor flight from export bans	L28 Pan-Africanism; L31 great power competition; L33 critical minerals; L34 Sahel synthesis; L49 Global South

SECTION 9 — REVIEW SCHEDULE

- **R1 (Day 1):** Re-read Section 2.7 African perspective and flashcards; define strategic autonomy and multi-alignment in your own words.
- **R2 (Day 3):** Reconstruct all five perspectives on Nigeria's multi-alignment without notes; check against Section 2.8.

- **R3 (Week 2):** Work the Problem Pair (South Africa) again under timed conditions; compare to model answer.
- **R4 (Week 4):** Re-run the Data Lab tables; update one trend claim with new evidence.
- **R5 (Week 8):** Full Feynman compression of the lesson; teach it to a peer or record a 5-minute explanation.

SECTION 10 — COMPLETION CHECKLIST

☐ I can define strategic autonomy and distinguish it from autarky.
☐ I can explain multi-alignment as rational strategy with mechanisms.
☐ I can compare Nigeria, South Africa, and Ethiopia as regional hegemons.
☐ I can assess AfCFTA's potential and limits.
☐ I can explain resource sovereignty via DRC-Zambia and export bans.
☐ I can articulate the limits of agency thesis.
☐ I can reconstruct all five perspectives on African agency.
☐ I can apply levels of analysis to Nigeria's multi-alignment.
☐ I can analyze South Africa's Russia-Ukraine balancing.
☐ I can interpret the Data Lab tables.
☐ I can identify falsifiers for agency claims.
☐ I can cite Adebajo, Alden, and Tshabalala & Ndzendze accurately.
☐ I have completed the Independent Memo.
☐ I have answered the Hinge Question.
☐ I have filled the error log.
☐ I have scheduled R1–R5 reviews.
☐ I can explain the lesson without jargon (Feynman step 1).
☐ I can name one thing the African perspective reveals that others miss.

34. Critical Minerals and Techno-Geopolitics in Africa

LESSON METADATA

Field	Value
Lesson number and title	Lesson 33 — Critical Minerals and Techno-Geopolitics in Africa
Module	Module 5: African Geopolitical Architecture
Prerequisites	L19 (energy/minerals), L29 (conflict political economy), L31 (great power competition)
Interleaved links	Forward to L34 (Sahel synthesis), L52–53 (semiconductors, minerals), L56 (innovation decoupling)
Reading load	7–9 hours
Content channels	Dense analytical prose; data tables; worked example; problem pair; visual anchor; flashcards
Bloom ceiling	Evaluate / Create
Estimated study time	7–9 hours

SECTION 0 — Why This Lesson Exists

The central puzzle of this lesson is not geological but political: Africa holds a disproportionate share of the minerals that the global energy transition and the digital economy require, yet it captures a vanishingly small share of the value those minerals generate once they leave the continent. The Democratic Republic of Congo (DRC) produces roughly two-thirds to three-quarters of global cobalt; the DRC and Zambia together dominate African copper; Zimbabwe, Namibia, and the DRC hold significant lithium; Mozambique and Tanzania hold graphite; South Africa and the DRC hold platinum-group metals and rare earth prospects. The International Energy Agency's *Critical Minerals Outlook* (2024) projects that demand for lithium, cobalt, nickel, and copper could grow several-fold by 2040 under net-zero scenarios. Yet the same documents show that refining, precursor manufacturing, cell production, and battery assembly remain concentrated in China, with the United States, the European Union, and Japan now racing to build parallel supply chains. Africa's position is therefore not merely "resource-rich"; it is structurally positioned at the lowest-value, highest-risk node of a techno-industrial chain whose governance is being renegotiated in real time. The question this lesson poses is whether that renegotiation can be turned into upward mobility for African states, or whether it will reproduce — in new, "green" language — the peripheralization that characterized the colonial and post-colonial mineral economy.

This puzzle sits at the intersection of three curriculum threads. From L19 (energy and minerals), the student inherits the "resource curse" debate: the Dutch-disease, rentier-state, and enclave-economy mechanisms through which mineral wealth can undermine rather than build state capacity. From L29 (conflict political economy), the student inherits the analysis of how mineral extraction finances armed groups, corrupts institutions, and fragments sovereignty — most visibly in the eastern DRC. From L31 (great power competition), the student inherits the frame of a multipolar order in which African states are not merely objects of

great-power rivalry but agents who can leverage competition. Lesson 33 synthesizes these: it asks how the *techno-geopolitical* moment — the scramble for inputs to batteries, semiconductors, and renewable-energy systems — reshapes the political economy of African minerals, and whether African governments can convert geological endowment into industrial capacity and bargaining power.

The theoretical stakes are high because the dominant vocabularies in circulation are not neutral. The term "critical minerals" itself is a security construct: a mineral becomes "critical" not by geology but by a state's assessment of supply risk to its own industrial base. The IEA, the US Department of Energy, and the European Commission each publish different criticality lists. This means that the "crisis" being managed is, from an African vantage, someone else's industrial vulnerability being projected onto African territory. African scholars from Walter Rodney through Thandika Mkandawire to Siba Grovogui have long argued that the international economic order systematically converts African abundance into external accumulation. The techno-geopolitical moment risks repeating this: "friend-shoring" and "de-risking" may simply relocate extraction and low-value processing to "trusted" jurisdictions while high-value manufacturing stays in the North and in China. Alternatively, the moment may create unprecedented leverage, because the energy transition cannot proceed without African inputs, and because the DRC-Zambia battery initiative and Zimbabwe's lithium export ban signal a new willingness to use state power to force value-chain upgrading.

The lesson therefore reconstructs five perspectives, with the African perspective primary and longest. The African perspective, drawing on Grovogui's critique of sovereignty, Mbembe's necropolitics, Bayart's "politics of the belly," Mamdani's bifurcated state, Rodney's underdevelopment thesis, and contemporary scholars such as Aning, Danso, and Tamale, treats mineral governance as a question of *resource sovereignty* and *bargaining power* rather than of supply security. The Chinese perspective treats state-backed offtake and developmental partnership as a model that delivers infrastructure and market access in exchange for long-term supply. The Russian perspective frames resource states as anti-hegemonic actors resisting Western conditionality. The Western perspective frames the problem as supply-chain security, friend-shoring, and the risk of peripheralization — a risk it sometimes acknowledges and sometimes obscures. The UN perspective frames it through resource governance, the Extractive Industries Transparency Initiative (EITI), and just-transition norms. Each perspective reveals and occludes; the lesson's analytical task is to adjudicate among them on evidence.

Mechanistically, the lesson disaggregates the mineral value chain into stages — extraction, refining, precursor and component manufacturing, cell and battery assembly, and end-use integration — and asks where value, jobs, technology, and risk accumulate at each stage. It then examines the policy instruments states use to move up the chain: export bans (Zimbabwe's 2022 raw lithium ban), joint ventures and special economic zones (the DRC-Zambia battery initiative of 2023), local-content requirements, state equity, and regional integration through the African Continental Free Trade Area (AfCFTA). It also examines the counter-instruments: WTO disciplines on export restrictions, investor-state dispute settlement, the conditionality embedded in Western critical-minerals agreements, and China's dominance of midstream refining. The student must learn to distinguish description (what is produced where), explanation (why value concentrates where it does), prediction (what happens if a given policy is adopted), and prescription (what ought to be done) — a distinction the independent memo explicitly tests.

By the end of the lesson, the student should be able to: (a) map Africa's position in the cobalt, copper, lithium, graphite, and rare-earth supply chains using USGS and IEA data; (b) explain the value-capture problem through the extraction-refining-manufacturing gradient; (c) evaluate Western supply-chain security responses (the US Inflation Reduction Act's critical-minerals provisions, the Minerals Security Partnership,

the EU Critical Raw Materials Act) for their peripheralization risk; (d) analyze Chinese state-backed offtake and the DRC-Zambia partnership as a developmental model with its own dependencies; and (e) adjudicate resource-nationalist experiments — the DRC-Zambia battery initiative and Zimbabwe's lithium ban — across levels of analysis and perspectives. The worked example (DRC-Zambia, 2023) and the problem pair (Zimbabwe, 2022) provide structured practice in mechanism identification, perspective reconstruction, and falsification. The data lab trains the student to read reserve, production, and refining-concentration data as political evidence rather than as neutral facts.

SECTION 1 — Pre-Class Priming

1.1 Retrieval warm-up Answer each question from memory before reading the lesson; note gaps for the metacognitive calibration in Section 7.

1. **L19 — Resource curse mechanisms.** What are the three canonical mechanisms through which mineral wealth can undermine development (Dutch disease, rentier state, enclave economy), and which African cases best illustrate each?
2. **L19 — Value addition.** Distinguish *extraction rents* from *value-added manufacturing* in a mineral economy, and explain why a state can be rich in ore yet poor in industrial capacity.
3. **L29 — Conflict political economy.** How does the "greed versus grievance" debate frame rebel financing in mineral-rich conflict zones, and what is the strongest critique of the greed thesis?
4. **L29 — Sovereignty fragmentation.** What is the relationship between mineral extraction and the fragmentation of state sovereignty in the eastern DRC, and how does this complicate "resource nationalism"?
5. **L31 — Great power competition.** Define "multi-alignment" as practiced by several African states, and explain how it differs from Cold War non-alignment in both structure and agency.
6. **L31 — Leverage.** Under what conditions can an African state convert great-power competition into bargaining leverage rather than into renewed dependency?

1.2 Orientation questions These questions frame the lesson's central puzzle; return to them after Section 2.7.

1. Does Africa's mineral endowment automatically translate into industrialization, or does geology without industrial policy reproduce extraction?
2. Can resource nationalism — export bans, joint ventures, state equity — overcome structural dependency in refining and manufacturing, or does it merely shift the terms of trade?
3. Does Western "friend-shoring" include Africa as a partner in value chains, or does it peripheralize Africa as a secure extraction zone?
4. How does the African perspective reframe "critical minerals" from a supply-security problem (whose problem?) into a sovereignty and value-capture problem?

1.3 Vocabulary pre-teach Provisional definitions; refine as you read.

- **Critical minerals** — minerals deemed essential to a state's or bloc's economic and security interests whose supply is judged at risk; the list is politically constructed and varies by jurisdiction (US, EU, IEA).

- **Value capture** — the share of total value added in a supply chain that accrues to a given country or firm at a given stage; in minerals, typically lowest at extraction and highest at manufacturing and end-use.
- **Value-chain upgrading** — movement from lower-value to higher-value stages (extraction → refining → precursors → components → assembly), requiring capital, skills, energy, and market access.
- **Resource nationalism** — state policies asserting greater control over natural resources, including export restrictions, local-content rules, state equity, and renegotiated contracts.
- **Offtake agreement** — a contract committing a buyer to purchase a specified volume of future production, often used to secure supply and finance mines.
- **Peripheralization** — the structural positioning of an economy at the low-value, high-risk end of global production networks, reproducing dependency.
- **Friend-shoring / near-shoring** — relocation of supply chains to geopolitically "trusted" or geographically proximate partners; may include or exclude African states.
- **EITI (Extractive Industries Transparency Initiative)** — a global standard for disclosure of payments and revenues in extractive industries, adopted by several African states.
- **Just transition** — the principle that the shift to low-carbon economies must be fair to workers and communities, including those in extractive regions.
- **Battery value chain** — the sequence from mineral extraction through refining, precursor and cathode/anode production, cell manufacturing, pack assembly, and integration into vehicles or grids.
- **Techno-geopolitics** — the intersection of technology, industrial capacity, and geopolitical competition, especially over inputs to batteries, semiconductors, and renewable energy.
- **Beneficiation** — the processing of raw minerals into higher-value products before export; a core demand of African resource-nationalist policy.

SECTION 2 — LESSON CORE

2.1 Learning objectives

By the end of this lesson, the student will be able to:

1. **Identify** (Bloom: Remember/Understand) the principal critical minerals in which African states hold significant reserves and production shares—cobalt, copper, lithium, graphite, and rare earth elements—and locate each within the global supply chain from extraction through refining to battery and component manufacturing, drawing on USGS Mineral Commodity Summaries and the IEA Critical Minerals Outlook (2024).

2. **Explain** (Bloom: Understand/Apply) the mechanism of vertical disarticulation: why Africa's geological abundance in critical minerals does not automatically translate into industrial upgrading or value capture, specifying the roles of refining concentration, offtake structures, and the geographic distribution of midstream and downstream capacity.

3. **Analyze** (Bloom: Analyze) Western supply-chain security responses—the US Inflation Reduction Act (IRA), the Minerals Security Partnership (MSP), and the EU Critical Raw Materials Act (CRMA)—as strategic reactions to Chinese refining dominance, evaluating the risk that these frameworks peripheralize African states as raw-material suppliers for Western green transitions.

4. **Evaluate** (Bloom: Evaluate) Chinese state-backed offtake and the DRC-Zambia partnership, weighing the Chinese developmental-partnership narrative against critiques of asymmetric bargaining, environmental and labor standards, and long-term dependency.
5. **Create** (Bloom: Create) a policy design for resource nationalism—such as Zimbabwe's 2022 raw lithium export ban or the DRC-Zambia joint battery initiative—that specifies the mechanism by which an upstream restriction is expected to generate downstream industrialization, the scope conditions under which it succeeds or fails, and the falsifiers that would indicate failure.

These objectives are assessable through the worked example, problem pair, independent memo, and hinge question in this lesson, and they connect backward to L19 (energy and minerals), L29 (conflict political economy), and L31 (great power competition), and forward to L34 (Sahel synthesis), L52–53 (semiconductors and minerals), and L56 (innovation decoupling).

2.2 KEY IDEA 1 — Cobalt, copper, lithium, graphite, and rare earth elements: Africa's position in the global supply chain

Bolded Causal Claim: Africa's geological endowment in cobalt, copper, lithium, graphite, and rare earth elements (REEs) positions the continent as an indispensable upstream node in the global energy-transition supply chain, yet this endowment alone does not confer bargaining power; rather, the structural position of extraction within a vertically segmented global division of labor systematically converts geological abundance into export revenue without industrial upgrading, unless specific institutional and policy conditions intervene.

Mechanism: The mechanism operates through three linked channels that together produce what can be called vertical disarticulation. First, geological concentration: the Democratic Republic of Congo (DRC) accounts for roughly two-thirds to three-quarters of global cobalt production and holds a comparable share of reserves; the Central African Copperbelt spanning the DRC and Zambia anchors global copper supply; Zimbabwe (Bikita, Arcadia), Namibia, Mali, and the DRC hold significant lithium deposits; Mozambique (Balama) and Tanzania hold major graphite deposits; and several West and East African states hold REE occurrences. Second, demand pull: the energy transition—electric vehicles, grid-scale storage, wind turbines, and electronics—has shifted mineral demand from bulk commodities to "critical" minerals whose supply is geographically concentrated and politically salient, inflating both strategic attention and price volatility. Third, and decisive, supply-chain segmentation: extraction occurs in Africa, but refining, precursor and cathode manufacturing, cell fabrication, and battery assembly occur overwhelmingly in China, with secondary capacity in South Korea, Japan, and, increasingly, the European Union and the United States. The result is that African states capture the lowest-value, highest-risk segment—mining, with its capital intensity, environmental externalities, and price volatility—while downstream rents accrue elsewhere. The IEA Critical Minerals Outlook (2024) documents that processing and refining concentration, not reserve concentration, determines supply-chain leverage; USGS Mineral Commodity Summaries confirm African production shares in cobalt, copper, and graphite that far exceed African shares of value-added in the battery chain. The mechanism is not merely the classic "resource curse" of rentierism and Dutch disease; it is a specific form of vertical disarticulation in which the continent's geological rents are realized as export earnings rather than as industrial capability. Sanderson (2022) and Kalantzakos (2020) both trace how the green-transition minerals boom has reproduced, rather than disrupted, this pattern, because the capital, technology, and offtake agreements required for refining remain concentrated outside Africa. The mechanism is reinforced by concession agreements and stabilization clauses that lock in fiscal terms for decades, by the absence of domestic demand

for batteries and electric vehicles that would anchor local offtake, and by infrastructure deficits that raise the cost of midstream investment.

Scope Conditions: This claim holds under conditions of (a) continued Chinese dominance in refining and midstream processing, which the IEA (2024) places at roughly 60–90 percent across several critical minerals; (b) limited African domestic demand for batteries and EVs that would create a local market for refined products; (c) absence of binding local-content, beneficiation, or export-restriction requirements; and (d) global commodity price cycles that favor volume over value and reward extraction over processing. It weakens where African states impose export bans or joint ventures—Zimbabwe's 2022 raw lithium export ban, the DRC-Zambia 2023 battery initiative—where Western friend-shoring creates alternative offtake, or where technological substitution (cobalt-free chemistries, sodium-ion batteries) reduces demand for specific minerals. The claim also does not imply uniformity across African mineral states: Botswana's diamond beneficiation and South Africa's platinum-group-metal refining demonstrate that upstream position can be leveraged under specific institutional conditions, including state equity, skills development, and deliberate industrial policy. Conversely, where governance is weak and elite capture strong, the mechanism intensifies.

Observable Implications: If the mechanism holds, one should observe: (i) rising African mineral export volumes alongside stagnant or falling manufacturing value-added in mineral sectors; (ii) persistent trade deficits in refined products and batteries despite mineral surpluses; (iii) foreign direct investment concentrated in extraction rather than processing; (iv) fiscal revenue volatility tied to commodity prices; and (v) environmental and social costs localized in mining regions, including artisanal cobalt mining in the DRC and graphite mining in Mozambique. Falsifying or qualifying evidence would include: rising African refining capacity, battery-assembly plants, technology-transfer agreements, or sustained increases in mineral-sector manufacturing value-added. The Africa Progress Panel reports have repeatedly documented the gap between resource wealth and human development, providing a longitudinal record against which to test these implications.

Perspective Note (five traditions in brief):

African (primary): From within the African vantage point, the central issue is not whether Africa "has" minerals but who controls the terms under which they leave the continent. African scholarship—Rodney's underdevelopment thesis, Nkrumah's neo-colonialism, and contemporary work by Grovogui, Mbembe, Bayart, and Mamdani—frames mineral extraction as a continuation of colonial political economy in which sovereignty over subsoil resources is formally African but substantively constrained by concession agreements, stabilization clauses, and external offtake. The African perspective insists that geological abundance is a necessary but insufficient condition for development; what matters is the institutional architecture of bargaining, taxation, local content, and industrial policy. It highlights that "critical minerals" discourse itself is externally generated—driven by US, EU, and Chinese industrial policy—and risks reducing African states to suppliers of inputs for others' green transitions. The African lens thus reframes the question from "how to secure supply" to "how to secure transformation," and it treats resource nationalism not as aberration but as a rational response to structural subordination. It also foregrounds the internal politics of mineral governance: elite capture, artisanal mining, and the gendered and environmental costs borne by communities near extraction sites, which external supply-chain frameworks systematically underweight. The Africa Progress Panel reports and African Union mining frameworks (such as the Africa Mining Vision) embody this insistence on value addition and beneficiation as the measure of mineral policy success.

Chinese: China's perspective treats African minerals as inputs into a state-coordinated industrial strategy in which Chinese firms, backed by state finance, infrastructure packages, and long-term offtake agreements,

secure supply and build processing capacity both in China and, increasingly, in Africa. The Chinese view emphasizes developmental partnership, mutual benefit, and non-interference, and it points to Chinese-built smelters, roads, and power infrastructure as evidence of value-chain contribution. It tends to occlude labor and environmental standards, the asymmetry of bargaining power between state-backed Chinese enterprises and African governments, and the long-term dependency created by debt and offtake structures.

Russian: Russia frames African mineral wealth through an anti-hegemonic lens, emphasizing sovereignty and resistance to Western conditionalities. Moscow's perspective highlights Western hypocrisy in supply-chain security while downplaying Russian mercenary and mining interests. It contributes a critique of unipolar resource governance but occludes its own extractive practices and the limited scale of Russian mineral investment relative to China.

Western: The Western perspective, articulated through the IRA, MSP, and CRMA, treats African minerals as strategic inputs requiring diversified, "friend-shored" supply chains to reduce dependence on China. It emphasizes governance standards, ESG, and rule of law, but risks peripheralizing Africa as a raw-material periphery for Western green transitions, reproducing the very dependency it claims to solve.

UN: The UN perspective centers on resource governance, EITI transparency, and just transition, seeking to align mineral extraction with the Sustainable Development Goals. It contributes normative frameworks and multi-stakeholder platforms but often lacks enforcement power and can be captured by state and corporate interests.

SECTION 2.3 KEY IDEA 2 — The value-capture problem: extraction vs refining vs battery manufacturing

Bolded Causal Claim: The structural asymmetry between where critical minerals are extracted (predominantly Africa) and where they are refined and manufactured into batteries (predominantly China and the West) reproduces a colonial division of labor that systematically strips African economies of value-added, fiscal revenue, and technological learning, unless deliberate industrial policy intervenes at the refining and manufacturing stages.

Mechanism: The mechanism operates through three interlocking channels that together constitute what development economists call the "value-capture gap." First, the geological endowment channel: Africa holds approximately 30% of global critical mineral reserves, including roughly 70% of cobalt (DRC), significant copper (Zambia, DRC), lithium (Zimbabwe, Namibia, DRC), graphite (Mozambique, Madagascar, Tanzania), and rare earth elements (South Africa, Burundi). Yet geological abundance does not translate into economic rents when the downstream stages of the value chain are controlled by external actors. The DRC produces over 70% of global cobalt but captures less than 5% of the final value of a lithium-ion battery. Zambia produces copper but imports copper wire and cable. Zimbabwe exports lithium concentrate but imports lithium carbonate and battery cells. This pattern is not accidental; it is structurally embedded in the global division of labor.

Second, the refining concentration channel: China processes approximately 60-70% of global cobalt, 60% of lithium, and dominates rare earth processing at over 80%. This concentration means that even when African states extract minerals, the value-added from refining—where margins are highest—accrues elsewhere. The "smiling curve" of value capture (Mudambi 2008) illustrates this dynamic: value concentrates at the R&D/design end and the branding/retail end, with manufacturing and extraction occupying the low-

value middle and bottom. In the battery value chain specifically, mining accounts for roughly 10-15% of total value, refining for 20-25%, cell manufacturing for 30-40%, and pack assembly and integration for the remainder. African economies are concentrated at the 10-15% mining stage, while China and the West capture the 50-65% refining and manufacturing stages. The mechanism is reinforced by technological barriers: refining cobalt to battery-grade standards requires specialized knowledge, equipment, and quality control that African states have not historically developed, in part because colonial and post-colonial investment patterns prioritized extraction over processing.

Third, the fiscal leakage channel: through transfer pricing, thin capitalization, and tax incentives granted to attract investment, African states capture a fraction of the resource rent. The Africa Progress Panel (2013) estimated that Africa lost $1.2-1.4 trillion in illicit financial flows over three decades, with extractive industries as a primary vector. Transfer pricing allows multinational mining companies to sell minerals to affiliated entities in low-tax jurisdictions at below-market prices, reducing taxable profits in the extracting country. Thin capitalization—loading African subsidiaries with debt from parent companies—allows interest payments to be deducted, further reducing tax liability. The result is that effective tax rates on mining operations in Africa are often well below statutory rates, and in some cases below those in developed countries. The mechanism is self-reinforcing: low value capture means low fiscal capacity means low investment in the infrastructure and skills needed to move up the value chain, which perpetuates low value capture.

The theoretical lineage runs through Prebisch-Singer (1950), which posited that terms of trade for primary commodities deteriorate relative to manufactured goods over time; through dependency theory (Frank 1967, Amin 1974) which argued that the global capitalist system structurally underdevelops the periphery; through global value chain analysis (Gereffi 1994, Humphrey and Schmitz 2002) which mapped how lead firms in the Global North coordinate production networks; and through more recent work on "upgrading" (Kaplinsky 2000, Pietrobelli and Rabellotti 2011) which asks whether and how suppliers can move from assembly to design. The African perspective adds a crucial dimension: the problem is not merely market failure but a historically constituted structure of power that requires political, not just economic, intervention to transform. Rodney's (1972) analysis of how colonialism "underdeveloped" Africa remains analytically relevant: the extraction-without-processing pattern is not a natural market outcome but a historically produced structure that requires deliberate policy to reverse.

Scope Conditions: The value-capture problem is most acute where three conditions coincide: (1) high concentration of global refining in a single country or bloc (currently China for most critical minerals); (2) weak domestic industrial capacity and infrastructure (power, transport, skills) in the extracting country; and (3) absence of regional coordination to pool markets and negotiate collectively. Where these conditions are absent—where refining capacity exists domestically (as in South Africa's PGM sector) or where regional integration is advanced—the problem is attenuated. The problem is also less severe for minerals with lower processing complexity or where African states have successfully negotiated local content requirements (as in Botswana's diamond beneficiation, though this is a non-critical mineral case). The scope condition of "technological learning" is critical: value capture requires not just physical infrastructure but absorptive capacity—the ability to learn from foreign investors and eventually substitute domestic for foreign inputs. Where foreign investors operate as enclaves with minimal linkages to the domestic economy, as in many African mining operations, technological learning is minimal. The scope condition of "state capacity" is equally important: moving up the value chain requires not just policy declarations but the ability to implement them—regulating transfer pricing, enforcing local content requirements, and investing in infrastructure and skills. Where state capacity is weak, as in the DRC, even well-designed policies may fail.

Observable Implications: If the value-capture thesis holds, we should observe: (a) rising export volumes of raw or semi-processed minerals from Africa alongside stagnant or declining manufacturing value-added as a share of GDP; (b) persistent trade deficits in processed goods despite mineral export surpluses; (c) foreign ownership of refining and manufacturing assets; (d) limited technology transfer and skills development; (e) fiscal revenue from minerals that is small relative to the value of exports. The data support this: Africa's share of global manufacturing value-added has declined from roughly 3% in 1970 to under 2% today, while its share of global mineral exports has risen. The DRC exports cobalt hydroxide (semi-processed) rather than refined cobalt metal or battery precursors. Zambia exports copper cathode but not copper wire or cable. Zimbabwe exports lithium concentrate but not lithium carbonate or hydroxide. The observable implication for policy is that export bans and local content requirements (as in Zimbabwe's 2022 lithium ban) are rational responses to this structural asymmetry, though their effectiveness depends on implementation capacity. A further observable implication is that African states with greater value-capture success (Botswana with diamonds, South Africa with PGMs) will have stronger industrial bases and higher fiscal capacity, creating a divergence within Africa that complicates continental solidarity.

Perspective Note (five traditions in brief):

African (primary): The African perspective frames the value-capture problem as a continuation of colonial extraction patterns, now mediated by global value chains rather than direct colonial rule. Scholars such as Grovogui (2006) argue that the international system was designed to facilitate resource extraction from Africa, and that "development" discourse often serves to legitimize this extraction. Mbembe (2001) emphasizes the "necropolitics" of resource extraction—the ways in which mineral wealth coexists with, and even produces, human suffering. Bayart (2009) and Mamdani (1996) highlight how African states are often "extraverted"—oriented toward external patrons rather than domestic constituencies—making value capture difficult. The African perspective demands not just more revenue but structural transformation: the ability to process, manufacture, and innovate. Nkrumah's (1965) concept of "neo-colonialism" remains analytically relevant: the DRC-Zambia battery initiative represents an attempt to break this pattern, but its success depends on overcoming the very structural constraints it seeks to address. The African vantage point reveals that value capture is not a technical problem solvable by market mechanisms alone; it is a political problem of power, sovereignty, and historical justice. Oyěwùmí (1997) adds that the gendered dimensions of extraction—where women bear disproportionate costs of mining while men capture most benefits—must be addressed for value capture to be genuinely transformative. Tamale (2020) extends this to argue that decolonization of resource governance requires centering African feminist epistemologies.

Chinese: The Chinese perspective views the value-capture problem through the lens of developmental state theory and South-South cooperation. China's own experience—moving from raw material exporter to manufacturing powerhouse through state-directed industrial policy—provides a template. Chinese state-backed firms invest in African extraction but also in processing (e.g., cobalt refineries in the DRC, copper smelters in Zambia). The Chinese narrative emphasizes mutual benefit and "win-win" cooperation, while acknowledging that Chinese firms have sometimes replicated extractive patterns. The perspective contributes the insight that state capacity and long-term planning are prerequisites for value capture, but occludes the power asymmetry between Chinese state-backed firms and African states, and the environmental and labor costs of Chinese processing investments. Kalantzakos (2020) notes that China's critical minerals strategy is explicitly designed to secure supply chains for its own industrial upgrading, not necessarily to promote African industrialization.

Russian: The Russian perspective frames the value-capture problem as evidence of Western-dominated

global capitalism's exploitative nature, while positioning Russia as an alternative partner that respects African sovereignty. Russia's own experience as a resource exporter (oil, gas, minerals) shapes its view: resource wealth can fund state capacity if managed by a strong state. However, Russia's limited industrial diversification and its own resource dependence weaken its credibility as a model for value-chain upgrading. The perspective contributes anti-hegemonic rhetoric but occludes Russia's own extractive practices and limited capacity to support African industrialization. Sanderson (2022) notes that Russian mineral investment in Africa remains limited in scale relative to China, constraining its ability to influence value-chain dynamics.

Western: The Western perspective, articulated through the IRA, MSP, and CRMA, increasingly recognizes the value-capture problem as a supply-chain security risk: if Africa remains a raw-material periphery, Western green transitions depend on Chinese refining. The response is to promote "responsible" mining and ESG standards, but this often translates into compliance burdens that raise costs for African producers without building domestic capacity. The Western perspective contributes governance frameworks and capital but occludes the structural incentives that keep value capture in the Global North and China. It risks treating African minerals as inputs to Western industrial policy rather than as foundations for African development. The IEA Critical Minerals Outlook (2024) acknowledges that current supply chains are "highly concentrated" and that diversification is needed, but frames this primarily as a security issue for consuming countries rather than a development issue for producing countries.

UN: The UN perspective centers on resource governance, EITI, and the SDGs, seeking to ensure that mineral extraction contributes to sustainable development. It contributes normative frameworks and multi-stakeholder platforms but often lacks enforcement power. The UN perspective occludes the power asymmetries between states, corporations, and communities, and can be captured by state and corporate interests. The "just transition" framework is promising but underdeveloped in the African context. The UN's emphasis on transparency (EITI) addresses the fiscal leakage channel but does not directly address the refining concentration or technological learning channels.

SECTION 2.4 KEY IDEA 3 — Western supply-chain security responses: IRA, MSP, CRMA, and the risk of peripheralization

Bolded Causal Claim: Western supply-chain security policies—the US Inflation Reduction Act's critical minerals provisions, the Minerals Security Partnership, and the EU Critical Raw Materials Act—restructure global mineral flows to reduce dependence on China, but in doing so risk peripheralizing Africa as a compliant raw-material supplier for Western green transitions, reproducing the very dependency structures they claim to solve.

Mechanism: The mechanism operates through four interlocking channels that together constitute what critical political economy scholars call "green extractivism." First, the FTA/eligibility channel: the IRA's Section 30D (clean vehicle credit) requires that a percentage of critical minerals in EV batteries be extracted or processed in the US or in countries with which the US has a free trade agreement. As of 2024, no African country has an FTA with the US (AGOA is a unilateral preference program, not an FTA). This means African minerals do not automatically qualify for IRA credits unless processed in qualifying countries—effectively incentivizing extraction in Africa but refining in FTA partners (Japan, South Korea, EU members). The percentage requirement rises from 40% in 2023 to 80% by 2027, tightening the constraint. The mechanism creates a powerful incentive for mining companies to extract in Africa but process in FTA countries, locking

in the extraction-without-processing pattern. The US has begun negotiating "critical minerals agreements" (CMAs) with individual countries, but these are narrower than FTAs and do not provide the same market access or legal protections.

Second, the MSP channel: the Minerals Security Partnership, launched in 2022 by the US and joined by the EU, UK, Japan, South Korea, Australia, Canada, Finland, France, Germany, Italy, Norway, Sweden, and the UK, aims to "catalyze public and private investment" in critical mineral supply chains. The MSP's project selection criteria emphasize ESG standards, governance, and "responsible" mining—standards that African producers may struggle to meet, potentially excluding them from Western supply chains. The MSP has announced projects in Africa, but most focus on extraction and exploration rather than refining. The mechanism here is one of standard-setting: by defining what counts as "responsible" mining, the MSP effectively determines which African producers can access Western capital and markets. This can raise costs for African producers, particularly artisanal and small-scale miners who lack the capacity to meet complex ESG reporting requirements. The MSP also creates a "club" dynamic: countries inside the partnership gain preferential access to Western capital and markets, while those outside face higher barriers.

Third, the CRMA channel: the EU's Critical Raw Materials Act (2024) sets targets for domestic extraction (10%), processing (40%), and recycling (25%) by 2030, and identifies "strategic projects" for fast-tracked permitting. The CRMA also requires that no more than 65% of any critical mineral come from a single third country—directly targeting China but also creating opportunities for African suppliers if they can meet EU standards. The CRMA's "strategic project" designation provides access to EU funding and fast-tracked permitting, but the criteria favor projects in EU member states or countries with which the EU has strategic partnerships. The mechanism creates a tiered system: EU-based projects receive the most support, strategic partner projects receive some support, and other projects receive none. African projects that do not meet the criteria may find themselves excluded from EU supply chains even as the EU diversifies away from China.

Fourth, the peripheralization channel: the combined effect of these policies is to create a bifurcated global mineral market—Western-aligned and China-aligned—with Africa potentially serving as a raw-material periphery for both, unable to capture value-added in either bloc. The mechanism is reinforced by the fact that Western capital for African mining typically comes with offtake agreements that lock in raw material exports rather than domestic processing. The "friend-shoring" discourse (Yellen 2022, Sullivan 2023) frames supply-chain restructuring as a security imperative, but the security being secured is Western security, not African development. The peripheralization risk is not that Africa is excluded from global supply chains, but that it is included on terms that reproduce dependency: extracting raw materials for processing elsewhere, with limited technology transfer, limited fiscal capture, and limited upward mobility.

The theoretical lineage runs through world-systems theory (Wallerstein 1974), which posits a core-periphery structure in which the core extracts surplus from the periphery; through dependency theory (Frank 1967, Cardoso and Faletto 1979) which argues that peripheralization is not a stage but a structural feature of capitalism; through more recent work on "green extractivism" (Dunlap and Jakobsen 2020, Zografos and Robbins 2020) which argues that the green transition reproduces extractive patterns under a sustainability veneer; and through the "friend-shoring" literature (Yellen 2022, Sullivan 2023) which frames supply-chain restructuring as a security imperative. The African perspective adds that peripheralization is not an unintended consequence but a structural feature of a system designed to maintain Western (and Chinese) industrial dominance. Grovogui (2006) argues that the international order was constructed to facilitate resource extraction from Africa, and that contemporary supply-chain policies are the latest iteration of this pattern.

Scope Conditions: The peripheralization risk is most acute where: (1) African states lack the industrial

capacity and infrastructure to process minerals domestically; (2) Western policies create eligibility criteria (FTA status, ESG standards) that African producers cannot meet; (3) offtake agreements lock in raw material exports; and (4) regional coordination is weak, preventing collective bargaining. The risk is attenuated where African states have successfully negotiated local content requirements, where regional integration provides scale (e.g., the African Continental Free Trade Area, AfCFTA), and where Western partners invest in processing capacity rather than just extraction. The scope condition of "geopolitical alignment" is also relevant: as great-power competition intensifies, African states may gain leverage by playing competing blocs against each other, but this leverage is contingent on maintaining non-alignment and avoiding exclusive partnerships. The scope condition of "state capacity" is critical: African states with stronger institutions (South Africa, Botswana, Namibia) are better positioned to negotiate terms that avoid peripheralization than those with weaker institutions (DRC, Zimbabwe). The scope condition of "mineral type" also matters: minerals with higher processing complexity (cobalt, lithium, REEs) present greater peripheralization risk than those with lower complexity (copper, graphite), because the value-added gap is larger.

Observable Implications: If the peripheralization thesis holds, we should observe: (a) increased Western investment in African extraction but not in African processing; (b) African minerals flowing to FTA partners (Japan, South Korea, EU) for processing rather than being processed domestically; (c) ESG compliance costs that disadvantage African small-scale and artisanal miners; (d) a growing gap between Western rhetoric about "partnership" and actual investment in value-added capacity; (e) African states increasingly turning to China for processing investment, reinforcing the bifurcation. Early evidence: the MSP has announced projects in Africa, but most focus on extraction and exploration rather than refining. The EU's CRMA strategic projects include African mining ventures but few processing facilities. The IRA's FTA requirement has led to discussions about "critical minerals agreements" (CMAs) with individual African countries, but these are narrower than FTAs and do not provide the same market access. A further observable implication is that African states will increasingly use resource nationalism (export bans, local content requirements) as a defensive response to peripheralization pressure, creating friction with Western partners who view these measures as market-distorting.

Perspective Note (five traditions in brief):

African (primary): The African perspective views Western supply-chain security policies with deep suspicion, recognizing them as the latest iteration of a long history of external powers structuring African economies to serve their own needs. From Nkrumah's neo-colonialism to contemporary critiques of "green extractivism," African scholars and policymakers see the IRA, MSP, and CRMA as potentially reproducing dependency under the guise of partnership. The key African concern is not whether Western policies reduce dependence on China, but whether they enable African value-chain upgrading or merely redirect raw material flows. The DRC-Zambia battery initiative is, in part, a response to this concern—an attempt to capture value before minerals leave the continent. African voices emphasize that "friend-shoring" is only meaningful if Africa is treated as a partner, not a periphery. Mamdani (1996) and Bayart (2009) highlight how African states are often "extraverted"—oriented toward external patrons rather than domestic constituencies—making it difficult to resist peripheralization. The African vantage point reveals that Western supply-chain security and African development are not automatically aligned; they may be in tension, and the resolution of that tension depends on African bargaining power, not Western goodwill. Aning and Danso (2013) argue that African agency in international relations is often underestimated, and that African states can leverage great-power competition to their advantage if they coordinate regionally and maintain strategic non-alignment.

Chinese: The Chinese perspective views Western supply-chain security policies as containment strategies designed to undermine China's dominant position in critical mineral processing. China argues that its investments in African mining and processing have contributed to African development and that Western policies—by imposing ESG standards and FTA requirements—seek to exclude Chinese firms and redirect African minerals to Western-aligned supply chains. The Chinese narrative emphasizes that Western "friend-shoring" is hypocritical: the West benefited from Chinese processing for decades and now seeks to exclude China without offering African states equivalent value-added opportunities. China contributes the insight that supply-chain restructuring is geopolitically motivated, not purely economic, but occludes its own role in creating the dependency it now criticizes the West for addressing. Kalantzakos (2020) notes that China's critical minerals strategy is explicitly designed to secure supply chains for its own industrial upgrading, and that Chinese investments in African processing, while significant, remain oriented toward Chinese rather than African industrial needs.

Russian: The Russian perspective frames Western supply-chain security policies as part of a broader Western strategy to maintain global hegemony and exclude non-Western powers from strategic resources. Russia argues that the MSP and CRMA are discriminatory and violate WTO principles of non-discrimination. Russia's own experience with sanctions and resource nationalism informs this view. The perspective contributes a critique of Western unilateralism but occludes Russia's own resource nationalism and its limited capacity to offer African states alternative processing partnerships. Russia's anti-hegemonic framing resonates with some African audiences but is undermined by its own geopolitical behavior. Sanderson (2022) notes that Russian mineral investment in Africa remains limited in scale relative to China, constraining its ability to influence supply-chain dynamics or offer African states meaningful alternatives to Western or Chinese partnerships.

Western: The Western perspective, articulated through policy documents and think-tank analyses, frames the IRA, MSP, and CRMA as necessary responses to China's dominance of critical mineral processing, which poses both economic and security risks. The Western narrative emphasizes that these policies are not designed to peripheralize Africa but to create diversified, resilient, and "responsible" supply chains. Western policymakers point to the MSP's project announcements and the CRMA's strategic project designations as evidence of commitment to African partnership. The perspective contributes governance standards, capital, and market access but occludes the structural incentives that favor extraction over processing in Africa, and the risk that ESG standards become non-tariff barriers. The strongest Western counterargument is that without these policies, China's dominance would be even more entrenched, leaving Africa with even less leverage. The IEA Critical Minerals Outlook (2024) acknowledges that current supply chains are "highly concentrated" and that diversification is needed, but frames this primarily as a security issue for consuming countries rather than a development issue for producing countries.

UN: The UN perspective views Western supply-chain security policies through the lens of global governance, sustainable development, and just transition. The UN emphasizes that supply-chain restructuring must not come at the expense of African development or environmental standards. The UN contributes normative frameworks (the SDGs, the UN Guiding Principles on Business and Human Rights) and multi-stakeholder platforms (EITI, the UN Global Compact) but lacks enforcement power. The UN perspective occludes the geopolitical competition driving these policies and can be captured by state and corporate interests. The "just transition" framework is promising but underdeveloped in the African context, and the UN's ability to shape Western industrial policy is limited. The UN's emphasis on transparency and multi-stakeholder governance addresses some of the governance deficits in African mining but does not directly address the structural power asymmetries that drive peripheralization.

2.5 KEY IDEA 4 — Chinese State-Backed Offtake and the DRC-Zambia Partnership

Bolded Causal Claim: Chinese state-backed offtake agreements, infrastructure-for-minerals arrangements, and vertically integrated state-owned enterprise (SOE) investment have secured Beijing's dominant position in African critical mineral supply chains by substituting patient, politically tolerant capital for the risk-averse, return-maximizing capital that Western firms typically deploy, thereby locking African states into long-term supply relationships in which geological endowment is exchanged for infrastructure and market access while refining and manufacturing rents accrue to China.

Mechanism: The mechanism operates through four reinforcing channels. First, financing: Chinese policy banks—principally the China Development Bank and the Export-Import Bank of China—extend concessional or semi-concessional credit to African governments and to Chinese SOEs operating abroad, accepting repayment horizons and risk profiles that commercial lenders and Western development finance institutions typically reject. This patient capital allows Chinese firms to absorb the high upfront costs of greenfield mining in jurisdictions with weak infrastructure, unstable regulation, and elevated political risk. Second, infrastructure bundling: Chinese investment frequently packages mineral extraction with transport, power, and port infrastructure—exemplified by the Sicomines agreement in the Democratic Republic of Congo (DRC), signed in 2008, under which Chinese firms committed to infrastructure construction in exchange for mining concessions. This bundling reduces the transaction costs of extraction and creates physical path dependence: once a railway or power line is built to serve a Chinese-operated mine, rerouting supply to alternative buyers becomes costly. Third, offtake lock-in: long-term purchase agreements guarantee feedstock to Chinese refineries and battery manufacturers, removing price risk from the Chinese side while transferring it to the African producer, who loses the ability to capture upside price movements or to diversify customers. Fourth, vertical integration: Chinese firms such as China Molybdenum (CMOC), Zijin Mining, and China Nonferrous Metal Mining Group (CNMC) operate across the chain from mine to smelter to cathode and battery production, with downstream firms such as Contemporary Amperex Technology Co. Limited (CATL) and BYD absorbing the highest-value stages. The result is a structural asymmetry: African states receive infrastructure, employment, and royalty revenue, but the rents from refining, precursor manufacturing, and battery assembly—the stages where value concentrates—flow to China. As Sanderson (2022) documents, this model has made China the dominant processor of cobalt, lithium, and rare earths even where African countries hold the geological reserves.

Scope Conditions: This mechanism is strongest where three conditions coincide: (a) African states lack the fiscal capacity and technical expertise to develop mines independently; (b) infrastructure deficits are severe enough that bundled investment is politically attractive; and (c) Western firms are deterred by risk, regulation, or shareholder pressure. It weakens where African governments possess credible alternatives—such as the DRC's 2023-2024 renegotiation of the Sicomines terms, which sought to increase the infrastructure commitment and adjust revenue sharing—or where Chinese capital itself retreats, as occurred when Zambia placed Konkola Copper Mines under provisional liquidation in 2019 amid disputes with Vedanta and, subsequently, when Chinese firms faced renegotiation pressure. The mechanism also assumes Chinese state capacity to coordinate across banks, SOEs, and diplomatic channels; where that coordination fragments, as in periods of Chinese domestic economic stress, the model's coherence degrades.

Observable Implications: Rising Chinese share of global cobalt and copper production and processing; the physical footprint of Chinese-built infrastructure corridors (the Lobito Corridor's Chinese-funded segments,

the TAZARA railway); renegotiation episodes and contract revisions in the DRC and Zambia; African fiscal dependence on Chinese loans and the associated debt-sustainability pressures; and the concentration of refining capacity in China documented in IEA (2024) Critical Minerals Outlook data. If the mechanism holds, one should observe continued Chinese dominance of midstream processing even as African states assert greater upstream control through export bans and joint ventures.

Perspective Note (five traditions in brief): The African perspective, drawing on Grovogui, Bayart, and Mamdani, reads Chinese engagement as a form of extraversion: African elites leverage external partnerships to consolidate domestic power, and the "developmental partnership" framing obscures the extraction of rents and the reinforcement of authoritarian governance structures. The Chinese perspective, articulated through official discourse and scholars such as Deborah Brautigam, frames the relationship as South-South cooperation and mutual benefit, emphasizing infrastructure delivery and non-interference in domestic politics. The Russian perspective, shaped by its own resource-state experience and anti-hegemonic framing, views Chinese dominance with ambivalence—welcoming the erosion of Western monopoly while wary of Chinese monopolization of the very markets Russia seeks to access. The Western perspective, particularly in Washington and Brussels, treats Chinese offtake as a strategic threat to supply-chain security, motivating friend-shoring and industrial policy responses. The UN perspective emphasizes governance standards, transparency, and the SDGs, noting that Chinese investment often bypasses EITI and multi-stakeholder frameworks, creating accountability gaps.

2.6 KEY IDEA 5 — Resource Nationalism: DRC and Zambia's Joint Battery Initiative, Zimbabwe's Lithium Export Ban

Bolded Causal Claim: Resource nationalism in Africa—exemplified by the DRC-Zambia joint battery value chain initiative and Zimbabwe's 2022 raw lithium export ban—represents a strategic attempt to convert geological endowment into industrial upgrading and fiscal sovereignty, but its success is contingent on overcoming binding constraints of energy, capital, skills, and market access that have historically defeated such ambitions, and its failure modes include smuggling, stockpiling, investor flight, and WTO-inconsistent trade restrictions.

Mechanism: The mechanism of resource nationalism operates through two distinct but related instruments. The first is the export ban or restriction: by prohibiting or taxing the export of unprocessed ore, the state raises the domestic price of feedstock relative to the world price, creating a price wedge that incentivizes local processing. Zimbabwe's 2022 ban on raw lithium exports, announced by the Ministry of Mines and Mining Development, was designed to force beneficiation and capture more value domestically. The second is the joint venture or industrial policy initiative: the DRC and Zambia signed a memorandum of understanding in 2022 (with subsequent framework agreements in 2023) to develop a joint battery and electric vehicle value chain, leveraging the DRC's cobalt and Zambia's copper to produce battery precursors and, eventually, batteries. The mechanism here is pooling: by combining complementary endowments across borders, the two states seek to achieve the scale and input diversity necessary to attract downstream investment.

Both instruments face a common structural problem. Export bans create incentives for local processing only if processing capacity exists or can be built; where it does not, the result is stockpiling, smuggling across porous borders, and price distortions that harm legitimate producers. Zimbabwe's ban initially led to stockpiling of lithium concentrate and reports of smuggling into South Africa and Mozambique, while the absence of domestic refining capacity meant the ban could not immediately generate the intended value

addition. The DRC-Zambia initiative faces the complementary challenge: even with pooled endowments, the absence of reliable and affordable electricity, skilled labor, and capital for precursor plants means the initiative risks remaining a memorandum rather than a factory. The mechanism thus depends on what Rodney (1972) identified as the infrastructure of development: without energy, transport, and human capital, resource endowment does not automatically translate into industrialization.

There is also a legal and institutional dimension. Export bans on raw materials may conflict with WTO obligations, particularly the prohibition on quantitative restrictions and the requirement of non-discrimination. While export duties are permitted under certain conditions, outright bans risk dispute settlement challenges and can deter the very foreign investment needed to build processing capacity. The DRC-Zambia initiative, by contrast, operates through bilateral and regional frameworks and does not directly implicate WTO rules, but it must navigate the African Continental Free Trade Area (AfCFTA) rules of origin and the investment protocols of the Southern African Development Community (SADC).

Scope Conditions: Resource nationalism succeeds where four conditions are met: (a) the state possesses or can acquire credible processing capacity, whether through state-owned enterprises, joint ventures, or foreign direct investment; (b) energy and transport infrastructure are adequate to support industrial operations; (c) the state can enforce the restriction without creating large black markets; and (d) the policy is accompanied by complementary measures—skills development, research and development, and fiscal incentives—that build the ecosystem around the ban or initiative. It fails where these conditions are absent, producing the "resource curse" dynamics that Mamdani and others have analyzed: elite capture, smuggling, and the substitution of one form of rent-seeking for another. Zimbabwe's ban illustrates the failure mode: without processing capacity, the ban generated stockpiling and smuggling rather than value addition, and the government was forced to partially relax enforcement while seeking investors for local plants. The DRC-Zambia initiative illustrates the ambition mode: the pooling of endowments is theoretically sound, but the binding constraints of energy and capital mean the outcome remains uncertain.

Observable Implications: For Zimbabwe: lithium concentrate stockpiling volumes, smuggling estimates, the number and capacity of domestic processing plants licensed, FDI inflows into lithium processing, and any WTO dispute notifications. For the DRC-Zambia initiative: progress on feasibility studies, power purchase agreements, financing commitments, and the construction of precursor or battery plants. More broadly, the spread of similar measures across Africa—Namibia's 2023 ban on unprocessed lithium and other critical mineral exports, Ghana's bauxite and manganese restrictions—would indicate a regional trend toward resource nationalism, while their reversal or non-enforcement would indicate the constraints are binding.

Perspective Note (five traditions in brief): The African perspective, drawing on Rodney, Nkrumah, and Cabral, frames resource nationalism as a necessary corrective to centuries of extractive colonialism and neocolonialism: the right to process one's own resources is an expression of sovereignty, and the failure of past initiatives reflects not the impossibility of industrialization but the structural obstacles—debt, energy deficits, skills gaps—that external powers have a hand in perpetuating. The Chinese perspective views African resource nationalism with pragmatic accommodation: Beijing has historically adapted to host-country regulations and may support local processing if it secures long-term offtake, but it resists measures that threaten the supply security of its refineries. The Russian perspective, drawing on its own experience of resource nationalism and state control of strategic sectors, is broadly sympathetic to African assertions of sovereignty, framing them as part of a multipolar challenge to Western-dominated trade rules. The Western perspective is divided: some actors support African value addition as consistent with "friend-shoring" and supply-chain diversification, while others worry that export bans distort markets, reduce supply, and risk WTO disputes

that could fragment the trading system. The UN perspective emphasizes the just transition and sustainable development, supporting value addition in principle but insisting on environmental and social safeguards, transparency through EITI, and compliance with international trade law.

2.7.1 African Perspective (PRIMARY)

The African perspective on critical minerals and techno-geopolitics is not a regional variant of a global debate; it is the vantage point from which the debate's foundational asymmetries become visible. To reconstruct it on its own terms requires beginning with the historical political economy of extraction rather than with contemporary supply-chain anxiety. The central claim, developed across generations of African scholarship, is that the continent's mineral wealth has been systematically converted into external industrialization while the sites of extraction remain underdeveloped, and that the current scramble for cobalt, copper, lithium, graphite, and rare earth elements risks reproducing this pattern unless African states can convert geological endowment into bargaining power and then into value-chain position. This is not merely a complaint about prices; it is a structural argument about the relationship between resource endowment, state capacity, and global production networks.

The theoretical lineage runs through several distinct but converging traditions. Walter Rodney's *How Europe Underdeveloped Africa* established the foundational mechanism: the extraction of raw materials from Africa and their processing in Europe was not a neutral market transaction but a transfer of surplus that financed European industrialization while foreclosing African industrialization. Rodney's argument was not that Africa lacked resources but that the *form* of integration into the global economy—export of unprocessed commodities—locked in underdevelopment. Kwame Nkrumah's concept of neo-colonialism extended this: formal political independence could coexist with continued economic subordination through control of extraction, pricing, and technology. Julius Nyerere's Arusha Declaration and the broader Ujamaa project attempted to break this pattern through state-led development, with mixed results that themselves became objects of scholarly debate. Amílcar Cabral's insistence on the "return to the source" and on the cultural and political dimensions of liberation added a dimension that pure economics misses: resource sovereignty is also about who defines development. Frantz Fanon's analysis of the "pitfalls of national consciousness" warned that post-colonial elites might simply replace colonial extractors without transforming the structure, a warning that resonates in contemporary debates about whether African resource nationalism serves broad publics or narrow oligarchies.

Contemporary African scholarship has refined and complicated these foundations. Siba N. Grovogui's work on sovereignty and international order argues that African states' claims to resource sovereignty are not merely economic demands but challenges to the epistemic and legal frameworks that have historically defined "development" and "property" in ways that disadvantage the global South. For Grovogui, the international legal order is not neutral; it encodes particular distributions of power, and African resource nationalism must be understood as a contestation of that order, not just a bid for higher rents. Achille Mbembe's concept of "necropolitics" and his broader analysis of the postcolony illuminate how extraction zones become spaces where life is subordinated to accumulation, where the violence of mining—environmental degradation, displacement, labor exploitation—is not an externality but constitutive of the value chain. Mbembe's work suggests that the critical minerals boom cannot be evaluated solely by export revenues or GDP growth; it must be evaluated by what happens to bodies, ecologies, and communities in the extraction zones. Jean-François Bayart's concept of "extraversion"—the idea that African political economies are structured around the externalization of resources and the internalization of rents—provides a mechanism for understanding

why resource wealth often fails to translate into broad development: the state's relationship to the global economy shapes its relationship to its own citizens. Mahmood Mamdani's analysis of the bifurcated state and of colonial legal categories helps explain why resource governance in Africa often operates through dual systems—formal statutory law and customary authority—that create ambiguities exploitable by both foreign investors and domestic elites.

Oyèrónkẹ́ Oyěwùmí's feminist scholarship on the "invention of women" and on Yoruba social organization, while not focused on minerals, contributes a methodological insistence that categories like "labor," "community," and "household" in resource economies are gendered constructions that obscure women's work and women's losses in extraction zones. Sylvia Tamale's work on African feminism and decolonization extends this, arguing that resource governance must be evaluated through intersectional lenses that mainstream supply-chain analysis ignores. Emmanuel Aning and Kwesi Aning's security studies work connects mineral extraction to conflict dynamics, showing how resource rents finance armed groups and how the "conflict minerals" framing can be both a genuine governance tool and a mechanism of external control. Kwesi Danso's work on African agency in international relations challenges the assumption that African states are merely objects of great-power competition, insisting that they have strategic interests and bargaining capacity that external analyses often underestimate.

The central puzzle from the African vantage point is not whether Africa has minerals—it does, in abundance—but whether the current moment of heightened global demand creates a genuine opportunity for structural transformation or merely a new iteration of the resource curse. The DRC holds roughly two-thirds of global cobalt reserves and is a major copper producer; Zambia is a significant copper producer; Zimbabwe has substantial lithium deposits; Namibia, Mozambique, and Tanzania have graphite; South Africa and others have rare earth potential. Yet the value capture is minimal. Cobalt mined in the DRC is refined predominantly in China; copper concentrates are smelted abroad; lithium is exported as spodumene concentrate for processing elsewhere; graphite is processed into battery-grade material outside Africa. The gap between geological endowment and economic capture is the defining feature of the African position.

The mechanism of upward mobility, as African policymakers and scholars frame it, requires moving from extraction to refining to manufacturing. The DRC-Zambia battery value chain initiative, announced in 2023, represents an attempt to build a regional battery manufacturing hub, leveraging the two countries' combined mineral endowments. Zimbabwe's 2022 ban on raw lithium exports represents a more aggressive form of resource nationalism, forcing domestic processing. These initiatives are not merely economic policies; they are assertions of sovereignty that challenge the global division of labor in which Africa supplies raw materials and others capture value through technology and capital.

The African perspective contributes what the other four cannot: a historically grounded account of why the current supply chain looks the way it does, an insistence that "development" must be defined by Africans rather than by external metrics, and a recognition that the minerals in question are not just inputs to green transitions elsewhere but potential foundations of African industrialization. It centers the question of who benefits from the energy transition and whether the transition will reproduce or transform global inequalities. It also foregrounds the lived experience of extraction zones—environmental destruction, labor conditions, community displacement—that supply-chain security frameworks treat as externalities.

What the African perspective occludes, or at least underweights, is significant. It can romanticize state capacity, understating the governance deficits, corruption, and elite capture that have historically diverted resource rents from public investment. It can understate intra-African competition and the difficulty of regional coordination, as the DRC-Zambia initiative's slow progress illustrates. It can treat "the West" and "China" as

monolithic actors, missing the internal divisions that create bargaining opportunities. It can underweight the genuine technological and capital constraints that make rapid value-chain upgrading difficult regardless of political will. And it can, in its most nationalist forms, risk WTO disputes and investment deterrence that harm the very populations it aims to serve. The strongest internal critique, voiced by scholars like Bayart and Mamdani, is that resource nationalism without institutional transformation may simply redistribute rents among elites rather than transform structures.

The African vantage point also reveals something the other perspectives miss about the temporal dimension of the critical minerals boom. The window for value-chain upgrading may be narrow: battery chemistries are evolving, with shifts toward lithium iron phosphate and sodium-ion batteries that reduce cobalt dependence; recycling technologies are advancing; and alternative supply sources are being developed. If African states do not capture value now, the geological advantage may depreciate. This creates urgency that the African perspective emphasizes and that slower-moving governance frameworks may not accommodate. At the same time, the perspective insists that urgency must not justify sacrificing environmental and social standards—a tension that the UN perspective shares but that the African perspective frames as a matter of justice rather than compliance.

In sum, the African perspective treats critical minerals as a test case for whether the post-colonial state can convert sovereignty into development. It draws on a rich theoretical tradition that sees extraction not as a market failure but as a structural feature of global capitalism, and it insists that the current moment offers both opportunity and risk. Its contribution is indispensable; its limitations are real and must be engaged rather than dismissed.

2.7.2 Chinese Perspective

The Chinese perspective on African critical minerals is best understood through the lens of state-backed supply-chain construction and developmental partnership, not through the Western framing of "resource grab." China's engagement with African minerals is long-standing, dating to the early 2000s and accelerating with the Belt and Road Initiative, but it has acquired new strategic significance with the global energy transition and the US-China technology competition. The core claim is that China has built, through state-directed investment and long-term offtake agreements, a dominant position in the processing and refining of critical minerals, and that this position is now a strategic asset in techno-geopolitical competition.

The theoretical lineage draws on Chinese developmental state theory and on the concept of "going out" (zou chuqu), the policy framework that encouraged Chinese firms to invest overseas. Chinese scholarship and policy discourse frame this engagement in terms of mutual benefit and "win-win" cooperation, emphasizing infrastructure development, employment, and technology transfer. The mechanism is state-backed capital: Chinese policy banks, state-owned enterprises, and sovereign wealth vehicles provide financing that Western private capital often does not, particularly in high-risk environments. This enables Chinese firms to secure long-term offtake agreements and to build processing capacity, creating vertical integration from mine to refined product to battery manufacturing.

China's position is formidable. It dominates cobalt refining, copper smelting, lithium processing, and graphite purification. The DRC's cobalt flows predominantly to Chinese refiners. Chinese firms have invested heavily in African mining assets, including in the DRC, Zambia, Zimbabwe, and Namibia. The China-DRC "infrastructure-for-minerals" deals of the late 2000s, though controversial, established a model of resource-backed development financing that China has replicated and refined. More recently, Chinese firms have moved downstream, investing in battery manufacturing and electric vehicle production, creating

a vertically integrated chain that few other actors can match.

The Chinese perspective contributes several things the others miss. First, it demonstrates that state-directed capital can build supply-chain position in ways that market-driven Western investment has not, at least not at comparable speed and scale. Second, it provides an alternative to the Western "friend-shoring" model, one that does not condition engagement on governance benchmarks that African states may find intrusive. Third, it offers African states a bargaining partner that is less likely to impose political conditionality, though it may impose other forms of leverage through debt and offtake terms.

What the Chinese perspective occludes is equally important. It tends to understate the environmental and social costs of extraction in African mining zones, treating them as host-country responsibilities. It underweights concerns about labor standards, community displacement, and ecological degradation that African civil society and international NGOs raise. It can frame "mutual benefit" in ways that obscure asymmetric power: Chinese firms' control of refining and manufacturing means that even when African states capture more rent at the mine gate, the high-value segments remain Chinese. The perspective also underweights the geopolitical risks of over-dependence: African states that align too closely with Chinese supply chains may find themselves caught in US-China decoupling dynamics, facing secondary sanctions or market access restrictions. Chinese scholarship and policy discourse rarely acknowledge these risks from the African side, focusing instead on the bilateral relationship.

The Chinese perspective also reveals the limits of Western supply-chain security strategies. If the goal is to reduce dependence on Chinese processing, the alternative is not simply to mine more in Africa but to build refining and manufacturing capacity elsewhere—a capital-intensive, time-consuming process that the Inflation Reduction Act and Critical Raw Materials Act attempt to incentivize but cannot achieve quickly. China's head start in processing is a structural fact that no policy can erase in the short term. This is a contribution to realism that the Western perspective sometimes lacks.

In sum, the Chinese perspective treats African critical minerals as one node in a state-directed global supply chain that China has built over two decades. It emphasizes partnership and mutual benefit while occluding environmental, social, and geopolitical risks. Its strength is its demonstrated capacity to mobilize capital and build vertical integration; its weakness is its tendency to treat African states as suppliers rather than as partners in value creation.

2.7.3 Russian Perspective

The Russian perspective on African critical minerals is shaped by Russia's own identity as a resource state, its experience of Western sanctions, and its broader anti-hegemonic framing of international order. Russia is itself a major producer of several critical minerals, including nickel, palladium, and various rare earths, and it has been targeted by Western sanctions that restrict its access to technology and markets. This experience informs a perspective that is broadly sympathetic to African assertions of resource sovereignty and that frames Western supply-chain security initiatives as instruments of hegemonic control rather than as neutral responses to market failure.

The theoretical lineage draws on Russian geopolitical thought, particularly the tradition of Eurasianism and the concept of multipolarity. Russian scholarship and policy discourse frame the international system as one in which a declining Western hegemon seeks to maintain control through institutional and economic mechanisms, including trade rules, financial systems, and now supply-chain governance. The mechanism of Western power, in this view, is not just military but structural: the ability to define the terms of trade, to set standards, and to exclude non-compliant actors. African resource nationalism is thus read as part of a

broader multipolar challenge to this hegemony.

Russia's direct engagement with African critical minerals is more limited than China's but not negligible. Russian firms, including state-backed entities, have invested in mining projects in several African countries, and Russia has sought to expand its presence in the continent's resource sector as part of its broader geopolitical pivot. The Wagner Group and its successor structures have been involved in resource extraction in conflict zones, though this is more prominent in gold and diamonds than in critical minerals for batteries. Russia's nuclear energy cooperation with some African states, including agreements on uranium and nuclear technology, represents another dimension of resource-related engagement.

The Russian perspective contributes an important corrective to Western narratives: it insists that "supply-chain security" and "friend-shoring" are not neutral technical concepts but political projects that serve particular interests. It highlights the hypocrisy of Western actors who promote free trade when it suits them and restrict it when it does not, and who invoke WTO rules against African export bans while themselves subsidizing domestic production through the Inflation Reduction Act. This critique has force, particularly when Western actors simultaneously demand that African states open their markets and restrict their own exports of processed materials.

What the Russian perspective occludes is substantial. It tends to treat African agency as derivative of great-power competition, subordinating African interests to the anti-hegemonic project. It underweights the genuine governance challenges in African resource sectors and the legitimate concerns about environmental and social standards. It can romanticize state control of resources, ignoring the inefficiencies and corruption that have plagued state-led extraction in many contexts, including Russia's own. And it offers little in the way of practical support for African value-chain upgrading: Russia's own industrial base is weakened by sanctions, and its capacity to provide technology, capital, or market access for African refining and manufacturing is limited. The perspective is more useful as critique than as construction.

The Russian perspective also reveals the limits of framing African resource nationalism purely in terms of great-power alignment. African states are not simply choosing between Western and Chinese (or Russian) models; they are attempting to navigate a complex landscape in which all external actors have interests that may not align with African development goals. The Russian framing, by reducing this to a multipolar struggle, risks obscuring the specific, contingent bargains that African states must strike.

In sum, the Russian perspective offers a valuable critique of Western hegemony and a degree of sympathy for African sovereignty claims, but it contributes little to the practical challenge of value-chain upgrading and tends to subordinate African agency to geopolitical competition. Its strength is its diagnostic clarity about power; its weakness is its lack of constructive capacity.

2.7.4 Western Perspective

The Western perspective on African critical minerals is organized around supply-chain security, friend-shoring, and the risk of peripheralization. It is not monolithic—encompassing US, EU, and allied positions that differ in emphasis—but it shares a common premise: that dependence on concentrated supply chains, particularly those running through China, poses strategic vulnerabilities that must be addressed through diversification, domestic production, and partnership with "like-minded" countries. Africa figures in this perspective primarily as a source of raw materials and, secondarily, as a potential partner in a reconfigured supply chain that reduces Western dependence on China.

The theoretical lineage draws on strategic trade theory, supply-chain risk management, and the emerging literature on "weaponized interdependence." The mechanism is straightforward: critical minerals are inputs

to technologies—batteries, semiconductors, defense systems—that underpin both economic competitiveness and military capability. Concentration of supply, whether in China for processing or in a few African countries for extraction, creates vulnerabilities that adversaries can exploit. The policy response includes the US Inflation Reduction Act (IRA), which provides tax credits for electric vehicles whose battery minerals are sourced from the US or free-trade-agreement partners; the EU Critical Raw Materials Act (CRMA), which sets targets for domestic extraction, processing, and recycling; and the Minerals Security Partnership (MSP), a multilateral initiative to catalyze investment in critical mineral supply chains. These instruments aim to build "friend-shored" supply chains that exclude or reduce dependence on China.

The Western perspective contributes genuine analytical value. It correctly identifies the concentration risk in critical mineral supply chains and the strategic implications of Chinese dominance in processing. It has mobilized significant capital and policy attention toward diversification. And it has, in some instances, supported African value addition: the MSP includes African partners, and some Western firms have invested in African refining and manufacturing projects. The "friend-shoring" concept, at its best, implies a partnership model rather than a purely extractive one.

What the Western perspective occludes is, however, substantial and structurally significant. First, it tends to treat Africa as a source of supply rather than as a site of value creation, reproducing the very peripheralization it claims to oppose. The IRA's sourcing requirements, for instance, favor US and FTA partners, which does not include most African countries; this creates incentives to extract in Africa but process elsewhere, precisely the pattern African states seek to reverse. Second, it underweights the historical dimension: the current supply chain concentration is not a natural market outcome but the result of decades of Western deindustrialization in processing and deliberate Chinese industrial policy. Blaming China for "dominance" while ignoring Western choices that enabled it is analytically incomplete. Third, it can treat African resource nationalism—export bans, local content requirements, state equity demands—as market distortions rather than as legitimate development strategies, revealing a double standard when Western states themselves subsidize domestic production. Fourth, it underweights the environmental and social costs of extraction, treating them as host-country issues rather than as shared responsibilities in a global supply chain.

The Western perspective also reveals an internal tension that African and other critics exploit: the gap between rhetoric and practice. "Friend-shoring" implies partnership, but the actual flow of investment and technology transfer remains limited. Western firms are often reluctant to invest in African processing because of risk perceptions, infrastructure gaps, and the availability of cheaper Chinese alternatives. The result is that Western policy creates demand for diversified supply without creating the conditions for African value addition, potentially leaving African states with the same extractive role but with more competitors.

The strongest Western counterargument to African resource nationalism is that export bans reduce global supply, raise prices, and may violate WTO commitments, ultimately harming the very industries—green technology, electric vehicles—that the energy transition requires. This argument has force but is weakened by the fact that Western states themselves restrict exports of critical technologies and subsidize domestic production, suggesting that the rules are applied asymmetrically.

In sum, the Western perspective offers a necessary analysis of supply-chain concentration and strategic vulnerability but tends to reproduce peripheralization by treating Africa as a source rather than a partner. Its strength is its capacity to mobilize capital and policy; its weakness is its failure to align supply-chain security with African value-chain upgrading.

2.7.5 UN Perspective

The UN perspective on African critical minerals is organized around resource governance, the Extractive Industries Transparency Initiative (EITI), and the just transition. It is not a single actor but a constellation of agencies, frameworks, and norms—the UN Environment Programme, UNCTAD, the UN Development Programme, the Sustainable Development Goals, and various expert panels and reports—that share a common emphasis on sustainable development, human rights, environmental protection, and inclusive governance. The core claim is that the critical minerals boom must be managed in ways that advance sustainable development, protect communities and ecosystems, and ensure that the benefits of extraction are shared equitably.

The theoretical lineage draws on the sustainable development paradigm, human rights law, and the resource governance literature. The mechanism is normative and institutional: international frameworks, transparency initiatives, and capacity-building programs aim to improve governance in resource-rich countries, reduce corruption, and ensure that extraction contributes to development rather than to conflict and environmental degradation. EITI, launched in 2003, is the flagship instrument, requiring participating countries to disclose payments from extractive companies to governments and vice versa. The UN's framing of the "just transition" extends this to the energy transition, insisting that the shift to renewable energy must not reproduce the injustices of the fossil fuel era.

The UN perspective contributes several things the others miss. First, it centers the environmental and social costs of extraction that supply-chain security frameworks treat as externalities. Mining for cobalt, copper, lithium, and graphite has significant environmental impacts—water pollution, deforestation, biodiversity loss, carbon emissions from processing—that the UN system has documented extensively. Second, it provides a framework for evaluating whether extraction benefits local communities, through concepts like free, prior, and informed consent (FPIC), benefit-sharing, and local content. Third, it insists on the rights of indigenous and affected communities, a dimension that state-centric perspectives often ignore. Fourth, it offers a global public-goods framing: the energy transition is a global challenge, and its mineral inputs should be governed by principles of equity and sustainability, not just by market or strategic logic.

What the UN perspective occludes is also significant. First, it can be overly procedural, focusing on transparency and governance standards without addressing the structural power asymmetries that determine who captures value. EITI disclosure is valuable but does not by itself change the distribution of rents or the location of refining. Second, it tends to treat "good governance" as a technical challenge rather than a political one, underweighting the ways in which external actors—multinational corporations, great powers, international financial institutions—shape the governance environment. Third, it can impose standards that African states find burdensome or that serve as barriers to entry, particularly for smaller firms and artisanal miners. Fourth, its emphasis on compliance with international trade law can conflict with African resource nationalism: the UN system generally supports WTO rules, which may constrain export bans and local content requirements that African states view as development tools.

The UN perspective also reveals a tension between the just transition and the critical minerals boom that it does not fully resolve. The energy transition requires massive mineral extraction, which has environmental and social costs; the UN system advocates for both the transition and for sustainable, rights-respecting extraction, but the practical reconciliation of these goals is difficult. The UN's response has been to promote "responsible sourcing" and "sustainable mining" standards, but these are voluntary and unevenly enforced. The gap between normative aspiration and material reality is a persistent feature of the UN perspective.

The UN perspective's strength is its normative comprehensiveness and its attention to environmental and social justice. Its weakness is its tendency to substitute governance procedures for structural change, and its difficulty in reconciling the competing demands of transition speed, supply security, and justice. For

African states, the UN perspective is both an ally—providing frameworks for demanding better terms—and a constraint—imposing standards that may limit policy space.

In sum, the UN perspective treats critical minerals as a governance challenge within a broader sustainable development agenda. It contributes indispensable attention to environmental and social justice but occludes structural power and can impose constraints on African policy autonomy. Its value lies in its normative framing; its limitation lies in its institutional weakness relative to the economic and geopolitical forces it seeks to govern.

2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Centers resource sovereignty and value-chain upgrading; reveals extraction as structural dependency reproduced across colonial and post-colonial regimes	May understate internal elite capture, governance failures, and the technical difficulty of refining at scale	Resource sovereignty, equitable development, African agency, and the right to industrialize	DRC-Zambia battery value chain initiative (2023); Zimbabwe's 2022 raw lithium export ban; cobalt-copper corridor politics	Western: state-led upgrading is inefficient, risks deterring investment, and may violate WTO commitments
Chinese	Demonstrates that state-backed coordination can secure offtake, finance infrastructure, and sustain long-term investment horizons	Downplays labor and environmental costs, debt implications, and the risk that Chinese firms dominate new value chains; frames commercial interest as partnership	Mutual benefit, South-South cooperation, non-interference, and developmental partnership	CMOC Tenke Fungurume operations; Huayou cobalt processing; DRC-Zambia infrastructure financing	African: reproduces extractive patterns without genuine local value addition or technology transfer

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Russian	Anti-hegemonic framing exposes Western hypocrisy in resource governance; offers rhetorical multipolarity and diplomatic support	Limited concrete mineral investment or technology transfer; own extractive record; gap between rhetoric and material capacity	Multipolarity, anti-imperialism, and resistance to Western conditionalities	Uranium and gold deals; diplomatic backing at UN forums; Wagner-linked security-mining arrangements	African: offers little value-chain investment, refining capacity, or industrialization support
Western	Brings ESG standards, transparency mechanisms, and supply diversification; IRA, MSP, and CRMA create demand-side incentives	Historical extractivism; "friend-shoring" may peripheralize Africa by sourcing raw materials while retaining refining at home	Rules-based order, supply-chain security, sustainability, and market efficiency	IRA tax credits; Minerals Security Partnership; EU Critical Raw Materials Act	African: secures supply without enabling African upgrading; standards function as non-tariff barriers
UN	Provides normative frameworks (EITI, UNGPs, just transition); centers environmental and social justice and intergenerational equity	Substitutes governance procedures for structural change; weak enforcement; may constrain African policy space with standards	Sustainable development, human rights, transparency, and intergenerational equity	EITI implementation; UN Guiding Principles on Business and Human Rights; SDG 7 and 12 linkages	African: imposes standards that limit industrial policy space and slow transition speed

2.8 WORKED EXAMPLE (I do)

Case: The DRC-Zambia Battery Value Chain Initiative (2023)

In April 2023, the Democratic Republic of the Congo and Zambia signed a memorandum of understanding to establish a joint battery and electric vehicle value chain, anchored by a special economic zone straddling the border near Kolwezi and Ndola. The initiative proposes to move beyond the export of raw cobalt, copper, and lithium toward precursor manufacturing and, eventually, battery cell production. It is the most ambitious attempt by African states to capture value upstream in the critical minerals supply chain, and it sits at the intersection of resource sovereignty, great power competition, and the global energy transition.

Levels of Analysis

At the *individual* level, the initiative is shaped by the decisions of mining engineers, customs officials, small-scale miners, and community leaders whose daily practices determine whether harmonized regulations function or remain paper commitments. Individual entrepreneurs in Kolwezi and Ndola face capital constraints, skills gaps, and uncertain offtake guarantees; their willingness to invest in processing depends on expectations about state capacity and market access. At the *state* level, the DRC and Zambia governments must coordinate industrial policy, fiscal regimes, and infrastructure planning across a porous border, while managing relations with incumbent mining firms—many of them Chinese—that control the underlying resource base. State capacity, bureaucratic coordination, and the political economy of elite capture determine whether the SEZ becomes a genuine industrial platform or an enclave. At the *systemic* level, the initiative operates within a global battery supply chain dominated by Chinese refining (roughly 70–80 percent of cobalt refining and a comparable share of lithium processing), Western demand-side incentives such as the US Inflation Reduction Act and the EU Critical Raw Materials Act, and price cycles that can make or break processing margins. The systemic structure constrains what either state can achieve unilaterally. At the *transnational* level, the initiative depends on cross-border infrastructure (the Lobito Corridor, power interconnections), regional trade frameworks (SADC, COMESA, the African Continental Free Trade Area), multinational mining companies, and external financiers. Transnational actors—Chinese offtakers, Western development banks, and regional institutions—shape the initiative's feasibility as much as domestic policy.

Mechanism

The causal mechanism runs as follows. First, resource endowment (DRC cobalt and copper, Zambian copper) creates a potential comparative advantage in battery precursors. Second, state-led industrial policy—harmonized regulations, a joint SEZ, and targeted incentives—attempts to convert that endowment into processing capacity rather than raw export. Third, regional integration reduces transaction costs and pools markets, addressing the scale problem that has historically defeated single-country industrialization in Africa. Fourth, external financing and technology transfer—whether from Chinese, Western, or multilateral sources—determines whether the physical infrastructure and technical know-how materialize. The mechanism is contingent at every stage: resource endowment does not automatically generate processing; state coordination does not guarantee implementation; regional integration does not ensure competitiveness; and external partners may prefer to retain refining in their own jurisdictions. The initiative's success therefore depends on a chain of conditionalities, each of which can be broken by capital gaps, energy deficits (both countries face chronic power shortages), governance failures, or shifts in global demand.

The deeper mechanism is political. Drawing on Nkrumah's analysis of neo-colonialism and Rodney's theory of underdevelopment, the initiative represents an attempt to break the extractive enclave by capturing value at the refining and precursor stages. But as Bayart's "politics of the belly" suggests, the same mineral wealth that funds industrial ambition also funds elite capture; the SEZ may become a rent-seeking arena rather than a development platform. Mamdani's critique of the bifurcated state—where modern institutions coexist with decentralized despotism—raises the question of whether regulatory harmonization can be enforced

across territories where state authority is fragmented. The mechanism is thus not merely economic but political: value-chain upgrading requires a state capable of disciplining capital, coordinating across borders, and resisting both external pressure and internal predation.

Perspective Reconstruction

African (primary, longest): The initiative is best understood as an assertion of resource sovereignty and a bid for upward mobility in the global battery supply chain. African scholars from Nkrumah through Rodney have argued that raw material export reproduces dependency; the SEZ is a concrete attempt to reverse that pattern. The joint framework reflects a regionalist strategy—pooling sovereignty to counter bilateral dependency on external powers—and aligns with the African Continental Free Trade Area's logic of scale. The African perspective also insists on the politics of bargaining: DRC and Zambia are not passive recipients of investment but actors leveraging mineral endowments to demand better terms. Yet this perspective, taken alone, risks underestimating the binding constraints of capital, technology, and energy. It can romanticize state capacity and understate the risk that the initiative becomes another enclave, benefiting elites and foreign firms while leaving communities impoverished. The African vantage point reveals what others miss: the historical depth of extraction as a structure, and the political necessity of industrialization as a sovereignty project. It occludes, however, the technical and financial barriers that make refining genuinely difficult.

Chinese: Beijing views the initiative through the lens of supply-chain security and developmental partnership. Chinese firms—CMOC, Zijin, Huayou—hold significant copper-cobalt assets in both countries, and a regional processing hub could secure offtake while reducing logistics costs. The Chinese perspective emphasizes infrastructure financing and long-term investment horizons, and it would likely support the initiative if Chinese firms retain a dominant role in processing. What it occludes is the risk that Chinese dominance of the new value chain reproduces dependency under a different flag, and that labor and environmental standards may be diluted in the pursuit of speed and cost. The Chinese contribution is material: capital and construction capacity. Its limitation is that partnership may shade into control.

Russian: Moscow would frame the initiative within an anti-hegemonic narrative, rhetorically supporting African industrialization as a challenge to Western dominance. In practice, Russia has limited mineral investment or technology transfer capacity in the DRC-Zambia corridor; its role is primarily diplomatic and discursive. The Russian perspective contributes a critique of Western conditionalities but occludes its own extractive record and its inability to deliver value-chain upgrading. Its strongest claim is normative—multipolarity—but its material contribution is thin.

Western: Washington and Brussels interpret the initiative through supply-chain security and friend-shoring. The US Inflation Reduction Act and the EU Critical Raw Materials Act create demand-side incentives that could, in principle, support African processing if the output qualifies for preferential access. The Western perspective contributes attention to ESG standards, transparency, and governance, and it worries about Chinese dominance of the new hub. What it occludes is the possibility that Western frameworks prefer raw material exports to Western refineries over African industrialization—that "friend-shoring" may peripheralize Africa by sourcing cobalt in Kolwezi while refining in Texas or Finland. The Western stance is normatively attractive (rules, standards, sustainability) but structurally self-interested.

UN: The UN perspective frames the initiative within sustainable development and just transition. It emphasizes EITI compliance, environmental and social safeguards, community benefit, and intergenerational equity. Its contribution is normative guardrails: without them, the SEZ risks becoming a pollution and labor-abuse enclave. What it occludes is structural power—it treats governance as the binding constraint

rather than capital, technology, and energy gaps—and it may constrain African policy space by imposing standards that raise costs and slow implementation. The UN perspective is an ally in demanding better terms but a constraint on the speed and autonomy of industrialization.

Explicit Adjudication

The African perspective best explains the initiative's motivations and its significance: it captures the political economy of bargaining, the historical legacy of extraction, and the sovereignty logic that drives DRC and Zambia to attempt upward mobility. No other perspective takes African agency as seriously or situates the initiative within the longue durée of resource dependency. However, the African perspective underestimates the binding constraints that the Chinese, Western, and UN perspectives highlight—capital intensity, technology gaps, energy deficits, and governance capacity. The best explanation is therefore synthetic: the initiative is a genuine and politically necessary attempt at value-chain upgrading whose feasibility is determined by transnational capital and technology flows that African states do not control. The African perspective misses the extent to which the initiative's success depends on whether external powers—Chinese offtakers, Western standard-setters, multilateral financiers—permit African industrialization or prefer to retain refining dominance. The case adjudicates in favor of African agency as the driver but systemic and transnational constraints as the limit.

SECTION 2.9 PROBLEM PAIR (We do)

Tasks

1. **Mechanism.** Trace the causal chain from Zimbabwe's December 2022 ban on raw lithium exports to its intended outcome of domestic value capture. Identify the intermediate steps and the point at which the chain is most fragile.
2. **Level of analysis.** Is the ban primarily a state-level, systemic, or transnational phenomenon? Justify your classification and note what each level reveals and obscures.
3. **Perspective reconstruction.** Reconstruct how the African resource-sovereignty, Chinese state-backed, Western supply-chain security, Russian anti-hegemonic, and UN governance perspectives would each frame the ban.
4. **Historical analogue.** Compare the ban to Indonesia's nickel export restrictions (2014/2020) and the DRC's 2018 mining code revision. What transfers, and what does not?
5. **Falsifiers.** List three to five pieces of evidence that would disprove the claim that the ban successfully upgraded Zimbabwe's position in the lithium value chain.
6. **Description, explanation, prediction, prescription.** Distinguish what the ban did, why it was adopted, what it is likely to achieve, and what policy complements would be required for success.

MODEL ANSWER

Zimbabwe's December 2022 prohibition on raw lithium exports operates through a mechanism that is simple in design but fragile in execution: by criminalizing the export of unprocessed ore, the state attempts to force downstream processing—concentrate production, then chemical conversion—onto domestic soil, thereby capturing a larger share of value added and creating industrial employment. The causal chain runs from policy lever (export prohibition) through intermediate effect (investor relocation of processing capacity) to outcome (domestic value capture). Yet each link is contingent. Processing requires reliable energy, water,

reagents, skilled labor, and capital; Zimbabwe's infrastructure deficits mean the ban alone cannot conjure a refining industry. The mechanism is therefore better understood as a bargaining instrument than as a self-sufficient industrial policy: it raises the cost of extraction for foreign firms and signals sovereign intent, but value capture depends on complementary investments that the ban does not itself generate.

At the level of analysis, the ban is primarily a state-level act with systemic and transnational reverberations. The state is the unit that legislates and enforces; but the decision is unintelligible without the systemic context of surging global lithium demand driven by electric-vehicle transitions and the transnational structure of Chinese-dominated processing. Zimbabwe's agency is real but bounded: it can withhold ore, yet it cannot independently set prices or standards in a market where refining capacity is concentrated in China. The transnational dimension appears in the immediate response—Chinese firms already operating in Zimbabwe, including Prospect Lithium Zimbabwe and Bikita Minerals, accelerated local processing plans—suggesting the ban functioned as a credible commitment device within an asymmetric bargaining relationship rather than as autarky.

Reconstructed from five perspectives, the ban looks different. From an African resource-sovereignty vantage, it is a legitimate assertion of permanent sovereignty over natural resources, correcting a colonial pattern in which raw materials leave and value returns as finished goods; the ban is read as a necessary, if blunt, corrective to extractive enclaves. From a Chinese perspective, the ban is a manageable friction in a developmental partnership: Chinese firms adapt by investing in local processing, consistent with Beijing's stated preference for industrialization in partner countries, though the risk of stranded assets and policy unpredictability is noted. From a Western supply-chain security perspective, the ban is a warning about concentration risk and the fragility of friend-shoring strategies that depend on predictable African supply; it reinforces the case for diversified sourcing and for Western investment in processing capacity outside China. From a Russian anti-hegemonic perspective, the ban exemplifies Global South resistance to Western-dominated value chains and the weaponization of resource control against unipolar economic structures, though Moscow's own interest in African minerals complicates the solidarity narrative. From a UN governance perspective, the ban raises questions about WTO consistency—export restrictions on raw materials are permitted under GATT Article XI exceptions but must not constitute arbitrary discrimination—about EITI transparency in licensing, and about whether the transition to processing will be "just," respecting labor rights, environmental standards, and community consent.

The closest historical analogue is Indonesia's 2014 and 2020 nickel export bans, which did attract significant downstream investment and transformed Indonesia into a major nickel-processing hub. What transfers is the logic of using export restrictions to force processing relocation; what does not transfer cleanly is Indonesia's larger domestic market, greater fiscal capacity, more developed infrastructure, and the specific structure of Chinese investment in Indonesian stainless steel and battery precursors. Zimbabwe's smaller scale and weaker state capacity mean the Indonesian outcome is an upper bound, not a baseline. A secondary analogue is the DRC's 2018 mining code revision, which raised royalties and introduced "strategic minerals" categories; like Zimbabwe's ban, it combined revenue extraction with sovereignty signaling, but its implementation was diluted by renegotiation and investor pushback.

Falsifiers of the claim that the ban upgraded Zimbabwe's value-chain position would include: continued export of lithium concentrate or ore through loopholes or smuggling; absence of commissioned chemical-conversion plants by 2026; declining fiscal revenue from lithium as production shifts to informal channels; increased import dependence on processed lithium products; a WTO dispute settlement ruling against the ban; or investor exit without replacement. Conversely, confirming evidence would be commissioned processing

facilities, rising export value per ton, increased formal employment in processing, and technology transfer agreements.

The ban illustrates the distinction between description (what happened: an export prohibition), explanation (why: sovereign bargaining and industrial ambition), prediction (likely partial success contingent on infrastructure and investment), and prescription (what should be done: pair bans with energy, infrastructure, skills, and transparent licensing). The lesson is that resource nationalism is a necessary but insufficient condition for value-chain upgrading; without complementary state capacity, it risks becoming a revenue-losing gesture.

SECTION 2.10 INDEPENDENT MEMO (You do)

Instructions only. Do not write a sample memo.

(a) Case description (150–200 words). In 2023, the Democratic Republic of Congo and Zambia signed a memorandum of understanding to jointly develop a battery value chain, including a special economic zone for precursor manufacturing, with support from the African Development Bank and the US-backed Minerals Security Partnership. The initiative aims to move both countries from cobalt and copper extraction into cathode precursor production. Despite high-level commitments, as of 2024 no commercial-scale precursor plant is operational; feasibility studies are ongoing, and the zone lacks reliable power and transport links. Chinese firms dominate existing cobalt refining; Western partners have pledged technical assistance but limited capital. The case asks whether this initiative represents genuine upward mobility or aspirational diplomacy.

(b) Required memo headings as prompts.

- **Mechanism:** Trace the causal chain from the DRC-Zambia MoU to intended value capture. Where is the chain most fragile, and what complementary inputs are missing?
- **Perspective reconstruction:** How would African resource-sovereignty, Chinese state-backed, Western supply-chain security, Russian anti-hegemonic, and UN governance perspectives each frame this initiative?
- **Historical analogue:** Compare to a prior attempt at African value-chain upgrading (e.g., DRC's 2018 mining code, or Indonesia's nickel downstreaming). What transfers, what does not?
- **Falsifiers:** What evidence would disprove the claim that the initiative has upgraded either country's position in the battery value chain?

(c) Self-check. Before submitting, verify that you have distinguished description (what happened), explanation (why), prediction (what is likely), and prescription (what should be done), and that no single perspective is treated as settled truth.

SECTION 2.11 HINGE QUESTION

Question. Zimbabwe's 2022 raw lithium export ban is best understood as:

A. A successful industrial policy that has already moved Zimbabwe into battery-grade lithium processing. B. A bargaining instrument whose value-capture outcome depends on complementary infrastructure and investment, with Indonesia's nickel ban as an upper-bound analogue. C. A WTO-prohibited measure with no legal basis under GATT exceptions. D. A purely symbolic gesture with no effect on investor behavior.

Distractor diagnoses.

- **A** conflates policy intent with realized outcome; it ignores the absence of commissioned chemical-conversion plants and the infrastructure deficits that constrain processing.
- **C** overstates WTO illegality; export restrictions on raw materials may be justified under GATT Article XI exceptions provided they are non-discriminatory and not arbitrary.
- **D** ignores documented evidence that Chinese firms already operating in Zimbabwe accelerated local processing plans in response to the ban.
- **B is correct** because it captures the mechanism (bargaining instrument), the contingency (complementary infrastructure and investment), and the appropriate historical comparator (Indonesia as upper bound, not baseline).

SECTION 2A — DATA LAB

Table 1. African Critical Mineral Endowment (approximate shares of global reserves and production, USGS Mineral Commodity Summaries, 2023–2024)

Mineral	Primary African holders	Approx. share of global reserves	Approx. share of global production	Key non-African competitor
Cobalt	DRC (Katanga/Copperbelt)	~50–55%	~70%	Indonesia (by-product nickel), Russia
Copper	DRC, Zambia	~6–8% combined	~10–12%	Chile, Peru
Lithium (hard rock/spodumene)	Zimbabwe, Namibia, Mali, DRC	~5–8% (growing)	~3–5% (growing)	Australia, Chile, China
Graphite (natural)	Mozambique, Madagascar, Tanzania	~25–30%	~15–20%	China (~65% production)
Rare earth elements (REEs)	Burundi, Madagascar, South Africa, Tanzania	~5–8%	<5%	China (~60% reserves, ~90% processing)
Platinum group metals (PGMs)	South Africa	~80% (PGM reserves)	~70%	Russia, Zimbabwe (minor)
Manganese	South Africa, Gabon	~75%+	~40%	Australia, Brazil
Nickel (laterite)	(limited African share)	<5%	<5%	Indonesia, Philippines
Tantalum/coltan	DRC, Rwanda	~60%+	~50%+	Brazil, Australia

Note: Figures are indicative ranges drawn from USGS Mineral Commodity Summaries and IEA Critical Minerals Outlook (2024); exact percentages vary by year and by whether "reserves" or "resources" are counted. Cobalt and PGM figures are the most stable; lithium and graphite shares are rising rapidly as new projects reach production.

Table 2. Refining and Processing Concentration (share of global refining/processing capacity, IEA 2024)

Stage / Mineral	Dominant refiner	Approx. share	African refining share	Implication
Cobalt refining	China	~75–80%	<5% (DRC has limited capacity)	DRC exports concentrate; value added abroad
Lithium chemical processing	China	~60–65%	<2% (Zimbabwe banned raw export; processing nascent)	Ban creates pressure but capacity lags
REE separation/processing	China	~85–90%	negligible	No African REE refinery at scale
Copper smelting/refining	China (~40%), Chile, Japan	~40% (China)	~5–8% (DRC, Zambia smelters)	Some African midstream capacity exists
Graphite anode processing	China	~90%+	negligible	Mozambique exports flake; China converts
Battery cell manufacturing	China, South Korea, Japan	~75%+ (China dominant)	~0%	No African gigafactory at scale
EV assembly	China, EU, US	~60%+ (China)	negligible	Downstream entirely offshore

Table 3. Illustrative Value Capture by Stage (indicative share of final EV value, industry estimates)

Stage	Activity	Approx. share of final EV value	African presence today
1. Extraction	Mining ore/concentrate	1–5%	Strong (DRC, Zambia, Zimbabwe, etc.)
2. Beneficiation	Concentration, smelting	5–15%	Partial (copper smelters in DRC/Zambia)
3. Refining	Chemical conversion to battery-grade material	15–30%	Minimal
4. Precursor/cathode	Active material production	20–35%	None at scale
5. Cell manufacturing	Battery cells	25–40%	None
6. Pack/system integration	Battery packs, BMS	10–20%	None
7. Vehicle assembly	EV manufacturing	15–30%	None
8. Services/software	Charging, software, finance	10–25%	Minimal

Interpretation: The bulk of value (stages 3–7) is captured outside Africa. The DRC-Zambia battery initiative and Zimbabwe's export ban are attempts to shift African participation from Stage 1 toward Stages 2–4.

Five Analysis Questions

1. **Trend.** Between 2015 and 2024, African lithium and graphite production shares rose while cobalt's share of global production remained dominant but its share of global *reserves* stayed flat. What does this divergence between "reserves" and "production" imply about the difference between geological endowment and investable supply? Which African countries gained most, and which lost relative position?

2. **Level of analysis.** Table 1 shows country-level reserve shares; Table 2 shows firm- and country-level refining concentration; Table 3 shows stage-level value capture. At which level of analysis does the "resource curse" argument operate most persuasively, and at which level does the "value-chain upgrading" argument operate? Explain why conflating the two levels produces analytical error.

3. **Perspective reconstruction (all five).** Reconstruct how each of the five perspectives reads Table 2's refining concentration data: (a) African (resource sovereignty), (b) Chinese (developmental partnership), (c) Russian (anti-hegemonic), (d) Western (supply-chain security), (e) UN (resource governance/just transition). Which perspective best explains *why* refining concentrated in China rather than in Africa or the West?

4. **Interpretation.** Does the DRC-Zambia battery initiative (2023) represent a genuine attempt at upward mobility in the value chain, or a bargaining tactic to extract better terms from existing offtakers? Use Tables 2 and 3 to construct an argument for each reading, then adjudicate on the evidence available in 2024.

5. **Limitation.** What do these tables *not* capture that would be necessary to evaluate whether African resource nationalism (e.g., Zimbabwe's lithium ban) actually increases domestic value capture? Identify at least three missing variables and explain how their absence biases policy conclusions.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1: The Value-Chain Ladder with Perspective Overlays

What to draw: A vertical ladder with seven rungs, bottom to top: (1) Extraction (ore), (2) Beneficiation (concentrate), (3) Refining (battery-grade chemicals), (4) Precursor/Cathode, (5) Cell Manufacturing, (6) Pack Integration, (7) Vehicle/Device Assembly. Draw each rung as a horizontal bar whose width indicates approximate value capture (widest at top). Color-code: green for stages where Africa has meaningful presence (rungs 1–2), yellow for partial (rung 3 in copper only), red for absent (rungs 4–7).

Labels to place: On the left margin, label each rung with its stage name and approximate value-share range (from Table 3). On the right margin, annotate which countries dominate each rung (DRC/Zambia at rung 1–2; China at rungs 3–5; South Korea/Japan at rung 5; EU/US at rungs 6–7).

Perspective overlay to annotate: Draw five small icons or colored dots along the right side, one per perspective, each with a one-line claim: African (green): "Climb the ladder or stay poor"; Chinese (red): "We

built the ladder, we own the middle rungs"; Russian (orange): "Western monopoly replaced by Eastern monopoly"; Western (blue): "Friend-shore the middle rungs"; UN (purple): "Climb sustainably or not at all." Draw arrows showing where each perspective wants Africa to move.

Visual 2: Map of African Critical Mineral Endowment with Great-Power Overlays

What to draw: A simplified outline map of Africa. Place mineral icons (small circles labeled Co, Cu, Li, Gr, REE, Pt, Mn) at approximate locations: Co/Cu in DRC-Zambia Copperbelt; Li in Zimbabwe, Namibia, Mali; Gr in Mozambique, Madagascar, Tanzania; REE in Burundi, Madagascar, South Africa; Pt in South Africa (Bushveld); Mn in South Africa, Gabon. Draw three overlay layers as semi-transparent shaded regions: (a) Chinese offtake/processing dominance (shaded red, covering DRC-Zambia cobalt/copper flows to China); (b) Western friend-shoring interest (shaded blue, covering DRC cobalt and Zambia copper as MSP targets); (c) Russian presence (shaded orange, covering limited but growing interest in DRC, Zimbabwe, Mali).

Labels to place: Country names for the eight mineral-holding states; a legend distinguishing "reserve location" from "processing destination"; a small inset box showing "Refining destination: China ~75% of cobalt."

Perspective overlay to annotate: At the bottom, a five-column mini-table (one column per perspective) with a single keyword each: African = "sovereignty"; Chinese = "partnership"; Russian = "multipolarity"; Western = "security"; UN = "governance." Draw a compass rose labeled "Value flows north/east, not south."

Visual 3: The Peripheralization Risk Diagram

What to draw: A concentric-circle (target) diagram. Inner circle: "Core value capture (refining, cells, EVs)" — labeled China/EU/US. Middle ring: "Midstream (smelting, some refining)" — labeled DRC, Zambia, South Africa (partial). Outer ring: "Extraction only" — labeled most African producers. Draw arrows from outer ring to inner circle showing value flow; draw a dashed arrow labeled "DRC-Zambia battery initiative (2023)" attempting to move from outer to middle/inner. Draw a second dashed arrow labeled "Zimbabwe lithium ban (2022)" blocking the outer-to-inner flow.

Labels to place: Each ring labeled with its stage and dominant actors. Annotate the gap between rings as "the missing middle" (a concept from African industrialization literature). Add a small scale: "1 unit of ore value → 20–60 units of battery value."

Perspective overlay to annotate: Five small callout boxes around the diagram, each from one perspective, stating what the diagram shows and what it hides: African: "Shows the trap; hides our agency"; Chinese: "Shows efficiency; hides dependency"; Russian: "Shows Western hypocrisy; hides Russian absence"; Western: "Shows security risk; hides historical extraction"; UN: "Shows inequality; hides governance gaps." This visual teaches that the same diagram is read five ways.

SECTION 4 — CORNELL NOTES

Cue (prompt)	Notes (with source log)
What is the "value-capture problem" in African critical minerals?	Extraction yields 1–5% of final EV value; refining and manufacturing occur offshore, mainly in China. African states hold reserves but not midstream capacity. Source: IEA Critical Minerals Outlook (2024); Sanderson (2022).
Which African country dominates cobalt?	DRC holds ~50–55% of reserves and ~70% of production. Cobalt is a by-product of copper mining in the Katanga/Copperbelt. Source: USGS Mineral Commodity Summaries.
What is the DRC-Zambia battery initiative (2023)?	A bilateral agreement to develop a joint battery value chain (precursor materials, eventually cells) using DRC cobalt and Zambia copper, with Afreximbank and other partners. Aimed at upward mobility. Source: African Union / Afreximbank announcements (2023).
What did Zimbabwe's 2022 lithium ban do?	Banned export of raw lithium ore; required local processing. Aimed at value capture; faced capacity constraints and WTO-compliance questions. Source: Government of Zimbabwe (2022); trade press.
What is "peripheralization" in this context?	The risk that Western supply-chain security policies (IRA, MSP, CRMA) secure mineral access for Western industry without transferring refining/manufacturing capacity to Africa, leaving Africa as extraction periphery. Source: Kalantzakos (2020); Sanderson (2022).
What are IRA, MSP, CRMA?	US Inflation Reduction Act (2022) EV tax credits requiring non-Chinese sourcing; Minerals Security Partnership (MSP, 2022) for allied supply chains; EU Critical Raw Materials Act (2023) setting domestic extraction/processing targets. Source: US/EU legislation.
What is Chinese state-backed offtake?	Long-term purchase agreements and equity stakes (e.g., CMOC in DRC cobalt) securing raw material flows to Chinese refineries; framed as developmental partnership. Source: Sanderson (2022); IEA (2024).
What is resource nationalism?	State assertion of sovereign control over minerals via export bans, local-content rules, state equity, or renegotiated contracts. African examples: Zimbabwe lithium ban, DRC mining code revisions, Zambia's copper renegotiations. Source: Africa Progress Panel reports.

Cue (prompt)	Notes (with source log)
What is EITI?	Extractive Industries Transparency Initiative — voluntary standard for revenue transparency; UN/World Bank-backed. Relevance: governance of mineral rents. Source: EITI (2023).
What is "the missing middle"?	The absence of midstream processing capacity (smelting, refining, precursor production) in African economies, which traps them in raw extraction. Source: African industrialization literature; Africa Progress Panel.
How does the UN frame just transition?	Critical minerals for green energy must not reproduce extractive harm; requires community consent, environmental safeguards, benefit-sharing. Source: UN (2023) and IEA (2024) just-transition language.
What is the strongest counterargument to resource nationalism?	Without processing capacity, export bans may reduce revenue, deter investment, and fail to create jobs; WTO compliance risk. Source: trade economists; Zimbabwe case (2022–2024).

Summary (3–5 sentences): Africa holds a disproportionate share of global critical mineral reserves but captures only 1–5% of final value because refining, cell manufacturing, and assembly occur offshore, predominantly in China. Western supply-chain security policies (IRA, MSP, CRMA) risk peripheralizing Africa as a raw-material supplier, while Chinese state-backed offtake secures flows eastward. African states have responded with resource nationalism (Zimbabwe's lithium ban) and value-chain initiatives (DRC-Zambia battery project), but both face the "missing middle" problem of absent processing capacity. The five perspectives disagree on whether the core problem is sovereignty, efficiency, multipolarity, security, or governance — and each reading is partially supported by the data.

SECTION 5 — FEYNMAN COMPRESSION

1. **Explain without jargon.** Africa has most of the rocks the world needs for electric cars and phones, but almost none of the factories that turn those rocks into batteries. So Africa sells cheap rocks and buys expensive batteries. China does most of the turning-rocks-into-batteries work. America and Europe now want their own secure rock supplies, which could leave Africa still just selling rocks. Some African governments are trying to force companies to process rocks at home (Zimbabwe's lithium ban) or build joint factories (DRC and Zambia's battery plan), but they lack the machines, skills, and money to do the processing yet.

2. **Mark gaps.** I am unsure whether the DRC-Zambia battery initiative has secured actual offtake contracts or is still a memorandum of understanding; I cannot state its financing status with confidence. I am also unsure of the exact WTO ruling status on Zimbabwe's ban. I conflated "reserves" and "resources" in Table 1 without flagging the distinction. I did not quantify the employment effects of

refining versus extraction.

3. **Reread verification.** Re-checking: IEA (2024) confirms China's ~75% cobalt refining share; USGS confirms DRC ~70% cobalt production. Sanderson (2022) documents Chinese state-backed offtake in DRC. Kalantzakos (2020) frames the peripheralization risk. The DRC-Zambia initiative was announced in 2023 with Afreximbank involvement; its implementation status remains uncertain. Zimbabwe's ban was enacted December 2022. These checks confirm the core claims; the gaps in Step 2 remain genuine uncertainties, not errors.

4. **Analogy with explicit limits.** *Analogy:* Africa is like a farmer who owns the best soil but sells raw wheat to a miller who bakes the bread and sells it back at ten times the price; the farmer's government now bans raw wheat exports to force a local mill, but the farmer has no mill. *Limits:* The analogy implies passivity and ignores African agency (states are actively bargaining, not just victims); it treats minerals as renewable like wheat when they are finite and geographically fixed; it understates the capital intensity and technology requirements of refining versus milling; and it obscures the geopolitical competition among buyers that gives African states leverage.

5. **Rewrite.** Africa's critical mineral endowment is a source of structural leverage that is currently underutilized: states hold ~50–70% of global cobalt and large shares of copper, lithium, graphite, and PGMs, but capture only 1–5% of final value because refining and manufacturing are concentrated in China. Western supply-chain security policies risk locking in this asymmetry by securing raw access without transferring capacity. African responses — resource nationalism (Zimbabwe) and value-chain initiatives (DRC-Zambia) — are rational but constrained by the "missing middle" of processing capacity. The five perspectives disagree on whether the remedy is sovereignty, partnership, multipolarity, security, or governance; the evidence supports a synthesis in which African bargaining power is real but bounded by capital and technology gaps that no single perspective fully addresses.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L33	Definition	What is the "value-capture problem" in critical minerals?	It is the gap between where minerals are extracted and where value is added through refining, processing, and manufacturing; African states often export raw ore while capturing only a small share of total value.	African perspective centers on structural inequality in global value chains.
L33	Mechanism	How does the Inflation Reduction Act (IRA) affect African mineral producers?	The IRA's clean-vehicle credit requires critical minerals to be extracted or processed in the US or FTA countries, which can exclude or marginalize non-FTA African suppliers unless they restructure supply chains.	Western perspective frames this as supply-chain security; African perspective sees peripheralization risk.
L33	Application	What is the DRC-Zambia battery value chain initiative (2023)?	A bilateral effort to move from exporting cobalt and copper ore toward local refining and battery precursor production, aiming at upward mobility in the EV supply chain.	African perspective treats it as resource sovereignty and bargaining; Western/Chinese perspectives assess feasibility and offtake.

Tag	Card Type	Front	Back	Perspective Note
L33	Comparison	How does Zimbabwe's 2022 raw lithium export ban differ from the DRC-Zambia initiative?	Zimbabwe used a unilateral export restriction to force domestic processing, while DRC-Zambia pursued a cooperative, investment-led industrialization strategy; both are resource nationalism but with different compliance and capacity risks.	African perspective highlights divergent state strategies; Western perspective worries about WTO compliance.
L33	Source	What does the IEA Critical Minerals Outlook (2024) emphasize?	It stresses that demand for lithium, cobalt, nickel, and copper will surge with clean-energy transitions, and that supply concentration and ESG risks require diversified, resilient supply chains.	UN/Western perspectives use it to justify governance and security frameworks.
L33	Debate	What is "peripheralization" in techno-geopolitics?	It is the risk that Africa remains a raw-material supplier while refining and manufacturing occur elsewhere, locking in low-value extraction despite high global demand.	African perspective frames it as neocolonial value-chain lock-in; Western perspective often treats it as market efficiency.

Tag	Card Type	Front	Back	Perspective Note
L33	Reconstruction	How does the Chinese perspective frame state-backed offtake in Africa?	Chinese firms and state banks secure long-term mineral supply through infrastructure-for-resources deals and processing investments, framed as developmental partnership and mutual benefit.	Chinese perspective emphasizes South-South cooperation; African critics raise debt and opacity concerns.
L33	Occlusion	What does the Russian perspective typically occlude in mineral debates?	It often foregrounds anti-hegemonic solidarity and resource sovereignty while downplaying governance deficits, conflict financing, and environmental costs in extractive zones.	Russian perspective amplifies sovereignty rhetoric; African scholars note selective solidarity.
L33	Adjudication	How should one adjudicate between "friend-shoring" and "resource sovereignty" claims?	Friend-shoring prioritizes allied supply security and may exclude African states; resource sovereignty prioritizes domestic processing and bargaining power; evidence on investment flows, FTA status, and local capacity should decide case by case.	Western and African perspectives clash; adjudication requires metric-specific evidence.

Tag	Card Type	Front	Back	Perspective Note
L33	Visual	What does a value-chain stage diagram show for cobalt?	It maps extraction in DRC, refining largely in China, and battery manufacturing in Asia/Europe, revealing where value and emissions concentrate.	African perspective uses it to argue for midstream capture; Western perspective uses it for security planning.
L33	Mechanism	What is the role of EITI in critical minerals governance?	The Extractive Industries Transparency Initiative promotes disclosure of payments and contracts to reduce corruption and improve accountability in mineral sectors.	UN perspective treats EITI as governance baseline; African activists note enforcement gaps.
L33	Application	Why is graphite strategically significant?	Graphite is essential for battery anodes; Africa (especially Mozambique and Madagascar) holds large reserves, but processing capacity is limited, creating offtake and value-capture tensions.	African perspective stresses reserve endowment vs. processing deficit.

Tag	Card Type	Front	Back	Perspective Note
L33	Debate	What is the "just transition" concern in African mining?	It refers to ensuring that the shift to green technologies does not reproduce extractive harm, labor abuse, or environmental degradation in mining communities.	UN/African perspectives converge on equity; Western security framing often sidelines it.
L33	Source	What do USGS Mineral Commodity Summaries provide?	They provide annual data on reserves, production, and trade for minerals including cobalt, copper, lithium, and REEs, enabling cross-country comparison.	All perspectives use USGS data, but interpret concentration and dependency differently.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence audit (score 0–100)

Competency	Score (0–100)	Evidence of mastery
Define value-capture stages in mineral supply chains		
Explain IRA/MSP/CRMA mechanisms and African implications		
Reconstruct Chinese state-backed offtake logic		
Analyze DRC-Zambia battery initiative		
Evaluate Zimbabwe lithium export ban		
Compare five perspectives on techno-geopolitics		
Identify falsifiers for resource nationalism claims		

7.2 Three-question debrief

1. Which perspective did you find hardest to steel-man, and what evidence would change your view?
2. Did you conflate description (what is happening) with prescription (what should happen) in your memo?
3. Which mechanism—value capture, friend-shoring, or resource nationalism—best explains a case you know, and what would falsify it?

7.3 Error-log

Common Misconception	Correction	Evidence
"Africa lacks critical minerals; it only has cobalt."	Africa holds major reserves of copper, lithium, graphite, manganese, and REEs across multiple countries.	USGS Mineral Commodity Summaries; IEA Critical Minerals Outlook (2024)
"Export bans automatically create domestic industry."	Bans can raise prices and attract smuggling or retaliation without processing capacity, skills, or energy.	Zimbabwe lithium ban debates; WTO compliance concerns
"Chinese investment is purely exploitative."	Chinese offtake includes infrastructure and processing investments; outcomes vary by contract transparency and local capacity.	Sanderson (2022); Kalantzakos (2020)
"Western friend-shoring includes Africa by default."	FTA and allied-country criteria can exclude African suppliers unless explicitly negotiated.	IRA clean-vehicle credit rules; MSP/CRMA frameworks
"EITI membership guarantees clean governance."	EITI improves disclosure but enforcement and political will vary; it is a floor, not a ceiling.	Africa Progress Panel reports

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Value capture; peripheralization; resource sovereignty; techno-geopolitics; just transition	Extraction→refining→manufacturing value gaps; offtake agreements; export bans; FTA gating; infrastructure-for-resources	Sanderson (2022); Kalantzakos (2020); IEA (2024); Africa Progress Panel; USGS summaries	DRC–Zambia battery initiative (2023); Zimbabwe lithium ban (2022); DRC cobalt; Mozambique graphite	Friend-shoring vs. resource sovereignty; EITI effectiveness; Chinese developmental partnership claims	No local processing growth after ban; FTA inclusion of African states; transparent contract outcomes	L19 energy/minerals; L29 conflict political economy; L31 great power competition; L34 Sahel; L52-53 semiconductors/minerals; L56 innovation decoupling

SECTION 9 — REVIEW SCHEDULE

- **R1 (Day 1, 20 min):** Re-read Key Ideas 1–2; redraw the value-chain stage diagram from memory; check against Section 3 visual.
- **R2 (Day 3, 30 min):** Reconstruct all five perspectives on the DRC-Zambia initiative in one paragraph each; compare with Section 2.7.
- **R3 (Day 7, 45 min):** Complete the Problem Pair (Zimbabwe ban) without notes; then check model answer; log errors in Section 7.3.
- **R4 (Day 14, 60 min):** Write a 500-word memo on a new mineral case using the four required headings; self-check description vs. explanation vs. prediction vs. prescription.
- **R5 (Day 30, 90 min):** Full timed practice: answer the hinge question, two flashcard rounds, and one Feynman compression rewrite; update confidence audit.

SECTION 10 — COMPLETION CHECKLIST

☐ I can name Africa's major critical minerals and their global supply-chain positions.
☐ I can explain the value-capture problem across extraction, refining, and manufacturing.
☐ I can describe IRA, MSP, and CRMA mechanisms and their African implications.
☐ I can reconstruct Chinese state-backed offtake logic from within.
☐ I can analyze the DRC-Zambia battery initiative as upward mobility.
☐ I can evaluate Zimbabwe's lithium export ban and its WTO risks.
☐ I can define resource nationalism and its scope conditions.
☐ I can distinguish friend-shoring from resource sovereignty.
☐ I can explain EITI and its limitations.
☐ I can articulate the just-transition concern in mining.
☐ I can steel-man all five perspectives on techno-geopolitics.
☐ I can identify what each perspective occludes.
☐ I can apply four levels of analysis to a mineral case.
☐ I can distinguish description, explanation, prediction, and prescription.
☐ I can identify falsifiers for key claims.
☐ I can use USGS and IEA data to support an argument.
☐ I can connect this lesson to L19, L29, L31, L34, L52-53, L56.
☐ I have updated my error log and confidence audit.

35. Sahel Synthesis: Insurgency, External Intervention, and Civilian Harm

LESSON METADATA

Field	Value
Lesson number and title	Lesson 34 — Sahel Synthesis: Insurgency, External Intervention, and Civilian Harm
Module	Module 5: African Geopolitical Architecture
Prerequisites	L23 (asymmetric warfare), L29 (conflict political economy), L30 (regional security complexes), L31 (great power competition)
Interleaved links	Forward to L35–L40 (Ukraine/Eastern Europe), L43–L44 (proxy warfare), L54 (AI and warfare)
Reading load	7-9 hours
Content channels	Text, data (ACLED/UNHCR), visual (maps/timelines), case reconstruction
Bloom ceiling	Evaluate / Synthesize
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

The central puzzle of this lesson is deceptively simple and profoundly destabilizing for the study of international security: between 2013 and 2023, France, the United States, the United Nations, and a constellation of regional partners deployed tens of thousands of troops, billions of dollars, and an elaborate architecture of counter-terrorism cooperation across the Sahel, and yet by 2023 the region contained more jihadist-controlled territory, more displaced civilians, more coups, and more Russian military presence than at any point since independence. The question is not merely why intervention failed, but what kind of political order the intervention itself produced, and whether the failure was contingent on bad strategy or structural to the form of external security provision in a postcolonial space. This lesson treats the Sahel not as a case of African state failure to which external actors responded, but as a hybrid-governance laboratory in which states, jihadists, militias, private military companies, and civilians continuously renegotiate authority, and in which external intervention is itself a variable that reshapes the laboratory rather than a neutral corrective applied to it.

The theoretical stakes are considerable. Conventional security studies frames the Sahel through the lens of state capacity: weak states cannot control territory, insurgents exploit the vacuum, and external assistance fills the gap. African scholarship has long contested this framing. Bayart's analysis of the politics of the

belly, Mbembe's work on necropolitics and the postcolony, Mamdani's distinction between citizen and subject, and Grovogui's critique of sovereignty as a Eurocentric legal construct all suggest that the Sahelian state was never simply weak; it was historically constituted through selective, extractive, and often violent relationships with its peripheries. From this vantage point, the arrival of French, American, and UN forces did not restore a pre-existing legitimate order; it inserted new external patrons into an already layered field of authority, empowering some actors (central governments, certain militias) and disempowering others (local communities, rival factions), with effects that outlasted the interventions themselves. The lesson therefore asks students to hold two explanations in tension: the Western account of insufficient resources and flawed tactics, and the African account of structural mismatch between external security templates and local political realities.

Placed in the curriculum, this lesson is the capstone of Module 5, African Geopolitical Architecture, and it synthesizes four prerequisite threads. From Lesson 23 on asymmetric warfare, it takes the tactical repertoire of jihadist groups—mobility, embedding in civilian populations, exploitation of state absence—and asks how that repertoire interacts with external force structures designed for conventional or counter-insurgency warfare. From Lesson 29 on conflict political economy, it takes the financing of armed groups through smuggling, artisanal mining, and protection rackets, and asks how intervention altered or failed to alter those economies. From Lesson 30 on regional security complexes, it takes the architecture of ECOWAS, the G5 Sahel, and the African Union's peace and security framework, and asks why regional mechanisms fragmented precisely when they were most needed. From Lesson 31 on great power competition, it takes the re-entry of Russia through Wagner and its successor Africa Corps, the continued Chinese security partnerships, and the Western retreat, and asks how the Sahel became a theater of multipolar contestation. Forward links to Lessons 35–40 on Ukraine and Eastern Europe, Lessons 43–44 on proxy warfare, and Lesson 54 on AI and warfare are not decorative: the Sahel is where several of those later themes—private military companies, drone warfare, information operations, and the erosion of the monopoly on legitimate force—were field-tested before appearing in European or technological registers.

By the end of this lesson, a student should be able to do five things that are not reducible to memorization. First, reconstruct the hybrid-governance landscape of the Sahel as a system of overlapping authorities rather than a state vacuum, using African scholarly frameworks rather than importing Western state-failure templates. Second, trace the intervention trajectories of France, the United States, the United Nations, and Russia from 2013 to 2025, identifying the specific mechanisms through which each altered local power balances and the specific points at which each produced unintended consequences. Third, read ACLED data on civilian targeting by perpetrator—state forces, Russian private military companies, jihadist groups—and interpret what the data can and cannot establish about causation, underreporting, and definitional bias. Fourth, analyze the collapse of the G5 Sahel and the ECOWAS crisis of 2023–2024 as institutional failures with both regional and great-power dimensions. Fifth, and most demanding, adjudicate the counterfactual question of whether any intervention could have worked, specifying the conditions under which external security provision might be compatible with local legitimacy, and identifying the falsifiers that would refute one's own conclusion. The lesson's assessment architecture—the worked example on the 2023 Niger coup, the problem pair on Mali 2012–2025, the independent memo, and the hinge question—is designed to test these capacities rather than recall.

The five perspectives that structure the lesson are not presented as neutral viewpoints to be balanced; they are epistemic positions that each reveal and occlude. The African perspective, treated as primary throughout, centers sovereignty, the agency of juntas and communities, and the cumulative failure of external intervention to produce durable security. It asks questions the others do not: who authorized the intervention,

whose security was being protected, and what forms of political life were foreclosed by the security template imposed. The Chinese perspective emphasizes non-interference combined with security partnerships and economic engagement, offering a model that avoids the legitimacy costs of Western intervention while raising its own questions about accountability and opacity. The Russian perspective frames its presence as sovereign choice by host governments and anti-Western solidarity, leveraging anti-colonial rhetoric while deploying private military companies whose conduct has been documented in civilian harm data. The Western perspective combines intervention failure, institutional self-critique, and a contested lessons debate that oscillates between "we did too little" and "we did the wrong things." The United Nations perspective centers MINUSMA's protection-of-civilians mandate, humanitarian access, and the institutional lessons of a mission that was asked to do more than its mandate and resources permitted. Each perspective is steel-manned from within; none is treated as the transparent truth, and the lesson's analytical payoff comes from the friction between them.

A methodological caution runs through the entire lesson and should be internalized before any data is read. Description, explanation, prediction, and prescription are distinct operations, and conflating them is the most common error in security analysis. Describing that civilian fatalities rose after 2019 is not explaining why; explaining that state forces and Russian contractors contributed to that rise is not predicting that their withdrawal would reduce it; predicting that a different force posture would help is not prescribing that it should be attempted. The lesson repeatedly asks students to mark which operation they are performing and to identify the evidentiary threshold that would be required to move from one to the next. This discipline matters because the Sahel has generated an enormous volume of policy prescription built on thin causal identification, and the student who masters this lesson should be able to distinguish a well-supported mechanism from a compelling narrative. The ACLED data, the UNHCR displacement figures, and the troop deployment timelines are tools for disciplined inference, not ammunition for predetermined conclusions.

SECTION 1 — Pre-Class Priming

1.1 Retrieval warm-up

1. (From L23, asymmetric warfare) Define asymmetric warfare and explain why a conventionally weaker actor might prefer protracted, low-intensity violence over decisive engagement. Give one Sahelian example of how jihadist groups have exploited this logic against state and external forces.
2. (From L29, conflict political economy) How does the "greed versus grievance" debate frame rebel financing, and what are the principal economic activities—licit and illicit—that have sustained armed groups in the Sahel since 2012?
3. (From L30, regional security complexes) What is a regional security complex, and how did the G5 Sahel joint force and ECOWAS mechanisms embody both the promise and the fragility of regional security cooperation in West Africa?
4. (From L31, great power competition) In what ways has great power competition in Africa moved beyond military bases to include private military companies, information operations, and security partnerships, and how does the Sahel illustrate this shift?
5. (From L23) What is the "ink spot" or oil-spot counter-insurgency strategy, and what are its principal limitations when applied to populations that do not trust the state providing security?
6. (From L29) Distinguish between the onset and the duration of civil conflict: which economic and political variables are more predictive of how long a conflict lasts than of whether it begins?

1.2 Orientation questions

1. Why did civilian harm in the central Sahel rise to record levels during and after the period of peak external intervention, and what does this imply about the relationship between counter-terrorism operations and protection of civilians?
2. How did the G5 Sahel collapse and the 2023–2024 ECOWAS crisis reconfigure regional security architecture, and what replaced the cooperative frameworks that had existed since 2017?
3. What do ACLED data show about the distribution of civilian targeting among state forces, Russian private military companies, and jihadist groups, and what are the principal methodological cautions in reading those data?
4. Could any external intervention have worked in the Sahel, and if so, under what conditions of mandate, force posture, political strategy, and local legitimacy? What evidence would falsify your answer?

1.3 Vocabulary pre-teach

- **Hybrid governance**: A political order in which authority is exercised by multiple, overlapping actors—states, insurgents, militias, traditional authorities, and external forces—none of which holds a monopoly on legitimate violence; the Sahel is treated in this lesson as a laboratory of such orders rather than a case of state absence.
- **Private military company (PMC)**: A commercial entity providing armed security, training, or combat support to states or other clients; in the Sahel, Wagner and its successor Africa Corps became the principal Russian instrument after 2021.
- **Africa Corps**: The Russian state-affiliated successor structure to Wagner's African operations, deployed in Mali and elsewhere following the 2023 mutiny and reorganization of Russian private military capacity.
- **MINUSMA**: The United Nations Multidimensional Integrated Stabilization Mission in Mali, deployed from 2013 to 2023, with a mandate spanning security, political support, and protection of civilians.
- **G5 Sahel**: A regional framework established in 2014 by Burkina Faso, Chad, Mali, Mauritania, and Niger, including a joint force intended to coordinate counter-terrorism operations across borders.
- **ECOWAS**: The Economic Community of West African States, a regional organization whose security and political mechanisms were severely tested by the 2020–2023 wave of coups.
- **ACLED**: The Armed Conflict Location & Event Data Project, a disaggregated dataset recording political violence and protest events, including civilian targeting, used in this lesson as the primary quantitative source on perpetrator patterns.
- **Civilian targeting**: Acts of violence in which civilians are the deliberate object of attack, as distinct from collateral harm; ACLED codes this as a specific event category, and its measurement carries definitional and underreporting caveats.
- **Coup belt**: A journalistic and analytical term for the contiguous band of states from Guinea through Mali, Burkina Faso, and Niger that experienced military takeovers between 2020 and 2023.
- **Sovereignty**: In this lesson, treated not as a fixed legal attribute but as a contested practice; African scholarship emphasizes how sovereignty claims by juntas, communities, and external actors compete and overlap.
- **Necropolitics**: Achille Mbembe's concept describing the subjugation of life to the power of death, used here to analyze how counter-terrorism and militia violence in the Sahel distribute vulnerability and mortality.
- **Protection of civilians (PoC)**: A normative and operational framework, central to UN peacekeep-

ing, requiring active measures to prevent and respond to violence against civilians; its application in MINUSMA is a key case in the lesson.

SECTION 2 — LESSON CORE

2.1 Learning objectives

By the end of this lesson, you will be able to:

1. **Analyze** the Sahel as a hybrid-governance laboratory in which state institutions, jihadist movements, ethnic and community militias, private military companies, and civilian populations co-produce authority, taxation, and violence, rather than treating the region as a simple absence of statehood. This objective requires you to move beyond the "failed state" frame and to identify the specific institutional arrangements through which non-state actors exercise governmental functions.
2. **Evaluate** the trajectories of external military intervention—French Operation Serval/Barkhane, the United States' train-and-equip and drone programs, the United Nations Multidimensional Integrated Stabilization Mission in Mali (MINUSMA), and Russian Wagner Group/Africa Corps deployments—by weighing their stated objectives against documented outcomes in civilian protection, territorial control, and political legitimacy, using ACLED event data and Crisis Group reporting as evidentiary anchors.
3. **Interpret** ACLED civilian-targeting data disaggregated by perpetrator category (state forces, Russian PMCs, jihadist groups, militias) to distinguish patterns of violence, identify temporal shifts following intervention transitions, and assess claims about which actors pose the greatest threat to civilians in specific periods and locations.
4. **Synthesize** the collapse of the G5 Sahel joint force and the ECOWAS crisis of 2023–2024 into a coherent account of regional security architecture failure, connecting institutional design flaws, sovereignty disputes, and the political economy of coups to the broader fragmentation of West African collective security.
5. **Judge** whether any external intervention in the Sahel could have succeeded under alternative conditions, and specify the necessary (not merely sufficient) conditions—political, institutional, economic, and normative—that would have been required, drawing on comparative cases and the African scholarly tradition's critique of externally imposed security templates.

These objectives are assessed through the worked example, problem pair, independent memo, and hinge question that follow.

2.2 KEY IDEA 1 — The Sahel as Hybrid-Governance Laboratory

Bolded Causal Claim: The Sahel is not a vacuum of authority produced by state failure; it is a hybrid-governance laboratory in which states, jihadist movements, militias, private military companies, and civilians co-produce sovereignty, taxation, and violence, and in which the boundary between "state" and "non-state" authority is analytically misleading.

Mechanism: The mechanism operates through four interlocking processes. First, *selective state presence*:

post-colonial Sahelian states never achieved uniform territorial penetration; as Bayart (2009) argues, African states have historically governed through extraversion and brokerage rather than Weberian monopoly, and the Sahel represents an extreme case where the state's presence is concentrated in capitals and garrison towns while rural peripheries are governed through indirect rule, customary authorities, and negotiated neglect. Second, *jihadist proto-state formation*: groups such as Jama'at Nusrat al-Islam wal-Muslimin (JNIM) and the Islamic State in the Greater Sahara (ISGS, now Islamic State Sahel Province) do not merely destroy state authority but replace it with alternative governance—zakat collection, qadi courts, dispute resolution, and protection rackets—filling the vacuum left by absent or predatory state services. Mamdani's (1996) analysis of decentralized despotism is instructive here: colonial indirect rule created "native authorities" that were accountable upward to the colonial state rather than downward to populations, and post-colonial Sahelian states inherited this architecture, producing local authorities who extract without protecting. Third, *militia mobilization*: community self-defense groups (Dozo hunters in central Mali, Dan Na Ambassagou among Dogon communities, GATIA among Tuareg) emerge where the state cannot protect and where jihadist incursion threatens communal survival; these militias become autonomous power centers with their own taxation and justice systems, often committing atrocities against rival communities. Fourth, *PMC subcontracting*: the state's monopoly on legitimate violence is further fragmented when governments hire private military companies—Wagner Group, later rebranded Africa Corps—to conduct counterinsurgency, creating a parallel chain of command accountable to the executive rather than to parliament or military hierarchy, and generating documented civilian harm that is difficult to attribute or sanction.

The interaction of these four processes produces *hybrid governance*: no single actor holds a monopoly; instead, authority is layered, contested, and transactional. Civilians are not passive victims but strategic actors who navigate among providers—paying zakat to jihadists for protection, taxes to the state for identity documents, fees to militias for safe passage—what Mbembe (2003) theorizes as the "becoming-necropolitical" of African sovereignty, where the power to dictate who may live and who must die is distributed across multiple agents. Grovogui (2006) sharpens this: sovereignty in the Sahel is not a legal status but a *practice* performed through violence, negotiation, and recognition, and the international community's insistence on recognizing only the state as sovereign systematically misreads the political field.

Scope Conditions: This model applies where (a) state territorial penetration is low and uneven; (b) jihadist groups possess both military capacity and governance ambition; (c) ethnic or communal boundaries are politically salient and militarized; (d) external actors subcontract coercion to non-state forces; and (e) civilian populations have experience navigating multiple authorities. It is less applicable where the state has maintained robust rural administration (e.g., parts of Senegal) or where jihadist groups lack governance capacity (e.g., purely predatory banditry in northwest Nigeria, though the boundary is porous). The model also assumes that violence is instrumental to governance rather than purely expressive; where violence is primarily criminal or resource-extractive, the hybrid-governance frame must be supplemented with political-economy analysis (see Lesson 29).

Observable Implications: If the Sahel is a hybrid-governance laboratory, we should observe: (1) multiple taxation and justice systems operating in the same territory; (2) ACLED data showing significant civilian targeting by state forces, militias, and PMCs—not only jihadists; (3) fluid alliances among actors (militias collaborating with jihadists against state forces, or with state forces against rival militias); (4) civilian strategies of hedging, flight, and selective compliance; and (5) international interventions that target "terrorists" while ignoring the governance vacuum that sustains them, thereby failing to alter the underlying political economy. The ACLED Sahel reports (2023–2025) document precisely this: civilian fatalities attributed to state forces and Russian PMCs rose sharply after 2021, even as jihadist violence continued, indicating that

the intervention transition did not reduce overall civilian harm but redistributed it among perpetrators.

Perspective Note (five traditions in brief):

African (primary): The African scholarly tradition treats the Sahel not as a security problem to be solved by external force but as a political crisis rooted in colonial state formation and post-colonial extraversion. Grovogui (2006) and Mbembe (2003) insist that sovereignty must be understood as practice rather than legal fiction; Bayart (2009) and Mamdani (1996) trace the hybridity of authority to colonial indirect rule and its post-colonial inheritance. African security scholars such as Aning emphasize that external interventions which ignore this genealogy reproduce the very conditions they claim to address. The African vantage point reveals what Western security frameworks occlude: that jihadist groups are not simply "terrorists" but political actors offering governance alternatives in spaces where the state has failed, and that civilian harm by state forces is not an aberration but a structural feature of externally supported counterinsurgency. The agency of juntas—however problematic—is read not as irrational authoritarianism but as a rejection of a security architecture that subordinated African sovereignty to French operational command.

Chinese: China's perspective, rooted in the Five Principles of Peaceful Coexistence and the principle of non-interference, treats the Sahel's hybrid governance as an internal matter to be addressed through state-to-state capacity building rather than external military intervention. Beijing's security partnerships—police training, equipment transfers, intelligence sharing—operate through bilateral channels that do not challenge host-state sovereignty, and Chinese analysts tend to frame jihadist violence as a development and governance problem rather than a military one. This perspective contributes an emphasis on infrastructure and economic integration as stabilizing forces, but it occludes the question of accountability for civilian harm and tends to treat host governments as the sole legitimate interlocutors, ignoring the hybrid reality on the ground.

Russian: Russia's framing, amplified through Wagner/Africa Corps operations, presents the Sahel's hybrid governance as evidence of Western failure and African sovereignty denied. Moscow's narrative emphasizes "sovereign choice"—the right of Sahelian juntas to select security partners without Western conditionality—and casts Russian PMCs as instruments of state restoration rather than external intervention. This perspective contributes a critique of Western conditionality and a recognition that African governments seek alternatives to French operational dominance, but it occludes the documented civilian harm attributed to Russian PMCs by ACLED and the UN, and it conflates anti-Western rhetoric with genuine sovereignty, since PMC dependence creates a new form of external subordination.

Western: The Western perspective, dominant in French and US policy circles, has historically framed the Sahel through a counterterrorism lens: jihadist groups are threats to international security, state weakness is an enabling condition, and external military force is the necessary response. This perspective contributed substantial resources, intelligence, and training, and generated important data through ACLED and MINUSMA reporting. However, it occludes the political and governance dimensions of the conflict, treats civilian harm by partner forces as collateral rather than structural, and has been slow to acknowledge that military-first strategies may have accelerated state collapse by delegitimizing governments that depended on foreign force for survival.

UN: The UN perspective, articulated through MINUSMA and the Office of the High Commissioner for Human Rights, frames the Sahel through protection of civilians, humanitarian access, and human rights monitoring. It contributes systematic documentation of violations by all parties, a normative framework for accountability, and a recognition that military solutions alone are insufficient. However, it occludes the political economy of intervention and the structural constraints on UN peacekeeping in active counterin-

surgency environments; MINUSMA's mandate was progressively narrowed by host-government resistance, and its withdrawal from Mali in 2023 illustrated the limits of consent-based peacekeeping when the host state prefers alternative security partners.

SECTION 2.3 KEY IDEA 2 — External Intervention Trajectories: France, US, UN, Russia (Wagner/Africa Corps), and the Consequences

Bolded Causal Claim: External military intervention in the Sahel did not fail merely because of insufficient force or poor tactics; it failed because each intervenor substituted its own security logic for the political bargains that would have made force legitimate, thereby accelerating state fragmentation, normalizing coup politics, and expanding the space in which jihadists, militias, and private military companies could compete for coercive authority.

Mechanism: The mechanism is a sequence of security substitutions rather than cumulative state-building. France's Operation Serval in 2013 reversed the jihadist advance in northern Mali and prevented the collapse of the Malian state, but its successor, Operation Barkhane, transformed a short-term stabilization mission into a regional counterterrorism campaign that embedded French forces across the Sahel. That embedding changed the political meaning of French presence: what began as emergency assistance became, in the eyes of many Sahelian publics and elites, a standing foreign military architecture. The United States, operating through AFRICOM and special-operations partnerships, emphasized partner capacity-building, intelligence, and drone-enabled targeting; bases and logistical arrangements in Niger and elsewhere turned host states into platforms for U.S. operations, tying sovereign control over territory to external access. The United Nations, through MINUSMA from 2013 to 2023, provided stabilization, protection-of-civilians functions, and political support, but its consent-based mandate narrowed as host governments changed and as the security environment deteriorated. Russia, entering through Wagner and later reorganized as Africa Corps, offered a different package: regime security, direct combat support, and an anti-Western narrative, with fewer public conditionality requirements and less emphasis on governance reform. Each intervention altered local incentives by creating security rents for elites, security forces, and intermediaries. When those rents shifted—whether through French withdrawal, U.S. retrenchment, UN exit, or Russian entry—domestic actors recalculated their alliances, and coups became a mechanism for renegotiating external patronage. The consequence was not simply the failure to defeat jihadist groups; it was the internationalization of local authority crises, in which external patrons became stakes in domestic power struggles and civilian populations bore the costs of competitive coercion.

Scope Conditions: This claim applies most strongly where the host state has limited territorial control, a fragmented security sector, elites capable of shopping among external patrons, and regional organizations with weak enforcement capacity. It also applies where external actors prioritize counterterrorism or regime survival over political settlement, accountability, and inclusive governance. It does not imply that all external intervention is futile; interventions can be stabilizing where the host state has a coherent reform agenda, local legitimacy, and external support is clearly subordinate to a domestically owned political process. The Sahel's condition of hybrid governance—where state institutions, jihadist movements, ethnic and community militias, private military companies, and civilians overlap in the same spaces—meant that external force could not be politically neutral. In such settings, even technically successful operations can deepen dependency and resentment if they are not embedded in a credible bargain over authority, resources, and accountability.

Observable Implications: If this mechanism is correct, one should observe not only the persistence or

expansion of jihadist violence but also a pattern of external substitution and domestic rupture: French withdrawal from Mali in 2022, from Burkina Faso in 2023, and from Niger in 2023; the end of MINUSMA's presence in Mali in 2023; U.S. withdrawal from Niger in 2024; the expansion of Russian-linked forces in Mali and the rebranding of Wagner as Africa Corps; coups in Mali in 2020 and 2021, Burkina Faso in 2022, and Niger in 2023; the weakening or collapse of the G5 Sahel; and ECOWAS crises over sanctions, suspension, and the formation of alternative regional alignments. One should also observe rising civilian harm associated with state forces and their auxiliaries, because external withdrawal and PMC entry often reduce external oversight while increasing the autonomy of coercive actors. Crisis Group and International Peace Institute analyses of the Sahel emphasize that military solutions repeatedly outran political strategies, while UN reporting on MINUSMA highlights the narrowing of consent and the difficulty of protecting civilians in an active counterinsurgency environment.

Perspective Note (five traditions in brief): *African:* The African perspective, reconstructed from within and drawing on scholars such as Grovogui, Mbembe, Bayart, Mamdani, Rodney, Nkrumah, Nyerere, Cabral, Fanon, Aning, Danso, Tamale, and Oyěwùmí, treats external intervention not as a neutral technical project but as a continuation of postcolonial asymmetry. From this vantage point, French, U.S., UN, and Russian interventions are different modalities of external power insertion into African political space; even when requested by governments, they reproduce dependency and constrain sovereign self-determination. The agency of juntas is therefore double-edged: their expulsion of French troops can express popular frustration with neocolonial military presence, yet coups also concentrate power, suppress dissent, and substitute one external patron for another. African scholarship emphasizes that security cannot be separated from the political economy of extraction, elite capture, and the historical weakening of state-society bargains. What the African perspective reveals that others often miss is that intervention failure is not only a strategic error by outsiders; it is also a symptom of unresolved postcolonial sovereignty, in which external actors and domestic elites jointly manage insecurity while civilians absorb its costs. *Chinese:* China's perspective emphasizes non-interference, sovereignty, and security partnership without political conditionality. It contributes an alternative to Western interventionism by framing external military presence as a violation of sovereign equality and by offering training, equipment, and infrastructure without demanding governance reform. It occludes, however, the accountability problems of partner states and the possibility that non-interference can shield abusive security practices from scrutiny. *Russian:* Russia frames its engagement as a sovereign choice requested by legitimate governments and as an anti-Western correction to neocolonial intervention. It contributes a narrative of multipolarity and a willingness to provide direct combat support where Western actors withdraw. It occludes the conduct of Wagner and Africa Corps, the dependency created by PMC protection of regimes, and the civilian harm associated with unaccountable external forces. *Western:* The Western perspective combines intervention failure, self-critique, and a lessons debate. It acknowledges overreliance on military tools, underinvestment in governance, and the unintended consequences of counterterrorism partnerships. It contributes valuable strategic reassessment and documentation of abuses. It often occludes, however, the structural and historical dimensions of sovereignty and may still center Western agency in diagnosing a crisis whose primary costs are borne by Sahelian civilians. *UN:* The UN perspective frames the Sahel through protection of civilians, humanitarian access, human rights monitoring, and consent-based peacekeeping. It contributes systematic documentation of violations by all parties and a normative framework for accountability. It occludes the political economy of intervention and the structural constraints on peacekeeping in active counterinsurgency; MINUSMA's withdrawal from Mali in 2023 illustrated the limits of consent-based operations when the host state prefers alternative security partners.

SECTION 2.4 KEY IDEA 3 — ACLED Data on Civilian Harm by Perpetrator: State Forces, Russian PMCs, and Jihadists

Bolded Causal Claim: ACLED data on civilian harm in the Sahel support the interpretation that civilian targeting is not merely an unfortunate byproduct of counterterrorism or jihadist insurgency; it is a mode of governance and competition among multiple armed actors, and the distribution of perpetrators shifts as external interventions reconfigure local power, impunity, and accountability.

Mechanism: The mechanism begins with ACLED's event-based methodology, which records incidents by date, location, actor, interaction type, and estimated fatalities, including whether civilians were targeted. In the Sahel, this data can reveal patterns that narrative accounts alone cannot: where violence concentrates, which actors are recorded as perpetrators, how civilian-targeting events change over time, and how geographic diffusion follows political and military ruptures. State forces and their auxiliaries may target civilians through sweeps, airstrikes, collective punishment, or reprisals against communities suspected of supporting jihadists. Russian-linked private military companies may be recorded in direct combat, village-level operations, or reprisals where they operate alongside or in support of state forces. Jihadist groups may target civilians through assassinations, improvised explosive devices, massacres, and punitive violence intended to enforce compliance, punish collaboration, or demonstrate control. The underlying mechanism is competitive governance: each actor uses violence not only to defeat rivals but to extract resources, regulate populations, and signal dominance. External intervention changes this competition by altering who has weapons, airpower, intelligence, impunity, and external backing. French withdrawal, UN exit, and U.S. retrenchment can reduce external oversight and increase the autonomy of state forces; Russian PMC entry can introduce a new coercive actor with limited transparency; jihadist groups can exploit grievances generated by state and PMC abuses. ACLED data therefore capture the shifting ecology of violence, but they do so through a reporting system that depends on media, civil society, official statements, and, in some cases, remote verification. The data are strongest for identifying trends, relative shifts, and geographic patterns; they are weaker for establishing precise casualty totals or the full scope of violence in inaccessible areas.

Scope Conditions: This claim is most defensible when ACLED data are used comparatively and longitudinally rather than as a complete census of harm. The data are useful for identifying changes in perpetrator composition, the spread of violence across Mali, Burkina Faso, and Niger, and the association between military operations and civilian-targeting events. They are less useful for adjudicating legal responsibility in individual cases, for measuring violence in areas with no media or humanitarian access, or for distinguishing combatants from civilians in contested incidents. Scope conditions include consistent coding rules, sufficient source coverage, and the ability to compare like with like across time. Limitations include underreporting in remote or insecure areas, definitional ambiguity, political pressure on reporting, and the possibility that state or PMC violence is less visible than jihadist violence because of access restrictions and information control. The claim also assumes that civilian targeting is analytically distinguishable from battlefield fatalities, which is not always straightforward in irregular warfare where armed actors embed among populations.

Observable Implications: If the claim holds, ACLED-based analyses should show several patterns. First, civilian-targeting events should not be concentrated exclusively among jihadist perpetrators; state forces and, where present, Russian-linked PMCs should account for a significant and sometimes rising share of recorded civilian harm in certain periods and regions. Second, spikes in state or PMC violence should coincide with major operations, reprisal campaigns, or periods of reduced external oversight. Third, jihadist violence should remain persistent and geographically diffuse, but its relative share of total civilian harm may fluctuate as other actors become more active. Fourth, rising civilian harm should correlate with displacement,

humanitarian access constraints, and the erosion of local trust in security institutions. Fifth, the geographic spread of violence from northern Mali into central Mali, Burkina Faso, and Niger should be visible in the data, reflecting the regionalization of conflict and the limits of territorially bounded intervention. ACLED's Sahel reporting and related analyses by Crisis Group and UN bodies provide the evidentiary basis for these patterns, while also warning that the data likely understate harm in the most inaccessible conflict zones.

Perspective Note (five traditions in brief): *African:* The African perspective, informed by scholars such as Grovogui, Mbembe, Bayart, Mamdani, Rodney, Nkrumah, Nyerere, Cabral, Fanon, Aning, Danso, Tamale, and Oyěwùmí, treats ACLED data as both useful and insufficient. It can support African claims that state militarization, external intervention, and PMC deployment harm civilians, and it can challenge narratives that attribute civilian suffering solely to jihadists. Yet the African perspective also insists that data produced by external institutions may miss locally meaningful categories of harm, including structural violence, everyday insecurity, gendered vulnerability, and the destruction of social reproduction. African scholarship emphasizes that numbers can document violence without capturing agency, survival, or the political meaning of harm. What this perspective reveals is that ACLED can show who is recorded as harming civilians, but it cannot by itself explain why communities experience the state, jihadists, and foreign forces as overlapping systems of domination. *Chinese:* China's perspective may use ACLED data to argue for non-interference and for the dangers of externally driven militarization, while emphasizing capacity-building and development as alternatives. It contributes a technocratic reading of violence data and a preference for state-to-state security cooperation. It occludes, however, the accountability of partner regimes and the possibility that Chinese security partnerships may also lack transparency. *Russian:* Russia may cite ACLED trends to argue that Western intervention created chaos and that state forces are engaged in legitimate counterterrorism. It may acknowledge some civilian harm while attributing it to the broader security crisis or to jihadist provocation. It occludes the specific conduct of Wagner and Africa Corps and deflects responsibility from unaccountable external forces. *Western:* The Western perspective often uses ACLED data for self-critique, policy adjustment, and human-rights monitoring. It contributes rigorous documentation and a willingness to reassess intervention strategies. It may, however, overfit to measurable violence and underweight political legitimacy, local knowledge, and the structural conditions that make civilian targeting possible. *UN:* The UN perspective uses data to support protection of civilians, accountability, humanitarian planning, and human-rights monitoring. It contributes normative frameworks and systematic documentation by all parties. It occludes, however, the gap between data and access: knowing that civilians are harmed does not by itself secure humanitarian corridors, consent for monitoring, or accountability in environments where host states resist external scrutiny.

2.5 KEY IDEA 4 — The collapse of the G5 Sahel and the ECOWAS crisis

Bolded Causal Claim: The collapse of the G5 Sahel and the ECOWAS crisis were not merely diplomatic accidents or personality conflicts; they were the regional expression of a legitimacy deficit in which externally funded security architectures and coercive regional norms lost authority when they were perceived to protect incumbent regimes and foreign interests rather than civilian populations, producing withdrawals, coups, and parallel alliances.

Mechanism: The G5 Sahel Joint Force, created in 2017 by Mauritania, Mali, Burkina Faso, Niger, and Chad, was designed to coordinate cross-border counterterrorism in the Liptako-Gourma region. Its mechanism of action depended on a chain of assumptions: that member states would pool sovereignty, that external donors

would provide sustained funding and logistics, that national armies would act as professional partners, and that counterterrorism operations would not alienate local communities. Each assumption was fragile. The force relied heavily on European and French financing, intelligence, and air support; it lacked autonomous airlift, unified command culture, and reliable national contributions. When France's political position deteriorated and its troops withdrew, the G5 lost not only operational capacity but also the external scaffolding that had made coordination possible. Mali withdrew from the G5 in 2022, and Burkina Faso and Niger followed, leaving the framework hollowed out.

ECOWAS experienced a different but related mechanism. Its Protocol on Democracy and Good Governance, adopted in 2001, gave the organization a normative mandate to deter coups through sanctions, mediation, and, in extreme cases, collective military action. In the Sahel, however, this mandate collided with a legitimacy crisis. Coups in Mali in 2020 and 2021, Burkina Faso in 2022, and Niger in 2023 were not simply elite seizures of power; in several cases they were accompanied by popular mobilization, anti-French sentiment, and claims that elected governments had failed to protect citizens from jihadist violence. ECOWAS sanctions, intended to restore constitutional order, were experienced by many civilians as collective punishment that worsened food insecurity, fuel shortages, and economic precarity. The threat of military intervention in Niger in 2023, even if never executed, became a rallying point for sovereignty claims and accelerated the formation of the Alliance of Sahel States by Mali, Burkina Faso, and Niger.

The mechanism of collapse can be described as a legitimacy inversion. Regional organizations that had once been seen as vehicles for African collective security were increasingly interpreted, by juntas and their supporters, as instruments of external preference enforcement. The G5 was associated with French counterterrorism priorities; ECOWAS was associated with Western democratic conditionality and, in the Niger case, with a threatened intervention that many West Africans viewed as disproportionate. Sanctions, rather than isolating juntas, often strengthened their nationalist framing. The result was counter-regionalism: the Alliance of Sahel States, mutual-defense commitments, parallel summits, and formal withdrawal notices from ECOWAS. This fragmentation weakened cross-border security cooperation precisely in the zone where jihadist groups operate across borders.

The collapse also reveals a principal-agent problem at the regional level. ECOWAS and the G5 depended on member states whose interests diverged. Nigeria, Senegal, Ghana, and Côte d'Ivoire did not share the same threat perceptions or political incentives as Mali, Burkina Faso, and Niger. Some members were themselves suspended or under sanctions, reducing organizational coherence. External donors, including the European Union and France, often treated regional organizations as force multipliers for their own priorities, which made those organizations vulnerable to accusations of dependency. When the external powers withdrew or were expelled, the regional architecture lacked autonomous resources to sustain itself.

Theoretically, this case illustrates the limits of regional security complexes when security interdependence is not matched by legitimacy and capacity. Buzan's regional security complex theory emphasizes that states in a region share security concerns that cannot be separated from one another; the Sahel confirms that interdependence can produce not cooperation but competitive fragmentation if the institutions meant to manage it are seen as illegitimate. It also supports critiques of "new regionalism" that warn against conflating institutional creation with institutional effectiveness. Regional organizations may proliferate while their authority erodes.

Scope Conditions: This mechanism applies most strongly where regional organizations are donor-dependent, where member states have weak domestic legitimacy, where external powers use regional frameworks as instruments for their own security agendas, and where coups are popularly legitimated

by anti-foreign or anti-elite sentiment. It applies less where regional norms align with domestic political legitimacy, where organizations possess autonomous funding and enforcement capacity, and where security cooperation produces visible civilian benefits. It does not imply that all regional integration in Africa has failed; ECOWAS's economic and free-movement achievements, however uneven, are analytically distinct from its security and democratic-governance crises. Nor does it imply that the Alliance of Sahel States represents a durable alternative; it may reproduce the same legitimacy and capacity problems under a different ideological banner.

Observable Implications: If this mechanism is operating, one should observe formal withdrawal notices, the creation of parallel regional bodies, reduced joint military operations, increased bilateral deals between Sahelian juntas and external powers outside ECOWAS frameworks, and continued or worsening jihadist activity in border zones. One should also observe ECOWAS mediation efforts that fail to restore constitutional order, followed by partial sanctions relief as the organization adjusts to new realities. Displacement data should show continued cross-border movement, and ACLED data should show violence concentrated in areas where state presence is fragmented and regional coordination has collapsed. Conversely, if regional legitimacy were being rebuilt, one would expect sustained joint operations, reduced border violence, and declining displacement.

Perspective Note (five traditions in brief): *African (primary):* The African perspective treats the collapse as a crisis of sovereignty and regional legitimacy rather than a mere institutional failure. From this vantage point, the G5 and ECOWAS were not neutral African mechanisms; they were entangled with French counterterrorism and Western democratic conditionality. African scholarship on sovereignty and postcolonial statehood—Grovogui's critique of international legal hierarchies, Mbembe's analysis of necropolitical governance, Bayart's "politics of the belly," Mamdani's work on decentralized despotism, and Aning's analyses of ECOWAS security governance—helps explain why regional organizations lost credibility when they appeared to serve external agendas. The agency of juntas matters: they are not simply puppets of Russia or China, but actors who exploit popular resentment against foreign intervention and regional coercion. Yet the African perspective is not uniformly pro-junta. Many African scholars and civil-society actors warn that sovereignty rhetoric can mask authoritarianism, civilian harm, and the erosion of democratic accountability. The key insight is that regional order cannot be imposed through sanctions and donor-funded force; it must be grounded in popular legitimacy, civilian protection, and accountable security institutions. *Chinese:* China emphasizes non-interference, sovereignty, and development-security linkages. It generally supports regional organizations rhetorically while avoiding coercive sanctions and regime-change pressures. Its contribution is to offer an alternative to Western conditionality, but it may occlude accountability for civilian harm and the political roots of insurgency. *Russian:* Russia frames the crisis as evidence of Western failure and presents itself as a defender of sovereign choice. It supports juntas diplomatically and through security partnerships, using anti-Western narratives. Its contribution is to provide an alternative patron, but it occludes PMC abuses, dependency, and the lack of accountability in its security model. *Western:* Western actors view the collapse as a failure of intervention and regional partnership, often emphasizing Russian influence and democratic backsliding. They contribute self-critique and policy reassessment, but may overstate external causation and understate their own legitimacy deficits. *UN:* The UN perspective emphasizes regional partnership, protection of civilians, humanitarian access, and lessons from MINUSMA. It contributes normative frameworks and documentation, but is constrained by host-state consent and the gap between data and access.

2.6 KEY IDEA 5 — Comparative lessons: could any intervention have worked? What would have been needed?

Bolded Causal Claim: No single external intervention could have "worked" in the Sahel under the logics actually deployed—counterterrorism, regime stabilization, or proxy competition—because the central problem was not a shortage of force but a mismatch between intervention designs and local political orders; a genuinely successful intervention would have required a protection-first, legitimacy-centered, and long-horizon strategy that the prevailing frameworks were structurally disinclined to provide.

Mechanism: The Sahel became a comparative laboratory for external intervention. France's Operation Serval in 2013 demonstrated that a rapid, well-resourced military intervention could halt a jihadist advance and prevent the collapse of the Malian state. But Serval's tactical success did not translate into strategic success. Operation Barkhane, which followed, embedded French forces in a long-term counterterrorism campaign that relied on partner armies, local militias, and intelligence networks. Its mechanism assumed that killing or capturing jihadist leaders and holding territory would create space for state recovery. Instead, the campaign often alienated civilians through collateral damage, reinforced predatory security practices, and created dependency. When political conditions shifted and French forces withdrew in 2022–2023, the security vacuum exposed the absence of legitimate local institutions.

The United States pursued a different mechanism: train-and-equip programs, security assistance, drone surveillance, and special operations partnerships. This model assumed that professionalizing African militaries would improve counterterrorism capacity and reduce the need for large Western deployments. The mechanism was undermined by principal-agent problems. Security assistance often strengthened coercive capacity without corresponding accountability, and in several cases officers who received U.S. training later participated in coups. The U.S. model also struggled to reconcile counterterrorism partnerships with democratic conditionality, especially after coups triggered legal suspensions of aid.

The United Nations, through MINUSMA from 2013 to 2023, pursued a stabilization and protection-of-civilians mandate. Its mechanism was to support the Malian state, protect civilians, and facilitate political processes. But MINUSMA operated in an environment with no durable peace agreement, asymmetric threats, and a host government that increasingly viewed the mission as an obstacle. The mission's constraints illustrate a general mechanism: peacekeeping can protect civilians and document abuses, but it cannot substitute for political settlement or overcome host-state resistance.

Russia's Wagner Group, and later the Africa Corps, introduced a fourth mechanism: regime protection, resource-linked security deals, information operations, and direct combat support. This model offered juntas short-term survival and an anti-Western narrative. Its mechanism, however, traded accountability for loyalty. It could suppress immediate threats and protect ruling elites, but it did not address the political and economic grievances driving recruitment into armed groups. Allegations of civilian harm and resource extraction further complicated its legitimacy.

Comparing these models reveals a common failure mode. Each intervention prioritized a measurable output—territory held, militants killed, regimes stabilized, or partnerships maintained—over the slower and less measurable work of building legitimate authority. Counterterrorism metrics crowded out civilian-protection metrics; regime stabilization crowded out accountability; external partnerships crowded out local ownership. The mechanism of failure was not simply bad tactics but a theory of change that treated armed groups as the disease rather than as symptoms of political breakdown, economic marginalization, and abusive security practices.

What would have been needed is not a larger version of the same interventions but a different causal chain. First, civilian protection would have to be the primary metric, not a secondary constraint on counterterrorism. Second, security sector reform would need to address command accountability, human-rights violations, and the integration or disarmament of militias. Third, political settlement would need to include marginalized communities, not just central governments and external partners. Fourth, regional coordination would need to be African-led and adequately resourced, rather than donor-dependent. Fifth, interventions would need time horizons measured in decades, not electoral or budget cycles. Sixth, local knowledge and consent would need to shape operational decisions.

Yet scope conditions matter. Even an optimally designed intervention might fail where structural drivers—climate stress, poverty, illicit economies, demographic pressures, and weak state capacity—are severe. The claim is not that a perfect intervention was available and ignored. It is that the interventions actually attempted were mismatched to the problem and that their failure was overdetermined by their own design. A protection-first strategy might have reduced civilian harm and displacement even if it could not eliminate insurgency. The relevant counterfactual is therefore not "victory" but "less harm and more legitimacy."

Scope Conditions: This comparative lesson applies to external interventions in contexts of fragmented authority, weak state legitimacy, and cross-border insurgency. It applies less where host states possess robust legitimacy, professional security institutions, and broad social consent. It also depends on the type of intervention: humanitarian protection, peacekeeping, counterterrorism, and regime support have different theories of change and different success conditions. The argument does not imply that all external involvement is illegitimate; it implies that intervention success is conditional on local legitimacy, accountability, civilian protection, and long-term commitment. Where these conditions are absent, even well-resourced interventions are likely to produce tactical gains and strategic losses.

Observable Implications: If a protection-first and legitimacy-centered approach had been adopted, one would expect lower civilian targeting by state forces and their partners, reduced displacement, improved local trust in security institutions, and more durable governance arrangements. If the prevailing counterterrorism and regime-stabilization approaches continued, one would expect territorial fluctuations, rising civilian harm, increased displacement, coups, and eventual external withdrawal. The Data Lab focus on ACLED civilian targeting by perpetrator, UNHCR displacement, and external troop deployments by year provides observable indicators for adjudicating these expectations. The absence of protection-first outcomes under actual interventions does not prove that such an approach was impossible; it demonstrates that the strategies chosen did not produce it.

Perspective Note (five traditions in brief): *African (primary):* The African perspective asks whether any intervention could have worked on African terms, not merely whether Western or Russian strategies failed. African scholarship—Rodney on underdevelopment, Nkrumah on neocolonialism, Nyerere on ujamaa and self-reliance, Cabral on class and national liberation, Fanon on violence and decolonization, and contemporary scholars such as Grovogui, Mbembe, Bayart, Mamdani, Aning, Danso, and Tamale—suggests that external intervention often reproduces dependency and distorts local political struggles. From this vantage point, a successful intervention would have required African ownership, accountability to civilians rather than to donors, and a shift from counterterrorism to political reconstruction. The agency of juntas and communities matters: external actors cannot manufacture legitimacy. Yet the African perspective also contains internal debate. Some argue that African-led regional forces could have succeeded where France failed; others warn that regional powers may reproduce the same abuses. The key insight is that "could have worked" must be evaluated against local legitimacy, not against the preferences of external patrons. *Chinese:* China's

perspective emphasizes non-interference, sovereignty, and development. It would view a successful intervention as one that respects host-state consent, avoids regime change, and supports economic development. Its contribution is to challenge Western interventionism, but it may occlude the need for accountability and civilian protection. *Russian:* Russia frames success in terms of sovereign choice, regime survival, and multipolarity. It presents its security partnerships as alternatives to Western failure. Its contribution is to exploit Western legitimacy deficits, but it occludes PMC abuses, dependency, and the absence of political reform. *Western:* Western actors increasingly engage in self-critique, debating whether better strategy, more patience, or less intervention would have worked. Their contribution is policy learning and human-rights monitoring, but they may overfit to measurable violence and underweight local political legitimacy. *UN:* The UN perspective emphasizes protection of civilians, humanitarian access, and lessons from MINUSMA. It contributes normative frameworks and systematic documentation, but is constrained by host-state consent and the gap between data and access.

2.7 FIVE PERSPECTIVES IN DEPTH

2.7.1 African Perspective (PRIMARY)

The African perspective on the Sahel crisis is not a regional variant of Western security studies; it is a distinct epistemological and political tradition that begins from the experience of post-colonial state formation, the unfinished project of decolonization, and the structural violence of the international order. To reconstruct it from within requires abandoning the premise that the Sahel is primarily a security problem to be solved by external actors, and instead treating it as a site where the contradictions of the post-colonial state, global capitalism, and great-power competition converge and are lived by African populations. This perspective is the longest of the five because it carries the analytical weight of the lesson's central puzzle: why did a decade of external intervention produce not stability but state collapse, junta rule, and expanded civilian harm?

The post-colonial state as the central problematic. The foundational insight of African political thought, from Fanon's analysis of the colonial state's reproduction in the post-colonial era to Mamdani's distinction between "citizens" and "subjects" in the bifurcated state, is that the Sahelian state was never designed to govern its populations democratically. Mamdani's *Citizen and Subject* (1996) argues that colonial rule created a dual state: a "civil" sphere for settlers and a "customary" sphere for natives, with the latter governed through decentralized despotism. The post-colonial state inherited this architecture, and the Sahelian variant—weak, extractive, and dependent on external rents—has proven unable to extend services, justice, or security to peripheral populations. Bayart's concept of the "politics of the belly" (*La politique du ventre*, 1989) captures the clientelist logic through which state resources are captured by elites and distributed through patronage networks rather than public goods. In the Sahel, this means that the state's presence in rural areas is often experienced not as protection but as predation—taxation without services, arbitrary arrest, and ethnic favoritism. The jihadist insurgencies that erupted after 2012 did not create this governance vacuum; they exploited and, in some areas, temporarily filled it by providing dispute resolution, taxation with some redistribution, and a rough justice that the state had failed to deliver. Rodney's *How Europe Underdeveloped Africa* (1972) supplies the deeper historical frame: the Sahelian state's weakness is not a natural condition but the product of centuries of extraction, slave raiding, colonial conquest, and post-colonial structural adjustment that systematically underdeveloped the region's productive capacity and state institutions.

Sovereignty as lived practice, not juridical fiction. African scholarship insists on distinguishing between sovereignty as recognized by the international community and sovereignty as exercised on the ground.

Grovogui's *Beyond Eurocentrism and Anarchy* (2006) argues that the international system's recognition of African states as sovereign equals masks a reality of structural subordination in which African agency is constrained by debt, conditionality, and security dependence. In the Sahel, this gap between juridical and substantive sovereignty has been acute: Mali, Niger, and Burkina Faso were formally sovereign but functionally dependent on French military support, EU budget support, and UN peacekeeping. The juntas that seized power in 2020-2023 framed their coups not merely as power grabs but as assertions of substantive sovereignty—the right to choose security partners, to expel foreign troops, and to define national interest without external veto. Whether one accepts this framing or not, the African perspective takes it seriously as a political claim rooted in a long history of anti-colonial struggle. Nkrumah's *Neo-Colonialism: The Last Stage of Imperialism* (1965) provides the theoretical vocabulary: formal independence without economic and military autonomy is neo-colonialism, and the Sahelian states' dependence on Operation Barkhane and MINUSMA exemplified this condition. Nyerere's vision of African socialism and self-reliance, articulated across his speeches and writings, reinforces the point that genuine sovereignty requires not just flag independence but the capacity to determine one's own development path.

The agency of juntas and the legitimacy question. A distinctive contribution of the African perspective is its refusal to reduce juntas to either democratic heroes or authoritarian villains. The coups in Mali (2020, 2021), Burkina Faso (2022), and Niger (2023) occurred in contexts of mass popular mobilization against incumbent governments perceived as corrupt, ineffective, and subservient to foreign powers. The juntas' popularity—evidenced by large rallies in Bamako, Ouagadougou, and Niamey—cannot be dismissed as mere manipulation or Russian disinformation, though both elements exist. African scholars such as Aning and Danso have emphasized that African populations evaluate governments by their capacity to deliver security and dignity, and that the failure of elected governments to do so created a legitimacy crisis that juntas exploited. At the same time, the African perspective is not uncritical: the same scholars note that juntas have delayed transitions, restricted civil liberties, and in some cases worsened civilian harm. The point is that the junta phenomenon must be understood as a response to a governance crisis, not as an exogenous shock, and that external actors who treat juntas solely as problems to be managed miss the political dynamics that produced them. Cabral's insight that the liberation struggle must be both political and military, and that the people must be the subjects rather than objects of history, is directly relevant: the juntas' claim to represent popular will must be tested against their actual practice, not assumed or dismissed.

Civilian harm and the racialization of violence. The ACLED data showing that state forces and Russian PMCs have been responsible for significant civilian casualties in the Sahel must be read through the lens of African scholarship on the racialization and ethnicization of violence. Mamdani's *When Victims Become Killers* (2001) demonstrates how colonial categories of race and ethnicity were politicized and became the basis for mass violence in Rwanda; similar dynamics operate in the Sahel, where Fulani communities have been disproportionately targeted by state forces and militias on suspicion of jihadist sympathies. The African perspective insists that civilian harm is not merely a tactical failure or a human-rights violation to be documented; it is a political act that reshapes communal relations, drives recruitment into armed groups, and undermines the legitimacy of the state. Mbembe's concept of "necropolitics" (*On the Postcolony*, 2001) is relevant here: the power to decide who lives and who dies is exercised not only by insurgents but by states and their external partners, and the Sahel has become a space where multiple actors compete in the exercise of death-dealing power. Oyěwùmí's *The Invention of Women* (1997) adds a gendered dimension: the categories through which violence is understood and justified are themselves colonial constructs, and the experiences of women in the Sahel—often the primary victims of displacement, sexual violence, and economic disruption—are systematically underrepresented in security analyses. Tamale's *Decolonization and*

Afro-Feminism (2020) extends this critique, arguing that African feminist scholarship must be central to any analysis of conflict and security, not an afterthought.

The collapse of regional architectures. The G5 Sahel and ECOWAS were designed as African-led solutions to African security problems, and their collapse is a central concern of the African perspective. The G5 Sahel Joint Force, created in 2017, was intended to demonstrate African ownership of security; its failure reflects not only resource constraints but the deeper problem that regional organizations in Africa are often instruments of member-state elites rather than expressions of popular will. ECOWAS's response to the 2023 Niger coup—threatening military intervention, imposing sanctions, and then retreating—exposed the organization's dependence on Nigerian leadership and its inability to act without Western backing. The African perspective, drawing on Nyerere's vision of regional solidarity and Cabral's emphasis on the unity of political and military struggle, sees this as a failure of pan-African institutional capacity. The withdrawal of Mali, Burkina Faso, and Niger from ECOWAS in 2024 and their formation of the Alliance of Sahel States (AES) represents a reconfiguration of regional order that the African perspective treats as significant, though its long-term viability remains uncertain. The AES is both a rejection of ECOWAS's perceived subservience to Western interests and an experiment in alternative regionalism, but it also risks fragmenting the West African security architecture and creating competing spheres of influence.

What the African perspective contributes that others cannot. First, it centers the lived experience of Sahelian populations rather than the strategic interests of external actors. Second, it provides a historical framework—colonialism, neo-colonialism, structural adjustment—that explains why Sahelian states are weak without blaming African culture or governance. Third, it takes seriously the political claims of juntas and popular movements, treating them as responses to real grievances rather than as pathologies. Fourth, it insists that civilian harm be understood as a political phenomenon with communal and historical dimensions, not merely as a data point. Fifth, it frames the crisis as a crisis of the post-colonial state and the international order that sustains it, pointing toward structural solutions—debt relief, fair trade, democratic reform, and genuine sovereignty—rather than military ones. Sixth, it brings gender and racial analysis to bear on security questions that are typically treated as gender-neutral and race-blind.

What the African perspective occludes. It can underweight the genuine security threats posed by jihadist groups to African populations, particularly women, minorities, and secular activists. It can romanticize junta rule and understate the authoritarian turn in Mali, Burkina Faso, and Niger. It can be slow to acknowledge that some external interventions, however flawed, did provide temporary protection to civilians. It can treat "the West" as a monolithic actor, obscuring differences between French, American, EU, and UN approaches. It can struggle to generate actionable policy prescriptions beyond the call for sovereignty and structural reform, which are necessary but insufficient for immediate civilian protection. And it can understate the agency of jihadist groups as political actors with their own ideologies and constituencies, rather than treating them solely as symptoms of state failure.

Key scholars and sources. Fanon, *The Wretched of the Earth* (1961); Nkrumah, *Neo-Colonialism* (1965); Rodney, *How Europe Underdeveloped Africa* (1972); Cabral, *Return to the Source* (1973); Bayart, *The State in Africa* (1993); Mamdani, *Citizen and Subject* (1996) and *When Victims Become Killers* (2001); Mbembe, *On the Postcolony* (2001); Grovogui, *Beyond Eurocentrism and Anarchy* (2006); Oyěwùmí, *The Invention of Women* (1997); Tamale, *Decolonization and Afro-Feminism* (2020); Aning and Danso (various works on African security governance). Crisis Group Sahel reports and ACLED analyses provide empirical grounding.

2.7.2 Chinese Perspective

China's perspective on the Sahel crisis is shaped by three interlocking principles: non-interference in internal affairs, the primacy of development over security, and the pursuit of strategic partnerships that advance Chinese economic and diplomatic interests without entangling China in local conflicts. This perspective is neither naive nor disinterested; it is a calculated position that reflects China's own historical experience, its global strategy, and its assessment of Western intervention failure.

Non-interference as doctrine and practice. The principle of non-interference is enshrined in China's Five Principles of Peaceful Coexistence (1954) and has been consistently reaffirmed in FOCAC declarations and UN voting behavior. In the Sahel context, this means China has avoided military intervention, declined to participate in MINUSMA, and refrained from conditioning aid on governance reforms. Chinese officials have repeatedly cited the failures of Western intervention in Libya, Mali, and the broader Sahel as validation of this approach. The argument is straightforward: external military intervention disrupts local political balances, creates power vacuums, and produces unintended consequences that harm civilians. China's own experience with Western intervention in Libya—where China lost significant investments and saw the country descend into chaos—reinforced this conviction. The Chinese perspective thus treats non-interference not as indifference but as a principled alternative to a failed Western model, and it has been remarkably consistent across decades and regions.

Development as the root cause and the solution. Chinese discourse frames the Sahel crisis primarily as a development problem rather than a security problem. Poverty, underdevelopment, and lack of infrastructure are identified as the root causes of instability, and the solution is economic growth, connectivity, and state capacity-building through infrastructure. China's engagement in the Sahel has focused on mining, energy, telecommunications, and infrastructure projects, often financed through loans and implemented by Chinese companies. The Belt and Road Initiative extends to the Sahel, though with less density than in East Africa. Chinese officials argue that economic development creates the conditions for stability and that security without development is unsustainable. This framing has the advantage of addressing structural drivers that Western counterterrorism often ignores, but it can underweight the immediate security threats faced by populations and the political grievances that drive recruitment into armed groups. It also assumes a linear relationship between economic growth and political stability that the Sahelian experience does not consistently support.

Security partnerships without boots on the ground. China has not deployed combat troops to the Sahel, but it has developed security partnerships that include arms sales, police training, intelligence sharing, and peacekeeping contributions to UN missions elsewhere in Africa. China is the largest contributor of peacekeepers among the P5, though primarily in non-combat roles. In the Sahel, China has sold military equipment to several governments and has expressed willingness to support counterterrorism efforts through capacity-building rather than direct intervention. The Chinese perspective emphasizes that these partnerships are conducted on the basis of host-state consent and without political conditionality, distinguishing them from Western security assistance. This is attractive to Sahelian juntas seeking alternatives to Western dependence, but it raises questions about accountability and the end-use of Chinese-supplied equipment. The Chinese perspective does not have a robust framework for monitoring how its security assistance is used or for addressing abuses by partner forces.

Anti-Western framing and multipolarity. China's Sahel policy is embedded in its broader narrative of multipolarity and opposition to Western hegemony. Chinese media and officials have criticized French intervention as neo-colonial and have portrayed the expulsion of French troops as a legitimate assertion of African sovereignty. This framing aligns with Chinese interests in displacing Western influence in Africa, but

it also resonates with genuine African grievances. The Chinese perspective contributes a critique of Western interventionism that is sharper and more consistent than Western self-critique, but it can be opportunistic—exploiting Western failures without offering substantive alternatives for civilian protection. China's voting behavior at the UN, including abstentions on resolutions critical of Sahelian juntas, reflects this strategic positioning.

What the Chinese perspective contributes. It offers a non-military approach to root causes, a critique of interventionism grounded in historical experience, and a model of engagement based on consent rather than conditionality. It has helped diversify Sahelian states' partnerships, reducing dependence on any single external actor. Its emphasis on development addresses structural drivers that security-focused approaches neglect.

What it occludes. It underweights the immediate security threats to civilians, avoids accountability for how Chinese-supplied equipment is used, and can be indifferent to governance quality and human rights. It treats development as a technocratic fix rather than a political process, and its non-interference principle can become a shield for authoritarian partners. It has not articulated a coherent approach to civilian protection or humanitarian access in conflict zones. And it can understate the degree to which Chinese economic engagement itself creates dependencies and vulnerabilities, particularly in the mining and resource sectors.

2.7.3 Russian Perspective

Russia's perspective on the Sahel is the most overtly geopolitical of the five, framing the region as a theater of great-power competition in which Western failure has created an opportunity for Russian influence. This perspective combines anti-Western rhetoric, security provision through private military companies, and resource extraction, all presented under the banner of sovereign choice and multipolarity.

Anti-Western framing as ideology and strategy. Russian discourse on the Sahel is saturated with anti-Western and anti-colonial rhetoric. Russian officials and media portray French intervention as neo-colonial, Western counterterrorism as a failure, and the expulsion of French troops as a victory for African sovereignty. This framing draws on a long Russian tradition of anti-imperialism, but it is deployed instrumentally: it delegitimizes Western actors while legitimizing Russian presence. The Russian perspective treats the Sahel not as a region with its own dynamics but as a front in a global struggle against Western hegemony. This has proven effective in Sahelian capitals where anti-French sentiment is genuine and deep, but it risks reducing complex local conflicts to a binary of Western vs. non-Western. Russian information operations in the Sahel, including disinformation campaigns and social media manipulation, have amplified anti-Western narratives and supported junta governments, though the extent of their impact on popular opinion is debated.

Wagner/Africa Corps as security provider. Russia's primary security instrument in the Sahel has been the Wagner Group, now rebranded as Africa Corps under Russian military intelligence (GRU) control following the 2023 mutiny and Prigozhin's death. Wagner deployed to Mali in 2021 and has been implicated in severe civilian harm, including the massacre at Moura in March 2022, where hundreds of civilians were killed. Russian officials have denied or downplayed these allegations, framing Wagner as a legitimate security partner invited by sovereign governments. The Russian perspective presents PMC deployment as a model of security cooperation that is more effective and less hypocritical than Western intervention: no lectures on human rights, no conditionality, and a willingness to use force decisively. The evidence, however, suggests that Wagner's operations have been associated with high civilian casualties and have not significantly degraded jihadist capabilities. The transition from Wagner to Africa Corps represents an attempt to institutionalize Russian military presence under state control, but the fundamental model—PMC-based security provision

with limited accountability—remains unchanged.

Sovereign choice and the legitimacy of juntas. Russia has been the most consistent external supporter of Sahelian juntas, recognizing their governments, providing diplomatic cover at the UN, and blocking resolutions critical of human rights abuses. The Russian perspective frames this as respect for sovereignty: African states have the right to choose their partners, and Western attempts to isolate juntas are illegitimate interference. This resonates with African grievances about Western double standards, but it also serves Russian interests in gaining strategic footholds, access to resources (gold, uranium), and voting support at the UN. The Russian perspective occludes the authoritarian nature of junta rule and the absence of political reform, treating sovereignty as a formal principle rather than a substantive practice. Russia's support for juntas is not unconditional—it expects returns in the form of resource access, military basing rights, and diplomatic alignment—but the terms of these arrangements are typically opaque.

Resource extraction and economic interests. Russian engagement in the Sahel is not purely ideological. Wagner/Africa Corps has secured mining concessions, particularly in gold, and Russian companies have pursued uranium and other mineral interests. The Russian perspective does not emphasize these economic dimensions publicly, framing engagement instead in terms of security and solidarity. This gap between rhetoric and practice is a significant vulnerability: if Sahelian populations come to perceive Russian presence as extractive rather than supportive, the legitimacy Russia has gained through anti-Western framing could erode. The model of PMC-based resource extraction has precedents in other regions and has consistently generated local resentment over time.

What the Russian perspective contributes. It has provided Sahelian juntas with an alternative to Western dependence, validated African grievances about neo-colonialism, and exposed the hypocrisy of Western actors who preach human rights while supporting authoritarian partners. It has forced a reckoning with the limits of Western intervention and demonstrated that the international order is more multipolar than Western actors assumed. Its anti-Western framing, while instrumental, resonates with genuine popular sentiment.

What it occludes. It ignores or denies PMC abuses, including mass civilian killings. It offers no political reform agenda, no development strategy, and no framework for civilian protection. It treats the Sahel as a geopolitical chessboard rather than a region with its own agency. Its anti-Western framing, while resonant, can become a substitute for substantive policy. It has not demonstrated that Russian security provision produces better outcomes for civilians than Western intervention did, and ACLED data suggests the opposite. And it underestimates the possibility that Sahelian populations will eventually apply the same critical standards to Russian presence that they applied to French presence.

2.7.4 Western Perspective

The Western perspective on the Sahel is characterized by a tension between interventionist ambition and growing self-critique. For over a decade, Western actors—France, the US, the EU, and NATO allies—pursued counterterrorism and stabilization in the Sahel, and the results have been widely judged as failure. The Western perspective now encompasses both defenders of intervention who argue that more resources and patience were needed, and critics who argue that intervention was fundamentally misconceived.

The interventionist consensus and its premises. The Western approach to the Sahel was built on several premises: that jihadist groups posed a threat to international security; that weak states needed external support to defeat them; that military force could create space for governance and development; and that Western values—democracy, human rights, rule of law—were compatible with security objectives. Operation Serval (2013) and its successor Barkhane (2014-2022) embodied this approach, with France deploying thousands

of troops to Mali and the broader Sahel. The US provided intelligence, training, and special operations support. The EU contributed training missions and budget support. MINUSMA provided a UN peacekeeping framework. The interventionist consensus assumed that external actors could strengthen Sahelian states sufficiently to take over security responsibilities, and that this would lead to stability. This consensus was reinforced by the post-9/11 counterterrorism paradigm, which framed jihadist groups as global threats requiring military responses, and by the R2P doctrine, which provided a normative framework for intervention.

The failure and its mechanisms. The failure of Western intervention is now widely acknowledged, though its causes are debated. The mechanisms of failure include: the mismatch between military capacity and political legitimacy; the inability to address root causes (poverty, governance, ethnic tensions); the alienation of local populations through civilian casualties and heavy-handed tactics; the corruption and ineffectiveness of partner forces; and the strategic overextension of French forces across a vast territory. ACLED data showing that state forces (often trained and equipped by Western partners) were responsible for significant civilian harm has been particularly damaging to the Western narrative. The Western perspective has had to confront the possibility that its interventions made things worse by strengthening predatory states, fueling recruitment, and delegitimizing moderate political alternatives. The French military's own assessments, including the 2022 withdrawal from Mali, acknowledged that the security situation had deteriorated despite years of effort.

Self-critique and the lessons debate. Western policy communities have engaged in extensive self-critique, producing reports, hearings, and academic analyses. The debate centers on several questions: Was the intervention too military and not enough political? Was the timeline too short? Were partner forces adequately vetted? Did Western actors ignore local knowledge and priorities? Should the West have engaged with jihadist groups politically rather than purely militarily? The "lessons learned" literature is substantial, but it often remains within a technocratic frame—improving strategy, tactics, and coordination—rather than questioning the fundamental premise of external intervention. Critics within the Western tradition, including some Africanist scholars based in Western institutions, argue that the problem was not execution but conception: the Sahel cannot be stabilized by external military force because the crisis is rooted in political and economic structures that external actors cannot transform. The tension between these positions—reform vs. rejection of intervention—defines the current Western debate.

Human rights monitoring and accountability. A genuine contribution of the Western perspective is its investment in documentation and accountability. Western-funded research organizations, human rights groups, and media have produced detailed accounts of civilian harm by all parties, including Western-trained forces and Russian PMCs. This documentation is essential for understanding the conflict and for any future accountability process. The Western perspective also maintains a normative commitment to civilian protection, democracy, and human rights that, however inconsistently applied, provides a standard against which to measure all actors. Organizations such as Human Rights Watch, Amnesty International, and the International Crisis Group have produced influential analyses that shape both policy and public understanding.

What the Western perspective contributes. It offers the most extensive empirical documentation of the conflict, a tradition of self-critique that is rare in great-power discourse, and normative frameworks (human rights, civilian protection, democratic governance) that remain relevant. Its policy-learning processes, however imperfect, have produced genuine insights about the limits of military solutions. Its academic and policy research communities have generated sophisticated analyses of conflict dynamics, governance, and political economy.

What it occludes. It can overfit to measurable violence and underweight local political legitimacy. It

may treat African agency as a variable to be managed rather than a force to be respected. Its self-critique often stops short of questioning the structural conditions—global inequality, historical extraction, arms proliferation—that produce Sahelian instability. And it can be slow to acknowledge that its interventions, however well-intentioned, were experienced by many Sahelians as neo-colonial. The Western perspective can also be self-referential, debating its own failures without adequately centering Sahelian voices in the analysis.

2.7.5 UN Perspective

The UN perspective on the Sahel is shaped by the organization's dual role as a peacekeeping and humanitarian actor and its dependence on member-state consent. The UN's experience in the Sahel—particularly MINUSMA (2013-2023)—provides a rich, if painful, case study in the limits of peacekeeping in active conflict zones and the tension between protection mandates and political realities.

MINUSMA as the central case. MINUSMA was established in 2013 following the French intervention in Mali, with a mandate that included stabilization, protection of civilians, and support for political transition. It became the UN's deadliest mission, with over 300 peacekeepers killed, and was ultimately expelled by the Malian junta in 2023. The UN perspective treats MINUSMA as a lesson in the limits of peacekeeping without a viable peace to keep. The mission operated in an environment where there was no ceasefire, no political settlement, and no consent from all parties. Its mandate was ambitious—protecting civilians across a vast territory with limited resources—and its performance was mixed. The UN's own assessments acknowledge that MINUSMA struggled to protect civilians, was constrained by host-state restrictions, and became a target for insurgent attacks. The mission's withdrawal in 2023 was orderly but marked the end of the UN's largest peacekeeping presence in the Sahel.

Protection of civilians as normative framework. The UN perspective is anchored in the protection of civilians (PoC) doctrine, which has evolved from a humanitarian principle to a mandated task for peacekeeping operations. In the Sahel, PoC has meant documenting violations, establishing protection sites, and in some cases physically protecting civilians. The UN's systematic documentation of civilian harm—through MINUSMA's human rights division and OHCHR—provides an evidence base that is essential for accountability and policy. The UN perspective insists that civilian harm must be measured, attributed, and addressed, and that all parties—including state forces and their partners—must be held to international humanitarian law standards. This normative commitment is a genuine contribution, but its enforcement depends on the cooperation of member states and the willingness of the Security Council to act.

Humanitarian access and the humanitarian-development-peace nexus. The UN's humanitarian agencies (OCHA, UNHCR, WFP, UNICEF) have been central to the Sahel response, providing food, shelter, and protection to millions of displaced persons. The UN perspective emphasizes that humanitarian access is increasingly constrained by insecurity, bureaucratic impediments, and the politicization of aid. The "humanitarian-development-peace nexus" (HDPN) framework, which the UN has promoted in the Sahel, seeks to integrate humanitarian relief, development investment, and peacebuilding. In practice, this integration has been difficult: humanitarian actors resist being instrumentalized for political objectives, while development and peacebuilding require stable environments that do not exist. The UN perspective acknowledges these tensions but maintains that integrated approaches are necessary for sustainable solutions. The displacement crisis in the Sahel—with millions internally displaced and hundreds of thousands as refugees—has tested the UN's humanitarian capacity to its limits.

Lessons from MINUSMA. The UN has produced extensive lessons-learned analyses from MINUSMA,

identifying several key insights: peacekeeping missions require realistic mandates matched to resources; host-state consent is essential but can be withdrawn; protection of civilians requires more than military presence; and political solutions must precede or accompany military ones. These lessons have informed subsequent UN thinking about peace operations, including the "New Agenda for Peace" and discussions about the future of peacekeeping. The UN perspective is self-critical but also defensive: it argues that MINUSMA was asked to do too much with too little, and that its failures reflect systemic underfunding and unrealistic expectations rather than organizational incompetence. The mission's experience has also raised questions about whether traditional peacekeeping is viable in environments of active insurgency and great-power competition.

What the UN perspective contributes. It provides the most systematic documentation of civilian harm and displacement, a normative framework (PoC, IHL, human rights) that applies to all actors, and a humanitarian response that has saved lives. Its lessons-learned processes contribute to institutional learning. Its convening power brings together diverse actors and maintains a focus on civilian welfare. The UN's data on displacement, civilian casualties, and humanitarian needs is indispensable for policy and research.

What it occludes. It is constrained by host-state consent, which limits its ability to operate in areas controlled by juntas or insurgents. It can be slow to adapt to rapidly changing political environments. Its data, while systematic, may not capture the full picture due to access constraints. And its institutional interests—maintaining missions, protecting staff, preserving relevance—can conflict with honest assessment of failure. The gap between UN data and UN access is a persistent problem: the organization documents civilian harm it cannot prevent. The UN perspective can also be overly procedural, treating the Sahel crisis as a series of technical challenges to be managed rather than a political crisis requiring fundamental change.

SECTION 2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Centers sovereignty, junta agency, and the failure of external intervention; reveals that Western actors misunderstood local political dynamics and treated the Sahel as a security problem to be managed rather than a political crisis requiring fundamental change	May understate the genuine security threat posed by jihadist expansion; risks romanticizing junta legitimacy and underplaying civilian harm perpetrated by state forces and their new partners	Sovereignty and self-determination; external intervention is illegitimate without genuine, ongoing consent; the right of peoples to choose their own security partners	Expulsion of French troops from Mali (2022), Burkina Faso (2023), and Niger (2023); formation of the Alliance of Sahel States (AES); sustained popular mobilization against French presence	**Western:** Withdrawal of external forces worsened civilian harm and accelerated jihadist territorial expansion; the juntas have not delivered security
Chinese	Non-interference principle avoids the sovereignty violations of Western intervention; security partnership without political conditionality; economic engagement as stabilizing force	Avoids addressing governance failures and authoritarian consolidation; economic interests may not align with security needs; limited security footprint means China benefits from stability without bearing costs of provision	Sovereignty, non-interference, mutual benefit; development as the foundation of security	Continued Chinese engagement in Sahel infrastructure and mining despite Western withdrawal; absence of Chinese military bases or combat troops in the region	**African:** Non-interference can become complicity with authoritarianism; economic extraction without security provision replicates colonial patterns

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Russian	Anti-Western framing resonates with popular sovereignty claims; PMC model provides security assistance without political conditionality or institutional reform demands; positions Russia as alternative to failed Western order	Wagner/Africa Corps documented civilian harm; extractive economic interests (gold, mining concessions); does not address root causes of insurgency; PMC model lacks accountability mechanisms	Sovereign equality; anti-imperialism; multipolarity; the right of states to choose security partners free from Western conditionality	Rapid expansion of Russian influence post-coup in Mali, Burkina Faso, and CAR; popular anti-French mobilization; junta alignment with Moscow	**UN:** Documented civilian harm by Russian PMCs; absence of accountability; extractive arrangements that benefit foreign actors over local populations
Western	Systematic data collection on civilian harm (ACLED); institutional frameworks for protection of civilians; self-critique and lessons debate; recognition that intervention failed	Assumed its own intervention was benevolent; underestimated local agency and political dynamics; conflated counterterrorism with state-building; treated symptoms rather than causes	Liberal internationalism; human rights; protection of civilians; democratic governance as security foundation	ACLED civilian targeting data; MINUSMA lessons reports; Crisis Group analyses; French military withdrawal under pressure	**African:** Intervention was neo-colonial in structure and effect; "lessons" debate preserves Western epistemic authority while avoiding accountability for harm caused

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
UN	Systematic documentation of civilian harm and displacement; protection of civilians frameworks; humanitarian access advocacy; multilateral legitimacy	Constrained by host-state consent; slow to adapt to political change; institutional interests can conflict with honest assessment; procedural focus treats political crisis as technical challenge	Multilateralism; protection of civilians; humanitarian principles; impartiality	MINUSMA reports; UNHCR displacement data; ACLED integration with UN reporting	**Western:** UN missions were ineffective, withdrew under pressure, and failed to prevent civilian harm despite massive resources

---

SECTION 2.8 WORKED EXAMPLE (I do)

Case: The 2023 Niger Coup and the Expulsion of French Troops — The Endpoint of a Decade of Sahel Intervention

Levels of Analysis

Individual level. The coup of July 26, 2023, was executed by General Abdourahamane Tchiani, commander of the Presidential Guard, who detained President Mohamed Bazoum and declared himself head of a military junta. At this level, the event turns on the decisions of specific actors: Tchiani's calculation that Bazoum was vulnerable, Bazoum's own political positioning, and the responses of individual French, American, and ECOWAS officials. The individual level also captures the role of specific mobilizers—civil society figures, religious leaders, and media personalities who framed anti-French sentiment as a popular demand. Yet reducing the coup to individual ambition misses the structural conditions that made it possible: a decade of French military presence that had failed to deliver security, a regional wave of coups in Mali (2020, 2021) and Burkina Faso (2022) that normalized military takeover, and an ECOWAS that had lost credibility as a democratic enforcer. The individual level is necessary but insufficient; it explains who acted but not why the action was thinkable.

State level. The Nigerien state in 2023 was a fragile post-colonial construct: a military with limited capacity, a civilian government dependent on external security guarantees, and institutions that had never fully consolidated democratic control over the armed forces. The coup exposed the hollowness of Niger's democratic transition—Bazoum's election in 2021 had been contested, and the military retained de facto veto power over civilian governance. The state's security apparatus was fragmented: the Presidential Guard, the regular army,

and various specialized units operated with overlapping mandates and competing loyalties. The junta's first acts—suspending the constitution, dissolving institutions, and arresting Bazoum—were classic state-capture moves, but they were also framed as sovereign assertions against a state that had been, in the junta's narrative, subordinated to French interests. The state level reveals that the coup was not merely a military putsch but a reconfiguration of state power, with the junta positioning itself as the authentic representative of national sovereignty against a civilian government perceived as externally dependent.

Systemic level. The Sahel regional security complex had been destabilized by a decade of intervention and its failures. The G5 Sahel joint force, created in 2017 with French backing, had collapsed by 2023, with Mali and Burkina Faso withdrawing and Niger following. ECOWAS, which had threatened military intervention to restore Bazoum, found itself paralyzed by internal divisions—Nigeria's new president, Bola Tinubu, faced domestic opposition to military action, while other member states were themselves led by juntas. The systemic level captures the regional contagion of coups: Mali's 2020 and 2021 coups, Burkina Faso's 2022 coups, and Guinea's 2021 coup created a permissive environment in which military takeover became normalized. The Alliance of Sahel States (AES), formed by Mali, Burkina Faso, and Niger in September 2023, represented a systemic realignment: a rejection of ECOWAS and French-led security architecture in favor of a self-declared sovereign bloc. The systemic level shows that the Niger coup was not an isolated event but a node in a regional pattern of state collapse and realignment.

Transnational level. The transnational dimension is the most consequential for understanding the coup's aftermath. France maintained approximately 1,500 troops in Niger, operating from bases in Niamey and the drone facility at Agadez, as part of Operation Barkhane's successor arrangements. The United States maintained a major drone base at Agadez, central to its counterterrorism operations across the Sahel. The junta's expulsion of French troops—completed by December 2023—was a direct transnational act, severing a decade-long military relationship. The transnational level also captures the jihadist networks that span the Sahel's porous borders: Jama'at Nasr al-Islam wal Muslimin (JNIM) and the Islamic State in the Greater Sahara (ISGS) operate across Mali, Niger, and Burkina Faso, making any single state's security dependent on regional and international cooperation. Finally, the transnational level includes the Russian dimension: while Niger did not immediately host Wagner or Africa Corps forces as Mali did, the junta's alignment with the AES bloc and its anti-Western rhetoric created space for Russian influence, and the broader pattern of Sahel realignment toward Moscow was unmistakable. The transnational level reveals that the coup was not merely a domestic event but a geopolitical pivot point in the competition between Western, Russian, and emerging multipolar orders.

Mechanism

The mechanism linking the coup to the expulsion of French troops operated through four interconnected channels. First, *legitimacy consolidation through anti-foreign mobilization*: the junta, lacking electoral legitimacy, used anti-French sentiment as a mobilizing frame to build popular support. French military presence had become a symbol of neo-colonial subordination, and the junta's expulsion of French troops was a performative act of sovereignty that generated domestic legitimacy. This mechanism drew on a decade of accumulated resentment: French intervention in Mali (Operation Serval, 2013) had initially been welcomed, but the prolonged presence, the failure to defeat jihadists, and incidents of civilian harm had eroded French credibility. The junta did not create anti-French sentiment; it channeled and instrumentalized it.

Second, *ECOWAS sanctions backfire*: ECOWAS imposed sanctions on Niger following the coup, including border closures and financial restrictions. Rather than weakening the junta, the sanctions rallied nationalist support around it, allowing the junta to frame itself as defending Niger against external pressure. The sanc-

tions also created economic hardship that the junta could blame on ECOWAS and, by extension, on France and the West. This mechanism inverted the intended effect of sanctions: instead of coercing compliance, they consolidated junta legitimacy and hardened anti-Western sentiment.

Third, *regional contagion and bloc formation*: the AES, formed in September 2023, provided Niger with diplomatic cover and a shared anti-French platform. Mali and Burkina Faso, already aligned with Russia and hostile to France, offered Niger a model of sovereign defiance. The AES mechanism reduced the cost of expelling French troops by ensuring that Niger would not be isolated; instead, it would be part of a bloc that collectively rejected Western security architecture.

Fourth, *French strategic recalculation*: France, facing the loss of its last major military foothold in the Sahel after withdrawals from Mali and Burkina Faso, chose not to attempt a military reassertion. The French government, under domestic political pressure and with limited appetite for another open-ended deployment, opted for withdrawal. This mechanism was shaped by the recognition that military force could not sustain a presence against a hostile host government and population. The French withdrawal was thus not merely a response to junta demands but a strategic concession that the intervention model had failed.

The combined effect of these four mechanisms was the expulsion of French troops by December 2023 and the effective end of France's decade-long military engagement in the Sahel. The coup was the proximate cause, but the mechanisms reveal that the expulsion was the culmination of a longer process of intervention failure, regional realignment, and anti-Western mobilization.

Perspective Reconstruction

African (primary). The 2023 Niger coup and French expulsion are best understood as an assertion of sovereignty by a people who had endured a decade of external military presence that delivered neither security nor development. The junta, whatever its democratic deficits, channeled a genuine popular demand for self-determination that had been building since the failures of Operation Serval became apparent. French intervention in Mali in 2013 was initially welcomed, but the prolonged presence, the civilian harm, and the failure to defeat jihadists transformed France from liberator to occupier in the eyes of many Sahelians. The ECOWAS sanctions, backed by France and the West, were perceived as punishment for sovereign choice, reinforcing the narrative that external actors sought to dictate Niger's political future. The AES formation represents not merely junta solidarity but a regional reimagining of security architecture on African terms. The African perspective insists that the coup cannot be evaluated solely through the lens of democratic norms without accounting for the democratic deficits of the intervention itself—French military operations were never subjected to meaningful African oversight, and the security architecture was designed in Paris, not Niamey. What this perspective reveals that others miss is the depth of popular legitimacy behind the expulsion: the crowds celebrating French withdrawal were not merely junta supporters but citizens expressing a sovereign demand that had been suppressed by a decade of externally managed security.

Chinese. The Niger coup and French expulsion illustrate the risks of external military intervention and the value of China's non-interference principle. China, which had maintained economic engagement in Niger—including uranium mining interests and infrastructure projects—did not intervene militarily or diplomatically in the coup's aftermath, preserving its relationship with whatever government emerged. The Chinese perspective views the French expulsion as a predictable consequence of intervention overreach: military presence without political legitimacy generates backlash. China's continued economic engagement, including in the uranium sector, positions it to benefit from the post-French landscape without bearing the security costs of stabilization. However, this perspective occludes the question of whether China's economic interests align

with Niger's security needs, and whether non-interference becomes complicity when a junta consolidates authoritarian power. The Chinese view contributes the insight that security partnerships must be built on consent rather than imposition, but it does not address how consent is manufactured or manipulated by juntas.

Russian. The Niger coup and French expulsion represent a strategic opportunity and a vindication of Russia's anti-Western framing. Russia, through its state media and diplomatic channels, amplified the narrative of French neo-colonialism and supported the junta's sovereignty claims. While Niger did not immediately host Wagner or Africa Corps forces, the broader pattern—Mali's turn to Wagner, Burkina Faso's alignment with Moscow—positioned Russia as the beneficiary of Western withdrawal. The Russian perspective frames the expulsion as a sovereign choice by a people rejecting imperial domination, and it positions Russia as a partner that respects sovereignty and does not impose political conditionality. This perspective occludes the documented civilian harm perpetrated by Wagner forces in Mali, the extractive economic arrangements that accompany Russian security partnerships, and the absence of accountability mechanisms in the PMC model. The Russian view contributes the insight that Western intervention generated its own opposition, but it does not address whether Russian alternatives deliver better security outcomes for civilians.

Western. The Niger coup and French expulsion represent a catastrophic failure of a decade of intervention and a strategic setback for Western counterterrorism. The Western perspective, particularly in its self-critical variant, acknowledges that French military presence failed to deliver security, that the intervention model conflated counterterrorism with state-building, and that the failure to address governance deficits undermined military gains. The expulsion of French troops is read as evidence that the intervention lacked local legitimacy and that the "partner force" model—training and equipping local militaries—created dependencies rather than capabilities. The Western perspective also notes the strategic cost: the loss of the Agadez drone base and the broader erosion of Western intelligence and operational capacity in the Sahel. However, this perspective can occlude the agency of Sahelian actors, framing the coup and expulsion as reactions to Western failure rather than as autonomous political projects. The Western view contributes systematic data on intervention failure and a genuine, if partial, self-critique, but it struggles to escape the assumption that Western engagement was fundamentally benevolent.

UN. The Niger coup and French expulsion highlight the fragility of multilateral security frameworks and the limits of UN engagement in a rapidly changing political environment. MINUSMA, the UN mission in Mali, had already been forced to withdraw in 2023 following junta demands, and the Niger coup further eroded the UN's operational space in the Sahel. The UN perspective emphasizes the humanitarian consequences: displacement, food insecurity, and the collapse of protection frameworks for civilians in conflict zones. The UN's data collection—through ACLED partnerships and its own reporting—documented the civilian harm that accompanied both Western intervention and its aftermath. However, the UN perspective is constrained by its dependence on host-state consent, which the junta withheld, and by its institutional interest in maintaining relevance in a region where its missions were being expelled. The UN view contributes the insight that civilian protection cannot be achieved without political legitimacy, but it occludes the question of whether the UN's own frameworks were adequate to the scale of the crisis.

Explicit Adjudication

The African perspective best explains the Niger coup and French expulsion, but with significant qualifications. Its central claim—that the expulsion was a sovereign assertion against a failed and resented intervention—captures the mechanism of legitimacy consolidation and the depth of popular support for the junta's anti-French stance. The evidence supports this: the crowds celebrating French withdrawal, the

AES formation, and the regional pattern of anti-French mobilization all point to a genuine demand for self-determination that the Western intervention model failed to accommodate. The African perspective also correctly identifies the ECOWAS sanctions backfire as a mechanism that consolidated rather than weakened junta legitimacy.

However, the African perspective misses or underplays three critical elements. First, it understates the security vacuum created by French withdrawal: ACLED data shows that civilian harm in the Sahel increased following the withdrawal of external forces, and jihadist groups expanded their territorial control in the absence of coordinated military pressure. The sovereignty assertion, while politically meaningful, did not deliver security to civilians. Second, it risks romanticizing junta agency: the juntas in Mali, Burkina Faso, and Niger have not demonstrated superior security outcomes compared to their predecessors, and their governance records include significant civilian harm by state forces. Third, it does not adequately address the transnational dimension: jihadist networks do not respect sovereignty, and the AES bloc's rejection of external cooperation may weaken the regional response to a threat that no single state can contain.

The Western perspective provides the strongest corrective on security outcomes, documenting through ACLED data that civilian harm increased post-withdrawal. But the Western perspective's self-critique remains partial: it acknowledges intervention failure without fully relinquishing the assumption that Western engagement was the appropriate framework. The UN perspective adds the critical dimension of civilian protection and humanitarian access, but its institutional constraints limit its explanatory power. The Russian perspective captures the geopolitical realignment but occludes the civilian harm associated with its own security partnerships. The Chinese perspective offers the non-interference principle as an alternative but does not address how security is actually provided.

The most accurate adjudication is that the Niger coup and French expulsion were simultaneously a sovereign assertion (African), a strategic failure of intervention (Western), a geopolitical realignment (Russian), a validation of non-interference (Chinese), and a humanitarian crisis (UN). No single perspective captures all five dimensions. The African perspective best explains the *political* dynamics—the coup, the expulsion, the popular mobilization—but the Western and UN perspectives better explain the *security* consequences. The synthesis is that sovereignty assertions without security provision create a vacuum that jihadist groups exploit, and that the decade of intervention failed not because sovereignty was irrelevant but because the intervention model never reconciled sovereignty with security.

SECTION 2.9 PROBLEM PAIR (We do)

Tasks

1. Reconstruct the sequence of external military interventions in Mali from 2012 to 2025, mapping each to its stated objective and to its observable effect on civilian harm as recorded by ACLED.
2. Using the four levels of analysis (individual, state, systemic, transnational), explain why French Operation Serval (January 2013) succeeded tactically but failed strategically, and identify the missing scope condition.
3. Reconstruct the African perspective on the 2020–2021 coups and the subsequent pivot to Russia: what grievance did the junta articulate, how did it frame sovereignty, and what did it occlude?
4. Evaluate the claim that Wagner/Africa Corps reduced jihadist violence in Mali. What does ACLED data on civilian targeting by perpetrator suggest about the composition, not just the level, of violence?

5. Assess the collapse of the G5 Sahel and ECOWAS's failed response to the 2023 Niger coup: what does this reveal about the regional security architecture's dependence on external patrons?
6. Synthesize: was Mali's trajectory from 2012 to 2025 determined more by external intervention choices or by internal governance failures? Adjudicate on the basis of evidence, and state one falsifier.

MODEL ANSWER

Mali's trajectory from 2012 to 2025 illustrates how external intervention can arrest territorial collapse without resolving the political economy of insurgency, and how the resulting legitimacy vacuum invites a second, more predatory external patron. The mechanism runs through three linked stages. First, the 2012 Tuareg rebellion and jihadist advance on Bamako created a state-survival crisis that invited French Operation Serval in January 2013. Serval's mechanism was kinetic: airpower and special forces disrupted jihadist command nodes in the north, pushing Ansar Dine, MUJAO, and AQIM into the Adrar des Ifoghas. The tactical success was real — Bamako was secured, elections held in 2013 — but the strategic mechanism failed because Serval did not rebuild the Malian state's coercive and distributive capacity in the north. French forces remained as Operation Barkhane (2014–2022), a counterterrorism campaign whose logic treated Mali as a battlespace rather than a polity. The scope condition for kinetic success — a partner state capable of holding territory — was absent; the Malian army's collapse in 2012 and its subsequent politicization meant that French gains were reversible.

Second, the 2020 and 2021 coups by Colonel Assimi Goïta's junta reframed the conflict. The junta's mechanism of legitimation was anti-French sovereignty rhetoric: it accused Paris of neo-colonial interference, expelled the French ambassador and forces, and withdrew from the G5 Sahel. This was not merely ideological; it reflected a genuine grievance that a decade of French presence had not reduced insecurity. ACLED data show civilian fatalities rising through 2019–2021, with state forces and allied militias increasingly implicated in massacres in central Mali (Mopti, Ségou). The junta's pivot to Russia, via Wagner (later Africa Corps), offered a different intervention model: less conditionality, no human-rights benchmarks, and a transactional security-for-resources logic. The mechanism here was regime survival through external patronage, not population protection.

Third, Wagner's deployment from late 2021 produced a distinctive harm profile. ACLED records show that Russian PMC operations in Mali, often alongside Malian forces (FAMa), were associated with elevated civilian targeting in central and northern Mali — the Moura massacre of March 2022 being the emblematic case, where hundreds of civilians were killed during a joint operation. The mechanism is not that Wagner caused more violence in aggregate; jihadist groups (JNIM, ISGS) remained the leading perpetrators of civilian harm. Rather, Wagner shifted the composition of violence: state-aligned forces became a larger share of civilian fatalities, eroding the distinction between counterterrorism and collective punishment. This is the hybrid-governance dynamic — the state, jihadists, militias, and PMCs all extract from and harm civilians, and no actor holds a monopoly on legitimate force.

The African perspective, reconstructed from within, frames this not as a story of Russian success or French failure alone but as a sovereignty crisis: external patrons, whether Western or Russian, treat Mali as a security theater, and juntas instrumentalize anti-imperial rhetoric to consolidate power without delivering governance. The Chinese perspective emphasizes non-interference and development-first sequencing, noting that neither France nor Russia addressed the economic drivers. The Russian perspective frames the pivot as sovereign choice and anti-Western solidarity. The Western perspective debates "lessons" — whether lighter footprints, earlier exit, or deeper state-building would have worked. The UN perspective, drawing on MINUSMA's 2013–2023 experience, stresses that peacekeeping without a political settlement and without host-state con-

sent (withdrawn in 2023) cannot protect civilians.

Adjudication: the evidence supports a conditional verdict. External intervention choices mattered at the margin — Serval prevented immediate state collapse; Barkhane's overreach fueled backlash; Wagner's arrival worsened civilian harm by state-aligned forces. But the deeper determinant was internal: the Malian state's failure to extend legitimate authority to the north and center, the politicization of the army, and the junta's substitution of sovereignty rhetoric for reform. No intervention could have succeeded without a credible Malian partner; the counterfactual of "better intervention" is bounded by this structural constraint. The falsifier would be evidence that a different external patron, under the same Malian political conditions, produced durable security and reduced civilian harm — none exists in the 2012–2025 record.

SECTION 2.10 INDEPENDENT MEMO (You do)

(a) Case description (150–200 words). Burkina Faso, 2022–2025. Following two coups in 2022, Captain Ibrahim Traoré's junta expelled French forces, suspended the constitution, and deepened security ties with Russia while jihadist groups (JNIM, ISGS) expanded control across the north and east. ACLED records show civilian fatalities rising sharply after 2022, with state-aligned forces and the Volunteers for the Defense of the Homeland (VDP) militia increasingly implicated alongside jihadists. The junta framed the pivot as sovereign emancipation from neo-colonial dependence, yet governance indicators deteriorated and humanitarian access contracted. Your task: analyze this trajectory using the lesson's framework.

(b) Required memo headings (use as prompts):

- **Mechanism:** Identify the causal chain linking the 2022 coups, the expulsion of French forces, the Russian security pivot, and the trajectory of civilian harm. Specify scope conditions and observable implications.
- **Perspective reconstruction:** Reconstruct all five perspectives (African primary, Chinese, Russian, Western, UN) on the Burkina Faso case in 3–5 sentences each, steel-manned from within.
- **Historical analogue:** Identify one comparable case from the lesson or prior lessons and specify what transfers and what does not.
- **Falsifiers:** State two observable developments that would weaken your central claim, and one that would strengthen it.

(c) Self-check: Before submitting, verify that you have distinguished description (what happened), explanation (why it happened), prediction (what follows), and prescription (what should be done) — and that no two are conflated.

SECTION 2.11 HINGE QUESTION

Question: Which of the following best explains why French Operation Serval's tactical success in January 2013 did not translate into strategic success in Mali by 2022?

A. Serval's rules of engagement were too restrictive to permit the operational tempo needed to defeat jihadist networks. B. The intervention's mechanism was kinetic disruption without state-building, and the Malian state lacked the capacity to hold territory. C. Russia's Wagner Group outcompeted France militarily in the Sahel after 2019, forcing a French withdrawal. D. The UN MINUSMA mission replaced French forces and failed to protect civilians, causing the strategic failure.

Distractor diagnoses:

- **A is wrong** because it misattributes failure to rules of engagement rather than to the structural absence of a capable partner state; Serval's kinetic tempo was in fact high, and restrictions were not the binding constraint.
- **C is wrong** because it reverses causality: Wagner arrived in Mali in late 2021, after the French withdrawal was already underway, and did not outcompete France militarily; the withdrawal was driven by junta hostility and domestic French fatigue, not battlefield defeat.
- **D is wrong** because MINUSMA did not replace French forces — it operated in parallel with a different mandate (protection of civilians, stabilization) — and its 2023 withdrawal followed, rather than caused, the strategic failure of the French-led counterterrorism model.

SECTION 2A — DATA LAB

The Sahel data landscape is politically consequential: ACLED event records, UNHCR displacement counts, and deployment timelines do not merely describe violence; they are used by governments, juntas, donors, and armed groups to justify or contest authority. The tables below therefore separate **measurement** from **interpretation**. All trend statements are qualitative because exact counts vary by ACLED version, coding rules, and reporting access; the stable finding is the direction and composition of harm, not a single number.

Table 1. Civilian targeting by perpetrator category, Sahel (qualitative trend, 2011–2025)

Period	Jihadist insurgents	State security forces	Pro-government militias / VDP-type groups	Russian PMCs (mainly Mali)	Dominant pattern
2011–2014	Low–moderate, localized	Low	Low	None	Jihadist control in northern Mali; French Serval reverses territorial loss but does not rebuild governance
2015–2018	Rising	Moderate, rising	Emerging	None / minimal	JNIM and ISGS expand; state responses harden; militia mobilization begins

Period	Jihadist insurgents	State security forces	Pro-government militias / VDP-type groups	Russian PMCs (mainly Mali)	Dominant pattern
2019–2021	High	High	High	Limited / transitional	Massacres, reprisals, and coup cycles; civilian harm becomes multi-perpetrator
2022–2025	Very high	High–very high	High	Significant in Mali	French withdrawal, MINUSMA withdrawal, Russian entrenchment; harm remains high despite fewer Western troops

Table 2. Displacement and external military presence (broad trend, selected periods)

Period	Displaced populations (UNHCR, broad)	France	United States	UN MINUSMA	Russia (Wagner / Africa Corps)	Reading
2013	Hundreds of thousands	Serval peak; Barkhane follows	Intelligence / support role	Mandate established	Minimal	Intervention restores state territorial control in parts of Mali but not durable protection

Period	Displaced populations (UNHCR, broad)	France	United States	UN MINUSMA	Russia (Wagner / Africa Corps)	Reading
2017	Growing	Barkhane regionalized	Expanding drone / base footprint	Full deployment	Minimal	Security footprint widens; civilian harm and displacement continue to rise
2020	Millions across central Sahel	Barkhane under strain	Present	Present	Limited / entry phase	Coups and jihadist expansion outpace external stabilization
2022	Millions	Withdrawal announced / underway	Present	Drawdown begins	Expanding	External order fragments; juntas redefine partnerships
2024–2025	Several million	Expelled from Niger and others	Niger expulsion / reconfiguration	Withdrawal completed (Mali 2023)	Entrenched in Mali; broader Sahel courtship	External military presence is reorganized, not reduced in geopolitical significance

Table 3. Data-quality and interpretive indicators

Indicator	What it measures	Strength	Limitation
ACLED civilian-targeting events	Reported deliberate violence against civilians	Disaggregated by perpetrator, location, and date	Undercounts remote areas; event-based, not population-based; coding depends on media and NGO access

Indicator	What it measures	Strength	Limitation
ACLED fatalities	Reported deaths in political violence	Useful for trend comparison	Casualty figures are estimates; mass-casualty claims are often contested
UNHCR displacement	Refugees and internally displaced persons	Humanitarian planning and cross-country comparison	Registration gaps; definitional and political variation; does not capture all forced movement
External troop-deployment records	Foreign military presence	Helps date intervention phases	Covert, rotational, or contractor forces may be undercounted
Coup and regime-change counts	Political instability	Tracks abrupt authority shifts	Does not measure governance quality, legitimacy, or civilian protection

Five numbered analysis questions

1. **Trend.** What does the ACLED pattern suggest about civilian targeting in the Sahel between 2011 and 2025?
   Answer: Civilian targeting rises sharply after the mid-2010s and becomes **multi-perpetrator**. Jihadist violence remains central, but state forces, militias, and Russian PMCs account for a growing share of reported harm in key periods. The trend therefore undermines any narrative that attributes civilian harm to one actor alone. It also shows that external intervention phases do not automatically reduce harm; in several periods, harm rises alongside or after major deployments.

2. **Level of analysis.** At which level should the Sahel pattern be explained?
   Answer: All four levels are necessary. At the **individual** level, commanders, militia leaders, and soldiers make targeting decisions under fear, revenge, and local grievance. At the **state** level, weak territorial control, coup politics, and security-force fragmentation shape who is armed and accountable. At the **systemic** level, French, US, UN, and Russian interventions alter incentives, legitimacy, and resource flows. At the **transnational** level, jihadist networks, PMC contracts, arms routes, and diaspora/remittance economies cross borders. A single-level explanation is almost always incomplete.

3. **Perspective reconstruction (all five).** How would each perspective read the same ACLED trend?
   African (primary): The data confirm that external intervention did not secure civilians; they also show that post-coup juntas and their new partners have not solved the problem. The African vantage point asks who is counted, who is protected, and whose sovereignty is treated as expendable. It stresses that civilian harm is not only a security metric but a legitimacy crisis: states that kill or fail to protect their own people lose the moral basis of rule, regardless of whether the killer wears a national uniform, a militia armband, or a PMC patch.
   Chinese: The trend supports the argument that security without development and without host-state ownership produces recurring violence. Beijing's reading emphasizes non-interference, state capac-

ity, and infrastructure/economic stabilization, while treating Western military-first intervention as a cautionary case. It may understate the role of authoritarian closure and the absence of accountability mechanisms.

Russian: The data are read through an anti-Western frame: Western intervention failed, created dependency, and delegitimized local regimes; Russian partnership is presented as sovereign choice and pragmatic security assistance. This reading can occlude Russian PMC abuses and the way mercenary accountability gaps may reproduce harm.

Western: The trend feeds a self-critical debate about counterinsurgency, partner-force abuse, and the limits of external military power. Western analysts often ask whether different force ratios, governance support, or earlier withdrawal would have changed outcomes. This reading can overstate technical failure and understate the structural illegitimacy of externally backed security orders.

UN: The data are read through protection-of-civilians mandates, humanitarian access, and mandate realism. The UN perspective stresses that civilian harm data should shape rules of engagement, human-rights due diligence, and exit planning. It can be constrained by member-state politics, host-state consent, and the gap between mandate language and deployable capacity.

4. **Interpretation.** Does the data imply that intervention "caused" civilian harm?
   Answer: Not by itself. The data show **correlation and temporal overlap**, not a single causal mechanism. Intervention may reduce harm in some localities while increasing it elsewhere through reprisals, displacement, or legitimacy collapse. Jihadist violence, state fragmentation, climate stress, and local revenge cycles also drive harm. The strongest defensible claim is that intervention trajectories changed the **composition and geography** of violence and often failed to produce durable civilian protection, not that any single external actor is solely responsible.

5. **Limitation.** What are the most important limits of these data?
   Answer: ACLED captures reported events, not all harm; remote and contested areas are underreported; fatality estimates are uncertain; displacement data miss unregistered movement; deployment records miss covert or contractor forces; and all datasets are shaped by political access, media coverage, and definitional choices. Data can illuminate patterns but cannot settle questions of legitimacy, intent, or historical responsibility without qualitative and local evidence.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — "Sahel Hybrid Governance Field Map" (hand-drawn sketch)

Draw a simplified outline of the central Sahel: western Mali, Burkina Faso, and Niger, with capital dots for Bamako, Ouagadougou, and Niamey. Use five node types: blue squares for state security forces, red triangles for jihadist groups, orange circles for pro-government militias, black diamonds for Russian PMC elements, and small grey dots for civilian communities. Draw solid arrows where an actor exercises coercion or taxation; dashed arrows where an actor provides protection or services; wavy arrows for displacement. Add a legend in the corner. Label three zones: "contested rural corridor," "capital-centered state," and "borderland trafficking route."

Perspective overlay: Annotate in the margin: African lens—"sovereignty is fragmented, not absent"; Western lens—"security vacuum"; Russian lens—"sovereign partner network"; Chinese lens—"development corridor"; UN lens—"protection gap." The visual should make clear that civilians are not passive background but the population whose survival and allegiance are being contested.

Visual 2 — "Intervention Timeline and Civilian Harm, 2013–2025" (hand-drawn timeline)
Draw a horizontal axis from 2013 to 2025. Above the axis, plot a jagged line labeled "relative civilian targeting (qualitative, not exact counts)." Below the axis, draw stacked horizontal bars for France, the United States, UN MINUSMA, and Russia, with bar thickness indicating relative presence and clear end points for withdrawals or expulsions. Mark vertical ticks for major events: French Serval, Barkhane, G5 Sahel, coups in Mali/Burkina Faso/Niger, MINUSMA withdrawal, Niger coup and French expulsion, Africa Corps expansion. Add a small box titled "Data caution: reported events only."
Perspective overlay: Place five short margin notes: African—"rejection of tutelage and demand for accountability"; Western—"counterinsurgency and partner-force dilemmas"; Russian—"anti-Western opportunity and sovereign choice"; Chinese—"stability through development, not expeditionary war"; UN—"mandate erosion and protection failures." The visual should show that external presence and civilian harm move on different clocks.

Visual 3 — "ACLED Perpetrator Composition and Displacement" (hand-drawn stacked chart)
Draw four stacked bars for the periods 2011–2014, 2015–2018, 2019–2021, and 2022–2025. Each bar is divided into segments for jihadists, state forces, militias, and Russian PMCs, with segment height showing relative share rather than exact counts. Overlay a dashed line for "displaced populations (broad trend)" rising across the same periods. Add annotations: "remote-area underreporting," "contested casualty figures," and "displacement is not only conflict-driven."
Perspective overlay: Annotate: African—"whose deaths are visible and whose are normalized?"; Western—"metrics of success and failure"; Russian—"Western data and double standards"; Chinese—"human security requires development indicators"; UN—"protection of civilians and humanitarian access." The visual should teach that composition matters: a decline in one perpetrator's share is not the same as a decline in civilian harm.

SECTION 4 — CORNELL NOTES

Cue (question / prompt)	Notes (dense answer + source log)
What is "hybrid governance" in the Sahel?	State, jihadist, militia, PMC, and civilian actors coexist and compete for authority, taxation, protection, and legitimacy. Governance is not a binary of state vs. non-state; it is layered and territorial. Source log: Crisis Group Sahel reports; ACLED Sahel reports.
What is the central civilian-harm trend?	Reported civilian targeting rises after the mid-2010s and becomes multi-perpetrator. Jihadist violence remains central, but state forces, militias, and Russian PMCs contribute significantly in later periods. Source log: ACLED Sahel reports 2023–2025.

Cue (question / prompt)	Notes (dense answer + source log)
How did French intervention evolve?	From Serval's rapid territorial reversal in Mali to Barkhane's regionalized counterterrorism, then withdrawal and expulsion. The trajectory shows short-term military gains without durable political settlement. Source log: Crisis Group; International Peace Institute analyses.
What is MINUSMA's lesson?	A large UN mission can stabilize and protect in some areas but cannot substitute for host-state legitimacy, regional cooperation, or a viable political process; withdrawal followed host-state pressure. Source log: UN MINUSMA lessons reports.
Why did the G5 Sahel collapse?	Joint force ambitions were undermined by funding gaps, uneven national capacity, coup politics, and diverging regime interests; the framework could not survive the broader breakdown of Sahelian political order. Source log: Crisis Group; IPI analyses.
What is the ECOWAS crisis?	Coups in Mali, Burkina Faso, and Niger strained ECOWAS norms, sanctions, and military-threat credibility; the bloc faced a tension between democratic norms and regional security cooperation. Source log: Crisis Group Sahel reports.
How should ACLED data be used?	As pattern evidence, not proof of causation or intent. Disaggregate by perpetrator, compare with displacement, and triangulate with field reporting. Source log: ACLED Sahel reports.
What does the African perspective emphasize?	Sovereignty, rejection of external tutelage, junta agency, and the legitimacy crisis produced by civilian harm. It asks whether any external actor has earned the right to define Sahelian security. Source log: African scholarship and regional political discourse; Crisis Group.
What do Chinese, Russian, Western, and UN perspectives add?	China: non-interference plus development and state capacity. Russia: sovereign choice plus anti-Western framing. Western: intervention failure and self-critique. UN: PoC, humanitarian access, mandate realism. Source log: IPI; UN MINUSMA lessons reports.

Cue (question / prompt)	Notes (dense answer + source log)
What are key falsifiers?	If civilian harm fell sustainably after a given intervention; if displacement reversed; if a regional force gained legitimacy; if data showed one perpetrator's dominance declining without replacement by another. Source log: ACLED; UNHCR.
What is the Niger 2023 worked example?	The coup and expulsion of French troops mark the endpoint of a decade of intervention: external military presence became politically untenable even where it had tactical utility. Source log: Crisis Group; ACLED.
What is the Mali 2012–2025 problem pair?	From French Serval to Russian dependence: a case of intervention substitution rather than conflict resolution, with civilian harm and sovereignty claims at the center. Source log: ACLED; Crisis Group; IPI.

Summary (3–5 sentences). The Sahel case shows that civilian harm is not a side effect of an otherwise stable security order but a constitutive feature of hybrid governance and contested sovereignty. ACLED data reveal a multi-perpetrator escalation that no single intervention narrative can explain. French, UN, and US trajectories lost political legitimacy, while Russian entry and junta agency reconfigured rather than ended external dependence. The African perspective is indispensable because it centers sovereignty, accountability, and the question of who is protected; the other perspectives add important but partial insights. The lesson's core judgment is that durable civilian protection requires political legitimacy and accountable local institutions, not merely a change in foreign flag.

SECTION 5 — FEYNMAN COMPRESSION

1. **Explain without jargon.**
   In the Sahel, several armed groups and governments are fighting over who rules and protects people. Civilians are harmed by jihadists, soldiers, militias, and foreign contractors. France, the UN, the United States, and Russia have all tried to shape the conflict, but none has produced lasting safety. The data show that violence against civilians has grown and that many different actors cause it. Coups in Mali, Burkina Faso, and Niger show that people and elites have rejected some outside plans. The main point is that safety cannot be imported by force; it depends on governments that people trust and that can be held accountable.

2. **Mark gaps.**
   I still need to be precise about the difference between "civilian targeting" and all civilian deaths; between displacement caused by violence and displacement caused by drought or economic collapse; and between a coup's popularity and its long-term legitimacy. I also need to avoid implying that Russian forces are the only new source of harm or that Western withdrawal automatically improves civilian out-

comes. Another gap: I have not yet specified what "accountability" would mean in practice—courts, parliamentary oversight, community justice, or international mechanisms.

3. **Reread verification.**
   After rereading the core sources, the stable claims are: ACLED shows rising and diversifying civilian harm; UNHCR shows large-scale displacement; external deployments shifted from French/UN dominance to Russian/junta alignment; and MINUSMA's withdrawal followed host-state pressure. The less stable claims are exact causal weights: the data do not prove that intervention caused all harm, nor that withdrawal will reduce it. I should state mechanisms and scope conditions, not just outcomes.

4. **Analogy with explicit limits.**
   The Sahel is like a neighborhood where several rival protection rackets claim to keep residents safe while also extorting them; outside patrons sometimes back one racket, then another, but residents still cannot call a trusted police force. The analogy helps explain hybrid governance and civilian vulnerability. Its limit is that states, juntas, PMCs, and jihadist movements are not merely criminal rackets: they make ideological, religious, and sovereignty claims, and some have genuine local support. The analogy also risks erasing the historical and colonial dimensions of state weakness.

5. **Rewrite.**
   The Sahel is a hybrid-governance arena in which civilian harm is produced by multiple armed actors and shaped by shifting external interventions. ACLED data show rising, diversifying civilian targeting; UNHCR data show massive displacement; and deployment records show a reorganization of external military presence rather than its disappearance. French and UN interventions achieved tactical gains but lost political legitimacy; Russian and junta partnerships have not yet demonstrated superior civilian protection. The African perspective centers sovereignty and accountability, while Chinese, Russian, Western, and UN perspectives each illuminate partial mechanisms and occlude others. The safest conclusion is that civilian protection depends on accountable local institutions and legitimate regional order, not on the nationality of the troops deployed.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L34	definition	What is “hybrid governance” in the Sahel?	It denotes overlapping and contested authority among states, jihadist movements, militias, private military companies, and civilians, where sovereignty is fragmented rather than absent. The concept shifts analysis from state failure to plural political orders.	African scholarship treats this as a historically produced political order, not a vacuum to be filled by external actors.
L34	mechanism	How did Operation Serval (2013) produce territorial gains without strategic victory?	It disrupted jihadist control of northern Mali but did not resolve local grievances, political exclusion, or state legitimacy deficits; armed groups adapted through dispersion and local embedding. Military success therefore did not convert into durable political order.	Western accounts often foreground operational success; African accounts foreground unresolved political bargains.

Tag	Card Type	Front	Back	Perspective Note
L34	mechanism	What does ACLED suggest about Russian PMC-linked violence in Mali?	ACLED event data associate Russian-linked forces with significant civilian-targeting incidents in some periods and locations, especially where they operate alongside state forces. The pattern is contingent on local command, mission type, and reporting conditions, not an invariant law.	Russian narratives emphasize sovereign partnership; African critics emphasize accountability and civilian protection gaps.
L34	comparison	How did the G5 Sahel and ECOWAS crises differ?	The G5 Sahel eroded through coups, funding shortfalls, and weak legitimacy among member states; the ECOWAS crisis centered on sanctions and intervention threats after the 2023 Niger coup. Together they show regional security architecture fragmenting under competing sovereignty claims.	Both reveal African institutional agency and constraint, not merely external manipulation.

Tag	Card Type	Front	Back	Perspective Note
L34	source	What is a key limitation of ACLED civilian-targeting data?	ACLED records reported events with perpetrator attribution, but underreporting, access constraints, definitional choices, and media bias shape the record. It is strong for trend and perpetrator comparison, weak for exact casualty totals.	Data should be read as an evidentiary floor, not a complete census of harm.
L34	debate	Could any Sahel intervention have worked?	A conditional yes: security operations integrated with political reform, local legitimacy, regional ownership, and civilian protection might have reduced violence. A counterterrorism-only model, detached from governance, is the stronger candidate for failure.	Western "lessons" debates often underweight African sovereignty and institutional capacity.

Tag	Card Type	Front	Back	Perspective Note
L34	reconstruction	How does the African perspective reconstruct the 2023 Niger coup?	It is read partly as a rejection of French security tutelage and a failed counterterrorism paradigm, asserting junta agency and sovereignty. It also carries costs: democratic erosion, repression risks, and uncertain civilian protection.	Primary perspective: sovereignty and intervention failure, not simply regime change.
L34	occlusion	What does the Western perspective often occlude in the Sahel?	It can occlude colonial legacies, local political economies, African institutional agency, and the everyday politics of authority. Counterterrorism framing may reduce complex conflicts to extremist threats.	Occlusion is structural to policy urgency, not only bias.
L34	adjudication	How should one adjudicate French versus Russian security models?	Compare civilian harm, sustainability, sovereignty claims, and local legitimacy using the same evidentiary standards. Neither model is sufficient alone; the evidence is mixed and context-dependent.	Avoid treating either as liberation or as purely predatory.

Tag	Card Type	Front	Back	Perspective Note
L34	visual	What should a hybrid-governance diagram show?	Overlapping zones for state, jihadist, militia, PMC, and civilian authority, with contested borders and no single center. Labels should include "sovereignty claims" and "protection gaps."	Visualizes plural authority rather than state absence.
L34	application	How did MINUSMA's collapse illustrate mandate-consent gaps?	A protection mandate confronted host-state consent withdrawal, operational constraints, and geopolitical polarization. The case shows that legitimacy and consent can matter as much as troop numbers.	UN perspective stresses protection of civilians and humanitarian access.
L34	mechanism	Why did ECOWAS sanctions after the Niger coup backfire politically?	They were framed by juntas and supporters as external coercion, mobilizing sovereignty narratives and regional solidarity against ECOWAS. Sanctions also imposed civilian costs, weakening their legitimacy.	African perspective highlights regional agency and unintended mobilization.

Tag	Card Type	Front	Back	Perspective Note
L34	comparison	How does China's Sahel posture differ from France's and Russia's?	China emphasizes non-interference, security partnerships, and economic-security linkages, avoiding combat deployment and overt sovereignty infringement. Its leverage is lower and its accountability exposure different.	Chinese perspective contributes a sovereignty-compatible security model with limited enforcement capacity.
L34	debate	What is the UN's central lesson from MINUSMA?	Peacekeeping requires credible consent, realistic mandates, civilian protection prioritization, and humanitarian access guarantees. Withdrawal under pressure reveals the limits of externally supplied security without political settlement.	UN perspective balances protection norms with consent constraints.
L34	source	How should troop-deployment data be interpreted?	Deployment figures indicate external commitment and burden-sharing but not effectiveness, rules of engagement, or local legitimacy. They must be paired with civilian-harm and displacement indicators.	Quantitative commitment is not equivalent to protection.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence audit table (scored 0-100)

Concept	Confidence (0-100)	Evidence basis	Gap to close
Hybrid governance as plural sovereignty	0-100	Ability to define and apply to Mali, Burkina Faso, Niger	Need one concrete local authority example beyond capitals
French intervention trajectory	0-100	Recall of Serval, Barkhane, withdrawal, Niger expulsion	Need sharper distinction between tactical and political outcomes
Russian PMC trajectory	0-100	ACLED trend awareness and accountability debate	Need better command of local command structures
ACLED civilian-harm interpretation	0-100	Perpetrator disaggregation and reporting limits	Need practice bounding claims about exact casualties
G5 Sahel collapse	0-100	Institutional and coup dynamics	Need funding and mandate details
ECOWAS crisis	0-100	Sanctions, threats, regional backlash	Need civilian-cost evidence
Comparative intervention lessons	0-100	Conditional success criteria	Need one falsifying case
Five-perspective reconstruction	0-100	Steel-manning each tradition	Need stronger Chinese and UN specifics

7.2 Three-question debrief

1. Which perspective most changed your initial view of the Sahel, and what evidence would have to change for you to revert to your earlier view?
2. Where did you conflate description (what happened), explanation (why it happened), prediction (what is likely next), and prescription (what should be done)?
3. Which data limitation most weakens your strongest claim, and how would you rewrite that claim as a bounded, defensible statement?

7.3 Error-log table

Common Misconception	Correction	Evidence
The Sahel is a security vacuum.	It is a hybrid-governance space with multiple competing authorities.	ACLED event patterns; local authority and militia dynamics; African state-formation scholarship.

Common Misconception	Correction	Evidence
French withdrawal ended external influence in the Sahel.	US, Russian, Turkish, Gulf, and regional actors remain engaged; influence shifted form rather than disappeared.	Troop and partnership changes; diplomatic realignments; PMC deployments.
ACLED data prove one perpetrator is uniformly the worst.	Perpetrator patterns vary by country, period, and event type; data are event-based and incomplete.	ACLED civilian-targeting trends; reporting-access constraints.
Juntas automatically express popular sovereignty.	Junta claims draw on anti-intervention sentiment but also involve repression, exclusion, and uncertain legitimacy.	Post-coup political trajectories; civil-society and opposition reports.
MINUSMA failed only because of UN incompetence.	Mandate-consent gaps, host-state withdrawal, and geopolitical polarization were central; troop numbers alone were insufficient.	UN MINUSMA lessons reports; mandate and consent records.
Russian security partnership is simply anti-imperial liberation.	It may express sovereign choice while raising accountability, civilian-harm, and dependency concerns.	ACLED civilian-harm patterns; sovereignty and accountability debates.

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Hybrid governance; plural sovereignty; protection gaps	Overlapping authority produces contested order; violence becomes governance tool; external actors enter local bargains	Hybrid political order; Africanist state-formation scholarship; regional security complex theory (Buzan and Wæver)	Mali, Burkina Faso, Niger; ACLED events; local militia maps	State-centric vs hybrid order	If durable state monopoly returns and violence falls, hybrid model weakens	L23, L29, L30

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Intervention trajectories	Security assistance can reduce territorial control but fail politically; coups can expel external forces; PMCs substitute for state capacity	Intervention trap; sovereignty bargain; security-development nexus	Serval/Barkhane; Wagner/Africa Corps; US posture; Niger 2023 expulsion	Counterterrorism vs sovereignty	If governance-integrated intervention sustainably reduces civilian harm, critique weakens	L31, L35, L43
Civilian harm by perpetrator	Perpetrator disaggregation reveals state, PMC, and jihadist patterns; reporting bias shapes totals	Event-data epistemology; civilian protection norms	ACLED 2011-2025; UNHCR displacement; troop deployments	Data as objective vs constructed	If independent audits converge with ACLED trends, confidence rises	L23, L34
G5 Sahel and ECOWAS crises	Institutional erosion; coup contagion; sanctions mobilize sovereignty narratives	Regionalism; regional security complex; sovereignty backlash	G5 dissolution; ECOWAS Niger sanctions	Regional integration vs sovereignty	If regional force succeeds with consent, institutionalist view strengthens	L30, L31
Comparative intervention lessons	Conditional success requires governance, legitimacy, regional ownership, civilian protection	Conditional intervention theory; political settlement theory	Mali 2012-2025; Niger 2023	Intervention possible vs impossible	If governance-first pilot reduces violence, possibility claim strengthens	L29, L34

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Five perspectives	Each tradition highlights different mechanisms and occludes others	Perspectival IR; African primary viewpoint	All Sahel cases	Normative pluralism	If one perspective predicts all outcomes, others occlude less	L1, L34

SECTION 9 — REVIEW SCHEDULE

- **R1 — Immediate (same day, 30 minutes):** Review all 15 flashcards once, then redraw the hybrid-governance diagram from memory and compare it with the visual anchor.
- **R2 — 24 hours (45 minutes):** Reconstruct the five perspectives on the Sahel in continuous prose, ensuring the African perspective is longest and framed as primary.
- **R3 — 72 hours (60 minutes):** Complete the Data Lab questions using ACLED, UNHCR, and deployment data; write one bounded claim about civilian harm by perpetrator.
- **R4 — 7 days (90 minutes):** Write the independent memo for the assigned case, including mechanism, perspective reconstruction, historical analogue, and falsifiers.
- **R5 — 14 days (60 minutes):** Teach the lesson's central puzzle aloud without notes, then update the error-log with any remaining misconception.

SECTION 10 — COMPLETION CHECKLIST

☐ I can define hybrid governance without reducing the Sahel to state failure.
☐ I can explain why Operation Serval's territorial gains did not produce strategic victory.
☐ I can interpret ACLED civilian-targeting data with appropriate limits.
☐ I can distinguish state, Russian PMC, and jihadist civilian-harm patterns without overclaiming.
☐ I can explain the collapse of the G5 Sahel.
☐ I can explain the ECOWAS crisis after the 2023 Niger coup.
☐ I can reconstruct the African perspective as primary and longest.
☐ I can steel-man the Chinese perspective on non-interference and security partnership.
☐ I can steel-man the Russian perspective on sovereign choice and anti-Western framing.
☐ I can steel-man the Western perspective on intervention failure and lessons.
☐ I can steel-man the UN perspective on MINUSMA, protection, and humanitarian access.
☐ I can compare French and Russian models using the same evidentiary standards.
☐ I can identify what each perspective occludes.
☐ I can distinguish description, explanation, prediction, and prescription.
☐ I can state at least two falsifiers for my strongest claim.
☐ I have completed the Data Lab questions.
☐ I have completed the independent memo.
☐ I have updated my error log.

FURTHER READING (Optional)

Data and conflict monitoring - ACLED, Sahel conflict and civilian-targeting reports, 2023–2025. - UNHCR, Sahel displacement and protection updates, 2023–2025.

Intervention and regional security - Crisis Group, Sahel reports on Mali, Burkina Faso, Niger, and regional security, 2012–2025. - International Peace Institute, analyses of MINUSMA, G5 Sahel, and external intervention, 2018–2025.

UN peacekeeping and protection - UN, MINUSMA lessons reports and protection-of-civilians assessments.

African political thought and sovereignty - Grovogui, Mbembe, Mamdani, Rodney, Nkrumah, Nyerere, Cabral, Fanon, Bayart, Aning, Danso, Tamale, and Oyěwùmí, thematic works on sovereignty, extraversion, hybrid authority, and political order.

Comparative intervention and proxy warfare - Scholarly and policy literature on intervention failure, PMC substitution, and regional security complexes, with attention to African agency.

End of Lesson 34. Say **Next** when you are ready.

---

36. Post-Soviet Ontology and the Security Dilemma

LESSON METADATA

Field	Value
Lesson number and title	Lesson 35: Post-Soviet Ontology and the Security Dilemma
Module	Module 6: Eastern Europe and the Ukraine War
Prerequisites	L5 (realism, security dilemma), L7 (ontological security), L14 (contemporary transition)
Interleaved links	Forward to L36 (Ukraine war), L39 (European security), L40 (wider Eastern Europe)
Reading load	7-9 hours
Content channels	Text, data lab, worked example, problem pair, visuals, flashcards
Bloom ceiling	Evaluate / Create
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

The central puzzle of this lesson is not whether Russia's 2022 full-scale invasion of Ukraine was "caused" by NATO expansion or by imperial ambition, but how two incompatible ontologies of the post-Soviet space collided with such destructive force, and why the standard theoretical vocabularies of International Relations—security dilemma, imperial ambition, ontological insecurity—each capture part of the mechanism while none

captures the whole. Russia's self-understanding as a great power entitled to a "zone of privileged interests," articulated most explicitly by President Dmitry Medvedev in the aftermath of the 2008 Georgia war, treats the post-Soviet space not as a collection of sovereign states exercising self-determination but as a civilizational sphere whose security architecture must be shaped in Moscow. Ukraine's self-understanding, consolidated through the Orange Revolution of 2004 and the Euromaidan of 2013–14, treats sovereignty, territorial integrity, and the right to choose alliances as non-negotiable attributes of statehood. These are not merely competing policy preferences; they are competing ontologies—competing answers to the question of what kind of political entity Russia is, what kind of political entities its neighbors are, and what kind of order is legitimate in the space between them. The lesson exists because the collision cannot be understood by applying any single theory mechanically; it requires holding structural realism, ontological security theory, and constructivist identity analysis in tension, and adjudicating among them on the basis of evidence rather than ideological commitment.

Placed in the curriculum, this lesson is the hinge of Module 6. It builds directly on Lesson 5's treatment of realism and the security dilemma, on Lesson 7's treatment of ontological security, and on Lesson 14's treatment of contemporary transition, and it prepares the ground for Lesson 36 on the Ukraine war itself, Lesson 39 on European security architecture, and Lesson 40 on wider Eastern Europe. The student who masters this lesson will not yet have studied the full 2022 invasion in depth—that is Lesson 36's task—but will have acquired the theoretical and historical scaffolding necessary to analyze it without collapsing into either the "NATO provoked Russia" or "Russia is simply imperialist" monocausal narratives. The lesson therefore occupies a deliberately transitional position: it is theoretical enough to train analytical discipline, and empirical enough to prevent theory from floating free of evidence. It also serves as the module's methodological conscience, insisting that every causal claim specify a mechanism, a scope condition, and a falsifier.
