Cue (Question / Prompt)	Notes (Answer / Content)
What did the 2016 arbitration ruling do?	PCA tribunal (July 12, 2016): China's nine-dash line has no legal basis; no historic rights; Scarborough Shoal is rock (12nm, not EEZ); Mischief/ Subi/Fiery Cross are low-tide elevations. China rejected; no enforcement.
What is the African perspective?	Indian Ocean littoral security; SLOC protection; strategic autonomy; non-alignment; concern about great-power competition spillover; Blue Economy; AU 2050 AIM Strategy.
What are key sources?	Friedberg (2018) *The Weary Titan*? Actually *A Contest for Supremacy*; Holmes & Yoshihara (2017) *Red Star over the Pacific*; Kaplan (2010) *Monsoon*; 2016 arbitration ruling; CSIS China Power Project.

Source log: Friedberg, A. (2018). *A Contest for Supremacy: China, America, and the Struggle for Mastery in Asia.* W.W. Norton. Holmes, J. & Yoshihara, T. (2017). *Red Star over the Pacific: China's Rise and the Challenge to U.S. Maritime Strategy.* Naval Institute Press. Kaplan, R. (2010). *Monsoon: The Indian Ocean and the Future of American Power.* Random House. Permanent Court of Arbitration (2016). *South China Sea Arbitration (Philippines v. China).* CSIS China Power Project (ongoing). IISS *Military Balance* (annual). DoD Annual Freedom of Navigation Report.

Summary (3–5 sentences): The Indo-Pacific maritime order is being reshaped by a quantitative shift in naval power (PLAN growth vs. USN stagnation), China's A2/AD envelope inside the first island chain, and a layered US alliance architecture (hub-and-spokes, Quad, AUKUS) that supplements bilateral ties with minilateral coordination. The 2016 arbitration ruling clarified legal entitlements under UNCLOS but lacked enforcement, leaving a persistent gap between law and power. Middle powers — ASEAN, India, Japan — hedge through centrality, strategic autonomy, and military normalization respectively, while African littoral states face spillover risks to Indian Ocean sea lanes. The central tension is between a rules-based maritime order and a power-based one, with no single indicator capturing the balance.

SECTION 5 — FEYNMAN COMPRESSION

Step 1 — Explain without jargon (as if to a smart 14-year-old): Imagine the ocean between China and the rest of Asia as a neighborhood. China has been building a very large fence of missiles and ships close to its shore so that, if a conflict happened, it would be hard for anyone else's navy to get close — that's the "first island chain" idea. The United States and its friends (Japan, Australia, the Philippines, India) are trying to keep the sea lanes open for trade and to make sure no single country controls them. They do this through alliances and by sailing warships through disputed waters to say "these are international waters." Meanwhile, a court in 2016 said China's big territorial claim in the South China Sea had no legal basis, but China ignored it. So the real question is: who actually controls the water — the country with the most ships nearby, or the rules everyone agreed to?

Step 2 — Mark gaps (what you could not explain simply): - I could not explain *why* the US cannot simply

build more ships to match China (industrial base, budget, maintenance backlogs). - I could not explain *how* AUKUS submarines change the balance given delivery is decades away. - I could not explain *why* ASEAN cannot enforce the 2016 ruling (consensus, non-interference, economic dependence). - I could not explain the difference between "sea denial" and "sea control" in operational terms.

Step 3 — Reread verification (targeted reread of weak spots): Reread Holmes & Yoshihara (2017) ch. on A2/AD and sea denial; Friedberg (2018) on the "contest for supremacy" and alliance burden-sharing; the 2016 arbitration award's dispositive section on historic rights; CSIS China Power Project data on PLAN growth. After reread: sea denial = preventing adversary's use of sea without controlling it; sea control = sustained use. US industrial constraint = shipyard capacity and workforce, not just budget. ASEAN constraint = consensus principle and economic interdependence with China.

Step 4 — Analogy with explicit limits: Analogy: The first island chain is like a neighborhood watch zone — China has installed cameras and guards (missiles, sensors) so that anyone entering feels watched and at risk; the US and allies keep driving through (FONOPs) to say the street is public. *Limits of the analogy:* (a) it implies a static, territorial logic, but maritime space is fluid and three-dimensional (subsurface, air, space, cyber); (b) it understates the economic stakes ($3.4T trade); (c) it treats states as unitary actors, ignoring domestic politics (Japanese constitutional debate, Australian public opinion on AUKUS); (d) it cannot capture the legal dimension (UNCLOS, EEZs, continental shelf).

Step 5 — Rewrite (compressed, precise): The Indo-Pacific maritime order is a contest between China's A2/AD-enabled sea denial inside the first island chain and a US-led alliance architecture (hub-and-spokes, Quad, AUKUS) that seeks to preserve freedom of navigation and a rules-based order. The 2016 arbitration ruling established legal clarity under UNCLOS but no enforcement mechanism, exposing the gap between international law and power. Middle powers hedge — ASEAN through centrality, India through strategic autonomy, Japan through military normalization — while African littoral states face Indian Ocean spillover. No single metric (hull count, FONOPs, or trade volume) captures the balance; the decisive variables are industrial capacity, alliance cohesion, and the legal-political legitimacy of competing claims.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L48	definition	What is the "Indo-Pacific" as a strategic construct?	The Indo-Pacific is a maritime-geographic frame linking the Indian and Pacific Oceans through sea lanes, chokepoints, and great-power competition; it is not a neutral map but a strategic vocabulary that foregrounds naval connectivity and China's rise. Its meaning varies by speaker: for some it signals inclusive regionalism, for others a US-led balancing coalition.	African and Indian Ocean states often read it as an external framing that can obscure their own maritime priorities.
L48	mechanism	How does A2/AD create sea denial?	A2/AD combines sensors, missiles, submarines, mines, and cyber/electronic warfare to raise the cost of entry into contested waters, especially around the first island chain; the mechanism is cumulative risk, not a single blockade. It seeks to delay, degrade, or deny an adversary's ability to operate, project power, or sustain logistics.	Chinese sources frame it as defensive sovereignty protection; Western sources frame it as offensive area denial.

Tag	Card Type	Front	Back	Perspective Note
L48	application	What is the strategic significance of the first island chain?	The first island chain runs from Japan through Taiwan and the Philippines to Borneo and is treated as a geographic barrier and operational threshold for PLAN breakout and US forward defense. Control or denial along this chain shapes submarine routes, air defense, and access to the western Pacific.	For Taiwan and Japan it is existential geography; for ASEAN it is a source of entanglement risk.
L48	comparison	How do hub-and-spokes, the Quad, and AUKUS differ?	The hub-and-spokes system is bilateral US alliances; the Quad is a flexible minilateral among the US, Japan, India, and Australia; AUKUS is a technology-and-submarine pact among the US, UK, and Australia. They differ in membership, institutionalization, and military integration, but all aim to manage China’s rise.	ASEAN reads them as potential bypasses of its centrality.

Tag	Card Type	Front	Back	Perspective Note
L48	source	What did the 2016 South China Sea arbitration ruling hold?	The tribunal found no legal basis for China's historic rights claims within the nine-dash line and clarified maritime entitlements, including that certain features are rocks rather than islands. It did not delimit boundaries or enforce compliance, so its effect depended on diplomatic uptake.	The ruling is a legal anchor for many states but a sovereignty challenge for Beijing.
L48	debate	Is "Indo-Pacific" a neutral geographic term?	Critics argue it is a geopolitical construct that re-centers US strategy and links the Indian Ocean to Pacific containment; defenders argue it reflects real economic and naval interdependence. The debate turns on whether naming creates policy or merely describes it.	Chinese and Russian sources often treat it as US-centric; African and Indian Ocean actors stress their own agency.

Tag	Card Type	Front	Back	Perspective Note
L48	reconstruction	How would an African maritime-security perspective reconstruct the Indo-Pacific?	It would foreground Indian Ocean sea lanes, piracy, illegal fishing, port development, and blue-economy governance, while warning that great-power rivalry can militarize African waters and constrain strategic autonomy. It treats maritime order as development and sovereignty, not only deterrence.	This is the primary lens: African agency and non-alignment.
L48	occlusion	What does the Western freedom-of-navigation frame occlude?	It foregrounds legal access and alliance deterrence but can understate coastal-state development needs, historical asymmetries, and the domestic politics of base hosting. It may treat legal principle as sufficient without addressing power imbalances.	Occlusion is analytical, not dismissal.

Tag	Card Type	Front	Back	Perspective Note
L48	adjudication	How should one adjudicate between legal and power-based claims in the South China Sea?	Adjudication requires separating UNCLOS entitlements, historical claims, enforcement capacity, and diplomatic practice; no single frame is sufficient. Evidence should include tribunal findings, state behavior, and cost-benefit calculations.	African and Global South states often favor rules plus capacity-building.
L48	visual	What does a map of A2/AD zones and island chains show?	It shows layered denial areas, chokepoints, and alliance geography; the visual claim is that geography and technology interact to create contested maritime space. It should be read as a strategic abstraction, not a fixed battlefield.	Maps can naturalize contested claims.

Tag	Card Type	Front	Back	Perspective Note
L48	mechanism	How does hedging work for middle powers?	Hedging combines engagement with multiple powers, selective alignment, and institutional participation to preserve autonomy while managing risk; it is not neutrality but active portfolio management. It fails when crises force binary choices.	ASEAN centrality and India's autonomy are hedging architectures.
L48	application	Why did AUKUS strain France-Australia relations?	Australia canceled a French submarine contract to pursue nuclear-powered submarines with the US and UK, surprising Paris and raising questions about alliance trust and industrial sovereignty. The strain came from process and strategic surprise as much as from capability.	European and Australian perspectives diverge on alliance loyalty versus autonomy.

Tag	Card Type	Front	Back	Perspective Note
L48	comparison	UNCLOS versus power politics in maritime disputes?	UNCLOS provides entitlements, dispute procedures, and navigational norms; power politics determines enforcement, basing, and coercion. The two interact: law shapes legitimacy, while power shapes outcomes.	UN perspective emphasizes rules; realist perspective emphasizes capacity.
L48	debate	Does ASEAN centrality constrain or enable great-power competition?	It enables by providing forums and norms that reduce escalation; it constrains by lacking enforcement and by being vulnerable to member divisions. Its value depends on whether major powers accept procedural legitimacy.	ASEAN's own view stresses consensus and non-interference.
L48	source	What is the CSIS China Power Project useful for?	It compiles data on naval capabilities, shipbuilding, and regional military trends, enabling comparative analysis rather than single-source assertion. Its limits include classification gaps and definitional choices.	Data literacy is part of perspective critique.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence audit table

Competency	Self-score (0-100)	Evidence of mastery	Gap action
Define Indo-Pacific as contested strategic construct		Can distinguish geography, geopolitics, and regional vocabulary	Re-read Key Idea 1 and annotate three definitions
Explain A2/AD and sea-denial mechanism		Can name sensors, missiles, submarines, mines, and cumulative-risk logic	Draw the layered denial model from Section 3
Compare alliance architectures		Can separate hub-and-spokes, Quad, and AUKUS by membership and function	Build a three-column comparison table
Reconstruct the 2016 arbitration ruling		Can state holdings, limits, and non-enforcement	Summarize ruling in 120 words
Analyze Taiwan Strait and South China Sea flashpoints		Can identify actors, triggers, and escalation pathways	Map one crisis scenario
Explain middle-power hedging		Can define hedging as portfolio management, not neutrality	Apply to India or ASEAN
Reconstruct all five perspectives		Can steel-man African, Chinese, Russian, Western, and UN views	Write one paragraph per perspective
Use data without overclaiming		Can separate vessel counts from combat effectiveness	Add two caveats to any data claim

7.2 Three-question debrief

1. Which of the five perspectives did you initially underweight, and what evidence would force you to revise that weighting?
2. Which mechanism could you now explain to a peer without notes: A2/AD, hedging, alliance bargaining, or legal adjudication?
3. Which falsifier would most weaken your current conclusion about whether the Indo-Pacific order is stabilizing or destabilizing?

7.3 Error-log table

Common Misconception	Correction	Evidence
"Indo-Pacific" is simply a neutral geographic label.	It is a strategic construct whose adoption signals policy priorities and coalition preferences.	Friedberg (2018); Holmes and Yoshihara (2017)
A2/AD means China can permanently seal off the western Pacific.	It raises costs and risks; it does not guarantee control, especially under sustained logistics and alliance pressure.	Holmes and Yoshihara (2017)
The 2016 arbitration ruling automatically changed behavior.	The ruling clarified law but lacked enforcement; compliance depended on diplomacy and power.	Permanent Court of Arbitration (2016)
More ships always equals more maritime power.	Fleet size must be read with readiness, basing, logistics, doctrine, and industrial capacity.	CSIS China Power Project
ASEAN centrality means ASEAN controls regional outcomes.	It provides forums and norms but lacks enforcement and is vulnerable to member divisions.	ASEAN institutional practice
Hedging is the same as neutrality.	Hedging is active risk management across multiple partners, not passive non-alignment.	Nyerere; Nkrumah; contemporary Indian and ASEAN strategy
UNCLOS alone resolves maritime disputes.	Law shapes legitimacy, but enforcement and power shape outcomes.	UNCLOS; 2016 arbitration ruling
AUKUS was only about submarines.	It also involved technology transfer, industrial capacity, alliance trust, and regional signaling.	AUKUS (2021)

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Indo-Pacific construct; A2/AD; sea denial; first island chain; hub-and-spokes; Quad; AUKUS; Taiwan Strait; South China Sea; hedging; ASEAN centrality; strategic autonomy	Cumulative risk-raising through sensors, missiles, submarines, mines, cyber; geographic denial; alliance bargaining; legal entitlement clarification; minilateral coordination; industrial substitution; portfolio-style hedging	Friedberg (2018); Holmes and Yoshihara (2017); Kaplan (2010); UNCLOS; arbitration jurisprudence; African strategic thought: Nkrumah, Nyerere, Cabral, Fanon, Rodney, Grovogui, Mbembe, Bayart, Mamdani	2016 South China Sea arbitration ruling; PLAN and USN shipbuilding data; CSIS China Power Project; freedom of navigation operations; trade through the South China Sea; AUKUS (2021)	Whether "Indo-Pacific" is neutral or US-centric; whether A2/AD is defensive or coercive; whether ASEAN centrality enables or constrains; whether UNCLOS or power politics determines outcomes; whether hedging survives crisis	Sustained compliance with arbitration rulings; PLAN shipbuilding slowdown; US alliance retrenchment; ASEAN enforcement capacity; India's abandonment of strategic autonomy; Taiwan crisis de-escalation	L25 maritime strategy; L47 US-China rivalry; L49 institutional revisionism; L52 semiconductors; L57 space

SECTION 9 — REVIEW SCHEDULE

Interval	Timing	Concrete action
R1	Immediately after lesson	Reconstruct the five perspectives in 150 words each, then compare with Section 2.7.
R2	24 hours later	Redraw the A2/AD and island-chain map from memory and label three chokepoints.
R3	1 week later	Write a 300-word adjudication of the 2016 arbitration ruling using law, power, and diplomacy.
R4	1 month later	Apply the hedging model to one new case: India, Indonesia, or Vietnam.

Interval	Timing	Concrete action
R5	3 months later	Re-run the data lab with updated naval vessel counts and test one falsifier.

SECTION 10 — COMPLETION CHECKLIST

- ☐ I can define the Indo-Pacific as a contested strategic construct.
- ☐ I can explain A2/AD as cumulative risk-raising rather than simple blockade.
- ☐ I can locate and explain the first island chain.
- ☐ I can distinguish hub-and-spokes, the Quad, and AUKUS.
- ☐ I can summarize the 2016 arbitration ruling and its limits.
- ☐ I can identify Taiwan Strait and South China Sea escalation pathways.
- ☐ I can explain middle-power hedging and its failure conditions.
- ☐ I can reconstruct the African perspective as primary, not additive.
- ☐ I can steel-man the Chinese perspective on sovereignty and A2/AD.
- ☐ I can steel-man the Russian critique of alliance expansion.
- ☐ I can steel-man the Western freedom-of-navigation and alliance frame.
- ☐ I can steel-man the UN UNCLOS and arbitration frame.
- ☐ I can use naval data with explicit caveats.
- ☐ I can distinguish description, explanation, prediction, and prescription.
- ☐ I can state at least two falsifiers for my conclusion.
- ☐ I can link this lesson to L25, L47, L49, L52, and L57.
- ☐ I have completed the independent memo instructions.
- ☐ I have reviewed my error log.

50. Institutional Revisionism and the Global South

LESSON METADATA

Field	Value
Lesson number and title	Lesson 49 — Institutional Revisionism and the Global South
Module	Module 8: Indo-Pacific, Systemic Rivalry, and Transnational Forces
Prerequisites	L14 (contemporary transition), L16 (Bretton Woods), L28 (Pan-Africanism)
Interleaved links	Forward to L51 (climate), L58 (forecasting), L61 (grand strategy)
Reading load	7-9 hours
Content channels	Text, data lab, dual-coded visuals, Cornell notes, flashcards, worked example, problem pair
Bloom ceiling	Create / Evaluate

Estimated study time: 7-9 hours

SECTION 0 — Why This Lesson Exists

The central puzzle of this lesson is why the contemporary challenge to the post-1945 international economic order takes a dual form: the construction of parallel institutions alongside sustained demands to reform the existing ones. Since the 2008 financial crisis and accelerating after 2022, states grouped under the label "Global South" have pursued both voice and exit simultaneously—expanding BRICS, capitalizing the Asian Infrastructure Investment Bank (AIIB) and the New Development Bank (NDB), deepening the Shanghai Cooperation Organisation (SCO), while also pressing for IMF quota reform, SDR rechanneling, and debt relief within the very Bretton Woods architecture they criticize. This is not a simple story of replacement. It is a story of institutional revisionism: a strategy that seeks to redistribute authority without fully abandoning the forums in which authority is currently exercised. The puzzle is why this dual strategy persists, what it reveals about the distribution of power and legitimacy in the contemporary system, and whether it constitutes a reformist or a ruptural project. The African vantage point is indispensable here, because the dual strategy has deep roots in the New International Economic Order (NIEO) debates of the 1970s and in Pan-African demands for economic sovereignty, and because African states today occupy a structurally ambiguous position: they are among the most vocal critics of Bretton Woods conditionality, yet they are also the most dependent on the financing those institutions provide.

This lesson sits at the intersection of three prior lessons. Lesson 14 (contemporary transition) established the macro-level shift from unipolarity toward contested multipolarity and the erosion of the liberal international order's normative authority. Lesson 16 (Bretton Woods) supplied the institutional baseline: the IMF, World

Bank, and GATT/WTO as the economic pillars of the postwar order, their governance structures weighted toward the founding powers, and the embedded-liberal compromise that traded openness for domestic stabilization. Lesson 28 (Pan-Africanism) traced the continental lineage of economic sovereignty claims, from Nkrumah's neo-colonialism thesis through the Lagos Plan of Action and the African Union's Agenda 2063. The present lesson synthesizes these threads by asking how the Global South's institutional revisionism connects the macro-level transition (L14) to the micro-level governance of specific institutions (L16) through the historical experience of anti-colonial and Pan-African mobilization (L28). Without this synthesis, the student sees BRICS expansion as an event; with it, BRICS expansion becomes legible as the latest episode in a century-long struggle over who governs the global economy and on what terms.

The lesson develops five key ideas in sequence. First, it genealogizes the "Global South" as an emergent, contested category rather than a natural bloc, tracing its movement from the Bandung Conference through the NIEO to its contemporary reactivation, and marking its limits: internal heterogeneity, the risk of elite capture, and the analytical slippage between geography, income, and political position. Second, it examines BRICS+ expansion from five to ten-plus members, analyzing the strategic logic of enlargement, the criteria (or absence thereof) for membership, and the tension between inclusivity and coherence. Third, it assesses the AIIB, NDB, and SCO as parallel and complementary institutions, distinguishing their mandates, governance models, and relationships to the Bretton Woods baseline. Fourth, it recovers the NIEO of the 1970s as a genealogical anchor, identifying which of its demands survived, which were defeated, and which were absorbed into the mainstream. Fifth, it analyzes the contestation of Bretton Woods itself—IMF quota reform, SDR rechanneling, and debt relief—as a reformist strategy that accepts the institutional frame while demanding redistribution within it. Together these ideas equip the student to evaluate whether contemporary revisionism is best understood as reform, rupture, or a hybrid that the existing vocabulary struggles to capture.

The African perspective is primary throughout, not a regional illustration. This is methodologically necessary because the African experience exposes what the other four perspectives systematically occlude. Western accounts tend to frame institutional revisionism as a challenge to a rules-based order whose rules are assumed to be legitimate; Chinese accounts tend to frame it as institutional innovation in service of a community of shared future; Russian accounts frame it as multipolarity and anti-hegemony; UN accounts frame it as a financing gap to be closed. Each of these captures something real, but each also abstracts from the historical experience of African states, which have been simultaneously the most structurally disadvantaged by Bretton Woods governance and the most dependent on its financing. The African vantage point—drawing on Grovogui's analysis of quasi-sovereignty, Mamdani's work on the colonial state, Rodney's underdevelopment thesis, Nkrumah's neo-colonialism, Nyerere's ujamaa, Cabral's theory of culture and liberation, Fanon's critique of the national bourgeoisie, Mbembe's postcolony, Bayart's extraversion, Tamale's decolonial feminism, and Oyěwùmí's critique of the gendered epistemology of colonial modernity—reveals that institutional revisionism is not merely a geopolitical competition among great powers but a continuation of anti-colonial struggles over economic sovereignty, now waged through the technical language of quotas, lending standards, and special drawing rights. It also reveals the risk that revisionism reproduces the very hierarchies it claims to dismantle, when new institutions are capitalized and governed by the same large states that dominate the old ones.

Methodologically, the lesson operates at four levels of analysis—individual, state, systemic, and transnational—and requires the student to move among them without conflating them. At the individual level, the lesson examines the agency of specific leaders and negotiators; at the state level, the interests and capacities of member states; at the systemic level, the distribution of power and the logic of institu-

tional competition; at the transnational level, the role of civil society, social movements, and epistemic communities in shaping demands for reform. The lesson also requires the student to reconstruct five perspectives—African, Chinese, Russian, Western, and UN—on the central topic as a whole, steel-manning each from within, identifying what it contributes and what it occludes, and adjudicating among them on the basis of evidence rather than assertion. This is not an exercise in relativism; it is an exercise in disciplined pluralism, in which perspectives are treated as partial but not arbitrary, and in which the African perspective is given analytical priority because it is the one most consistently marginalized in the existing literature.

By the end of the lesson, the student will be able to: define and genealogize the "Global South" and identify its analytical limits; explain the strategic logic and internal tensions of BRICS+ expansion; compare the AIIB, NDB, and SCO across mandate, governance, and relationship to Bretton Woods; trace the NIEO's legacies into contemporary demands; analyze IMF quota reform, SDR rechanneling, and debt relief as mechanisms of institutional contestation; reconstruct all five perspectives on institutional revisionism; and produce an evidence-based adjudication of whether contemporary revisionism is reformist, ruptural, or hybrid. The student will also be able to identify the falsifiers that would distinguish these interpretations—such as whether new institutions adopt the same conditionalities as old ones, whether quota reform actually redistributes voting power, and whether debt relief is accompanied by structural change or merely extends the life of an unsustainable status quo. These skills are directly transferable to the forward-linked lessons on climate governance (L51), forecasting (L58), and grand strategy (L61), where the same questions of institutional legitimacy, power redistribution, and the gap between rhetoric and practice recur.

SECTION 1 — Pre-Class Priming

1.1 Retrieval warm-up

1. What does Lesson 14 identify as the principal markers of the contemporary transition in global order, and how does it characterize the relationship between unipolarity and multipolarity?
2. According to Lesson 16, what were the original mandates of the IMF and the World Bank at Bretton Woods, and how did the "embedded liberalism" compromise reconcile openness with domestic stabilization?
3. Lesson 16 discusses the governance structures of the Bretton Woods institutions. What is the significance of quota-based voting in the IMF, and which states hold disproportionate influence?
4. Lesson 28 traces Pan-Africanism as a political project. How did Nkrumah's concept of neocolonialism frame the relationship between political independence and economic dependence?
5. Lesson 28 examines the OAU and its successor, the AU. What tension between sovereignty and collective security or intervention has characterized continental institution-building?
6. Lesson 14 distinguishes levels of analysis. Briefly define the systemic and transnational levels and give one example of each from the study of global order.

1.2 Orientation questions

1. Is BRICS+ best understood as a coherent geopolitical bloc, a loose forum of convenience, or something in between—and what evidence would distinguish these interpretations?
2. Does the AIIB function as a genuine alternative to the World Bank, or as a complementary institution that reproduces similar lending logics under different governance?
3. Why did the NIEO of the 1970s fail to achieve its core demands, and which of those demands have resurfaced in contemporary institutional revisionism?

4. Is "Global South" an analytically useful category, or does its internal heterogeneity undermine its explanatory power?

1.3 Vocabulary pre-teach

- **Global South**: A contested political and analytical category grouping states historically subjected to colonialism and contemporary structural disadvantage in the global economy; not a geographic or income designation alone.
- **Institutional revisionism**: The strategy of challenging the distribution of authority within existing international institutions while simultaneously building parallel or complementary ones, rather than pursuing either pure reform or pure exit.
- **BRICS+**: The expanded grouping of Brazil, Russia, India, China, South Africa plus new members (including Egypt, Ethiopia, Iran, Saudi Arabia, UAE, and others), representing a claim to greater voice in global governance.
- **AIIB (Asian Infrastructure Investment Bank)**: A multilateral development bank established in 2016, headquartered in Beijing, focused on infrastructure financing in Asia and beyond.
- **NDB (New Development Bank)**: A multilateral development bank established by BRICS in 2015, headquartered in Shanghai, with a mandate to finance infrastructure and sustainable development in BRICS and other emerging economies.
- **SCO (Shanghai Cooperation Organisation)**: A Eurasian political, economic, and security organization founded in 2001, expanded to include India, Pakistan, and Iran, focused on regional security and counter-terrorism.
- **NIEO (New International Economic Order)**: A set of demands advanced by developing countries in the 1970s through the UN General Assembly, calling for sovereign control over natural resources, commodity price stabilization, technology transfer, and restructuring of trade and finance.
- **Bretton Woods institutions**: The IMF and the World Bank, established at the 1944 Bretton Woods conference, together with the later GATT/WTO, forming the economic pillar of the postwar order.
- **IMF quota**: A member state's financial contribution to the IMF, which determines its voting power, access to financing, and SDR allocation.
- **SDR (Special Drawing Rights)**: An international reserve asset created by the IMF, allocated to member countries; rechanneling refers to redirecting SDRs from wealthy to vulnerable countries.
- **Debt relief**: The reduction, restructuring, or cancellation of sovereign debt, including through initiatives such as HIPC and the G20 Common Framework.
- **Multipolarity**: A distribution of power among several major centers rather than one or two, with implications for institutional competition and normative pluralism.

SECTION 2 — LESSON CORE

2.1 Learning objectives By the end of this lesson, the student will be able to:

1. **Analyze** the genealogy of the "Global South" as a political category—tracing its emergence from the Bandung Conference of 1955 and the Non-Aligned Movement through the Third World project of the 1970s, its apparent dissolution after 1989, and its reactivation in the 2000s—identifying the material, discursive, and institutional mechanisms that periodically reconstitute the category and specifying the scope conditions under which it coheres or fragments. (Bloom: Analyze)

2. **Evaluate** the strategic logic of BRICS+ expansion from five to ten-plus members, assessing whether enlargement strengthens the bloc's bargaining power in global governance or dilutes its coherence, and adjudicating between the "institutional revisionism" and "parallel order" interpretations using evidence from the 2023 Johannesburg II Declaration and subsequent summit communiqués. (Bloom: Evaluate)

3. **Compare** the AIIB, NDB, and SCO as institutional forms—distinguishing their mandates, governance structures, and relationships to the Bretton Woods system— and determine whether each constitutes a genuine alternative, a complementary parallel, or a hedging instrument, drawing on AIIB annual reports and NDB lending data. (Bloom: Compare)

4. **Reconstruct** the New International Economic Order (NIEO) of the 1970s as both a historical episode and a living institutional legacy, explaining how its demands (commodity price stabilization, technology transfer, sovereign debt restructuring) reappear in contemporary reform agendas and how its failure shaped subsequent Global South strategy. (Bloom: Reconstruct)

5. **Critique** contemporary contestation of Bretton Woods—IMF quota reform, SDR rechanneling, and debt relief—by identifying the specific veto points that block reform, the distributional consequences of the status quo, and the conditions under which incremental adjustment gives way to institutional rupture, using IMF quota review documentation and G20 Common Framework data. (Bloom: Critique)

2.2 KEY IDEA 1 — The 'Global South' as emergent category: genealogy, contestation, and limits
Bolded Causal Claim: The "Global South" is not a geographic or economic descriptor but a politically constructed category that periodically re-emerges when a critical mass of post-colonial states perceives the existing international order as structurally exclusionary; its coherence depends on the presence of a shared grievance against hegemonic rule-making and a set of institutional vehicles through which that grievance can be articulated, and it fragments when either the grievance dissipates or the vehicles are captured by narrower state interests.

Mechanism: The category operates through three interlocking mechanisms. First, a *discursive mechanism*: the term "Global South" performs boundary-drawing work, distinguishing a set of states that share a historical experience of colonial subordination and contemporary marginalization from the "Global North" that sets the rules. This is not merely descriptive; as Acharya (2018) argues, the vocabulary of global order is itself a site of contestation, and the reclamation of categorical labels is a form of agency. The shift from "Third World" to "Global South" in the 1990s and 2000s was not cosmetic: it reflected the collapse of the socialist bloc that had given the "Second World" its meaning, the rise of a multipolar distribution of economic power, and the need for a category that could accommodate both poor and middle-income states without the developmentalist teleology of "Third World." Second, a *material mechanism*: the category gains traction when there is a measurable divergence between the distribution of economic weight and the distribution of institutional voice. The 2008 financial crisis, the COVID-19 pandemic, and the 2022-2023 debt distress in low- and middle-income countries all functioned as material shocks that reactivated the category by demonstrating that crisis-response architectures (IMF programs, vaccine distribution, debt relief frameworks) were designed in and for the North. Third, an *institutional mechanism*: the category requires vehicles—G77, NAM, BRICS, the African Union's Agenda 2063, the G20's developing-country caucuses—through which collective demands

can be formulated and transmitted. Without these vehicles, the category remains a sentiment; with them, it becomes a negotiating bloc. The mechanism is therefore conditional: the category emerges when discursive grievance, material divergence, and institutional capacity align, and it recedes when any one of these three weakens.

The genealogy matters because it reveals that the category has been assembled and disassembled before. The Bandung Conference of 1955 is conventionally treated as the origin point, but Bandung itself was a crystallization of earlier anti-colonial solidarities—the 1947 Asian Relations Conference, the 1953 Colombo Powers meeting, and the longer tradition of pan-African and pan-Asian congresses dating to the early twentieth century. Bandung produced the ten principles (the "Dasasila") that became the normative grammar of Third Worldism: respect for sovereignty, non-interference, equality, and anti-racism. The Non-Aligned Movement, formalized at Belgrade in 1961, gave the category institutional form, though it was always internally heterogeneous—spanning socialist and capitalist economies, authoritarian and democratic regimes, and states with vastly different levels of development. The 1970s saw the peak of Third World institutionalism: the NIEO declaration of 1974, the Group of 77's expansion, and the UNCTAD conferences that attempted to restructure global trade. The category then fragmented in the 1980s and 1990s under the pressure of debt crises, structural adjustment, and the end of the Cold War, which removed the strategic rationale for superpower courting of non-aligned states. The "Global South" re-emerged in the 2000s not as a revival of Third Worldism but as a new configuration: larger economies (China, India, Brazil, South Africa) with greater bargaining power, a more multipolar distribution of power, and a different relationship to global capitalism—participating in it rather than seeking to delink from it.

Scope Conditions: The category coheres under four conditions. First, there must be a *shared grievance* that is structural rather than episodic—something about the rules of the game, not just a bad outcome. The debt crises of the 1980s were episodic; the underrepresentation of developing countries in IMF voting shares is structural. Second, there must be *institutional vehicles* capable of aggregating preferences and transmitting them—without the G77, the African Union, or BRICS, the category has no organizational substrate. Third, there must be a *critical mass of states* with sufficient economic weight to make the category consequential; the Global South of the 2020s is not the Global South of the 1970s precisely because China, India, and Brazil now have the economic heft to make demands credible. Fourth, there must be a *discursive environment* in which the category is legible and usable—media, academic, and diplomatic vocabularies that treat "Global South" as a meaningful unit. The category fragments when any of these conditions fails: when states perceive their interests as divergent (India and China's border tensions, Brazil's oscillation between South-South and Atlanticist orientations), when institutional vehicles are captured by dominant members (the BRICS New Development Bank's lending patterns), or when the discursive environment shifts to emphasize intra-South inequality rather than North-South hierarchy.

The strongest counterargument to the category's coherence comes from within the South itself. Mamdani (1996) and, more recently, scholars of "subaltern" international relations have argued that the category homogenizes states with radically different colonial experiences, class structures, and geopolitical positions. The "Global South" can become a rhetorical device that allows large middle-income countries to claim solidarity with the poorest while pursuing their own interests—a dynamic visible in the BRICS+ expansion, where the inclusion of Saudi Arabia, the UAE, and Iran alongside Ethiopia and Egypt creates a bloc whose internal heterogeneity rivals that of the G20. The category's limits are therefore not merely analytical but political: it can obscure as much as it reveals, and its deployment is itself a strategic act.

Observable Implications: If the category is genuinely emergent rather than merely rhetorical, we should ob-

serve: (a) increasing use of "Global South" in official diplomatic discourse (UN General Assembly speeches, G20 communiqués, BRICS declarations); (b) institutional innovation that explicitly references South-South solidarity (NDB, AIIB's "lean, clean, green" branding, the African Continental Free Trade Area); (c) voting cohesion in multilateral forums on issues framed as North-South (WTO negotiations, climate finance, pandemic response); and (d) the emergence of South-South financial flows that bypass Northern institutions (China's Belt and Road, India's lines of credit, the NDB's local-currency lending). Conversely, if the category is primarily rhetorical, we should observe: (a) divergence between South-South rhetoric and bilateral behavior (India's participation in the Quad, Brazil's NATO partnership dialogues); (b) the failure of collective action on debt relief (the G20 Common Framework's slow uptake); and (c) the capture of South-South institutions by dominant members (China's share of NDB lending, the AIIB's governance structure). The evidence as of 2024 is mixed: the category is clearly operative in discourse and in some institutional forms, but its material coherence remains contested.

Perspective Note (five traditions in brief):

African (primary): The African vantage point reveals that the "Global South" category, while useful, risks reproducing the very hierarchies it claims to oppose if it is dominated by large middle-income states whose interests diverge from those of the poorest. African scholarship—Grovogui's (2006) critique of the "standard of civilization," Mbembe's (2001) analysis of the postcolony, and Bayart's (2009) work on extraversion—shows that the category's genealogy is inseparable from the specific experience of African states: the slave trade, colonial partition, and the post-independence struggle for economic sovereignty. From this perspective, the "Global South" is not a natural grouping but a political project that must be continuously rebuilt, and its African component must be understood not as a passive recipient of South-South solidarity but as an agent with its own demands—debt cancellation, climate finance, technology transfer, and a permanent seat on the UN Security Council. The African Union's Agenda 2063 and the AfCFTA are not merely regional projects but attempts to construct the material basis for a more coherent Southern bloc. What the African perspective reveals that others miss is the *internal* dimension of the category: the "Global South" is not just a North-South relationship but a set of South-South relationships that are themselves structured by inequality, and any analysis that treats the South as a unitary actor obscures the power asymmetries within it.

Chinese: China frames the Global South as a "community of shared future" (□□□□□□□□), a concept that Xi Jinping has elevated to the center of Chinese foreign policy discourse. From this perspective, the category is not primarily about grievance but about constructive engagement: China's role is to provide public goods (infrastructure, financing, technology) that the North has failed to deliver. The Belt and Road Initiative, the AIIB, and the NDB are presented as institutional expressions of this commitment. The Chinese perspective occludes the power asymmetries within the South—particularly China's own economic dominance—and tends to treat Southern solidarity as convergent with Chinese interests. It also tends to downplay the coercive dimensions of Chinese economic engagement (debt distress in Sri Lanka, Zambia) that complicate the narrative of benign South-South cooperation.

Russian: Russia frames the Global South through the lens of multipolarity and anti-hegemonism, drawing on a Soviet-era vocabulary of anti-imperialism that has been repurposed for the post-2014 context. From this perspective, the category is defined by opposition to US unipolarity and the "rules-based order" that Russia characterizes as a euphemism for Western dominance. The SCO and BRICS are presented as institutional vehicles for a more just international order. The Russian perspective occludes the fact that its own actions (the 2022 invasion of Ukraine) have complicated its claim to represent Southern interests, and that many Global South states have refused to align with Russia on Ukraine, revealing the limits of anti-hegemonic

solidarity when it conflicts with economic interests.

Western: The Western perspective is divided between a "reform" camp and a "rupture" camp. The reform camp (Cooper and Farooq 2016; Acharya 2018) acknowledges the legitimacy of Southern grievances and advocates for incremental institutional adjustment—IMF quota reform, World Bank capital increases, G20 expansion. The rupture camp warns that parallel institutions (AIIB, NDB, SCO) are designed to fragment the global order and undermine the liberal international order's normative foundations. Both camps tend to treat the "Global South" as an object of policy rather than a subject of history, and both understate the degree to which Western institutions themselves generated the grievances that produced the category. The Western perspective's key occlusion is its own agency in creating the conditions for Southern solidarity.

UN: The UN perspective treats the Global South as a development challenge and a partner in achieving the Sustainable Development Goals. The UN's framing emphasizes financing gaps, capacity building, and the need for "inclusive multilateralism." This perspective is institutional rather than geopolitical: it does not take sides in the North-South contestation but seeks to mediate it through frameworks like the 2030 Agenda, the Addis Ababa Action Agenda, and the SDG financing gap estimates. Its occlusion is the structural power asymmetry that makes "inclusive multilateralism" difficult to achieve when the Security Council and the Bretton Woods institutions remain dominated by the same powers that created them.

2.3 KEY IDEA 2 — BRICS+ Expansion: From Five to Ten-Plus Members and the Strategic Logic

Bolded Causal Claim: BRICS+ expansion increases the aggregate bargaining power and institutional visibility of the Global South, but the same heterogeneity that enlarges the coalition also limits its capacity to convert demographic and economic weight into coherent, binding revisions of global governance.

Mechanism: The mechanism is not simply that more members produce more power. It operates through four channels. First, aggregation: by adding populous, resource-rich, and strategically located states, BRICS+ raises its share of global population, energy production, and GDP at purchasing power parity, thereby increasing the cost to Western powers of ignoring Southern demands in forums such as the G20, the UN General Assembly, and the IMF and World Bank. Second, agenda brokerage: summit declarations and ministerial working groups create a recurring calendar in which issues such as local-currency settlement, grain and fertilizer security, digital infrastructure, and UN Security Council reform can be framed as "Global South" priorities rather than bilateral grievances. Third, institutional thickening: the New Development Bank, the Contingent Reserve Arrangement, and BRICS+ dialogues with outreach partners provide at least partial alternatives to Western-controlled finance, giving members an outside option that strengthens their voice even when they do not use it. Fourth, hedging: for many middle powers, BRICS+ membership is a portfolio strategy rather than an exit; it signals dissatisfaction with the status quo while preserving access to Western markets, security guarantees, and Bretton Woods finance. Yet each channel has a counter-channel. Aggregation is undermined by internal asymmetry, especially China's economic dominance relative to other members. Agenda brokerage is constrained by consensus decision-making, which pushes declarations toward lowest-common-denominator language. Institutional thickening is limited by capital scarcity and by the fact that BRICS+ institutions remain smaller and less liquid than their Western counterparts. Hedging means that members' commitment to collective revision is instrumental and reversible, as Argentina's post-2023 withdrawal from accession illustrates. The result is a coalition whose size is its strength and whose diversity is its constraint: it can block, delay, and embarrass, but it struggles to legislate.

Scope Conditions: Expansion works as institutional revisionism under conditions where (i) dissatisfaction with the status quo is widely shared and salient—stagnant IMF quota shares, rising debt-service burdens, sanctions exposure, and perceived double standards in the application of international law; (ii) member economies are complementary rather than directly competitive in strategic sectors, allowing trade and investment gains to offset political friction; (iii) at least one member can provide public goods such as capital, infrastructure finance, or diplomatic brokerage; and (iv) Western powers are either unwilling or unable to offer credible reform. It is weakened when members are security rivals, as with India-China border tensions, Saudi-Iranian competition, or Egypt-Ethiopia disputes over the Nile; when domestic political turnover reverses accession commitments; or when Western institutions co-opt Southern demands through partial reform. The scope condition is therefore not merely economic size but "negative consensus": members need not agree on a positive blueprint, but they must agree that the current distribution of institutional power is illegitimate enough to justify collective voice. Where that negative consensus frays—because one member's security threat is another's partner—BRICS+ reverts to a summit forum rather than a revisionist bloc.

Observable Implications: If the mechanism holds, one should observe rising but uneven BRICS+ institutional activity: expanded summit declarations, new working groups, and incremental NDB lending, alongside persistent non-cohesion in UN voting on contested issues such as Ukraine or Gaza. One should also observe application queues from states seeking status and leverage, but also withdrawals or hesitations when accession becomes costly. The aggregate GDP (PPP) share of BRICS+ relative to the G7 should rise or remain high, yet this economic indicator should not be mistaken for institutional power: voting shares in the IMF and World Bank, the currency composition of reserves, and the location of financial clearing infrastructure change more slowly. A further implication is defensive adaptation by Western institutions—reform rhetoric, new financing windows, and bilateral deals with key Southern states—because BRICS+ expansion functions partly as a competitive threat that disciplines the incumbent order. Finally, one should expect forum shopping by borrower states, which use BRICS+ membership and NDB access as leverage in negotiations with the World Bank and IMF without fully abandoning either.

Perspective Note (five traditions in brief):

African (primary): From an African vantage point, BRICS+ expansion is legible as the latest episode in a long struggle over economic sovereignty that runs from the Bandung Conference through the New International Economic Order to contemporary demands for quota reform and debt relief. African scholarship has long insisted that formal political independence did not produce economic independence: Rodney's analysis of underdevelopment, Nkrumah's warning about neo-colonialism, and Cabral's insistence on returning to the source all frame BRICS+ not as a gift from rising powers but as a terrain on which African agency must be exercised. The entry of Egypt and Ethiopia into BRICS+ in 2023 expanded African representation beyond South Africa's long-standing role as the continent's sole member, yet this expansion also imported regional rivalries and raised the question of whether African states are participants in a collective Southern project or clients in a China-centered bloc. Mamdani's analysis of the bifurcated state and Bayart's work on extraversion suggest that African governments often navigate external power by converting dependency into bargaining leverage; BRICS+ can be read as one such strategy. But Mbembe's critique of postcolonial brutality and Grovogui's excavation of international law's racialized foundations remind us that new institutions do not automatically escape old hierarchies. African feminist scholars such as Oyěwùmí and Tamale add that global governance bargains are gendered: the "voice" amplified by BRICS+ is usually state and elite voice, not the voice of women, informal workers, or communities displaced by infrastructure corridors. From this perspective, the strategic value of BRICS+ for Africa lies less in its aggregate GDP share than in whether it creates space for African industrial policy, technology transfer, local content requirements, and debt restruc-

turing. The African Continental Free Trade Area and the African Union's Agenda 2063 provide normative benchmarks: BRICS+ is useful if it supports continental integration and productive capacity, and suspect if it merely re-routes extractive relationships through new capitals. Thus the African perspective is neither celebratory nor dismissive; it treats BRICS+ as a contested arena in which the old NIEO demand—sovereign equality plus structural transformation—must be renegotiated under new power asymmetries.

Chinese: China frames BRICS+ as a platform for "multipolarity" and a "community of shared future," emphasizing non-interference, development finance, and infrastructure connectivity. In this view, expansion demonstrates that the Western monopoly on legitimate multilateralism is eroding and that the Global South can build institutions reflecting its priorities. The occlusion is asymmetry: China's economic weight, its role as the largest trading partner for many members, and its bilateral leverage through the Belt and Road Initiative mean that "shared" governance may be less shared than the rhetoric implies. Chinese official discourse tends to treat institutional innovation as technical and developmental, understating the geopolitical competition embedded in it.

Russian: Russia presents BRICS+ as evidence of a "world majority" resisting hegemony and as a sanctions-resilient network in which Moscow is not isolated. The framing emphasizes anti-unilateralism, sovereign equality, and the right to development. Its occlusion is Russia's own reliance on China, its limited economic contribution relative to its political ambition, and the tension between anti-hegemonic rhetoric and coercive actions in its near abroad. Russian discourse often converts BRICS+ into a geopolitical scoreboard rather than a development project.

Western: Western perspectives are divided between those who see BRICS+ as a fragmentation risk that weakens universal standards and those who argue that reform of existing institutions is preferable to rupture. The first emphasizes authoritarian solidarity, sanctions evasion, and the dilution of human-rights and governance conditionality. The second, more reformist, acknowledges that quota stagnation and legitimacy deficits have pushed middle powers toward alternatives. The occlusion common to both is the difficulty of conceding that Western dominance itself generated the demand for BRICS+; "reform versus rupture" often presumes that the baseline order was legitimate for all.

UN: The UN perspective treats BRICS+ as both a partner and a complication in achieving the Sustainable Development Goals. It emphasizes financing gaps, climate finance, and the need for "inclusive multilateralism," while worrying that competing blocs may fragment normative frameworks. Its occlusion is structural: the UN cannot easily adjudicate between incumbent and challenger institutions when its own Security Council and the Bretton Woods bodies remain dominated by the powers that created them.

2.4 KEY IDEA 3 — AIIB, NDB, SCO: Parallel and Complementary Institutions

Bolded Causal Claim: Parallel institutions created by non-Western powers do not simply replace Bretton Woods bodies; they complement, compete with, and legitimate them, and their revisionist significance depends on whether they alter financing norms, governance rules, or the outside options available to borrowers.

Mechanism: The mechanism is "competitive multilateralism." New institutions change global governance not only by lending money but by changing the menu of choices and the standards against which incumbent institutions are judged. The AIIB operates primarily as an infrastructure financier: it was created to address the gap between infrastructure needs and available finance in Asia, and it has emphasized lean staffing, rapid project approval, and co-financing with the World Bank and Asian Development Bank. Its significance lies in demonstrating that a China-initiated multilateral bank can adopt familiar safeguards, obtain a high credit

rating, and issue bonds in international markets, thereby normalizing non-Western leadership in development finance. The NDB, founded by BRICS members, has emphasized equal voting among its founders and a growing share of local-currency lending, positioning itself as a development bank that reduces currency mismatch and borrower dependence on dollar finance. The SCO is not a financial institution but a security and political platform; its mechanism is normative and geopolitical, providing a Eurasian forum for counter-terrorism coordination, energy dialogue, and connectivity initiatives, and expanding the diplomatic space in which China and Russia can present themselves as providers of public goods. Together, these institutions create three effects. First, an outside option: borrowers can compare terms, timelines, and conditionality, which may improve their bargaining position even with legacy institutions. Second, a demonstration effect: by co-financing projects with the World Bank and ADB, the AIIB signals that parallel institutions can be compatible with existing standards, reducing the perceived risk of defection. Third, a legitimation effect: founders gain status as responsible stakeholders and rule-makers, not merely rule-takers. Yet complementarity cuts both ways. Co-financing means that AIIB and NDB projects often remain embedded in the same legal, environmental, and procurement frameworks as Western-led finance; their "alternative" status is therefore partial. Governance asymmetries—China's dominant share in the AIIB, the NDB's expansion beyond BRICS founders, and the SCO's consensus-based China-Russia condominium—limit the claim that these institutions are more egalitarian than the ones they challenge. The mechanism produces pressure for adaptation, not automatic displacement.

Scope Conditions: Parallel institutions function as effective revisionist tools when (i) there is a large, unmet demand for infrastructure or development finance that incumbent institutions cannot or will not meet quickly; (ii) founders can mobilize capital and technical expertise credible enough to attract borrowers and co-financiers; (iii) their governance and safeguard standards are perceived as legitimate by enough states to avoid stigma; and (iv) geopolitical tensions do not prevent cooperation among founders. They are less effective when capital constraints force dependence on international bond markets, when safeguards are seen as weaker or politicized, when founder rivalries such as China-India or Russia-China asymmetry undermine trust, or when sanctions and financial restrictions limit their reach. A further scope condition is "normative compatibility": if parallel institutions are framed as complements, they can gain legitimacy; if framed as explicit rivals, they may trigger defensive coalitions and capital-market skepticism. Thus the AIIB's early co-financing strategy was not a retreat from revisionism but a mechanism for making revisionism acceptable.

Observable Implications: If the mechanism holds, AIIB annual reports should show sustained lending volumes, a significant co-financing share with the World Bank and regional development banks, and expansion of membership beyond Asia. The NDB should show growth in local-currency lending and project approvals in member states, while also revealing constraints from capital-raising and credit-rating considerations. The SCO should show expanded membership or dialogue partnerships, joint exercises, and connectivity initiatives, but also difficulty in producing binding economic agreements. Incumbent institutions should respond with procedural reforms—faster approval, new infrastructure windows, or safeguard revisions—because parallel institutions create competitive pressure. Borrower states should engage in "multi-banking," using AIIB or NDB finance for some projects and World Bank finance for others, rather than wholesale switching. One should also observe debates over standards: civil society and Western governments will scrutinize AIIB and NDB safeguards, while founders will emphasize efficiency and respect for sovereignty. The absence of a wholesale shift in reserve currencies or clearing systems would not disprove the mechanism; the claim is about institutional menu expansion, not monetary revolution.

Perspective Note (five traditions in brief):

African (primary): For African states, the AIIB, NDB, and SCO raise a concrete question: do parallel institutions expand the financing available for structural transformation, or do they add new creditors to an already unsustainable debt landscape? African scholarship on development has long warned that infrastructure without industrialization can reproduce extraversion: Rodney's underdevelopment thesis, Nkrumah's neo-colonialism, and Bayart's politics of the belly all suggest that new lenders may simply finance extractive corridors, enclave projects, and elite bargains. Yet the African Union's Agenda 2063 and the Programme for Infrastructure Development in Africa identify a genuine financing gap that Western institutions have not closed. From this vantage, the NDB and AIIB are potentially useful if they support regional integration, energy access, and value-added production; they are dangerous if they replicate the "projectization" of development, bypass African industrial policy, or weaken safeguards. Mamdani's analysis of the bifurcated state and Grovogui's critique of international legal hierarchies suggest that African governments must scrutinize governance rules, not just interest rates: who selects projects, who bears risk, and who has recourse when projects fail? African feminist scholars such as Tamale and Oyěwùmí would add that infrastructure finance is never gender-neutral; transport, energy, and water projects reshape care work, land tenure, and informal livelihoods in ways that standard economic metrics may obscure. The SCO is less directly relevant to Africa, though its expansion of dialogue partnerships and its China-Russia security coordination may affect African states through arms markets, counter-terrorism norms, and great-power competition. The African perspective therefore treats parallel institutions as instruments to be evaluated against continental priorities, not as automatic allies. It also insists that African agency requires more than membership: it requires capacity to negotiate contracts, monitor safeguards, and align external finance with the African Continental Free Trade Area. In short, the question is not whether the AIIB is "alternative" in the abstract, but whether it is accountable to African publics.

Chinese: China presents the AIIB as a "lean, clean, and green" institution that addresses infrastructure gaps while respecting borrower sovereignty. The NDB is framed as a BRICS-owned vehicle for development finance and local-currency lending, and the SCO as a security community based on the "Shanghai Spirit" of mutual trust and non-interference. This perspective emphasizes institutional innovation, South-South cooperation, and the legitimacy of non-Western leadership. Its occlusion is the concentration of power within these institutions—especially China's dominant position in the AIIB—and the possibility that "respect for sovereignty" can become a rationale for weaker safeguards or for financing projects aligned with Chinese strategic interests.

Russian: Russia frames the NDB and SCO as instruments of multipolarity and as buffers against Western sanctions and hegemony. The SCO, in particular, is presented as a Eurasian security architecture that resists NATO expansion and unilateral intervention. The NDB is valued for reducing dollar dependence and for providing finance outside Western-controlled channels. The occlusion is Russia's limited capital contribution relative to its geopolitical ambition, its dependence on China within these institutions, and the tension between anti-hegemonic rhetoric and its own coercive regional policies.

Western: Western perspectives range from concern about standards erosion and geopolitical fragmentation to pragmatic acceptance of co-financing and reform pressure. Critics worry that parallel institutions may weaken environmental and social safeguards, procurement transparency, and debt sustainability. Reformists argue that the AIIB's adoption of familiar standards and its co-financing with the World Bank show that competition can improve incumbent institutions. The occlusion is the tendency to treat Western standards as universal while understating the legitimacy deficits and slow disbursement that drove borrowers toward alternatives.

UN: The UN perspective sees the AIIB, NDB, and SCO through the lens of the SDG financing gap and the need for "inclusive multilateralism." It welcomes additional development finance and infrastructure investment, while emphasizing debt sustainability, safeguards, and alignment with the 2030 Agenda. Its occlusion is the difficulty of ensuring accountability when new institutions proliferate outside the UN's normative and oversight frameworks, and the underlying power asymmetries that make "inclusive" multilateralism hard to achieve.

2.5 KEY IDEA 4 — The New International Economic Order (1970s) and its institutional legacies

Bolded Causal Claim: The New International Economic Order was not merely a rhetorical protest by newly independent states but a structured attempt to alter the rules of trade, finance, and technology transfer through UN majorities and commodity leverage; although its 1970s program was defeated by debt crisis and neoliberal counter-mobilization, its institutional and normative legacies persist in contemporary Global South demands for debt relief, special and differential treatment, and South-South institutional alternatives.

Mechanism: The NIEO operated through three linked channels. The first was intellectual: structuralist and dependency theories reframed underdevelopment as a product of unequal exchange rather than domestic failure. Prebisch's center-periphery analysis, Cardoso and Faletto's dependent development, and Rodney's account of how colonial extraction structured contemporary poverty all supplied the analytical premise that the international economy was politically constructed and could be politically renegotiated. The second channel was institutional: the Group of 77 and UNCTAD used post-decolonization majorities in the UN General Assembly to pass the 1974 Declaration and Programme of Action on the Establishment of a New International Economic Order and the 1974 Charter of Economic Rights and Duties of States. These documents asserted permanent sovereignty over natural resources, regulation of transnational corporations, technology transfer, commodity price stabilization, preferential market access, and debt relief. The third channel was material: the 1973 oil shock demonstrated that commodity cartels could redistribute income and temporarily shifted bargaining power toward resource exporters. The mechanism failed, however, because it required sustained Southern cohesion across heterogeneous economies, Northern willingness to accept binding constraints, and macroeconomic conditions favorable to debtors. The 1982 debt crisis, the Volcker shock, and IMF conditionality reversed that bargaining power. Yet the NIEO's legacies remained: UNCTAD survived as a forum; special and differential treatment entered GATT and later WTO practice; debt relief frameworks such as HIPC and MDRI institutionalized some demands; South-South cooperation expanded; and the vocabulary of economic sovereignty persisted. The legacy is therefore one of institutional revisionism rather than revolution: the NIEO seeded reforms and parallel institutions that reappear whenever commodity cycles, debt distress, or geopolitical competition reopen political space.

Scope Conditions: The NIEO mechanism was most effective when commodity prices rose and Southern exporters gained leverage; when decolonization produced UN majorities; when Northern economies were vulnerable to supply shocks; and when Southern states could coordinate despite divergent interests. It weakened when interest rates rose, debt overhang empowered creditors, IMF conditionality imposed liberalization, and Northern states coordinated through the G7 and OECD. It also presupposed state capacity and developmentalist elites; where states were captured by rentier or comprador interests, NIEO demands risked becoming symbolic. Contemporary analogues face similar scope conditions: debt relief requires creditor coordination; WTO reform requires consensus; climate finance requires Northern fiscal commitment. The mechanism is therefore historically contingent rather than automatically reproducible.

Observable Implications: If the NIEO-legacy thesis holds, one should observe recurring demands in BRICS+ and G77 statements for debt relief, SDR rechanneling, and special treatment; institutional persistence of UNCTAD and the G77; South-South banks and funds as partial alternatives; Northern resistance to binding commodity or technology-transfer regimes; and reformist rather than abolitionist rhetoric toward Bretton Woods. Evidence includes the BRICS Johannesburg II Declaration (2023) calls for IMF and World Bank reform and local-currency trade, African Union demands for debt relief and climate finance, and WTO disputes over special and differential treatment. A falsifier would be a sustained Southern consensus abandoning institutional reform for full autarky, or a Northern agreement to comprehensive binding redistribution that rendered revisionist demands obsolete.

Perspective Note (five traditions in brief):

African (primary): African scholarship treats the NIEO as an unfinished chapter of decolonization rather than a failed 1970s episode. Nkrumah's neo-colonialism thesis argued that political independence without economic sovereignty left African states vulnerable to external control through trade, finance, and multinational corporations; Rodney's underdevelopment thesis showed how colonial extraction structured contemporary poverty; Nyerere's Arusha Declaration and ujamaa emphasized self-reliance and cooperative development; Cabral linked liberation to control of productive resources; and Fanon warned that formal independence could reproduce elite domination. From this vantage, NIEO demands for commodity price stabilization, technology transfer, and debt relief were not utopian but defensive: they sought to prevent the conversion of political sovereignty into economic subordination. Contemporary African perspectives connect NIEO legacies to Agenda 2063, the African Continental Free Trade Area, demands for climate finance and loss-and-damage compensation, and debt relief through the G20 Common Framework. The African perspective also insists that debt is not merely a liquidity problem but a structural feature of unequal integration, and that "reform" must include reparative dimensions. Its occlusion is the risk of romanticizing state capacity: African scholars such as Mamdani and Bayart have shown how postcolonial states were often captured by patronage, extraversion, or elite bargaining, meaning that NIEO-style demands could be instrumentalized by domestic elites. The African perspective is therefore strongest when it combines a structural critique of global inequality with an internal critique of governance, linking external reform to domestic accountability.

Chinese: Chinese perspectives frame the NIEO as a legitimate anti-hegemonic precedent and align it with "community of shared future for mankind" and South-South cooperation. They emphasize infrastructure finance, industrialization, and non-interference, presenting China as a partner rather than a new hegemon. The occlusion is China's own creditor power and the asymmetries of Belt and Road lending, which can reproduce dependency even while rhetorically opposing it.

Russian: Russian perspectives interpret the NIEO through multipolarity and anti-hegemonic framing, supporting Southern demands as a counterweight to Western dominance. They emphasize sovereignty and resistance to sanctions. The occlusion is the tendency to instrumentalize Global South grievances while downplaying Russia's own coercive economic practices and limited development finance.

Western: Western perspectives often view the NIEO as a failed statist project defeated by market realities, while acknowledging that its grievances about terms of trade and debt were partially legitimate. The contemporary "reform versus rupture" debate asks whether to adjust quotas and debt frameworks or resist binding redistribution. The occlusion is the assumption that Western market norms are universal and the underestimation of legitimacy deficits in incumbent institutions.

UN: The UN perspective treats the NIEO as a normative foundation for development cooperation, special

and differential treatment, and the SDGs. It welcomes South-South cooperation and institutional pluralism while emphasizing debt sustainability, safeguards, and alignment with the 2030 Agenda. The occlusion is the gap between declarations and implementation, and the difficulty of enforcing commitments in a fragmented system.

2.6 KEY IDEA 5 — The contestation of Bretton Woods — IMF quota reform, SDR rechanneling, debt relief

Bolded Causal Claim: Contestation of Bretton Woods is driven by a structural mismatch between quota-based voting power and contemporary economic weights, the regressive distribution of Special Drawing Rights, and asymmetric debt relief; reform demands seek to convert institutional legitimacy into material redistribution, but are constrained by supermajority rules, creditor coordination failures, and the strategic interest of incumbent powers in preserving influence.

Mechanism: The mechanism operates through three institutional channels. First, IMF quotas determine not only financial subscriptions and access to Fund resources but also voting power and SDR allocations; because quotas reflect historical economic weights and are adjusted only through periodic reviews requiring an 85 percent supermajority, the United States retains effective veto power and emerging economies remain underrepresented relative to GDP. Second, SDRs are allocated by quota, so the 2021 $650 billion allocation disproportionately benefited advanced economies; rechanneling through the Poverty Reduction and Growth Trust and the Resilience and Sustainability Trust was proposed to redirect unused SDRs to vulnerable countries, but participation is voluntary and disbursement has lagged. Third, debt relief mechanisms—HIPC and MDRI in the 2000s, the Debt Service Suspension Initiative and Common Framework during COVID-19—require creditor coordination among Paris Club, non-Paris Club (including China), and private bondholders; holdout problems, comparability-of-treatment disputes, and fears of moral hazard have limited uptake. Contestation arises because Global South states use G20, UN, BRICS+, and African Union platforms to demand quota realignment, SDR rechanneling, and faster debt relief, while incumbent powers offer incremental adjustments to preserve legitimacy without surrendering control. The mechanism is therefore not simply "reform versus rupture" but a bargaining process in which legitimacy deficits create pressure and institutional rules filter demands.

Scope Conditions: Reform is more likely when debt distress is widespread, geopolitical competition makes incumbent powers seek legitimacy, and Southern states coordinate through the G20 or BRICS+. It is less likely when the US Congress blocks quota changes, private creditors resist haircuts, China and the Paris Club disagree on comparability, or macroeconomic conditions reduce urgency. The mechanism also depends on technical consensus: without agreement on quota formulas (GDP, openness, variability, reserves), realignment stalls. Debt relief works best for low-income, multilateral-debt-heavy cases; it struggles with middle-income market debt and complex creditor structures. Acharya (2018) and Cooper and Farooq (2016) both point, in different ways, to the broader pattern in which rising powers challenge incumbent institutions while still seeking the legitimacy those institutions confer.

Observable Implications: If this thesis holds, one should observe quota reviews producing increases without major realignment; SDR rechanneling pledges exceeding actual disbursements; Common Framework cases moving slowly due to creditor coordination; BRICS+ and African Union statements demanding IMF and World Bank reform; and incumbent powers emphasizing "reform from within" while resisting voting-power shifts. Evidence includes the 2023-2024 IMF quota review cycle's 50 percent increase without substantive realignment, the creation of the Resilience and Sustainability Trust, limited Common Framework

uptake, and the BRICS Johannesburg II Declaration (2023) calls for quota reform. A falsifier would be a comprehensive realignment matching economic weights or a binding, automatic debt-relief mechanism with full private-creditor participation.

Perspective Note (five traditions in brief):

African (primary): African perspectives treat Bretton Woods contestation as a matter of structural justice rather than technical adjustment. From Nkrumah's neo-colonialism to contemporary African Union and G20 advocacy, African scholars and policymakers argue that quota underrepresentation, SDR regressivity, and debt overhang reproduce a system in which African states borrow in foreign currency, face procyclical conditionality, and lack voice in rules that shape their fiscal space. The African view emphasizes that debt relief is not charity but correction of an asymmetric system; it connects IMF reform to climate finance, since climate-vulnerable African states face debt distress exacerbated by external shocks. African scholarship highlights the legitimacy crisis of institutions that demand austerity while failing to deliver countercyclical support, and it stresses regional agency through the African Union's G20 membership, the African Development Bank, and demands for SDR rechanneling to regional institutions. Its occlusion is the heterogeneity of African economies and the risk that continental demands mask elite borrowing and weak debt management; internal accountability remains essential. Thus the African vantage point reframes IMF reform as part of a broader struggle for economic sovereignty and climate justice.

Chinese: Chinese perspectives support quota reform and multipolar governance, framing Bretton Woods as outdated and advocating a "community of shared future." They emphasize development finance and infrastructure, and support SDR rechanneling in principle. The occlusion is China's dual role as a major creditor and a beneficiary of export-led growth, which complicates its position as a champion of debt relief.

Russian: Russian perspectives frame Bretton Woods as an instrument of US hegemony and support de-dollarization, alternative payment systems, and multipolar finance. They emphasize sanctions resistance and sovereignty. The occlusion is the limited attractiveness of Russian financial alternatives and the instrumental use of anti-hegemonic rhetoric.

Western: Western perspectives are divided between "reform from within" and "fragmentation risk." Some argue that quota reform and SDR rechanneling can preserve legitimacy; others warn that rapid change undermines creditor confidence and institutional effectiveness. The occlusion is the tendency to treat incrementalism as sufficient while underestimating the cumulative legitimacy deficit.

UN: The UN perspective focuses on the SDG financing gap, debt sustainability, and inclusive multilateralism. It supports IMF reform, SDR rechanneling, and the Common Framework, while emphasizing human rights, social protection, and alignment with the 2030 Agenda. The occlusion is limited enforcement power and dependence on member-state consensus.

2.7.1 African Perspective (PRIMARY)

The African perspective treats institutional revisionism not as a technocratic adjustment of voting shares or a diplomatic contest over multipolarity, but as the unfinished business of decolonization. From this vantage point, the central question is not whether BRICS+ can rival the G7, whether the AIIB can match the World Bank, or whether IMF quotas can be marginally rebalanced. It is whether the rules, metrics, and hierarchies that govern global economic life still reproduce the colonial and racialized structures that Rodney, Nkrumah, Fanon, and Cabral identified as the core of underdevelopment. Institutional revisionism is therefore read as

a longue durée struggle over economic sovereignty: the attempt to convert formal political independence into substantive control over finance, trade, technology, debt, and development pathways. The African perspective is the longest and most developed here because it supplies the historical memory that the other four perspectives tend to compress into a post-1990 or post-2008 story. It insists that the New International Economic Order was not a failed footnote but a diagnostic moment that exposed the limits of sovereignty without structural transformation.

Historically, the NIEO of the 1970s crystallized demands that remain alive in contemporary debates: commodity price stabilization, technology transfer, preferential market access, debt relief, and a fairer international division of labor. African and broader Global South diplomats at UNCTAD and the General Assembly framed these demands as corrections to an international economic order built on unequal exchange. The failure of the NIEO is usually narrated in Western and UN accounts as a casualty of oil shocks, Northern resistance, and the neoliberal turn. The African perspective adds a sharper internal critique: the NIEO was also weakened by the class character of postcolonial states, by the extraversion of African elites, and by the difficulty of sustaining solidarity among states with divergent interests. Bayart's concept of extraversion is crucial here. African political economies have often been organized around the management of external dependence rather than its transcendence, with elites deriving power from their position as intermediaries between domestic societies and global markets, donors, and creditors. This means that institutional revisionism cannot be evaluated only by the rhetoric of sovereignty; it must be evaluated by whether it changes the material incentives that reward extraversion. Mamdani's distinction between citizens and subjects adds a further layer. Colonial rule produced bifurcated states in which urban citizens enjoyed rights while rural subjects were governed through customary authority. Contemporary global governance often reproduces this bifurcation by treating African states as sovereign units in international law while subjecting their populations to conditionality, austerity, and technocratic oversight. From this perspective, quota reform or new development banks are incomplete unless they alter the relationship between state power and social protection.

The African perspective also reframes the category of the "Global South." It acknowledges the genealogy of the term—Bandung, the Tricontinental, the G77, the NIEO, and later BRICS—but warns against treating it as a natural bloc. The category is politically useful because it names shared experiences of colonialism, racialized hierarchy, and structural disadvantage. Yet it can obscure the fact that the Global South contains states with vastly different capacities, interests, and degrees of agency. China and India are not in the same structural position as low-income African states; Russia is a nuclear great power with a permanent Security Council seat; Brazil and South Africa occupy intermediate positions. The African vantage point therefore insists on disaggregation. It asks who speaks for the Global South, who benefits from its institutional innovations, and whose priorities are diluted in the name of solidarity. This is particularly important in BRICS+ expansion. The 2023 Johannesburg II Declaration framed expansion as a step toward a more representative and multipolar order, and the inclusion of Egypt and Ethiopia in 2024 broadened African representation. But from an African perspective, two members out of a much larger continent cannot carry continental legitimacy, especially when their interests, debt profiles, and geopolitical alignments differ. South Africa's role as the original African member has been both valuable and constraining: it has provided a bridge between African and emerging-power agendas, but it has also risked being treated as the default African voice in forums where fifty-four states have distinct priorities.

On BRICS+ specifically, the African perspective is neither celebratory nor dismissive. It recognizes the strategic logic of expansion: larger markets, energy and mineral complementarities, diplomatic weight, and a platform for challenging Western dominance in agenda-setting. It also recognizes that BRICS+ can amplify

demands for IMF reform, SDR rechanneling, and development finance. But it worries about "sub-imperial" dynamics, in which large emerging economies use the language of South-South solidarity while reproducing extractive relationships with smaller states. African scholarship on resource governance and extraversion suggests that new institutions can become new arenas for old patterns if procurement, transparency, and local content rules are weak. The African perspective therefore asks whether BRICS+ institutions will finance industrialization and value addition, or merely facilitate commodity exports and infrastructure that locks in primary specialization. It also asks whether African states will have meaningful voice in the governance of the New Development Bank and any future BRICS financial mechanisms, or whether decision-making will reflect the capital contributions and geopolitical weight of China and India.

The parallel institutions—AIIB, NDB, and SCO—are read through the same lens. The African perspective does not treat them as automatic alternatives to Bretton Woods institutions. It treats them as complementary or parallel arenas whose value depends on governance, terms, and developmental outcomes. The AIIB's co-financing with the World Bank and its adoption of familiar environmental and social frameworks suggest that it is not a rupture but a competitor within a shared institutional grammar. That may be beneficial if it increases financing for infrastructure and reduces monopoly power, but it may also mean that the underlying standards, risk models, and creditor hierarchies remain intact. The NDB's emphasis on local-currency lending and its smaller scale are attractive to African borrowers worried about dollar exposure, yet its capital base and project portfolio remain limited relative to the continent's infrastructure gap. The SCO is less directly relevant to African economic governance, but its security and connectivity agendas intersect with African concerns about militarization, great-power competition, and the securitization of development. The African perspective warns that institutional proliferation can fragment accountability: borrowers may face multiple creditors with inconsistent standards, while creditors may compete for influence rather than coordinate for development.

The NIEO legacy is central to this perspective. African diplomats and scholars do not treat the NIEO as a nostalgic project; they treat it as an unfinished agenda. Its demands reappear in contemporary calls for special drawing right rechanneling, debt relief, climate finance, and reform of the international tax and trade architecture. The 2021 SDR allocation illustrated the problem: because allocations follow quota shares, high-income countries received the largest share of new liquidity, while African states received a small fraction relative to their needs. Rechanneling through the Poverty Reduction and Growth Trust and the Resilience and Sustainability Facility is therefore welcomed but seen as insufficient and conditional. Similarly, the G20 Common Framework for debt treatments has been slow, creditor coordination has been difficult, and private creditors have often remained outside comparable treatment. The African perspective argues that debt relief must be timely, comprehensive, and linked to development and climate investment, not merely to fiscal consolidation. It also insists that debt sustainability analyses must account for climate vulnerability, pandemic risk, and the cost of capital, rather than treating African borrowing as a moral failure.

IMF quota reform is read with similar skepticism. The African perspective supports greater voice for underrepresented regions, but it questions whether marginal quota adjustments can correct a structure that was designed in an era of colonial and racial hierarchy. Quota formulas based on GDP, openness, variability, and reserves tend to reward large economies and financial centers, not necessarily those most affected by global shocks or most in need of policy space. The 2023 review cycle, which increased overall quotas without a major redistribution of shares, is seen by many African analysts as evidence that incremental reform can preserve legitimacy rhetorically while leaving power intact. The perspective therefore distinguishes between representation and transformation: more African chairs or slightly larger quotas may improve voice, but they do not by themselves change the conditionality, surveillance, and creditor power that shape macroeconomic

policy in debtor states.

What the African perspective contributes that the other four cannot is a historically grounded critique of the relationship between global governance and racialized underdevelopment. It connects contemporary institutional debates to colonial extraction, neocolonial dependence, and the politics of knowledge production. It also foregrounds the lived consequences of macroeconomic rules: austerity, unemployment, informalization, gendered burdens of social reproduction, and climate vulnerability. Tamale's Afro-feminist scholarship and Oyěwùmí's critique of the colonial invention of gender categories remind us that development finance is not gender-neutral; conditionality and fiscal consolidation often shift costs onto women and households. Aning and Danso's work on African security governance highlights that economic institutions cannot be separated from security architectures, because debt distress, resource extraction, and external military presence interact. Grovogui's critique of sovereignty and international legal hierarchy shows that African states have often been treated as quasi-sovereigns, granted formal equality while denied substantive equality. Mbembe's analysis of the postcolony and of brutalism helps explain why global economic governance can appear technocratic while producing violent exclusions.

The African perspective also has occlusions. It can overstate the coherence of "Africa" and understate internal diversity, class conflict, and elite agency. It can risk romanticizing the NIEO, which was itself shaped by state elites and did not adequately address gender, ethnicity, or democratic accountability. It can underplay the benefits of incremental reform, private investment, and institutional learning. It can treat external structure as the primary cause of underdevelopment while giving insufficient attention to domestic governance failures, corruption, and policy choices. And it can be instrumentalized by political elites who invoke anti-imperialism to deflect accountability. These limits matter. A rigorous African perspective must be self-critical: it should not assume that every challenge to Western institutions is emancipatory, nor that every Southern institution is automatically more legitimate. It should distinguish between reform that expands policy space and rhetoric that merely relocates dependency.

In sum, the African perspective reframes institutional revisionism as a question of historical justice and structural transformation. It supports the expansion of voice, the creation of parallel institutions, and the contestation of Bretton Woods, but it evaluates these developments by their effects on African sovereignty, industrialization, debt sustainability, and social protection. It contributes a memory of failed promises, a critique of extraversion, and a demand that global governance be measured not by the number of new institutions but by whether it ends the reproduction of underdevelopment.

2.7.2 Chinese Perspective

The Chinese perspective treats institutional revisionism as a necessary correction to an international order that no longer reflects the distribution of economic power, demographic weight, or developmental needs. It is anchored in the idea of a "community of shared future for mankind," which frames global governance not as a zero-sum contest but as a project of inclusive development, connectivity, and mutual benefit. From this vantage point, the Global South is not merely a residual category; it is the majority of humanity whose underrepresentation in Bretton Woods institutions has become a legitimacy crisis. China's support for BRICS+ expansion, the AIIB, the NDB, and quota reform is presented as institutional innovation rather than rupture: new platforms that complement existing institutions, increase financing for infrastructure, and give developing countries greater voice. The 2023 Johannesburg II Declaration is read as evidence that the international community is moving toward a more multipolar and representative order, with China positioning itself as a partner in development rather than a hegemon.

Mechanistically, the Chinese perspective emphasizes capacity-building and infrastructure-led growth. The AIIB is presented as a lean, clean, and green multilateral development bank, with high standards, co-financing with established institutions, and a focus on sustainable infrastructure. The NDB is presented as a bank created by and for emerging economies, with an emphasis on local-currency lending and reducing dependence on the dollar. The SCO is presented as a security and development platform for Eurasia, linking stability, connectivity, and economic cooperation. Quota reform and SDR rechanneling are supported as ways to make global liquidity more responsive to developing-country needs. The broader normative claim is that development should precede or accompany political conditionality: states should have policy space to pursue industrialization, poverty reduction, and modernization without externally imposed templates.

What this perspective contributes is a serious challenge to the assumption that Western institutional models are the only legitimate forms of multilateralism. It has mobilized capital, built infrastructure, and created forums in which developing countries can coordinate outside Western-dominated settings. It has also forced a debate about the adequacy of existing institutions, particularly in areas such as infrastructure finance and climate adaptation. For many African and Asian states, Chinese financing and AIIB lending have filled gaps left by traditional donors and the World Bank.

The occlusions are equally important. The Chinese perspective tends to understate power asymmetries within the institutions it promotes. China is the largest shareholder in the AIIB and a dominant economic presence in BRICS+, which raises questions about whether new institutions are genuinely multilateral or China-centered. It often frames debt sustainability concerns as Western propaganda, even though several borrowing countries face serious repayment pressures. It can treat non-interference as a neutral principle while overlooking how economic leverage shapes domestic politics. It also tends to present "community of shared future" as universally beneficial, without fully addressing how Chinese commercial interests, state-owned enterprises, and strategic priorities shape project selection. Finally, it may overstate the coherence of the Global South and understate the diversity of interests among BRICS+ members. The strongest version of the Chinese perspective would acknowledge these asymmetries and argue that institutional innovation still expands the menu of options available to developing countries, even if it does not eliminate hierarchy.

2.7.3 Russian Perspective

The Russian perspective frames institutional revisionism as part of a broader struggle against unipolar hegemony and for a multipolar world order. It treats BRICS+, the SCO, and demands for IMF reform as instruments for reducing Western dominance, particularly in the aftermath of sanctions and geopolitical confrontation. From this vantage point, the Global South is a coalition of states that resist external interference, defend sovereignty, and seek alternatives to a financial system dominated by the dollar and Western institutions. The 2023 BRICS expansion is interpreted as evidence that the West's ability to isolate Russia and shape global governance is declining. The SCO is presented as a Eurasian security architecture that challenges NATO-centric models and promotes non-interference, counterterrorism cooperation, and regional connectivity.

Mechanistically, Russia emphasizes de-dollarization, alternative payment systems, local-currency trade, and the political diversification of global institutions. It supports quota reform not only as a technical adjustment but as a challenge to Western voting dominance. It presents sanctions as proof that the existing order is weaponized and argues that multipolar institutions are necessary for economic security. In this framing, the NIEO legacy is less about commodity prices or technology transfer and more about the right of states to pursue independent development paths without external coercion.

What this perspective contributes is a sharp critique of the securitization of global economic governance. It

highlights how financial infrastructure, sanctions, and institutional power can be used as tools of coercion. It also expands diplomatic space for states that feel constrained by Western conditionality or geopolitical alignment. For some African, Asian, and Latin American governments, Russia's anti-hegemonic rhetoric resonates with historical experiences of intervention and unequal treatment.

The occlusions are severe and must be stated plainly. Russia's invasion of Ukraine has damaged its credibility as a defender of sovereignty and international law, creating a tension between its anti-hegemonic rhetoric and its own use of force. Its economy is heavily sanctioned, comparatively narrow, and dependent on commodity exports, which limits its capacity to provide development finance or institutional leadership. The SCO and BRICS+ are often more useful to Russia as diplomatic platforms than as mechanisms for delivering public goods. The anti-hegemonic framing can also be instrumental: it may serve to deflect attention from domestic authoritarianism, economic stagnation, and the use of energy and security leverage. Finally, Russia's perspective tends to conflate opposition to the West with support for development, even though multipolarity alone does not guarantee improved outcomes for poorer states. The strongest version of this perspective would separate legitimate critiques of hegemony from the defense of great-power prerogatives.

2.7.4 Western Perspective

The Western perspective is divided between two camps: those who argue that existing institutions can be reformed from within, and those who warn that rapid institutional fragmentation risks undermining global public goods. The reformist camp supports IMF quota adjustments, SDR rechanneling, debt relief, and greater developing-country voice, but insists that changes must preserve creditor confidence, macroeconomic stability, and high standards of transparency and accountability. The fragmentation camp worries that BRICS+, the AIIB, and the NDB are creating parallel structures that may weaken the World Bank, the IMF, and the broader liberal international order. From this vantage point, the Global South is a legitimate object of concern, but its demands must be balanced against the need for rules-based governance, fiscal discipline, and human rights.

Mechanistically, the Western perspective emphasizes institutional quality. It argues that the World Bank and IMF, despite their flaws, possess deep technical capacity, data systems, and crisis-response mechanisms that newer institutions cannot easily replicate. It treats the AIIB's co-financing with the World Bank as evidence that parallel institutions often rely on established standards rather than replacing them. It supports SDR rechanneling and the Common Framework in principle, but stresses the importance of creditor coordination, private-sector participation, and debt sustainability. It also frames quota reform as a legitimacy issue: if emerging economies do not receive greater voice, they will build alternatives that may be less transparent and less accountable.

What this perspective contributes is a focus on institutional effectiveness and the risks of fragmentation. It reminds us that development finance requires not only capital but also project appraisal, safeguards, monitoring, and enforcement. It highlights the dangers of debt distress, unsustainable lending, and geopolitical competition over infrastructure. It also brings normative concerns about human rights, labor standards, gender equality, and environmental protection into institutional debates.

The occlusions are significant. The Western perspective often treats incremental reform as sufficient while underestimating the cumulative legitimacy deficit of Bretton Woods institutions. It can present conditionality as technical expertise rather than political power, and it can understate the historical responsibility of creditor countries for colonial extraction, unequal trade, and climate debt. It sometimes frames developing-country demands as threats to stability rather than as responses to structural injustice. It also tends to assume that

Western institutional models are universally applicable, even though they have often failed to deliver industrialization or social protection in the Global South. The strongest version of this perspective would accept that legitimacy and effectiveness are interdependent: institutions that are perceived as unjust will eventually lose the cooperation on which their effectiveness depends.

2.7.5 UN Perspective

The UN perspective frames institutional revisionism through the lens of inclusive multilateralism, sustainable development, and the 2030 Agenda. It does not treat BRICS+, the AIIB, or the SCO as ends in themselves, but as part of a broader landscape of institutions that must be aligned with the Sustainable Development Goals, human rights, and debt sustainability. From this vantage point, the central problem is the financing gap for development and climate action, not merely the distribution of power among states. The UN system emphasizes SDR rechanneling, IMF quota reform, the G20 Common Framework, and expanded development finance, while insisting that these mechanisms must protect social protection, gender equality, and environmental standards.

Mechanistically, the UN perspective relies on convening power, norm-setting, data, and technical assistance. It supports the rechanneling of SDRs to the Poverty Reduction and Growth Trust and the Resilience and Sustainability Facility, while arguing that more ambitious mechanisms are needed to reach countries not covered by existing facilities. It treats the NIEO legacy as a reminder that development requires systemic change, not just aid. It also emphasizes that debt relief must be linked to investment in health, education, climate adaptation, and social protection, rather than to austerity alone. The UN's approach to the Global South is therefore functional and normative: it seeks to make all institutions, old and new, more responsive to the needs of the poorest and most vulnerable.

What this perspective contributes is a human-centered framework that prevents institutional debates from becoming purely geopolitical. It keeps attention on the SDG financing gap, on the costs of debt distress for households, and on the need for coordination among creditors, borrowers, and multilateral institutions. It also provides a space in which African, Chinese, Russian, Western, and other perspectives can be articulated, even if they are not always reconciled.

The occlusions are structural. The UN has limited enforcement power and depends on member-state consensus, which means that its proposals often lack binding force. It can be captured by powerful states or constrained by budgetary limitations. It also struggles to reconcile competing visions of development: state-led industrialization, market-led growth, human-rights-based approaches, and geopolitical competition all pull in different directions. Finally, the UN perspective can become overly technocratic, treating the SDG framework as a substitute for political contestation over power and resources. The strongest version of this perspective would acknowledge that norms without power are fragile, and that inclusive multilateralism requires not only better financing mechanisms but also a redistribution of decision-making authority.

SECTION 2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Reconstructs institutional revisionism as a continuation of anti-colonial and NIEO demands; insists that representation, debt relief, technology transfer, and sovereign equality are the criteria by which any new institution should be judged	Can overstate bloc coherence; may underplay intra-South inequality, authoritarian members, and the risk that state elites speak for peoples rather than with them	Redistributive multilateralism and sovereign equality	1974 NIEO Charter; AU Agenda 2063; African positions in IMF quota debates; Johannesburg II Declaration (2023)	**Western:** expanded blocs may fragment governance, politicize finance, and empower illiberal states without improving accountability
Chinese	Supplies institutional innovation and financing capacity through AIIB, NDB, and SCO; frames multipolarity as "community of shared future" and pragmatic development cooperation	Obscures asymmetry of Chinese power, debt-sustainability concerns, and the possibility that new institutions reproduce dependency under new creditors	Win-win development and multipolar order	AIIB annual reports; NDB lending; SCO expansion; BRICS Johannesburg II Declaration (2023)	**African/Western:** financing must not reproduce dependency, and governance standards cannot be treated as optional

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Russian	Provides anti-hegemonic and multipolar framing; uses SCO and BRICS to resist unipolarity and sanctions-based coercion	Conflates anti-Westernism with emancipation; limited economic weight; risks instrumentaliz-ing Global South grievances	Sovereign equality and resistance to unipolarity	SCO membership and activities; BRICS rhetoric on multipolarity; Russian positions in UN debates	**Western:** multipolarity without rules risks disorder; **African:** anti-hegemony must not become a new dependency relationship
Western	Identifies fragmentation risks, standards gaps, and the "reform vs rupture" dilemma; defends incremental IMF/World Bank reform and rules-based order	Treats the status quo as more neutral and inclusive than many Global South actors experience it; underestimates legitimacy crisis	Rules-based order with incremental reform	IMF quota review documentation; G7 statements; World Bank evolution reports	**African:** incremental reform has repeatedly failed to deliver quota equity, debt relief, or technology transfer
UN	Places SDG financing gap, inclusive multilateralism, and normative frameworks at center; proposes IMF reform and development financing agendas	Technocratic bias; limited enforcement power; dependence on member-state consensus; can treat SDGs as substitute for power redistribution	Inclusive multilateralism and sustainable development	SDG financing gap estimates; UNCTAD and IMF reform proposals; UN development system reports	**African:** norms without power are fragile; **Western:** UN lacks imple-mentation capacity and can be captured by powerful states

SECTION 2.8 WORKED EXAMPLE (I do)

Case: The 2023 BRICS Johannesburg expansion and the question of whether an enlarged BRICS+ reshapes global governance.

Levels of analysis

At the **individual** level, the Johannesburg summit was shaped by leader-level bargaining and domestic political incentives. Cyril Ramaphosa hosted the summit and sought to position South Africa as a convening power for African and Global South grievances; Xi Jinping pushed for rapid expansion as part of a broader institutional diplomacy; Narendra Modi balanced participation with caution about Chinese dominance; Luiz Inácio Lula da Silva used the summit to reassert Brazil's multilateral ambitions after a period of diplomatic retrenchment; and Vladimir Putin participated virtually, constrained by the International Criminal Court warrant and by Russia's need to demonstrate that sanctions had not isolated it. Individual agency mattered, but it operated within structural constraints: no leader could simply impose a new order, and each faced domestic constituencies skeptical of either Western alignment or Chinese leadership.

At the **state** level, the expansion reflected divergent but overlapping state interests. Existing members wanted a larger platform for bargaining over IMF quotas, development finance, trade settlement, and sanctions resilience; invitees such as Egypt, Ethiopia, Iran, and the United Arab Emirates sought status, market access, and diversification of partnerships. Saudi Arabia's ambiguous posture illustrated that state interest is not identical to bloc loyalty: energy power, security ties, and hedging strategies can make membership attractive without producing automatic alignment. Argentina's decline of the invitation after its 2023 election showed that domestic political change can reverse state commitment. The state level therefore explains both the appeal of BRICS+ and its fragility: the bloc is a coalition of sovereigns, not a federation, and each member retains an exit option.

At the **systemic** level, the expansion occurred during a measurable shift in the distribution of economic weight and institutional legitimacy. On purchasing-power-parity measures, the expanded grouping's share of global output is comparable to or larger than that of the G7, depending on membership counting and data source, while the G7 retains greater control over reserve currencies, financial infrastructure, and the Bretton Woods institutions. The systemic context includes stalled IMF quota reform, debt distress in low- and middle-income countries, sanctions against Russia, and competition over development finance. In this setting, BRICS+ functions less as a replacement for the existing order than as a bargaining coalition that raises the cost of ignoring Global South demands. Its systemic significance lies in agenda-setting and in the demonstration that alternative platforms can attract members, not in the creation of a fully parallel governance architecture.

At the **transnational** level, the summit and its aftermath involved business councils, think-tank networks, civil-society forums, commodity traders, and financial institutions that operate across borders. BRICS civil-society and academic networks have promoted South-South cooperation narratives, while transnational firms in energy, mining, and infrastructure have interests in how the bloc frames investment rules. The transnational dimension also includes the diffusion of norms: "multipolarity," "de-dollarization," and "Global South" have become circulating political vocabularies that shape expectations even where institutional change is slow. Yet transnational civil society is not unified; labor, environmental, feminist, and human-rights groups often contest the bloc's state-centric and elite-driven character. Thus the transnational level reveals both the cultural power of BRICS+ rhetoric and the gap between summit declarations and social accountability.

Mechanism

The mechanism through which the Johannesburg expansion reshapes global governance is **leverage amplification through representational enlargement**, not institutional replacement. BRICS+ does not possess a secretariat with enforcement power, a common currency, or a unified trade policy; its Johannesburg II Declaration is a political statement rather than a binding treaty. The causal chain runs as follows: expansion increases the bloc's share of population, output, energy production, and diplomatic weight; this larger footprint strengthens its claim to represent the Global South; that claim raises the legitimacy cost for the G7 and Bretton Woods institutions when they exclude or underweight BRICS+ members; and the resulting pressure can shift bargaining outcomes in IMF quota reviews, debt-relief forums, development-bank governance, and climate finance negotiations. A second mechanism is **agenda diversification**: by including African, Middle Eastern, and additional Asian states, the bloc broadens the issues it can plausibly claim to represent, from debt and infrastructure to energy transition and food security. A third mechanism is **institutional signaling**: the expansion signals to states and markets that alternatives to Western-led finance are available, which can improve the bargaining position of borrowers even if they never use those alternatives. The limits are equally important. Consensus decision-making among heterogeneous regimes produces lowest-common-denominator outcomes; the bloc's economic asymmetry means China's preferences weigh more than those of smaller members; and the absence of enforcement mechanisms means declarations may not become policy. Therefore the expansion reshapes governance primarily by changing the distribution of voice and the cost of exclusion, not by displacing existing institutions.

Perspective reconstruction

The **African perspective**, which should be treated as primary in this lesson, reads the Johannesburg expansion as a belated institutional echo of the New International Economic Order and of Pan-African demands for sovereign equality. From this vantage point, the summit's Africa-focused theme is significant because it frames African states not as beneficiaries of development assistance but as co-authors of global economic rules. The African perspective insists that legitimacy requires more than membership expansion: it requires IMF quota reform, debt relief, technology transfer, and financing that does not reproduce dependency. It also warns that BRICS+ could become another arena in which external powers extract resources unless African states coordinate through the African Union and regional economic communities. At the same time, this perspective acknowledges internal tensions: South Africa chairs the bloc but cannot speak for all African interests, and the consensus model may mute smaller states. Thus the expansion is promising but insufficient—it opens space for contestation without guaranteeing redistribution.

The **Chinese perspective** treats the expansion as institutional innovation in service of a "community of shared future" and a more multipolar order. It emphasizes the creation and expansion of parallel or complementary institutions—AIIB, NDB, and SCO—and presents BRICS+ as a platform for development cooperation rather than confrontation. This perspective highlights financing capacity, infrastructure, and South-South cooperation, and it frames Western resistance as defense of an outdated hierarchy. Its occlusion is that it can understate the asymmetry of Chinese power within these institutions and the concerns of borrowers about debt sustainability, transparency, and strategic dependence.

The **Russian perspective** frames the expansion as evidence of a durable shift away from unipolarity and as validation of anti-hegemonic multipolarity. It stresses resistance to sanctions, the legitimacy of alternative centers of power, and the right of states to choose partners without Western conditionality. The Russian perspective is strongest in diagnosing the coercive dimensions of the existing order, but it risks conflating opposition to Western dominance with genuine emancipation and can instrumentalize Global South grievances

for great-power competition. Its economic weight within BRICS+ is limited, which means its influence depends more on diplomatic framing than on material capacity.

The **Western perspective** interprets the expansion as a fragmentation risk and as a test of whether the existing order can reform without rupturing. It worries that an enlarged BRICS+ may weaken universal standards, politicize development finance, and create parallel institutions that are less transparent or accountable. At the same time, the more sophisticated Western position acknowledges a legitimacy crisis in Bretton Woods governance and debates whether incremental reform—quota adjustments, SDR rechanneling, World Bank evolution—can absorb Global South demands. Its occlusion is that it often treats the status quo as neutral and underestimates how long-delayed reform has fueled the very revisionism it now fears.

The **UN perspective** sees the expansion through the lens of SDG financing, inclusive multilateralism, and the gap between global needs and available resources. It emphasizes that the Johannesburg Declaration's development language aligns with UN agendas on poverty, infrastructure, and climate, and it treats IMF reform proposals and debt-relief initiatives as necessary complements to any bloc politics. This perspective is valuable for keeping human development at the center, but it can become technocratic: norms without enforcement power are fragile, and inclusive multilateralism requires redistribution of decision-making authority, not only better financing mechanisms.

Explicit adjudication

The African perspective best explains why the Johannesburg expansion matters: it captures the historical lineage from NIEO to contemporary reform demands and insists that voice without redistribution is insufficient. However, it is less able to explain the timing and scale of the expansion, which are better explained by the systemic perspective—stalled quota reform, sanctions, and shifting PPP weights—and by the Chinese perspective, which supplies institutional and financial capacity. The Western perspective best identifies the risks of fragmentation and standards erosion, but it underestimates the extent to which delayed reform produced the legitimacy crisis that BRICS+ exploits. The Russian perspective contributes a critique of coercion but overstates its own material capacity and risks reducing Global South agency to anti-Western alignment. The UN perspective keeps development needs visible but lacks the power analysis required to explain why institutions change. On the evidence, the most defensible adjudication is that the 2023 expansion reshapes global governance through **leverage and representation rather than replacement**: it increases the cost of excluding large parts of the Global South from rule-making, but it does not yet create enforceable alternatives to Bretton Woods. The African perspective provides the normative benchmark; the systemic and Chinese perspectives explain the mechanism; the Western and UN perspectives identify constraints and risks that any assessment must include.

SECTION 2.9 PROBLEM PAIR (We do)

Tasks

1. **Membership and capital.** Compare the AIIB's founding membership (57 in 2016, now 109) and subscribed capital ($100 billion) with the World Bank's IBRD ($298 billion in callable capital, 189 members). What does the capital gap imply about lending capacity, risk-bearing, and the AIIB's ability to lead large syndicated projects without co-financing partners?

2. **Portfolio composition.** Using AIIB annual reports, classify lending by sector (transport, energy, water,

urban) and by region (Asia, Africa, Europe, Latin America). How concentrated is the portfolio in Asia, and what does that concentration imply for claims that the AIIB is a "global" alternative to the World Bank?

3. **Co-financing and complementarity.** Identify the share of AIIB projects co-financed with the World Bank, ADB, or EBRD. Does co-financing indicate genuine complementarity, or does it reveal operational dependence on established institutions' standards, pipelines, and credibility?

4. **Governance and voice.** Compare voting structures: the AIIB's regional/non-regional split (75/25), China's roughly 26 percent voting share (effective veto over major decisions requiring 75 percent), versus the World Bank's US roughly 16 percent share with veto over amendments. How does each institution's decision rule shape whose preferences dominate, and what does this mean for borrower perceptions of neutrality?

5. **Standards and safeguards.** Evaluate the AIIB's Environmental and Social Framework against World Bank safeguards. Where are they convergent, and where do they diverge (for example, on resettlement, indigenous peoples, and coal financing)? Does convergence indicate institutional isomorphism or strategic learning?

6. **African vantage.** From an African perspective, has the AIIB expanded meaningful financing for African infrastructure, or has it remained Asia-centric? What does this reveal about the limits of "Global South" solidarity and about whose priorities the new institutions actually serve?

MODEL ANSWER

The AIIB's first decade does not support the claim that it is a genuine alternative to the World Bank; rather, the evidence points to a complementary, Asia-centric institution that borrows heavily from established multilateral templates while offering China a parallel venue for infrastructure finance. On membership and capital, the AIIB's $100 billion in subscribed capital is roughly one-third of the IBRD's callable capital, and although its 109 members are impressive, many are non-borrowing advanced economies whose participation signals diplomatic hedging rather than a wholesale exit from Bretton Woods. The capital gap matters because it constrains the AIIB's ability to lead large syndicated projects without co-financing partners, which in turn shapes its operational dependence on the World Bank and the Asian Development Bank.

Portfolio data reinforce this reading. The AIIB's lending remains heavily concentrated in Asia, with transport and energy dominating and Africa, Latin America, and the Middle East receiving a small and only slowly growing share. A genuinely global alternative would show broader geographic diversification; instead, the AIIB's footprint tracks Asian infrastructure demand and, indirectly, Chinese strategic corridors. This concentration is not accidental. It reflects both the bank's mandate and the risk appetite of shareholders who prefer familiar markets, and it undercuts any claim that the institution embodies a pan-Southern development vision.

Co-financing is the decisive indicator. A substantial share of AIIB projects are co-financed with the World Bank, the ADB, or the EBRD, and the AIIB frequently adopts the lead institution's safeguard and procurement standards. This is complementarity, not rupture: the AIIB expands the total pool of infrastructure finance and reduces transaction costs for borrowers, but it does not displace the World Bank's standard-setting role. Where the AIIB has innovated—leaner staffing, faster approval timelines, greater tolerance for public-private partnerships—these are operational efficiencies within a shared paradigm rather than a new development model.

Governance tells a similar story. China's roughly 26 percent voting share gives it an effective veto over major decisions, a concentration of power that no single shareholder enjoys at the World Bank, where the United States holds roughly 16 percent and must build coalitions. This is a genuine difference, but it cuts both ways: it makes the AIIB more responsive to Chinese strategic priorities, including the "community of shared future" framing, and less attractive to borrowers seeking multilateral neutrality. The regional/non-regional 75/25 split ensures Asian dominance, mirroring the World Bank's weighted-voting logic rather than transcending it.

On safeguards, convergence outweighs divergence. The AIIB's Environmental and Social Framework closely tracks IFC Performance Standards and World Bank safeguards; differences are marginal, as on coal, where the AIIB's 2017 energy strategy restricted but did not eliminate coal financing. The bank's accountability mechanism, the Project-affected People's Mechanism, is modeled on the World Bank's Inspection Panel. These parallels suggest institutional isomorphism: the AIIB adopted proven templates to secure AAA ratings and co-financing access, trading distinctiveness for credibility.

From an African vantage, the AIIB's record is thin. African members are few, and lending to Africa remains a small fraction of the portfolio. This undercuts any claim that the AIIB embodies "Global South" solidarity; it is, in practice, an Asian development bank with global membership. African scholars and policymakers who hoped for a counterweight to conditionality-laden Bretton Woods finance have found instead a narrower, regionally focused institution whose strategic logic is Chinese rather than pan-Southern.

Adjudication: the AIIB is a complementary institution that expands infrastructure finance and offers China a parallel governance venue, but it has not displaced the World Bank's lending volume, standard-setting authority, or global reach. It is best understood as institutional layering—adding a new node to a dense network—rather than institutional replacement. Falsifiers of this conclusion would include AIIB lending to Africa and Latin America exceeding 30 percent of portfolio; a sustained decline in World Bank infrastructure lending attributable to AIIB competition; AIIB adoption of a safeguard regime that diverges materially from World Bank standards; or China's voting share falling below 20 percent through new capital subscriptions. Absent such evidence, the "genuine alternative" thesis remains aspirational.

SECTION 2.10 INDEPENDENT MEMO (You do)

(a) Case description. In 2024-2025, the IMF's 16th General Review of Quotas concluded with a 50 percent quota increase but no change to the quota formula, leaving emerging-market and developing-country voting shares largely unchanged. The United States, holding 16.5 percent of votes and thus an effective veto over major decisions requiring an 85 percent supermajority, blocked formula reform. Several Global South members argued that the outcome perpetuated a 1944 power structure and accelerated the shift toward parallel institutions such as the NDB, AIIB, and SCO financing facilities. Critics noted that the increase was not accompanied by new conditionality relief, SDR rechanneling, or debt-suspension mechanisms. Your memo should assess whether this outcome constitutes genuine reform or the preservation of hegemony, and what it implies for the legitimacy, financing capacity, and future of Bretton Woods institutions in an era of institutional revisionism.

(b) Required memo headings (respond to each as a prompt).

- **Mechanism:** Identify the causal mechanism linking the quota formula stalemate to institutional fragmentation. Specify the intermediate steps (veto politics, legitimacy erosion, exit to parallel institutions) and the scope conditions under which the mechanism operates.

- **Perspective reconstruction:** Reconstruct how at least three of the five perspectives (African, Chinese, Russian, Western, UN) would interpret this outcome, steel-manning each from within its own premises.
- **Historical analogue:** Identify one historical episode of institutional revisionism or failed reform (for example, the NIEO debates of the 1970s, the 2010 IMF quota reform delay, or the creation of the NDB) and specify what it does and does not illuminate about the 2024-2025 case.
- **Falsifiers:** State two or three observable developments that would falsify your central claim, and specify the evidentiary standard you would apply.

(c) Self-check. Before submitting, verify that you have distinguished description (what happened), explanation (why it happened), prediction (what will follow), and prescription (what should be done), and that no single paragraph conflates all four.

SECTION 2.11 HINGE QUESTION

Question: Which of the following best captures the African scholarly critique of the "Global South" as an analytical category?

A. The Global South is a coherent geopolitical bloc with shared interests that should replace the Non-Aligned Movement as the primary vehicle of Southern solidarity.

B. The category obscures internal hierarchies, class divisions, and gendered power relations within Africa and the broader South, and risks reproducing the very homogenization it claims to oppose.

C. The Global South is primarily a Chinese strategic construct designed to legitimize BRICS expansion and should be discarded in favor of strict regionalism.

D. The category is analytically useless and should be abandoned entirely in favor of country-level analysis.

Correct answer: B.

Distractor diagnoses:

- **A** is wrong because it treats the Global South as a coherent bloc, which African scholars such as Mamdani and Mbembe explicitly reject; the category's political utility does not imply ontological coherence, and conflating the two is precisely the error the African critique targets.
- **C** is wrong because it reduces African intellectual agency to Chinese strategy, ignoring the African genealogy of the concept (Nkrumah, Nyerere, Cabral, Fanon) and the fact that African scholars critique the category from within rather than attributing it to external authorship.
- **D** is wrong because it overstates the critique; African scholarship generally treats the Global South as a strategically useful but analytically leaky category, not as worthless, and "abandon entirely" misrepresents the nuanced position of scholars who deploy it critically rather than reject it outright.

SECTION 2A — DATA LAB

The data lab triangulates three datasets that together measure the gap between *economic weight*, *institutional capacity*, and *decision-making power* in the contemporary order. Each table is a snapshot; the analytical work lies in moving between levels of analysis and between the five perspectives.

Table 1 — BRICS+ and G7 share of world GDP (PPP), selected years

Year	BRICS (original 5)	BRICS+ (expanded)	G7	Notes
2001	~8%	—	~46%	IMF WEO figures widely cited in policy literature
2010	~20%	—	~43%	Post-crisis divergence visible
2023	~32%	~37%	~30%	BRICS Johannesburg II Declaration (2023) references expanded weight
2028 (proj.)	~33%	~38%	~28%	IMF WEO projections; treat as indicative

Reading note: PPP shares measure purchasing-power-adjusted output, not financial-market depth, reserve-currency status, or institutional voice. A state can be 37% of world output (PPP) and hold under 15% of IMF voting power.

Table 2 — Institutional lending volumes: AIIB vs World Bank vs NDB

Institution	Measure	Approx. figure	Period	Source
AIIB	Cumulative approved financing	~$50 billion	2016–2024	AIIB annual reports
World Bank (IDA)	Annual commitments	~$30 billion	FY2024	World Bank annual report

Reading note: Cumulative (AIIB, NDB) and annual (IBRD, IDA) figures are not directly comparable; convert to annual averages or compare project-level additionality. AIIB's annual flow is roughly one-third of IBRD+IDA combined.

Table 3 — SCO membership timeline and IMF quota reform status

Track	Year	Event
SCO	2001	Founded (Shanghai Five + Uzbekistan)
SCO	2017	India and Pakistan admitted as full members
SCO	2023	Iran admitted as full member

Track	Year	Event
SCO	2024	Belarus admitted (10 full members)
IMF	2019	15th General Review: no quota increase; limited governance reform
IMF	Dec 2023	16th General Review concluded: 50% quota increase agreed; **no change in quota shares/voting power**; pending effectiveness
IMF	2024–	17th General Review ongoing; quota-share realignment on agenda

Reading note: The SCO row tracks geopolitical alignment; the IMF row tracks the *failure* of voice reform despite repeated review cycles. The two move on different clocks.

Five numbered analysis questions

1. **Trend.** Table 1 shows BRICS+ PPP share rising from negligible (2001) to roughly 37% (2023) while the G7 share falls from ~46% to ~30%. What does this trajectory establish about *economic weight*, and what does it *not* establish about *institutional power*? A strong answer distinguishes stock from flow, PPP from market exchange rates, and output share from voting share, and notes that the G7 still controls the IMF, World Bank, and dollar-based payment infrastructure.

2. **Level of analysis.** Table 2 operates at the *systemic* level (aggregate lending volumes), Table 3's SCO row at the *state* level (membership decisions), and Table 3's IMF row at the *systemic-institutional* level. What is gained and what is lost by aggregating to the systemic level? A strong answer identifies that aggregation hides *project-level* conditionality differences, *bilateral* side deals, and the *individual* agency of finance ministers and central-bank governors who negotiate quota formulas.

3. **Perspective reconstruction (all five).** How would each perspective read Table 2?

    - *African:* AIIB lending is welcome additional finance but must be judged by whether it reaches infrastructure-poor states on terms that do not replicate extractive conditionality; the NIEO demand was for *voice*, not just volume.
    - *Chinese:* AIIB demonstrates institutional innovation and "community of shared future" delivery; complementarity with, not replacement of, the World Bank.
    - *Russian:* Evidence of multipolar institutional pluralism; any non-Western lender weakens hegemonic monopoly.
    - *Western:* Fragmentation risk; AIIB may duplicate standards and dilute environmental/social safeguards; "reform vs rupture" debate.
    - *UN:* Financing-gap arithmetic; whether AIIB flows count toward SDG targets and whether they are additional or substitutive. A strong answer keeps each reading internally coherent and notes where two readings converge (e.g., African and UN on additionality).

4. **Interpretation.** Does SCO expansion (2001 → 10 members, 2024) indicate a *security community* or a *geopolitical bloc*? What evidence would distinguish the two? A strong answer uses the SCO's institutional outputs (Regional Anti-Terrorist Structure, joint exercises, economic cooperation) against its political statements, and notes the India–China–Pakistan tensions inside the same body as evidence against a tight bloc reading.

5. **Limitation.** What do these three tables *not* capture? A strong answer names: informal power (G7 coordination outside formal votes), conditionality differences (AIIB's "lean" model vs World Bank safeguards), SDR rechanneling and debt-relief mechanics, the role of private capital, and the gap between *pledged* and *disbursed* finance. It also notes that PPP shares say nothing about who sets the rules of trade, technology, and security.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — Institutional Genealogy Tree (hand-drawn, A4 landscape)

What to draw: A tree with a single trunk labeled "Post-1945 International Economic Order" splitting into two main branches. Left branch: "Bretton Woods (1944)" → "IMF / World Bank / GATT-WTO" → "Quota/voting structure (1944 weights)" → "16th Review (2023): +50% quotas, no share change." Right branch: "NIEO (1974, UNGA Res. 3201)" → "BRICS (2009)" → "BRICS+ (2023/24)" → three sub-branches: "AIIB (2016)", "NDB (2015)", "SCO (2001, expanded)". Draw a dashed horizontal line labeled "Reform vs Rupture fault line" cutting across both branches at the level of the 2020s.

Labels to place: On the left branch, annotate "Voice deficit" (African perspective); on the right branch, annotate "Institutional innovation" (Chinese perspective) and "Multipolarity" (Russian perspective). At the root, annotate "Shared premise: sovereignty + development."

Perspective overlay: Color-code branches: left branch blue (Western/UN institutionalism), right branch red (revisionist), trunk grey (shared). Add a legend. The African perspective appears as a *bridge* arrow between NIEO (1974) and contemporary reform demands, labeled "Continuity of demand, change of addressee."

Visual 2 — BRICS+ Expansion as Concentric Membership Waves (hand-drawn, A4 portrait)

What to draw: Four concentric circles (like a target). Innermost circle (smallest): "BRICS 5 (2009): Brazil, Russia, India, China, South Africa." Second ring: "BRICS+ Wave 1 (2024): Egypt, Ethiopia, Iran, UAE, Saudi Arabia (invited/accepted)." Third ring: "BRICS+ Partners (2024): 9 partner countries (e.g., Nigeria, Turkey, Indonesia, Vietnam, etc. — label as 'partner tier')." Outermost ring: "Aspirants / observers." Draw arrows from each ring outward labeled with the accession year. Place a small inset box: "G7 (7) for scale."

Labels to place: Inside innermost circle: "GDP (PPP) ~32% (2023)." Across second+third rings: "GDP (PPP) ~37% (2023)." Outside: "Population ~45% of world." Add a note: "Membership ≠ voting weight; BRICS has no formal charter or quota system."

Perspective overlay: Annotate the rings with perspective tags: African (outer rings = African accession: Egypt, Ethiopia, Nigeria as partner — "voice through numbers"); Chinese (inner rings = "community of shared future" core); Russian (whole target = "multipolar alternative"); Western (whole target = "fragmentation risk / coherence question"); UN (outer rings = "SDG financing geography").

Visual 3 — Quota Reform Stalemate: Voting Share vs GDP (PPP) Share (hand-drawn bar chart)

What to draw: A grouped bar chart with country/group on the x-axis (United States, EU bloc, China, India, Africa (aggregate), Other emerging) and two bars per group on the y-axis (0–20%): bar A = "IMF quota/voting share (post-16th Review, 2023 agreement)" and bar B = "GDP (PPP) share (2023, IMF WEO)." Show the US bar high on A, low on B; China bar low on A, high on B; Africa bar very low on A, moderate on B. Draw a horizontal dashed line at "15% blocking minority" and annotate the US position relative to it.

Labels to place: Title: "Voice Gap: Quota Share vs Economic Weight (2023)." Legend: blue = quota share, orange = PPP share. Footnote: "16th Review: +50% quotas, no realignment of shares; 17th Review pending."

Perspective overlay: Annotate the Africa bars with "NIEO continuity" (African); the China bar with "underrepresentation" (Chinese); the US bar with "veto preservation" (Western/Russian readings differ: Western = stability; Russian = hegemony). Add a small "UN" tag near the footnote: "SDG financing requires voice reform."

SECTION 4 — CORNELL NOTES

Cue (prompt)	Notes (with source log)
What is the "Global South" as a category?	Emergent, contested, historically layered term. Lineage: Bandung (1955) → NIEO (1974) → post-Cold War "developing countries" → 2000s "Global South." Not a geography; a political position. Source log: Acharya (2018); Cooper and Farooq (2016).
What is institutional revisionism?	Efforts to alter rules, quotas, or create parallel institutions rather than accept status quo. Spans reformist (quota reform) to rupturist (new banks). Source log: Acharya (2018).
What was the NIEO (1974)?	UNGA Resolution 3201 (S-VI) + Charter of Economic Rights and Duties of States. Demanded: commodity price stabilization, technology transfer, debt relief, sovereign resource control. Largely unimplemented; legacy in contemporary demands. Source log: NIEO documents (1974).
What is BRICS+ (2023/24)?	Expansion from 5 to 10 full members + partner tier. Johannesburg II Declaration (2023) sets agenda: local-currency trade, NDB capitalization, UNSC reform. Source log: BRICS Johannesburg II Declaration (2023).
What is the AIIB?	Multilateral development bank, Beijing-headquartered, 100+ members, ~$50B cumulative approved (2016–2024). "Lean, clean, green" model; co-financing with World Bank common. Source log: AIIB annual reports.

Cue (prompt)	Notes (with source log)
What is the SCO?	Shanghai Cooperation Organisation; security + economic cooperation; 10 full members (2024). RATS (Regional Anti-Terrorist Structure). Source log: SCO documents.
What is the IMF quota reform stalemate?	16th Review (Dec 2023): +50% quotas, no share realignment; 17th Review pending. Voice gap persists: emerging economies under-represented vs PPP weight. Source log: IMF quota review documentation.
What is SDR rechanneling?	Special Drawing Rights allocated 2021 (~$650B); rechanneling to vulnerable countries via MDBs/PRGT proposed; implementation partial. Source log: IMF documentation.

Summary (3–5 sentences): Institutional revisionism in the 2020s is not a single project but a family of demands and experiments: the Global South as an emergent political category, BRICS+ expansion, parallel institutions (AIIB, NDB, SCO), and contested Bretton Woods reform (IMF quotas, SDR rechanneling, debt relief). The African vantage point reveals continuity from the NIEO (1974) to present demands for voice and non-extractive finance, while the Chinese, Russian, Western, and UN perspectives each read the same data through different mechanisms—innovation, multipolarity, fragmentation, and financing gaps respectively. The data show rising economic weight without matching institutional voice, and the 16th IMF Review's +50% quota increase without share realignment captures the stalemate. Whether this moment is reform or rupture remains adjudicable only by evidence on additionality, conditionality, and voice.

SECTION 5 — FEYNMAN COMPRESSION

1. **Explain without jargon.** The world's economic center of gravity has shifted toward countries that were once called "developing," but the institutions that lend money and set rules were built in 1944 by the winners of World War II. Those countries are now building their own banks and clubs (BRICS, AIIB, SCO) and asking for more votes in the old ones (IMF). The question is whether this is a repair job or a replacement—and the answer depends on whether the new institutions actually deliver money on fairer terms.

2. **Mark gaps.** I am unsure of the exact AIIB annual flow relative to IBRD in a single year; I conflated cumulative and annual figures in Table 2 and must keep them separate. I also treated "BRICS+" as a coherent actor, when it has no charter, no quota system, and internal rivalries (India–China). I have not specified the mechanism by which SDR rechanneling would reach low-income countries, nor the conditionality differences between AIIB and World Bank projects.

3. **Reread verification.** Re-reading Acharya (2018) and Cooper and Farooq (2016) confirms that "Global South" is an emergent, contested category rather than a fixed bloc, and that institutional revisionism spans reformist and rupturist strategies. The BRICS Johannesburg II Declaration (2023) confirms the expansion agenda (local currency, NDB capitalization, UNSC reform) but does not

resolve internal coherence. AIIB annual reports confirm ~$50B cumulative approved financing 2016–2024. IMF quota review documentation confirms the 16th Review's +50% increase without share realignment.

4. **Analogy with explicit limits.** Think of the international financial system as a 1944-built highway network: the BRICS+ countries are now heavy trucks (rising GDP share) forced onto roads with toll booths they did not design (IMF quotas). They are building bypass roads (AIIB, NDB) and demanding toll-booth votes (quota reform). The analogy holds for *infrastructure mismatch* and *voice deficit*, but it breaks down because highways are physical and neutral, whereas financial institutions embed power, conditionality, and ideology; and because the "trucks" are not a single convoy—BRICS+ members disagree on destination and speed.

5. **Rewrite.** Institutional revisionism is the set of strategies by which states with rising economic weight but stagnant institutional voice seek to alter, supplement, or replace the rules and organizations of the post-1945 order. It runs from reformist demands (IMF quota realignment, SDR rechanneling, debt relief) to parallel institution-building (AIIB, NDB, SCO, BRICS+). The African perspective, rooted in the NIEO (1974), frames the core demand as *voice plus non-extractive additionality*; the Chinese as *institutional innovation and complementarity*; the Russian as *multipolarity*; the Western as *fragmentation risk and reform-vs-rupture*; the UN as *SDG financing gaps*. The 2023 BRICS Johannesburg expansion and the 16th IMF Review's quota increase-without-realignment are the twin empirical signatures of a moment in which economic weight has shifted faster than institutional voice.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L49	Definition	What is the "Global South" as an emergent category?	It is a contested political-geographic label for states and peoples positioned outside the historical core of Western industrial capitalism; it signals shared experiences of colonialism, debt, and marginalization while obscuring internal inequality and divergent interests.	African perspective: the category is most coherent when tied to historical extraction and racialized hierarchy, not merely income level.

Tag	Card Type	Front	Back	Perspective Note
L49	Mechanism	What is the strategic logic of BRICS+ expansion?	BRICS+ expansion combines commodity power, demographic scale, and institutional ambition to reduce dependence on Western-led finance and amplify bargaining power, but expansion also dilutes consensus and raises questions about shared norms.	Chinese perspective: platform for multipolar governance; Russian perspective: anti-hegemonic framing.
L49	Comparison	Is the AIIB a genuine alternative to the World Bank?	The AIIB is a multilateral development bank with leaner governance and an infrastructure focus, while the World Bank has a broader mandate, longer history, and conditionality traditions; the AIIB can complement the Bank through speed and regional ownership, but it has not replaced its scale or poverty-reduction role.	Western perspective: scrutiny of standards; African perspective: demand for infrastructure finance.

Tag	Card Type	Front	Back	Perspective Note
L49	Source	What did the 1974 NIEO demand?	The New International Economic Order demanded sovereign control over resources, fairer trade, and restructuring of international economic institutions; its legacy persists in contemporary calls for quota reform, debt relief, and technology transfer.	African perspective: memory of unfulfilled promises and unfinished decolonization.
L49	Debate	What is the "reform vs rupture" debate?	Reformists seek to adjust Bretton Woods through quota shifts, SDR rechanneling, and debt relief, while rupture advocates build parallel institutions and reduce dollar dependence; the debate turns on whether existing institutions can be democratized or are structurally captured.	Western perspective often prefers reform; Russian and Chinese perspectives may favor parallel options.

Tag	Card Type	Front	Back	Perspective Note
L49	Reconstruction	How does the African perspective frame institutional revisionism?	The African perspective treats institutional revisionism as a continuation of anti-colonial and Pan-African demands for economic sovereignty, fair representation, and redistributive finance, emphasizing historical extraction and contemporary debt.	It is not merely anti-Western; it demands accountability and redistribution.
L49	Occlusion	What does the Western perspective often occlude?	The Western perspective often occludes how Bretton Woods governance reflects historical power and how conditionality reproduced dependency, sometimes framing Global South demands as destabilizing rather than corrective.	Occlusion: the historical construction of “neutral” global rules.

Tag	Card Type	Front	Back	Perspective Note
L49	Adjudication	Does BRICS+ expansion automatically reshape global governance?	Expanded BRICS+ increases aggregate economic weight and symbolic multipolarity, but its governance impact depends on implementation of New Development Bank lending, payment systems, and coordinated positions; symbolic expansion alone does not automatically rewrite rules.	Adjudication: aggregate weight must be separated from institutionalized power.
L49	Visual	What does BRICS+ PPP GDP share vs G7 not prove?	A larger BRICS+ PPP share shows aggregate economic shift but not per capita income, institutional cohesion, financial market depth, or rule-making authority; data must be read with level-of-analysis discipline.	Data perspective: avoid conflating size with governance.

Tag	Card Type	Front	Back	Perspective Note
L49	Mechanism	How does IMF quota reform work?	IMF quota reform reallocates voting power and access to resources; SDR rechanneling can direct liquidity to vulnerable states, but political blockage and creditor concerns limit speed and scale.	UN perspective: aligns reform with SDG financing and debt sustainability.
L49	Application	What is the SCO's role relative to BRICS+?	The SCO is a security-political platform with expanding economic and connectivity agendas; it overlaps with BRICS+ but has different membership and China-Russia leadership dynamics, so it can coordinate but not substitute for development finance institutions.	Russian perspective: multipolarity and security; Chinese perspective: connectivity.

Tag	Card Type	Front	Back	Perspective Note
L49	Source	What does Acharya (2018) contribute?	Acharya (2018) argues for a "multiplex" world order in which no single power dominates and regional institutions matter, helping explain parallel institutions as diversification rather than simple replacement.	Useful for adjudicating reform vs rupture.
L49	Debate	Why is BRICS+ coherence contested?	BRICS+ coherence is contested because members differ in regime type, development level, and geopolitical interests; expansion increases representativeness but may reduce decision-making efficiency.	African perspective: membership gains must be weighed against diluted voice.
L49	Reconstruction	How does the UN perspective frame institutional revisionism?	The UN perspective frames revisionism through SDG financing gaps, debt sustainability, and inclusive multilateralism, seeking to align institutional reform with development outcomes rather than great-power competition.	Occlusion: may understate geopolitical rivalry.

Tag	Card Type	Front	Back	Perspective Note
L49	Application	What are the limits of SDR rechanneling?	SDR rechanneling can augment concessional finance for climate- and debt-vulnerable states, but it depends on donor willingness, IMF safeguards, and absorption capacity; it is a liquidity tool, not a solvency solution.	African perspective: liquidity helps, but debt structure remains.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence Audit (scored 0-100)

Competency	Self-score (0-100)	Evidence of mastery	Priority gap
Genealogy of "Global South"		Can explain why the term is political, not merely geographic	Conflating region with shared interests
BRICS+ expansion logic		Can distinguish aggregate weight from governance change	Overstating institutional coherence
AIIB vs World Bank comparison		Can compare mandate, scale, standards, and complementarity	Treating AIIB as replacement
NIEO legacies		Can link 1974 demands to quota, debt, and technology debates	Assuming NIEO "failed" without legacy
IMF quota, SDR, and debt relief		Can explain voting power and liquidity constraints	Treating reform as purely technical
Five-perspective reconstruction		Can steel-man African, Chinese, Russian, Western, and UN views	Collapsing perspectives into one narrative

Competency	Self-score (0-100)	Evidence of mastery	Priority gap
Data interpretation (PPP, lending, quotas)		Can separate aggregate, per capita, and institutional measures	Inferring power from GDP share alone
Adjudication of reform vs rupture		Can specify falsifiers for each claim	Prescribing without evidence

7.2 Three-Question Debrief

1. Which evidence would most seriously weaken your claim that BRICS+ is primarily an anti-Western bloc rather than a heterogeneous bargaining platform?
2. Where did you conflate aggregate BRICS+ GDP (PPP) with institutional rule-making power, and what additional data would correct that inference?
3. Did you distinguish African demands for economic sovereignty and debt relief from Chinese institutional innovation and Russian anti-hegemonic framing, or did you merge them into one "Global South" position?

7.3 Error-Log

Common Misconception	Correction	Evidence
"The Global South is a homogeneous bloc."	It is heterogeneous in regime type, income, debt exposure, and geopolitical interest; solidarity is strategic and partial.	BRICS+ includes divergent economies and political systems; African demands vary by creditor exposure and resource profile.
"The AIIB has replaced the World Bank."	The AIIB complements rather than replaces the World Bank; its mandate and scale remain narrower.	AIIB annual reports show infrastructure-focused lending and co-financing patterns; World Bank retains broader poverty-reduction and crisis-lending roles.
"BRICS+ expansion proves multipolarity has already been achieved."	Aggregate economic weight is not the same as governance change, currency internationalization, or institutionalized rule-making.	IMF quota review status and continued dollar dominance in reserves and payments.
"The NIEO completely failed."	Many NIEO demands were blocked, but their institutional legacies reappear in quota reform, SDR rechanneling, and debt-relief debates.	1974 NIEO declaration and contemporary IMF reform proposals.

Common Misconception	Correction	Evidence
"IMF quota reform is purely technical."	Quota reform reallocates power and is therefore deeply political, involving creditor interests, regional representation, and legitimacy claims.	IMF quota review documentation and stalled reform negotiations.
"PPP GDP share equals global power."	PPP measures aggregate purchasing power, not financial depth, per capita welfare, alliance cohesion, or institutional authority.	BRICS+ vs G7 comparisons must be read alongside reserves, lending, and governance data.

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Global South as emergent category; postcoloniality; dependency; racialized hierarchy	Labeling, solidarity-building, strategic aggregation, occlusion of internal inequality	Rodney (1972); Nkrumah (1965); Fanon (1961); Mamdani (1996); Mbembe (2001); Grovogui (1996); Acharya (2018)	NIEO (1974); BRICS+ expansion; debt and quota debates	Homogeneity vs heterogeneity; description vs political project	Sustained divergence in interests; collapse of shared demands	L28 Pan-Africanism; L14 contemporary transition
BRICS+ as platform; multipolarity; bargaining power	Expansion, agenda-setting, summit diplomacy, institutional creation	Cooper and Farooq (2016); Acharya (2018)	Johannesburg II Declaration (2023); new members; NDB	Coherence vs fragmentation; anti-Western vs reformist	No joint institutions; persistent voting divergence	L14; L58 forecasting

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Parallel institutions; AIIB; NDB; SCO	Lean governance, co-financing, infrastructure targeting, regional ownership	AIIB annual reports; IMF quota review documentation	AIIB first decade (2016-2025); NDB lending; SCO membership	Alternative vs complement; standards convergence	AIIB adopts World Bank-style conditionality at scale; no independent lending growth	L16 Bretton Woods; L51 climate finance
NIEO; economic sovereignty; fair trade; technology transfer	Resolutions, demands, North-South bargaining, institutional memory	UN General Assembly (1974), Declaration on the Establishment of a New International Economic Order; Rodney (1972)	1974 NIEO; contemporary quota and SDR debates	Failure vs legacy; reform vs rupture	No contemporary echoes of NIEO demands	L28; L16
Bretton Woods contestation; quotas; SDRs; debt relief	Voting-power reallocation, liquidity provision, creditor coordination, conditionality	IMF quota review documentation	IMF quota review status; SDR rechanneling proposals	Reform vs rupture; legitimacy vs efficiency	Quota shifts without policy change; no debt relief	L16; L51; L58
Data and measurement; PPP GDP; lending volumes; membership	Aggregation, comparison, level-of-analysis discipline	Data lab sources; AIIB annual reports; IMF documentation	BRICS+ vs G7; AIIB vs World Bank; SCO activities	Aggregate vs per capita; size vs power	Data shows no relative shift; lending remains marginal	L58; L61 grand strategy

SECTION 9 — REVIEW SCHEDULE

Interval	Timing	Concrete action
R1	Same day, 20 minutes	Recall all 15 flashcards without looking, then check gaps and rewrite two weak cards.
R2	48 hours, 30 minutes	Reconstruct the five perspectives from memory, then compare with Section 2.7 and mark occlusions you missed.
R3	1 week, 45 minutes	Redo the Problem Pair on AIIB's first decade and adjudicate "alternative vs complement" with explicit falsifiers.
R4	2 weeks, 40 minutes	Reinterpret the Data Lab tables, distinguishing aggregate PPP share, per capita income, lending volume, and quota status.
R5	1 month, 60 minutes	Write the Independent Memo on BRICS+ expansion and complete the hinge question without notes.

SECTION 10 — COMPLETION CHECKLIST

- ☐ I can define "Global South" as a contested emergent category rather than a fixed region.
- ☐ I can trace the genealogy from colonialism and NIEO demands to contemporary institutional revisionism.
- ☐ I can explain BRICS+ expansion in terms of strategic logic, not just membership lists.
- ☐ I can distinguish BRICS+ aggregate economic weight from institutional governance change.
- ☐ I can compare AIIB and World Bank by mandate, scale, standards, and complementarity.
- ☐ I can explain the NIEO's demands and their institutional legacies.
- ☐ I can describe IMF quota reform, SDR rechanneling, and debt relief as political mechanisms.
- ☐ I can reconstruct the African perspective as primary and on its own terms.
- ☐ I can steel-man the Chinese, Russian, Western, and UN perspectives.
- ☐ I can identify what each perspective contributes and what it occludes.
- ☐ I can use the four levels of analysis from Lesson 1 in a worked example.
- ☐ I can adjudicate reform vs rupture using evidence and falsifiers.
- ☐ I can interpret BRICS+ vs G7 PPP data without overclaiming power.
- ☐ I can distinguish description, explanation, prediction, and prescription in a memo.
- ☐ I can complete the hinge question and diagnose each distractor.
- ☐ I can identify at least three priority gaps from the confidence audit.
- ☐ I can schedule and execute the five spaced-review intervals.

51. Transnational Non-State Actors

LESSON METADATA

Field	Value
Lesson number and title	Lesson 50: Transnational Non-State Actors
Module	Module 8: Indo-Pacific, Systemic Rivalry, and Transnational Forces
Prerequisites	L23 (asymmetric warfare), L24 (cyber), L7 (constructivism)
Interleaved links	Forward to L51 (climate), L57 (infrastructure), L54 (AI and warfare)
Reading load	7-9 hours
Content channels	Text, data tables, worked example, problem pair, flashcards, Cornell notes
Bloom ceiling	Evaluate / Create
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

The central puzzle of this lesson is deceptively simple: if international relations theory was built to explain the behavior of sovereign states, how do we account for the fact that some of the most consequential strategic actors of the twenty-first century possess no territory, no diplomatic recognition, and no seat at the United Nations? Multinational corporations command revenues exceeding the GDP of most member states; private military companies project force across continents under contract; jihadist networks coordinate violence across dozens of jurisdictions without a capital; advocacy coalitions reshape treaty agendas from outside formal diplomatic channels; and illicit financial networks move capital across borders faster than any customs regime can track. The puzzle is not whether these actors "matter"—their effects are visible in shipping

lanes, commodity markets, and body counts—but how to theorize their power without either (a) reducing them to instruments of states, which strips them of agency they demonstrably exercise, or (b) dissolving the state into a flat ontology of "actors," which obscures the distinctive coercive and legal capacities that only states possess. This lesson teaches you to hold both truths simultaneously: that non-state actors are genuine strategic agents, and that their agency is always conditioned by, and often parasitic upon, the state system they operate within and against.

This lesson occupies a pivotal position in Module 8, which moves from systemic rivalry and the Indo-Pacific to transnational forces that cut across regional boundaries. It follows directly from L23 on asymmetric warfare and L24 on cyber, which established that weaker actors exploit technological and organizational asymmetries to impose costs on stronger ones, and from L7 on constructivism, which established that identities, norms, and shared meanings are constitutive of interests rather than mere epiphenomena of material power. Here those threads converge into a single analytical problem: non-state actors are not merely constraints on state power, as realists sometimes concede, nor merely expressions of transnational civil society, as liberal institutionalists sometimes celebrate. They are co-producers of the international order, operating through mechanisms—market leverage, violence entrepreneurship, norm entrepreneurship, and financial opacity—that the state-centric canon struggles to capture. The lesson also sets up the forward links to L51 on climate, L57 on infrastructure, and L54 on AI and warfare, because each of those domains is increasingly governed by non-state actors whose power is exercised through precisely the mechanisms developed here.

By the end of this lesson, you will be able to do five things. First, classify any non-state actor by its resource base (capital, coercion, legitimacy, information), its organizational form (hierarchical, networked, hybrid), and its relationship to state authority (complement, substitute, parasite, rival). Second, trace the specific mechanism by which that actor converts non-territorial resources into political effects, specifying the intermediate steps rather than asserting a correlation. Third, reconstruct five distinct perspectives—African, Chinese, Russian, Western, and UN—on any given case, steel-manning each from within its own premises. Fourth, adjudicate between competing explanations of the same event on the basis of evidence, identifying which perspective's scope conditions are met and which are violated. Fifth, specify the falsifiers that would disconfirm your preferred account, so that your analysis is genuinely explanatory rather than merely descriptive. These are not abstract competencies; they are the skills required to write the memo, solve the problem pair, and answer the hinge question that close this lesson.

The theoretical stakes are high because the lesson sits at the intersection of three major debates in international relations. The first is the state-centrism debate: whether the state remains the "primary" or "privileged" unit of analysis, or whether globalization has produced a genuinely polycentric order. The second is the rationalism-constructivism debate: whether non-state actors are best understood as utility-maximizers responding to incentives (rationalist) or as identity-bearers mobilized by shared meanings and normative commitments (constructivist). The third is the security-political economy nexus: whether violence and markets are analytically separable domains, or whether, as Reno argues in the African context, they are fused in "warlord politics" where economic extraction and coercive control are the same activity. The lesson does not resolve these debates; it teaches you to locate any given case within them and to specify which theoretical premises are doing the work in your explanation.

The African perspective is primary in this lesson, not as a regional illustration but as a generative vantage point. The reason is structural: the African continent is the site where the gap between the Weberian ideal of the state as monopoly of legitimate force and the empirical reality of fragmented authority is most visible and most theoretically productive. In much of Africa, the state is not the default governance provider but one

actor among many—alongside chiefs, militias, religious authorities, multinational firms, and international NGOs—competing and cooperating in what Reno calls "shadow states" and what Mbembe theorizes as the "necropolitical" management of populations. This vantage point reveals what Western state-centrism occludes: that "non-state" is not a deviation from a norm but a constitutive feature of political order in much of the world, and that the very category of "state" is an achievement rather than a given. It also reveals what Chinese non-interference rhetoric and Russian PMC strategy both exploit: the space opened by weak or contested state authority. The African perspective thus frames the lesson's central puzzle rather than appearing as one case among many.

A final methodological note. Throughout this lesson, you must distinguish four operations that students routinely conflate: description (what happened), explanation (why it happened, via what mechanism), prediction (what will happen next under specified conditions), and prescription (what ought to be done). The worked example and problem pair are designed to force this distinction. When you reconstruct a perspective, you are not endorsing it; when you adjudicate, you are not merely summarizing. The hinge question at the end tests whether you can identify which operation a given argument is performing. Mastering this distinction is, in the end, what separates analytical competence from sophisticated opinion.

SECTION 1 — Pre-Class Priming

1.1 Retrieval Warm-Up

Answer each question from memory before consulting any source. These draw on L23 (asymmetric warfare), L24 (cyber), and L7 (constructivism).

1. **L23 retrieval:** What is the core logic of asymmetric warfare as theorized in the literature, and how does it differ from conventional force-on-force engagement? Name one historical case where a weaker actor imposed disproportionate costs on a stronger one through asymmetry rather than parity.
2. **L23 retrieval:** How does the concept of "cost imposition" function in asymmetric strategies, and what does it imply about the relationship between tactical defeat and strategic success?
3. **L24 retrieval:** Distinguish between cyber espionage, cyber sabotage, and information operations. Which of these three is most difficult to attribute, and why does attribution matter for deterrence?
4. **L24 retrieval:** What is the "attribution problem" in cyber conflict, and how does it interact with the logic of deterrence that depends on credible threat of retaliation?
5. **L7 retrieval:** In constructivist theory, what is the difference between "interests" and "identities," and how does the latter constitute the former? Give one example of a norm cascade.
6. **L7 retrieval:** How does constructivism explain change in the international system differently from rationalist (neorealist/neoliberal) theories? What role do "epistemic communities" play?

1.2 Orientation Questions

These questions frame the problems you will work through in this lesson. Do not answer them fully now; use them to guide your reading.

1. If a multinational corporation's revenue exceeds the GDP of the state in which it operates, does that make it more powerful than that state? What kind of power, and over what domain?
2. How does a private military company convert commercial contract into strategic influence, and at what point does it cease to be a "contractor" and become a geopolitical actor in its own right?
3. Why do transnational jihadist networks fragment into affiliates rather than consolidating into a single hierarchy, and what does this organizational form imply for counterterrorism strategy?
4. Under what conditions does an NGO advocacy network succeed in changing state behavior, and when does it fail? What does Keck and Sikkink's "boomerang model" predict about the domestic-international linkage?

1.3 Vocabulary Pre-Teach

Provisional definitions to be refined as you read. These are starting points, not final formulations.

Term	Provisional Definition
Transnational non-state actor	An entity operating across national borders that is not a sovereign state, exercising some form of political, economic, or coercive influence; includes firms, NGOs, armed groups, and financial networks.
Hybrid governance	A political order in which state and non-state authorities share, compete over, or sequentially exercise governance functions such as security, taxation, and justice; common in contexts of contested sovereignty.
Private military company (PMC)	A corporate entity providing military or security services for profit under contract; distinct from mercenaries in legal status but overlapping in function; may operate as strategic instrument of a sponsoring state.
Cyber mercenary	An individual or firm selling offensive cyber capabilities—exploits, intrusion tools, or operational services—to state or non-state clients on a commercial basis.
Transnational advocacy network (TAN)	A network of activists, NGOs, and sometimes state officials linked across borders by shared values and dense information exchange, seeking to change policy or norms; Keck and Sikkink's central concept.
Illicit financial flow	Money illegally earned, transferred, or used, crossing borders to evade detection, taxation, or sanctions; includes money laundering, trade misinvoicing, and sanctions evasion.

Term	Provisional Definition
Sanctions evasion	Techniques used to circumvent economic sanctions, including front companies, ship-to-ship transfers, cryptocurrency, and jurisdictional arbitrage.
Kleptocracy	A system of rule in which state officials systematically loot public resources for private gain, often using transnational financial networks to launder and store proceeds.
Affiliate system	A decentralized organizational model in which a central brand or leadership provides ideology, training, or legitimacy to semi-autonomous local groups that retain operational independence.
State-firm nexus	The institutional and personal linkages between state officials and corporate actors that shape how firms exercise geopolitical influence; ranges from arm's-length regulation to direct state ownership.
FATF grey list	The Financial Action Task Force's list of jurisdictions under increased monitoring for strategic deficiencies in anti-money-laundering and counter-terrorist-financing regimes.
Constructivist identity	In constructivist theory, the socially constructed sense of self of an actor (state or non-state) that defines its interests and appropriate behavior; identities are shaped by interaction and can change.

End of Section 1. Section 2 (Lesson Core) begins in the next chunk.

SECTION 2 — LESSON CORE

2.1 Learning Objectives

By the end of this lesson, the student will be able to: (1) define multinational corporations as political actors rather than mere market participants, distinguishing market power from infrastructural and structural power; (2) explain the mechanisms through which states and firms bargain over investment, regulation, technology, standards, and security, including embedded autonomy, jurisdictional arbitrage, enclave extraction, and weaponized interdependence; (3) identify scope conditions under which MNCs become geopolitical instruments or independent coercive actors, including sectoral criticality, network centrality, home-state capacity, host-state institutional strength, and legal regime; (4) evaluate observable implications such as export controls, investment screening, resource nationalism, supply-chain restructuring, and corporate compliance behavior using comparative and quantitative evidence; and (5) reconstruct African, Chinese, Russian, Western, and UN perspectives on MNC-state relations, adjudicating among them with attention to what each reveals, what it occludes, and what would falsify it. Assessment will require mechanism specification, level-

of-analysis discipline, and explicit adjudication rather than description. Students should be able to move from a case description to an explanation of why a particular firm became strategically salient, to a prediction about how states will respond, and to a prescription that is bounded by the scope conditions identified. They should also be able to distinguish description, explanation, prediction, and prescription in their own memos, and to identify the strongest counterargument to any claim they make.

2.2 KEY IDEA 1 — Multinational Corporations as Geopolitical Actors: The State-Firm Relationship

Bolded Causal Claim: Multinational corporations become geopolitical actors—not merely economic agents—when their control over capital, technology, logistics, data, or network chokepoints gives them infrastructural power over states, and when states in turn can instrumentalize that power; the resulting state-firm relationship is therefore a bargaining structure whose outcomes depend on sectoral criticality, network position, and institutional capacity rather than on market efficiency alone.

Mechanism: The mechanism is a two-level bargaining game between a firm seeking profit, protection, and predictability and a state seeking revenue, technology, employment, and strategic advantage. At the first level, the firm's threat of exit or relocation disciplines the host state: capital mobility, transfer pricing, and jurisdictional arbitrage allow MNCs to shop for regulatory environments, tax regimes, and labor costs. At the second level, the host or home state's threat of expropriation, regulation, or market closure disciplines the firm. The equilibrium is not determined by comparative advantage alone but by asset specificity: when production requires sunk investments in mines, fabs, pipelines, or data centers, both sides become locked in, and bargaining shifts from price to governance. Raymond Vernon's "sovereignty at bay" captured the early fear that MNCs would outgrow states; Robert Gilpin reframed the relationship as an extension of U.S. power; Susan Strange argued that structural power lies in the ability to shape the frameworks within which others operate. Contemporary work on weaponized interdependence sharpens the mechanism: global networks are not flat but hub-and-spoke, and states can coerce by controlling nodes occupied by firms, as in semiconductor export controls or financial messaging restrictions. Firms also exercise power by setting technical standards, controlling data flows, and using investor-state dispute settlement to chill regulation. In extractive economies, the mechanism becomes more coercive: MNCs do not merely invest; they help constitute the state's fiscal base, security apparatus, and territorial control, producing enclave economies in which the state governs access rather than citizens. William Reno's analysis of shadow states is relevant here: rulers may monetize MNC access to resources to fund patronage, bypassing public institutions and converting corporate investment into regime survival. Thus the state-firm relationship can be developmental, predatory, or hybrid, depending on whether the state has the capacity to discipline firms toward public ends.

Scope Conditions: The claim holds only under identifiable conditions. Sectorally, it is strongest in strategic and dual-use sectors—semiconductors, critical minerals, telecommunications, energy, pharmaceuticals, defense, and finance—where supply interruptions have security externalities; it is weaker in consumer goods and services with low asset specificity. Network position matters: firms at chokepoints (for example, extreme ultraviolet lithography suppliers or dominant cloud providers) have more leverage than firms in competitive, substitutable markets. Home-state capacity matters: the United States, China, and the European Union can convert firm capabilities into statecraft through export controls, subsidies, and procurement; weaker states cannot. Host-state capacity matters inversely: strong regulators can impose local content, environmental standards, and tax compliance; weak states may become gatekeepers that trade access for rents. Legal regime matters: investor-state dispute settlement can empower firms against regulation, while sanctions and national-security reviews can subordinate firms to state priorities. Firm governance matters: state-owned enterprises

blur the public-private boundary, but even privately owned firms can be compelled when their home market or supply chains are state-dependent. Finally, time horizon matters: short-term profit maximization may conflict with long-term geopolitical alignment, and crises (war, pandemic, sanctions) can force decoupling or "de-risking" that restructures the bargain. Where these conditions are absent, MNCs remain ordinary market actors.

Observable Implications: If the claim is correct, we should observe states treating firms as strategic assets and liabilities. Observable implications include expanded investment screening (for example, CFIUS reviews), entity lists and export controls, subsidies for domestic production (CHIPS Acts), and "friend-shoring" rhetoric. We should also observe corporate adaptation: supply-chain diversification, dual sourcing, compliance departments, lobbying for exemptions, and in some cases withdrawal from contested markets. In host states, especially resource-dependent ones, we should observe contract renegotiation, local-content requirements, tax disputes, and disputes over environmental and community impacts. Quantitatively, the Data Lab's comparison of MNC revenue to national GDP should show that the largest firms exceed the economic scale of many states, but scale alone does not prove geopolitical power; concentration metrics, single-source dependency, and control over standards are better indicators. In Africa, implications include cobalt and copper in the Democratic Republic of Congo, lithium in Zimbabwe, and hydrocarbons in Nigeria and Angola, where MNC revenue and enclave infrastructure can exceed state capacity in the producing region. We should also observe firms becoming nodes in sanctions enforcement, as when financial and technology firms implement restrictions that states announce. Falsifiers would include: MNCs consistently defying home-state strategic priorities without cost; host states with weak capacity successfully disciplining MNCs without external support; or strategic sectors showing rapid, low-cost substitution after a supply shock.

Perspective Note (five traditions in brief):

African (primary). African scholarship treats the MNC-state relationship as historically constituted by colonial extraction and postcolonial extraversion rather than as a generic market bargain. Walter Rodney's dependency analysis and Kwame Nkrumah's neo-colonialism thesis frame foreign firms as mechanisms through which surplus is extracted and development distorted; Mahmood Mamdani's analysis of the bifurcated state suggests that corporate enclaves reproduce colonial spatial divisions between "modern" export sectors and customary rural authority. Jean-François Bayart's concept of extraversion argues that African elites convert external connections—including MNC access—into domestic power, so the state-firm bargain is internal to state formation rather than external to it. William Reno's work on shadow states shows how rulers monetize resource access to fund patronage, making MNCs partners in regime survival. This perspective reveals what Western market models occlude: MNCs are co-constitutive of sovereignty, violence, and territorial control in many African states, and "weak capacity" is often a strategy of rule rather than an absence. It also highlights racialized and hierarchical global bargaining power: African states face firms whose home governments can deploy sanctions, subsidies, and diplomatic pressure. At the same time, the African perspective must avoid economic determinism: African elites and communities exercise agency through contract renegotiation, local-content demands, and resistance; some MNC investment brings technology, employment, and fiscal revenue; and resource nationalism can fail when it deters investment or provokes capital flight. The strongest African claim is therefore conditional: MNCs become geopolitical actors in Africa where they control extractive enclaves and where states lack the institutional capacity to convert rents into public goods.

Chinese. China's perspective is shaped by the experience of late development and by a state-capital model in which firms are expected to serve national rejuvenation. The "going out" strategy and Belt and Road Initiative treat MNCs—especially state-owned enterprises—as instruments of development finance, resource security,

and market expansion. Beijing's official discourse emphasizes non-interference and host-state sovereignty, but Chinese firms' security needs in unstable environments have generated private security contractors and port or mining enclaves that complicate that principle. Chinese analysts often argue that Western MNCs historically enjoyed privileged access and that China's firms are merely catching up; they also stress technology transfer and infrastructure as mutual gains. The perspective reveals the developmental potential of state-firm coordination but occludes concerns about debt sustainability, labor standards, environmental harm, and the political effects of opaque contracts. It tends to understate the autonomy of large private firms and the ways in which host states experience Chinese investment as coercive.

Russian. Russia's perspective treats MNCs as "national champions" subordinated to state interests, especially in energy and defense. Sanctions after 2014 and 2022 accelerated a "sovereignization" agenda: state pressure on oligarchs, import substitution, and the use of energy firms as foreign-policy instruments. Russian analysts often frame Western MNCs as instruments of U.S. hegemony and argue that Russia must build autonomous corporate capacity. The perspective reveals how sanctions can politicize firm behavior and how energy interdependence can be weaponized, but it occludes the costs of isolation, technological stagnation, and the dependence of Russian firms on Western finance and components. It also risks conflating state interest with regime interest.

Western. The Western perspective combines liberal-institutional and realist strands. The liberal strand sees MNCs as efficiency-enhancing actors that diffuse technology, create employment, and integrate markets; regulation should correct market failures and human-rights abuses, not politicize commerce. The realist strand, especially in recent U.S. and European policy, treats MNCs as nodes in strategic competition and justifies export controls, investment screening, and industrial policy. This perspective reveals the security externalities of supply chains but can occlude the distributional costs of decoupling, the interests of host states, and the possibility that over-securitization undermines the gains from trade. It also struggles to reconcile corporate autonomy with democratic accountability.

UN. The UN perspective is legal and normative rather than strategic. It emphasizes the UN Guiding Principles on Business and Human Rights, the Sustainable Development Goals, and frameworks such as the UN Global Compact, which assign responsibilities to MNCs without creating binding international corporate law. UN panels of experts and sanctions committees may document corporate sanctions evasion, while UNCTAD and related bodies focus on investment for development. This perspective reveals the accountability gap: MNCs can shape rights and environments across borders while remaining primarily accountable to home-state law. It occludes power asymmetries among states and the enforcement weaknesses of soft law, but it provides a vocabulary for holding firms responsible for human-rights and environmental harms.

2.3 KEY IDEA 2 — Cyber Mercenaries and the Market for Offensive Cyber Capability

Bolded Causal Claim: The commodification of offensive cyber capability turns cyber conflict from a state monopoly into a market-mediated ecosystem in which states, firms, and criminal actors purchase intrusion, surveillance, and disruption services, thereby lowering barriers to entry, diffusing accountability, and making attribution structurally ambiguous.

Mechanism: The mechanism is a two-sided market with supply, demand, and intermediation. On the supply side, vulnerability researchers, exploit developers, intrusion operators, infrastructure providers, and commercial spyware vendors convert technical knowledge into saleable services. On the demand side, states seek

deniability and capability without indigenous investment; corporations seek competitive intelligence or protection; criminal groups seek monetization through extortion, fraud, or data theft. Brokers and "as-a-service" platforms reduce search and transaction costs, allowing buyers to rent capability rather than build it. Vendors often frame products as "lawful interception" or defensive tools, while the same code can be used for repression, espionage, or sabotage. The market is sustained by regulatory arbitrage: firms incorporate, host infrastructure, or recruit talent in jurisdictions with weak export controls, permissive corporate law, or limited oversight. Because attribution in cyberspace is already probabilistic, the insertion of a private intermediary creates a "cut-out" between the ultimate beneficiary and the operation. The state can plausibly deny; the vendor can claim lawful use; the operator can claim independent contracting. This diffusion of agency weakens deterrence, because retaliation requires confidence about who acted and under whose authority. The market also distorts vulnerability disclosure: high prices for zero-days incentivize hoarding and resale rather than reporting to vendors or defenders, so the stock of unpatched vulnerabilities becomes a tradable asset. Over time, the market professionalizes: subscription models, service-level agreements, customer support, and rebranding after sanctions. The result is not merely more attacks, but a changed political economy of cyber power in which capability is rented, deniability is priced, and accountability is fragmented across borders.

Scope Conditions: This mechanism operates most strongly where internet infrastructure is transnational, legal regimes are fragmented, and demand for covert access is high. It requires states or firms willing to pay premium prices for intrusion capability, and suppliers able to move talent, code, and infrastructure across jurisdictions. It is reinforced by dual-use ambiguity: the same exploit can be sold for "authorized" surveillance, criminal intrusion, or state espionage. It weakens where export controls are enforced, where procurement is transparent, where liability attaches to vendors, and where targets have strong defensive capacity. It also depends on the continued profitability of data theft, extortion, and political surveillance; if monetization declines or attribution improves, the market contracts. Not all cyber conflict is mercenary: many states maintain in-house units, and many firms sell only defensive services. The mercenary model thrives especially where secrecy, deniability, and speed matter more than legal accountability.

Observable Implications: The observable implications include the proliferation of commercial spyware targeting journalists, activists, opposition politicians, and officials; the growth of ransomware-as-a-service ecosystems with affiliates and revenue-sharing; the public identification of private vendors in threat-intelligence reporting; sanctions and export-control designations against spyware firms; and the rebranding or relocation of vendors after regulatory pressure. One also observes diplomatic friction when surveillance tools cross borders, defensive cost inflation for targeted organizations, and the emergence of national regulations attempting to license or restrict offensive cyber services. The market's existence is visible not only in attacks but in price structures, recruitment patterns, and the legal language used to justify sales. Where the mechanism is strong, attribution reports increasingly name private actors rather than states alone, and policy debates shift from "which state attacked?" to "which market supplied the capability?"

Perspective Note (five traditions in brief): The African perspective is primary because African states and societies experience cyber mercenaries as both consumers and targets of a market they rarely control. Security services may procure surveillance technology to monitor dissent, while journalists, activists, and opposition figures face intrusion with limited legal recourse. African scholarship on sovereignty, hybrid governance, and digital extraction suggests that cyber mercenarism can reproduce older patterns of externalized control in a new technical register: capability is imported, data is extracted, and accountability is displaced to foreign vendors and opaque procurement chains. The African vantage point also highlights regulatory asymmetry: African markets may be penetrated by spyware and ransomware while African regulators lack the technical capacity, legal frameworks, or bargaining power to constrain vendors. This perspective reveals

that cyber mercenaries are not only a security problem but a sovereignty problem, because they allow external and domestic actors to surveil populations without democratic authorization. It occludes less when it is attentive to African agency, including local technologists, civil-society watchdogs, and regional efforts to build cyber capacity, but it insists that market-driven cyber power must be judged by its effects on vulnerable publics rather than only by interstate deterrence.

The Chinese perspective emphasizes cyber sovereignty, state control over information infrastructure, and suspicion of Western dominance in standards, platforms, and threat attribution. It tends to view unregulated private offensive actors as destabilizing and supports state-led governance, export controls, and platform regulation, while also treating Western sanctions and attribution claims as potentially politicized. The Russian perspective treats cyber capability as an instrument of asymmetric competition and plausible deniability, often blurring the boundary between state units, criminal networks, and patriotic hackers. It is skeptical of Western norms that would constrain Russian leverage while leaving Western intelligence advantages intact. The Western perspective foregrounds human rights, export controls, sanctions, and the rule of law, seeking to regulate vendors and protect dissidents, but it also contains demand from Western agencies for similar capabilities, creating a tension between market restriction and security procurement. The UN perspective approaches cyber mercenaries through norms of responsible state behavior, human-rights law, and multi-stakeholder processes; it provides vocabulary for accountability but lacks binding enforcement, leaving a gap between normative condemnation and market practice.

2.4 KEY IDEA 3 — Transnational Jihadist Networks: Al-Qaeda, ISIS, and the Affiliate System

Bolded Causal Claim: Transnational jihadist networks persist and adapt not primarily through centralized command but through a franchising logic in which ideology, brand, and selective material support convert local insurgencies into nodes of a global movement, so that territorial defeat of a core does not eliminate the network's capacity to inspire, recruit, finance, and attack.

Mechanism: The mechanism is ideological franchising combined with operational decentralization. Al-Qaeda historically operated as a vanguard: a relatively small cadre of experienced militants sought spectacular attacks against "far enemies," while affiliates such as Al-Qaeda in the Islamic Maghreb, Al-Qaeda in the Arabian Peninsula, and Al-Shabaab pledged allegiance and gained brand recognition, training, and sometimes funding. The affiliate model allowed the core to project power without maintaining large standing forces. ISIS then innovated by seizing territory, declaring a caliphate, and building a bureaucratic state apparatus that attracted foreign fighters and generated revenue through taxation, oil, extortion, and smuggling. After territorial loss, ISIS shifted toward a provincial model, encouraging affiliates and inspired actors to continue under its brand. In both cases, the key mechanism is not top-down micromanagement but the combination of a portable ideology, a recognizable brand, selective resource flows, and local grievances. Local groups adopt the global narrative because it offers legitimacy, recruits, and access to transnational networks; the global brand gains reach because local groups provide manpower, territory, and operational initiative. Decentralization is not a weakness but an adaptation: when counterterrorism pressure kills leaders or disrupts finance, affiliates and inspired individuals can continue. Digital propaganda, encrypted communication, and diaspora networks lower the cost of coordination and recruitment. Financing is diversified: donations, kidnapping for ransom, criminal activity, hawala transfers, and, where territory is held, taxation and resource extraction. State collapse or weak governance provides permissive environments, while sectarian polarization and political exclusion provide grievances. Competition between Al-Qaeda and ISIS can intensify violence as groups seek to prove loyalty and relevance through attacks. The network therefore

behaves less like a corporation with a headquarters and more like a franchise system in which brand value, ideological screening, and local initiative combine to produce resilience.

Scope Conditions: This mechanism is strongest where states are weak or collapsed, where political exclusion and sectarian grievance are acute, and where digital connectivity allows propaganda and recruitment to cross borders. It requires ideological entrepreneurs capable of framing local conflicts as part of a global struggle, and it benefits from diaspora communities, foreign fighter flows, and permissive financial channels. It is weaker where states provide inclusive governance, where counterterrorism is combined with political reform, and where local populations reject jihadist rule. Not all Islamist movements become transnational jihadists; many remain national or local, and some explicitly reject global brands. The franchising model also depends on the continued credibility of the brand: if the core is discredited by defeat, atrocities, or ideological splits, affiliates may defect or rebrand. Finally, territorial control is not necessary for persistence, but it can amplify resources and legitimacy; conversely, territorial loss can force a return to insurgency and inspiration-based violence.

Observable Implications: The observable implications include attacks claimed by affiliates far from any core territory; shifts in allegiance from Al-Qaeda to ISIS or vice versa; the persistence of violence after the loss of a caliphate or safe haven; regionalization of conflict in the Sahel, the Horn of Africa, Syria, Iraq, and elsewhere; and the continued relevance of foreign fighter mobilization and returnee monitoring. One also observes counterterrorism dilemmas: decapitation strikes may disrupt leadership but not local capacity; military campaigns may displace rather than defeat networks; and overbroad security measures may deepen grievances. Financial indicators include sanctions listings, asset freezes, and assessments of terrorist-financing vulnerabilities. Humanitarian indicators include displacement, civilian casualties, and the erosion of state services in contested areas. Where the mechanism is strong, the defeat of a central leadership does not produce a durable reduction in attacks, because the brand and ideology continue to mobilize local actors.

Perspective Note (five traditions in brief): The African perspective is primary because transnational jihadist networks in Africa are not simply imported threats; they are embedded in local political economies, governance gaps, and regional conflicts. In the Sahel and the Horn of Africa, groups such as Al-Shabaab, Jama'at Nasr al-Islam wal Muslimin, and ISIS affiliates have exploited state weakness, pastoral and farmer tensions, ethnic marginalization, and the uneven reach of central governments. African scholarship on warlord politics, hybrid governance, and the political construction of religious identity helps explain why jihadist brands gain traction: they offer order, dispute resolution, protection, or revenue in places where the state is absent or predatory. Reno (2011) is useful for understanding how non-state armed actors can become alternative governance structures, while Mamdani's work on the political construction of Muslim identity reminds analysts not to treat "jihadism" as a primordial cultural essence. The African vantage point reveals that counterterrorism framed as a purely military or intelligence problem often misses the local bargains, grievances, and governance deficits that make franchising possible. It also highlights sovereignty tensions: external military interventions may weaken networks tactically while undermining the legitimacy of African states and regional institutions. This perspective occludes less when it recognizes African agency, including community resilience, religious leadership, and regional security cooperation, but it insists that African populations are not merely battlegrounds for global ideologies.

The Chinese perspective treats transnational jihadist networks primarily as threats to state stability, territorial integrity, and development corridors, especially where they intersect with regions linked to the Belt and Road Initiative. It favors state-centric counterterrorism, non-interference in internal affairs, and coopera-

tion with host governments, while framing extremism as a security and development problem rather than a human-rights or governance issue. The Russian perspective sees jihadist networks as both a genuine security threat and an opportunity to justify intervention, expand influence, and compete with Western powers. It emphasizes state sovereignty, military solutions, and the use of private military companies, while often rejecting Western conditionality and human-rights criticism. The Western perspective combines counterterrorism, intelligence cooperation, sanctions, and military force with a liberal-institutional emphasis on democracy, human rights, and development; it has generated extensive legal frameworks and sanctions regimes, but it is vulnerable to critique for overmilitarization, civil-liberties erosion, and the unintended consequences of intervention. The UN perspective centers on Security Council sanctions regimes, counterterrorism conventions, international humanitarian law, and the tension between security imperatives and human-rights protections. It provides a multilateral vocabulary and listing mechanisms, including those targeting Al-Qaeda and ISIS, but enforcement depends on member states, and its frameworks can be criticized for vague definitions, due-process weaknesses, and the risk of legitimizing repression under the banner of counterterrorism.

SECTION 2.5 KEY IDEA 4 — NGOs and advocacy networks: Keck and Sikkink's transnational advocacy model

Bolded Causal Claim: Transnational advocacy networks (TANs) alter state behavior and international normative standards by mobilizing information, framing issues, and leveraging domestic–international pressure linkages—most characteristically through the "boomerang pattern"—when domestic political channels are blocked or unresponsive.

Mechanism: Margaret Keck and Kathryn Sikkink's *Activists Beyond Borders* (1998) defines a transnational advocacy network as a set of actors working internationally on an issue, sharing values, exchanging information and services, and pressuring states and other targets. The network's components are heterogeneous: domestic and international NGOs, social movements, foundations, media organizations, churches, trade unions, consumer organizations, parts of intergovernmental organizations, and even sympathetic officials within states. What binds them is not formal hierarchy but shared principled ideas and the exchange of politically usable information. The central causal mechanism is the boomerang pattern: when a state represses or ignores domestic activists, those activists bypass the state and appeal to international allies; those allies then pressure the offending state (and its allies, donors, or trading partners) from outside; the resulting international pressure raises the domestic cost of repression and can reopen space for local challengers. Keck and Sikkink identify four political strategies through which TANs operate. Information politics is the generation, verification, and dissemination of credible, politically usable information—often the network's most important resource, because states and publics cannot easily dismiss well-documented claims. Symbolic politics frames issues in terms of existing norms, values, and identities, making abstract harms concrete and morally legible. Leverage politics uses material power—aid, trade, investment, military assistance—channeled through sympathetic states or institutions to alter a target's cost-benefit calculus. Accountability politics holds actors to their own stated commitments, laws, and international obligations, turning formal promises into enforceable standards. Complementing this framework, Martha Finnemore and Kathryn Sikkink (1998) model the "life cycle" of international norms: emergence, in which norm entrepreneurs (often TANs) persuade states to adopt new standards; cascade, in which adoption accelerates through socialization and pressure; and internalization, in which the norm becomes taken for granted and embedded in law and practice. TANs are thus not merely lobbyists but norm entrepreneurs that can shift the "logic of appropriate-

ness" governing state conduct. The mechanism is relational and discursive rather than material in the first instance: it works by changing what counts as legitimate, by making violations visible and costly, and by creating coalitions that bridge domestic and international arenas.

Scope Conditions: The boomerang mechanism operates only where several conditions hold. First, there must be credible, verifiable information; TANs that traffic in unsubstantiated claims lose the epistemic authority on which leverage depends. Second, there must be access to international forums, media, and at least one powerful state or institution willing to apply leverage; networks facing a fully insulated target with no external dependencies are largely ineffective. Third, domestic partners must possess local legitimacy and organizational capacity; TANs cannot substitute for absent grassroots actors. Fourth, the issue must be one on which international norms are contested but not wholly settled—human rights, environmental protection, women's rights, landmines—rather than core security interests of great powers, where sovereignty claims are strongest. The model's scope is also limited by internal critiques. Clifford Bob (2005) argues that transnational advocacy is a competitive "market" in which movements must market themselves to Northern gatekeepers, privileging photogenic, easily framed causes over structurally complex ones. R. Charli Carpenter (2007) shows agenda-setting biases: certain harms (e.g., child soldiers, landmines) attract attention while others (e.g., male civilian casualties, older children) are marginalized, revealing that TANs do not simply respond to need but construct it. Further, "NGOization" can professionalize and depoliticize movements, substituting donor-driven project cycles for radical politics, and Northern-dominated networks can impose liberal-individualist frames that clash with communal, religious, or sovereignty-based claims. The strongest counterargument, then, is that TANs are not neutral norm entrepreneurs but politically situated actors whose influence depends on asymmetries of attention, funding, and epistemic power; they can amplify some voices while silencing others, and their successes (treaty ratifications, policy shifts) do not always translate into durable behavioral change on the ground.

Observable Implications: If the mechanism holds, one should observe TAN campaigns preceding and correlating with measurable normative shifts: the anti-apartheid movement and sanctions; the International Campaign to Ban Landmines and the 1997 Ottawa Treaty; women's rights advocacy and CEDAW ratifications and the Beijing Platform; human rights campaigns in Latin America documented by Risse, Ropp, and Sikkink (1999); debt-relief mobilization (Jubilee 2000) and Heavily Indebted Poor Countries initiatives; and the campaign for the International Criminal Court. Observable indicators include treaty ratification rates, policy and legislative changes, naming-and-shaming indices, shifts in state rhetoric, and the creation of new international institutions. Failures and limits are equally observable: campaigns that stall where targets are powerful and insulated (e.g., great-power resistance to human-rights scrutiny); contested or politicized information undermining credibility; and gaps between formal commitment and implementation. The model predicts not automatic success but conditional influence shaped by leverage, credibility, and framing.

Perspective Note (five traditions in brief): The African perspective (primary) treats transnational advocacy as a terrain of both empowerment and contestation: African movements—from anti-apartheid to debt relief, women's rights, and climate justice—have been genuine norm entrepreneurs, yet African scholars stress that "civil society" is often donor-driven and that Northern NGOs can override local priorities; the African Charter on Human and Peoples' Rights (Banjul Charter, 1981) and African Union mechanisms reflect African agency in norm-setting, while Grovogui's work on sovereignty and international law highlights the ambivalence of African engagement with externally generated standards, and Mbembe's analyses of the postcolony warn against the NGOization of politics; the boomerang pattern in Africa (e.g., Nigerian Ogoni activists, Kenyan women's movements) reveals TANs as sites of struggle over epistemic authority and sovereignty, not merely liberal norm diffusion. The Chinese perspective is state-centric: NGOs are viewed as extensions

of state purpose or as potential vectors of foreign interference, "people-to-people" diplomacy is preferred to autonomous advocacy, and Western-funded NGOs are suspected of regime-change activity; yet China has expanded its own NGO participation in UN forums and BRI-related civil society, emphasizing development rights over civil-political rights and treating TANs as instruments of Western soft power. The Russian perspective is deeply suspicious of Western NGOs as regime-change instruments (the "color revolutions"), underwriting "foreign agent" laws and state-sponsored GONGOs, while also deploying advocacy networks for compatriot and geopolitical purposes; it frames TANs as tools of liberal normative hegemony rather than neutral civil society. The Western perspective is the canonical home of the Keck-Sikkink model: TANs are norm entrepreneurs advancing human rights, democracy, and environmental protection through information and leverage, though internal critiques (Bob, Carpenter) acknowledge power asymmetries, agenda biases, and accountability deficits. The UN perspective partners with NGOs through ECOSOC consultative status and human-rights mechanisms (UPR, treaty bodies), relying on TANs for information and monitoring, while navigating tensions between state sovereignty, access, and legitimacy; its frameworks provide multilateral vocabulary but depend on member-state consent.

SECTION 2.6 KEY IDEA 5 — Illicit financial networks: money laundering, sanctions evasion, and kleptocracy

Bolded Causal Claim: Illicit financial networks convert political power and criminal proceeds into durable wealth and influence by exploiting gaps in global financial regulation, thereby eroding state capacity, distorting markets, and undermining sanctions and governance regimes.

Mechanism: The mechanism operates through three interconnected channels. First, money laundering converts illicitly obtained funds into apparently legitimate assets through the classic stages of placement (introducing cash into the financial system), layering (obscuring origins through complex transactions), and integration (reinvesting in legitimate enterprises). The Financial Action Task Force (FATF) has codified these stages and the "risk-based approach" to anti-money-laundering (AML) and counter-terrorist-financing (CFT), establishing standards that states are expected to implement. Second, kleptocracy: ruling elites extract rents from state resources and convert them into private wealth held offshore, using shell companies, trusts, real estate, and professional gatekeepers (lawyers, accountants, bankers). William Reno (2011) analyzes how "shadow states" and warlord politics in Africa rest on the fusion of public authority and private accumulation, where rulers treat the state as a resource to be looted and externalized. Moisés Naím (2005) frames the broader phenomenon as the rise of illicit networks—of crime, terror, and corruption—that exploit globalization's open borders, financial integration, and technological connectivity while evading state control. Third, sanctions evasion: targeted states and actors use front companies, trade-based money laundering, correspondent-banking gaps, cryptocurrency, and informal value-transfer systems (hawala) to circumvent restrictions. The mechanism is enabled by structural features of global finance: secrecy jurisdictions, weak enforcement in peripheral nodes, complicit or negligent gatekeepers, and the sheer volume and speed of cross-border flows that overwhelm monitoring. The causal chain runs from political power or criminal opportunity → extraction → concealment → integration into legitimate markets → durable influence and impunity. Illicit networks thus do not merely accompany globalization; they are parasitic on its infrastructure and, in some accounts, constitutive of it.

Scope Conditions: The mechanism flourishes where regulatory gaps intersect with demand for concealment. Key scope conditions include: the existence of secrecy jurisdictions and weak AML regimes; the

availability of professional enablers willing to construct opaque structures; technological tools that outpace regulation (cryptocurrency, encrypted communications); and the complicity or incapacity of political elites in source and destination countries. The mechanism is constrained where FATF mutual evaluations, beneficial-ownership registries, and international cooperation raise the cost of concealment; where investigative journalism (Panama Papers, Pandora Papers) exposes networks; and where asset-recovery mechanisms operate. Strong counterarguments challenge the framing itself. Critics argue that "illicit" is defined by Western-dominated standards that criminalize flows from the Global South while legitimizing the structural violence of global finance; that major Western financial centers are themselves enablers of kleptocracy (London property, Delaware shell companies, Swiss banking); and that FATF's grey/blacklists are applied unevenly, punishing weak states while powerful ones escape scrutiny. Others note that sanctions evasion often harms civilian populations more than targeted elites, and that the "shadow state" literature risks exoticizing African politics while ignoring the global architecture that makes extraction profitable. The strongest objection, therefore, is that illicit financial networks are not aberrations external to global capitalism but are embedded in its legal and institutional infrastructure; addressing them requires reforming the centers, not just policing the peripheries.

Observable Implications: If the mechanism holds, one should observe: large-scale capital flight from resource-rich and conflict-affected states; the concentration of kleptocratic assets in Western real estate and financial centers; FATF grey/blacklist designations correlating with weak AML regimes; sanctions-evasion cases involving Russia, Iran, North Korea, and Venezuela; asset seizures and recovery efforts (e.g., Abacha funds, Dos Santos assets); and investigative revelations (Panama Papers 2016, Pandora Papers 2021) mapping networks of shell companies. Metrics include illicit financial flow estimates (UNCTAD/UNODC), FATF mutual evaluation scores, asset-recovery statistics, and sanctions-enforcement actions. One should also observe unintended consequences: de-risking by banks that cuts off legitimate actors in high-risk jurisdictions; civilian harm from sanctions; and the displacement of illicit flows to less regulated channels when one node is closed.

Perspective Note (five traditions in brief): The African perspective (primary) places kleptocracy and capital flight at the center of African political economy: Rodney's analysis of underdevelopment, Bayart's "politics of the belly," Reno's shadow states, and Mbembe's necropolitics all illuminate how rulers extract and externalize wealth, while the complicity of Western financial centers in receiving stolen assets reveals that illicit finance is a transnational system, not an African pathology; FATF listings can appear as external imposition that punishes weak states without reforming enabling centers, and African demands for asset recovery and beneficial-ownership transparency (e.g., the African Union's work on illicit financial flows, the Mbeki panel) reflect a push for accountability that targets both domestic elites and global enablers; the African vantage reveals that "illicit" networks are often the operating system of postcolonial states, not deviations from them. The Chinese perspective emphasizes anti-corruption campaigns (Xi Jinping's) and state-led capital controls, while expressing concern about BRI financial integrity and money laundering; it is suspicious of Western sanctions as geopolitical tools and of FATF as a Western-dominated body, yet it has strengthened domestic AML frameworks and cooperates selectively; non-interference limits external scrutiny of Chinese-linked flows. The Russian perspective treats sanctions evasion as a survival strategy under Western pressure, with oligarchic networks and state capture blurring public and private; it critiques Western financial hegemony and the extraterritorial reach of U.S. sanctions, while its own financial system has been shaped by sanctions-driven adaptation (parallel imports, alternative payment systems); the PMC-oligarch nexus illustrates how illicit and strategic networks intertwine. The Western perspective is the canonical home of AML/CFT frameworks, FATF, and sanctions as tools of liberal order; it emphasizes

rule of law, transparency, and asset recovery, but is vulnerable to critique for enabling kleptocracy through its own financial centers and for uneven enforcement that burdens the Global South. The UN perspective centers on the UN Convention against Corruption (UNCAC), Security Council sanctions regimes, and Panel of Experts monitoring; it provides multilateral vocabulary and listing mechanisms, but enforcement depends on member states, and its frameworks face criticism for vague definitions, due-process weaknesses, and the risk that anti-corruption and AML agendas are instrumentalized for political ends.

SECTION 2.7 — FIVE PERSPECTIVES IN DEPTH

2.7.1 African Perspective (PRIMARY)

The African vantage point on transnational non-state actors begins from a premise that the other four perspectives tend to treat as background: the state itself, in much of the continent, has never been the Weberian monopoly on legitimate violence that Western IR theory assumes as its baseline. From this premise, the entire taxonomy of "non-state actors" appears differently. What Western, Chinese, Russian, and UN frameworks classify as deviations from a state-centric norm—warlords, militias, jihadist affiliates, private military companies, transnational criminal networks, advocacy NGOs, and multinational extractive firms—are, in the African experience, not external intrusions upon a pre-existing state order but constitutive elements of the political order itself. African scholarship has spent decades theorizing this condition, and its insights reframe every one of the five key ideas in this lesson.

The theoretical lineage runs through several distinct but converging traditions. Walter Rodney's *How Europe Underdeveloped Africa* (1972) established the structuralist premise that Africa's integration into the global economy was not a neutral market process but a historically specific extraction of surplus, in which European capital and African comprador elites jointly produced underdevelopment. Kwame Nkrumah's concept of neocolonialism extended this: formal political independence masked continued economic and military subordination, exercised not only by states but by multinational corporations, financial institutions, and covert operations. Julius Nyerere's reflections on ujamaa and non-alignment added a normative register—African socialism as an alternative to both capitalist and communist blocs—while Amílcar Cabral's writings on national liberation emphasized that the struggle was not merely against colonial armies but against the entire social structure that colonialism produced, including the class alliances that would outlast formal independence. Frantz Fanon's *The Wretched of the Earth* (1961) supplied the psychological and violent dimensions: decolonization was not a legal transfer of sovereignty but a rupture, and the postcolonial state inherited the colonial apparatus of coercion, often turning it against its own population. These thinkers do not merely describe African cases; they offer a theory of how transnational power operates through, rather than against, local structures.

Jean-François Bayart's *The State in Africa* (1993) and subsequent work on the "politics of the belly" and the "criminalization of the state" (Bayart, Ellis, and Hibou, 1999) provide the crucial bridge to contemporary non-state actor analysis. Bayart argued that African states are not "failed" versions of Western states but operate according to a different logic: extraversion, in which political elites mobilize external resources—aid, investment, military support, illicit rents—to maintain domestic power. In this framework, the boundary between state and non-state, licit and illicit, public and private, is not a line to be policed but a zone of negotiation. The "rhizome state" is penetrated by transnational networks—MNCs, diaspora financiers, jihadist recruiters, NGO donors, PMC contractors—and these networks are not external threats to sovereignty but media through which sovereignty is exercised. This is the African contribution that Western state-failure

discourse systematically occludes: what looks like absence of state capacity is often a particular mode of statecraft.

Mahmood Mamdani's *Citizen and Subject* (1996) adds the institutional architecture. The colonial state was bifurcated: a "modern" civic sphere for settlers and a "customary" sphere for natives, governed through chiefs. Postcolonial states inherited this duality, producing a citizenship that is ethnically differentiated and a sovereignty that is internally fragmented. Transnational non-state actors exploit this fragmentation: jihadist groups recruit along ethnic and religious fault lines; PMCs contract with factions rather than states; MNCs negotiate with customary authorities for land and minerals; NGOs channel resources through ethnic or religious civil society organizations. The African perspective thus insists that non-state actor proliferation is not a security problem to be solved by strengthening the state but a political condition produced by the historical structure of the state itself.

Siba Grovogui's work on sovereignty and international law (*Sovereigns, Quasi Sovereigns, and Africans*, 1996) pushes further: the international legal order that defines "statehood" and "non-state actor" status is itself a product of colonial racial hierarchy. The Montevideo criteria for statehood, the UN Charter's Article 2(4) prohibition on force, and the Geneva Conventions' distinction between state and non-state belligerents all encode a Eurocentric ontology that renders African political forms illegible or illegal. From this vantage, the UN's IHL obligations for non-state actors, the FATF's AML standards, and the Security Council's sanctions regimes are not neutral technical frameworks but instruments of a particular, historically situated order that has consistently denied African sovereignty while demanding African compliance. This is not a rejection of international law but a demand for its decolonization—a theme developed by Sylvia Tamale in her call for decolonization and Afro-feminism (2020) and by Oyèrónkẹ́ Oyěwùmí in her critique of the gendered, Eurocentric categories through which African social life is apprehended.

Achille Mbembe's *Necropolitics* (2003, 2019) provides the philosophical capstone. Mbembe argues that sovereignty, in the postcolony, is exercised as the power to dictate who may live and who must die—not only by states but by a constellation of actors including militias, warlords, and corporate security forces. The "becoming-black of the world" suggests that techniques of domination developed in the colony are now globalized. Applied to transnational non-state actors, necropolitics implies that the violence of jihadist networks, PMCs, and illicit financial flows is not an aberration but a modality of contemporary sovereignty. Mbembe's later work on the "brutalism" of contemporary capitalism connects MNC extractivism to the destruction of African life-worlds, framing corporate actors not as neutral economic agents but as participants in a necropolitical order.

Applied to the five key ideas:

First, multinational corporations. In the African perspective, MNCs are not merely geopolitical actors in a state-firm rivalry; they are historically constitutive of the African state's form. The extractive industries—cobalt in the DRC, oil in Nigeria, gold in South Africa, coltan in Rwanda's sphere of influence—create enclave economies that bypass national development and generate parallel sovereignties. The state-firm relationship is often one of mutual predation: firms provide rents that sustain regimes; regimes provide security and legal cover that sustain firms. Reno (2011) documented how warlords in Sierra Leone and Liberia operated as shadow states, taxing diamond extraction and contracting with MNCs. The African perspective thus reveals what Western FDI frameworks occlude: that MNC presence can be a mechanism of state fragmentation rather than development, and that "good governance" conditionality often ignores the structural incentives that make predation rational.

Second, cyber mercenaries and offensive cyber capability. Africa is less a producer than a target and a market for surveillance technology. The Pegasus spyware revelations (2021) showed Israeli firm NSO Group's tools deployed against African journalists, opposition figures, and activists in countries including Rwanda, Morocco, and Togo. Chinese surveillance systems—Huawei's "Safe City" projects, Hikvision cameras—are embedded in African urban governance. The African perspective frames this not as a technical cybersecurity issue but as digital colonialism: the extraction of data and the outsourcing of coercion to foreign firms, with African states as intermediaries. Indigenous African cyber capacity is limited, but non-state actors—hacktivist collectives, diaspora networks—also operate. The occlusion in Western cyber discourse is the assumption that the primary threat is state-on-state espionage; the African reality is that cyber tools are instruments of domestic repression and transnational extraction, often with Western or Chinese corporate origins.

Third, transnational jihadist networks. Al-Shabaab in Somalia, Boko Haram and its ISWAP faction in the Lake Chad basin, and the JNIM/AQIM constellation in the Sahel are not simply branches of a global terrorist franchise. African scholarship (Aning and Danso, 2013) emphasizes their embeddedness in local political economies: pastoralist conflicts, state neglect of peripheries, ethnic grievances, and the collapse of rural livelihoods. The "affiliate system" that Western counterterrorism frames as a command-and-control hierarchy is, on the ground, a loose network of local actors who adopt global jihadist branding for local purposes. The African perspective reveals what the GWOT framework occludes: that military responses (French Operation Barkhane, US drone strikes, AU missions) often exacerbate the grievances that drive recruitment, and that "counterterrorism" can become a resource for authoritarian regimes to suppress dissent. The African Union's African Peace and Security Architecture and regional economic communities represent an alternative, sovereignty-respecting approach, but they are underfunded and politically constrained.

Fourth, NGOs and advocacy networks. Keck and Sikkink's (1998) "boomerang model"—in which domestic NGOs blocked by repressive states appeal to international networks to pressure their governments—has African variants. African women's movements, human rights organizations, and environmental groups have used transnational advocacy to advance causes from anti-apartheid to land rights. But the African perspective also documents the "NGO-ization" of civil society: donor dependency, professionalization, and the displacement of radical politics by project-based service delivery. Tamale's feminist critique warns that universal human rights frames can override African epistemologies and impose Western gender categories. The African vantage thus both affirms the Keck-Sikkink model's descriptive power and critiques its normative assumptions: transnational advocacy can amplify African voices, but it can also ventriloquize them.

Fifth, illicit financial networks. The African perspective on money laundering, sanctions evasion, and kleptocracy is perhaps its most distinctive contribution. Rodney's structuralism and Bayart's extraversion converge on a claim that Western AML frameworks systematically misdiagnose the problem. Illicit financial flows from Africa—estimated by the UN Economic Commission for Africa and the AU at tens of billions of dollars annually, exceeding foreign aid and FDI combined—are not primarily the product of African criminality but of a global financial architecture that enables capital flight. Tax havens, shell companies, and correspondent banking relationships in London, New York, Dubai, and Geneva are the infrastructure of African kleptocracy. The FATF grey-listing of African states, from this vantage, appears as a disciplinary mechanism that punishes the periphery for systemic failures of the center. The African perspective thus reveals what the Western AML/CFT framework occludes: that "illicit" finance is not a deviation from global capitalism but one of its modalities, and that anti-corruption agendas can be instrumentalized to constrain African policy space while leaving Western financial centers untouched.

What the African perspective contributes that the other four cannot is a historically grounded, structurally critical theory of non-state actors as constitutive of, rather than external to, political order. It reveals the colonial genealogy of the state/non-state distinction, the extraversion of African political economies, and the complicity of global financial and corporate structures in producing the very phenomena that Western frameworks treat as African pathologies. What it occludes is less a blind spot than a deliberate bracketing: it tends to underweight the agency of great powers in shaping non-state actor dynamics (treating them as systemic background rather than strategic choice), and its structural critique can struggle to generate actionable policy prescriptions beyond "decolonize." It also risks romanticizing community-level and customary governance, which can be as exclusionary and violent as state institutions. The African perspective is thus not a replacement for the other four but a necessary corrective: without it, transnational non-state actor analysis remains trapped in a state-centric ontology that misrecognizes the very phenomena it seeks to explain.

2.7.2 Chinese Perspective

China's approach to transnational non-state actors is anchored in the Five Principles of Peaceful Coexistence, particularly non-interference in internal affairs, and in a developmentalist framing that treats sovereignty and stability as preconditions for economic growth. This perspective is not merely defensive; it is a coherent alternative to the Western liberal-interventionist model, with distinct implications for each of the five key ideas.

On multinational corporations, China's state-firm relationship is the inverse of the Western liberal model. Chinese SOEs and private firms operating abroad—Huawei, ZTE, CNPC, CNOOC, COSCO—are instruments of state strategy, coordinated through the Belt and Road Initiative (BRI) and the "going out" policy. The state does not merely regulate firms; it directs them toward strategic sectors (ports, telecoms, minerals, energy) and provides diplomatic and financial backing. From the Chinese perspective, this is not "state capitalism" as a deviation but a legitimate development model: the state ensures that corporate activity serves national interest rather than shareholder value alone. The occlusion is the lack of transparency and accountability: Chinese firms have been implicated in corruption, environmental degradation, and labor abuses in Africa and Latin America, and the non-interference principle prevents Beijing from conditioning investment on governance standards. The Western critique of "debt-trap diplomacy" is rejected as a smear, but Chinese scholars acknowledge that BRI security concerns—piracy in the Gulf of Aden, terrorism in Pakistan, instability in the Sahel—have forced a partial retreat from strict non-interference toward "protective" deployments (PLA base in Djibouti, private security companies guarding BRI projects).

On cyber mercenaries and offensive cyber capability, China's perspective is shaped by its own experience as a target of Western surveillance and by its strategic interest in information sovereignty. The "Great Firewall" and the Cybersecurity Law (2017) reflect a view that the internet is not a global commons but a domain of national sovereignty. China has been accused of sponsoring APT groups that conduct espionage and intellectual property theft; Beijing denies state direction and frames these as criminal or patriotic actors. The market for offensive cyber capability is viewed with alarm when Western firms sell to actors targeting Chinese interests, but Chinese firms also participate in the global cybersecurity market. The occlusion is the asymmetry: China demands sovereignty over its own information space while its firms and state-linked actors operate aggressively abroad, and the non-interference principle is selectively applied.

On transnational jihadist networks, China's perspective is dominated by the Xinjiang question and the perceived threat of Uyghur militancy. The East Turkestan Islamic Movement, now often labeled the Turkistan Islamic Party, has been cited by Beijing as a justification for mass detention and surveillance in Xinjiang. China's engagement with jihadist-affected regions (Pakistan, Afghanistan, the Sahel) is framed through coun-

terterrorism cooperation and economic development. The BRI's China-Pakistan Economic Corridor is vulnerable to attacks by Baloch and jihadist groups, prompting Chinese security involvement. The occlusion is the conflation of legitimate political dissent with terrorism, and the use of counterterrorism discourse to justify human rights abuses that the Western and UN perspectives condemn.

On NGOs and advocacy networks, China's perspective is deeply suspicious. The Foreign NGO Law (2017) requires registration and police oversight, reflecting a view that Western-funded NGOs are instruments of "color revolution" and subversion. Keck and Sikkink's advocacy model is read not as civil society empowerment but as a tool of Western interference. Chinese scholars emphasize "people-to-people" exchanges and state-directed civil society as alternatives. The occlusion is the suppression of domestic advocacy that could address corruption, environmental harm, and labor rights—issues that Chinese NGOs might otherwise pursue.

On illicit financial networks, China's perspective combines strict capital controls with selective anti-corruption enforcement. The anti-corruption campaign under Xi Jinping has targeted officials who moved assets abroad. China participates in FATF and has strengthened AML laws, but enforcement is uneven and politically directed. The BRI has been associated with corruption scandals, and Chinese banks have been fined for sanctions violations. The occlusion is the instrumentalization of anti-corruption: it targets political rivals while leaving systemic channels—underground banking, trade-based money laundering, real estate investment in Western cities—partially intact. The Chinese perspective contributes a state-centric, development-first approach that challenges Western liberal universalism, but it occludes accountability, transparency, and the rights of individuals and communities affected by state and corporate power.

2.7.3 Russian Perspective

Russia's perspective on transnational non-state actors is shaped by its post-Soviet experience of state collapse, its strategic rivalry with the West, and its self-conception as a civilizational pole in a multipolar order. The central instrument is the private military company, particularly Wagner Group and its successor Africa Corps, which Russia has deployed as a deniable, cost-effective tool of foreign policy in Syria, Libya, the Central African Republic, Mali, and Sudan.

On multinational corporations, Russia's state-firm relationship reflects a post-Soviet oligarchic structure in which strategic sectors (energy, defense, mining) are dominated by state-linked firms (Gazprom, Rosneft, Rostec, Alrosa). These firms are geopolitical instruments: Gazprom's pipeline politics, Rosneft's oil diplomacy, and Rostec's arms exports. The Russian perspective treats corporate activity as an extension of state power, not a separate sphere. Sanctions since 2014 and 2022 have accelerated this fusion, forcing Russian firms into shadow networks and alternative payment systems. The occlusion is the corruption and inefficiency of state-directed capitalism, and the dependence on Western technology and finance that sanctions have exposed.

On cyber mercenaries, Russia has cultivated a distinctive model: patriotic hackers and criminal groups operate with tacit state tolerance or direction, providing deniable offensive capability. The market for cyber mercenaries is viewed as a legitimate arena of competition; Russian scholars frame Western accusations as hypocrisy given NSA and CIA operations. The "sovereign internet" law (2019) and disconnection tests reflect a view that information infrastructure is a strategic asset. The occlusion is the blurring of criminal and state activity, which undermines rule of law and enables ransomware attacks that harm civilians globally.

On transnational jihadist networks, Russia's perspective is shaped by the Chechen wars and the Syrian intervention. Moscow frames its counterterrorism as defense against a global jihadist threat that the West, by

supporting "moderate rebels" in Syria, inadvertently strengthened. The Wagner Group's deployment in Syria and Africa is justified as counterterrorism assistance to sovereign governments. The occlusion is the instrumentalization of counterterrorism: Russian operations in Syria and Africa have targeted not only jihadists but political opponents and civilians, and the "counterterrorism" label has been used to justify authoritarian consolidation.

On NGOs and advocacy networks, Russia's perspective mirrors China's suspicion. The "foreign agent" law (2012, expanded 2022) requires NGOs receiving foreign funding to register as foreign agents, reflecting a view that Western-funded civil society is a vector of regime change. Keck and Sikkink's advocacy model is read as a mechanism of Western interference, particularly after the color revolutions in Georgia, Ukraine, and Kyrgyzstan. The occlusion is the suppression of domestic accountability and the closure of space for independent civil society, which weakens governance and enables corruption.

On illicit financial networks, Russia's perspective is paradoxical. Moscow has been a target of Western sanctions and AML enforcement, and Russian elites have developed sophisticated sanctions-evasion networks—shadow fleets, cryptocurrency, trade-based laundering, and the use of third countries. The Russian perspective frames these as defensive measures against illegitimate Western coercion. Simultaneously, Russia has used illicit financial networks as offensive tools: funding political parties, media outlets, and paramilitary groups abroad. The occlusion is the denial of agency: Russian state and non-state actors are active participants in global illicit finance, not merely victims of Western overreach. The Russian perspective contributes a multipolar, anti-hegemonic framing that challenges Western monopoly on defining legitimate force and finance, but it occludes accountability, human rights, and the distinction between defensive sovereignty and predatory statecraft.

2.7.4 Western Perspective

The Western perspective on transnational non-state actors is the canonical framework of contemporary IR: a state-centric, liberal-institutional order in which non-state actors are deviations to be regulated, sanctioned, or countered. It is the home of the GWOT, the FATF, the sanctions architecture, and the liberal critique of corporate power. Its strength is its institutional density; its weakness is its tendency to universalize a historically specific order.

On multinational corporations, the Western perspective treats the state-firm relationship as a governance problem: how to align corporate behavior with public interest through regulation, antitrust, export controls, and human rights due diligence. The US CHIPS Act, the EU Corporate Sustainability Due Diligence Directive, and CFIUS screening reflect a view that firms are economic actors subject to state oversight. But the perspective also acknowledges that MNCs are geopolitical actors: the "weaponization of interdependence" (Farrell and Newman) describes how states leverage corporate networks (SWIFT, semiconductor supply chains) for coercion. The occlusion is the complicity of Western financial centers and corporate headquarters in enabling kleptocracy and tax evasion; the "rules-based order" often exempts its own firms.

On cyber mercenaries, the Western perspective has shifted from laissez-faire to alarm. The market for offensive cyber capability—NSO Group's Pegasus, Hacking Team, Candiru—was initially tolerated as a private-sector innovation. Revelations of abuse against journalists, activists, and politicians prompted US export controls (Commerce Department Entity List, 2021) and EU scrutiny. The perspective treats cyber mercenaries as a market failure requiring regulation, but struggles with the dual-use nature of cyber tools and the role of Western intelligence agencies as customers and enablers. The occlusion is the assumption that regulation can contain a market that is structurally global and deniable.

On transnational jihadist networks, the Western perspective is defined by the GWOT and its evolution. The 9/11 attacks produced a framework—UNSCR 1373, the 1267 sanctions regime, military interventions in Afghanistan and Iraq—that treated jihadist networks as a global threat requiring a global response. Keck and Sikkink's advocacy model was adapted: counterterrorism networks of states, NGOs, and international organizations. The perspective has evolved toward "countering violent extremism" and stabilization, acknowledging that military force alone is insufficient. The occlusion is the blowback: interventions in Iraq, Libya, and Syria destabilized regions and fueled jihadist recruitment; the "terrorist" label has been applied to legitimate resistance movements; and the GWOT's human rights costs (torture, drone strikes, mass surveillance) undermined the liberal values it claimed to defend.

On NGOs and advocacy networks, the Western perspective is the natural home of Keck and Sikkink's (1998) model. Transnational advocacy networks—human rights, environmental, women's rights—are celebrated as agents of norm change, operating through information politics, symbolic politics, leverage politics, and accountability politics. The boomerang model describes how domestic NGOs bypass repressive states by appealing to international allies. The perspective's occlusion is its optimism: it underestimates the co-optation of NGOs by donors, the depoliticization of radical demands, and the backlash from states that view advocacy as interference. It also tends to treat Western NGOs as neutral arbiters rather than actors with their own interests and blind spots.

On illicit financial networks, the Western perspective is the canonical home of AML/CFT. The FATF, the UN Convention against Corruption (UNCAC), the OECD Anti-Bribery Convention, and national laws (US Bank Secrecy Act, EU AML directives) constitute a dense regulatory architecture. The perspective emphasizes rule of law, transparency, and asset recovery. Its occlusion is well-documented: Western financial centers (London, New York, Delaware, Switzerland) are the destination for illicit flows; enforcement is uneven and politically selective; and the compliance burden falls disproportionately on developing countries. The "liberal-institutional critique" from within acknowledges these failures but frames them as implementation gaps rather than structural features.

The Western perspective contributes institutional capacity, normative frameworks, and a self-critical tradition. Its occlusion is the tendency to treat its own order as universal, to exempt its own centers from the standards it imposes on others, and to conflate Western interests with global public goods.

2.7.5 UN Perspective

The UN perspective on transnational non-state actors is institutional and legalistic: it seeks to extend the international legal order—designed for states—to non-state actors through Security Council resolutions, conventions, and expert bodies. Its strength is multilateral legitimacy; its weakness is dependence on member-state enforcement and the political constraints of consensus.

On multinational corporations, the UN perspective has evolved from the failed 1970s New International Economic Order debates to the UN Guiding Principles on Business and Human Rights (2011, Ruggie). The framework is "protect, respect, remedy": states protect human rights, firms respect them, and victims have access to remedy. The UN Working Group on Business and Human Rights monitors implementation. The perspective acknowledges that MNCs are geopolitical actors but frames their accountability through voluntary and soft-law mechanisms. The occlusion is the lack of binding enforcement: the treaty on business and human rights remains under negotiation, and the Guiding Principles rely on corporate self-regulation and state willingness.

On cyber mercenaries, the UN perspective is nascent. The Group of Governmental Experts and the Open-

Ended Working Group have developed norms for responsible state behavior in cyberspace, including that states should not knowingly allow their territory to be used for cyberattacks. The applicability of IHL to cyber operations is debated. The UN has not yet developed a specific framework for commercial spyware or cyber mercenaries, though the Human Rights Council has addressed surveillance. The occlusion is the gap between norm development and enforcement: states disagree on attribution, thresholds, and the status of non-state cyber actors.

On transnational jihadist networks, the UN perspective is most developed. UNSCR 1267 (1999) and 1373 (2001) established the sanctions regime against Al-Qaeda, the Taliban, and later ISIS, with the 1267 Committee (now the ISIL/Da'esh and Al-Qaida Sanctions Committee) maintaining a consolidated list. The Counter-Terrorism Committee and CTED monitor implementation. The UN Global Counter-Terrorism Strategy (2006) emphasizes a comprehensive approach including root causes. The occlusion is well-known: due-process weaknesses in listing and delisting, the conflation of counterterrorism with counter-insurgency, and the risk that sanctions are instrumentalized by powerful states. The UN's IHL framework struggles with non-state belligerents: Common Article 3 and Additional Protocol II apply to non-international armed conflicts, but the status of transnational jihadist fighters remains contested.

On NGOs and advocacy networks, the UN perspective provides institutional access through ECOSOC consultative status, which allows NGOs to participate in UN processes. The UN has been a site of advocacy success: the landmine ban, the ICC, the women's rights agenda. But the perspective also reflects state control: NGO accreditation is politically contested, and states have used ECOSOC mechanisms to exclude critical organizations. The occlusion is the gap between participatory rhetoric and state-dominated practice.

On illicit financial networks, the UN perspective centers on UNCAC (2003), the UN Convention against Transnational Organized Crime (UNTOC, 2000), and the work of the UN Office on Drugs and Crime (UNODC). The Security Council has imposed sanctions on individuals and entities involved in sanctions evasion and illicit finance (e.g., DPRK, Iran, Libya). UN Panels of Experts monitor implementation. The FATF, though not a UN body, is recognized by the UN and its standards are incorporated into UN frameworks. The occlusion is enforcement dependence: the UN lacks independent enforcement capacity, and its frameworks are only as effective as member states' willingness to implement them. The UN perspective contributes multilateral legitimacy and a universal vocabulary, but its effectiveness is constrained by the very state sovereignty it seeks to regulate.

SECTION 2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Reveals non-state actors as governance providers and hybrid political orders; treats sovereignty as negotiated rather than given; centers African agency and the costs borne by African littoral states	Risks romanticizing hybridity; may understate coercive and violent dimensions of armed groups; can obscure accountability deficits	Plural sovereignty; African agency; critique of external intervention and state-centrism	Reno (2011) on warlord politics; Mamdani on the colonial state; hybrid governance in Somalia and the Sahel	Western: hybrid governance can legitimate armed groups that violate human rights and understate the need for accountable institutions
Chinese	Emphasizes economic connectivity and development; non-interference protects sovereignty; BRI frames stability as commercial infrastructure	Understates human rights and accountability; treats non-state actors mainly as threats to commerce; can shield abusive regimes	Sovereignty, non-interference, development-first	BRI port investments; Saudi–Iran mediation (2023); Red Sea shipping concerns	African/Western: non-interference can shield abusive regimes; economic framing ignores political grievances
Russian	Demonstrates PMCs as flexible instruments of state power; multipolar challenge to Western dominance; exploits gaps in Western accountability	Obscures state control; conflates state and private violence; deniability undermines accountability	Multipolarity; great-power prerogative; deniability	Wagner in CAR, Mali, Sudan; Africa Corps transition	Western/UN: PMCs evade IHL; deniability undermines accountability and rule of law

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Western	Legal-institutional frameworks; sanctions; counterterrorism; human rights; IHL; rule of law	State-centrism; assumes Westphalian norms universal; may ignore root causes and local legitimacy	Liberal international order; rule of law; human rights	FATF standards; UN sanctions regimes; counterterrorism frameworks	African: frameworks applied selectively; counterterrorism can justify intervention
UN	Multilateral legitimacy; universal vocabulary; sanctions regimes; FATF standards; IHL obligations for non-state actors	Enforcement dependence; constrained by state sovereignty; politicized implementation	Collective security; universal norms	Security Council resolutions; Panels of Experts; UNCAC/UNTOC	African/Russian: enforcement is politicized; great powers exempt themselves

SECTION 2.8 WORKED EXAMPLE (I do)

The 2023–2025 Houthi Attacks on Red Sea Shipping

Levels of analysis. At the individual level, the attacks turn on decisions by Houthi leadership—above all Abdul-Malik al-Houthi and the movement's military commanders—to link maritime violence to the Gaza war, framing strikes as solidarity with Palestinians and as pressure for a ceasefire. Individual agency matters: the timing, target selection (commercial versus naval vessels), and rhetorical justification were choices, not structural necessities, and they reveal how a non-state leader can convert a regional conflict into a global economic shock. At the state level, the case is embedded in Yemen's fragmented sovereignty, Iran's material support to the Houthis, Saudi Arabia's security concerns, Egypt's dependence on Suez Canal revenues, and the US/UK decision to launch strikes; states provide weapons, intelligence, basing, and legal cover, and the Houthi movement itself exercises de facto state-like authority over territory and population. At the systemic level, the attacks expose the vulnerability of a US-led maritime order and a globalized just-in-time supply chain to disruption by a comparatively weak actor; they also register the shift toward multipolarity, in which non-state actors can exploit great-power distraction and the diffusion of precision-strike technology. At the transnational level, the case is irreducibly cross-border: Iranian support networks, Hezbollah-linked technical assistance, global shipping firms and insurers, and the rerouting of trade around the Cape of Good Hope all operate beyond any single state's jurisdiction, making the crisis a transnational problem that no state can solve alone.

Mechanism. The core mechanism is chokepoint coercion through asymmetric cost imposition. The Houthis

exploited the Bab el-Mandeb strait—roughly thirty kilometers wide at its narrowest—and the southern Red Sea to threaten commercial shipping with comparatively cheap systems (anti-ship missiles, drones, explosive boats) against which defense requires expensive naval assets and sustained patrols. Because the cost of a single successful strike or even a near-miss is catastrophic for a container vessel, and because insurance markets price risk rapidly, the mere threat of attack forced major carriers to suspend transits and reroute around the Cape of Good Hope, adding roughly two weeks to Asia–Europe voyages. The mechanism runs through several linked channels: (1) physical threat to hulls and crews; (2) insurance and reinsurance repricing that made Red Sea transits commercially unviable; (3) carrier decisions driven by liability and crew safety rather than by state directive; (4) Suez Canal revenue collapse for Egypt; and (5) a naval coalition response (Operation Prosperity Guardian, US/UK strikes from January 2024) that raised the military stakes without fully restoring commercial confidence. The Houthis thus converted localized violence into global economic leverage: a non-state actor with limited conventional power imposed costs on the world economy disproportionate to its resources, using geography and market psychology as force multipliers. The attacks also carried a signaling function—demonstrating solidarity with Gaza and claiming a role in the "axis of resistance"—which sustained domestic legitimacy and recruitment even as the military effect on Israel itself was marginal.

Perspective reconstruction. From the African perspective, which must be read first and at length, the Houthi case is not an exotic anomaly but a variant of a familiar pattern: armed movements exercising de facto sovereignty and providing (or disrupting) order in spaces where the state is weak or contested. African scholarship—Reno on warlord politics, Mamdani on the colonial state's bifurcated sovereignty, Bayart on the "politics of the belly," and Grovogui on the international as a site of African agency—would read the Houthis as a hybrid political order whose authority is negotiated with populations, external patrons, and rival factions rather than derived from Westphalian recognition. The Red Sea is an African-adjacent space: Yemen faces Eritrea, Djibouti, and Somalia across a narrow strait, and African littoral states bear direct costs—Egypt's Suez revenues, Djibouti's port traffic, the risk of piracy resurgence off Somalia—while having little voice in the US-led military response. The African vantage thus reveals two things the other perspectives miss: first, that "non-state actor" is often a misnomer for a de facto state-like authority whose legitimacy is local and performative; second, that the security architecture responding to the crisis (coalition strikes, naval patrols) reproduces a pattern in which African and Arab coastal populations absorb the costs of order defined by external powers. The case also resonates with African experiences of non-state violence in the Sahel and the Horn, where state weakness, external intervention, and armed group governance intertwine, and where the line between "terrorist," "insurgent," and "governance provider" is politically contested rather than analytically clear.

From the Chinese perspective, the attacks threaten a maritime corridor central to the Belt and Road Initiative and to China's Europe-bound trade; Beijing's non-interference doctrine keeps it out of the US-led coalition, yet China benefits from the freedom of navigation that US naval power secures, producing a free-rider tension. Chinese shipping (COSCO among others) rerouted, and Beijing emphasized de-escalation and a Gaza ceasefire rather than military action, consistent with its preference for political solutions and its interest in not antagonizing Iran. The Chinese vantage contributes an economic-connectivity framing and a critique of military escalation, but it occludes the question of how to protect commerce when diplomacy fails and underplays the Houthis' agency by treating them as a variable in great-power management.

From the Russian perspective, the crisis is read as evidence of Western overreach and the fragility of the US-led order: Moscow criticized US/UK strikes as violations of sovereignty and used the episode to position itself as a defender of multipolarity, while Russian shipping and interests in the region (including

long-standing interest in a Red Sea naval facility) were affected. Russia does not control the Houthis, but the disruption serves its narrative that Western maritime dominance is contestable and that non-state actors can impose costs on the liberal order. The Russian vantage contributes a critique of unilateral military action and highlights great-power hypocrisy, but it occludes accountability for violence and treats the Houthis instrumentally.

From the Western perspective, the attacks are a threat to freedom of navigation and global commerce requiring a collective security response; the US and UK framed strikes as defensive, invoked self-defense, and assembled a coalition, while also maintaining sanctions on Houthi leaders and supporting UN processes. The Western framing supplies legal vocabulary (UNCLOS, self-defense) and institutional response capacity, but it tends to treat the Houthis as a security problem to be managed rather than as a political actor with grievances, and it risks overestimating what military force can achieve against a dispersed, ideologically motivated movement.

From the UN perspective, the crisis sits atop an existing sanctions architecture (Security Council resolutions 2140 and 2216 on Yemen) and a humanitarian catastrophe; the UN emphasizes IHL obligations for all parties, including non-state actors, mediation by the Special Envoy, and the protection of civilian shipping and aid flows. The UN vantage contributes multilateral legitimacy and a humanitarian lens, but its effectiveness is constrained by Council divisions and by the gap between resolutions and enforcement.

Adjudication. Which perspective best explains the case? The central puzzle is how a non-state actor reshaped global shipping, and on that question the transnational/systemic lens—combined with the African hybrid-governance insight—carries the most explanatory weight. The mechanism of chokepoint coercion only works because of transnational interdependence (shipping, insurance, supply chains) and because the Houthis exercise de facto sovereignty over a coastal territory that no state fully controls, a condition the African perspective theorizes better than the state-centric Western or UN frames. The Western perspective best explains the response (coalition strikes, sanctions) but occludes the actor's capacity and the local political roots of its authority; the Chinese and Russian perspectives illuminate great-power positioning but treat the Houthis as a variable in interstate competition rather than as an autonomous actor. If forced to choose a single best explanation, the African hybrid-governance perspective best accounts for why the Houthis could act at all, while the systemic/transnational perspective best accounts for why their actions mattered globally; neither alone suffices, and the Western security framing, though dominant in policy, is the most incomplete because it mistakes a symptom for the disease. What the best explanation misses is the specifically ideological and religious dimension of Houthi mobilization—individual-level commitment and transnational Shia networks—which the five perspectives here underweight relative to material and institutional factors.

SECTION 2.9 PROBLEM PAIR (We do)

Tasks

1. **Mechanism identification.** The Wagner Group's transformation from a Russian private military company into a strategic instrument of foreign policy is often described as "plausible deniability." Evaluate whether this label captures the actual mechanism, or whether the relationship is better understood as principal-agent delegation with high monitoring costs, or as a hybrid of state capture and commercial extraction. Specify the observable implications of each mechanism.

2. **Levels of analysis.** Analyze the Wagner/Africa Corps case at all four levels: individual (Yevgeny Prigozhin, field commanders, local brokers), state (Russian Ministry of Defense, FSB, host governments), systemic (post-Cold War order, sanctions architecture, great-power competition), and transnational (PMC networks, gold and diamond smuggling routes, mercenary labor markets).

3. **African perspective reconstruction.** Reconstruct, from within, how host governments in Mali, the Central African Republic, and Burkina Faso have framed PMC presence. Is it sovereignty assertion against Western conditionality, a security bargain, or resource extraction? What does this vantage point reveal that Western counterterrorism framing misses?

4. **Western perspective reconstruction.** Reconstruct the Western framing: sanctions, counterterrorism, liberal-institutional critique. What does it capture and what does it occlude?

5. **Adjudication.** On the evidence available through 2025, does the Wagner/Africa Corps case support the claim that PMCs are instruments of Russian state power, or the claim that they are autonomous commercial enterprises that occasionally align with state interests? Adjudicate with evidence.

6. **Falsifiers.** State two pieces of evidence that, if observed, would force you to revise your adjudication in task 5.

MODEL ANSWER

The Wagner Group's evolution into a strategic instrument of Russian foreign policy is best understood not through the single label of "plausible deniability" but through a layered mechanism that combines principal-agent delegation with commercial extraction and, after June 2023, direct state absorption. The causal claim is that Moscow used Wagner as a low-cost instrument to project power into spaces where conventional military deployment was politically or legally costly, while allowing the firm to self-finance through resource extraction. The mechanism runs as follows: the Russian state provided political cover, weapons, and intelligence; Wagner provided deniable force and local security services; host governments provided mining concessions and basing rights; and the resulting revenue streams reduced the fiscal burden on Moscow while creating a constituency within the Russian security apparatus with a stake in continued engagement. Scope conditions include weak host-state capacity, the presence of extractable resources, and a sanctions environment that makes conventional arms transfers visible. Observable implications include the pattern of Wagner deployments following French or UN withdrawals, the correlation between PMC presence and gold or diamond concessions, and the post-Prigozhin rebranding as "Africa Corps" under direct Ministry of Defense control, which suggests that the deniability function diminished once the instrument had proven its value.

At the individual level, Yevgeny Prigozhin operated as both entrepreneur and political broker, cultivating relationships with African leaders and Russian security elites simultaneously; his death in August 2023 and the subsequent absorption of Wagner into the Africa Corps under the Ministry of Defense indicates that the individual-level principal had become a liability to the state principal. At the state level, the Russian Ministry of Defense and FSB provided the enabling environment, while host governments in Mali, the Central African Republic, and Burkina Faso traded sovereignty concessions for security guarantees. At the systemic level, the post-2014 sanctions architecture and the erosion of the unipolar order created demand for alternatives to Western security provision, and the PMC model offered a template that other powers could emulate. At the transnational level, gold smuggling networks, mercenary labor markets drawing on veterans from Syria and Libya, and the offshore financial infrastructure that launders extractive revenues all sustained the enterprise beyond any single state's control.

The African perspective reconstructs PMC presence as a sovereignty bargain rather than a neocolonial imposition. From within, Malian and Central African leaders have framed Wagner's arrival as a rejection of Western conditionality—human rights benchmarks, governance reforms, and the perceived failures of French Operation Barkhane and the UN MINUSMA mission. The African vantage point reveals what Western counterterrorism framing misses: that PMC demand is endogenous to African security dilemmas and to the delegitimation of Western military presence, not merely a Russian imposition. It also reveals the hybrid governance reality in which non-state security providers become embedded in local political economies, sometimes displacing state functions and sometimes reinforcing them. The occlusion in this perspective is the long-term cost: resource extraction, civilian harm documented by UN panels of experts, and the erosion of accountability mechanisms that even weak democratic institutions might provide.

The Western perspective frames Wagner through sanctions, counterterrorism, and liberal-institutional critique. It captures the documented links between Wagner and Russian state structures, the human rights abuses, and the threat to democratic governance. Its occlusion is the failure to account for why African governments invited Wagner in the first place—the security vacuum and the conditionality fatigue that preceded PMC arrival. The UN perspective, operating through Security Council sanctions regimes and panels of experts, documents violations of arms embargoes and international humanitarian law but lacks enforcement capacity; FATF frameworks address the financial flows but depend on host-state cooperation that is often absent.

Adjudicating between "instrument of state power" and "autonomous commercial enterprise," the evidence through 2025 favors the hybrid interpretation with a tilt toward state instrumentality. The post-Prigozhin absorption into the Africa Corps under direct Ministry of Defense control is decisive: a genuinely autonomous enterprise would not have been so smoothly nationalized. Yet the commercial extraction dimension—gold concessions in the Central African Republic, diamond and timber deals—persisted after nationalization, suggesting that the revenue model is structurally embedded and not merely a byproduct of state direction. The strongest counterargument is that Prigozhin's mutiny in June 2023 demonstrated genuine autonomy and that the Africa Corps rebranding represents state capture of a previously independent asset rather than proof of prior control. On balance, however, the pattern of deployments tracking Russian strategic interests—Mali after the French withdrawal, Sudan during the civil war, Libya in support of Haftar—indicates that commercial extraction was the financing mechanism, not the strategic purpose.

Two falsifiers would revise this adjudication. First, if documentary evidence emerged showing that Wagner deployments were initiated by host governments without Russian state coordination and that Moscow consistently opposed them, the "autonomous enterprise" interpretation would strengthen. Second, if the Africa Corps were dissolved or withdrawn following a change in Russian strategic priorities while host governments retained the commercial contracts, this would suggest that the commercial dimension had become independent of state direction. Absent such evidence, the case supports treating PMCs as hybrid instruments in which state direction and commercial extraction are mutually reinforcing, with the balance shifting toward state control after 2023.

SECTION 2.10 INDEPENDENT MEMO (You do)

Case description. In 2023-2024, investigations by Citizen Lab, Amnesty International, and the European Parliament documented the use of commercial spyware—Pegasus and successor products—by multiple governments against journalists, opposition figures, and civil society actors across at least forty countries. The NSO Group, an Israeli firm, and a growing field of competitors operate in a market where offensive cyber

capability is sold as a service, with export licenses granted by home governments and resale through intermediaries in third countries. Several purchasers appear on the FATF grey list, and the market has persisted despite the US Commerce Department's blacklisting of NSO Group in 2021 and the EU's proposed spyware regulation. The case raises the question of whether commercial spyware is best understood as a transnational non-state actor in its own right, as an instrument of state power delegated through market mechanisms, or as a market failure that existing regulatory frameworks cannot contain.

Memo headings (respond to each as a prompt):

- **Mechanism:** Identify and specify the causal mechanism linking the commercial spyware market to state power projection. State scope conditions and observable implications.
- **Perspective reconstruction:** Reconstruct all five perspectives (African, Chinese, Russian, Western, UN) on this case in 3-5 sentences each, steel-manned from within.
- **Historical analogue:** Identify one historical case of a transnational non-state actor serving as a delegated instrument of state power, and specify what transfers and what does not.
- **Falsifiers:** State two pieces of evidence that would force you to revise your mechanism claim.

Self-check: Before submitting, verify that you have distinguished description (what happened), explanation (why it happened), prediction (what follows), and prescription (what should be done), and that no single paragraph conflates two of these.

SECTION 2.11 HINGE QUESTION

Question: Which of the following best captures the mechanism by which transnational non-state actors most consistently convert structural opportunity into strategic influence?

A. By replacing the state entirely in zones of weak governance, becoming the sole provider of security and services.

B. By occupying the gap between state capacity and transnational demand, converting regulatory arbitrage into durable leverage.

C. By achieving formal recognition in international law, which grants them standing equivalent to states.

D. By relying exclusively on ideological mobilization to override material interests.

Correct answer: B.

Distractor diagnoses:

- **A** confuses non-state actor presence with state replacement. Most transnational non-state actors complement, parasitize, or hybridize with states rather than replace them; the "failed state" narrative overstates the autonomy of non-state providers and understates their dependence on state toleration or sponsorship.
- **C** conflates legal personality with strategic influence. Most transnational non-state actors operate precisely by avoiding formal recognition; legal standing is neither necessary nor sufficient for influence, and many of the most consequential actors (PMCs, spyware firms, jihadist affiliates) derive leverage from operating in legal grey zones.
- **D** overstates ideational factors. Even jihadist networks and advocacy NGOs depend on material

resources, organizational infrastructure, and opportunity structures; ideology alone rarely sustains transnational action, and materialist mechanisms are required to explain variation in outcomes.

SECTION 2A — DATA LAB

Table 1 — MNC revenue and state-capacity comparisons (illustrative, rounded, circa 2023–2024)

Entity / comparator	Annual revenue or GDP (USD, billions)	What the comparison can show	What it cannot show
Walmart revenue	~650	A single firm's sales can exceed the GDP of mid-sized states	Revenue is gross sales, not value added, profit, or coercive capacity
Amazon revenue	~575	Platform firms operate across jurisdictions at scale	It does not mean Amazon governs territory or commands force
Apple revenue	~383	Technology firms concentrate intangible assets and tax-base mobility	It does not measure employment, welfare, or state legitimacy
State Grid (China) revenue	~550	State-owned enterprises blur public/private boundaries	Ownership and control differ from market-listed MNCs
Sweden GDP	~586	Useful benchmark for "firm larger than state economy" claims	GDP is value added, not a measure of state power
Belgium GDP	~624	Helps calibrate claims about corporate scale	Does not imply corporate sovereignty
Poland GDP	~811	Shows that even very large firms remain smaller than major economies	Scale alone does not determine geopolitical influence

Source note: figures are rounded from publicly reported corporate revenues and standard national-accounts benchmarks; verify exact values before citation. The point of the table is order-of-magnitude reasoning, not a ranking of power.

Table 2 — Cyber-mercenary and offensive-cyber market estimates

Segment	Estimated scale	Evidentiary basis	Key limitation
Commercial spyware vendors	Low single-digit billions USD annually, highly uncertain	Investigative reporting, export-control cases, leaked contracts	Firms rebrand, shell companies obscure ownership, and contracts are confidential
Zero-day exploit brokers	Tens to low hundreds of millions USD	Bug-bounty platforms, broker advertisements, court documents	Prices are secret; "exclusive" sales are not publicly auditable
Hack-for-hire services	Fragmented; no reliable global total	Law-enforcement indictments, platform takedowns	Many operations are criminal, informal, and undercounted
State procurement of offensive cyber capability	Classified; likely larger than commercial market	Budget opacity, procurement secrecy	Cannot be separated cleanly from intelligence budgets
Defensive and compliance spending	Much larger than offensive market	Corporate cybersecurity budgets, regulatory filings	Defensive spending is not a proxy for offensive capability

Source note: estimates are ranges, not audited market totals. Treat them as indicators of commercialization, not as precise measurements.

Table 3 — FATF pressure and terrorist-activity indicators

Indicator	What it captures	Illustrative reading	Major limitation
FATF black list	Jurisdictions subject to countermeasures	DPRK, Iran, Myanmar in recent plenaries	List changes; membership reflects diplomatic as well as technical assessment
FATF grey list	Jurisdictions under increased monitoring	20+ jurisdictions in recent cycles, including several African and Asian states	Grey-listing can reflect capacity gaps as much as political will
Designated terrorist groups	Legal status under national/UN regimes	Dozens of groups across regions	Designation is political and varies by jurisdiction
Attack counts by region	Frequency of violent events	Concentration in conflict zones and fragile states	Underreporting, definitional variation, and state violence may be excluded

Indicator	What it captures	Illustrative reading	Major limitation
Affiliate expansion	Organizational spread of jihadist networks	ISIS- and Al-Qaeda-linked groups in Africa and Middle East	"Affiliation" can mean branding, command, or loose inspiration
Maritime incident counts	Disruption to shipping lanes	Red Sea attacks, rerouting, insurance spikes	Counts conflate attempted, successful, and intercepted attacks

Source note: FATF lists are current only as of the latest plenary; terrorist-activity metrics depend on dataset definitions and should not be read as objective counts of "terrorism."

Five numbered analysis questions

1. **Trend.** Looking at Table 1, what trend do MNC revenue-to-GDP comparisons reveal about the relationship between private economic scale and state capacity? Does the trend imply that large firms are becoming "more powerful than states," or does it show something narrower about mobility, market concentration, and regulatory arbitrage? Specify the mechanism.

2. **Level of analysis.** For each of the five actor types in this lesson—MNCs, cyber mercenaries, jihadist networks, NGOs/advocacy networks, and illicit financial networks—identify the primary level of analysis at which it operates (individual, state, systemic, transnational). Which actor type most clearly straddles two levels, and what evidence would distinguish a transnational explanation from a state-centric one?

3. **Perspective reconstruction (all five).** Reconstruct how each perspective would read Tables 1–3:

   - **African:** hybrid governance, non-state security provision, sovereignty costs, and the gap between formal state capacity and lived authority.
   - **Chinese:** non-interference, BRI route security, state-firm coordination, and suspicion of Western sanctions extraterritoriality.
   - **Russian:** PMCs as strategic instruments, deniability, sanctions evasion, and great-power competition.
   - **Western:** liberal-institutional regulation, counterterrorism, sanctions, and market-governance norms.
   - **UN:** Security Council sanctions, FATF standards, IHL obligations, and humanitarian access. Which perspective best explains the *data-generation process* behind FATF lists and terrorist-activity metrics, and which best explains the *political consequences* of those lists?

4. **Interpretation.** Does grey-listing primarily function as (a) a technical compliance tool, (b) a sovereignty-sensitive form of economic coercion, or (c) a hybrid of both? Use Table 3 and specify the scope conditions under which each interpretation holds. What would falsify the claim that FATF listing is merely technocratic?

5. **Limitation.** What do terrorist-activity metrics and maritime-incident counts systematically miss? Consider underreporting, definitional politics, state violence, and the difference between "attacks" and

"strategic effects." How would your answer change if the unit of analysis were shifted from events to networks?

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — "Transnational Actor Power Map" (hand-drawn scatter plot) What to draw: Draw a large rectangle. On the horizontal axis, label left-to-right: "Low state regulatory capacity / weak territorial control" to "High state regulatory capacity / strong territorial control." On the vertical axis, label bottom-to-top: "Low transnational reach" to "High transnational reach." Divide the space into four quadrants with light grid lines.

Points to plot and label: - Top-left quadrant: "Jihadist affiliate networks," "Cyber-mercenary vendors," "Illicit finance nodes." - Top-right quadrant: "MNCs with home-state backing," "Large NGOs/advocacy networks," "State-owned enterprises." - Bottom-left quadrant: "Local militias," "Informal brokers." - Bottom-right quadrant: "Domestic firms," "State agencies."

Arrows to draw: From "Local militias" upward to "Jihadist affiliate networks" (radicalization/affiliation); from "Domestic firms" upward to "MNCs" (internationalization); from "Cyber-mercenary vendors" rightward toward "State procurement" (state absorption).

Perspective overlay to annotate: - African: shade the top-left quadrant and label "Hybrid governance zone: authority without full state control." - Chinese: draw a dashed line from "BRI corridors" across the top-right and top-left, labeled "Route security and non-interference tension." - Russian: annotate top-left with "Deniable strategic instruments." - Western: annotate top-right with "Regulatory and sanctions targets." - UN: place a small box in the center labeled "Sanctions, FATF, IHL, humanitarian access."

Caption to write beneath: "Transnational reach is not the same as state power; the map separates mobility from authority."

Visual 2 — "Houthi Maritime Disruption Causal Chain" (hand-drawn flowchart) What to draw: Draw six boxes in a left-to-right chain, connected by arrows: 1. "Houthi attacks on Red Sea shipping" 2. "Vessel rerouting around Cape of Good Hope" 3. "Longer transit times and higher fuel costs" 4. "Freight and insurance premium spikes" 5. "Consumer and industrial price effects" 6. "Naval coalition response and escalation risk"

Side boxes to attach: - Above Box 1: "Non-state actor with state-linked capabilities" - Below Box 2: "Supply-chain chokepoint" - Above Box 5: "Food and energy security effects" - Below Box 6: "Deterrence vs. escalation dilemma"

Levels-of-analysis labels: Place small tags beside boxes: - Box 1: "Transnational / sub-state" - Box 2: "Systemic" - Box 3–5: "Transnational economic" - Box 6: "State and systemic"

Perspective overlay to annotate: - African: "Port economies, import prices, and food security." - Chinese: "BRI route security and commercial shipping interests." - Russian: "US naval overstretch and multipolar opportunity." - Western: "Freedom of navigation and alliance burden-sharing." - UN: "Maritime law, civilian protection, and humanitarian corridors."

Feedback loop to draw: Draw a curved arrow from Box 6 back to Box 1 labeled "Retaliation can reinforce mobilization."

Caption to write beneath: "A non-state actor can reshape systemic trade flows without controlling territory beyond its launch areas."

Visual 3 — "Wagner/Africa Corps as Strategic Instrument" (hand-drawn network diagram) What to draw: Place a central node labeled "Kremlin / security services." Draw arrows to a second node labeled "PMC command structure." From the PMC node, draw arrows to three nodes: "African host regime," "Local armed groups," and "Resource concession sites." Draw a return arrow from "Resource concession sites" to "PMC funding / logistics." Draw a separate arrow from "Kremlin / security services" to "Information operations," then to "Host-regime legitimation."

Labels on arrows: - Kremlin → PMC: "Deniable force projection" - PMC → Host regime: "Regime security" - Host regime → PMC: "Access and basing" - PMC → Resource sites: "Protection" - Resource sites → PMC funding: "Revenue" - Kremlin → Information operations: "Narrative support"

Perspective overlay to annotate: - African: "Hybrid governance: security provided outside formal state monopoly." - Chinese: "Non-interference norm tested by security externalities." - Russian: "Strategic depth with plausible deniability." - Western: "Sanctions, accountability gaps, and mercenary prohibition." - UN: "IHL, mercenary conventions, and Panel of Experts monitoring."

Caption to write beneath: "The PMC is not merely a firm; it is a networked instrument linking force, resources, and narrative."

SECTION 4 — CORNELL NOTES

Cue (question / prompt)	Notes (answer, evidence, source log)
What is a transnational non-state actor?	An organization or network that operates across borders and exercises political, economic, coercive, or normative influence without being a sovereign state. Key distinction: transnational reach ≠ statehood. Sources: Keck and Sikkink (1998); Naim (2005).
How do MNCs become geopolitical actors?	Through scale, supply-chain position, technology control, tax mobility, and home-state alignment. Revenue comparisons show scale but not authority. Source log: corporate financial reports; World Bank national accounts.
What is the cyber-mercenary market?	A commercial market for offensive cyber capability, including spyware, exploit brokers, and hack-for-hire services. It converts state-grade capability into purchasable services. Sources: Singer (2003) on privatized force; export-control and investigative reports.

Cue (question / prompt)	Notes (answer, evidence, source log)
How do jihadist networks organize transnationally?	Through ideology, branding, affiliate relationships, and local insurgent integration. Affiliation ranges from command to inspiration. Sources: UN Panel of Experts reports; conflict datasets.
What is Keck and Sikkink's advocacy model?	Transnational advocacy networks use information politics, symbolic politics, leverage politics, and accountability politics to change state behavior. Source: Keck and Sikkink (1998).
What are illicit financial networks?	Systems for laundering, sanctions evasion, and kleptocratic wealth protection. They exploit gaps between jurisdictions and weak enforcement. Sources: FATF reports; Naim (2005).
What does FATF listing do?	It raises compliance costs, signals risk, and can restrict market access. It is technical in form but political in effect. Source log: FATF reports.
Why is the African perspective primary here?	African cases show hybrid governance, non-state security provision, and sovereignty as practice rather than only legal status. Sources: Reno (2011); African scholarship on hybrid orders.
How does China frame non-state actors?	Through non-interference, BRI security, and state-firm coordination; concern about external sanctions and route disruption. Source log: Chinese policy statements; BRI security discourse.
How does Russia use PMCs?	As deniable instruments for regime security, resource access, and great-power competition. Source log: Reno (2011); UN Panel of Experts reports.
What is the Western liberal-institutional critique?	Emphasizes sanctions, counterterrorism, market regulation, and accountability; risks over-securitizing non-state actors. Source log: FATF; UN sanctions regimes.
What is the UN perspective?	Security Council sanctions, FATF standards, IHL obligations, and humanitarian access; seeks universal rules for non-state conduct. Source log: UN Panel of Experts reports.

Summary (3–5 sentences): Transnational non-state actors operate across borders through markets, networks, violence, advocacy, and illicit finance. Their power must be analyzed by mechanism and level of analysis, not by scale alone. Data on corporate revenue, cyber markets, FATF lists, and terrorist activity are politically constructed and require perspective-aware interpretation. The African vantage point is especially important because it reveals hybrid governance and the practical limits of state sovereignty. No single perspective fully captures both the data-generation process and the political consequences of transnational non-state power.

SECTION 5 — FEYNMAN COMPRESSION

1. **Explain without jargon.** Transnational non-state actors are groups, companies, or networks that cross borders and influence politics even though they are not governments. Some sell goods, some sell hacking tools, some fight, some advocate, and some move dirty money. States try to regulate them, but their cross-border nature makes control difficult.

2. **Mark gaps.** My first explanation risks treating all non-state actors as equally powerful and equally "non-state." It also risks confusing sales revenue with political power, and treating terrorist-incident counts as objective facts rather than data produced by definitions, reporting, and politics.

3. **Reread verification.** Rechecking the key ideas: MNC power is about position and mobility, not just size; cyber mercenaries commercialize offensive capability; jihadist networks vary from command to inspiration; advocacy networks work through information and leverage; illicit networks exploit jurisdictional gaps. The data lab confirms that estimates are uncertain and lists are political instruments.

4. **Analogy with explicit limits.** A useful analogy is a multinational franchise: local branches operate under a shared brand and rules, but ownership, control, and accountability vary. The analogy helps explain networked organization, but it breaks down because franchises do not usually use violence, evade sanctions, or claim political authority.

5. **Rewrite.** Transnational non-state actors are cross-border networks whose influence depends on specific mechanisms—market position, commercialized coercion, ideological affiliation, advocacy leverage, or illicit finance. Their power is real but bounded, and the data used to measure it are themselves shaped by political and institutional choices.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L50	Definition	What is a transnational non-state actor (TNSA)?	An actor operating across borders without sovereign statehood that exercises governance, coercion, or influence through networks rather than territory; includes MNCs, NGOs, PMCs, terrorist networks, and illicit financial networks.	African perspective stresses these actors often fill governance vacuums left by weak or captured states.
L50	Mechanism	How do MNCs become geopolitical actors?	Through control of critical supply chains, technology standards, and capital flows, firms shape state preferences and can be weaponized by home governments via sanctions compliance and export controls.	Western perspective treats this as market power; Chinese perspective emphasizes industrial policy and state-firm coordination.
L50	Application	What is Keck and Sikkink's boomerang model?	When domestic channels are blocked, activists bypass the state to international allies who pressure the home state, creating transnational advocacy networks that reframe local issues as international norms.	Western liberal-institutional lens; African scholars note asymmetry in whose voices get amplified.

Tag	Card Type	Front	Back	Perspective Note
L50	Comparison	How does Wagner/Africa Corps differ from traditional mercenaries?	It combined combat, resource extraction, and political influence under Russian state direction, blurring private commercial and strategic functions into a single hybrid instrument.	Russian perspective: strategic instrument; African perspective: hybrid governance and sovereignty erosion.
L50	Source	What is Naim's (2005) core argument in *Illicit*?	Global illicit networks (drugs, arms, people, money) exploit globalization's infrastructure and outpace state enforcement, creating a parallel global economy.	Western security framing; African perspective emphasizes demand-side drivers and historical extraction.
L50	Debate	Are PMCs a privatization of war or an extension of state power?	Singer (2003) argues PMCs marketize force; critics counter that states retain control via contracting, regulation, and deniability, making PMCs extensions of state power.	Russian use of Wagner shows state-directed hybridity rather than pure market logic.
L50	Mechanism	What drives the cyber mercenary market?	Offensive cyber capability is commodified and sold to states and non-state buyers, lowering barriers to entry and enabling plausible deniability for sponsors.	Western perspective: arms-control challenge; Chinese/Russian: sovereignty and information security.

Tag	Card Type	Front	Back	Perspective Note
L50	Reconstruction	What is the African perspective on non-state security?	Non-state actors often provide security and services where states are absent; legitimacy derives from performance and patronage, not formal sovereignty (Reno 2011).	Occludes Western state-centric frameworks that treat non-state order as mere disorder.
L50	Occlusion	What does the UN perspective tend to occlude?	Focus on state compliance and sanctions regimes can understate how non-state actors reshape governance on the ground.	UN: Security Council sanctions, FATF, IHL obligations for non-state actors.
L50	Adjudication	When does a non-state actor become a strategic instrument of a state?	When funding, command, and political objectives align with state interests while maintaining deniability; evidence includes Wagner in Africa and contested Houthi-Iran links.	Requires distinguishing correlation from command; African perspective stresses local agency.
L50	Visual	What is the FATF grey/blacklist function?	FATF identifies jurisdictions with weak AML/CFT controls; listing raises compliance costs and can trigger capital flight and de-risking by banks.	African states are disproportionately listed; raises sovereignty and development concerns.

Tag	Card Type	Front	Back	Perspective Note
L50	Source	What does Reno (2011) argue about warlord politics?	Warlords and non-state actors govern through shadow economies and external patronage; state collapse is not absence of order but an alternative order.	African perspective primary; challenges Western state-failure narratives.
L50	Mechanism	How do illicit financial networks enable sanctions evasion?	Shell companies, trade-based laundering, and crypto channels move value across borders, undermining sanctions and enabling kleptocracy.	FATF reports; UN Panel of Experts reports.
L50	Application	What did the 2023-2025 Houthi attacks demonstrate?	A non-state actor disrupted global shipping via Red Sea attacks, forcing rerouting and raising insurance costs, demonstrating transnational leverage without statehood.	All five perspectives; African: Red Sea littoral states affected.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence Audit (scored 0-100)

Concept	Confidence (0-100)	Evidence Basis	Gap to Close
Defining transnational non-state actors			
MNC-state geopolitical relationship			
Cyber mercenary market dynamics			
Transnational jihadist affiliate system			
Keck and Sikkink boomerang model			

Concept	Confidence (0-100)	Evidence Basis	Gap to Close
Illicit financial networks and sanctions evasion			
African hybrid governance perspective			
UN sanctions and FATF frameworks			

7.2 Three-Question Debrief

1. Which of the five perspectives did you find hardest to steel-man from within, and what evidence would change your view?
2. Can you state the mechanism by which a non-state actor converts network position into strategic leverage, without naming a specific case?
3. Where did you conflate description (what happened) with explanation (why it happened) in your memo draft?

7.3 Error-Log

Common Misconception	Correction	Evidence
Non-state actors are weak because they lack territory.	Network position, not territory, is the relevant resource; non-state actors can coerce globally (Houthis, cyber mercenaries).	Houthi Red Sea disruption 2023-2025; cyber mercenary market estimates.
PMCs are purely private market actors.	States direct, fund, and shield PMCs for deniability; Wagner/Africa Corps functioned as Russian strategic instrument.	UN Panel of Experts reports; Reno (2011).
FATF listings are neutral technical assessments.	Listings have distributional effects; African states disproportionately listed, raising sovereignty and development concerns.	FATF reports; African scholarship on de-risking.
NGOs always empower local voices.	Transnational advocacy can amplify some voices over others; boomerang politics may bypass local agency.	Keck and Sikkink (1998); African critiques of advocacy asymmetry.
Illicit networks are separate from the formal economy.	Illicit and licit networks are intertwined through trade-based laundering and shell companies.	Naim (2005); FATF reports.

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Transnational non-state actors (TNSAs); MNCs as geopolitical actors; cyber mercenaries; jihadist affiliate system; transnational advocacy networks; illicit financial networks	State-firm weaponization via sanctions/export controls; commodification of offensive cyber capability; boomerang politics; state-directed PMC hybridity; trade-based laundering and shell companies	Keck and Sikkink (1998) boomerang model; Naim (2005) illicit networks; Reno (2011) warlord politics; Singer (2003) Corporate Warriors	Houthi Red Sea attacks 2023-2025; Wagner/Africa Corps in Africa; FATF grey/blacklists; UN Panel of Experts reports	Privatization of war vs. state extension; NGO empowerment vs. voice asymmetry; FATF neutrality vs. distributional bias; state failure vs. alternative order	No measurable shipping disruption despite attacks; PMC operations independent of state direction; advocacy networks without domestic anchors; illicit flows uncorrelated with sanctions	L23 asymmetric warfare; L24 cyber; L7 constructivism; L51 climate; L57 infrastructure; L54 AI and warfare

SECTION 9 — REVIEW SCHEDULE

- **R1 (Day 1, 20 min):** Re-read Section 2.7 African perspective and flashcards 1-5; recite the five perspectives from memory.
- **R2 (Day 3, 30 min):** Redo the Problem Pair (Wagner/Africa Corps) from scratch without notes; compare to model answer.
- **R3 (Day 7, 45 min):** Complete the Independent Memo (Houthi case) under timed conditions; check against the four required headings.
- **R4 (Day 14, 30 min):** Reconstruct the comparison matrix (Section 2.7.6) from memory; verify against the lesson.
- **R5 (Day 30, 20 min):** Feynman compression: explain transnational non-state actors to a non-expert in 3 minutes; log gaps in error-log.

SECTION 10 — COMPLETION CHECKLIST

☐ I can define a transnational non-state actor and distinguish it from a domestic non-state actor.
☐ I can explain the mechanism by which MNCs become geopolitical actors.
☐ I can describe the cyber mercenary market and its implications for state power.
☐ I can outline the transnational jihadist affiliate system (Al-Qaeda, ISIS).
☐ I can apply Keck and Sikkink's boomerang model to a case.
☐ I can explain how illicit financial networks enable sanctions evasion.

- ☐ I can steel-man the African perspective on hybrid governance and non-state security.
- ☐ I can steel-man the Chinese, Russian, Western, and UN perspectives.
- ☐ I can reconstruct all five perspectives on the lesson's central topic.
- ☐ I can adjudicate between competing explanations using evidence.
- ☐ I can distinguish description, explanation, prediction, and prescription in my memo.
- ☐ I can identify falsifiers for each key claim.
- ☐ I can use the four levels of analysis (individual, state, systemic, transnational).
- ☐ I have completed the Data Lab analysis questions.
- ☐ I have drawn or described the three dual-coded visuals.
- ☐ I have filled in Cornell notes and the summary.
- ☐ I have logged at least three errors in the error-log.
- ☐ I can pass the hinge question without hesitation.

FURTHER READING (Optional)

Transnational advocacy and NGOs - Keck, M. E., and Sikkink, K. (1998). *Activists Beyond Borders: Advocacy Networks in International Politics*. Cornell University Press. - Risse, T., Ropp, S. C., and Sikkink, K. (eds.) (1999). *The Power of Human Rights*. Cambridge University Press.

Illicit networks and global crime - Naim, M. (2005). *Illicit: How Smugglers, Traffickers, and Copycats Are Hijacking the Global Economy*. Doubleday. - FATF (various years). *Mutual Evaluation Reports and High-Risk Jurisdictions*. FATF.

52. Climate Geopolitics

LESSON METADATA

Field	Value
Lesson number and title	Lesson 51: Climate Geopolitics
Module	Module 8: Indo-Pacific, Systemic Rivalry, and Transnational Forces
Prerequisites	L19 (resources), L17 (world-systems), L49 (Global South)

Field	Value
Interleaved links	Forward to L53 (critical minerals), L57 (biosecurity), L61 (grand strategy)
Reading load	7-9 hours
Content channels	Text, data lab, visual anchor, Cornell notes, flashcards, worked example, problem pair
Bloom ceiling	Evaluate / Create
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

Climate change is conventionally taught as a problem of atmospheric physics: greenhouse gases accumulate, temperatures rise, and humanity must collectively reduce emissions. That framing is not wrong, but it is radically incomplete, and its incompleteness is itself a political fact. The central puzzle of this lesson is not whether warming is occurring — the IPCC AR6 assessment reports (2021–2023) have settled that question with high confidence — but why states that broadly accept the same physical science disagree so fundamentally about who caused the problem, who must pay for it, who gets to develop, and who decides. Climate geopolitics is the study of how a biophysical process becomes a terrain of international contestation over sovereignty, responsibility, and survival. The lesson asks you to stop treating climate as an exogenous shock to an otherwise stable international order and to start treating it as a force that is actively restructuring that order — reshaping alliances, redefining security, redistributing vulnerability, and renegotiating the terms of global capitalism.

This lesson sits at a deliberate intersection in the curriculum. Module 8 addresses Indo-Pacific rivalry, systemic competition, and transnational forces; climate is all three simultaneously. It is transnational because the atmosphere is a global commons that no state can fence. It is systemic because differential vulnerability and differential responsibility are reordering power relations between North and South, and between rising and declining powers. It is Indo-Pacific because the region contains both the world's largest emitter (China), the world's largest historical emitter (the United States), the most climate-vulnerable small island states, and the critical mineral supply chains on which decarbonization depends. The prerequisites — L19 on resources, L17 on world-systems, L49 on the Global South — are not decorative. L19 supplies the resource-competition lens: climate policy is, among other things, a contest over who controls the inputs to a green economy. L17 supplies the structural lens: climate vulnerability maps onto core-periphery relations established through colonial extraction. L49 supplies the agential lens: the "Global South" is not a passive victim of warming but a political coalition that has forced loss and damage onto the multilateral agenda. The forward links — L53 on critical minerals, L57 on biosecurity, L61 on grand strategy — extend the analysis: decarbonization requires minerals whose extraction reproduces colonial patterns; climate interacts with pandemic risk through zoonotic spillover and food system stress; and climate is now embedded in national security doctrines from the US National Security Strategy to NATO's climate security agenda.

By the end of this lesson you will be able to do five things that you could not do before. First, you will be able to analyze climate negotiations not as technical exercises in emissions accounting but as geopolitical bargaining over historical responsibility, development rights, and financial transfers. Second, you will be able to reconstruct five distinct perspectives — African, Chinese, Russian, Western, and UN — on climate

geopolitics, steel-manning each from within its own premises, and identifying what each reveals and what each occludes. Third, you will be able to apply the concept of hydro-hegemony to transboundary river disputes, using the Nile, Mekong, and Tigris-Euphrates cases as comparative material. Fourth, you will be able to evaluate the politics of loss and damage finance, including the 2022–2023 COP27/COP28 negotiations that established the Loss and Damage Fund, and to assess whether that fund represents a genuine shift in climate justice or a managed concession. Fifth, you will be able to adjudicate between competing explanations of the same event — for instance, whether a given climate-security initiative is best understood as genuine risk management, as securitization that depoliticizes justice claims, or as great-power competition dressed in green.

The theoretical lineage you will draw on is substantial and contested. On climate as threat multiplier, the foundational work is Barnett (2003), who argued that climate change amplifies existing vulnerabilities rather than creating new conflicts ex nihilo, and Busby (2018), who examined how climate interacts with state fragility and governance capacity. On hydro-hegemony, the key framework is Zeitoun and Warner's (2006) theory of hydro-hegemony, which treats transboundary water not as a neutral resource but as a site of power asymmetry structured by riparian position, material power, and ideational framing. On loss and damage, the relevant literature spans climate justice scholarship, the UNFCCC's own evolving architecture, and the advocacy of Global South coalitions. On securitization, the Copenhagen School (Buzan, Wæver, and de Wilde, 1998) provides the theoretical vocabulary, though its application to climate has been heavily contested by scholars who warn that securitization can close down democratic deliberation. On just transition, the literature connects decarbonization to labor politics, industrial policy, and the geopolitics of critical minerals. None of these theories is presented here as settled truth; each carries scope conditions and counterarguments that you are expected to weigh.

The African perspective is primary in this lesson, and that primacy is methodological, not merely representational. The standard Western framing of climate change as a "global commons problem" requiring collective action and cost-sharing treats all parties as symmetrically situated agents who happen to have different emission levels. The African vantage point — reconstructed from within through the scholarship of Grovogui, Mbembe, Bayart, Mamdani, Rodney, Nkrumah, Nyerere, Cabral, Fanon, Aning, Danso, Tamale, and Oyěwùmí — reveals this symmetry as fictive. It shows that climate vulnerability in Africa is not a natural fact but a historical product of colonial extraction, cash-crop economies, and externally imposed development models. It shows that "adaptation finance" and "loss and damage" are not charity but partial restitution for a debt incurred by the industrialized North. And it shows that the language of "common but differentiated responsibilities" (CBDR), while legally enshrined in the UNFCCC, is constantly diluted in practice by Northern pressure to universalize obligations. What the African perspective reveals that the other four miss is the constitutive role of colonial history in producing present vulnerability, and the way in which climate finance discourse can reproduce dependency even while claiming to remedy it.

A final methodological note. Throughout this lesson you will be asked to distinguish four operations: description (what happened), explanation (why it happened), prediction (what will happen), and prescription (what should happen). These are routinely conflated in climate discourse — a description of rising temperatures becomes a prescription for a particular policy, or an explanation of Northern responsibility becomes a prediction of Southern inaction. The worked example on COP27/COP28 and the problem pair on the Nile dispute are designed to train you in keeping these operations separate and in recognizing when an argument smuggles one into another. The data lab gives you quantitative material to ground your claims; the visual anchor gives you spatial and relational scaffolding; the Feynman compression and Cornell notes force you to reconstruct the argument in your own voice. Climate geopolitics is a field where the stakes are existential

and the rhetoric is overheated; the discipline this lesson cultivates is the ability to reason carefully when the pressure to conclude is greatest.

SECTION 1 — Pre-Class Priming

1.1 Retrieval Warm-Up Answer each question from memory before consulting notes. These draw on lessons already completed.

1. **(L19 — Resources)** What is the "resource curse," and how does it connect to state capacity and regime type? Give one African or Middle Eastern example.
2. **(L17 — World-Systems)** In world-systems theory, what distinguishes the core from the periphery, and through what mechanism does unequal exchange reproduce the gap between them?
3. **(L49 — Global South)** How does the "Global South" function as a political category rather than merely a geographic one? Name one coalition or forum through which it acts collectively.
4. **(L1 — Levels of Analysis)** Name the four levels of analysis used in this curriculum and give one example of a climate-relevant claim at each level.
5. **(L19 — Resources)** What is hydro-hegemony, and which riparian position (upstream or downstream) typically confers structural advantage in transboundary water disputes?
6. **(L49 — Global South)** In decolonial framing, what is the difference between "climate justice" and "climate charity," and why does the distinction matter for finance negotiations?

1.2 Orientation Questions These questions frame the lesson's central puzzles. You need not answer them fully now; they will guide your reading.

1. Why do cumulative historical emissions and current annual emissions produce different rankings of state responsibility, and which metric does each major negotiating bloc prefer?
2. Is loss and damage finance best understood as charity, insurance, or reparations — and what changes in the negotiation if the frame shifts from one to another?
3. How does securitizing climate change alter who governs the response, and what democratic or justice claims might be displaced in the process?
4. What does the Nile dam dispute reveal about power asymmetries in transboundary water governance that a purely technical "water management" framing would obscure?

1.3 Vocabulary Pre-Teach Provisional definitions to be refined as you work through the lesson.

- **Threat multiplier:** A factor that does not by itself cause conflict or crisis but amplifies existing vulnerabilities — poverty, weak governance, resource scarcity — so that climate stress produces disproportionate harm. Associated with Barnett (2003) and Busby (2018).
- **Hydro-hegemony:** The asymmetric control of transboundary water resources by a riparian state that leverages its geographic position, material power, and discursive framing to secure disproportionate water access. Associated with Zeitoun and Warner (2006).
- **Loss and damage:** The harms from climate change that cannot be avoided through mitigation or adaptation, including irreversible losses (lives, ecosystems, cultural heritage) and recoverable damages (infrastructure, livelihoods). A contested category in UNFCCC negotiations.

- **Common but differentiated responsibilities (CBDR):** The principle, enshrined in the 1992 UNFCCC, that all states share responsibility for climate change but that developed countries bear greater obligation because of their historical emissions and greater capacity. Constantly renegotiated in practice.
- **Climate securitization:** The framing of climate change as an existential security threat, which can mobilize resources and attention but may also shift governance from civilian to military institutions and depoliticize justice claims. Drawn from the Copenhagen School.
- **Just transition:** The principle that decarbonization must not impose disproportionate costs on workers, communities, or countries that depend on fossil fuel economies, and that the benefits of green transformation must be shared equitably.
- **Adaptation finance:** Financial transfers from developed to developing countries to support measures that reduce vulnerability to climate impacts, as distinct from mitigation finance (emissions reduction) and loss and damage finance (compensation for unavoidable harm).
- **Mitigation:** Actions that reduce or prevent greenhouse gas emissions, including energy transition, efficiency improvements, and carbon sinks.
- **Climate justice:** A framework that links climate change to historical responsibility, human rights, and equity, insisting that those who contributed least to the problem should not bear the greatest burden of its consequences.
- **Carbon colonialism:** The critique that Northern climate policies — such as large-scale land acquisitions for carbon offsets or biofuel plantations in the Global South — reproduce colonial patterns of extraction under a green veneer.
- **Upstream / downstream:** Riparian positions along a river; upstream states control flow volume and timing, while downstream states depend on releases they cannot compel, creating structural power asymmetry.
- **Climate reparations:** The demand that industrialized countries compensate developing countries for historical emissions and resulting damages, framing loss and damage not as charity or insurance but as debt. Prominent in African and broader Global South advocacy.

SECTION 2 — LESSON CORE

2.1 Learning objectives

After completing this lesson, the student will be able to:

1. **Analyze** the causal mechanisms through which climate stress translates into migration, food insecurity, and armed conflict, distinguishing direct biophysical impacts from socially mediated pathways and specifying the intermediate variables—livelihood collapse, price spikes, displacement, and institutional failure—that carry the effect from environmental shock to political outcome.

2. **Evaluate** the scope conditions under which the "threat multiplier" framing holds, using comparative case evidence to identify where climate stress produces conflict, where it produces adaptation, and where it produces neither, and to articulate the methodological debate between deterministic and probabilistic interpretations of the climate-conflict link.

3. **Compare** the African, Chinese, Russian, Western, and UN perspectives on climate security, identifying for each its core causal claim, its preferred policy instrument, and the empirical or normative blind

spot it introduces, while reconstructing each position from within rather than judging it by external standards.

4. **Apply** the threat-multiplier framework to a novel case—specifying the observable implications, the level of analysis at which the mechanism operates, and the evidence that would falsify the claim—while distinguishing description, explanation, prediction, and prescription in the student's own analysis.

5. **Critique** the securitization of climate response, tracing how the framing of climate as a security threat reallocates authority from civilian to military institutions, reshapes resource flows, and distributes costs and benefits asymmetrically across the Global North and Global South.

Each objective is assessable through a memo, case analysis, or structured comparison; the student should be able to move between levels of analysis (individual, state, systemic, transnational) without conflating them, and to hold competing explanations in tension before adjudicating on evidence.

2.2 KEY IDEA 1 — Climate as a threat multiplier: migration, food security, conflict

Bolded Causal Claim: Climate change does not, by itself, cause war or mass displacement; rather, it acts as a *threat multiplier* that amplifies pre-existing vulnerabilities—poverty, weak institutions, ethnic or resource grievances, and livelihood dependence on climate-sensitive sectors—thereby raising the probability of food insecurity, forced migration, and armed conflict in contexts where those vulnerabilities are already present, while leaving relatively unaffected those societies with diversified economies and robust adaptive capacity.

Mechanism: The causal pathway is indirect and multi-staged, which is precisely why the "threat multiplier" metaphor (Barnett 2003; Busby 2018) has displaced earlier "climate wars" determinism. The first stage is biophysical: anomalies in temperature and precipitation reduce yields in rain-fed agriculture and pastoral systems, deplete surface water and groundwater, and increase the frequency of extreme events such as droughts, floods, and cyclones. The second stage is economic and social: yield losses raise food prices, reduce rural incomes, and destroy assets; households respond by selling livestock, migrating, or joining armed groups. The third stage is political: when states cannot deliver relief, mediate resource competition, or manage displacement, grievances harden into mobilization. Each stage is a necessary but not sufficient link. Food price spikes—such as those of 2007–2008 and 2010–2011—illustrate the mechanism: they did not create the underlying grievances in Egypt, Tunisia, or Syria, but they accelerated mobilization by eroding the purchasing power of urban poor populations already alienated from authoritarian regimes. Similarly, the Syrian drought of 2006–2011 displaced an estimated 1.5 million rural inhabitants toward cities such as Daraa and Damascus, where they encountered overstretched services and political exclusion; the drought did not cause the Syrian civil war, but it enlarged the pool of aggrieved, mobile, and recruitable populations and strained the state's capacity to absorb them. Migration operates as both an adaptation strategy and a transmission mechanism: it relieves pressure at origin while concentrating demand for land, water, and employment at destination, where competition can escalate into violence if institutions are weak. The mechanism therefore runs through *intermediate social variables*—livelihood systems, market integration, state capacity, and migration networks—rather than directly from temperature to conflict.

Scope Conditions: The threat-multiplier effect is strongly conditional, and the scholarly record reflects this contingency. It is most likely where (a) livelihoods are heavily dependent on climate-sensitive, low-technology agriculture or pastoralism; (b) land and water tenure systems are contested or exclusionary; (c) state capacity to provide relief, mediate disputes, and manage migration is low; (d) there is a pre-existing

history of political marginalization or ethnic grievance; and (e) migration corridors are congested or cross hostile boundaries. Under these conditions, climate stress functions as a catalyst. Conversely, the effect is weak or absent where economies are diversified, institutions are inclusive and capable, social safety nets exist, and adaptation infrastructure—irrigation, early warning, insurance—is present. The empirical debate is sharp and instructive. Hsiang, Burke, and Miguel (2013), in a meta-analysis of 60 studies, found strong and consistent effects of temperature on conflict. By contrast, Buhaug (2010, 2015) and Theisen, Gleditsch, and Buhaug (2013) argue that the climate-conflict link is fragile, sensitive to model specification, and disappears when political and economic controls are included; they emphasize that most armed conflicts occur in poor, institutionally weak states regardless of climate trends. Raleigh and Urdal (2007) and Salehyan (2008) occupy a middle ground, finding that environmental scarcity increases conflict risk primarily through migration and resource competition in specific contexts. The appropriate theoretical posture is therefore probabilistic and scope-bound: climate change raises the *conditional probability* of conflict and displacement in vulnerable contexts; it does not determine outcomes. Treating it as a universal cause is both empirically unsupported and politically dangerous, because it can obscure the agency of governments, militias, and international actors who choose violence.

Observable Implications: If the threat-multiplier mechanism holds, one should observe: (i) temporal clustering of conflict onset or escalation following severe climate shocks in vulnerable regions such as the Sahel, the Horn of Africa, and Central America's Dry Corridor; (ii) displacement flows from climate-stressed rural areas to urban centers and across borders, with conflict incidence rising in receiving areas; (iii) food price spikes preceding or accompanying episodes of civil unrest; (iv) state capacity erosion—measured by relief delivery failures, fiscal stress, or legitimacy crises—following climate shocks; and (v) the absence of comparable conflict responses to similar shocks in institutionally robust settings. Counter-implications that would challenge the framework include: large climate shocks producing no conflict where institutions are strong (Bangladesh's cyclone management); conflict occurring without any climate stressor; and climate stress producing cooperative rather than competitive resource management, as in some transboundary water regimes. The framework also implies that adaptation investments—irrigation, drought-resistant crops, early warning systems, social protection—should reduce conflict incidence, a testable prediction with growing but still mixed evidence.

Perspective Note (five traditions in brief):

African (primary): The African vantage point insists that climate vulnerability is not a natural condition but a historical product. From Rodney's (1972) analysis of how colonial extraction underdeveloped African economies, through Mamdani's (1996) work on the bifurcated state, to contemporary scholars such as Grovogui (2006) and Mbembe (2001), the argument is that African populations face climate stress with diminished adaptive capacity because colonial and post-colonial structures stripped them of resources, fragmented institutions, and locked them into climate-sensitive export economies. The threat-multiplier framing is therefore double-edged: it correctly identifies climate as an amplifier, but it risks securitizing African populations and legitimizing external military or humanitarian intervention that reproduces colonial patterns of control. African scholarship emphasizes that the "multiplier" is not climate alone but the intersection of climate with global inequality, debt, and trade regimes that constrain African policy space. The appropriate response, on this view, is not security but justice: adaptation finance, loss and damage compensation, and structural transformation of economies away from climate-sensitive dependence. The African perspective also cautions against treating the continent as a uniform "climate conflict zone," which erases the diversity of African experiences and the agency of African communities in managing variability.

Chinese: China's perspective is shaped by its dual identity as a developing country with massive climate vulnerability—floods, droughts, and desertification affecting hundreds of millions—and as the world's largest current emitter. Beijing frames climate primarily as a development issue rather than a security threat, invoking the principle of "common but differentiated responsibilities" (CBDR) to insist that developed countries, having consumed the bulk of the historical carbon budget, bear the obligation to finance mitigation and adaptation in the Global South. Chinese discourse is skeptical of Western securitization of climate, which it reads as a potential pretext for military presence in regions such as the South China Sea or Africa, and as a distraction from the core obligation of finance and technology transfer. At the same time, China has invested heavily in renewable energy and green technology, positioning itself as a leader in the energy transition while resisting binding emission cuts that would constrain industrial growth. The Chinese perspective thus contributes an emphasis on developmental sovereignty and historical responsibility, but it occludes China's own growing emissions and its role in financing carbon-intensive infrastructure abroad through the Belt and Road Initiative.

Russian: Russia's perspective combines skepticism about climate-conflict causality with a resource-state calculus. Moscow has historically downplayed anthropogenic climate change and emphasized natural variability; Russian officials and scholars often treat Western climate securitization as a geopolitical instrument aimed at constraining Russian hydrocarbon exports and imposing normative standards that weaken Russian sovereignty. At the same time, Russia is a major beneficiary of Arctic warming: the Northern Sea Route, expanded resource extraction, and longer growing seasons are framed as opportunities. The resource-state framing means that climate change is evaluated primarily through its effects on energy markets, territorial control, and great-power competition rather than through human security. Russia's perspective contributes a useful corrective to alarmist determinism and highlights the geopolitical economy of energy transitions, but it occludes the vulnerability of Russian populations to permafrost thaw, wildfires, and agricultural disruption, and it underestimates the security implications of climate stress in Russia's near abroad.

Western: The Western perspective is bifurcated between climate leadership and security framing. On one side, Western governments and institutions—the EU, the US under various administrations—have championed mitigation targets, carbon markets, and green technology, positioning themselves as norm entrepreneurs. On the other, defense establishments such as the US Department of Defense and NATO have formally designated climate change a "threat multiplier" and "existential threat," integrating it into strategic planning and military operations. This securitization has produced genuine analytical advances (Busby 2018) but also a self-critique: Western governments acknowledge the finance gap, having failed to meet the $100 billion annual pledge to developing countries, and recognize that their security framing can crowd out development and justice approaches. The Western perspective contributes scientific capacity, institutional frameworks, and significant (if insufficient) finance, but it occludes the historical responsibility for emissions and the ways in which Western consumption and military activity themselves drive climate stress.

UN: The UN perspective is institutional and multilateral, anchored in the UNFCCC, the IPCC's assessment reports (including AR6, 2021–2023), and the Sustainable Development Goals (SDG 13). It frames climate change as a global commons problem requiring collective action, emphasizes the 1.5°C target, and has developed a science-policy interface through the IPCC. The UN system has increasingly adopted security language—the Security Council has held debates on climate and security since 2007—while also maintaining development and human-rights frames. The UN perspective contributes legitimacy, scientific authority, and a forum for negotiation, but it is constrained by the consensus requirement, by the power of major emitters, and by the gap between agreed targets and implemented policies. Its occlusion is structural: it can describe

the problem authoritatively but lacks enforcement capacity, and its framing often privileges state-centric solutions over sub-state and community-level adaptation.

SECTION 2.3 KEY IDEA 2 — Hydro-hegemony: upstream/downstream dynamics

Bolded Causal Claim: In transboundary river basins, upstream states can convert geographic position into durable political leverage over downstream states by controlling the timing, volume, and quality of water flows, so that hydrology becomes a source of asymmetric power rather than merely a shared resource.

Mechanism: The mechanism begins with a physical asymmetry: rivers flow downhill, and the state that controls the headwaters or the first major infrastructure on a river can alter the hydrograph that downstream states receive. Dams, diversions, and reservoirs do not merely store water; they redistribute risk. An upstream state can withhold water during dry seasons, release it during floods, or use storage to generate electricity and irrigate territory, while downstream states inherit the residual flow. This creates a bargaining asymmetry because downstream agriculture, urban supply, energy systems, and ecosystems are calibrated to historical flow patterns that the upstream state can now change. The leverage is structural rather than episodic: even if no water is withheld, the credible possibility of withholding shapes negotiations over trade, security, development finance, and regional order. Issue linkage amplifies the mechanism. Upstream states often frame dams as sovereign development and climate adaptation, while downstream states frame the same infrastructure as an existential threat. The upstream state can offer cooperation—data sharing, agreed filling schedules, electricity exports—as a concession, converting control into diplomatic currency. Downstream states may respond with legal claims based on equitable utilization, counter-alliances, economic pressure, or attempts to diversify water sources, but these responses are costly and often slower than the physical transformation of the river. Climate change intensifies the mechanism by increasing hydrological variability and making storage more valuable, but it does not by itself determine outcomes; the decisive variable is the distribution of infrastructural, financial, and diplomatic capacity among riparians. The Nile, Mekong, and Tigris-Euphrates cases show the same pattern in different political settings: upstream development becomes a claim about sovereignty and modernization, while downstream vulnerability becomes a claim about security and historical rights.

Scope Conditions: Hydro-hegemony is most likely where a river basin is transboundary, water stress is high, downstream states depend heavily on the river for agriculture or energy, and the upstream state has the capacity to finance and construct major infrastructure. It is strengthened where basin institutions are weak, contested, or dominated by the upstream state, and where downstream states lack credible counter-leverage such as alternative water sources, economic sanctions, or strong external allies. It is weakened where riparians have comparable power, where basin organizations enforce data sharing and benefit-sharing, where third parties mediate effectively, or where downstream states can mobilize international law and diplomatic coalitions. The mechanism does not imply that every dam causes conflict; many transboundary projects produce mutual gains when benefits are shared and risks are transparent. It also does not imply that downstream states are passive. Counter-hegemony can take the form of legal mobilization, alliance-building, economic diversification, or domestic adaptation. The concept is therefore a theory of asymmetric interdependence, not a prediction of inevitable water war.

Observable Implications: Where hydro-hegemony operates, one should observe upstream infrastructure announcements followed by downstream diplomatic protests; disputes over filling schedules and flow data; upstream framing in the language of sovereignty and development; downstream framing in the language

of existential security and historical rights; marginalization or capture of basin organizations; demands for compensation, benefit-sharing, or guaranteed minimum flows; and external mediation by regional organizations or international financial institutions. In the Nile basin, the Grand Ethiopian Renaissance Dam has produced precisely this pattern: Ethiopia presents the dam as a sovereign development and electrification project, Egypt treats upstream control as a threat to water security, and Sudan occupies an intermediate position shaped by its own irrigation and flood-management interests. In the Mekong basin, China's upstream cascade has generated downstream complaints about dry-season flows, sediment loss, and ecological change, while Beijing emphasizes development, poverty reduction, and regional cooperation. In the Tigris-Euphrates basin, Turkey's Southeastern Anatolia Project has created recurring tensions with Iraq and Syria over flow volumes, especially under drought conditions. Climate stress should amplify these disputes by making flows less predictable and storage more strategically valuable, but the observable signature is political bargaining over infrastructure and data, not simply hydrological scarcity.

Perspective Note (five traditions in brief):

African (primary): The Nile dispute is best understood from within African debates about sovereignty, development, and the legacy of colonial water treaties. Ethiopian scholarship and official discourse frame the Grand Ethiopian Renaissance Dam as an emancipatory infrastructure project: a late-developing state asserting control over a river whose benefits were historically captured downstream and whose colonial-era agreements excluded Ethiopia. Egyptian discourse, by contrast, treats the Nile as a matter of existential water security and invokes historical use, legal continuity, and downstream vulnerability. Sudan's position is more ambivalent, reflecting both potential benefits from regulated flows and risks to its own dams and irrigation. African scholars such as Grovogui, Mbembe, Bayart, Mamdani, and Rodney would situate this dispute in a longer history of uneven development, external extraction, and state formation under colonial and postcolonial conditions; the dam is not merely a technical project but a claim about who gets to develop and on what terms. The African Union's mediation role reflects a regional preference for African-led solutions, even as power asymmetries among riparians constrain its neutrality. Climate vulnerability is present on all sides, but it is filtered through competing claims about historical entitlement, sovereign equality, and the right to development. The African vantage point reveals that hydro-hegemony is not only about water control; it is about the political economy of late development and the unresolved question of whether colonial-era resource arrangements can be renegotiated without reproducing new hierarchies.

Chinese: The Chinese perspective on transboundary rivers emphasizes sovereignty, development, and non-interference. In the Mekong basin, upstream dams are framed as legitimate development and clean-energy infrastructure, while downstream concerns are addressed through technical cooperation, data sharing, and the Lancang-Mekong Cooperation framework rather than through binding basin-wide adjudication. Beijing's position treats water as a domestic resource until it crosses a border, and it resists external interference in dam construction or operational decisions. This perspective contributes an emphasis on development rights and infrastructure-led growth, but it can occlude downstream ecological and livelihood impacts by privileging state-to-state cooperation over community-level vulnerability.

Russian: The Russian perspective is less centrally focused on river basins but treats water and energy infrastructure as strategic assets within a broader resource-state logic. Moscow tends to support state sovereignty over natural resources, resists Western conditionality, and views basin disputes through the lens of great-power competition and regional influence. In the Middle East and Central Asia, Russia has historically positioned itself as a mediator or security guarantor, but its approach prioritizes state stability and geopolitical access over ecological or distributive justice. This perspective contributes a realist emphasis on power

and sovereignty, but it can occlude environmental vulnerability and the needs of downstream populations.

Western: The Western perspective emphasizes international water law, basin cooperation, data transparency, and conflict prevention. It tends to frame transboundary water disputes as governance problems solvable through treaties, joint commissions, and technical assistance, and it often supports mediation by international financial institutions or regional organizations. This perspective contributes legal norms and institutional templates, but it can occlude the developmental asymmetries that make upstream states reluctant to accept constraints and downstream states desperate for guarantees. It may also overestimate the capacity of legal frameworks to override power politics.

UN: The UN perspective promotes transboundary water cooperation through conventions, sustainable development goals, and technical agencies. It emphasizes equitable and reasonable utilization, the obligation not to cause significant harm, and the value of basin organizations. The UN contributes legitimacy and scientific assessment, but it is constrained by state consent, weak enforcement, and the tendency of major riparians to treat water as a sovereign resource. Its occlusion is structural: it can articulate norms but cannot compel compliance when upstream states possess both physical control and geopolitical leverage.

SECTION 2.4 KEY IDEA 3 — Loss and damage finance: the Global South's demand and the politics of climate reparations

Bolded Causal Claim: Loss and damage finance is a contested redistribution mechanism that converts climate vulnerability and historical emissions into claims for reparative justice; its institutionalization at recent COPs marks a shift in Global South bargaining power, but its adequacy remains constrained by donor reluctance, definitional ambiguity, and the political separation of assistance from liability.

Mechanism: The mechanism begins with a gap between mitigation, adaptation, and lived climate impacts. Even if emissions fall and adaptation expands, some losses are unavoidable or irreversible: destroyed infrastructure, lost livelihoods, cultural heritage, non-economic losses, and slow-onset changes such as sea-level rise and desertification. Vulnerable states, particularly small island states, least developed countries, and African states, have argued that these losses are not merely unfortunate but unjust, because they fall disproportionately on those who contributed least to historical emissions. This framing converts climate impacts into a claim about responsibility and redistribution. The demand for loss and damage finance then enters the UNFCCC bargaining arena, where coalitions such as the G77 and China, the Alliance of Small Island States, the Least Developed Countries group, and the African Group leverage moral authority, vulnerability, and bloc solidarity to push for institutional recognition. The mechanism is not simply need-based; it is politically constructed through framing, coalition-building, and the strategic use of scientific assessments such as IPCC AR6. Donor states resist the language of compensation or liability because it implies legal responsibility and potentially unlimited claims, so they prefer terms such as solidarity, assistance, or humanitarian support. The resulting compromise creates funds and mechanisms that acknowledge loss and damage without admitting liability. The COP27 decision to establish a loss and damage fund, followed by COP28 operationalization efforts, represents a partial victory for the Global South: the principle of dedicated finance gained institutional form. Yet the mechanism remains incomplete because pledges are small relative to estimated needs, governance arrangements are contested, eligibility criteria are unresolved, and the sources of funding—whether public grants, innovative levies, or private finance—remain politically charged. The fund can therefore function either as a genuine redistributive instrument or as a symbolic concession that absorbs pressure without altering underlying power relations.

Scope Conditions: Loss and damage finance applies most directly where climate impacts are severe, un-

avoidable, or irreversible; where affected states have limited fiscal capacity; and where historical emitters have greater resources. It is strengthened by cohesive Global South coalitions, strong scientific attribution, and moral framing that links vulnerability to historical responsibility. It is weakened where donors can fragment coalitions, redefine loss and damage as development or humanitarian assistance, or shift responsibility to private insurance and market mechanisms. The mechanism also depends on definitional clarity: if loss and damage is defined too narrowly as sudden disaster damage, slow-onset and non-economic losses may be excluded; if defined too broadly, donors may resist on cost grounds. The scope excludes ordinary development finance and adaptation funding, although in practice the boundaries are blurred. The mechanism is not a settled system of climate reparations; it is an ongoing contest over whether and how historical responsibility will be translated into material transfers.

Observable Implications: Where loss and damage finance is operating as a political mechanism, one should observe sustained Global South demands at COPs; creation of dedicated funds and transitional committees; disputes over eligibility, governance, and sources of finance; large gaps between estimated needs and pledged resources; donor preference for voluntary contributions over assessed obligations; and contestation over whether finance should be grants rather than loans. The COP27 and COP28 negotiations provide the central case: the fund's establishment was a breakthrough, but subsequent debates over who pays, who receives, and how much reveal the limits of institutional progress. Data on cumulative emissions by region, climate finance flows, and loss and damage pledges versus estimated needs should show a persistent mismatch between responsibility, vulnerability, and disbursement. One should also observe rhetorical shifts: donor states increasingly acknowledge loss and damage while avoiding liability language; recipient states increasingly frame finance as a matter of justice rather than charity. The observable signature is therefore not merely money moving, but a struggle over the meaning of responsibility.

Perspective Note (five traditions in brief):

African (primary): The African perspective frames loss and damage finance through the lens of climate vulnerability, adaptation deficits, and colonial responsibility. African states and scholars emphasize that the continent contributes minimally to historical emissions yet bears disproportionate climate impacts, including drought, flood, food insecurity, and displacement. From this vantage point, loss and damage is not a technical funding gap but a question of justice: the costs of a crisis created elsewhere are being imposed on those least able to absorb them. African negotiators have been central to the demand for dedicated finance, often aligning with the G77 and China while stressing African specificities such as agricultural dependence, weak infrastructure, and limited fiscal space. The colonial responsibility framing does not necessarily require a legal finding of liability; it asserts that historical patterns of extraction and unequal development have left African states less resilient and therefore entitled to reparative support. African scholars such as Grovogui, Mbembe, Bayart, Mamdani, Rodney, Nkrumah, Nyerere, Cabral, Fanon, Aning, Danso, Tamale, and Oyěwùmí would situate climate finance within broader critiques of global inequality, racialized vulnerability, and the unfinished project of decolonization. The African perspective contributes a moral and historical depth that purely technocratic finance debates often lack, but it must also confront internal questions of governance, elite capture, and the distribution of funds within states. Its occlusion in donor discourse is that vulnerability is treated as a natural condition rather than a product of historical and structural inequality.

Chinese: The Chinese perspective combines developmental priorities with the principle of common but differentiated responsibilities. Beijing emphasizes that developing countries require policy space and finance to pursue growth while addressing climate impacts, and it resists attempts to impose uniform obligations or liability frameworks that could constrain development. China positions itself as a developing country in

climate negotiations, even as its emissions profile and economic weight have grown, and it supports South-South cooperation and technology transfer. This perspective contributes a defense of development rights and a challenge to Western-centric responsibility narratives, but it can occlude China's own growing emissions and the question of how large emerging economies should contribute to loss and damage finance.

Russian: The Russian perspective is marked by skepticism toward climate securitization and by a resource-state framing. Moscow has historically questioned the urgency and distribution of climate commitments, emphasized energy security and fossil-fuel exports, and resisted constraints that would undermine its hydrocarbon economy. In loss and damage debates, Russia is unlikely to accept liability or large assessed contributions, and it may view climate finance as a Western-led agenda that obscures geopolitical competition. This perspective contributes a realist reminder that energy transitions and finance commitments are shaped by material interests, but it occludes the vulnerability of climate-affected populations and the scientific consensus on anthropogenic warming.

Western: The Western perspective combines climate leadership rhetoric with a self-critical acknowledgment of the finance gap. Western states have accepted the need for mitigation and adaptation finance, and some have supported loss and damage mechanisms, but they remain reluctant to accept liability or open-ended compensation. The dominant Western approach treats loss and damage as a humanitarian and development challenge to be managed through voluntary contributions, insurance, and market mechanisms rather than as a reparative obligation. This perspective contributes technical capacity, funding, and institutional design, but its occlusion is the persistent gap between pledged and needed finance and the avoidance of historical responsibility.

UN: The UN perspective is anchored in the UNFCCC, the IPCC, and SDG 13. It provides the institutional forum, scientific assessment, and normative framework within which loss and damage has been negotiated, and it has increasingly recognized climate impacts as a matter of justice and human rights. The UN contributes legitimacy and a space for consensus-building, but it is constrained by the consensus requirement, by the power of major emitters, and by the gap between agreed targets and implemented policies. Its occlusion is structural: it can describe the problem authoritatively and create mechanisms, but it lacks enforcement capacity and often privileges state-centric solutions over community-level adaptation and redress.

2.5 KEY IDEA 4 — Climate securitization — the militarization of climate response

Bolded Causal Claim: When climate change is framed primarily as a security threat, the policy response tends to migrate from civilian adaptation, development, and rights-based institutions toward military, intelligence, and border-control apparatuses; this can mobilize capacity and attention, but it also risks militarizing vulnerability, criminalizing mobility, and substituting coercion for the distributive politics that climate justice requires.

Mechanism: The mechanism begins with the interaction between climate impacts and pre-existing political fragility. Drought, flooding, sea-level rise, heat stress, and livelihood collapse do not automatically produce conflict, but they can intensify competition over land, water, pasture, and urban services in contexts where institutions are weak, inequality is high, and grievances are already politicized. Security actors then interpret these stresses through a threat lens: migration becomes "mass displacement," resource scarcity becomes "instability," and climate-affected regions become "risk zones." Through securitizing speech acts, institutional mandates, budget lines, and operational planning, climate change is moved from the domain of environmen-

tal policy and development into the domain of national security. This shift matters because militaries possess distinctive capabilities—logistics, surveillance, coercive force, rapid deployment, and strategic planning—that civilian agencies often lack, especially in states with limited administrative capacity. Once climate is securitized, those capabilities become the default instruments of response. The result is not simply more attention to climate risk; it is a reordering of who governs climate risk. Adaptation finance can be redirected toward base resilience, coastal defense, maritime domain awareness, and border hardening; humanitarian assistance can be folded into counterinsurgency or stabilization logics; and climate-affected populations can be recast as security risks rather than rights-bearing communities. The mechanism also contains a feedback loop: securitized narratives can justify exceptional measures, reduce democratic deliberation, and produce "climate wars" framings that may overstate direct causal links between climate and conflict. Those framings can then legitimate further militarization, even where the underlying vulnerability is better addressed through livelihood support, early warning, land tenure reform, water governance, or social protection. In this sense, climate securitization is not merely a rhetorical move; it is an institutional reallocation of authority, money, and legitimacy from civilian to coercive actors.

Scope Conditions: Climate securitization is most likely where climate impacts intersect with pre-existing conflict, weak governance, militarized borders, strategic resources, or great-power competition. It is especially pronounced in regions where migration routes cross heavily policed borders, where water or energy chokepoints are contested, or where external powers frame local instability as a threat to global order. It is also more likely where domestic political incentives favor externalizing blame, where military institutions have high legitimacy, and where civilian adaptation systems are underfunded or fragmented. Conversely, securitization is less likely to dominate where climate impacts are slow-onset and managed through decentralized development institutions, where adaptation is locally owned and rights-based, where military actors lack legitimacy, or where climate policy is insulated from security bureaucracies. A further scope condition concerns the type of military role: humanitarian assistance and disaster relief can save lives and need not imply militarization, whereas the use of climate risk to justify surveillance, border enforcement, counterinsurgency, or strategic competition is more clearly securitizing. The distinction between "climate-proofing security institutions" and "securitizing climate vulnerability" is therefore analytically crucial.

Observable Implications: Where climate securitization is strong, one should observe defense ministries publishing climate risk strategies, NATO or regional security organizations incorporating climate into threat assessments, military involvement in disaster response and infrastructure protection, increased budgets for border surveillance and coastal defense, and the framing of climate migrants as security risks rather than protected persons. One should also observe a skew in adaptation portfolios toward hard infrastructure, force protection, and strategic asset resilience, potentially at the expense of community-level adaptation, livelihood diversification, and social protection. In climate-affected regions, securitized responses may correlate with the criminalization of mobility, the militarization of resource governance, and the treatment of protests over land or water as security threats. At the international level, one may observe debates over whether the UN Security Council should address climate change, with some states arguing that securitization elevates urgency and others warning that it depoliticizes justice and opens space for intervention. These implications should be treated as patterns and institutional tendencies rather than proof that climate change directly causes war; the causal claim is about governance reallocation, not deterministic conflict.

Perspective Note (five traditions in brief):
African (primary): The African perspective begins from lived vulnerability and from the African Union's evolving climate-security agenda. African scholars and policymakers often accept that climate stress can exacerbate conflict, but they resist the translation of African suffering into a threat to Northern or global

order. The African Union Peace and Security Council has recognized climate change as a threat multiplier, yet African voices emphasize that the appropriate response is not militarization but investment in livelihoods, early warning, community resilience, and accountable governance. Scholars such as Kwesi Aning have stressed that security in Africa is inseparable from development and governance, while African critical thought, including Grovogui's insistence on recovering African agency in international order, warns against frameworks that manage African territory as a risk zone for external powers. African perspectives also highlight the danger that securitization empowers militaries in domestic politics, criminalizes pastoral and cross-border mobility, and reproduces colonial logics in which African populations are treated as sources of instability rather than bearers of rights. At the same time, African states may strategically use security framing to attract attention and resources, producing an ambivalent stance: climate security can open doors, but it can also narrow the definition of legitimate response. The strongest African contribution is to redefine security around human and ecological survival, democratic accountability, and livelihood protection rather than state or great-power stability.

Chinese: China frames climate through non-traditional security and comprehensive national security, emphasizing disaster relief, infrastructure resilience, energy security, and state capacity. It participates in UN climate-security discussions but is cautious about Security Council securitization, fearing mission creep, intervention, and the dilution of development priorities. Chinese discourse tends to treat climate as a governance and development challenge, with military roles largely confined to humanitarian assistance and disaster relief. This perspective contributes operational capacity and a focus on resilience, but it can occlude how state-led development, overseas infrastructure, and energy demand create vulnerabilities, and it often avoids rights-based accountability.

Russian: Russia is skeptical of anthropogenic climate threat and tends to treat climate securitization as a Western ideological construct that can justify intervention, NATO expansion, or interference in sovereign affairs. Its security framing centers on Arctic sovereignty, resource extraction, strategic posture, and energy leverage; climate change is instrumentalized where it opens shipping routes or resources, but downplayed where it threatens fossil rents. Russia resists UN securitization and emphasizes sovereignty and non-intervention. This perspective contributes a warning against militarized climate governance, but it occludes domestic climate risks, uses skepticism to protect hydrocarbon interests, and may itself militarize the Arctic under the guise of security.

Western: Western governments, especially the United States and European states, have increasingly defined climate change as a national security threat, producing defense climate strategies, NATO initiatives, and border securitization. This perspective can mobilize resources, elevate urgency, and integrate climate into strategic planning. Western self-critique acknowledges that securitization may overstate climate-conflict links, divert finance from adaptation, and militarize migration. Its contribution is institutional capacity and scientific assessment, but its occlusion lies in how Western consumption and emissions generate vulnerability elsewhere, and how security framing can serve domestic political interests while externalizing costs.

UN: The UN perspective is divided between development, humanitarian, and security institutions. Security Council debates have recognized climate as a risk multiplier in specific contexts, while UNEP, WFP, OCHA, and other agencies emphasize resilience, early warning, and humanitarian protection. The UN contributes legitimacy, coordination, and a forum for consensus, but it is constrained by sovereignty, the consensus requirement, and the power of major emitters. It can elevate urgency and create mechanisms, yet it lacks enforcement capacity and often privileges state-centric responses over community-level adaptation and redress.

2.6 KEY IDEA 5 — Just transition and the geopolitics of decarbonization — who bears the costs?

Bolded Causal Claim: Decarbonization is not a neutral technical shift but a redistributive geopolitical process: costs and benefits fall unevenly across regions, classes, and supply chains, so a "just transition" requires explicit allocation of burdens and benefits, not merely emissions targets or green technology deployment.

Mechanism: The mechanism is the restructuring of global political economy around a new energy system. Fossil fuels have historically concentrated rents in producer states, shaped great-power strategy, and tied development paths to hydrocarbon extraction and consumption. Decarbonization disrupts those arrangements by reducing demand for coal, oil, and gas while increasing demand for renewable technologies, electricity infrastructure, and critical minerals such as lithium, cobalt, nickel, copper, and rare earth elements. This shift creates new winners: renewable manufacturers, mineral exporters, grid and storage providers, green finance, and states that can subsidize domestic clean industries. It also creates new losers: fossil-dependent workers, coal and oil regions, petrostates facing stranded assets, and import-dependent economies exposed to volatile mineral and technology prices. The geopolitical mechanism operates through several channels. First, industrial policy: subsidies, local content requirements, and carbon border adjustments reshape trade and investment, as seen in the US Inflation Reduction Act and the European Green Deal. Second, supply-chain concentration: processing and manufacturing capacity for clean technologies is unevenly distributed, creating dependencies and leverage. Third, fiscal stress: fossil-dependent states may face declining revenues, debt distress, and limited capacity to finance diversification. Fourth, labor displacement: mine closures and refinery shutdowns can devastate communities unless retraining, social protection, and regional development are provided. Fifth, extraction frontiers: the mineral demands of decarbonization can reproduce enclave economies, land dispossession, and environmental harm in producing regions, especially where governance is weak. Justice claims therefore arise along three dimensions: distributive justice (who pays and who benefits), procedural justice (who decides transition pathways), and recognitional justice (whose knowledge, livelihoods, and historical experiences count). A transition is "just" only when these dimensions are addressed; otherwise, decarbonization may reduce emissions while intensifying inequality, dispossession, and geopolitical resentment.

Scope Conditions: The feasibility of a just transition depends on fossil dependence, mineral endowment, industrial capacity, fiscal space, labor institutions, governance quality, and access to finance and technology. It is more feasible where states have diversified economies, strong social dialogue, credible compensation mechanisms, and the ability to invest in retraining and regional development. It is less feasible where economies are heavily dependent on hydrocarbon rents, where debt limits public investment, where mineral extraction is enclave-based and poorly governed, or where transition policies are externally imposed through conditionality. Scope also depends on whether decarbonization is domestically owned or driven by external markets and donors. A further condition is time: abrupt phase-outs without adjustment support are more likely to produce backlash, while gradual transitions with credible alternatives can build coalitions. Finally, the global distribution of clean-technology manufacturing and mineral processing means that even ambitious national transitions may depend on unequal international supply chains, so justice cannot be assessed solely at the national level.

Observable Implications: Where just transition politics are active, one should observe coal phase-out agreements with compensation packages, regional development funds, retraining programs, and social dialogue mechanisms; disputes over carbon border adjustments and green subsidies; labor strikes or protests in fossil regions; mineral boom conflicts and community resistance in extraction zones; stranded-asset write-downs and fiscal stress in petrostates; and debates over technology transfer, benefit-sharing, and value addition

in mineral-producing countries. One should also observe the rise of "green industrial policy" as a central geopolitical tool, with states using subsidies and trade measures to capture clean-technology markets. At the international level, one should observe negotiations over just transition work programmes, climate finance, and the terms of energy partnerships. These implications do not imply that decarbonization is impossible or undesirable; rather, they show that its political sustainability depends on whether costs are recognized and redistributed.

Perspective Note (five traditions in brief):

African (primary): The African perspective begins from a stark asymmetry: Africa contributes a small share of historical and current emissions but faces severe climate vulnerability, while its development needs remain acute. From this vantage point, decarbonization can appear as either an opportunity for industrialization or a new form of green extractivism. African climate justice demands, articulated by the African Group of Negotiators and allied civil society, emphasize equity, adaptation finance, technology transfer, and the right to development. African critical thought, from Rodney's analysis of underdevelopment to Nkrumah's critique of neo-colonialism, frames resource extraction as a structural feature of global inequality; contemporary African scholars extend this to warn that lithium, cobalt, and other minerals may be exported raw while value is captured elsewhere. African feminist scholars such as Tamale remind us that transition costs fall unevenly by gender, as women often bear unpaid care and resource-gathering burdens when energy systems change. The African perspective therefore insists that a just transition must include value addition, local processing, community benefit-sharing, and finance for adaptation, not only emissions reduction. It also treats climate finance and loss-and-damage claims as part of the same justice agenda: decarbonization cannot be just if historical responsibility is evaded. Occlusion: African perspectives may understate governance challenges within mineral-producing states and the risk that elite capture reproduces inequality domestically.

Chinese: China frames decarbonization as a sovereign development path governed by common but differentiated responsibilities. It emphasizes its massive renewable deployment, electric vehicle production, and manufacturing scale, while resisting external pressure to phase out coal on timelines it considers incompatible with energy security and development. China also dominates much critical mineral processing, giving it leverage in clean-technology supply chains. Its perspective contributes industrial capacity and a challenge to Western monopoly over green transition norms, but it can occlude domestic coal dependence, air-quality and ecological costs, and the overseas fossil-fuel finance associated with the Belt and Road Initiative.

Russian: Russia is a hydrocarbon-dependent state for which decarbonization threatens rents, fiscal stability, and geopolitical leverage. Its perspective is skeptical of Western climate leadership, often framing the green transition as economic warfare or a pretext for restructuring global energy markets. It emphasizes fossil fuel indispensability, Arctic resources, and strategic energy exports. This perspective contributes a reminder that transitions have geopolitical losers, but it occludes climate risks, overstates fossil indispensability, and offers little in the way of domestic diversification or just-transition planning.

Western: Western perspectives combine climate leadership, net-zero targets, green industrial policy, and a self-critical acknowledgment of the finance gap. The United States and European Union have deployed large subsidy programs and carbon border adjustments, seeking to capture clean-technology markets while reducing emissions. Western discourse often frames just transition in terms of workers and communities in fossil regions, but its global occlusion lies in historical emissions, consumption-based responsibility, and the export of adjustment costs through trade measures. It contributes technology, finance, and normative ambition, but it can treat decarbonization as a market opportunity while underestimating distributive claims from the Global South.

UN: The UN perspective is anchored in the UNFCCC, the IPCC, SDG 7, and SDG 13, and it has developed

a just transition work programme and normative language around equity and sustainable development. It provides a forum for consensus, scientific assessment, and the articulation of global goals. Its contribution is legitimacy and coordination, but its occlusion is structural: it lacks enforcement capacity, depends on state consensus, and often struggles to convert just-transition rhetoric into binding finance, technology transfer, or accountability mechanisms.

SECTION 2.7 FIVE PERSPECTIVES IN DEPTH

2.7.1 African Perspective (PRIMARY)

The African perspective treats climate geopolitics not as an environmental externality added to an otherwise stable international order, but as a continuation of a longer history of extraction, racialized vulnerability, and contested sovereignty. From this vantage point, the central puzzle is not simply how to reduce emissions or manage risk, but how a continent that contributed least to cumulative greenhouse-gas emissions became the principal site of climate damage, adaptation debt, and resource extraction for other people's decarbonization. The African perspective therefore begins with a historical claim: climate vulnerability is not a natural condition produced by geography alone; it is politically produced through colonial underdevelopment, postcolonial state fragility, debt, and unequal integration into the global economy. Rodney's argument that underdevelopment is a process rather than an absence is directly relevant here, because it frames contemporary climate vulnerability as the latest phase in a longer pattern in which African labor, land, and resources were mobilized for external accumulation while local adaptive capacity was systematically weakened. Mamdani's analysis of the bifurcated colonial state helps explain why climate shocks do not land on a neutral institutional surface: they interact with inherited administrative divisions between "citizens" and "subjects," with rural authorities that lack fiscal capacity, and with states whose legitimacy is often thinner in the very regions most exposed to drought, flood, or land degradation. Mbembe's work on necropolitics and the postcolony adds a further layer: climate deaths and displacements are not merely unfortunate outcomes of biophysical change, but are shaped by political decisions about whose lives are protected, whose mobility is criminalized, and whose territories are treated as sacrifice zones. Bayart's concept of extraversion is equally important, because it suggests that African states have historically survived by inserting themselves into external circuits of power; climate finance, carbon markets, and green investment can become new forms of extraversion if they reproduce dependency rather than build autonomous capacity. The African perspective thus reads climate geopolitics as a problem of historical justice and sovereignty before it reads it as a problem of atmospheric chemistry.

On climate as a threat multiplier, the African perspective accepts that climate change can intensify migration, food insecurity, and conflict, but it insists that the mechanism is mediated by political economy rather than determined by temperature alone. Barnett's early work on security and climate change, and Busby's later analysis of climate security, are useful for identifying exposure and institutional pathways, yet the African vantage point pushes further: it asks why some societies absorb shocks while others fracture. The answer, in this view, lies in colonial land regimes, extractive economies, weak public health and transport infrastructure, and the historical marginalization of pastoralist, smallholder, and informal urban populations. In the Sahel, for example, climate stress interacts with land tenure, state absence, and armed group competition; in the Horn of Africa, recurrent drought intersects with debt, food import dependence, and political exclusion. The African perspective therefore treats "threat multiplier" as a relational concept: climate multiplies pre-existing inequalities rather than creating insecurity from nothing. This has an important policy implication. If the

mechanism is political, then adaptation cannot be reduced to early-warning systems or drought-resistant seeds; it requires land reform, fiscal capacity, regional infrastructure, and accountable governance. The perspective also warns against a purely securitized reading of climate risk, because such a reading can convert African populations into objects of surveillance and control rather than agents of resilience.

On hydro-hegemony, the African perspective is especially visible in the Nile basin, where upstream and downstream claims collide with colonial legal inheritances. Egypt has historically exercised a form of hydro-hegemony rooted in colonial-era treaties, particularly the 1929 and 1959 agreements, which allocated the bulk of Nile waters to Egypt and Sudan while excluding Ethiopia, the source of most of the Blue Nile. Ethiopia's Grand Ethiopian Renaissance Dam is therefore not merely an infrastructure project; it is an assertion of developmental sovereignty against a downstream order that was constructed under imperial conditions. The African perspective does not automatically endorse every upstream claim, but it does insist that colonial water treaties cannot be treated as permanently binding simply because they favor downstream states. Nyerere's emphasis on self-reliance and Cabral's insistence on returning to the source provide an intellectual backdrop for this claim: African development cannot be permanently subordinated to arrangements negotiated under colonial or quasi-colonial conditions. Grovogui's work on sovereignty and quasi-sovereignty is also relevant, because it shows how African states have been granted formal sovereignty while being denied substantive equality in international law. From this angle, hydro-hegemony is not only about who controls the river; it is about who has the authority to define legitimate development. The African perspective contributes the insight that water disputes are inseparable from the unfinished business of decolonizing international legal regimes. At the same time, it must acknowledge its own occlusion: an upstream sovereignty frame can understate the genuine vulnerability of downstream populations, especially in Sudan and Egypt, and can romanticize state-led megaprojects that may displace local communities or concentrate benefits among elites.

On loss and damage finance, the African perspective is perhaps at its most forceful. It frames the demand not as charity, humanitarian relief, or discretionary aid, but as a claim of justice rooted in historical responsibility. The mechanism is straightforward in principle: industrialized states accumulated wealth through fossil-fuel-intensive development, while African states and communities bear disproportionate losses from climate impacts that they did little to cause. The Loss and Damage Fund agreed at COP27 and operationalized in subsequent negotiations is therefore read as a partial and belated recognition of this claim. Yet the African perspective is also skeptical of the gap between promise and delivery. Pledges remain far below estimated needs, and finance that arrives as loans rather than grants can deepen debt distress. Fanon's analysis of colonial violence and Nkrumah's critique of neo-colonialism help explain why African negotiators treat conditionality with suspicion: climate finance can reproduce the same hierarchies as older aid regimes if it is tied to policy prescriptions, private-sector intermediation, or debt-creating instruments. Tamale's decolonial feminist scholarship adds that loss and damage is gendered; women, who often manage water, food, and care systems, bear disproportionate burdens when climate shocks destroy livelihoods. The African perspective thus insists that loss and damage finance must be grant-based, predictable, accessible to vulnerable communities, and governed in ways that do not simply transfer risk back to those least able to bear it. Its contribution is to reframe climate finance from a technocratic transfer problem into a question of reparative justice. Its occlusion is that it can sometimes understate the heterogeneity of African interests: oil-exporting states, middle-income economies, small island states, and least-developed countries do not all share the same priorities, and elite capture can divert finance away from the most vulnerable.

On climate securitization, the African perspective is deeply ambivalent. It recognizes that climate change can intensify insecurity, but it is wary of the militarization of climate response. The mechanism of concern is that once climate is framed primarily as a security threat, the policy response tends to shift from development and

adaptation to border control, surveillance, militarized conservation, and intervention. For African states, this can mean that climate vulnerability becomes a justification for external military presence, fortress-Europe migration policies, or the securitization of resource-rich territories. Aning and Danso's work on African security governance is relevant here because it emphasizes the need for African-owned security architectures rather than externally imposed frameworks. Mbembe's analysis of borders and the postcolony reinforces the point: climate securitization can extend a longer history in which African mobility is criminalized while capital and carbon move freely. The African perspective therefore prefers a human-security framing that centers livelihoods, food systems, and community resilience, and it insists that the African Union and regional economic communities should shape climate-security responses. At the same time, this perspective must not ignore the reality of climate-related conflict in places such as the Sahel, where resource competition, state weakness, and armed violence are intertwined. Its occlusion is that an anti-securitization stance can sometimes underplay the need for coercive capacity to protect civilians or manage violent competition over land and water.

On just transition and the geopolitics of decarbonization, the African perspective argues that the global shift away from fossil fuels cannot simply export adjustment costs to the Global South. The mechanism is visible in critical minerals: cobalt, lithium, copper, and other inputs essential for batteries and renewable technologies are disproportionately located in Africa, yet value addition, processing, and technological rents often accrue elsewhere. This creates a risk of green colonialism, in which Africa remains a supplier of raw materials for other people's energy transitions while bearing the environmental and social costs of extraction. Nkrumah's critique of neo-colonialism is directly applicable: formal political independence does not prevent economic subordination if ownership, technology, and finance remain external. Oyěwùmí's epistemic decolonization adds that the categories used to measure development, gender, and progress are themselves historically constructed; a just transition must therefore be evaluated not only by emissions reductions but by whether it transforms the knowledge and power structures that produced vulnerability in the first place. The African perspective also notes the tension between decarbonization and development: many African states still face energy poverty, and some argue that gas should serve as a transitional fuel to support industrialization. This is not a rejection of climate action, but a demand for equity in the distribution of carbon space and transition finance. The perspective contributes the insight that decarbonization is not automatically just; its justice depends on who owns the minerals, who processes them, who gets the jobs, and who pays for stranded assets. Its occlusion is that it can sometimes protect fossil-fuel interests or elite bargains under the language of development, and it may understate the domestic political reforms needed to ensure that mineral wealth actually funds public goods.

Taken together, the African perspective reveals what the other four perspectives often miss: climate geopolitics is not primarily a technical problem of emissions, finance, or security, but a historical problem of sovereignty, justice, and development. It centers the experience of communities that have contributed least to climate change but suffer most from its effects, and it insists that adaptation, loss and damage, and transition must be evaluated by their impact on those communities. It also exposes the limits of perspectives that treat climate as a market opportunity, a security threat, or a diplomatic forum without confronting the colonial and neo-colonial structures that shape vulnerability. At the same time, the African perspective is not a single voice. It contains tensions between upstream and downstream states, between fossil-fuel exporters and renewable-rich economies, between governments and social movements, and between elite negotiators and grassroots communities. Its greatest strength is its capacity to reframe climate geopolitics around historical responsibility and human dignity; its greatest risk is that it can become a rhetorical shield for state elites or a homogenizing narrative that obscures internal inequality. The most rigorous version of this perspective

therefore combines solidarity with self-critique: it demands global justice while also insisting on domestic accountability, gender equity, and the democratization of climate governance.

2.7.2 Chinese Perspective

The Chinese perspective on climate geopolitics is anchored in a developmentalist reading of international order, in which climate change is inseparable from poverty eradication, industrialization, energy access, and state capacity. From this vantage point, the central claim is that historical responsibility matters: industrialized Western states accumulated wealth through carbon-intensive development and therefore bear the primary obligation to reduce emissions and finance the transition. This is the logic of common but differentiated responsibilities, a principle embedded in the UNFCCC and repeatedly invoked by Chinese diplomacy. The Chinese perspective does not deny China's current scale of emissions; rather, it argues that per capita emissions, cumulative historical emissions, and development stage must be weighed together. It therefore treats unilateral demands for rapid decarbonization as potentially inequitable if they constrain the development space of countries that are still industrializing. The mechanism here is not climate denial but a sovereignty-centered developmentalism: climate policy must not become a new form of conditionality imposed by states that industrialized first.

On hydro-hegemony, the Chinese perspective is most visible in the Mekong/Lancang basin, where China is the upstream power. Chinese framing tends to emphasize poverty alleviation, energy security, renewable hydropower, and mutual benefit, while resisting the label of hydro-hegemon. It argues that upstream development is a legitimate exercise of sovereignty and that dams provide clean energy and flood control. Critics, however, point to opacity, downstream vulnerability, and the strategic leverage that upstream infrastructure can create. The Chinese perspective contributes the argument that transboundary water governance must balance downstream concerns with the development rights of upstream states, but it can occlude the asymmetry of power created by controlling the headwaters. On loss and damage, China rhetorically supports Global South demands and frames itself as a developing country, while also providing South-South finance and green investment through the Belt and Road Initiative. Yet it resists being classified as a donor in the same category as industrialized states, which creates tension between solidarity rhetoric and financial obligation. On climate securitization, China generally opposes the militarization of climate response and external intervention, preferring to frame climate as a development and non-traditional security issue. Domestically, however, it has embraced ecological civilization as a state project, linking environmental governance to political legitimacy and social stability. On just transition, China's perspective is shaped by its dominance in solar manufacturing, batteries, electric vehicles, and critical mineral processing. It sees decarbonization as industrial policy and geopolitical opportunity, but this can generate new dependencies in the Global South and overcapacity in global markets. The Chinese perspective thus contributes scale, technology, and a powerful CBDR framing; its occlusion is that it can understate China's annual emissions, coal dependence, downstream water impacts, and the geopolitical leverage embedded in green supply chains.

2.7.3 Russian Perspective

The Russian perspective on climate geopolitics is shaped by its identity as a resource state and by a deep skepticism toward Western-led decarbonization agendas. From this vantage point, climate change is often treated less as an existential planetary threat than as a political and economic instrument that can be used to constrain Russian fossil-fuel exports, justify protectionist measures such as carbon border adjustments, and restructure global energy markets in favor of Western green industries. The mechanism is straightforward: Russia's economy, fiscal stability, and geopolitical influence depend heavily on oil, gas, and coal exports, so a rapid global transition away from hydrocarbons threatens not only revenue but also state capacity and great-

power status. Russian discourse therefore frequently emphasizes energy security, technological sovereignty, and the right to development, while questioning the fairness and feasibility of Western net-zero timelines. It also points to Western hypocrisy: states that industrialized through fossil fuels now demand that others decarbonize quickly while failing to meet their own finance commitments.

On climate as a threat multiplier, the Russian perspective is more likely to highlight the opportunities created by warming, such as Arctic navigation, expanded agricultural potential, and resource access, than to emphasize vulnerability. This does not mean Russia ignores climate impacts; rather, it tends to frame them as manageable or regionally differentiated, and it often resists the securitization of climate in ways that could justify NATO or Western intervention. On hydro-hegemony, Russia is less central to the major basins discussed in this lesson, but its vantage point is relevant to Arctic and transboundary water politics, where it asserts sovereignty over Northern Sea Route access and resource extraction. On loss and damage, Russia is generally skeptical of reparations frameworks and is not a major contributor to climate finance; it may rhetorically align with Global South critiques of Western conditionality while offering little material support. On climate securitization, Russia opposes the use of climate as a justification for military intervention or alliance expansion, and it frames Western climate-security discourse as a pretext for geopolitical containment. On just transition, Russia promotes gas as a transitional fuel, nuclear energy, and Arctic development, while treating Western decarbonization as a threat to its economic model. The Russian perspective contributes a useful critique of Western hypocrisy and of the uneven distribution of transition costs, but its occlusion is severe: it can minimize climate risk, protect fossil-fuel dependence, and use anti-Western rhetoric to avoid domestic accountability. It also struggles to offer a credible adaptation or finance agenda for vulnerable states, which limits its constructive role in global climate governance.

2.7.4 Western Perspective

The Western perspective on climate geopolitics combines climate leadership, scientific authority, and a growing self-critique regarding the finance gap. From this vantage point, the central problem is to align global emissions with temperature targets while maintaining economic competitiveness and security. Western states and institutions have been the principal architects of the UNFCCC, the Paris Agreement, and the IPCC assessment process, and they often present themselves as the leaders of global mitigation ambition. The mechanism of leadership is a mix of domestic decarbonization targets, green industrial policy, climate finance pledges, technology development, and normative pressure on other states. At the same time, the Western perspective increasingly acknowledges that its own performance has been uneven: finance commitments have fallen short, adaptation funding lags behind mitigation, and historical emissions remain disproportionately high. This self-critique is important, but it often remains bounded by a technocratic framing that treats climate change as a problem of targets, markets, and innovation rather than as a problem of historical justice.

On climate as a threat multiplier, the Western perspective has been central to securitizing climate risk. It frames climate change as a threat to national security, military readiness, migration management, and global stability. This can produce useful attention to risk assessment and preparedness, but it can also lead to the militarization of climate response and the treatment of climate migrants as security threats. On hydro-hegemony, Western diplomacy often emphasizes transboundary water cooperation, data sharing, and basin-wide agreements, while also protecting strategic alliances and commercial interests. In the Nile case, Western actors have generally sought to mediate rather than impose solutions, but their influence is constrained by sovereignty claims and by the legacy of colonial water arrangements. On loss and damage, the Western perspective has moved from resistance to reluctant acceptance, culminating in support for the Loss and Damage Fund. Yet it continues to worry about liability, moral hazard, and the fiscal burden of open-ended reparations.

The mechanism of Western hesitation is the fear that acknowledging historical responsibility could generate unlimited legal and financial claims. On just transition, Western states are increasingly adopting green industrial policies, carbon border adjustments, and domestic transition programs for coal communities. These measures can accelerate decarbonization, but they can also export adjustment costs to the Global South and create new forms of green protectionism. The Western perspective contributes scientific capacity, finance, and institutional leadership; its occlusion is that it can understate historical responsibility, overemphasize mitigation relative to adaptation, and treat climate justice as an afterthought to market-led transition.

2.7.5 UN Perspective

The UN perspective on climate geopolitics is anchored in the UNFCCC, the IPCC, the Sustainable Development Goals, and the broader UN system. It treats climate change as a global collective-action problem requiring scientific assessment, normative consensus, and multilateral coordination. The UNFCCC provides the legal and diplomatic framework for negotiations; the IPCC supplies the scientific baseline; SDG 13 and related goals connect climate action to development; and the COP process provides a forum for incremental agreement. The UN perspective is therefore less a single national interest than an institutional attempt to reconcile competing claims under conditions of sovereignty and inequality. Its central contribution is legitimacy: it can articulate global goals, standardize measurement, and create spaces in which vulnerable states can demand finance, technology transfer, and loss and damage recognition.

On climate as a threat multiplier, the UN perspective draws heavily on IPCC assessments to frame climate risk as a threat to food security, health, displacement, and peace. It has also seen debates in the Security Council about whether climate should be treated as a security issue, revealing tension between development and securitization framings. On hydro-hegemony, the UN system promotes transboundary water cooperation through conventions and basin initiatives, but it lacks enforcement power and must navigate sovereignty claims. On loss and damage, the UNFCCC process has been the main venue for the Global South's demand, culminating in the Loss and Damage Fund. The UN perspective can elevate this demand and provide institutional form, but it cannot compel adequate funding. On climate securitization, the UN contains both development-oriented and security-oriented actors, producing an internal tension between human security and militarized responses. On just transition, the UN has developed a just transition work programme and normative language around equity, sustainable development, and decent work, but it struggles to convert rhetoric into binding finance, technology transfer, or accountability. The UN perspective contributes coordination, science, and normative framing; its occlusion is structural. It depends on state consensus, lacks enforcement capacity, and often reflects power asymmetries rather than overcoming them. It can name climate justice, but it cannot guarantee it.

2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African	Centers climate vulnerability, adaptation finance, loss and damage, and colonial responsibility; reframes climate finance as reparative justice rather than charity	Can underweight agency of non-Western emitters and domestic governance failures in African states	Climate justice as reparative; historical responsibility; differentiated obligations	IPCC AR6 WGII vulnerability assessments; COP27 Loss and Damage Fund decision; African Group of Negotiators positions	Western/Chinese: historical framing ignores contemporary emissions and development needs of emerging economies
Chinese	Developmental priorities; CBDR framing; South-South cooperation; technology transfer demands	Obscures China's own emissions trajectory and coal expansion; state-centric framing	CBDR; development rights; climate action must not constrain growth	China's NDCs; BASIC group positions; Belt and Road green finance initiatives	Western: China's emissions make it a major contributor, not merely a victim of historical injustice
Russian	Skepticism about climate alarmism; resource state framing; highlights de-carbonization costs for fossil fuel exporters	Understates climate risks; ignores vulnerability of own territory (permafrost, Arctic); instru-mentalizes climate for geopolitical leverage	Climate change is manageable; energy security and sovereignty; resistance to binding mitigation	Russia's climate strategy documents; Arctic policy; fossil fuel export dependence	African/UN: skepticism delays necessary action and harms vulnerable populations

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Western	Climate leadership; finance gap self-critique; institutional innovation (UNFCCC, IPCC); market mechanisms	Historical emissions responsibility; finance shortfalls; greenwashing; conditionality; prioritizes mitigation over adaptation	Liberal internationalism; market-based solutions; rule-based order; climate as security threat	EU Green Deal; US Inflation Reduction Act; climate finance pledges; IPCC assessments	African: leadership rhetoric masks inadequate finance and historical responsibility
UN	Coordination; science (IPCC); normative framing (SDG 13); institutional architecture (UNFCCC, Paris Agreement)	Structural dependence on state consensus; lacks enforcement; reflects power asymmetries	Multilateralism; common but differentiated; sustainable development	Paris Agreement; Loss and Damage Fund; IPCC AR6; SDG 13	African: UN processes produce weak outcomes that favor powerful states

2.8 WORKED EXAMPLE (I do)

Case: The 2022-2023 COP27/COP28 negotiations and the Loss and Damage Fund

Levels of analysis. At the individual level, the Loss and Damage Fund negotiations were shaped by specific negotiators and advocates: the Egyptian COP27 presidency under Sameh Shoukry, the UAE's Sultan Al Jaber as COP28 president, and the sustained advocacy of small island state representatives and African negotiators who had pressed the issue for decades. Individual climate activists and scientists, including IPCC authors, provided the epistemic foundation by documenting escalating impacts. At the state level, national positions diverged sharply: the G77+China bloc, led by Pakistan and supported by the African Group of Negotiators, demanded a dedicated fund; the European Union initially resisted a separate fund but shifted under pressure; the United States opposed liability language while accepting a fund without admission of legal responsibility; China positioned itself as a developing country while facing pressure to contribute. At the systemic level, the negotiations reflected the North-South divide in climate governance, the historical asymmetry of cumulative emissions, and the power dynamics of multilateralism in which wealthy states control finance flows. At the transnational level, civil society networks, scientific institutions, philanthropic actors, and private sector stakeholders shaped both the agenda and the implementation design, with the World Bank's role as interim host reflecting transnational financial governance structures.

Mechanism. The establishment of the Loss and Damage Fund at COP27 in November 2022 and its opera-

tionalization at COP28 in December 2023 followed a specific causal mechanism. First, escalating climate impacts—floods in Pakistan, drought in the Horn of Africa, cyclones in Mozambique—created material pressure that could not be addressed through existing mitigation or adaptation finance. Second, sustained advocacy by the G77+China, the African Group of Negotiators, and civil society organizations maintained the issue on the agenda across multiple COPs, preventing its dilution. Third, the shifting geopolitical context—US re-engagement under the Biden administration after the Trump withdrawal, China's growing assertiveness in climate diplomacy, and the EU's need to demonstrate climate leadership—created a window for compromise. Fourth, the Egyptian COP27 presidency leveraged its position to force the issue onto the agenda, making loss and damage a central negotiating track. Fifth, the compromise at COP27 established a fund "for responding to loss and damage" without conceding liability or compensation, a deliberate ambiguity that allowed agreement. Sixth, at COP28, the transitional committee's recommendations were adopted, with the World Bank designated as interim host for four years, and initial pledges totaling approximately $700 million were announced—far below estimated needs in the hundreds of billions. The mechanism thus combined material pressure, sustained advocacy, geopolitical opportunity, institutional entrepreneurship, and deliberate ambiguity to produce an outcome that was simultaneously historic and inadequate.

Perspective reconstruction. From the African perspective, the Loss and Damage Fund represents a partial and overdue recognition of climate injustice. African negotiators and scholars have long argued that the continent contributes minimally to cumulative emissions yet suffers disproportionate impacts, and that climate finance must be understood as reparative rather than charitable. The fund's establishment validates this framing, but its inadequacy—pledges of roughly $700 million against needs estimated in the hundreds of billions—confirms that recognition has not been matched by redistribution. The African perspective emphasizes that the fund's design, with the World Bank as interim host, risks replicating conditionalities and governance structures that have historically disadvantaged African states. It also stresses that loss and damage cannot be separated from adaptation and development finance, and that the fund must not become a substitute for mitigation ambition by wealthy emitters. From the Chinese perspective, the fund aligns with the principle of common but differentiated responsibilities, and China has positioned itself as a developing country with historical emissions far below those of industrialized nations. China supports the fund in principle while resisting pressure to contribute as a donor, arguing that its per capita emissions and development needs justify its classification. From the Russian perspective, the fund is viewed with skepticism as another mechanism for Western conditionality and as a distraction from energy security; Russia's position reflects its status as a fossil fuel exporter and its broader skepticism about climate alarmism. From the Western perspective, the fund represents climate leadership and a willingness to address historical responsibility, but with significant self-critique: the finance gap remains vast, and the fund's establishment without liability language reflects a compromise that protects wealthy states from legal exposure. From the UN perspective, the fund demonstrates the capacity of multilateral processes to produce institutional innovation, but also reveals structural limitations: dependence on voluntary pledges, lack of enforcement, and the gap between normative ambition and material commitment.

Adjudication. The African perspective best explains the case because it captures both the breakthrough and the inadequacy of the Loss and Damage Fund. It identifies the core mechanism—material vulnerability combined with sustained advocacy and geopolitical opportunity—and it explains why the outcome, while historic, remains structurally insufficient. The African framing of climate finance as reparative justice, rather than charity, accounts for the political dynamics that produced the fund and for the resistance to adequate funding. However, this perspective misses or underweights several elements: the genuine agency of non-Western emitters, particularly China's role in shaping the outcome; the internal diversity of African states'

interests and capacities; and the possibility that institutional design choices (such as World Bank hosting) may reflect pragmatic rather than purely extractive logics. The Western perspective captures the institutional innovation and self-critique but occludes the historical responsibility that makes the fund necessary. The Chinese perspective correctly identifies CBDR but obscures China's own emissions trajectory. The Russian perspective is largely orthogonal to the case. The UN perspective describes the process accurately but cannot explain the power asymmetries that shaped the outcome. The best explanation is thus a synthesis: the African perspective provides the normative and structural core, supplemented by Western institutional analysis and Chinese geopolitical positioning, with the UN framework as the arena in which these forces interacted.

SECTION 2.9 PROBLEM PAIR (We do)

1. Identify the basin's upstream–downstream power asymmetry and the historical legal baseline (the 1929 and 1959 agreements) that Ethiopia rejects as a basis for allocating Nile waters.

2. Apply the hydro-hegemony framework to classify Egypt, Sudan, and Ethiopia, and explain why Sudan's position is not simply aligned with either Egypt or Ethiopia.

3. Explain how the Grand Ethiopian Renaissance Dam (GERD) alters Egypt's hydro-hegemony through resource capture, and identify the specific technical parameters (filling speed, drought releases, data sharing) that convert engineering facts into bargaining leverage.

4. Evaluate two competing explanations—(a) zero-sum water security and (b) cooperative benefit-sharing—and specify the evidence that would falsify each.

5. Assess whether securitization rhetoric is justified given climate variability in the Nile basin, and distinguish mobilization benefits from bargaining costs.

6. Propose a bounded policy recommendation and state its scope conditions: under what institutional and political conditions would it be feasible?

MODEL ANSWER: The Nile dispute is best understood not as a simple upstream–downstream quarrel but as a contest over the reconfiguration of hydro-hegemony in a basin whose legal and infrastructural order was built under colonial and post-colonial Egyptian dominance. Egypt's position rests on the 1929 and 1959 agreements, which allocated the bulk of Nile waters to Egypt and Sudan and which Ethiopia, as a non-signatory, regards as illegitimate inheritances of imperial preference. Ethiopia's construction of the Grand Ethiopian Renaissance Dam is therefore not merely a development project; it is a counter-hegemonic move that converts latent upstream geographic advantage into infrastructural and bargaining power. Under Zeitoun and Warner's framework, Egypt has long functioned as the basin hegemon through a combination of material power, ideational authority, and the institutionalization of its water claims; Ethiopia's dam challenges that order by creating a new fact on the ground that Egypt cannot easily reverse without risking regional escalation. Sudan occupies an intermediate position: it stands to gain regulated flows, flood control, and cheaper electricity, yet it also faces safety, sedimentation, and coordination risks if filling and operation are not jointly managed. This mixed incentive structure explains why Sudan's alignment has shifted across negotiation rounds and why a simple Egypt-versus-Ethiopia dyad misrepresents the politics. Historically,

Egypt's hegemony was reinforced by its diplomatic weight, its alliance with Sudan under the 1959 agreement, and its control over downstream infrastructure; Ethiopia's counter-hegemony depends on the fact that the GERD is already built and that military options are constrained by geography, cost, and international law. The Declaration of Principles signed in 2015 acknowledged equitable use and no significant harm, but it left operational details unresolved, creating a gap between normative commitment and enforceable rules. This gap is where hydro-hegemony is actually contested: not in abstract sovereignty claims, but in the technical parameters of filling speed, drought release, and information sharing.

The zero-sum water-security explanation captures Egypt's vulnerability because the Blue Nile contributes the majority of Egypt's Nile water, and any sustained reduction during drought years could threaten agriculture, urban supply, and the Aswan High Dam's electricity generation. Yet this explanation overstates the likely magnitude and intent of harm if the dam is operated with drought-mitigation rules and transparent data sharing. The cooperative benefit-sharing explanation is supported by the potential for the GERD to reduce evaporation losses relative to downstream reservoirs and to provide regional electricity, but it assumes trust and institutional capacity that the parties have not built. Evidence that would falsify the zero-sum view would be a multi-year record of filling and operation that does not reduce Egypt's usable water below agreed thresholds; evidence that would falsify the cooperative view would be repeated unilateral filling during drought, refusal to share real-time data, or dam-safety incidents. Climate variability intensifies both arguments: IPCC assessments emphasize that the Nile basin faces increasing hydrological uncertainty, which makes static allocation formulas less adequate and raises the value of adaptive, data-driven management. Securitization rhetoric, which frames the dam as an existential threat, can mobilize domestic support and international attention, but it also narrows the bargaining space by converting technical disputes into sovereignty contests. For Sudan, the dam's benefits are concrete but conditional; for Ethiopia, the dam is tied to national development and electricity export ambitions; for Egypt, the issue is framed as survival, which makes compromise politically costly. The African Union's role illustrates the difficulty of mediating among member states when one party sees the dispute as development and another as existential security. External mediation by the United States and the World Bank in 2019–2020 failed to secure a final text, in part because Ethiopia rejected binding third-party arbitration while Egypt insisted on enforceable guarantees. The UN Security Council's 2021 discussion underscored that the dispute is internationalized, but it did not impose a settlement, leaving the basin's governance dependent on voluntary negotiation. The most defensible recommendation is a binding, adaptive agreement on filling schedules, drought contingencies, and data exchange, backed by neutral monitoring and dispute resolution, rather than either unconditional Ethiopian sovereignty or Egyptian veto power. Such an arrangement is feasible only if all parties accept that water security is interdependent and that the basin's closure under climate stress requires cooperation rather than unilateral optimization.

SECTION 2.10 INDEPENDENT MEMO (You do)

(a) Case description: The European Union's Carbon Border Adjustment Mechanism entered its transitional reporting phase in October 2023, requiring importers of steel, cement, aluminium, fertilizers, electricity, and hydrogen to report embedded emissions. Several African and other Global South exporters argue that the measure functions as a unilateral trade barrier that penalizes late industrializers, while the EU presents it as a climate-integrity tool to prevent carbon leakage and protect its own decarbonization investments. South Africa, Egypt, and other developing-country voices have questioned its compatibility with the principle of common but differentiated responsibilities and have warned that compliance costs could constrain export revenues and industrial upgrading. Analyze the dispute as

a problem of just transition and decarbonization geopolitics: identify the mechanism, reconstruct the competing perspectives, find a historical analogue, and specify what evidence would falsify your explanation. You are advising a trade ministry in an affected African state; your memo should explain whether the mechanism is primarily climate policy, protectionism, or a hybrid, and what bounded policy response is available.

(b) Required memo headings as prompts:

- **Mechanism:** What causal chain links CBAM's reporting and pricing rules to changes in trade flows, industrial location, emissions, and diplomatic alignment? Specify scope conditions and the level of analysis at which the mechanism operates.
- **Perspective reconstruction:** Reconstruct the EU, African, Chinese, Russian, and UN perspectives on CBAM without straw-manning; identify what each perspective contributes and what it occludes.
- **Historical analogue:** Compare CBAM to one prior case of unilateral trade-environment linkage (for example, EU deforestation regulation, U.S. Superfund taxes, or carbon border debates in the 1990s) and state the limits of the analogy.
- **Falsifiers:** List observable evidence that would weaken or refute your central claim, including trade data, emissions data, diplomatic statements, and legal rulings.

(c) Self-check: Did you distinguish description (what CBAM does), explanation (why it produces these effects), prediction (what will happen under specified conditions), and prescription (what your government should do), and did you avoid conflating them?

SECTION 2.11 HINGE QUESTION

Hinge question: At COP27, states agreed to establish a Loss and Damage Fund, but pledges and capitalization have lagged behind estimated needs. Which explanation best captures the central political obstacle?

A. The absence of a shared scientific consensus that climate damages are occurring.
B. The disagreement over whether loss and damage finance should be framed as compensation/reparations or as solidarity-based assistance, and over who pays.
C. The lack of any institutional venue for discussing climate finance.
D. The refusal of all developing countries to accept mitigation obligations.

Distractor diagnosis:
- **A is wrong** because IPCC AR6 and UNFCCC processes already establish that climate damages are occurring and attributable; the obstacle is political allocation, not scientific consensus.
- **B is correct** because the central contest is over framing (compensation/reparations versus solidarity-based assistance) and burden-sharing, which determines contributor obligations, recipient eligibility, and legal liability.
- **C is wrong** because venues such as the UNFCCC, the Green Climate Fund, and COP negotiation tracks already exist; the problem is mandate, scale, and contributor willingness, not institutional absence.
- **D is wrong** because it overgeneralizes: many developing countries have submitted NDCs and mitigation commitments, and the dispute centers on finance, historical responsibility, and capacity, not a blanket refusal to mitigate.

SECTION 2A — DATA LAB

Table 1: Cumulative CO□ Emissions by Region, 1850–2021 (approximate shares of global total)

Region	Share of cumulative CO□ (%)	Approx. tonnes (Gt)	Population share (%)	Per-capita cumulative (t)
United States	20.3	~420	4.3	~1,250
European Union (27)	17.3	~360	5.8	~790
China	12.7	~265	17.8	~190
Russia / former USSR	7.1	~148	4.8	~390
Japan	3.9	~81	1.6	~640
India	3.4	~71	17.7	~51
Middle East & North Africa	3.2	~67	6.0	~140
Latin America & Caribbean	4.0	~83	8.4	~125
Sub-Saharan Africa	2.8	~58	14.5	~51
Rest of world	25.3	~527	23.1	~288
Global total	**100**	**~2,080**	**100**	**~260**

Sources: Global Carbon Project / Our World in Data cumulative emissions estimates; population figures from UN DESA. Figures are approximate and rounded; exact totals vary by accounting convention (territorial vs. consumption-based, land-use change inclusion).

Table 2: Climate Finance Flows to Developing Countries, 2013–2022 (USD billions, annual)

Year | Total public + private finance (OECD-reported) | Public finance | Private finance (mobilised) | Share of $100B target met | |—|—|—|—|—| | 2013 | 52.2 | 37.9 | 14.3 | 52% | | 2015 | 61.8 | 44.6 | 17.2 | 62% | | 2017 | 71.2 | 56.7 | 14.5 | 71% | | 2019 | 79.6 | 62.9 | 16.7 | 80% | | 2020 | 83.3 | 68.3 | 15.0 | 83% | | 2021 | 89.6 | 73.1 | 16.5 | 90% | | 2022 | 115.9 | 91.6 | 24.3 | 116% (first year above target) |

Sources: OECD, Climate Finance Provided and Mobilised by Developed Countries in 2013–2022* (2024); UNFCCC Standing Committee on Finance. Note: OECD methodology counts loans at face value; developing-country negotiators argue grant-equivalent figures are substantially lower.*

Table 3: Loss and Damage Fund — Pledges vs. Estimated Needs (USD)

Category	Amount	Source / basis
Pledges at COP28 (Dubai, Dec 2023)	~$700 million	UNFCCC / COP28 Presidency

Category	Amount	Source / basis
Estimated annual loss and damage needs by 2030	$400 billion – $1.8 trillion	V20 / Climate Vulnerable Forum estimates; IIED
Estimated annual needs (conservative, IPCC-aligned)	$100–300 billion	UNEP Adaptation Gap Report

Sources: UNFCCC Loss and Damage Fund documentation; V20 Group; UNEP Adaptation Gap Report 2023; Oxfam Climate Finance Shadow Report.

Table 4: Nile Basin — Flow and Storage Data

Parameter	Value	Notes
Total Nile flow at Aswan (average annual)	~84 billion m³	Naturalised flow; varies with rainfall
Blue Nile contribution (at Khartoum)	~59% of total flow	Originates in Ethiopian Highlands
White Nile contribution	~28%	Originates in Lake Victoria / Equatorial Lakes
Atbara River contribution	~13%	Ethiopian/Sudanese origin
GERD (Grand Ethiopian Renaissance Dam) installed capacity	5,150 MW	Africa's largest hydroelectric project
GERD reservoir volume	~74 billion m³	Comparable to 1.5× annual Nile flow at Aswan
Egypt's annual water allocation (1959 Agreement)	55.5 billion m³	Bilateral Egypt–Sudan agreement; Ethiopia not party
Sudan's annual water allocation (1959 Agreement)	18.5 billion m³	
Egypt's population (2024 est.)	~112 million	97% of population lives on Nile floodplain/delta
Ethiopia's population (2024 est.)	~126 million	~60% lack grid electricity access

Sources: Nile Basin Initiative (NBI); International Water Management Institute (IWMI); World Bank; GERD project documentation; UN DESA population estimates.

Analysis Questions

1. Trend. Using Tables 1 and 2, describe the trajectory of cumulative emissions inequality and climate finance delivery between 2013 and 2022. What does the juxtaposition of these two trends reveal about the structural relationship between historical responsibility and present obligation?

2. Level of analysis. Table 4 presents the Nile dispute in terms of flows, reservoir volumes, and population figures. At which level of analysis (individual, state, systemic, transnational) does each data point operate, and which level is systematically underrepresented in the table? What would a transnational-level analysis of the same dispute require that the table cannot provide?

3. Perspective reconstruction (all five). For each of the five perspectives (African, Chinese, Russian, Western, UN), identify which table(s) and which specific figures would be foregrounded as decisive evidence, and which would be treated as misleading or irrelevant. Produce a one-sentence evidentiary claim for each perspective.

4. Interpretation. Table 3 shows that COP28 pledges to the Loss and Damage Fund (~$700 million) amount to less than 1% of the lower-bound annual need estimate ($100 billion). Does this gap constitute evidence of (a) a failure of political will, (b) a structural incapacity of the international system, or (c) a deliberate strategic choice by donor states? What evidence from Tables 1–2 would you need to adjudicate among these three interpretations?

5. Limitation. All four tables rely on data produced by institutions embedded in particular power structures (OECD, UN agencies, national governments). Identify one specific methodological or political limitation in each table that would lead a critical scholar to treat its headline figure with caution, and state what alternative measurement approach would address that limitation.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1: "The Threat Multiplier Cascade" — Climate as Systemic Amplifier

What to draw: A vertical cascade diagram on a single page. At the top, draw a large circle labeled "Climate Stress" containing three sub-labels: "Temperature rise," "Precipitation shift," and "Extreme events." From this circle, draw three downward arrows to a middle row of three rectangles: "Food insecurity," "Water scarcity," and "Livelihood collapse." From each rectangle, draw arrows converging on a bottom rectangle labeled "Conflict / Displacement / State fragility." Draw a feedback loop arrow from the bottom rectangle back up to the top circle, labeled "Conflict degrades adaptive capacity."

How to label it: Label each arrow with a mechanism: "crop yield reduction," "aquifer depletion," "pastoral route disruption," "resource competition," "governance erosion." Place a small legend in the bottom-left corner distinguishing "direct causal link" (solid arrow) from "feedback loop" (dashed arrow).

Perspective overlay to annotate: In the top-right corner, draw a small inset box labeled "African vantage: the cascade begins with colonial land tenure and extractive agriculture, not with temperature." Draw a dashed line from this box to the "Livelihood collapse" rectangle, indicating that the African perspective inserts a structural precondition into the cascade that the Western threat-multiplier framing omits. In the bottom-right corner, draw a second inset box labeled "UN vantage: IPCC AR6 confidence levels" with a small scale from "low" to "high" confidence, noting that the conflict link is rated "medium" confidence while the food-security link is rated "high."

Visual 2: "Hydro-Hegemony on the Nile" — Upstream/Downstream Power Geometry

What to draw: A horizontal cross-section of the Nile basin from south (left) to north (right). Draw the Blue Nile originating in the Ethiopian Highlands (left), flowing through Sudan (center), and reaching Egypt (right).

Mark the GERD as a large dam icon on the Blue Nile in Ethiopia. Mark the Aswan High Dam as a smaller dam icon in Egypt. Draw the White Nile entering from the south (Lake Victoria) joining at Khartoum. Use shading: darker blue for the Blue Nile (59% of flow), lighter blue for the White Nile (28%), lightest for the Atbara (13%). Draw arrows showing flow direction. Draw a dashed line representing the 1959 Agreement allocation boundary.

How to label it: Label each country with population and water allocation: "Ethiopia: 126M people, 0% allocated under 1959 Agreement"; "Sudan: 48M people, 18.5 bcm"; "Egypt: 112M people, 55.5 bcm." Label the GERD reservoir with "74 bcm storage capacity." Label the Aswan reservoir with "169 bcm capacity." Place a scale bar and north arrow.

Perspective overlay to annotate: Draw three small flag-icons or perspective tags along the river: near the GERD, tag "Ethiopian perspective: sovereign right to development, energy poverty, no colonial-era obligation"; near Khartoum, tag "Sudanese perspective: downstream beneficiary of GERD flood control, but anxious about filling timeline"; near Aswan, tag "Egyptian perspective: existential water security, 97% dependence, historical rights." In the top margin, draw a small box labeled "Russian/Chinese vantage: infrastructure financing and non-interference" with arrows pointing to the GERD icon, indicating external power involvement in dam construction.

Visual 3: "The Loss and Damage Gap" — Pledges vs. Needs as a Geopolitical Bar Chart

What to draw: A vertical bar chart with a logarithmic y-axis (USD billions). Draw four bars: (1) "Cumulative CO□ share — Global South (excluding China)" at ~10% (labeled as a horizontal reference line, not a bar); (2) "Climate finance delivered 2022" at $115.9B; (3) "Loss & Damage Fund pledges (COP28–29)" at ~$1.4B cumulative; (4) "Estimated annual L&D need by 2030" at $400B (lower bound) with an error bar extending to $1.8T. Color-code: bar 2 in blue (finance delivered), bar 3 in red (pledges), bar 4 in dark red (need). Draw a large gap bracket between bars 3 and 4 labeled "The reparations gap."

How to label it: Label each bar with its source (OECD, UNFCCC, V20). Add a small inset pie chart showing the composition of climate finance (adaptation vs. mitigation vs. cross-cutting) to illustrate that loss and damage is not separately tracked in standard flows. Add a footnote: "OECD counts loans at face value; grant-equivalent figures are lower."

Perspective overlay to annotate: Draw five small perspective tags around the chart: "African: the gap is a measure of colonial debt unpaid"; "Chinese: CBDR requires differentiated timelines, not just differentiated amounts"; "Russian: the gap reflects the unreliability of Western commitments"; "Western: the gap reflects domestic political constraints and the need for private-sector mobilisation"; "UN: the gap is a governance failure addressable through the Fund's Board and the NCQG process." Place these as a legend in the bottom margin, each with a distinct color.

SECTION 4 — CORNELL NOTES

Cue Column | Notes Column (with Source Log)

Cue (Question / Keyword)	Notes (Answer / Elaboration + Source)
What is a "threat multiplier"?	A condition that amplifies existing vulnerabilities rather than creating new ones independently. Barnett (2003) introduced the term in the context of environmental security; Busby (2018) operationalised it for climate-conflict research. The mechanism: climate stress → resource scarcity → competition → conflict, conditional on weak governance. Scope condition: threat multipliers require pre-existing institutional fragility; they do not generate conflict in robust states.
What is hydro-hegemony?	The control of water resources by an upstream or dominant riparian state to extract political or economic leverage over downstream states. Key cases: Nile (Ethiopia/Egypt), Mekong (China/downstream ASEAN), Tigris-Euphrates (Turkey/Syria/Iraq). Mechanism: dam construction alters flow timing and volume, creating asymmetric dependence.
What is "loss and damage"?	The harms from climate change that cannot be avoided through mitigation or adaptation. Demanded by Global South negotiators since the 1990s; formalised in the Warsaw International Mechanism (2013) and the Loss and Damage Fund (COP27, 2022). Distinct from adaptation finance: L&D addresses irreversible harm, not risk reduction.
What is climate securitization?	The framing of climate change as a security threat, leading to military involvement in climate response. Mechanism: threat framing → security-sector budget allocation → militarised adaptation (e.g., border fortification, resource guarding). Critique: securitization may crowd out civilian adaptation and human-security approaches.
What is "just transition"?	The principle that decarbonisation must not impose disproportionate costs on workers, communities, or countries least responsible for emissions. Mechanism: carbon-intensive economies face stranded assets; transition costs fall on fossil-fuel-dependent regions unless redistributive mechanisms are designed.

Cue (Question / Keyword)	Notes (Answer / Elaboration + Source)
What is CBDR?	"Common but Differentiated Responsibilities and Respective Capabilities" — the UNFCCC principle (Rio 1992, Art. 3.1) that all states share responsibility for climate action but obligations differ by historical contribution and capacity. Chinese and Indian negotiators invoke CBDR to resist equal mitigation obligations.
What is the GERD?	Grand Ethiopian Renaissance Dam: 5,150 MW capacity, 74 bcm reservoir, on the Blue Nile in Ethiopia. Africa's largest hydroelectric project. Disputed by Egypt (downstream water security) and Sudan (filling timeline, flood control). Negotiations stalled since 2021.
What is the Loss and Damage Fund?	Established at COP27 (Sharm el-Sheikh, 2022); operationalised at COP28 (Dubai, 2023). Governed by a Board with 26 members (14 developing, 12 developed). Pledges ~$700M at COP28; estimated annual need $100B–$1.8T by 2030.

Source Log: - IPCC AR6 (2021–2023), WGI/WGII/WGIII — physical science, impacts, mitigation. - Barnett, J. (2003), "Security and Climate Change," *Global Environmental Change* 13(1): 7–17. - Busby, J. (2018), "Warming World: Why Climate Change Matters More Than Anything Else," *Foreign Affairs* 97(4): 49–55. - UNFCCC, Warsaw International Mechanism (2013); COP27/COP28 Loss and Damage Fund decisions. - Nile Basin Initiative (NBI) technical reports; IWMI Nile flow data. - OECD, *Climate Finance Provided and Mobilised by Developed Countries in 2013–2022* (2024). - V20 Group / Climate Vulnerable Forum loss-and-damage need estimates. - Grovogui, S. (2006), *Beyond Eurocentrism and Anarchy*; Mamdani, M. (2020), *Neither Settler nor Native*.

Summary (3–5 sentences): Climate geopolitics operates through five interconnected mechanisms: climate as threat multiplier, hydro-hegemony, loss-and-damage finance demands, securitization, and just-transition politics. Each mechanism is interpreted differently across the five perspectives, with the African perspective foregrounding colonial responsibility and structural vulnerability, the Chinese perspective invoking CBDR and developmental sovereignty, the Russian perspective combining skepticism with resource-state interests, the Western perspective oscillating between leadership and self-critique, and the UN perspective providing institutional frameworks (UNFCCC, IPCC, SDGs) that mediate but do not resolve these conflicts. The data show a persistent gap between historical emissions responsibility, finance delivered, and loss-and-damage needs — a gap that is simultaneously a measure of political failure, structural incapacity, and strategic choice. The Nile dispute exemplifies how hydro-hegemony converts resource asymmetry into geopolitical leverage, with Ethiopia's GERD challenging Egypt's historical water rights. Understanding climate geopolitics requires holding all five perspectives in tension without collapsing them into a single narrative.

SECTION 5 — FEYNMAN COMPRESSION

Step 1 — Explain without jargon. Climate change is not just a weather problem; it is a power problem. The countries that burned the most fossil fuels over the last 150 years are not the ones suffering the most from droughts, floods, and rising seas. When rivers cross borders, the country upstream can build a dam and control how much water flows downstream — that is what is happening on the Nile, where Ethiopia built a massive dam that Egypt fears will cut its water supply. Poor countries are asking rich countries to pay for the damage climate change is already causing, and rich countries have pledged a few hundred million dollars against needs estimated in the hundreds of billions. Meanwhile, some governments are treating climate change as a military threat, sending soldiers instead of aid workers, and the shift away from fossil fuels is creating winners and losers depending on who owns the oil and who owns the solar panels.

Step 2 — Mark gaps. My explanation above does not specify: (a) the mechanism by which climate stress becomes conflict (it is not automatic — it requires weak governance and pre-existing resource competition); (b) the distinction between adaptation finance and loss-and-damage finance (they address different problems and are often conflated); (c) the scope conditions under which hydro-hegemony operates (not all upstream states can leverage water; it requires infrastructure capacity and political will); (d) the difference between securitization as framing and securitization as practice (rhetoric vs. budgetary reality); (e) the specific African scholarly lineage (Grovogui, Mamdani, Rodney) that grounds the colonial-responsibility argument rather than treating it as a generic developing-country claim.

Step 3 — Reread verification. Re-reading the source material confirms: Barnett (2003) specifies that environmental scarcity becomes conflict only through intervening political and economic variables — the threat-multiplier framing is conditional, not deterministic. The IPCC AR6 WGII states with high confidence that climate impacts are already widespread but rates the climate-conflict link at medium confidence, confirming the gap identified in Step 2(a). The Loss and Damage Fund documentation confirms that L&D is distinct from adaptation and that the Fund's mandate excludes liability/adaptation overlap — confirming gap 2(b). Grovogui's *Beyond Eurocentrism and Anarchy* and Mamdani's *Neither Settler nor Native* provide the African scholarly grounding for the colonial-responsibility framing, confirming gap 2(e).

Step 4 — Analogy with explicit limits. Analogy: climate geopolitics is like a debt-collection dispute in which the debtor (the Global North) wrote the contract (the industrial economy), the creditor (the Global South) is demanding payment for damages already incurred, and a third party (the UN) is mediating without enforcement power. **Limits of this analogy:** (i) climate harm is not a single debt but a continuous, accumulating flow; (ii) the "debtor" is not a single actor but a heterogeneous group of states with divergent interests; (iii) the "creditor" is also heterogeneous and includes states (China) that are simultaneously creditors and debtors; (iv) the analogy implies a clear liability framework that international law does not provide — the Loss and Damage Fund explicitly excludes liability and compensation language; (v) the analogy cannot capture the hydro-hegemony dimension, which is about resource control rather than financial transfer.

Step 5 — Rewrite. Climate geopolitics is the study of how climate change redistributes power, vulnerability, and obligation across the international system. It operates through five mechanisms: (1) climate as a threat multiplier that amplifies pre-existing fragilities in food, water, and livelihood systems, with conflict as a conditional rather than automatic outcome; (2) hydro-hegemony, in which upstream states leverage dam infrastructure to extract political concessions from downstream dependents, as in the Nile dispute between Ethiopia and Egypt; (3) loss-and-damage finance, in which Global South states demand reparations for irreversible climate harm, confronting a gap between pledged funds (~$700M at COP28) and estimated needs ($100B–$1.8T annually by 2030); (4) climate securitization, in which threat framing channels resources

toward military responses and away from civilian adaptation; and (5) just-transition politics, in which decarbonization costs fall unevenly on fossil-fuel-dependent economies and communities. These mechanisms are interpreted through five perspectives: the African perspective, grounded in the colonial-responsibility scholarship of Grovogui and Mamdani, foregrounds structural vulnerability and demands reparations; the Chinese perspective invokes CBDR and developmental sovereignty; the Russian perspective combines climate skepticism with resource-state interests; the Western perspective oscillates between climate leadership and self-critique of the finance gap; and the UN perspective provides institutional mediation through the UNFCCC, IPCC, and SDG 13 without resolving the underlying power asymmetries. The data reveal a persistent triple gap — between historical emissions and present vulnerability, between finance delivered and finance needed, and between pledged loss-and-damage funds and estimated damages — that is simultaneously a measure of political failure, structural incapacity, and strategic choice by donor states.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L51	Definition	What is “climate as threat multiplier”?	Climate change amplifies pre-existing vulnerabilities—food insecurity, water stress, livelihood loss—rather than directly causing conflict; risk multiplies in fragile contexts.	African: centers agrarian vulnerability; Western: security framing.
L51	Mechanism	How does climate become a conflict multiplier?	Through resource scarcity, livelihood collapse, migration pressure, and weakened state capacity in already fragile regions, interacting with governance failures.	African: colonial legacies shape fragility; UN: SDG 13 lens.

Tag	Card Type	Front	Back	Perspective Note
L51	Definition	What is hydro-hegemony?	The structural power of an upstream riparian state over shared water resources via control of flow, data, and infrastructure.	African: Nile dispute exemplifies; Chinese: Mekong dams.
L51	Application	What is the Nile dam dispute?	Ethiopia's GERD versus Egypt/Sudan downstream water-security concerns; upstream development collides with downstream historical entitlements.	African: primary case; Western: mediation attempts.
L51	Definition	What is loss and damage finance?	Compensation/reparations for climate impacts beyond adaptation limits, demanded by the Global South as a matter of climate justice.	African: colonial responsibility framing; UN: UNFCCC process.
L51	Debate	What is "common but differentiated responsibilities" (CBDR)?	All states share responsibility for climate action, but historical emitters bear greater mitigation and finance burdens.	Chinese: core diplomatic frame; Western: self-critique on delivery.

Tag	Card Type	Front	Back	Perspective Note
L51	Source	What does IPCC AR6 contribute?	Synthesizes climate science; WGII on impacts/adaptation, WGIII on mitigation; stresses regional vulnerability and limits to adaptation.	UN: science-policy interface; African: vulnerability evidence.
L51	Mechanism	What is climate securitization?	Framing climate as a security threat that channels response through military and border-control institutions rather than civilian adaptation.	Western: security discourse; African: militarization risk.
L51	Comparison	Securitization vs. human security?	Securitization prioritizes state/military stability; human security prioritizes people's livelihoods, rights, and adaptive capacity.	African: human-security preference; Russian: state-centric.
L51	Definition	What is a just transition?	Decarbonization that protects workers and communities and distributes costs fairly across North and South.	African: cost-bearing equity; Chinese: developmental space.
L51	Occlusion	What does Western climate leadership occlude?	Historical responsibility and the finance gap; self-critique acknowledges pledged finance often unmet.	Western: self-critique; African: demands accountability.

Tag	Card Type	Front	Back	Perspective Note
L51	Reconstruction	Chinese perspective on climate geopolitics?	Developmental priorities plus CBDR; resists binding mitigation constraining growth; emphasizes South-South cooperation and technology transfer.	Chinese: developmental sovereignty; Western: rivalry lens.
L51	Reconstruction	Russian perspective on climate geopolitics?	Skepticism of anthropogenic urgency; resource-state interests; frames climate governance as Western regulatory capture.	Russian: energy-state framing; Western: obstruction narrative.
L51	Adjudication	How to adjudicate loss-and-damage claims?	Weigh historical emissions, demonstrated vulnerability, and unmet finance against attribution-science limits and political will.	African: justice claim; UN: fund architecture.
L51	Visual	What does cumulative CO2 by region show?	Historical responsibility concentrated in the Global North, informing reparations and finance debates.	African: evidence base; Western: self-critique.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence Audit (score 0–100)

Concept	Confidence (0–100)	Basis for score
Threat-multiplier mechanism (climate → conflict)		
Hydro-hegemony and Nile dynamics		
Loss-and-damage finance politics		
Climate securitization vs. human security		
Just transition and cost distribution		
Reconstruction of all five perspectives		
Data interpretation (CO2, finance flows, Nile data)		
Adjudication of competing claims		

7.2 Three-Question Debrief

1. Which of the five perspectives was hardest to steel-man from within, and what specifically resisted your reconstruction?
2. Where did your initial causal claim about climate and conflict fail when tested against counter-evidence or scope conditions?
3. What single piece of evidence would most change your adjudication of the Nile dispute or the loss-and-damage fund?

7.3 Error-Log

Common Misconception	Correction	Evidence
Climate change directly causes war.	It multiplies risk in fragile contexts; conflict requires governance and livelihood failures as intermediaries.	Busby (2018); IPCC AR6 WGII.
Upstream states always dominate shared rivers.	Hydro-hegemony is contested by downstream coalitions, international water law, and counter-hegemonic alliances.	Nile dispute (Egypt/Sudan/Ethiopia).
The Loss and Damage Fund equals full climate reparations.	The fund is limited, largely voluntary in pledges, and does not cover full estimated needs.	UNFCCC/Loss and Damage Fund documentation.
Climate securitization improves response.	It can militarize adaptation, displace civilian governance, and prioritize borders over people.	Barnett (2003); securitization literature.
Decarbonization costs are shared equally.	The Global South bears disproportionate costs; just transition demands explicit equity mechanisms.	IPCC AR6 WGIII; UNFCCC.

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Threat multiplier; hydro-hegemony; loss and damage; securitization; just transition	Scarcity → livelihood loss → migration → conflict; upstream flow control; finance-gap politics; militarization of adaptation; cost shifting in decarbonization	Barnett (2003); Busby (2018); IPCC AR6; UNFCCC; CBDR principle	Nile/GERD; COP27/COP28 L&D Fund; cumulative CO2 by region; climate finance flows; Nile flow data	Security vs. human security; reparations vs. aid; CBDR vs. universal obligations	No conflict in high-vulnerability/low-governance cases; downstream veto power; full fund delivery; equal cost sharing	L19 resources; L17 world-systems; L49 Global South; L53 critical minerals; L57 biosecurity; L61 grand strategy

SECTION 9 — REVIEW SCHEDULE

- **R1 (Day 1):** Re-read Key Idea 1 and flashcards 1–3; define "threat multiplier" in one sentence without jargon.
- **R2 (Day 3):** Reconstruct the Nile dispute from memory (actors, interests, upstream/downstream claims); check against notes.
- **R3 (Week 1):** Write a 200-word memo on the Loss and Damage Fund's political economy; compare with worked example.
- **R4 (Week 2):** Steel-man the Russian and Chinese perspectives in a short debate; identify one occlusion in each.
- **R5 (Month 1):** Timed practice question adjudicating securitization vs. human security using all five perspectives.

SECTION 10 — COMPLETION CHECKLIST

☐ I can define "climate as threat multiplier" and specify its mechanism.
☐ I can explain hydro-hegemony with the Nile case.
☐ I can distinguish upstream from downstream claims in the GERD dispute.
☐ I can explain loss-and-damage finance and its political economy.
☐ I can state the CBDR principle and its contestations.
☐ I can distinguish climate securitization from human security.
☐ I can explain just transition and cost distribution.
☐ I can reconstruct all five perspectives from within.
☐ I can identify what the African perspective reveals that others miss.
☐ I can interpret cumulative CO2 and climate finance data.
☐ I can adjudicate competing claims with evidence.
☐ I can state falsifiers for each key idea.
☐ I have completed the confidence audit honestly.

☐ I have logged at least one misconception in the error-log.
☐ I can link this lesson to L19, L17, L49, L53, L57, L61.
☐ I can answer the hinge question correctly.
☐ I have scheduled R1–R5 reviews.

FURTHER READING (Optional)

Climate science and impacts - IPCC, *Sixth Assessment Report (AR6)*, Working Groups I–III (2021–2023). - Barnett, J. (2003), "Security and Climate Change," *Global Environmental Change*.

Conflict and security - Busby, J. (2018), "Warming World: Why Climate Change Matters More Than Anything Else," *Foreign Affairs* (and related work on climate and security).

Water and hydro-hegemony - UNFCCC reports on water and climate adaptation; Nile Basin Initiative documentation.

Loss and damage and finance - UNFCCC, Loss and Damage Fund documentation and COP27/COP28 decisions.

Perspectives and global justice - African scholarship on climate vulnerability and colonial responsibility (e.g., Grovogui, Mbembe, Rodney, Nkrumah) as framing for reparations debates.

End of Lesson 51. Say **Next** when you are ready.

---

53. Semiconductor Chokepoint Geopolitics

LESSON METADATA

Field	Value
Lesson number and title	Lesson 52 — Semiconductor Chokepoint Geopolitics
Module	Module 9: Techno-Geopolitics, AI, and Emerging Domains
Prerequisites	L18 (weaponized interdependence), L47 (US–China strategic competition), L19 (critical minerals)
Interleaved links	Forward to L53 (critical minerals), L54 (AI governance), L55 (quantum), L56 (innovation systems)
Reading load	7-9 hours
Content channels	Dense analytical prose, data tables, worked example, problem pair, dual-coded visuals, flashcards
Bloom ceiling	Evaluate / Create
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

The central puzzle of this lesson is deceptively simple: how did a single manufactured component — the advanced semiconductor — become the most consequential chokepoint in the global economy, and why do states now treat fabrication capacity as a matter of national security rather than commercial efficiency? Semiconductors are not rare in the geological sense; silicon is abundant. What is scarce is the *capacity to manufacture* chips at the leading edge, and that scarcity is concentrated in a handful of firms and a handful of geographies. Taiwan Semiconductor Manufacturing Company (TSMC) produces roughly ninety percent of the world's most advanced logic chips. ASML of the Netherlands is the sole supplier of extreme ultraviolet (EUV) lithography systems. Applied Materials, Lam Research, and Tokyo Electron dominate critical equipment segments. This concentration means that a disruption at any one node — a blockade, an earthquake, an export-control ruling — propagates through every downstream industry, from smartphones to missile guidance. The lesson asks when control over such a node constitutes durable geopolitical leverage, and when it instead accelerates the diversification that erodes the very power it confers.

This puzzle sits at the intersection of three threads already developed in the curriculum. From L18 on weaponized interdependence, the student inherits the Farrell and Newman framework: states can weaponize network structures by controlling *chokepoints* (nodes through which others must pass) and *panopticons* (nodes that let them observe and discipline). From L47 on US–China competition, the student inherits the strategic context: a rising power whose technological ascent threatens a hegemon's military and economic edge, and a hegemon willing to restrict technology flows to slow that ascent. From L19 on critical minerals, the student inherits the upstream logic: that the "green" and "digital" transitions rest on physical inputs whose supply is geographically concentrated and politically contested. Semiconductors are the downstream mirror image — not a raw material but a *processed* capability, and one whose production requires not just minerals but an ecosystem of tools, chemicals, talent, and capital accumulated over decades. The lesson tests whether the chokepoint logic developed for pipelines and financial messaging (SWIFT) transfers to a manufactured good whose production can, in principle, be replicated given enough time and money.

The stakes are not abstract. In October 2022 the United States imposed sweeping export controls restricting China's access to advanced chips, chip-making equipment, and US-person support for Chinese fabrication. In August 2023 China retaliated with export controls on gallium and germanium — inputs into compound semiconductors and fiber optics. The CHIPS and Science Act of 2022 committed roughly fifty-two billion dollars to domestic semiconductor manufacturing and research. TSMC broke ground on a fab in Arizona. The European Union passed its own Chips Act. Japan and the Netherlands aligned with US restrictions on lithography exports. These moves collectively signal a regime change: from the post-Cold War assumption that semiconductor production should follow comparative advantage and cost minimization, to a new assumption that fabrication geography is a security variable. Whether this shift is wise, sustainable, or self-defeating is precisely the evaluative question the lesson trains the student to adjudicate.

The African vantage point reframes the entire puzzle rather than appearing as a regional illustration. Africa is almost entirely absent from the semiconductor supply chain — not as a consumer only, but as a non-participant in design, fabrication, equipment, or even most packaging. This absence is not a natural fact; it is the product of decades of industrial policy choices, structural adjustment, and the concentration of capital-intensive manufacturing in East Asia, Europe, and North America. From an African perspective, the "chokepoint" debate among great powers is a debate about who controls a technology that Africa does not produce and largely does not design, yet on which its digital economies, financial systems, and (increasingly) agricultural and health infrastructure depend. The digital divide is not merely a gap in connectivity; it

is a gap in *productive capacity*, and the semiconductor geopolitics of the 2020s risks widening it by diverting investment and attention toward "friend-shoring" among already-industrialized partners. African scholars such as Grovogui, Mbembe, and Rodney have long argued that technological dependence is a form of structural subordination; the semiconductor case gives that argument contemporary, concrete form. The lesson therefore asks not only "who controls the chokepoint?" but "who is excluded from the chain entirely, and what does that exclusion cost?"

Methodologically, the lesson applies the four levels of analysis established in Lesson 1 — individual, state, systemic, and transnational — to a single case, and requires the student to reconstruct five perspectives (African, Chinese, Russian, Western, UN) on the same events. It also demands that the student distinguish description (what the supply chain looks like), explanation (why concentration emerged), prediction (whether controls will slow China), and prescription (what policy should follow). These distinctions are easy to blur in techno-geopolitical discourse, where analysts routinely slide from "China is catching up" to "therefore we must restrict" without examining the causal mechanism or the counterfactual. The lesson's worked example on the 2022–2023 US controls and its problem pair on China's 2023 gallium and germanium controls are designed to force that discipline: each requires the student to state a mechanism, identify scope conditions, and specify what evidence would falsify the claim.

By the end of the lesson the student should be able to: map the semiconductor supply chain by stage and identify the dominant firm and geography at each; apply chokepoint analysis to ASML, TSMC, and Applied Materials with explicit scope conditions; evaluate the US export-control architecture (Entity List, CHIPS Act, "small yard, high fence") against its stated objectives and its documented loopholes; reconstruct China's self-sufficiency strategy and assess its progress and constraints; and adjudicate between competing perspectives on whether economic security framing improves or worsens global welfare. The student should also be able to carry these tools forward to L53 (minerals), L54 (AI), L55 (quantum), and L56 (innovation systems), where the same chokepoint logic recurs with different materials and different political economies.

SECTION 1 — Pre-Class Priming

1.1 Retrieval Warm-Up

Answer these from memory before reading the lesson core. Each question targets a concept from an earlier lesson that this lesson builds on.

1. **(L18 — Weaponized Interdependence)** Define *chokepoint* and *panopticon* in the Farrell and Newman framework, and give one non-semiconductor example of each from the curriculum.
2. **(L18)** Under what conditions does weaponized interdependence *fail* — i.e., when does the target state escape or reverse the leverage?
3. **(L47 — US–China)** What is the "small yard, high fence" doctrine, and which US administration articulated it? What is the yard, and what is the fence?
4. **(L47)** How does the US–China technology competition differ from the US–Soviet competition in terms of supply-chain integration and mutual dependence?
5. **(L19 — Critical Minerals)** Name three critical minerals whose supply is geographically concentrated, and identify the dominant producer for each.
6. **(L19)** What is the difference between *resource nationalism* and *friend-shoring*, and which states have pursued each in the minerals domain?

1.2 Orientation Questions

These frame the lesson's central puzzle. Do not answer them yet; hold them in mind as you read.

1. If TSMC's advanced fabrication were disrupted for six months, which industries would halt first, and does that dependency give Taiwan *political* leverage over the United States or only *economic* leverage?
2. The US controls exports of EUV lithography to China but not of older deep-ultraviolet (DUV) equipment. Is this a coherent "small yard," or does the yard expand over time as controls are tightened? What evidence would distinguish the two?
3. China's gallium and germanium controls of 2023 were widely read as retaliation. Did they impose costs on the US and its allies, or did they mainly accelerate substitution and stockpiling? What metric would settle this?
4. From an African standpoint, is the semiconductor chokepoint debate a distraction from more urgent development priorities, or is control over digital infrastructure now a precondition for any development strategy?

1.3 Vocabulary Pre-Teach

Provisional definitions — refine these as you encounter the terms in the lesson core.

Term	Provisional Definition
Chokepoint	A node in a network through which others must pass, giving the controller potential leverage over users.
Node (process node)	A semiconductor manufacturing generation, measured in nanometers (e.g., 3 nm, 5 nm), indicating transistor density; smaller is more advanced.
EDA (Electronic Design Automation)	Software tools used to design integrated circuits; dominated by Synopsys, Cadence, and Siemens EDA.
Lithography	The process of patterning circuits onto silicon wafers using light; EUV lithography is the most advanced and is monopolized by ASML.
Fabrication (fab)	A facility that manufactures semiconductor wafers; leading-edge fabs cost $15–20 billion and take years to build.
Small yard, high fence	The US doctrine of narrowly restricting the most sensitive technologies while keeping broader trade open.
Indigenous innovation	China's policy goal of developing domestic technological capability to reduce dependence on foreign suppliers.
Import substitution	A development strategy of replacing imported goods with domestic production; in the Russian case, accelerated by sanctions.

Term	Provisional Definition
Friend-shoring	Relocating supply chains to politically aligned or allied countries to reduce geopolitical risk.
Digital divide	The gap between those with and without access to digital technologies and the productive capacity to use them; in this lesson, extended to semiconductor production capacity.
Weaponized interdependence	The use of network structures and chokepoints as instruments of coercion, per Farrell and Newman.

End of requested chunk. Sections 2 onward follow in subsequent chunks.

SECTION 2 — LESSON CORE

2.1 Learning objectives

After mastering this lesson, the student will be able to:

1. **Map and classify** the semiconductor supply chain into its principal stages—electronic design automation (EDA), lithography, wafer fabrication, and packaging—and identify the dominant firms, technologies, and geographies at each stage, drawing on industry data and the canonical sources (Miller, 2022; Miller and Varas, 2021; SIA State of the Industry reports). (Bloom: Understand/Analyze)
2. **Explain the mechanism** by which extreme geographic and firm-level concentration in a sequentially dependent production network generates structural chokepoints, specifying the roles of co-specified inputs, non-substitutability, and adjustment time horizons, and connecting this mechanism to the theory of weaponized interdependence. (Bloom: Explain/Analyze)
3. **Evaluate the scope conditions** under which a chokepoint converts into usable coercive leverage—including durable barriers to entry, stockpiling feasibility, credibility of denial, and the absence of substitute pathways—and identify the conditions under which chokepoint power erodes. (Bloom: Evaluate)
4. **Reconstruct and compare** how African, Chinese, Russian, Western, and UN perspectives frame the semiconductor supply chain's implications for development, security, sovereignty, and global order, identifying what each perspective contributes and what it occludes. (Bloom: Analyze/Compare)
5. **Apply** the chokepoint framework to a novel disruption scenario—for example, a sudden loss of access to EUV lithography or advanced packaging capacity—and derive falsifiable predictions about state and firm behavior, including relocation, stockpiling, and indigenous innovation responses. (Bloom: Apply)

These objectives are assessed through the worked example, problem pair, independent memo, and hinge question in later sections of this lesson, and they build directly on the weaponized interdependence framework developed in Lesson 18 and the US-China strategic competition framework developed in Lesson 47.

2.2 KEY IDEA 1 — The semiconductor supply chain: EDA, lithography, fabrication, and packaging

Bolded Causal Claim: The semiconductor supply chain is not a competitive market with interchangeable suppliers but a sequentially dependent production network in which each stage's output must meet tolerances that only the next stage's specific inputs can satisfy; consequently, control over a single bottleneck node confers structural power over all downstream stages, and this power persists for as long as substitution remains slower than the political time horizon of the actors involved.

Mechanism: The production of a leading-edge semiconductor proceeds through a chain of stages whose outputs are not generic commodities but co-specified inputs. Electronic design automation (EDA) software—dominated by Synopsys, Cadence, and Siemens EDA—translates circuit intent into manufacturable layouts validated against the design rules of a specific fabrication process. Those layouts are patterned onto silicon using lithography systems; at the leading edge, extreme ultraviolet (EUV) lithography is supplied exclusively by ASML of the Netherlands, with deep ultraviolet (DUV) systems also concentrated among ASML, Canon, and Nikon. The patterned wafers are processed in fabrication facilities (fabs) whose equipment—deposition, etch, ion implantation, metrology—is dominated by Applied Materials, Lam Research, KLA (United States), and Tokyo Electron (Japan). The resulting dies are then packaged and tested, increasingly through advanced techniques such as 2.5D/3D integration and chiplet assembly, where capacity is concentrated at TSMC's advanced packaging lines and at outsourced semiconductor assembly and test (OSAT) providers such as ASE, Amkor, and JCET. Each stage's output must satisfy the next stage's input specifications: EDA tools must support the target node's design rules; lithography resolution must match the feature size; fab processes must achieve yield on that node; packaging must accommodate the die's thermal and electrical profile. Because these specifications are co-evolved rather than standardized, substituting one supplier for another is not a procurement decision but a re-engineering of the entire chain. The mechanism of chokepoint power follows: an actor controlling a node whose output cannot be replaced within the relevant time horizon can deny downstream actors access to the entire chain's output, even if that actor holds a small share of total industry value. This is the logic of weaponized interdependence applied to production networks—centrality in a network, not aggregate market share, determines structural power. The time dimension is critical. Building a new leading-edge fab requires three to five years and ten to twenty billion dollars; developing a new lithography platform took ASML roughly two decades; EDA algorithms embody decades of accumulated process knowledge. In the short run, supply is highly inelastic, so denial is effective. In the long run, substitution is possible but costly and slow, which means chokepoint power is a wasting asset whose value depends on the speed of the target's adaptation relative to the controller's willingness to sustain denial. As Miller and Varas (2021) and Miller (2022) document, this concentration is not an accident of market competition but the outcome of decades of specialization, capital intensity, and learning-by-doing that have made each stage's dominant firms effectively irreplaceable within policy-relevant horizons.

Scope Conditions: Chokepoint power of the kind described holds only under four conditions. First, concentration at the node must be durable: barriers to entry must be high enough that no competitor can emerge within the policy horizon, whether because of capital intensity, tacit knowledge, or intellectual property. ASML's EUV monopoly satisfies this; the OSAT market, where several firms compete, does not. Second, downstream actors must be unable to stockpile or reroute: stockpiling is feasible for some inputs (Huawei accumulated chip inventories before the 2020 controls) but not for others (EUV systems are installed, maintained, and updated under service contracts that can be terminated). Third, the controlling actor must have a credible and sustained commitment to deny access; intermittent or partial denial invites circumvention. Fourth, no viable alternative pathway must exist within the relevant horizon: SMIC's production of a 7-nanometer chip using DUV multi-patterning demonstrates that a determined actor can partially substitute,

but at lower yield and higher cost. Chokepoint power erodes when any of these conditions fails—when stockpiles are built, when multi-patterning or other workarounds mature, when demand shifts to less advanced nodes where concentration is lower, or when third-country transshipment blunts the denial. The power is also node-specific: controlling packaging does not confer the leverage of controlling EUV lithography, and controlling EDA does not automatically control fabrication. Finally, the mechanism assumes that the downstream product is valuable enough to justify the cost of denial; for mature-node chips used in automobiles or appliances, where multiple suppliers exist, chokepoint logic applies weakly if at all.

Observable Implications: If the mechanism holds, several patterns should be observable. States and firms that depend on a bottleneck node will seek to secure access through geographic diversification of production (TSMC's Arizona and Japan fabs, Intel's Ohio and Germany investments) and through stockpiling of critical inputs. Controlling states will restrict exports from bottleneck nodes (United States controls on EDA software and semiconductor manufacturing equipment; Dutch licensing of ASML EUV exports to China). Targeted states will pursue indigenous capability at the bottleneck (China's support for SMIC, Huawei's Kirin chip development, and the "whole-nation" (□□□□) mobilization for semiconductor self-sufficiency). Market prices and lead times for bottleneck inputs will spike under disruption or anticipated restriction, as occurred during the 2020–2021 chip shortage and following the 2022 export controls. Geographic concentration of leading-edge fabrication will correlate with geopolitical risk premia in equity and insurance markets, particularly around Taiwan. New stages will become chokepoints as technology evolves: advanced packaging, once a commoditized back-end process, is emerging as a binding constraint on AI accelerator supply, with TSMC's CoWoS capacity a limiting factor. Conversely, where concentration is low, behavior should differ: no state has sought to weaponize mature-node packaging in Southeast Asia, and no export control regime targets commodity memory chips with the same intensity as leading-edge logic. The framework thus generates falsifiable predictions about where controls will be imposed, where investment will flow, and where substitution efforts will concentrate.

Perspective Note (five traditions in brief):

African (primary): The semiconductor supply chain as described above does not merely exclude Africa; it renders Africa structurally invisible as a participant while deeply implicated as a consumer and as a supplier of upstream minerals. Reconstructed from within African scholarship, the chain exemplifies what Walter Rodney identified as the systematic underdevelopment of the continent through its insertion into global capitalism as a supplier of raw materials and a market for finished goods: Africa exports cobalt, coltan, tantalum, and other minerals essential to electronics manufacturing, yet captures none of the value added in EDA, lithography, fabrication, or packaging, all of which occur in the Global North or East Asia. Jean-François Bayart's concept of "extraversion"—the orientation of African elites toward external patrons rather than domestic productive capacity—helps explain why African states have not historically mobilized to enter semiconductor manufacturing, though it also risks overstating elite agency and understating structural barriers. Kwame Nkrumah's analysis of neo-colonialism illuminates how technological dependence reproduces political dependence: a state that cannot produce the chips running its communications, financial, and security infrastructure is not merely economically disadvantaged but sovereignty-constrained. The digital divide, on this view, is not a gap in access to devices or connectivity but a gap in production capability; importing smartphones and cloud services while exporting unprocessed minerals is a continuation of the colonial division of labor. Julius Nyerere's and Amílcar Cabral's insistence on self-reliant development, and Frantz Fanon's critique of the comprador bourgeoisie, frame the question of whether African states can realistically pursue semiconductor industrialization or whether such ambition diverts scarce resources from more attainable goals. Oyèrónkẹ́ Oyěwùmí's epistemic critique reminds us that the very categories of "technology" and

"development" are not neutral but carry Eurocentric assumptions about modernity. Contemporary African scholars such as Kwesi Aning and Kwaku Danso have analyzed African agency in global governance, noting that Africa's collective weight in forums such as the African Union and the G20 could in principle be leveraged to demand technology transfer and local content requirements, as some states have done in mining. Sylvia Tamale's decolonial feminist lens adds that the burdens of technological marginalization fall unevenly: women and marginalized groups are least likely to benefit from digital infrastructure and most exposed to its harms, including surveillance and data extraction. What the African vantage reveals that the other four perspectives miss is that the semiconductor chokepoint debate among great powers is, for Africa, a debate about a supply chain in which Africa is present only at the mineral extraction stage and absent from every stage where value and power are created; "friend-shoring" and "de-risking" strategies that redirect investment toward allied states risk bypassing Africa entirely, locking in its marginalization. The African perspective also highlights that the minerals on which the chain depends—cobalt from the Democratic Republic of Congo, coltan from the Great Lakes region—are themselves chokepoints, but ones controlled not by African states but by multinational firms and armed actors, a fact that the great-power framing of "chokepoint geopolitics" systematically obscures.

Chinese: China frames the semiconductor supply chain as a domain of sovereign technological development unjustly constrained by US hegemony. The concept of "chokepoint" (□□□) technologies—those controlled by foreign suppliers—has become central to Chinese industrial policy, with semiconductors the paradigmatic case. Beijing's response combines state-led investment (the National Integrated Circuit Industry Investment Fund, or "Big Fund"), indigenous innovation campaigns, and a narrative of anti-hegemonic resistance that portrays US export controls as violations of market principles and WTO obligations. The success of SMIC's 7-nanometer production and Huawei's Kirin 9000S chip is presented as evidence that external pressure accelerates rather than prevents Chinese capability. This perspective contributes a reminder that chokepoint power can provoke the very substitution it seeks to prevent, and that "de-risking" by one side is read as "decoupling" by the other. It occludes, however, the role of foreign technology and talent in China's semiconductor rise, the inefficiencies and corruption associated with state-led investment, and the security concerns that motivate US and allied controls.

Russian: Russia draws lessons from China's experience while confronting its own far weaker industrial base. Post-2014 and especially post-2022 sanctions have made "technological sovereignty" (технологический суверенитет) and import substitution (импортозамещение) central to Russian policy, but the Russian microelectronics sector—centered on firms such as Mikron and Angstrem—lacks the scale, capital, and ecosystem to replicate even mature-node production without foreign equipment and EDA tools. Russia's experience functions as a cautionary case: a state that allowed its semiconductor industry to atrophy cannot quickly rebuild it under sanctions, and "parallel imports" through third countries provide only partial relief. Moscow also notes its own upstream role as a supplier of neon and palladium used in lithography, suggesting that chokepoint logic cuts both ways. This perspective contributes an emphasis on the long time horizons and sunk costs of industrial reconstruction, but it occludes the extent to which Russia's technological dependence was a policy choice rather than an inevitability, and it understates the gap between Russian ambition and capability.

Western: The United States and its allies frame semiconductor supply chain concentration as a national security vulnerability requiring "small yard, high fence" controls, friend-shoring, and industrial policy. The CHIPS and Science Act of 2022, the EU Chips Act, and Japan's semiconductor subsidies reflect a shared judgment that leading-edge fabrication and equipment must be geographically diversified among trusted partners. The economic cost debate—quantified in industry analyses by the Semiconductor Industry Asso-

ciation and Boston Consulting Group—warns that full self-sufficiency could cost the global industry over a trillion dollars, leading to a preference for "de-risking" over "decoupling." This perspective contributes a coherent account of how alliance coordination (US-Japan-Netherlands equipment controls) can multilateralize chokepoint power, and it has generated substantial public investment. It occludes, however, the possibility that security framing overstates the threat, that controls accelerate Chinese substitution, and that the costs of fragmentation fall disproportionately on developing countries and on the global innovation ecosystem.

UN: The United Nations frames semiconductor concentration through the lenses of technology transfer, the digital divide, and Sustainable Development Goal 9 (industry, innovation, and infrastructure). UNCTAD, the ITU, and UNESCO have emphasized that equitable access to digital technologies requires not only connectivity but participation in production, and that a bifurcated global technology stack risks leaving developing countries further behind. The UN's digital cooperation agenda calls for multilateral governance of emerging technologies and for bridging divides rather than deepening them. This perspective contributes a normative framework that centers development and equity, and it highlights the risk that great-power techno-competition will marginalize the Global South. It occludes, however, the security dilemmas that drive national controls, and its aspirational character is limited by the absence of enforcement mechanisms.

2.3 KEY IDEA 2 — Chokepoint Analysis: ASML, TSMC, Applied Materials, and the Geography of Concentration

Bolded Causal Claim: The extreme geographic and firm-level concentration of critical semiconductor manufacturing steps creates structural chokepoints that convert commercial market positions into instruments of geopolitical coercion, transforming the supply chain from a neutral market network into a site of weaponized interdependence.

Mechanism: The mechanism derives from Farrell and Newman's (2019) theory of weaponized interdependence, which posits that global economic networks are not flat but hub-and-spoke structures in which certain nodes concentrate flows of goods, information, or capital. States that control these hubs gain two forms of power: the panopticon (surveillance of flows) and the chokepoint (denial of access). In semiconductors, the chokepoint form dominates. The mechanism operates through three channels. First, denial: a state controlling a critical node can refuse to supply inputs, halting downstream production. Second, threat of denial: even absent execution, the credible possibility of cutoff shapes the target's behavior through anticipatory compliance and self-censorship. Third, rerouting costs: because semiconductor inputs are highly specific and qualified—a chip design validated on one foundry's process cannot simply move to another—the target cannot quickly substitute, making the threat credible. The concentration is not accidental but reflects decades of capital-intensive specialization, learning curves, and network externalities. ASML's monopoly in extreme ultraviolet (EUV) lithography emerged from a European consortium's sustained investment and from the fact that no other firm could master the optics and light-source engineering required. TSMC's dominance in advanced foundry services reflects Morris Chang's foundry model, Taiwan's industrial policy, and the clustering of suppliers and talent. Applied Materials, Lam Research, and KLA dominate deposition, etch, and process control equipment through accumulated process knowledge and customer lock-in. The mechanism is therefore path-dependent: chokepoints are sticky because they rest on tacit knowledge and capital sunk over decades, not merely on patents or market share.

Scope Conditions: The chokepoint mechanism applies only under specific conditions. (a) Concentration must be extreme—ideally monopoly or tight oligopoly—so that no ready substitute exists. (b) The input

must be non-substitutable in the relevant time horizon; if the target can redesign around the input or source it elsewhere within months, the chokepoint is weak. (c) The controlling state must possess both the legal authority (export control jurisdiction) and the political will to deny access; a concentrated firm in a state unwilling to act is not a geopolitical chokepoint. (d) The target must be dependent in a way that cannot be quickly reversed; high switching costs and qualification timelines matter. The mechanism weakens or fails when: alternatives emerge (e.g., China's push for domestic EUV alternatives, however distant); the controlling state's allies refuse to coordinate (a firm in one country cannot choke a target if third countries supply equivalents); the good becomes commoditized; or the target has stockpiled sufficient inventory. A further scope condition concerns time: chokepoints are most powerful in the short-to-medium term; over the long term, denial accelerates the target's indigenization, potentially eroding the chokepoint. This is the "chokepoint paradox"—the very use of the weapon incentivizes its own obsolescence.

Observable Implications: If the chokepoint thesis holds, we should observe: (1) policy actions specifically targeting the concentrated nodes—US pressure on the Netherlands to restrict ASML's EUV sales to China (2019–2023), and on TSMC to halt advanced chip production for Chinese firms; (2) stockpiling and inventory accumulation by dependent states and firms—China's accumulation of semiconductor manufacturing equipment in 2020–2022 ahead of anticipated controls; (3) investment in alternative suppliers and reshoring—US CHIPS Act subsidies, TSMC's Arizona fab, Samsung's Texas expansion, Intel's Ohio and Germany projects; (4) price premiums and supply anxiety for non-controlled advanced chips; (5) diplomatic contestation around specific firms—ASML's CEO publicly warning about overreach, TSMC's Morris Chang stating that "globalization is dead" in semiconductors. Quantitatively, TSMC holds over 50% of global foundry revenue and over 90% of the most advanced nodes (5nm and below); ASML is the sole supplier of EUV lithography systems, each costing roughly $150–200 million; Applied Materials, Lam Research, and KLA together account for a dominant share of wafer fabrication equipment. These figures are consistent with the chokepoint prediction that a handful of firms control irreplaceable steps.

Perspective Note (five traditions in brief):

African (primary): From an African vantage point, the chokepoint analysis reveals not merely a US-China contest but the deeper architecture of technological dependency that structures the global economy. African economies occupy the lowest rungs of the semiconductor value chain: no advanced fabrication, minimal assembly, and limited design capacity. The concentration of chokepoints in the US, Netherlands, Taiwan, Japan, and South Korea means that African states are triply dependent—on imported chips, on imported equipment, and on the geopolitical decisions of states that control both. This reproduces the dependency dynamics analyzed by Rodney (1972) and Nkrumah (1965): the periphery's integration into the global economy on terms set by the center, with value capture concentrated upstream. What the chokepoint literature often misses, from this perspective, is that the "weaponization" is not new for Africa; African states have long faced technology denial through export controls, sanctions, and conditional aid. The novelty is that great powers now experience the vulnerability that peripheral states have always known. African scholarship—Grovogui (2006) on sovereignty and the international order, Mbembe (2001) on the postcolony—suggests that the chokepoint is not an aberration of globalization but its constitutive logic: the center's control over critical nodes is what makes the periphery peripheral. The African perspective thus reframes chokepoint analysis from a security problem to be solved by the great powers into a structural feature of global capitalism that demands democratization of technology governance, not merely friend-shoring among allies.

Chinese: The Chinese perspective treats chokepoints as evidence of US hegemonic weaponization of commercial interdependence. Beijing's framing, articulated in official documents and state media, holds that

the US has politicized supply chains and coerced allies into restricting China's access to critical technologies, violating market principles. The chokepoint is thus not a natural market outcome but a deliberately constructed instrument of containment. This framing justifies China's pursuit of indigenous innovation and self-sufficiency (zili gengsheng) as defensive necessity rather than aggressive ambition. It occludes, however, China's own use of economic leverage in other domains (rare earths, critical minerals) and the security concerns that motivate US and allied controls.

Russian: The Russian perspective draws lessons for import substitution and sanctions resilience. Moscow's experience with Western sanctions after 2014 and 2022 has highlighted the dangers of single-source dependency and the value of domestic alternatives, however costly. Russian analysts view the semiconductor chokepoint as a cautionary tale: a state that relies on foreign-controlled nodes is vulnerable to coercion, and resilience requires accepting efficiency losses for security gains. This perspective contributes an emphasis on autarky and the political economy of sanctions-proofing, but it occludes the scale of investment required and the technological gap that makes full substitution impractical for most states.

Western: The Western perspective—encompassing US, European, and Japanese viewpoints—treats chokepoints as vulnerabilities to be remediated through allied coordination and industrial policy. The emphasis is on "friend-shoring": relocating critical production to trusted partners, diversifying away from single points of failure, and using export controls to slow adversaries. This perspective contributes a security-centered framework and has driven concrete policy (CHIPS Act, EU Chips Act, Japanese subsidies). It occludes the economic costs of fragmentation, the risk of overreach, and the exclusion of non-allied developing countries from trusted supply chains.

UN: The UN perspective frames chokepoint concentration as a barrier to equitable technology access and sustainable development. UNCTAD, ITU, and UNESCO have emphasized that participation in production, not merely consumption, is necessary for digital development, and that bifurcated technology stacks risk leaving developing countries further behind. The UN's digital cooperation agenda calls for multilateral governance and bridging divides. This perspective contributes a normative framework centering development and equity, but it occludes the security dilemmas driving national controls and lacks enforcement mechanisms.

2.4 KEY IDEA 3 — US Export Controls: The Entity List, CHIPS Act, and 'Small Yard, High Fence'

Bolded Causal Claim: The United States has transformed export controls from a narrow national-security tool into a comprehensive strategy of technological containment, using the Entity List, the CHIPS Act, and the "small yard, high fence" doctrine to restrict China's access to advanced semiconductors and the means of producing them, while attempting to limit collateral damage to allied economies and global supply chains.

Mechanism: The mechanism operates through four layered instruments. First, the Entity List, administered by the Commerce Department's Bureau of Industry and Security (BIS), designates specific foreign entities as requiring licenses for exports of controlled items; the 2019 designation of Huawei and the 2020 designation of SMIC signaled the shift from targeted to strategic controls. Second, the Foreign Direct Product Rule (FDPR) extends US jurisdiction extraterritorially: foreign-made products that are the direct product of US technology or software, or produced by plants that are themselves direct products of US technology, are subject to US controls even if no US component is present. This captures TSMC's production for Huawei and ASML's tools. Third, the CHIPS and Science Act of 2022 provides $52.7 billion in subsidies and tax credits for domestic semiconductor manufacturing, conditioned on "guardrails" that prohibit recipients from expanding advanced fabrication in China for ten years. Fourth, the "small yard, high fence" doctrine, articu-

lated by National Security Advisor Jake Sullivan in September 2022, holds that the US should restrict only the most critical technologies—advanced logic chips, AI accelerators, and the equipment to produce them—while keeping the broader technology trade open. The mechanism's logic is to raise the cost and reduce the feasibility of China's advanced semiconductor development, creating a "sliding doors" trajectory in which China's technological path diverges from the frontier. The October 2022 BIS rules imposed controls on advanced computing chips (below 14/16nm logic, certain memory), semiconductor manufacturing equipment, and US person support for Chinese fabs. The October 2023 update tightened these, closing loopholes (e.g., chiplet workarounds, cloud access to controlled chips) and adding more Chinese entities. Allied coordination followed: the Netherlands restricted ASML's advanced DUV and EUV exports (2023), and Japan imposed controls on 23 categories of equipment. The mechanism thus depends on a coalition; unilateral US controls would be circumvented through third-country production.

Scope Conditions: The export control strategy is effective under specific conditions. (a) The US must control critical nodes—EDA software (Synopsys, Cadence, Siemens EDA dominate), equipment (Applied Materials, Lam, KLA), and advanced design IP. (b) Allies must coordinate; the FDPR is a backstop, but allied participation reduces friction and closes gaps. (c) The target must lack short-term substitutes; if China can source equivalent equipment from non-controlled suppliers, controls leak. (d) Enforcement capacity must keep pace with circumvention; transshipment through third countries (UAE, Malaysia, Singapore) and cloud-based access to controlled compute are ongoing challenges. The strategy is less effective or counterproductive when: controls are overbroad, harming US firms' revenue and R&D funding (Nvidia's China revenue loss, Applied Materials' exposure); when they accelerate the target's indigenization by creating guaranteed demand for domestic alternatives; when allied coordination fractures due to commercial interests; or when the "small yard" expands into a "large yard," undermining the doctrine's credibility and allied buy-in. A further scope condition is technological dynamism: the definition of "advanced" shifts as the frontier moves, requiring constant rule updates that lag behind innovation.

Observable Implications: If the strategy operates as described, we should observe: (1) specific, dated control actions—October 2022 BIS rules, October 2023 update, December 2024 further tightening; (2) Chinese firm responses—Huawei's Mate 60 Pro (August 2023) containing a 7nm chip produced by SMIC, demonstrating partial progress despite controls; SMIC's reported 5nm/3nm development efforts; (3) allied policy changes—Dutch government's 2023 restrictions on ASML's NXT:2000i and subsequent tools, Japan's 2023 equipment controls; (4) US firm impacts—Nvidia's development of China-specific chips (H20, L20) to comply, then their subsequent control; Applied Materials and Lam Research revenue exposure to China (China became the largest market for some equipment makers in 2023); (5) circumvention and enforcement—BIS enforcement actions, reports of chip smuggling, and the 2024 rules addressing cloud access and chiplet architectures. The pattern of action-response-escalation is consistent with the mechanism.

Perspective Note (five traditions in brief):

African (primary): From an African perspective, US export controls are not merely a US-China matter but a restructuring of global technology access that risks marginalizing the continent further. The "friend-shoring" logic underlying the CHIPS Act and allied coordination defines a "trusted" supply chain that excludes most African states, not because of African choices but because of geopolitical categorization. African countries, already at the periphery of semiconductor production, face reduced technology availability, higher costs, and diminished leverage as the global tech stack bifurcates. The controls also set precedents: if the US can restrict technology flows for security reasons, other powers may follow, and African states—lacking bargaining power—will be rule-takers rather than rule-makers. African scholarship on technology and development—

Aning and Danso (2013) on African agency in global governance, Tamale (2020) on decolonial approaches—suggests that the relevant question is not whether controls are justified but who participates in setting the rules. The African perspective reveals that the "small yard, high fence" is drawn by great powers for great-power interests; the yard's perimeter passes through Africa without African consent. It also highlights a paradox: controls intended to slow China may accelerate China's development of alternative, potentially cheaper technology ecosystems that could, in the long run, offer African states more affordable access than Western-controlled supply chains—though at the cost of dependency on a different hegemon.

Chinese: The Chinese perspective frames US export controls as hegemonic containment and a violation of free-trade principles. Official Chinese discourse describes the controls as "technological blockade" and "decoupling," positioning China as a victim of US unilateralism. The controls are cited as justification for self-reliance campaigns and for building indigenous alternatives. This perspective contributes a critique of US extraterritoriality and the politicization of trade, and it resonates with Global South grievances about unequal rules. It occludes, however, the security concerns (military end-use, human rights) that motivate some controls, and China's own restrictive practices in other domains.

Russian: The Russian perspective treats US export controls as a template for sanctions and a lesson in import substitution. Moscow's experience with Western technology sanctions has reinforced the view that dependency on foreign-controlled nodes is a strategic vulnerability. Russian analysts emphasize the need for domestic production capacity, even at high cost, and view China's push for self-sufficiency as a model—while acknowledging the scale of the challenge. This perspective contributes an emphasis on resilience and the political economy of sanctions-proofing, but it occludes the technological gap and the efficiency costs of autarky.

Western: The Western perspective treats export controls as a necessary security tool, justified by the military applications of advanced semiconductors and AI, and by the need to slow a strategic competitor. The "small yard, high fence" doctrine is presented as a calibrated approach that preserves beneficial trade while protecting critical capabilities. This perspective contributes a security-centered framework, allied coordination mechanisms, and concrete policy instruments. It occludes the economic costs to domestic firms, the risk of accelerating Chinese indigenization, and the exclusionary effects on developing countries.

UN: The UN perspective raises concerns about technology transfer, the digital divide, and SDG 9 (industry, innovation, infrastructure). UNCTAD and ITU have emphasized that export controls and bifurcated technology stacks risk leaving developing countries further behind, and that multilateral governance is preferable to unilateral measures. The UN's digital cooperation agenda calls for bridging divides rather than deepening them. This perspective contributes a normative framework centering development and equity, but it occludes the security dilemmas driving national controls and lacks enforcement mechanisms.

2.5 KEY IDEA 4 — China's response: SMIC, Huawei, and the pursuit of self-sufficiency

Bolded Causal Claim: China's semiconductor self-sufficiency drive is best understood as strategic adaptation to weaponized interdependence: export controls raise the expected cost of dependence, so Beijing redirects state capacity toward indigenous capability, but because chokepoints are nested, progress is fastest in stages where foreign inputs are substitutable and slowest where lithography, EDA, and materials remain indispensable.

Mechanism: The mechanism runs through a state-led reallocation of capital, talent, and procurement toward

domestic semiconductor capability, often described as a "whole-nation system" in which national champions absorb subsidies, preferential credit, and guaranteed demand. SMIC's advance to 7nm-class production without access to ASML's EUV systems illustrates the mechanism's partial success: multi-patterning with deep-ultraviolet lithography can compress the gap, but at higher cost, lower yield, and greater process complexity. Huawei's return to advanced smartphone silicon, most visibly in the Mate 60 Pro, demonstrates that controls can be circumvented or delayed through stockpiling, design optimization, and domestic foundry progress, but it does not demonstrate parity in cost, volume, or reliability. The mechanism also operates through substitution at the margins: Chinese equipment makers, EDA firms, and materials suppliers gain market share where performance requirements are less extreme, while foreign suppliers retain leverage at the frontier. A second, less visible mechanism is learning-by-doing under scarcity: when imported inputs become uncertain, domestic firms face stronger incentives to redesign products around available tools, but this can lock in suboptimal architectures and raise unit costs. A third mechanism is counter-coercion: China's controls on gallium and germanium, and its broader "de-risking" rhetoric, signal that interdependence is being politicized on both sides. The result is not autarky but a bifurcated innovation ecosystem in which China's share of mature-node capacity can rise while its dependence on foreign chokepoints at the leading edge persists.

Scope Conditions: This adaptation is most likely when four conditions hold: the state has sufficient fiscal and administrative capacity to sustain long-horizon subsidies; the domestic market is large enough to amortize learning costs; the technological gap is bridgeable through incremental engineering rather than a single missing scientific breakthrough; and foreign suppliers can be circumvented through stockpiling, third-country routing, or redesign. It is least likely when the bottleneck is a single, tightly controlled input such as EUV lithography, advanced EDA, or specialized materials; when allied enforcement is coordinated; when domestic firms lack absorptive capacity; or when subsidies generate rent-seeking rather than capability. The mechanism also assumes that national security framing can override efficiency losses, which is politically contingent and may weaken if growth slows or fiscal constraints tighten.

Observable Implications: Observable implications include SMIC's demonstrated 7nm-class production without EUV access; Huawei's re-entry into advanced smartphone markets; rising Chinese market share in mature-node fabrication and in selected equipment and materials segments; increased stockpiling of controlled inputs before enforcement dates; third-country transshipment and diversion investigations; Beijing's counter-controls on critical minerals; expanded domestic subsidy programs; and a widening gap between China's mature-node capacity and its advanced-node dependence. One should also expect more frequent "good enough" product strategies that sacrifice peak performance for supply security, and greater emphasis on packaging, chiplet architectures, and software optimization as partial substitutes for leading-edge nodes. If the mechanism is working, Chinese firms should show rising revenue in non-controlled segments and persistent cost or yield penalties in controlled ones.

Perspective Note (five traditions in brief):

African (primary): From an African vantage point, China's self-sufficiency drive is neither simply a challenge to Western hegemony nor a model to emulate; it is a reminder that technological marginalization is structural and that the global semiconductor order is being reorganized around the security priorities of great powers. African states remain predominantly consumers of digital infrastructure, with limited participation in fabrication, EDA, equipment, or advanced packaging. The African perspective, drawing on Grovogui's insistence that sovereignty is performed through control over knowledge and infrastructure, and on Rodney's analysis of underdevelopment as a relational process, highlights that both US controls and Chinese indige-

nization can narrow Africa's room for maneuver: controls restrict access to affordable advanced chips, while Chinese alternatives may create new dependencies on non-Western technology stacks. The digital divide is not merely a gap in access but a gap in agency, because African firms and governments rarely set standards, control chokepoints, or capture rents from the semiconductor value chain. Mbembe's critique of extractive modernity and Bayart's analysis of extraversion suggest that Africa's integration into global technology markets has often been mediated by external powers, leaving domestic industrial policy under-resourced. Yet the African perspective also identifies openings: regional integration under the African Continental Free Trade Area, investment in digital skills, and bargaining for technology transfer could convert geopolitical rivalry into developmental leverage. The strongest African claim is that the lesson of China's response is not autarky but strategic patience: building absorptive capacity, protecting policy space, and refusing to be locked into either Western or Chinese technological blocs without reciprocal industrial benefits. This perspective contributes a corrective to great-power narratives by centering dependency and agency, but it risks understating the scale of capital and know-how required to move from consumption to production.

Chinese: The Chinese perspective frames self-sufficiency as defensive modernization against coercive containment. It emphasizes indigenous innovation, the "whole-nation system," and the legitimacy of reducing vulnerability to unilateral controls. It contributes a theory of state-led catch-up under sanctions, but it can occlude the inefficiency of subsidy-driven allocation, the continued dependence on foreign chokepoints, and the risk that techno-nationalism narrows international cooperation.

Russian: The Russian perspective treats China's response as a larger-scale version of import substitution under sanctions, emphasizing state capacity, parallel supply chains, and resilience. It contributes lessons about operating under restricted access, but it occludes differences in market size, technological depth, and alliance structure; Russia's experience is more about survival than frontier catch-up.

Western: The Western perspective reads China's response as evidence that controls are working partially but also accelerating indigenization. It emphasizes the need for allied coordination, enforcement, and "small yard, high fence" discipline. It contributes a security-centered framework, but it can occlude the economic costs to domestic firms and the possibility that overreach strengthens Chinese resolve.

UN: The UN perspective stresses technology transfer, the digital divide, and SDG 9. It warns that bifurcated technology stacks and unilateral controls may leave developing countries further behind. It contributes a development-centered normative framework, but it occludes the security dilemmas driving national controls and lacks enforcement mechanisms.

2.6 KEY IDEA 5 — The strategic logic: economic security as national security

Bolded Causal Claim: The redefinition of economic security as national security transforms semiconductor chokepoints from commercial assets into strategic terrain, justifying state intervention across the supply chain; but this securitization can overreach, conflating resilience with autarky and imposing costs that fall unevenly on allies and developing economies.

Mechanism: The mechanism begins with a cognitive shift: policymakers treat concentrated supply chains not merely as efficiency outcomes but as vulnerabilities that adversaries can exploit. This reframing converts firms' sourcing decisions into security externalities and legitimizes instruments that were previously considered protectionist: export controls, investment screening, subsidies, friend-shoring, and alliance coordination. In semiconductors, the mechanism is especially powerful because the supply chain is both highly concentrated and militarily salient; advanced chips underpin AI, precision weapons, and intelligence systems.

Once securitized, the policy logic expands: a control on lithography becomes a control on AI capability; a subsidy for domestic fabs becomes a hedge against geopolitical shock; a restriction on Chinese firms becomes a tool to slow an adversary's military modernization. The mechanism then feeds back through markets: firms restructure supply chains, governments fund redundancy, and allies negotiate burden-sharing. But securitization also generates second-order effects. It can accelerate the very indigenization it seeks to prevent, as targeted states invest in alternatives. It can raise costs for downstream industries, from automotive to cloud computing. It can strain alliances when partners face different exposure to China. And it can marginalize developing countries that lack the fiscal capacity to subsidize fabs or the diplomatic weight to secure exemptions. The strategic logic is therefore not simply "security first"; it is a contest over how much efficiency to sacrifice for resilience, and who bears that sacrifice.

Scope Conditions: Securitization is most coherent when three conditions hold: chokepoints are genuinely concentrated and difficult to replicate; the adversary has both capability and intent to exploit them; and domestic political coalitions accept higher costs for security. It is least coherent when controls are overbroad, when allies are not aligned, when the targeted technology diffuses through third countries, or when the economic costs undermine the industrial base that security is meant to protect. The mechanism also depends on credible enforcement: a fence with holes becomes a subsidy for evasion. Finally, securitization is bounded by innovation dynamics; if controls slow domestic firms' access to global markets or talent, they may weaken the technological leadership they are meant to preserve.

Observable Implications: Observable implications include the CHIPS Act's subsidies for domestic fabrication and R&D; the EU Chips Act and comparable Japanese and Korean programs; expanded US export controls in October 2022 and October 2023; allied coordination through the US-Japan-Netherlands arrangement on advanced lithography; "friend-shoring" and "de-risking" rhetoric; TSMC's investments in Arizona and Japan; increased screening of outbound investment; and China's counter-controls on critical minerals. One should also expect debates over the size of the "yard," the height of the "fence," and the cost of redundancy; lobbying by semiconductor firms over control thresholds; and diplomatic friction with allies over extraterritorial application. If securitization is stabilizing, one should see diversified but still interconnected supply chains; if destabilizing, one should see accelerated bifurcation, higher prices, and reduced innovation spillovers.

Perspective Note (five traditions in brief):

African (primary): The African perspective treats the securitization of semiconductors as a warning that economic security is being defined by great powers in ways that can reproduce technological marginalization. African states are rarely the architects of export controls or subsidy regimes, yet they bear the consequences: higher prices for digital infrastructure, reduced access to advanced chips, and pressure to align with one technological bloc or another. Drawing on Mamdani's critique of bifurcated states and Nkrumah's analysis of neo-colonialism, the African vantage point sees "friend-shoring" as potentially a new form of exclusion, in which security partnerships determine who gets access to technology and who does not. The perspective also draws on Nyerere's emphasis on self-reliance and Cabral's insistence on reclaiming the productive base, suggesting that African agency requires not autarky but strategic industrial policy: investing in skills, regional value chains, and bargaining capacity. Tamale's feminist political economy and Oyěwùmí's critique of imposed categories remind us that "security" is not gender-neutral or culturally universal; who is protected, and at whose cost, matters. The African perspective contributes a necessary corrective by asking whether resilience for some is exclusion for others, and by insisting that development, not only deterrence, is a security good. Its limitation is that it can understate the genuine security dilemmas that drive great-power controls,

and it may overestimate the policy space available to states with limited fiscal and technological capacity.

Chinese: The Chinese perspective frames economic security as national security in mirror image: US securitization is read as hegemonic containment, justifying China's own controls and self-sufficiency drive. It contributes an anti-hegemonic narrative and a theory of defensive modernization, but it can occlude the coercive uses of interdependence by all parties and the costs of bifurcation.

Russian: The Russian perspective emphasizes sanctions resilience, import substitution, and the weaponization of economic interdependence by Western powers. It contributes a critique of unipolar economic governance, but it occludes Russia's own coercive uses of energy and trade and the limits of its technological base.

Western: The Western perspective centers technology security, alliance coordination, and the economic cost debate. It argues that securitization is necessary but must be calibrated to avoid self-harm. It contributes detailed policy frameworks, but it can occlude distributional costs to allies and developing countries and the risk of over-securitization.

UN: The UN perspective centers technology transfer, the digital divide, and SDG 9. It warns that securitization may undermine multilateral development goals and calls for governance that bridges divides. It contributes a normative framework, but it occludes enforcement challenges and the security dilemmas that drive national measures.

2.7 FIVE PERSPECTIVES IN DEPTH

2.7.1 African Perspective (PRIMARY)

From an African vantage point, semiconductor chokepoint geopolitics is not primarily a contest between Washington and Beijing over advanced nodes; it is the latest phase in a long history of technological dependency, unequal exchange, and epistemic marginalization. The chokepoints that dominate policy debate—electronic design automation, extreme ultraviolet lithography, leading-edge fabrication, and advanced packaging—are concentrated in a small set of wealthy states and firms, while African economies remain positioned mainly as suppliers of raw and semi-processed minerals, consumers of finished devices, and recipients of standards written elsewhere. The "digital divide" is therefore not a temporary gap in access that can be closed by connectivity projects alone; it is a structural feature of a global political economy in which control over productive technology, intellectual property, and data infrastructure is asymmetrically distributed. African scholarship on underdevelopment, neo-colonialism, and extraversion provides the theoretical resources for seeing this asymmetry not as an accident of market evolution but as a continuation of older patterns of extraction and subordination.

The lineage begins with Rodney's argument that underdevelopment is not a stage preceding development but a product of the same historical process that produced European industrialization. Applied to semiconductors, Rodney's insight suggests that Africa's limited participation in high-value segments of the supply chain is not simply a failure to "catch up"; it is partly the outcome of a global division of labor that rewards design, fabrication, and platform control while relegating mineral extraction and low-value assembly to the periphery. Nkrumah's neo-colonialism thesis extends this logic: formal political independence does not guarantee economic sovereignty, and external control can persist through technology, finance, and standards rather than direct rule. In this reading, US export controls, Chinese self-sufficiency drives, and allied "friend-shoring"

initiatives may reorganize supply chains without altering the underlying hierarchy. African states may be offered new roles as mineral suppliers or assembly locations, but the commanding heights of semiconductor production—EDA tools, lithography systems, process knowledge, and advanced packaging—remain elsewhere. Cabral's insistence that national liberation requires mastery of the productive forces, and Fanon's analysis of the psychological and material violence of colonial systems, reinforce the point that technological dependency is not merely an economic inconvenience; it shapes the horizon of political possibility.

Bayart's concept of extraversion adds a crucial nuance. African political economies have often been organized around the strategic use of external connections, with elites deriving power and resources from their position as intermediaries between global markets and domestic societies. Semiconductor geopolitics creates new opportunities for extraversion: critical-mineral concessions, data-center investments, special economic zones, and digital infrastructure deals can become sources of rent and patronage. From this perspective, the danger is not only exclusion but also a form of inclusion that deepens dependency by locking African states into extractive or low-value roles. Mamdani's analysis of the bifurcated state and decentralized despotism helps explain why many African governments struggle to convert mineral endowments or digital ambitions into broad-based industrial capacity: colonial legal inheritances, weak bureaucratic coherence, and fragmented authority can undermine long-term technology policy. The result is that even where African states articulate digital sovereignty agendas, implementation may be captured by narrow elites or external partners.

Grovogui's critique of international law and global governance is equally important. The language of "technology security," "resilience," and "trusted supply chains" often presents itself as universal, yet it can mask the interests of powerful states and firms. African agency in global technology governance has historically been limited, whether in standard-setting bodies, trade negotiations, or intellectual-property regimes. The UN's development frameworks may call for technology transfer, but the enforcement of such commitments is weak, and security-driven export controls can override them. An African perspective therefore asks not only who controls fabs but who gets to define the categories of "critical," "trusted," and "secure." Aning and Danso's African security scholarship suggests that security should be understood in human and structural terms—food, health, climate, and livelihoods—not only in terms of advanced military technology. From this standpoint, the securitization of semiconductors can divert attention and resources from more immediate vulnerabilities while justifying external intervention in the name of supply-chain resilience.

The African vantage point also reveals mechanisms that the other four perspectives tend to understate. First, mineral extraction without value addition: the geopolitics of semiconductors and related clean-energy technologies increases demand for cobalt, coltan, copper, lithium, and other minerals, many of which are found in Africa. Without processing capacity, local content requirements, and regional industrial planning, this demand can reproduce extractivism rather than development. The "critical minerals" discourse may sound like opportunity, but without beneficiation it risks becoming a new vocabulary for old patterns. Second, downstream exclusion: even where African economies grow, they often remain at the bottom of the "smiling curve," capturing little value from design, fabrication, or platform services. Third, standards and intellectual property: African firms and researchers face barriers to participation in patent pools, EDA ecosystems, and technical standards, which means that even successful local innovation may be constrained by foreign-controlled IP. Fourth, data and cloud dependency: semiconductors enable AI, cloud computing, and digital platforms, and African data is frequently stored, processed, and monetized outside the continent. This creates a form of digital dependency that parallels older resource dependency. Fifth, ecological and gendered costs: mining and electronics assembly can impose disproportionate burdens on women, informal workers, and local environments, while e-waste flows can turn parts of Africa into sinks for discarded technology. These costs are often invisible in aggregate measures of supply-chain efficiency or national security.

What this perspective contributes that the others cannot is a insistence that semiconductor geopolitics be evaluated by its effects on technological citizenship and developmental equity, not only by great-power balance or market efficiency. It shows that "de-risking" and "friend-shoring" are not neutral technical adjustments; they reorganize exclusion. If supply chains move from China to Vietnam, India, or Mexico without deliberate inclusion of African processing, design, and standards capacity, Africa may remain peripheral under a new geography. It also shows that technological sovereignty need not mean autarky. African states are unlikely to build leading-edge fabs in the near term, and pretending otherwise would waste scarce resources. But sovereignty can mean regional integration through the African Continental Free Trade Area, shared digital infrastructure, pooled procurement, investment in applied research, and collective bargaining over minerals and data. It can mean "appropriate technology" strategies that prioritize agricultural technology, health systems, climate adaptation, and public digital infrastructure rather than mimicking the advanced-node priorities of great powers. It can mean demanding technology transfer not as charity but as a matter of justice, given the historical extraction of resources and knowledge from the continent.

The African perspective also has important occlusions and limits, and a rigorous account must acknowledge them. Structuralist narratives can understate African agency: there are documented cases of digital leapfrogging, fintech innovation, mobile-money ecosystems, and startup growth that do not fit a simple dependency model. Heterogeneity matters: South Africa, Egypt, Morocco, Nigeria, Kenya, and Rwanda occupy very different positions in digital and industrial capacity, and pan-African generalizations can obscure these differences. State capacity and governance constraints are real: industrial policy requires reliable electricity, skilled labor, capital, and institutional coherence, and corruption or debt distress can undermine even well-designed plans. Some African elites benefit from extraversion and may not seek autonomy. Finally, an overemphasis on historical determinism can obscure contemporary policy choices and the possibility of incremental gains through regional cooperation. The strongest version of the African perspective therefore combines structural critique with a pragmatic, capacity-sensitive agenda: it does not romanticize the state, but it insists that the global semiconductor order be judged by whether it expands or contracts the space for African technological citizenship.

2.7.2 Chinese Perspective

The Chinese perspective on semiconductor chokepoint geopolitics is shaped by a historical memory of technological containment and a strategic doctrine of self-reliance. From this vantage point, US export controls are not merely prudent security measures but an attempt to preserve hegemony by "strangling" China's technological development. The vocabulary of "small yard, high fence" is read as a legitimizing frame for a broader project of containment, while the Entity List and CHIPS Act are seen as instruments of economic coercion. Chinese policy discourse emphasizes *zili gengsheng* (self-reliance) and indigenous innovation, not as autarky but as strategic resilience: the goal is to reduce vulnerability to external disruption while remaining integrated into global markets where possible. The pursuit of self-sufficiency in semiconductors is therefore framed as a defensive necessity and a matter of national sovereignty, analogous to earlier campaigns to overcome technological blockades.

This perspective contributes several important insights. It highlights the political character of supply-chain concentration: chokepoints are not natural market outcomes but are embedded in alliances, export-control regimes, and intellectual-property systems that favor incumbent powers. It demonstrates that state capacity, long-term planning, and public-private coordination can accelerate catch-up even under pressure, as seen in the mobilization of firms such as SMIC and Huawei and in the broader push for "new quality productive

forces." It also challenges the assumption that Western stewardship of advanced technology is benign or neutral, pointing to the ways in which security language can be used to protect market position. For many in the Global South, the Chinese narrative resonates because it frames technology not as a gift from advanced economies but as a domain of sovereign equality.

At the same time, the Chinese perspective has significant occlusions. It can understate the costs of duplication, inefficiency, and talent constraints in state-led catch-up strategies. It may overstate progress by treating symbolic breakthroughs as evidence of systemic parity. It tends to downplay the security concerns of other states, including those that fear technology transfer could strengthen coercive capabilities. The anti-hegemonic framing can also obscure China's own uses of economic leverage and its growing technological power, which may reproduce dependency for smaller partners. Finally, "dual circulation" and indigenous innovation do not automatically resolve chokepoints in EDA, lithography, or advanced materials; they may shift bottlenecks rather than eliminate them. A balanced assessment recognizes that China's response is both a rational reaction to containment and a project with its own distributional and geopolitical costs.

2.7.3 Russian Perspective

The Russian perspective treats semiconductor chokepoint geopolitics as a lesson in vulnerability and a justification for import substitution. From Moscow's standpoint, Western sanctions after 2022 demonstrated that concentrated supply chains can be weaponized against any state that challenges the prevailing order. Russia's experience of chip shortages in key sectors reinforced the view that technological sovereignty is not optional but existential. The policy response has emphasized parallel imports, domestic alternatives, and closer technological partnership with China, framed as a necessary adaptation to a hostile international environment. In this narrative, US export controls are not exceptional security measures but part of a broader pattern of economic warfare that can be turned against any non-compliant state.

This perspective contributes a useful corrective to complacent assumptions about supply-chain resilience. It shows that even states with significant resource endowments and military capacity can face acute technological bottlenecks when access to advanced semiconductors is restricted. It validates diversification and redundancy as strategic imperatives and highlights the political risks of over-dependence on a small number of suppliers or jurisdictions. It also underscores that sanctions and export controls have spillover effects: they do not merely target adversaries but can disrupt global markets, raise costs, and accelerate fragmentation.

Yet the Russian perspective is heavily occluded by its own political and technological limitations. It often overstates resilience by treating workarounds as sustainable solutions, while understating quality gaps, brain drain, and the long-term costs of isolation. It can ignore Russia's own coercive uses of energy and trade, which undermine its claim to be a victim of arbitrary economic power. The import-substitution agenda may preserve regime survival in the short term but at the expense of innovation, efficiency, and integration into global value chains. Moreover, the Russian framing can be instrumentalized to justify aggression by portraying any external constraint as illegitimate. A rigorous assessment therefore accepts the warning about concentrated dependency while rejecting the broader narrative that all technology controls are merely imperial coercion.

2.7.4 Western Perspective

The Western perspective centers on technology security, alliance coordination, and the economic cost of securitization. Its core claim is that semiconductors are foundational to military power, economic competitiveness, and critical infrastructure, and that the concentration of advanced production in a few locations creates

unacceptable strategic risk. The policy toolkit includes the Entity List, export controls on advanced chips and manufacturing equipment, the CHIPS Act's subsidies for domestic fabrication, and "friend-shoring" initiatives designed to move sensitive production into allied jurisdictions. The "small yard, high fence" formula attempts to reconcile security with openness: restrict only the most sensitive technologies while preserving broader trade and innovation flows.

This perspective contributes detailed policy frameworks and a sophisticated understanding of chokepoints. It has mobilized substantial public investment, coordinated allies, and forced a global reckoning with the security implications of semiconductor concentration. It also introduces an important economic cost debate: subsidies are expensive, controls can reduce firm revenues, and excessive securitization may fragment innovation networks and raise consumer prices. The Western view is not monolithic; it includes disagreements between hawks who favor broad decoupling and moderates who prefer calibrated "de-risking." This internal debate is a strength, because it recognizes that security and efficiency must be balanced.

However, the Western perspective occludes several issues. It can treat market outcomes as natural before controls while ignoring the prior role of state support in building Western technological leadership. It often underestimates distributional costs to allies, who may bear compliance burdens without equal influence over policy design. It can also marginalize developing countries, whose access to technology and development goals may be collateral damage in great-power competition. The securitization frame may conflate genuine security threats with commercial competition, risking overreach. Finally, by defining "trusted" suppliers in geopolitical terms, it may reproduce hierarchies that exclude African and other Global South actors from high-value participation. The strongest Western position acknowledges these costs and seeks multilateral legitimacy, but the perspective as a whole remains centered on the security of advanced economies.

2.7.5 UN Perspective

The UN perspective approaches semiconductor chokepoint geopolitics through the lenses of technology transfer, the digital divide, and sustainable development, particularly SDG 9 on industry, innovation, and infrastructure. From this vantage point, the central problem is not only who controls advanced chips but whether the global technology order enables inclusive and sustainable development. Export controls, subsidy races, and supply-chain fragmentation are seen as potential threats to multilateral development goals, especially for countries that lack the fiscal capacity to subsidize domestic fabs or the diplomatic leverage to secure exemptions. The UN framework emphasizes technology as a means of achieving human development, not merely as an instrument of state power.

This perspective contributes a normative and institutional vocabulary that the other four often lack. It foregrounds metrics of inclusion, capacity building, and equitable access, and it calls for governance arrangements that bridge rather than deepen divides. It reminds policymakers that semiconductors are not only military assets but enablers of health systems, education, climate monitoring, and public administration. It also provides a platform for developing countries to articulate demands for technology transfer, fairer intellectual-property regimes, and support for digital infrastructure. In principle, this can counterbalance the tendency of great-power competition to crowd out development concerns.

The UN perspective's main occlusion is enforcement. It can articulate norms and goals but lacks the hard power to compel compliance from major states or firms. Security dilemmas and alliance politics often override multilateral development commitments, and technology transfer pledges are frequently diluted by national-security exceptions. The perspective may also be overly aspirational, assuming that governance frameworks can manage conflicts that are rooted in material power and strategic rivalry. Nevertheless, it

remains essential because it insists that the semiconductor order be judged not only by its contribution to great-power security but by its effects on global equity and sustainable development.

SECTION 2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Reframes semiconductor chokepoints as structures of technological dependency and global inequality; asks who bears the costs of great-power techno-decoupling and whether "friend-shoring" includes Africa or merely relocates concentration among allies.	May understate the security motivations behind US controls and the genuine risks of military diffusion; can treat "Africa" as more homogeneous than it is.	Equity, technological self-determination, inclusive development, and digital sovereignty.	African dependence on imported digital infrastructure; limited domestic fabrication; mineral endowments without downstream value capture; digital divide indicators.	Western and Chinese perspectives argue that security and industrial policy, not equity, are the primary drivers of state behavior; African states may also benefit from cheaper mature-node imports and foreign investment.

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Chinese	Demonstrates how a targeted state can mobilize industrial policy, firm-level innovation, and alternative supply routes under sanctions; reveals the limits of unilateral controls.	Tends to frame US actions as purely hegemonic, understating legitimate security concerns and allied coordination; may overstate progress toward full self-sufficiency.	Sovereignty, anti-hegemony, development rights, and strategic autonomy.	SMIC's 7nm-class production for Huawei; stockpiling before controls; gallium and germanium export controls; domestic equipment subsidies and talent programs.	Western perspective: security externalities justify controls; African/UN perspectives: retaliation can harm developing economies and fragment global supply chains.
Russian	Draws analogies between semiconductor controls and sanctions resilience; emphasizes import substitution, parallel imports, and state-led technological sovereignty.	Russia is not a major semiconductor producer; may overgeneralize from its own sanctions experience and underestimate capital intensity, ecosystem depth, and network effects.	Multipolarity, strategic autonomy, resistance to Western economic coercion.	Russian import-substitution programs; parallel import schemes; lessons drawn from technology sanctions.	Chinese and Western perspectives: semiconductor ecosystems require decades, foreign inputs, and dense supplier networks; Russia's model is not easily scalable.

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Western	Articulates the security rationale for controls: protect military-relevant compute, slow adversary AI and quantum progress, coordinate allies, and use economic tools for strategic ends.	May understate costs to firms, innovation, and allies; risks overestimating control efficacy; can neglect Global South impacts and the distributional consequences of techno-decoupling.	National and alliance security, controlled openness, and economic security as national security.	Entity List designations; foreign direct product rule; CHIPS Act subsidies; allied coordination with the Netherlands and Japan.	Chinese perspective: coercion and containment; African/UN perspectives: inequity, development harm, and erosion of technology transfer norms.
UN	Places semiconductor governance in a development and equity frame; emphasizes technology transfer, the digital divide, SDG 9, and multilateral norms.	Lacks enforcement capacity; can be aspirational; may not fully account for security dilemmas, alliance politics, or the material power behind great-power rivalry.	Inclusive development, multilateral cooperation, human security, and global equity.	SDG 9; UNCTAD/ITU digital economy reporting; technology transfer debates; development-finance and capacity-building agendas.	Western perspective: security exceptions are necessary; Chinese perspective: sovereignty limits external governance; African perspective: implementation gaps persist.

SECTION 2.8 WORKED EXAMPLE (I do)

Case. The 2022–2023 US export controls on advanced chips and semiconductor manufacturing equipment, including the expansion of the Entity List, the foreign direct product rule, and allied coordination with the Netherlands and Japan, followed by Chinese responses such as SMIC's 7nm-class production for Huawei, stockpiling, and retaliatory controls on gallium and germanium.

Levels of analysis. At the **individual** level, the policy reflects bureaucratic politics among officials in the Commerce Department's Bureau of Industry and Security, the National Security Council, the Pentagon, and

allied ministries, as well as firm-level lobbying by Nvidia, AMD, Intel, Applied Materials, ASML, TSMC, Samsung, and others. Individual beliefs about China's military-civil fusion, Huawei's telecommunications role, and SMIC's technological progress shaped the timing and scope of controls, while Chinese engineers, procurement managers, and intermediaries sought workarounds. This level explains why the final policy took the form of a "small yard, high fence" rather than a blanket decoupling: compromises among security hawks, commercial interests, and allied governments produced targeted restrictions with carve-outs. At the **state** level, the United States sought to preserve its military-technological edge and slow China's advanced compute capabilities, while China sought to reduce vulnerability to external coercion; Taiwan's position as the central advanced foundry hub and the Netherlands' and Japan's roles as equipment chokepoint suppliers made alliance coordination essential. The CHIPS Act's subsidies and China's counter-subsidies show that states treated semiconductor capacity as strategic infrastructure, not merely commercial output. At the **systemic** level, the case is an instance of weaponized interdependence: the United States leveraged its structural position in electronic design automation, advanced equipment, and design intellectual property, while China retained counter-leverage through market size, critical minerals, and its role in mature-node production. Systemic analysis explains why controls were both possible and incomplete—interdependence creates leverage, but also mutual vulnerability and incentives for decoupling. At the **transnational** level, global value chains, cross-border research and development, talent mobility, standards bodies, and illicit procurement networks determined how controls were implemented and evaded. Firms rerouted through subsidiaries, third-country intermediaries, cloud access arrangements, and servicing channels; this level explains the loopholes and adaptive responses that limited the controls' immediate effect.

Mechanism. The mechanism combined legal extraterritoriality with chokepoint concentration. The 2022 controls restricted exports of advanced logic and memory chips, certain manufacturing equipment, and US-person support for Chinese fabrication facilities; the 2023 updates expanded coverage to additional equipment and destinations and tightened the foreign direct product rule so that foreign-made items produced with US technology or software could be controlled. Allied coordination extended restrictions to Dutch advanced lithography systems and Japanese equipment categories, reducing the availability of alternative suppliers. The intended causal chain ran from restricted access to advanced nodes and tools, to slower Chinese progress in AI-relevant compute, to preserved US and allied military-technological advantage. The limiting mechanisms were equally important: pre-implementation stockpiling, gray-market transshipment, cloud-based access to controlled chips, servicing of installed equipment, continued availability of mature-node tools, and China's domestic substitution efforts. China's response included SMIC's production of a 7nm-class chip for Huawei's Mate 60 Pro, expanded subsidies, talent programs, equipment localization, and retaliatory export controls on gallium and germanium. The result was not a clean halt to Chinese progress but a partial slowdown, higher costs, and accelerated indigenous innovation efforts.

Perspective reconstruction. From the African perspective, the 2022–2023 controls show how advanced technology governance is negotiated among great powers with limited African voice. African economies remain consumers of digital infrastructure and advanced chips, with limited participation in fabrication, electronic design automation, or equipment manufacturing, so the episode reinforces technological marginalization and dependency on external standards, cloud platforms, and vendor ecosystems. At the same time, the controls may create openings for African states to attract mature-node investment, digital services, or mineral-processing roles, but only if industrial policy and skills development accompany them. The African perspective's distinctive contribution is to ask who bears the costs of great-power techno-decoupling and whether "friend-shoring" includes Africa or merely relocates concentration among allies. Its occlusion is that it may understate the security motivations driving US policy and the genuine risks of military diffusion.

From the Chinese perspective, the controls are read as evidence of US hegemonic containment and as validation of indigenous innovation; China's response—SMIC's 7nm-class chip, Huawei's comeback, and export controls on gallium and germanium—demonstrates both vulnerability and adaptive capacity, while emphasizing sovereignty and the right to develop. This perspective occludes the security externalities of advanced compute and China's continued dependence on foreign equipment and talent. From the Russian perspective, the US semiconductor controls are treated as a template for sanctions and a lesson in resilience, highlighting import substitution, parallel imports, and state-led technological sovereignty, while acknowledging that Russia lacks China's scale and ecosystem depth; it occludes the capital intensity and network effects that make semiconductor self-sufficiency uniquely difficult. From the Western perspective, the controls are justified as protecting military-relevant technology and slowing China's AI and quantum progress, while coordinating allies and using economic tools for strategic ends; it emphasizes legal precision, alliance burden-sharing, and the "small yard, high fence" logic, but occludes costs to firms, innovation, and the risk that controls accelerate Chinese substitution. From the UN perspective, the controls raise concerns about technology transfer, the digital divide, and SDG 9, while acknowledging security exceptions; it stresses multilateral governance and equitable access, but lacks enforcement and may be aspirational.

Explicit adjudication. The Western security perspective best explains the proximate design and intent of the 2022–2023 controls: the Entity List, the foreign direct product rule, and allied coordination were instruments to protect a military-technological edge and manage alliance risk. However, it is insufficient alone because it underestimates transnational adaptation, the limits of unilateral leverage, and the distributional consequences of reorganizing the semiconductor order around great-power security. The Chinese perspective best explains the response and its political framing, but overstates autonomy and understates continued dependence on foreign tools and talent. The African perspective does not explain the policy's origin, but best identifies its blind spot: the global semiconductor order is being reorganized with limited attention to development equity, digital sovereignty, and the position of states outside the US-China rivalry. If one perspective must be privileged for explaining the case's outcome, the systemic weaponized-interdependence perspective—expressed through Western policy design and Chinese adaptation—best captures both the attempt to control chokepoints and its partial failure. Yet that systemic view still misses the African distributional question, which should be treated as a normative correction to the analysis rather than as an alternative explanation of state behavior.

SECTION 2.9 PROBLEM PAIR (We do)

Tasks

1. **Mechanism identification.** Distinguish whether China's July 2023 announcement of licensing requirements for gallium and germanium exports was primarily retaliation for US, Dutch, and Japanese semiconductor controls, a demonstration of latent chokepoint power, domestic industrial policy, or a combination. Specify the causal chain from policy lever to intended effect and the feedback loops that may weaken it.
2. **Levels of analysis.** Analyze the episode at the individual level (procurement managers and inventory behavior), the state level (China's Ministry of Commerce, US Bureau of Industry and Security, allied regulators), the systemic level (weaponized interdependence, alliance coordination, market adjustment), and the transnational level (multinational supply chains, WTO dispute settlement). Identify

which level best explains short-run price spikes and which best explains long-run adjustment.

3. **Perspective reconstruction.** Steel-man the African, Chinese, Russian, Western, and UN interpretations of the controls. For each, state its central claim, strongest supporting evidence, and principal blind spot.

4. **Historical analogue.** Compare the 2023 gallium and germanium controls with China's 2010 rare-earth export restrictions toward Japan. Identify the similarities (supply concentration, signaling, downstream panic) and the differences (byproduct status, licensing rather than quotas, globalized chip demand) that matter for inference.

5. **Falsifiers.** List observable implications that would weaken the claim that the controls create durable leverage: rapid price normalization, high license approval rates, new non-Chinese capacity, process substitution, or legal reversal.

6. **Adjudication.** Conclude whether the controls are better understood as effective coercion, costly signaling, or self-limiting leverage. State the boundary conditions—time horizon, substitutability, and alliance coordination—under which each interpretation becomes more plausible.

MODEL ANSWER

The 2023 Chinese controls on gallium and germanium are best analyzed as a case of asymmetric but time-limited leverage rather than durable coercion. The immediate mechanism was not a total embargo but a licensing requirement imposed by China's Ministry of Commerce on exports of specified gallium and germanium products, announced in July 2023 and effective in August 2023. Because China occupies a dominant position in the production of these inputs—gallium largely as a byproduct of aluminum processing and germanium as a byproduct of zinc processing—the policy converted latent supply concentration into an active cost shock. The intended causal chain ran from administrative uncertainty to higher input prices, inventory hoarding, and pressure on downstream semiconductor, fiber-optic, and defense-related manufacturers in the United States, Europe, Japan, and their partners. Yet the same mechanism contained its own limits: licensing is not prohibition, and the very visibility of the threat accelerated stockpiling, recycling, and the search for alternative sources.

At the state level, the controls functioned as retaliation and signaling in the context of US-led restrictions on advanced semiconductors and manufacturing equipment. They demonstrated that chokepoints are reciprocal: the same logic of weaponized interdependence that justified US controls could be turned against Western and allied supply chains. At the systemic level, however, the episode revealed that leverage depends on elasticity. Gallium and germanium are not rare in geological terms; their concentration reflects processing economics and environmental regulation rather than absolute scarcity. Therefore, a sustained price premium can induce new capacity, especially where allied governments subsidize diversification. At the transnational level, multinational firms responded not by exiting China entirely but by segmenting supply chains, dual-sourcing, and increasing inventory buffers. The individual level matters too: procurement managers facing license uncertainty rationally over-order, which can temporarily amplify price spikes even when physical scarcity is modest.

The African perspective is primary because it exposes what the great-power framing occludes. For African states and firms, the controls are not merely a US-China bargaining chip; they are an additional layer of structural dependency in a digital economy where Africa already imports most semiconductors, network equipment, and cloud infrastructure. Higher input costs and compliance fragmentation can raise the price

of connectivity, delay 5G and data-center expansion, and widen the digital divide. African scholarship on technological marginalization would read the episode as another instance in which African development is conditioned by decisions taken in Beijing, Washington, Brussels, and Tokyo, with little African voice in the rule-making. At the same time, the African vantage point can identify opportunity: if global buyers diversify away from concentrated supply, African mineral endowments and processing ambitions could gain strategic attention, but only if accompanied by industrial policy, skills, and energy capacity. Without those, Africa risks remaining an exporter of raw materials while importing the technologies that determine productivity.

The Chinese perspective frames the controls as sovereign and reciprocal: a state with dominant processing capacity uses licensing to defend its interests against extraterritorial technology restrictions and to signal that decoupling will be costly. Its strength is that it correctly identifies the asymmetry of US controls and the legitimacy of resource sovereignty; its occlusion is that it underestimates how quickly buyers can adapt and how the policy may accelerate the very diversification that reduces China's future leverage. The Russian perspective treats the episode as validation of import-substitution and sanctions-resilience strategies: if China can weaponize inputs, then states under sanctions must build redundant supply chains and state-directed industrial capacity. Its contribution is attention to resilience; its blind spot is that Russia's smaller market and technological base make replication far harder than the analogy suggests. The Western perspective emphasizes technology security and friend-shoring: controls are necessary to slow China's military-civil fusion, but they impose costs on downstream industries and require allied coordination. Its strength is strategic clarity; its occlusion is the tendency to treat economic pain as acceptable without fully accounting for global development costs. The UN perspective centers technology transfer, the digital divide, and SDG 9: export controls and retaliatory licensing fragment the global technology commons and may undermine inclusive industrialization. Its contribution is normative; its limitation is that it lacks enforcement power when security logics dominate.

The best historical analogue is China's 2010 rare-earth export restrictions toward Japan. Both episodes involved concentrated Chinese supply, sudden administrative restrictions, downstream panic, and subsequent diversification. The differences matter: gallium and germanium are byproducts with latent non-Chinese capacity, whereas rare earths involved more complex separation and refining; the 2023 measures used licensing rather than explicit quotas; and global demand for chips is more politically salient than rare-earth demand was in 2010. The analogue therefore supports the inference that China's leverage is real but perishable: Japan and others diversified after 2010, and China's market share in some rare earths later declined. Similarly, if gallium and germanium prices remain elevated, non-Chinese projects, recycling, and process redesign will expand, eroding the chokepoint.

Falsifiers of the durable-coercion thesis include rapid normalization of prices after an initial spike, high license approval rates with minimal disruption, measurable expansion of non-Chinese capacity, substitution in manufacturing processes, and a decline in China's share of global supply. Conversely, if downstream firms experience sustained shortages, if allied governments fail to coordinate diversification, or if China tightens licensing into de facto bans, the leverage thesis would be strengthened. On balance, the controls are best characterized as costly signaling with bounded, short-run coercive effects: they impose real costs and demonstrate reciprocity, but they also accelerate the market and policy responses that reduce China's future chokepoint power. The boundary conditions are time horizon, substitutability, and alliance coordination; under conditions of low substitutability and weak coordination, leverage persists, while under high substitutability and strong coordination, it dissipates.

SECTION 2.10 INDEPENDENT MEMO (You do)

(a) Case description. In 2024, an African mobile-network operator plans to expand 5G infrastructure using imported base-station components and cloud servers. Its suppliers depend on advanced semiconductors subject to US export controls and on gallium and germanium inputs subject to Chinese licensing. The operator has no domestic semiconductor fabrication, limited foreign-exchange reserves, and must choose between a Western vendor package with compliance guarantees and a lower-cost Asian package with uncertain licensing exposure. The government seeks to attract digital investment while avoiding secondary sanctions. Assess the case over a three-to-five-year horizon, including procurement risk, compliance costs, supplier diversification, and the possibility that African mineral endowments could support future processing capacity. The memo should distinguish immediate cost shocks from structural dependency. Analyze the mechanism, perspectives, analogue, and falsifiers.

(b) Required memo headings as prompts.

Mechanism: Explain how US controls and Chinese licensing interact to shape the operator's procurement options; identify the causal chain from chokepoint to price, uncertainty, and strategic choice.

Perspective reconstruction: Steel-man African, Chinese, Russian, Western, and UN readings of the operator's dilemma; state what each reveals and what it occludes.

Historical analogue: Compare the case to a prior episode of input or technology restriction, such as China's 2010 rare-earth measures or an earlier technology embargo, and specify what transfers and what does not.

Falsifiers: State observable evidence that would weaken your conclusion about leverage, dependency, or the likely success of diversification.

(c) Self-check line. Self-check: Did you distinguish description (what happened), explanation (why), prediction (what follows), and prescription (what should be done)?

SECTION 2.11 HINGE QUESTION

Question: Which option best explains why China's 2023 gallium and germanium export controls are unlikely to yield durable coercive leverage over advanced semiconductor supply chains?

A. China does not control 100 percent of global gallium and germanium production.
B. Licensing creates uncertainty and short-run cost shocks, but byproduct status, latent capacity, and buyer adaptation erode leverage over time.
C. WTO rules automatically nullify any export restriction that affects semiconductors.
D. African and Latin American suppliers will quickly replace Chinese processing capacity.

Correct answer: B.

Distractor diagnoses.
- **A** is true but insufficient: near-monopoly is not required for leverage, and the decisive issue is duration rather than market share alone.
- **C** is false: WTO disciplines are slow, contested, and do not automatically nullify restrictions; legal process is not immediate market relief.
- **D** is false: no near-term replacement capacity exists; it confuses geological endowment with processing capability, infrastructure, and industrial policy.

SECTION 2A — DATA LAB

Table 1 — Semiconductor supply-chain market share by stage (approximate, 2022–2023)

Stage	Dominant geography / firms	Approx. share of stage	Concentration note
EDA tools	US (Synopsys, Cadence, Siemens EDA)	~70%+ US	Near-duopoly at leading edge; high switching costs
Core IP (processor architectures)	UK/Japan (Arm), US (Synopsys, Cadence)	Arm ~40%+ of licensed cores	Single architecture family underpins most mobile SoCs
Chip design (fabless)	US firms (Qualcomm, Nvidia, AMD, Broadcom, Apple)	~46% of global design revenue	US leads in design value capture
Wafer-fabrication equipment (WFE)	US ~40%; Netherlands (ASML) ~25%; Japan ~25%	US+NL+JP ≈ 90%	ASML sole supplier of EUV; duopoly/oligopoly in deposition, etch, metrology
Fabrication (foundry)	Taiwan (TSMC ~55%), South Korea (Samsung ~15%), China (SMIC ~5%), US (Intel/GlobalFoundries)	TSMC ~55% of foundry revenue	TSMC ~90%+ of advanced nodes (<7 nm)
Advanced packaging	Taiwan (ASE ~25%), US (Amkor ~15%), China (JCET ~10%)	Top 3 ≈ 50%	CoWoS/advanced packaging bottlenecked at TSMC
Specialty materials/chemicals	Japan ~50% of several photoresists, gases, wafers	Japan dominant in high-purity inputs	Single-country dependency in photoresists, neon, etc.

Sources: SIA State of the Industry reports (2022–2023); CSIS technology and supply-chain analyses; Miller (2022). Figures are approximate industry estimates, not audited financials.

Table 2 — Fab capital expenditure by country/region (approximate, 2022–2023 annual)

Country/region	Approx. annual fab capex (USD bn)	Share of global	Key drivers
Taiwan	~35–40	~25%	TSMC 3 nm/2 nm build-out, advanced packaging
South Korea	~30–35	~22%	Samsung memory + foundry; SK Hynix

Country/region	Approx. annual fab capex (USD bn)	Share of global	Key drivers
China	~25–30	~18%	SMIC mature-node expansion; memory (YMTC, CXMT)
United States	~20–25	~15%	Intel, TSMC Arizona, Samsung Texas, Micron
Japan	~8–12	~7%	TSMC Kumamoto, Rapidus, memory
Europe	~5–8	~4%	Intel Magdeburg, TSMC Dresden, ST/GF
Rest of world	~5–8	~4%	Singapore, Israel, Malaysia

Sources: SEMI World Fab Forecast; SIA; company capex guidance. Approximate; capex is lumpy and revised quarterly.

Table 3 — TSMC revenue by technology node (approximate, recent quarterly mix)

Node band	Approx. share of TSMC revenue	Strategic significance
3 nm	~6–10%	Ramp node; highest value per wafer; US export-controlled
5 nm	~30–35%	Dominant advanced-node revenue; AI/GPU demand
7 nm	~18–22%	Mature-advanced; still restricted under some controls
10/12/16 nm	~10–12%	Mid-range; partially controlled
22/28 nm and above	~20–25%	Mature nodes; automotive, IoT, industrial; less restricted
Advanced packaging (CoWoS, etc.)	~5–8% (growing)	AI accelerator bottleneck; capacity-constrained

Sources: TSMC quarterly earnings reports; SIA; CSIS. Percentages approximate and shift quarter to quarter.

Five numbered analysis questions

1. **Trend.** Between 2019 and 2023, which stage of the supply chain shows the steepest *increase* in geographic concentration, and which shows the most *decentralization*? Use Tables 1–2 to justify your answer, and note one data point that would falsify your claim.

2. **Level of analysis.** The chokepoint argument can be read at the individual (firm strategy), state (industrial policy), systemic (great-power competition), or transnational (supply-network) level. Using Table 1's concentration figures, identify which level best explains why a single Dutch firm (ASML) can be compelled by US policy to halt shipments to China, and explain why the other three levels are insufficient on their own.

3. **Perspective reconstruction (all five).** Reconstruct how each of the five perspectives would read Table 2's capex shift toward the US, Taiwan, and South Korea:

    - **African:** dependency, technological marginalization, and the digital divide;
    - **Chinese:** self-sufficiency, indigenous innovation, and the anti-hegemonic framing;
    - **Russian:** lessons for import substitution and sanctions resilience;
    - **Western:** technology security, friend-shoring, and the economic cost debate;
    - **UN:** technology transfer, the digital divide, and SDG 9. Each in 2–3 sentences, steel-manned from within.

4. **Interpretation.** Does Table 3 support the claim that US export controls on advanced nodes (≤7 nm logic, ≤14/16 nm equipment) have *already* reduced TSMC's revenue exposure to China, or does it instead show that controls have *reallocated* revenue toward non-Chinese advanced-node customers (AI, US hyperscalers)? Distinguish description from explanation.

5. **Limitation.** What is the most important thing these three tables *cannot* tell you about semiconductor geopolitics? Identify one specific inference that would be unsupported, and state what additional data (and from which source) would be needed to test it.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — "The Semiconductor Funnel: Where Chokepoints Live"

What to draw: A vertical funnel (wide at top, narrow at middle, widening slightly at bottom) divided into seven horizontal bands, top to bottom: (1) EDA & Core IP, (2) Design, (3) Materials & Chemicals, (4) Wafer-Fab Equipment, (5) Fabrication (Foundry), (6) Advanced Packaging, (7) End-Use Systems. Draw the funnel narrowing most sharply at bands 1, 4, and 5.

Labels to place: In each band, write the dominant country/firm and an approximate share (e.g., "EDA: US ~70%"; "WFE: US/NL/JP ~90%"; "Foundry: TSMC ~55%, ~90% advanced"). Add a bold arrow on the right side labeled "Concentration gradient" pointing downward. On the left, annotate "Bottleneck nodes" with small red circles at EDA, EUV lithography, and advanced foundry.

Perspective overlay: In the margin, four short tags: "African: where is Africa in this funnel? (absent)"; "Chinese: indigenous substitution targets"; "Western: control points"; "UN: technology-transfer gaps." Color-code: red for chokepoint, blue for US-aligned, green for Chinese, grey for absent/African.

Visual 2 — "Small Yard, High Fence" (concentric control diagram)

What to draw: Three concentric circles. Innermost circle labeled "Controlled core" (advanced logic ≤14/16 nm, EUV, advanced packaging, AI accelerators). Middle ring labeled "Controlled periphery" (DUV immersion, 14–28 nm equipment, some materials, US-person restrictions). Outer ring labeled "Open commerce" (mature nodes ≥28 nm, commodity chips, consumer electronics). Draw a thick fence line between innermost and middle rings; a thinner dashed line between middle and outer.

Labels to place: Along the fence, annotate "Entity List (Huawei 2019; SMIC 2020)", "Oct 2022 rules", "Oct 2023 update", "Netherlands/Japan alignment (Jan 2023)". Add arrows showing "leakage" (dashed arrows crossing the fence) labeled "third-country transshipment," "cloud compute access," "mature-node workarounds." Add a small box: "Loopholes closed iteratively."

Perspective overlay: Top tag "Western: security perimeter"; bottom-left "Chinese: containment narrative"; bottom-right "Russian: sanctions-evasion playbook"; right margin "UN: extraterritoriality concerns"; left margin "African: collateral damage to digital access."

Visual 3 — "Five Perspectives on the Same Chokepoint" (comparison wheel)

What to draw: A central circle labeled "Semiconductor chokepoint (TSMC/ASML)" with five spokes radiating to five outer boxes, one per perspective. Each box contains a one-line core claim and a one-line occlusion.

Labels to place: - African (top, largest box): "Dependency & digital divide; occludes: African agency in leapfrogging." - Chinese (right): "Self-sufficiency & anti-hegemony; occludes: cost of duplication." - Russian (bottom-right): "Import substitution lessons; occludes: scale differences." - Western (bottom-left): "Technology security & friend-shoring; occludes: economic costs & ally friction." - UN (left): "Technology transfer & SDG 9; occludes: enforcement power."

Perspective overlay: Shade the African box darkest (primary). Draw a dashed line from African box to a small note: "What the other four miss: who is excluded from the map entirely." Add a legend for shading intensity = analytical weight in this lesson.

SECTION 4 — CORNELL NOTES

Cue (question / prompt)	Notes (answer + source log)
What are the four stages of the semiconductor supply chain, and which is the binding constraint?	EDA → lithography → fabrication → packaging. Binding constraint shifts by node: EUV lithography (ASML) and advanced foundry (TSMC) at leading edge; packaging (CoWoS) for AI accelerators. Source: Miller (2022); CSIS.
Why is ASML a chokepoint, and what is its product?	Sole supplier of EUV lithography machines (~$150–200M each); required for sub-7 nm. Dutch firm, US-controlled via export-control extraterritoriality. Source: Miller (2022); CSIS.
How has China responded?	SMIC 7 nm (Mate 60 Pro, 2023); Huawei indigenous design; "whole-nation" self-sufficiency push; gallium/germanium export controls (Jul 2023). Source: CSIS; Miller.
What are the loopholes in the 2022 controls?	Third-country equipment, cloud compute access, mature-node workarounds, US-person gaps; partially closed in Oct 2023 update. Source: CSIS; BIS.
What is the African vantage on semiconductor geopolitics?	Dependency, technological marginalization, digital divide; Africa absent from the supply chain; leapfrogging debates; SDG 9. Source: Grovogui; Bayart; UNCTAD.

Cue (question / prompt)	Notes (answer + source log)
What does the UN perspective emphasize?	Technology transfer, digital divide, SDG 9 (industry, innovation, infrastructure); concern over extraterritorial export controls. Source: UNCTAD; ITU.
What is the strongest counterargument to "chokepoints guarantee US leverage"?	Controls accelerate Chinese self-sufficiency, alienate allies, raise costs, and may not stop diffusion; "running faster" vs. "running away." Source: Miller (2022); CSIS debate.
What metric would falsify the chokepoint-leverage thesis?	Sustained Chinese advanced-node yield improvement + non-US equipment substitution + loss of US firm revenue share. Source: SIA; CSIS.

Summary (3–5 sentences): Semiconductor geopolitics centers on a supply chain where value and control concentrate at a few nodes—EDA, EUV lithography, advanced foundry, and packaging—creating structural leverage for the US and its allies. The 2022–2023 US export controls weaponized this concentration, but their effectiveness depends on allied alignment, loophole closure, and the pace of Chinese substitution. The African vantage reveals that the entire debate presumes a seat at the table Africa does not hold, framing the chokepoint not as leverage but as exclusion. Data on market share and capex show concentration, yet cannot by themselves establish causation, intent, or future diffusion. The lesson's core adjudication: chokepoints are real and consequential, but their durability as instruments of state power is contingent and contested.

SECTION 5 — FEYNMAN COMPRESSION

1. **Explain without jargon.** Imagine the world's most advanced computer chips are made through a long assembly line. At a few stations, only one company in one country can do the work. If that country says "stop," the whole line stops. The US and its allies sit at several of these stations, so they can slow China's progress in AI and advanced weapons. But China is building its own stations, and the slowdown may also push China to become self-sufficient faster. Meanwhile, most of the world—including Africa—just buys the finished chips and has no say in who controls the stations.

2. **Mark gaps.** I am unsure about the exact yield rates of SMIC's 7 nm process and whether they are commercially viable at scale. I conflated "having a chip" (Mate 60 Pro) with "having a sustainable, cost-competitive foundry business." I also glossed over the difference between equipment controls and design-tool controls, and I did not specify how the US-persons provision actually binds foreign firms. Finally, I have not quantified the economic cost to US firms (lost revenue, R&D funding).

3. **Reread verification.** Re-reading Miller (2022), ch. on ASML and TSMC, confirms that EUV is the single most concentrated node and that TSMC's advanced-node dominance is structural, not merely a market outcome. CSIS reports confirm the Oct 2022/Oct 2023 control sequence and the loophole-closure logic. SIA data confirm US design-revenue share (~46%) and the global capex distribution. The African marginalization claim is supported by UNCTAD/ITU digital-divide data and by Grovogui's critique of technological hierarchy, though I should not overstate Africa's absence as total—there are assembly/packaging and mineral nodes (linked to L19/L53).

4. **Analogy with explicit limits.** *Analogy:* Semiconductor chokepoints are like a single bridge over a river: whoever controls the bridge controls traffic, but if you close it too often, people build ferries and alternative bridges, and the bridge-owner loses toll revenue. *Limits:* The analogy breaks because (a) bridges are physical and substitutable over years, whereas EUV lithography has taken decades and billions to develop and may not be replicable quickly; (b) the "bridge" is not one asset but a network of complementary assets (EDA + lithography + foundry + packaging), so closure requires coordinated multilateral action, not a single gate; (c) the analogy ignores the African vantage—most countries are not trying to cross the bridge but are passengers on someone else's truck, with no bridge of their own.
5. **Rewrite.** Semiconductor chokepoints are structurally concentrated nodes—EDA tools, EUV lithography, advanced foundry capacity, and advanced packaging—where a handful of firms in the US, Netherlands, Taiwan, and Japan hold near-monopoly positions. This concentration gives the US and its allies leverage to restrict China's access to advanced chips and equipment, as exercised in the 2022–2023 export controls. That leverage is real but contingent: it depends on allied coordination, loophole closure, and the speed of Chinese indigenous substitution, which the Mate 60 Pro episode suggests is faster than many assumed. The economic costs fall on US and allied firms, and the strategic costs include accelerated Chinese self-sufficiency. From the African vantage, the entire framework presumes participation in a supply chain from which Africa is largely excluded, reframing the chokepoint less as an instrument of power than as a structure of global technological hierarchy that reproduces the digital divide. Adjudication: chokepoints are durable in the short run, eroding in the medium run, and their legitimacy depends on whether the controlling states can sustain a coalition and absorb the costs of restriction.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L52	Definition	What are the four main stages of the semiconductor supply chain?	The chain runs from electronic design automation and chip design, through materials and manufacturing equipment, to fabrication, and finally packaging, testing, and distribution. Each stage has distinct capital intensity and geographic concentration, so a disruption at one stage can halt output even when other stages remain available.	The African vantage stresses that most value-adding stages are offshore, limiting local value capture.
L52	Mechanism	Why does geographic concentration create chokepoint leverage?	Concentration means that a few firms or countries control inputs that are difficult to replace, so restricting access raises rivals' costs and delays production. Leverage is strongest where substitutes are scarce, switching takes years, and demand is inelastic.	Western security framing treats concentration as vulnerability; Chinese framing treats it as hegemonic leverage.

Tag	Card Type	Front	Back	Perspective Note
L52	Application	Name three chokepoint firms and their roles.	ASML dominates extreme ultraviolet lithography; TSMC leads advanced-node foundry manufacturing; Applied Materials is a major supplier of deposition and etch equipment. Their positions show that chokepoints span equipment, fabrication, and process technology rather than one single market.	The UN perspective asks how such concentration affects equitable technology access.
L52	Comparison	How does a chokepoint differ from a monopoly?	A monopoly controls price and output within a market, while a chokepoint controls an irreplaceable node in a network. A chokepoint can exist even when several firms compete, if all depend on one supplier, geography, or standard.	Russian import-substitution debates often confuse domestic production with genuine chokepoint removal.

Tag	Card Type	Front	Back	Perspective Note
L52	Source	What is the central argument of Miller (2022)?	Miller argues that semiconductors are a strategic technology whose supply-chain geography shapes great-power competition. The book traces how US, Japanese, Dutch, Taiwanese, and Korean capabilities created both extraordinary efficiency and structural vulnerability.	African readers can use it to see how technological dependence is historically constructed rather than natural.
L52	Debate	What does “small yard, high fence” mean in US policy?	It refers to narrowly defining controlled technologies while enforcing restrictions strictly. The aim is to limit China’s access to militarily relevant capabilities without severing all commercial trade.	Chinese officials frame the same policy as containment disguised as precision.

Tag	Card Type	Front	Back	Perspective Note
L52	Mechanism	How do US export controls transmit through the supply chain?	Controls restrict US-origin and foreign-direct-product items, equipment, software, and technical support, forcing firms to redesign supply chains or seek licenses. Effects propagate downstream to chip availability, AI compute, and military systems.	Western proponents emphasize security; critics emphasize cost and allied coordination.
L52	Application	What was China's response to the 2022-2023 controls?	China accelerated state-backed investment, import substitution, and indigenous innovation while using firms such as SMIC and Huawei to demonstrate progress. It also imposed retaliatory controls on gallium and germanium.	African observers see both superpowers using technology as leverage, narrowing space for non-aligned development.

Tag	Card Type	Front	Back	Perspective Note
L52	Reconstruction	How would an African perspective reconstruct semiconductor geopolitics?	It would center dependency, technological marginalization, and the digital divide rather than only US-China rivalry. The key question is who captures value, skills, and infrastructure, and how African states can move from mineral extraction to industrial capability.	This is the primary lens; it reveals distributional effects often invisible in security debates.
L52	Occlusion	What does the Western perspective tend to occlude?	It often foregrounds security and allied coordination while understating efficiency losses, consumer costs, and impacts on developing countries. It may treat friend-shoring as costless resilience.	African and UN perspectives highlight these distributional and developmental costs.

Tag	Card Type	Front	Back	Perspective Note
L52	Adjudication	How should one adjudicate between security and efficiency claims?	Compare measurable outcomes such as cost, lead times, allied compliance, and China's progress against stated security goals. A policy is better supported when controls are narrow, enforceable, and matched by domestic capacity building.	The UN perspective adds equity and technology-transfer criteria.
L52	Visual	What would a supply-chain map highlight?	It would show design in the US, equipment in the Netherlands, Japan, and US, fabrication in Taiwan and Korea, and packaging across Asia. Overlaying controls would reveal where chokepoints and rerouting pressures occur.	African states appear mainly as mineral and market peripheries unless industrial policy is included.

Tag	Card Type	Front	Back	Perspective Note
L52	Definition	What is “economic security as national security”?	It is the securitization of supply chains, treating access to critical technologies as a core state interest. This expands national security from military threats to economic vulnerabilities and industrial capacity.	African critics warn that securitization can justify protectionism that excludes developing economies.
L52	Mechanism	Why might export controls accelerate the target’s self-sufficiency?	Controls raise the expected cost of dependence and increase the political return to indigenous investment. They can also create protected markets for domestic firms, although progress remains constrained by chokepoint inputs.	Chinese discourse frames this as proof that containment backfires.

Tag	Card Type	Front	Back	Perspective Note
L52	Data	What does TSMC revenue by node indicate?	Revenue concentration in advanced nodes shows where value and technological leadership lie, while mature nodes remain important for automotive and industrial chips. Interpreting the data requires separating revenue share from physical volume and geopolitical risk.	African manufacturing strategies should not assume access to leading-edge nodes is necessary for all digital development.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence audit (score 0-100)

Skill or concept	Confidence (0-100)	Evidence of mastery	Next action
Mapping the semiconductor supply chain by stage		Can name EDA, materials, equipment, fabrication, packaging, and testing without notes	Draw the chain from memory and mark chokepoints
Identifying chokepoint firms and geographies		Can explain ASML, TSMC, and Applied Materials in one sentence each	Add one counterexample where concentration is not leverage
Explaining US export-control mechanisms		Can distinguish Entity List, foreign-direct-product rules, and licensing	Trace one control through a firm's supply chain
Assessing China's self-sufficiency push		Can separate SMIC/Huawei progress from EUV and EDA constraints	List three remaining bottlenecks

Skill or concept	Confidence (0-100)	Evidence of mastery	Next action
Reconstructing all five perspectives		Can state each perspective's core claim and occlusion	Write the African perspective first, then compare
Adjudicating security versus efficiency		Can specify falsifiers for a control policy	Add cost, allied compliance, and China's progress metrics
Interpreting semiconductor data		Can explain revenue by node without confusing share with volume	Rebuild one table from memory

7.2 Three-question debrief

1. Which perspective did you initially underweight, and what evidence would make you revise that ranking?

2. Where did you confuse description of the supply chain with prescription about what states should do?

3. Which falsifier would most weaken your conclusion in the independent memo, and how would you test it?

7.3 Error-log

Common misconception	Correction	Evidence
Export controls will quickly stop China's chip progress.	Controls raise costs and delay progress but do not eliminate it; partial advances remain possible under constraints.	Miller (2022); CSIS technology reports
TSMC's dominance means Taiwan is the only chokepoint.	Chokepoints span EDA, lithography, materials, equipment, and fabrication across several countries.	Miller and Varas (2021); SIA State of the Industry reports
Self-sufficiency is achievable if a state spends enough money.	Money cannot quickly recreate tacit knowledge, supplier ecosystems, and equipment monopolies; time and learning curves matter.	CHIPS Act text; CSIS technology reports
African states are irrelevant to semiconductor geopolitics.	They are embedded through minerals, markets, and digital dependence; marginalization is structural rather than absence.	African perspective reconstruction; Rodney (1972)

Common misconception	Correction	Evidence
Friend-shoring eliminates risk.	It relocates and may concentrate risk; costs and political dependencies remain.	SIA State of the Industry reports; Western economic-cost debate

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Semiconductor supply chain; chokepoint; foundry; node; packaging; EDA	Geographic concentration; irreplaceable inputs; switching costs; network dependency	Weaponized interdependence (Farrell and Newman); supply-chain security	ASML EUV; TSMC advanced nodes; Applied Materials equipment	Efficiency versus security; decoupling versus de-risking	New entrants remove concentration; costs fall without security loss	L18; L47; L19
US export controls; Entity List; foreign direct product rule; licensing	Restrict items, software, support, and end uses; propagate downstream to compute and military systems	Securitization of technology; economic security as national security	2022-2023 advanced chip and equipment controls; CHIPS Act subsidies	Precision versus overreach; allied coordination	Controls fail to slow target; smuggling and cloud loopholes dominate	L47; L54
China's self-sufficiency; indigenous innovation; import substitution	State subsidies; protected markets; firm-level breakthroughs; retaliatory controls	Developmental state; technological nationalism	SMIC; Huawei; gallium and germanium controls	Containment backfire versus chokepoint persistence	No progress in EUV, EDA, or materials; costs exceed gains	L47; L53

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
African dependency and digital divide	Value-chain exclusion; mineral extraction without processing; skills gaps	Dependency theory (Rodney; Nkrumah); technological marginalization	Cobalt, coltan, and other mineral inputs; limited fab capacity	Development versus security; non-alignment versus alignment	African industrial policy builds processing and skills; digital access improves	L19; L53; L56
Data interpretation	Revenue by node; capex by country; control coverage; market share by stage	Political economy of technology; innovation systems	TSMC revenue concentration; fab investment geography	Revenue share versus physical volume; risk versus efficiency	Data show diversification without higher costs or delays	L52 Data Lab; L56

SECTION 9 — REVIEW SCHEDULE

- **R1 — Same day, 20 minutes:** Recite the supply-chain stages and three chokepoint firms from memory, then check against the flashcards.
- **R2 — 24 hours, 30 minutes:** Reconstruct all five perspectives in writing, beginning with the African perspective, and compare each with its occlusion.
- **R3 — 3 days, 45 minutes:** Redo the worked-example adjudication using one new piece of evidence from the data lab.
- **R4 — 1 week, 60 minutes:** Interpret one semiconductor data table and write a short memo outline with mechanism, perspectives, analogue, and falsifiers.
- **R5 — 2 weeks, 90 minutes:** Complete a timed independent memo, then review the error-log and update the confidence audit.

SECTION 10 — COMPLETION CHECKLIST

☐ I can map the semiconductor supply chain from design to packaging.

☐ I can identify at least three chokepoint firms and explain their roles.

☐ I can distinguish a chokepoint from a monopoly.

☐ I can explain how US export controls transmit through the supply chain.

☐ I can summarize China's response without overstating its independence from chokepoints.

☐ I can define "economic security as national security."

☐ I can reconstruct the African perspective as primary and explain what it reveals.

☐ I can reconstruct the Chinese, Russian, Western, and UN perspectives.

☐ I can compare the five perspectives using contribution, occlusion, stance, evidence, and objection.

☐ I can apply the four levels of analysis to the worked example.

☐ I can adjudicate between security and efficiency claims using evidence.

☐ I can interpret at least one semiconductor data table.

☐ I can identify a strong falsifier for a policy conclusion.

☐ I can distinguish description, explanation, prediction, and prescription.

☐ I have completed the confidence audit honestly.

☐ I have logged at least one misconception and its correction.

☐ I can connect this lesson to L18, L47, L19, L53, L54, L55, and L56.

☐ I can explain why African technological marginalization is structural rather than incidental.

54. Critical Minerals and Advanced Materials

LESSON METADATA

Field	Value
Lesson number and title	53 — Critical Minerals and Advanced Materials
Module	Module 9: Techno-Geopolitics, AI, and Emerging Domains
Prerequisites	L19 (minerals), L33 (African minerals), L52 (semiconductors)
Interleaved links	Forward to L54 (AI and hyperwar), L56 (innovation), L57 (biosecurity)
Reading load	7-9 hours
Content channels	Text, Data Lab, Visual Anchor, Cornell Notes, Flashcards
Bloom ceiling	Evaluate / Create
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

The central puzzle of this lesson is not whether minerals matter—they plainly do—but how a state converts geological endowment into durable geopolitical leverage, and why the most powerful consumer states on earth have repeatedly failed to secure the physical inputs on which their digital economies and military platforms depend. Critical minerals are the material substrate of the fourth industrial revolution and of contemporary warfare: they sit inside batteries, semiconductors, permanent magnets, hypersonic thermal-protection systems, and stealth coatings. Yet unlike oil, they are not combusted and therefore not consumed in a single use; they are embedded in durable capital stock, which means that coercion in minerals markets operates less through price shocks than through refining bottlenecks, export licensing, and the slow strangulation of midstream capacity. The puzzle is therefore structural: leverage accrues not necessarily to whoever owns the mine, but to whoever controls the chemical transformation that turns ore into usable material, and that transformation is concentrated in a handful of jurisdictions, above all China. Understanding this requires moving beyond the familiar "resource curse" vocabulary of extraction and rent-seeking into a political economy of midstream industrial capacity, state-backed finance, and the construction of "criticality" itself as a category that consumer states use to justify intervention.

This lesson is positioned deliberately after L52 on semiconductors and after L19 and L33 on minerals and African minerals. L52 taught the student to locate chokepoints in fabrication and design; this lesson moves the analysis upstream to extraction and, more importantly, midstream to refining and processing, where the actual leverage resides. L19 introduced the resource curse, comparative advantage, and strategic trade; L33 introduced African producer-state strategies and the politics of value-chain upgrading. Here those threads are woven into a techno-geopolitical frame in which minerals are not merely commodities but inputs to AI compute, hypersonic flight, and energy transition. The lesson also prepares the ground for L54 on AI and hyperwar, where material inputs determine operational tempo and magazine depth; for L56 on innovation,

where substitution research and recycling are the long-run strategic response; and for L57 on biosecurity, where advanced materials enable containment, filtration, and sensor platforms. The student who masters this lesson will be able to trace a single mineral from ore body to weapons platform, identify where in that chain leverage is actually exercised, and explain why different states disagree about where the chain should be governed.

By the end of the lesson the student should be able to do five things. First, reconstruct the five perspectives—African, Chinese, Russian, Western, and UN—on critical minerals as a whole, steel-manning each from within and identifying what each reveals and what it occludes. Second, specify mechanisms rather than outcomes: refining concentration, export-control licensing, stockpiling, friend-shoring, and substitution each have identifiable causal pathways and scope conditions. Third, apply the four levels of analysis inherited from Lesson 1—individual, state, systemic, and transnational—to a minerals case without collapsing one into another. Fourth, adjudicate between competing explanations of the same event, such as China's 2023–2024 gallium and germanium export controls, on the basis of evidence rather than assertion. Fifth, produce a short analytical memo that distinguishes description, explanation, prediction, and prescription, and that includes explicit falsifiers for its own claims. These are assessable skills, not attitudes, and the lesson's exercises are designed to make them visible.

The theoretical framing draws on several lineages that the student must keep distinct. From political economy, dependency theory and world-systems analysis (associated with Rodney, Amin, and Wallerstein) explain how extraction in the periphery feeds industrialization in the core, but they risk treating producer states as passive. From international political economy, strategic trade theory and techno-nationalism explain why states subsidize domestic capacity in sectors with spillovers, but they often understate the fiscal and environmental costs. From security studies, the resource-security and "weaponization of interdependence" literatures explain how concentrated supply chains become instruments of coercion, but they can overstate the ease with which leverage is exercised. From development studies, the resource-sovereignty and value-chain-upgrading literatures—strongly associated with African scholarship—explain how producer states attempt to capture rents and move up the value chain, but they must confront the technical and capital barriers to refining. The lesson's central argumentative move is to treat the African vantage point not as a regional application of Western theory but as a generative perspective in its own right: from the producer state's position, "criticality" is not a natural property of a mineral but a demand-side construction by consumer states, and the same mineral that is "strategic" for a battery manufacturer is "strategic" for a producer state as development finance, employment, and industrialization.

Scope conditions matter. This is not a geology lesson, though geological endowment sets the outer bound of what is possible; it is a political-economy lesson about how geological facts become political facts. It is also not a procurement manual: stockpiling volumes and tariff schedules are treated as evidence for mechanisms, not as policy recommendations. The data lab uses USGS Mineral Commodity Summaries and the IEA Critical Minerals Outlook (2024) to ground claims in production and refining shares by country, and the student is expected to read those shares as political facts—who refines, not merely who mines. The worked example examines China's 2023–2024 gallium and germanium export controls as a case of coercion in minerals markets, asking how the mechanism actually works, what it achieved, and what it did not. The problem pair examines US, EU, and Japanese critical minerals strategies—the Inflation Reduction Act, the EU Critical Raw Materials Act, and the Minerals Security Partnership—as competing responses to the same structural problem. Throughout, the five perspectives are reconstructed in depth in Section 2.7, with the African perspective first and longest, because the lesson's central puzzle is reframed, not merely illustrated, by the producer-state vantage point.

A final methodological note. The lesson insists on distinguishing description, explanation, prediction, and prescription, because minerals debates are saturated with conflation: a description of China's refining share is routinely treated as proof of inevitable coercion, and a prescription for friend-shoring is routinely treated as an explanation of why supply chains are concentrated. The student should leave able to say, for any claim about critical minerals, what would falsify it, at which level of analysis it operates, and from which perspective it is voiced. That discipline is the transferable skill; the mineral names and percentages are the scaffolding.

SECTION 1 — Pre-Class Priming

1.1 Retrieval Warm-Up

Answer from memory before reading. These questions draw on Lessons 19, 33, and 52.

1. **Resource curse (L19).** Define the resource curse and name two African cases that illustrate different variants of it—one in which rents fueled conflict and one in which rents funded state capacity without diversification.
2. **Colonial extraction (L33).** How did colonial mineral extraction shape post-colonial state capacity in Africa, and what is the "enclave economy" critique associated with that literature?
3. **Semiconductor chokepoint (L52).** Where is the most consequential chokepoint in the semiconductor supply chain, and which firm and which state exercise it?
4. **Comparative advantage vs. strategic trade (L19).** Distinguish comparative advantage from strategic trade theory in minerals, and state the condition under which strategic trade arguments are theoretically valid.
5. **Value-chain upgrading (L33).** What is value-chain upgrading, why is it difficult for producer states to achieve in minerals, and what policy instruments do they typically use to attempt it?
6. **Export controls on tools (L52).** How did US export controls on electronic design automation tools and advanced lithography affect China's semiconductor ambitions, and what was China's principal counter-strategy?

1.2 Orientation Questions

These frame the lesson's central puzzle. Do not answer them yet; return to them after Section 2.

1. Why might refining concentration matter more than mining concentration for geopolitical leverage, and what does that imply about which states actually "control" a mineral?
2. Are export controls on minerals more effective as instruments of coercion or as signals of resolve, and what evidence would distinguish the two?
3. How does the African producer-state perspective redefine "criticality," and what policy consequences follow from that redefinition?
4. What would falsify the claim that China's dominance in critical minerals refining is durable over a ten-to-fifteen-year horizon?

1.3 Vocabulary Pre-Teach

Provisional definitions; refine as you read.

- **Critical mineral.** A mineral designated by a consumer state or bloc as essential to economic or national security and subject to supply risk; the designation is political and varies across jurisdictions.
- **Refining concentration.** The share of global processing and chemical transformation of a mineral controlled by a small number of firms or states; typically higher and more durable than mining concentration.
- **Export control / licensing.** A state requirement that exporters obtain government permission to ship specified goods; in minerals, used to restrict flows of gallium, germanium, graphite, and rare earths.
- **Value-chain upgrading.** A producer state's effort to move from raw extraction into processing, manufacturing, and services to capture more rent and employment.
- **Resource sovereignty.** The claim by producer states that they hold legitimate authority over extraction, processing, and revenue from natural resources within their territory.
- **Friend-shoring.** The relocation of supply chains to geopolitically aligned or "trusted" countries, as opposed to pure cost minimization.
- **Stockpiling.** Government accumulation of strategic material reserves to buffer against supply disruption; distinct from commercial inventory.
- **Substitution.** The replacement of one material with another in a given application, typically through engineering redesign or materials science; the long-run response to scarcity.
- **Advanced materials.** Engineered materials with superior properties—thermal protection, stealth, hypersonic survivability—used in defense and aerospace platforms.
- **Hypersonics.** Flight vehicles and weapons traveling at Mach 5 or above, requiring materials that survive extreme heat and aerodynamic stress.
- **EITI (Extractive Industries Transparency Initiative).** A multi-stakeholder standard for disclosure of payments and revenues in extractive industries.
- **Techno-nationalism.** The view that technological capability is a component of national power and that states should actively cultivate domestic capacity in strategic sectors.

SECTION 2 — LESSON CORE

2.1 Learning objectives By the end of this lesson, the student should be able to: (1) **Explain** why rare earth elements are strategically scarce even though their crustal abundance is not exceptionally low, identifying refining and magnet manufacturing as the binding constraints rather than geology alone. (2) **Analyze** the mechanisms through which China acquired and maintains near-monopoly positions in rare earth separation, refining, and downstream permanent-magnet production, including state support, vertical integration, environmental cost externalization, and learning-by-doing. (3) **Evaluate** the scope conditions under which concentrated refining capacity becomes coercive leverage, distinguishing market concentration from usable power and specifying when substitution, recycling, stockpiling, or new entry can erode that power. (4) **Compare** African, Chinese, Russian, Western, and United Nations perspectives on critical minerals governance, identifying what each tradition contributes to understanding resource sovereignty, supply-chain security, and multilateral regulation, and what each systematically occludes. (5) **Apply** these concepts to the 2023–2024 Chinese gallium and germanium export controls and to the United States, European Union, and Japanese critical minerals strategies, producing an evidence-based adjudication of whether observed outcomes reflect structural dependence, policy signaling, or transitional market adjustment. These objectives require the student to move beyond description of mineral deposits toward causal explanation of industrial bottlenecks, to connect material capabilities to diplomatic bargaining, and to assess competing normative frameworks

without collapsing them into a single Western security narrative.

2.2 KEY IDEA 1 — Rare earth elements: deposits, refining, and China's near-monopoly Bolded Causal Claim: The strategic scarcity of rare earth elements is produced less by geological rarity than by the concentration of refining, separation, and magnet-manufacturing capacity, especially in China; therefore, states and firms that control midstream processing rather than ore extraction possess durable leverage over advanced manufacturing, clean-energy systems, and defense supply chains.

Mechanism: Rare earth elements comprise seventeen metallic elements, including the fifteen lanthanides plus scandium and yttrium. They are not rare in the Earth's crust in the sense of vanishing abundance, but economically viable deposits are geographically concentrated, and the elements occur together in complex mineral matrices that must be separated through chemically intensive processes. The binding constraint is therefore not the existence of ore bodies but the capacity to perform solvent extraction, precipitation, calcination, and metallization at scale, followed by alloying and magnet production. China's position emerged through a combination of state-directed investment, subsidized credit, tolerance of environmental externalities, acquisition and diffusion of processing technology, and vertical integration from mine to magnet. As Kalantzakos (2020) emphasizes, China's dominance is best understood as an industrial-ecology achievement rather than a simple accident of geology: it built capacity across the value chain while many consuming states treated rare earths as a low-margin commodity and offshored the dirty and difficult stages of production. The result is a near-monopoly not necessarily in mining alone but in the stages that convert ore into usable inputs for electric vehicles, wind turbines, precision-guided munitions, radar, and aerospace systems. Sanderson (2022) similarly stresses that the strategic problem is not the absence of deposits outside China but the absence of commercially viable, environmentally permitted, and technologically mature refining capacity. Once a producer controls separation and magnet making, it can influence prices, allocate supply, impose licensing requirements, and shape the location of downstream manufacturing without needing to own every mine. The mechanism is therefore cumulative: state support lowers capital costs, environmental forbearance lowers operating costs, learning-by-doing raises yields, vertical integration captures margins, and downstream dependence locks in customers. Each stage reinforces the others, producing a self-sustaining concentration that market prices alone do not quickly dissolve.

Scope Conditions: The translation of concentrated refining capacity into coercive leverage is conditional rather than automatic. Leverage is strongest when demand is inelastic in the short run, as in defense applications, aerospace alloys, and specialized magnets where redesign is costly and qualification timelines are long; when alternative suppliers face high capital requirements, long permitting horizons, and environmental opposition; when consuming firms have optimized production around Chinese specifications and cannot switch without retooling; and when consuming states lack stockpiles or coordinated procurement. Leverage is weaker when price spikes are large enough to finance new projects, when recycling and substitution technologies mature, when consuming states coordinate demand and investment, and when the dominant supplier's own downstream industries depend on stable export revenues. The scope conditions also include legal and institutional constraints: export controls may trigger World Trade Organization disputes, retaliatory measures, or accelerated diversification that reduces future leverage. A further condition is the supplier's willingness to absorb self-harm: restricting exports can damage domestic magnet producers, reduce foreign-exchange earnings, and invite political backlash. Thus near-monopoly in refining is a necessary but not sufficient condition for coercion; usable power depends on demand structure, time horizon, institutional response, and the supplier's cost-benefit calculus. The mechanism is strongest in the short and medium term and weakest where long-term industrial policy, recycling, and substitution are already funded and permitted.

Observable Implications: If the causal claim is correct, several observable patterns should appear. First, policy signals or export restrictions should generate price volatility and inventory behavior disproportionate to changes in underlying ore availability, because the bottleneck is processing rather than mining. Second, consuming states should invest in refining and magnet capacity even where domestic ore is limited, revealing that the strategic asset is midstream capability. Third, firms should diversify suppliers, redesign products, and build stockpiles, but with lags that reflect engineering and qualification constraints. Fourth, diplomatic disputes over rare earths should center on processing and export licensing rather than mine ownership alone. Fifth, market concentration metrics should show higher Herfindahl-Hirschman-type concentration in separation and magnet manufacturing than in mining. Sixth, new projects in Australia, the United States, Malaysia, and elsewhere should be evaluated not only by ore grade but by their ability to secure offtake, financing, and environmental permits for refining. The 2010 rare earth dispute between China and Japan, later adjudicated through the World Trade Organization, illustrates the pattern: the leverage arose from China's control over processing and export quotas, not from an absolute absence of Japanese or global deposits. More recent United States and European efforts to support domestic and allied refining, including measures associated with the Inflation Reduction Act and the European Union's Critical Raw Materials Act, further imply that policymakers have recognized the midstream bottleneck. If, by contrast, ore deposits alone determined power, then new mines outside China would rapidly eliminate leverage; the persistence of diversification efforts suggests that the mechanism operates through processing capacity and industrial ecosystems.

Perspective Note (five traditions in brief):

African (primary): The African perspective begins from the historical experience that mineral wealth has too often been extracted as raw ore while refining, manufacturing, and technological rents accrued elsewhere. From this vantage point, the rare earth story is not simply a Sino-Western contest over supply chains; it is a recurring pattern in which producer regions are treated as geological warehouses rather than industrial partners. African scholarship on extraction and underdevelopment, including Rodney's analysis of how external extraction shaped African economies, Nkrumah's critique of neo-colonialism, and Mamdani's work on the colonial state and its afterlives, frames the problem as one of value-chain position rather than resource endowment. Bayart's concept of extraversion and Grovogui's insistence on reconstructing sovereignty from within further suggest that African states are not merely passive suppliers but actors negotiating terms of incorporation into global capitalism. For rare earth deposits in parts of Africa, including the Great Lakes region and southern Africa, the strategic question is whether extraction will be linked to local refining, skills transfer, energy infrastructure, and fiscal capacity, or whether it will reproduce enclave economies. The African perspective therefore treats "critical minerals" discourse with suspicion when it defines criticality solely from the standpoint of consuming industrial powers. It asks who defines the mineral as critical, who captures the value added, and whether producer states can use bargaining power to upgrade rather than merely export. Resource sovereignty, in this tradition, is not autarky; it is the capacity to negotiate technology transfer, local content, environmental safeguards, and regional value chains, including through the African Continental Free Trade Area. The African vantage also highlights that environmental costs of refining are often displaced onto producer regions, making transparency and accountability mechanisms such as the Extractive Industries Transparency Initiative necessary but insufficient. What this perspective reveals that the others miss is that midstream monopoly is not only a geopolitical weapon; it is also a developmental ladder that producer states may seek to climb, and that Western friend-shoring can bypass African industrialization if it treats Africa only as a source of ore.

Chinese: The Chinese perspective treats rare earth dominance as the outcome of sustained industrial policy, long-term investment, and willingness to absorb environmental and social costs that other states avoided. It

frames export controls and licensing as legitimate instruments of resource management and national security, especially when advanced technologies are subject to external restrictions. The developmental-partnership narrative presents Chinese mining and processing investment in producer states as mutually beneficial, emphasizing infrastructure, market access, and industrialization. This perspective contributes a reminder that market concentration can reflect comparative advantage built through state capacity rather than mere coercion. It occludes, however, the opacity of subsidies, the environmental and health costs of refining, the coercive potential of export restrictions, and the asymmetry between a dominant supplier and dependent consumers.

Russian: The Russian perspective approaches critical minerals through a commodity-state and anti-hegemonic lens. It tends to interpret Western supply-chain security initiatives as attempts to cartelise access, exclude competitors, and preserve unipolar control over advanced manufacturing. Russia emphasizes resource sovereignty, state ownership, and the legitimacy of producer states using minerals for strategic purposes. This perspective contributes a critique of liberal market rhetoric that often masks power asymmetries. It occludes Russia's own dependence on commodity exports, its limited rare earth refining capacity, the effects of sanctions on technology access, and the tendency to subordinate producer-country development to geopolitical alignment.

Western: The Western perspective defines critical minerals primarily through supply-chain security, alliance management, and the cost of disruption. It emphasizes concentration risk, friend-shoring, domestic and allied refining, and the economic trade-offs of diversification. The Inflation Reduction Act, the European Union's Critical Raw Materials Act, and the Minerals Security Partnership reflect this framing. This perspective contributes rigorous attention to bottlenecks, stockpiles, and industrial policy. It occludes the developmental aspirations of producer states, the environmental costs of relocating refining, and the possibility that security-driven procurement may raise costs without quickly reducing dependence.

United Nations: The United Nations perspective frames critical minerals through resource governance, transparency, sustainable development, and multilateral norms. It emphasizes the Extractive Industries Transparency Initiative, human rights, environmental standards, and the contribution of minerals to Sustainable Development Goals seven and nine. This perspective contributes a normative vocabulary for benefit sharing and accountability. It occludes enforcement weaknesses, the power asymmetries between consuming and producing states, and the gap between voluntary standards and the strategic urgency of industrial policy.

2.3 KEY IDEA 2 — Gallium, germanium, and graphite: export control leverage

Bolded Causal Claim: Export controls on gallium, germanium, and graphite convert concentrated refining and processing capacity into coercive bargaining power by weaponizing not absolute scarcity but the time, cost, and uncertainty of downstream adjustment.

Mechanism: Gallium and germanium are, in most production systems, recovered as byproducts rather than mined as primary ores: gallium is typically associated with bauxite and alumina processing, while germanium is commonly recovered from zinc concentrates and coal fly ash. This byproduct structure means that supply elasticity is unusually low. An importer cannot easily solve a shortage by opening a new mine, because increasing gallium or germanium output requires expanding host-metal production, changing metallurgical flows, or installing recovery circuits whose economics depend on the price of the primary metal.

Graphite presents a different but related bottleneck: natural graphite mining is geographically concentrated, but the strategically decisive step is processing—sphericalization, purification, coating, and anode-material qualification for lithium-ion batteries. The coercive mechanism therefore operates at the processing node, not merely at the mine mouth. Export controls work through licensing requirements, end-use verification, customs discretion, and administrative delay. Their effect is not necessarily to cut off all supply; rather, they raise the risk premium of procurement, force downstream firms to hold larger inventories, complicate just-in-time manufacturing, and create uncertainty about whether a license will be granted for a particular end use. Semiconductor, fiber-optic, solar, and battery firms face qualification requirements that make rapid supplier switching costly. Even a partial or unpredictable control can alter investment plans, because firms must price in the possibility of future disruption. In this sense, export control leverage is a form of chokepoint coercion: the exporter exploits a node where substitution is technically possible but commercially and temporally expensive.

Scope Conditions: The mechanism is strongest when four conditions hold. First, the exporter possesses a high share of global refining or processing capacity, not merely mining output. Second, downstream users face high switching costs because of technical qualification, capital intensity, or regulatory approval. Third, the controlled material is embedded in products with high political and economic salience, such as semiconductors, defense systems, electric vehicles, or telecommunications infrastructure. Fourth, the control is administered with enough discretion to create uncertainty without necessarily triggering a total trade collapse. The mechanism weakens when alternative processing capacity already exists, when firms can substitute materials or redesign products quickly, when stockpiles are large enough to bridge the adjustment period, or when the exporter's own revenue dependence makes a broad embargo self-defeating. It also weakens if controls are so predictable that firms fully decouple in advance, eroding future leverage. The most effective controls are therefore often targeted, opaque, and calibrated to impose costs while preserving the exporter's role as an indispensable supplier.

Observable Implications: Observable implications include price spikes and heightened volatility in gallium, germanium, and graphite markets; delays or denials in export-license processing; downstream firms announcing supplier diversification, inventory buildup, or accelerated qualification of alternative sources; increased research and development into substitution and recycling; diplomatic protests and retaliatory trade measures; and policy responses such as stockpiling, friend-shoring, and domestic processing subsidies. China's 2023–2024 export controls on gallium and germanium, followed by graphite-related controls, provide a clear empirical illustration: the immediate effect was not necessarily a complete cessation of trade, but a restructuring of procurement risk, a rise in compliance costs, and a visible acceleration of efforts by consuming states to reduce dependence. Data from the USGS Mineral Commodity Summaries and the IEA Critical Minerals Outlook can be used to track concentration, trade flows, and the gap between mining and processing capacity. The key analytical point is that the strategic effect of controls should be measured not only by volume reductions but by changes in firm behavior, investment timelines, and bargaining positions.

Perspective Note (five traditions in brief): African (primary): From an African perspective, export controls on gallium, germanium, and graphite highlight the difference between possessing mineral deposits and controlling the value chain. Several African states hold graphite and other critical mineral resources, yet much of the refining, sphericalization, and anode-material production occurs elsewhere. African scholarship on resource sovereignty—drawing on Rodney's analysis of unequal exchange, Nkrumah's critique of neocolonialism, and later work on extractivism—would frame the issue as one of structural position: producer states may gain revenue from raw exports while remaining vulnerable to price volatility and to decisions made in processing centers. The African vantage point asks whether export controls by a dominant proces-

sor create openings for African value-chain upgrading or merely reproduce a pattern in which African states supply raw materials while others capture technological and strategic rents. It also foregrounds environmental and social costs of relocating refining, and the possibility that security-driven procurement by consuming states may raise costs without quickly reducing dependence. **Chinese:** The Chinese perspective treats export controls as legitimate instruments of national security and industrial policy, consistent with a state-backed supply-chain strategy and a developmental partnership framing in which China presents itself as a responsible supplier while retaining sovereign discretion over strategic materials. **Russian:** The Russian perspective tends to view such controls through a commodity-state and anti-hegemonic lens, emphasizing resistance to Western sanctions, the legitimacy of sovereign resource management, and the possibility of coordination among non-Western producers. **Western:** The Western perspective frames the issue as supply-chain security, friend-shoring, and the economic cost of dependence, debating whether controls justify expensive diversification or whether market adjustment and substitution will suffice. **United Nations:** The United Nations perspective emphasizes resource governance, transparency, sustainable development, and multilateral norms, including the Extractive Industries Transparency Initiative and Sustainable Development Goals seven and nine, while often understating enforcement weaknesses and power asymmetries between consuming and producing states.

2.4 KEY IDEA 3 — Advanced materials for defense: hypersonics, stealth, and thermal protection

Bolded Causal Claim: Advanced defense materials create strategic bottlenecks because weapons performance is constrained by physical material limits, and the inputs required to reach those limits are concentrated, slow to qualify, and politically controlled.

Mechanism: Modern high-performance weapons systems are not limited only by software, sensors, or propulsion concepts; they are limited by whether materials can survive extreme temperatures, stresses, electromagnetic environments, and manufacturing tolerances. Hypersonic vehicles, for example, require thermal protection systems—such as carbon-carbon composites and ultra-high-temperature ceramics—that can withstand aerodynamic heating and thermal shock while maintaining structural integrity. Stealth platforms depend on radar-absorbing materials, precise surface treatments, and manufacturing processes that reduce detectability. Propulsion and airframe performance depend on nickel-based superalloys, titanium, and refractory metals such as tungsten, rhenium, and tantalum. The mechanism is cumulative: material properties define the engineering envelope; the engineering envelope defines system performance; and system performance defines strategic capability. Because defense materials must be qualified under stringent standards, substitution is not simply a matter of finding a chemically similar substance. A new alloy or composite may require years of testing, certification, and integration before it can be used in a weapons platform. This creates inelastic demand and long adjustment lags. Moreover, several critical inputs are geographically concentrated or subject to export controls, meaning that a disruption in mining, refining, or component manufacturing can propagate into program delays. Defense demand is also relatively insensitive to price, because procurement is driven by strategic requirements rather than commercial optimization. The result is a hidden layer of military power: the material base beneath visible platforms.

Scope Conditions: The mechanism is strongest when three conditions coincide. First, the material has no near-term substitute at the required performance threshold; if a substitute exists, even at higher cost, the bottleneck is softened. Second, production is concentrated in a small number of firms or countries, especially where refining, alloying, or composite manufacturing is more concentrated than mining. Third, qualification and certification cycles are long relative to the expected duration of a supply disruption. The mechanism

weakens when additive manufacturing, new ceramic matrix composites, or alternative alloy systems reduce dependence; when commercial aerospace or energy demand diversifies supply; or when stockpiles and recycling provide buffer capacity. It also weakens if defense programs are flexible enough to accept performance trade-offs. Conversely, it strengthens when materials are subject to export controls, when procurement is classified and therefore lacks market transparency, and when geopolitical rivalry accelerates demand for the same limited inputs.

Observable Implications: Observable implications include defense stockpiling and strategic-reserve programs; export controls and licensing requirements on materials and components; allied sourcing initiatives and "friend-shoring" in defense supply chains; increased research funding for substitutes, recycling, and advanced manufacturing; price premiums for qualified materials; and program delays or cost overruns attributed to material shortages. Analysts should also look for divergence between commercial and defense-grade supply: a material may be available in industrial quantities but not in the purity, form, or certification required for military use. In the data lab, production and refining by country for relevant minerals can be compared with defense procurement patterns, though the latter are often partially classified. The broader implication is that advanced materials policy cannot be reduced to mining output; it must account for processing, qualification, manufacturing, and the institutional capacity to sustain a defense-industrial base under stress.

Perspective Note (five traditions in brief): African (primary): The African perspective foregrounds the fact that many advanced defense materials depend, directly or indirectly, on minerals extracted from African states—cobalt, graphite, tungsten, titanium sands, and other inputs—while value capture, refining, and strategic decision-making often occur elsewhere. African scholarship on extractivism and resource sovereignty, including work by Rodney, Nkrumah, and later analysts of the resource curse, would stress that militarized demand can intensify extraction without corresponding development benefits. The African vantage point also raises questions about environmental degradation, labor conditions, and the risk that critical-mineral booms will reproduce enclave economies. It asks whether African producer states can use defense-driven demand to upgrade processing capacity and negotiate better terms, or whether security framing by consuming states will prioritize supply assurance over local development. **Chinese:** The Chinese perspective emphasizes state-backed supply chains, civil-military fusion, and a developmental partnership framing in which industrial capacity is treated as a strategic asset and external partnerships are presented as mutually beneficial. **Russian:** The Russian perspective views defense-materials competition through a commodity-state and anti-hegemonic lens, stressing sovereign control over resources, resistance to Western sanctions, and the legitimacy of state-directed industrial mobilization. **Western:** The Western perspective frames the issue as supply-chain security, alliance coordination, and the economic cost of resilience, debating whether defense-driven diversification is worth its fiscal and efficiency costs. **United Nations:** The United Nations perspective emphasizes resource governance, transparency, human rights, environmental standards, and the contribution of industrial capacity to Sustainable Development Goals seven and nine, while often understating enforcement gaps and the strategic urgency of military procurement.

2.5 KEY IDEA 4 — Battery supply chains — lithium, cobalt, nickel, graphite

Bolded Causal Claim: Battery supply chains convert geographically concentrated mineral endowments and processing capacity into strategic leverage over electrification, because the energy transition's material intensity makes states and firms dependent on a small set of extraction and refining nodes.

Mechanism: The battery value chain is sequential, cumulative, and qualification-intensive. Geological endowment determines where lithium brine or hard rock, cobalt ore, nickel laterite or sulfide, and natural graphite can be extracted; refining and chemical conversion determine whether those inputs become battery-grade lithium carbonate or hydroxide, cobalt sulfate, nickel sulfate, and spherical graphite; precursor and cathode or anode manufacturing determine cell performance; and cell assembly determines pack-level deployment in electric vehicles, consumer electronics, and grid storage. Leverage arises where a stage is concentrated and difficult to replicate quickly. Lithium extraction is geographically dispersed across Australia, Chile, Argentina, and China, but chemical conversion has been heavily concentrated in China, meaning that even non-Chinese mine output can pass through Chinese refining before reaching cell makers. Cobalt is mined predominantly in the Democratic Republic of the Congo, while refining and precursor production are concentrated in China, creating a two-node dependence: a producer state with weak regulatory capacity at extraction and a processing hegemon at conversion. Nickel presents a different pattern: Indonesia has used export restrictions and domestic processing requirements to move from ore exports to nickel pig iron, matte, and increasingly battery-grade intermediates, demonstrating that producer states can use resource nationalism to climb the value chain, but also that such climbing can lock in coal-intensive processing and raise environmental costs. Graphite is both a battery anode material and a broader industrial input; natural graphite mining and, especially, spherical graphite processing have been dominated by China, while synthetic graphite depends on needle coke and energy-intensive graphitization. The mechanism is not merely scarcity but bottleneck power: a state or firm that controls a non-substitutable, high-fixed-cost stage can influence prices, licensing, investment, and technology transfer without necessarily halting all supply, because buyers face switching costs, qualification timelines, and offtake contracts. In battery markets, qualification is particularly important: automotive and cell manufacturers require consistent purity, particle size, cycle life, and safety performance, so new suppliers cannot enter merely by offering ore; they must pass lengthy validation. This creates time asymmetry: disruption can be immediate, while replacement takes years. The mechanism also operates through finance and standards: offtake agreements, export credit, and environmental, social, and governance due diligence shape which projects reach production, while carbon accounting and traceability requirements can advantage or disadvantage suppliers. Thus battery supply chains generate leverage through the interaction of geological concentration, processing concentration, capital intensity, qualification barriers, and regulatory standards.

Scope Conditions: The leverage mechanism is strongest when (i) a mineral or intermediate has few technically viable substitutes at the cell-chemistry level; (ii) refining capacity is concentrated and subject to state licensing or export controls; (iii) demand growth outpaces new project development; (iv) environmental, social, and governance standards raise barriers to entry; and (v) buyers require long qualification periods. It weakens when cell chemistries shift, for example toward lithium iron phosphate, which removes cobalt and nickel from the cathode but increases demand for lithium and graphite; when recycling reaches scale; when alternative anode materials are commercialized; or when producer states successfully diversify processing. The mechanism also varies by mineral: lithium's leverage is more diffuse because resources are spread across several continents; cobalt's is more acute because extraction and refining are both concentrated; nickel's is shaped by Indonesia's industrial policy; graphite's is shaped by China's dominance in spherical graphite and by the energy intensity of synthetic alternatives. Scope conditions include not only geology but also permitting timelines, water availability for brine operations, energy costs for refining, and the availability of skilled labor and chemical engineering capacity. In addition, battery supply chains are path-dependent: once a cell manufacturer qualifies a supplier's material, switching costs create inertia even if a cheaper or more secure alternative exists, and this inertia can protect incumbents as much as it protects buyers.

Observable Implications: If the mechanism holds, one should observe price volatility around policy shocks; export licensing or quota announcements; vertical integration by cell manufacturers and automakers into mining or refining; offtake agreements with non-dominant suppliers; and public investment in domestic processing. One should also observe friend-shoring and alliance-based mineral partnerships, as well as producer-state bargaining over local content, royalties, and downstream processing. Environmental and labor controversies should correlate with supply risk because environmental, social, and governance failures can trigger buyer exclusion and regulatory action. The mechanism implies that resilience policies will be slower and more expensive than headline announcements suggest, because qualification and permitting lag behind political timelines. It also implies that battery supply chains will be a site of repeated contestation between climate-transition goals and security goals: the same minerals required for decarbonization become objects of strategic competition. Observable implications further include the rise of battery passport and traceability schemes, the use of long-term offtake contracts to de-risk mining projects, and the strategic importance of midstream chemical conversion even in countries that do not mine the underlying ore.

Perspective Note (five traditions in brief): African (primary): The African perspective centers producer-state strategies, value-chain upgrading, and resource sovereignty, asking whether mineral endowments can be converted into industrialization rather than enclave extraction; it highlights cobalt in the Democratic Republic of the Congo, lithium in Zimbabwe and Namibia, and graphite in Mozambique and Tanzania, and insists that battery transitions must not reproduce colonial patterns of raw export and externalized environmental cost. **Chinese:** The Chinese perspective emphasizes state-backed supply chains, long-term offtake, processing dominance, and a developmental partnership framing that presents Chinese investment as infrastructure and industrial capacity building, while treating Western de-risking as politicization of markets. **Russian:** The Russian perspective treats battery minerals through a commodity-state and anti-hegemonic lens, stressing sovereign control, sanctions resistance, and the legitimacy of state-directed resource mobilization, while often understating governance and environmental deficits. **Western:** The Western perspective frames battery supply chains as security and alliance problems, emphasizing friend-shoring, the Inflation Reduction Act, the EU Critical Raw Materials Act, and the economic cost of resilience, while debating whether diversification is worth its fiscal and efficiency costs. **United Nations:** The United Nations perspective emphasizes resource governance, transparency, human rights, environmental standards, and the contribution of industrial capacity to Sustainable Development Goals seven and nine, while often understating enforcement gaps and the strategic urgency of procurement.

2.6 KEY IDEA 5 — Stockpiling, substitution, and recycling — the search for resilience

Bolded Causal Claim: Resilience in critical minerals is produced not by eliminating dependence but by managing time: stockpiles buy time, substitution changes material requirements, and recycling closes loops, yet each instrument has distinct cost, scale, governance, and environmental constraints.

Mechanism: Stockpiling operates as a buffer against supply disruption by holding physical inventories or strategic reserves of minerals, intermediates, or finished components; its effectiveness depends on knowing which materials are truly critical, how long a disruption will last, and whether stockpiled forms can be converted into usable inputs. Substitution operates through engineering and chemistry: battery makers can shift from nickel-manganese-cobalt cathodes to lithium iron phosphate, reducing cobalt and nickel exposure but increasing lithium and graphite demand; magnet makers can explore reduced-dysprosium or dysprosium-free designs; and materials scientists can seek alternative alloys, coatings, or thermal protection systems. Recycling operates as urban mining: end-of-life batteries, electronics, and industrial scrap can be processed

into black mass and then refined into battery-grade materials, reducing primary extraction but requiring collection systems, safe handling, and energy-intensive metallurgy. The three mechanisms interact. Stockpiling can bridge the gap while substitution and recycling scale; substitution can reduce the volume that must be stockpiled; recycling can reduce long-term import dependence but cannot quickly offset a sudden disruption because feedstock availability lags deployment by years or decades. The mechanism is therefore temporal: resilience is not a static end state but a portfolio of instruments matched to different time horizons. Stockpiles address short-run shocks, substitution addresses medium-run design change, and recycling addresses long-run circularity. Each instrument also has a governance dimension: stockpiles require public or private capital and release rules; substitution requires research and development, standards, and intellectual property; recycling requires collection infrastructure, extended producer responsibility, and cross-border movement of waste. The mechanism further depends on information: without accurate data on inventories, scrap flows, and material content, governments and firms cannot calibrate buffers or circularity targets.

Scope Conditions: Stockpiling is most effective for materials with stable chemical forms, long shelf life, clear conversion pathways, and predictable disruption durations; it is less effective for materials that degrade, for highly specialized intermediates with short technological half-lives, or for minerals whose criticality changes rapidly with technology. Substitution is most effective where performance trade-offs are acceptable, where engineering standards permit redesign, and where alternative materials are available at scale; it is constrained by safety certification, energy density, thermal performance, and the sunk costs of manufacturing lines. Recycling is most effective where collection rates are high, scrap is concentrated, material values justify processing, and metallurgical routes can recover target elements at battery grade; it is constrained by diffuse end-of-life products, hazardous handling, energy costs, and the long lag between first deployment and scrap availability. The mechanism weakens if stockpiles create moral hazard by reducing incentives to diversify, if substitution merely shifts dependence to another concentrated input, or if recycling is treated as a substitute for primary supply before sufficient feedstock exists. Scope conditions also include price: recycling and substitution accelerate when primary prices are high and sustained, but may stall when prices fall, creating a boom-bust cycle in circular-economy investment. Public policy can alter these conditions through extended producer responsibility, recycled-content mandates, research funding, and strategic reserve legislation.

Observable Implications: If the mechanism holds, one should observe strategic reserve legislation and inventory disclosures; research programs on alternative chemistries and materials; battery recycling plants and black-mass offtake agreements; and policy debates over whether to stockpile raw ore, refined chemicals, or finished components. One should also observe tension between short-term cost minimization and long-term resilience: firms may underinvest in recycling or substitution when prices are low, while governments may overinvest in stockpiles for political visibility. The mechanism implies that resilience strategies will be evaluated differently by different actors: defense planners may prioritize stockpiles, engineers may prioritize substitution, and environmental regulators may prioritize recycling. It also implies that no single instrument can solve critical-mineral dependence; the observable outcome should be a mixed portfolio rather than a single dominant solution. Further observable implications include the emergence of recycling hubs near battery manufacturing clusters, the use of digital product passports to track material content, and the political difficulty of releasing strategic stocks during non-emergency price spikes.

Perspective Note (five traditions in brief): African (primary): The African perspective asks whether stockpiling, substitution, and recycling in consuming countries will bypass African producers or create new opportunities for local refining and circular industry; it stresses resource sovereignty, value-chain upgrading, and the risk that recycling in the Global North could reduce demand for African raw materials before

African states capture processing rents. **Chinese:** The Chinese perspective treats stockpiling and recycling as components of state-backed supply-chain security and industrial planning, emphasizing scale, vertical integration, and the ability to manage price cycles through state capacity, while framing Western restrictions as market distortion. **Russian:** The Russian perspective views resilience instruments through a commodity-state and anti-hegemonic lens, stressing sovereign control over reserves, resistance to sanctions, and the legitimacy of state-directed mobilization, while often understating governance and environmental deficits. **Western:** The Western perspective frames stockpiling, substitution, and recycling as supply-chain security and alliance coordination tools, debating their fiscal cost, efficiency losses, and compatibility with market principles. **United Nations:** The United Nations perspective emphasizes resource governance, transparency, human rights, environmental standards, and the contribution of circular industry to Sustainable Development Goals seven and nine, while often understating enforcement gaps and the strategic urgency of procurement.

SECTION 2.7 FIVE PERSPECTIVES IN DEPTH

2.7.1 African Perspective (PRIMARY) The African perspective begins from a different question than the one that dominates most critical-minerals debates. Where Western, Chinese, and even much UN discourse asks how to secure supply for advanced economies and defense industries, the African vantage point asks who defines "criticality," who captures value, who bears risk, and who has the authority to decide the terms under which minerals leave the ground. In this sense, critical minerals are not merely inputs to batteries, semiconductors, hypersonic vehicles, or stealth systems; they are sites where the political economy of extraction, sovereignty, and global hierarchy is reproduced. The African perspective therefore treats minerals as simultaneously geological, economic, social, and constitutional objects. It is not a regional application of Western resource economics or Chinese industrial policy; it is a distinct theoretical tradition rooted in anti-colonial thought, postcolonial state theory, feminist and decolonial scholarship, and contemporary African political economy.

The lineage of this perspective runs through Fanon's analysis of colonial violence and the postcolonial bourgeoisie, Cabral's insistence that liberation must "return to the source" and rebuild the material and cultural base of society, Nkrumah's theory of neo-colonialism as the continuation of imperial control through economic rather than formal political means, and Rodney's demonstration that underdevelopment was not an original condition but an active historical process produced by the integration of African economies into unequal global circuits. Nyerere's ujamaa and self-reliance traditions add a normative emphasis on collective welfare, regional cooperation, and the rejection of externally imposed models of development. These thinkers do not merely provide moral critique; they supply mechanisms. Rodney's underdevelopment thesis implies that extraction without industrial linkage reproduces dependency. Nkrumah's neo-colonialism thesis implies that formal sovereignty can coexist with substantive economic subordination. Fanon's analysis of the comprador elite implies that mineral rents may strengthen domestic gatekeepers rather than broad-based development. Cabral's materialism implies that resource sovereignty requires not only ownership but productive capacity, education, and cultural reconstruction.

Later African scholarship refines these mechanisms. Bayart's account of the "politics of the belly" and the gatekeeper state suggests that mineral rents can convert the state into a broker between external capital and domestic society, weakening accountability and encouraging enclave development. Mamdani's work on the bifurcated state and on citizen and subject helps explain why mineral governance often operates through dual legal and political orders: one for investors and urban elites, another for rural communities, custom-

ary authorities, and informal miners. Grovogui's critique of international hierarchy and of the racialized foundations of global order suggests that mineral governance regimes, including transparency initiatives and "responsible sourcing" standards, are not neutral technical instruments but expressions of historically unequal power. Mbembe's work on the postcolony and on necropolitics raises the question of whose lives are treated as expendable in extraction zones, where environmental degradation, displacement, and violence are not accidental side effects but structurally tolerated costs. Oyěwùmí's feminist scholarship and Tamale's decolonial Afro-feminism draw attention to the gendered invisibility of labor, land, and social reproduction in mining economies, showing that value-chain analysis that counts only formal wage labor systematically underestimates women's work and harm.

From this theoretical base, the African perspective reconstructs critical minerals as a problem of value-chain truncation. The central mechanism is not simply that Africa has minerals and others process them; it is that the global division of labor assigns geological abundance to African territories while assigning refining, component manufacturing, standards-setting, finance, and technological learning to external centers. This truncation means that price volatility, demand shocks, and geopolitical controls are transmitted into African economies without corresponding control over value capture. When China restricts gallium or germanium exports, when the United States subsidizes battery supply chains through the Inflation Reduction Act, or when the European Union designates strategic projects under the Critical Raw Materials Act, African producer states experience these events as downstream decisions made in centers they do not control. The African perspective therefore insists that "supply-chain security" for advanced economies can look, from the producer side, like the reorganization of dependency.

A second mechanism is the extractive enclave. Mining projects often generate foreign exchange and fiscal revenue while remaining weakly linked to domestic industry, agriculture, or services. Roads, power, and ports may be built for export corridors rather than national integration. Employment may be temporary, capital-intensive, and skill-segmented. Artisanal and small-scale mining, which supports millions of livelihoods, is frequently criminalized or ignored by formal governance frameworks, even though it supplies significant shares of minerals such as cobalt and gold. The African perspective thus sees the "critical minerals boom" not as an automatic development opportunity but as a high-risk conjuncture in which rents can either fund industrialization or deepen enclave economies.

A third mechanism is resource nationalism as a sovereignty claim. African states have increasingly used export bans, local-content requirements, state equity, and beneficiation mandates to retain value. Zimbabwe's restrictions on raw lithium exports, the Democratic Republic of Congo's cobalt governance reforms, Guinea's bauxite and alumina ambitions, South Africa's platinum-group metal strategies, and Zambia's copper-sector renegotiations illustrate different versions of this strategy. The African perspective does not treat these measures as mere market distortions; it treats them as attempts to convert geological endowment into bargaining power. Yet it also recognizes that resource nationalism can fail when states lack energy, capital, skills, infrastructure, or regional markets. Beneficiation is not a slogan; it requires electricity, water, transport, metallurgical knowledge, and patient finance. Without these, export bans may simply reduce revenue or shift smuggling into informal channels.

A fourth mechanism is the politics of community consent and environmental justice. The African perspective foregrounds land tenure, displacement, water contamination, tailings, and the gendered distribution of harm. It challenges the assumption that minerals needed for "green" technologies are automatically green. Cobalt, lithium, graphite, and rare earth production can reproduce the same extractive violence associated with fossil fuels if governance remains weak. This is where Oyěwùmí and Tamale are especially important: women of-

ten bear the costs of land loss, water scarcity, and social disruption while being excluded from compensation, consultation, and employment. The African perspective therefore refuses a simple trade-off between global decarbonization and local sacrifice; it demands that transition minerals be governed by justice, not only by efficiency.

A fifth mechanism is regionalism. Because individual African states often lack scale, the African perspective emphasizes continental and regional frameworks such as the African Mining Vision, the African Continental Free Trade Area, and regional power pools. The argument is that value-chain upgrading requires cross-border industrial corridors, shared infrastructure, and coordinated bargaining. A single state may be unable to support a refinery; a regional market may. This also changes the meaning of "friend-shoring": from an African standpoint, external powers that seek "trusted" supply chains should invest in regional African capacity rather than simply rerouting extraction through preferred partners.

What the African perspective contributes that the other four cannot is a producer-side theory of criticality. It shows that criticality is not an objective property of minerals but a relational category defined by the needs, fears, and industrial strategies of powerful consumers. It reveals that supply-chain security agendas can reproduce the very dependency they claim to solve. It insists that governance must be judged not only by transparency metrics but by whether it redistributes power, value, and risk. It brings into view artisanal mining, gendered labor, community consent, and environmental harm, which are often treated as externalities in security and market frameworks. It also recovers African agency: African states, firms, workers, and communities are not passive suppliers but strategic actors whose choices shape global markets.

What it occludes is equally important. The African perspective can overstate the coherence of "Africa" as a unitary actor, understating sharp differences among mineral-rich states, regional hegemons, and import-dependent economies. It can romanticize state capacity, even though many producer states face fiscal stress, debt, weak regulatory institutions, and elite capture. It can treat external investment primarily through the lens of neo-colonialism, sometimes underestimating genuine technology transfer, infrastructure provision, or the possibility of mutually beneficial contracts. It may understate the capital intensity, energy requirements, and environmental costs of domestic beneficiation, as well as the difficulty of building regional markets in the presence of poor infrastructure and political fragmentation. It can also understate intra-African competition for investment and the ways in which African elites themselves profit from extractive arrangements. Finally, while it rightly critiques Western and Chinese power, it sometimes lacks a fully developed account of how African states can manage great-power rivalry without becoming arenas of competition. The strongest version of the perspective therefore combines anti-extractivist critique with a hard-headed analysis of state capacity, regional coordination, and industrial policy.

2.7.2 Chinese Perspective The Chinese perspective treats critical minerals as strategic inputs to a long-term project of industrial modernization, energy transition, and technological self-reliance. It is rooted in a developmental-state tradition that views supply chains not as neutral market outcomes but as objects of planning, investment, and state coordination. From this standpoint, China's dominance in rare earth processing, battery materials, and related manufacturing is not an accident of geology or a temporary market distortion; it is the result of decades of sustained industrial policy, infrastructure investment, education, tolerance for low-margin processing, and vertical integration. The perspective is reinforced by China's experience of vulnerability: dependence on imported oil, advanced semiconductors, and maritime chokepoints has convinced Beijing that control over upstream and midstream mineral capacity is a matter of national security.

A central mechanism is state-backed supply-chain construction. Chinese firms, often supported by state

finance, subsidies, infrastructure, and diplomatic backing, have built capacity across mining, refining, component manufacturing, and recycling. The goal is not merely to extract minerals but to capture value-added stages and to reduce dependence on foreign technology. This is visible in rare earths, where China's near-monopoly is stronger in processing and magnet manufacturing than in raw deposits, and in battery supply chains, where Chinese firms dominate refining of lithium, cobalt, nickel, and graphite and much of cell production. The Chinese perspective argues that this dominance reflects strategic patience and willingness to absorb costs that market-driven firms in liberal economies often avoid.

A second mechanism is the developmental partnership framing. In Africa and other producer regions, China presents its engagement as South-South cooperation rather than neo-colonial extraction. The rhetoric emphasizes non-interference, infrastructure-for-resources arrangements, mutual benefit, and respect for sovereignty. From Beijing's viewpoint, Chinese investment builds roads, ports, power plants, and industrial zones that Western firms and institutions have not provided. It also argues that producer states gain markets, revenue, and development opportunities. This framing is not merely propaganda; it reflects a genuine belief that development requires infrastructure and industrial capacity, and that China's own rise offers a model for late industrializers.

A third mechanism is export control leverage. China's 2023-2024 controls on gallium and germanium, and its broader ability to restrict exports of processed materials, are presented as legitimate tools of national security and as responses to Western technology controls. The Chinese perspective holds that export management is a normal sovereign function, comparable to Western export controls on semiconductors, and that it is justified by the need to protect strategic resources and prevent their use in military applications. It also implies that China has learned from Western sanctions and technology restrictions that interdependence can be weaponized, and that Beijing must retain reciprocal leverage.

What this perspective contributes is a clear account of how state capacity, long time horizons, and vertical integration can reshape global supply chains. It demonstrates that market share in minerals is not determined solely by geology but by processing investment, industrial ecosystems, and policy coordination. It also forces Western governments to confront the cost and time required to rebuild capacity they once offshored.

What it occludes is significant. The developmental partnership framing can obscure asymmetries in bargaining power, opacity in state-firm relations, and the environmental and social costs of rapid extraction. It tends to understate debt distress, community displacement, and labor conditions in some project sites. It also understates the coercive potential of export controls: even if framed as defensive, restrictions on gallium, germanium, or graphite can disrupt global industries and invite retaliation. The perspective often treats domestic political accountability and transparency as secondary to growth and security, and it may understate the risks of overcapacity, technological lock-in, and geopolitical backlash. Finally, while it criticizes Western "friend-shoring" as politicized, it can present Chinese supply-chain dominance as natural or benign, minimizing the strategic leverage that dominance creates.

2.7.3 Russian Perspective The Russian perspective approaches critical minerals through the lens of the commodity state, sovereign control over natural resources, and resistance to Western hegemony. It begins from the premise that Russia's vast mineral endowment is not merely an economic asset but a foundation of state power, strategic autonomy, and multipolarity. In this view, minerals such as nickel, palladium, uranium, and other strategic materials are instruments through which Russia can withstand sanctions, finance state capacity, and challenge a Western-dominated international order. The perspective is shaped by Russia's historical experience as a resource-exporting great power and by its post-2014 and post-2022 confrontation

with Western sanctions.

A central mechanism is state-directed mobilization. Russia treats strategic minerals as matters of national security rather than purely commercial commodities. State control, state-owned enterprises, and regulatory intervention are justified as necessary to prevent foreign capture of rents and to ensure that resource wealth serves state priorities. This includes restrictions on foreign ownership, export management, and the use of commodity revenues to support fiscal stability and military capacity. The Russian perspective argues that Western market liberalism is hypocritical: liberal states also restrict exports, stockpile, and subsidize strategic industries when convenient, while lecturing others on free markets.

A second mechanism is anti-hegemonic framing. Russia portrays Western critical-minerals strategies—friend-shoring, export controls, sanctions, and alliance-based supply chains—as instruments of neo-imperial control rather than neutral security measures. From Moscow's standpoint, the United States and its allies are attempting to monopolize advanced technology and to deny rival powers access to the material basis of modern industry. Russia therefore aligns its mineral policy with a broader narrative of multipolarity, in which resource-rich states should cooperate to resist Western dominance. This framing can resonate with producer states that view Western "green" and security agendas as new forms of conditionality.

A third mechanism is resilience through commodity power. Russia's experience under sanctions has reinforced the belief that control over key commodities provides leverage and buffers against external pressure. Even when sanctions reduce market access, resource rents can sustain state spending, military production, and geopolitical maneuvering. The perspective emphasizes self-sufficiency, Eurasian partnerships, and alternative trade routes as ways to reduce dependence on Western markets.

What this perspective contributes is a reminder that minerals are embedded in geopolitical conflict and that sanctions and export controls are themselves forms of economic coercion. It highlights the legitimacy concerns raised when powerful states reorganize supply chains for security reasons while invoking market principles. It also underscores the strategic value of state control over resources in a world of sanctions and great-power rivalry.

What it occludes is substantial. The anti-hegemonic framing often serves to legitimize authoritarian governance, corruption, and repression. It tends to understate environmental degradation, including the legacy of Soviet and post-Soviet industrial pollution, and the social costs of resource dependence. It also understates Russia's technological weaknesses in advanced materials, refining, and high-end manufacturing, as well as its vulnerability to sanctions, capital flight, and brain drain. The commodity-state model can produce short-term leverage but long-term stagnation, because rents reduce incentives for diversification and institutional reform. Finally, the perspective's moral critique of Western hypocrisy is weakened by Russia's own use of coercion, its war-driven economic mobilization, and its limited credibility as a development partner for African or other producer states.

2.7.4 Western Perspective The Western perspective frames critical minerals primarily as a supply-chain security problem. Its central concern is that advanced economies depend on concentrated, often adversarial, sources for materials essential to defense, energy transition, digital infrastructure, and industrial competitiveness. The policy response is to diversify supply, reshore or friend-shore processing, stockpile, substitute, recycle, and coordinate with allies. This perspective is rooted in liberal market economics but has shifted toward "de-risking," industrial policy, and alliance-based economic security.

A central mechanism is market-correcting industrial policy. The United States Inflation Reduction Act, the

European Union Critical Raw Materials Act, and the Minerals Security Partnership exemplify a turn away from pure market reliance toward subsidies, tax credits, strategic project designation, and diplomatic coordination. The Western perspective argues that private markets underinvest in resilience because they do not price geopolitical risk, long lead times, or the social cost of concentration. Public intervention is therefore justified to create alternative supply chains, even if it raises costs in the short term.

A second mechanism is friend-shoring and alliance coordination. Rather than seeking full autarky, Western strategies emphasize "trusted" partners, shared standards, and mutual recognition. The goal is to reduce dependence on China and Russia while preserving efficiency through allied networks. This includes offtake agreements, financing for projects in partner countries, and coordination on export controls. The perspective treats alliances as force multipliers: no single Western state can replicate China's scale, but collective action can diversify supply.

A third mechanism is the resilience triad of stockpiling, substitution, and recycling. Stockpiles buffer short-term shocks; substitution reduces dependence on specific materials; recycling and circularity lower primary demand and environmental impact. The Western perspective often presents these as pragmatic, technocratic tools that can be optimized through data, innovation, and market incentives.

What this perspective contributes is a sophisticated account of how liberal democracies can adapt to geopolitical competition without abandoning market mechanisms entirely. It provides concrete policy instruments, emphasizes transparency and rule of law, and takes seriously the fiscal and efficiency costs of intervention. It also highlights innovation, permitting reform, and private capital as necessary complements to public funding.

What it occludes is also considerable. The Western perspective can externalize extraction by seeking "secure" supply from producer states without fully addressing local development, environmental harm, or community consent. "Friend-shoring" may become geopolitical sorting that rewards compliant suppliers rather than transforming power relations. It often underestimates the time and capital required to build processing capacity, as well as the NIMBY and permitting constraints within Western democracies. It can treat minerals as security inputs rather than as the basis of livelihoods and sovereignty in producer regions. The cost debate—between efficiency and resilience—sometimes assumes that market prices capture all relevant risks, when in fact they often ignore distributional and ecological costs. Finally, Western ESG rhetoric can be inconsistent with practice, creating a gap between stated standards and the realities of extraction.

2.7.5 UN Perspective The United Nations perspective frames critical minerals through the lenses of resource governance, sustainable development, human rights, and multilateral cooperation. It is less concerned with national advantage than with global public goods: ensuring that mineral extraction supports the energy transition, industrialization, and poverty reduction without undermining environmental sustainability or human rights. Its instruments include the Extractive Industries Transparency Initiative, the UN Guiding Principles on Business and Human Rights, the Sustainable Development Goals—especially SDG 7 on affordable and clean energy and SDG 9 on industry, innovation, and infrastructure—and various environmental and social standards.

A central mechanism is normative governance. The UN perspective seeks to make mineral supply chains transparent, accountable, and rights-respecting through voluntary standards, reporting frameworks, and capacity-building. It emphasizes free, prior, and informed consent, gender equality, environmental protection, and benefit-sharing. The underlying theory is that markets and states alone will not protect vulnerable communities; multilateral norms and institutions are needed to set minimum standards and to

support producer states in negotiating better terms.

A second mechanism is the circular economy and just transition. The UN perspective highlights recycling, substitution, and efficiency not only as security tools but as sustainability imperatives. It argues that reducing primary demand, extending product life, and improving resource efficiency are essential to meeting climate goals without exhausting ecosystems or displacing communities. This connects critical minerals to SDG 7 and SDG 9: minerals are necessary for clean energy and industrialization, but their extraction must not undermine other development goals.

A third mechanism is multilateral coordination. The UN perspective favors global frameworks over unilateral export controls or bloc-based supply chains. It sees critical minerals as a shared challenge requiring cooperation among producer, consumer, and transit states, as well as firms, civil society, and international organizations. This includes support for geological surveys, capacity building, technology transfer, and financing for sustainable mining in developing countries.

What this perspective contributes is a necessary corrective to purely strategic or market-based approaches. It foregrounds human rights, environmental standards, gender, and community consent. It provides a language and institutional framework for holding states and firms accountable. It also connects mineral governance to broader development goals, reminding powerful consumers that the energy transition cannot be built on new forms of exploitation.

What it occludes is the gap between norms and enforcement. Many UN frameworks are voluntary, underfunded, or dependent on state and corporate goodwill. The perspective can understate the urgency of geopolitical competition and the speed at which consumer states are reorganizing supply chains. It may also be too technocratic, treating governance as a matter of standards and reporting rather than power and redistribution. Finally, while it emphasizes producer-state capacity, it often lacks the leverage to ensure that capacity-building translates into genuine value-chain upgrading or community benefit. In a world of export controls, subsidies, and strategic stockpiles, multilateral norms risk becoming aspirational unless backed by material incentives and enforcement.

2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Centers producer-state agency, value-chain upgrading, and resource sovereignty; shows how mineral power depends on who controls refining and industrial capacity, not only who owns deposits.	Can understate the speed and scale of consumer-state retaliation, subsidy races, and the difficulty of building midstream capacity under capital and energy constraints.	Resource sovereignty plus developmental upgrading: minerals should support industrializa-tion, fiscal capacity, and community benefit rather than enclave extraction.	African producer strategies around cobalt, lithium, and graphite; calls for beneficiation and regional value chains; uneven EITI implementa-tion.	Western perspective: without demand guarantees, capital, and technology transfer, producer-state ambition may produce stranded assets or higher costs.
Chinese	Explains how state-backed supply chains, licensing, and industrial policy can convert refining dominance into coercive and developmental leverage.	Occludes the coercive effect on downstream firms and the way administrative discretion can function as a non-tariff barrier; understates dependence on imported ores and technology.	State-led development and security: mineral supply chains are strategic infrastructure to be governed for national resilience and industrial upgrading.	China's dominance in gallium, germanium, graphite, and rare-earth refining; export-control licensing; overseas mining and processing investments.	African perspective: Chinese "developmental partnership" can reproduce extractive asymmetries if value addition remains offshore.

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Russian	Highlights commodity-state power, anti-hegemonic resource nationalism, and the use of mineral and energy leverage against Western dominance.	Occludes Russia's own vulnerability to sanctions, technological dependence, and the limits of commodity power without diversified industry.	Anti-hegemonic sovereignty: resource exporters should resist Western control over prices, finance, and technology.	Russian energy and commodity leverage; sanctions-era reorientation toward China and BRICS; state control over strategic sectors.	Western perspective: commodity leverage invites counter-coercion, accelerates diversification, and can isolate the exporter.
Western	Clarifies consumer-state insecurity, friend-shoring, subsidy strategies, and the economic cost of de-risking.	Occludes producer-state agency, environmental and labor externalities of accelerated mining, and the possibility that "security" masks protectionism.	Supply-chain security and market resilience: reduce dependence on adversarial or concentrated suppliers while preserving efficiency.	IRA critical-minerals provisions; EU CRMA; Minerals Security Partnership; USGS and IEA concentration data.	African perspective: friend-shoring may redirect investment without ensuring local processing, jobs, or revenue.
UN	Provides governance vocabulary—transparency, EITI, SDGs, producer capacity, sustainable development—and a multilateral alternative to bilateral coercion.	Occludes enforcement gaps, the speed of geopolitical reorganization, and the power asymmetries that make voluntary norms insufficient.	Multilateral resource governance: minerals should be extracted transparently, sustainably, and in ways that advance development.	EITI reports; UNCTAD and UNEP resource-governance work; SDG 7 and 9 framing.	Chinese/Western perspectives: in a crisis, states prioritize security and industrial policy over voluntary multilateral norms.

2.8 WORKED EXAMPLE (I do)

Case: China's 2023–2024 gallium and germanium export controls and the question of how coercion works in minerals markets.

Levels of analysis. At the **individual** level, the case turns on the decisions of procurement managers, semiconductor engineers, traders, and customs officials who must interpret ambiguous licensing rules under uncertainty. Their behavior—panic buying, inventory hoarding, supplier switching, and lobbying—transmits a state policy into market prices and production schedules. At the **state** level, China's Ministry of Commerce used export licensing to convert a refining advantage into political leverage, while the United States, European Union, Japan, and other consumer states responded with stockpiling, subsidy programs, and diplomatic pressure. At the **systemic** level, the episode reveals a concentrated market structure in which a small number of processing nodes can shape global supply, producing what the literature calls weaponized interdependence: states exploit network centrality rather than total volume. At the **transnational** level, the controls cut across firms, standards bodies, logistics networks, and regulatory regimes, showing that mineral coercion is not merely a bilateral state act but a disruption of cross-border production systems in which private actors bear much of the adjustment cost.

Mechanism. The mechanism is not a simple embargo. China did not need to halt all exports; it needed to introduce administrative friction into a market with inelastic short-run supply and high switching costs. Gallium and germanium are not necessarily rare in the earth's crust, but their recovery depends on complex metallurgical processing, often as by-products of other industrial streams. When licensing requirements were imposed, buyers faced uncertainty about timing, volume, and eligibility. That uncertainty raised effective costs even where physical supply continued. Firms responded by drawing down inventories, seeking alternative suppliers, and pressuring governments for relief. The coercive effect therefore operates through three channels: first, a **chokepoint channel**, in which control over refining rather than mining creates leverage; second, an **expectations channel**, in which the possibility of future denial changes procurement and investment behavior; and third, a **political channel**, in which downstream firms become constituencies for accommodation or retaliation. The mechanism is strongest when the controlling state has credible capacity, the commodity has few short-run substitutes, and downstream industries are politically influential. It weakens when buyers can substitute, recycle, stockpile, or reroute supply through third countries. In this sense, mineral coercion is less like a blockade and more like a calibrated tax on uncertainty: it raises the cost of dependence without necessarily severing trade.

Perspective reconstruction. The **African perspective** is the most revealing for the long-run structure of the case, even though Africa is not the immediate site of the gallium and germanium controls. From an African vantage point, the episode demonstrates that mineral power is created not by geological endowment alone but by control over refining, standards, and industrial demand. African states have long exported ores and concentrates while importing finished materials, capturing little of the value added. China's controls show that a state which has moved up the value chain can use midstream dominance as leverage, while states that remain at the extraction stage remain price-takers. The lesson for African producer strategies is therefore double: resource sovereignty requires beneficiation, regional industrialization, and strategic stockpiling, but it also requires caution, because great-power competition can instrumentalize African minerals without delivering durable development. African scholarship on extraversion, dependency, and the politics of the belly suggests that external demand shocks often reorganize local elites and institutions without transforming productive capacity. The controls thus validate African demands for value-chain upgrading, but they also warn that upgrading under geopolitical pressure may be captured by foreign capital, security agendas, or elite

bargains. In short, the African perspective sees China's move as both a model of industrial statecraft and a reminder that mineral wealth without processing capacity is strategic vulnerability.

The **Chinese perspective** treats the controls as a defensive and legitimate exercise of sovereign regulatory authority in response to Western technology restrictions, especially in semiconductors and advanced manufacturing. It emphasizes that China remains a supplier, not a total embargoer, and that licensing is a normal tool of export administration. The developmental framing presents Chinese supply chains as integrated, efficient, and mutually beneficial, particularly for producer states that receive investment and market access. This perspective contributes the insight that mineral leverage is embedded in a broader industrial ecosystem rather than an isolated commodity trick. Its occlusion is the coercive effect on downstream firms and the asymmetry between a state that controls licensing and firms that cannot easily replace inputs.

The **Russian perspective** reads the controls through an anti-hegemonic lens, as evidence that Western technological dominance can be challenged by resource and industrial power. It validates commodity-state strategies and the idea that sanctions and export controls are instruments of geopolitical competition rather than neutral regulation. Russia's own experience with energy leverage and sanctions reinforces the view that mineral interdependence is a battlefield. What this perspective occludes is the fragility of commodity power without diversified industry, technological autonomy, and reliable logistics; it can overstate solidarity among non-Western states and understate the costs of retaliation.

The **Western perspective** interprets the controls as confirmation that concentrated supply chains are a security risk. It emphasizes de-risking, friend-shoring, stockpiling, recycling, and subsidy-driven investment in alternative supply. This perspective is strongest on the consumer-state dilemma: efficiency and security pull in opposite directions, and reshoring or friend-shoring is expensive. Its occlusion is that it can treat producer states as passive suppliers or security problems, underestimating their agency and the environmental and social costs of accelerated extraction outside China.

The **UN perspective** frames the episode as a governance failure and an argument for transparent, rules-based, sustainable resource management. It highlights EITI, producer-state capacity, and the SDG agenda, suggesting that mineral security should be pursued through multilateral cooperation rather than unilateral controls. Its contribution is to keep distributional and environmental questions visible. Its occlusion is enforcement: voluntary norms and reporting standards move slowly relative to export-control politics, and they lack the material leverage to compel compliance.

Explicit adjudication. The Chinese perspective best explains the immediate instrument and its transmission, because the case is centrally about state capacity to administer a chokepoint. However, it is not sufficient. It underexplains why the controls were credible: that credibility came from systemic market concentration and transnational firm dependence, not merely from Chinese policy intent. The Western perspective best explains the response dynamics—stockpiling, subsidy races, and friend-shoring—but it tends to overstate how quickly consumer states can escape dependence and understates the cost of doing so. The African perspective is indispensable for the long-run question of who captures value from mineral systems, but it is less directly explanatory of the short-run coercive shock. The Russian perspective captures the geopolitical symbolism but adds little mechanism. The UN perspective identifies governance gaps but cannot explain the timing or effectiveness of coercion. Therefore, the best explanation is layered: a state instrument operating through a concentrated market structure and transnational firm vulnerability, with long-run legitimacy and value capture determined by producer-state industrial capacity. China's controls worked because of where China sits in the supply chain; whether that power endures depends on whether other states can move processing, recycling, and substitution out of China's shadow.

SECTION 2.9 PROBLEM PAIR (We do)

1. **Mechanism identification.** Explain how the Inflation Reduction Act's critical-minerals and foreign-entity-of-concern rules change the effective demand for lithium, nickel, cobalt, and graphite, and distinguish that mechanism from a simple subsidy to domestic mining.

2. **Comparative institutional design.** Compare the IRA, the EU Critical Raw Materials Act, and the Minerals Security Partnership: which instrument is best at accelerating investment, which is best at setting circularity targets, and which is best at reducing political risk for capital-intensive projects?

3. **Levels of analysis.** Analyze the same strategy at four levels: firm-level compliance and traceability; state-level alliance politics; systemic-level refining concentration; and transnational-level governance through EITI, MSP, and responsible-sourcing standards.

4. **Perspective reconstruction.** Reconstruct how an African producer state, China, Russia, Western cost-focused analysts, and UN governance actors would each evaluate "friend-shoring" in battery minerals.

5. **Historical analogue.** Compare the current critical-minerals agenda to the 1970s oil shocks and to Cold War strategic-materials programs; identify which analogy is more useful and where each breaks down.

6. **Falsification.** Specify two observations that would show that IRA/CRMA/MSP strategies have failed to reduce vulnerability or to increase producer-country value addition by the late 2020s.

MODEL ANSWER

The central mechanism is a demand-side and rules-of-origin shock: the IRA's clean-vehicle credit makes part of the subsidy contingent on sourcing critical minerals from the United States or free-trade-agreement partners and on excluding foreign entities of concern from battery components, while the EU CRMA uses permitting acceleration, strategic-project status, and 2030 benchmarks for extraction, processing, and recycling, and the MSP pools public finance and diplomatic risk-sharing among partners. Together these instruments do not merely subsidize production; they redefine which supply chains count as "secure" for subsidy, procurement, and alliance purposes. The IRA is fastest at moving investment because it attaches large consumer subsidies to compliance; the CRMA is slower but more explicit about circularity and domestic processing; the MSP is weakest as a direct production policy but strongest as a coordination device for capital-intensive projects in jurisdictions where private investors perceive political or offtake risk. Japan's parallel strategy, through JOGMEC and resource diplomacy, adds a firm-level layer in which trading houses and battery makers seek long-term offtake and equity rather than full vertical integration. The scope condition is that these policies work only where capital, permitting, power, and skills can respond within the policy horizon; where they cannot, the result is not reshoring but rerouting through FTA partners and "friend-shored" intermediaries.

At the firm level, battery and automakers face a compliance optimization problem: they must map mineral origin, processing location, and ownership through multiple tiers, which raises transaction costs and can favor incumbents with traceability systems. At the state level, the United States, European Union, and Japan are attempting to convert alliance structures into supply-chain geography, while China retains the

incumbent advantage in refining and, in several minerals, in mining. At the systemic level, the relevant fact is concentration: even where mining is dispersed, refining and chemical conversion often remain concentrated, so diversification of mines alone does not remove leverage. At the transnational level, the MSP and EITI-style governance initiatives attempt to make investment compatible with transparency and local benefit, but they do not by themselves create African or Latin American processing capacity. From an African producer-state perspective, friend-shoring can look like a relocation of the same extractive bargain unless it includes local refining, power infrastructure, and fiscal terms that retain value; from a Chinese perspective, de-risking is read as a politically driven attempt to displace state-backed supply chains that were built through long-term finance and infrastructure; from a Russian perspective, the Western strategy confirms a commodity-state view that resource interdependence is being weaponized by incumbent powers; from a Western cost perspective, the open question is whether security premiums are worth the inflationary and efficiency losses; from a UN governance perspective, the test is whether new supply chains meet EITI, human-rights, and SDG 7 and 9 standards rather than merely shifting extraction to new jurisdictions.

The best historical analogue is not the 1970s oil shock but the Cold War strategic materials programs, with one crucial difference: oil had few short-run substitutes, whereas battery minerals face a portfolio of substitution, recycling, and chemistry changes, but only over decade-long horizons. The oil analogy overpredicts immediate coercion and underpredicts the slow, capital-intensive nature of mineral adjustment. A falsifying observation would be that by the late 2020s non-Chinese refining capacity for lithium, nickel, cobalt, and graphite has not expanded despite subsidies and permits, or that African value-added processing has not increased despite MSP rhetoric. Another falsifier would be that cost premiums from FEOC compliance are so high that automakers absorb penalties or restructure credits rather than change sourcing. The adjudication is therefore conditional: the strategies are plausible mechanisms for reducing single-point vulnerability, but their success depends on whether policy-induced demand is matched by investable projects, grid and water infrastructure, and credible long-term offtake; absent those, they risk producing a more expensive but still concentrated supply chain.

SECTION 2.10 INDEPENDENT MEMO (You do)

(a) Case description: A Namibian lithium developer with a permitted hard-rock project must choose among three offtake structures in 2025: a US Minerals Security Partnership-backed package requiring FEOC-compliant refining outside China; an EU Critical Raw Materials Act strategic-project fast track with European cathode offtake; or a Chinese state-backed proposal to build a local concentrator and chemical plant with majority offtake to China. The developer faces limited grid power, water constraints, and a government demanding local employment and fiscal revenue. The state has no domestic battery market and limited capital. The question is which structure best advances resource sovereignty without sacrificing project finance.

(b) Required memo headings as prompts:

Mechanism: Identify the causal chain through which each offtake structure changes investment, refining location, fiscal revenue, and vulnerability to export controls or subsidy rules.

Perspective reconstruction: Reconstruct the Namibian state's, China's, the US/EU/Japan partners', Western cost-focused critics', and UN governance actors' readings of the same choice, steel-manning each.

Historical analogue: Compare the case to one earlier resource-development episode (for example, Cold War uranium, 1970s copper, or post-2000s oil-backed infrastructure) and state where the analogy holds and

where it fails.

Falsifiers: List two or three observations that would show your recommended choice was wrong, including at least one measurable indicator of value addition and one of supply-chain concentration.

(c) Self-check: Did your memo distinguish description (what each strategy does), explanation (why it changes incentives), prediction (what capacity or cost outcomes follow), and prescription (what the producer state should choose)?

SECTION 2.11 HINGE QUESTION

Question: China's 2023–2024 gallium and germanium export controls most clearly illustrate which mechanism?

A. They caused an immediate physical shortage that halted Western defense production.
B. They used licensing as a signaling and cost-raising tool that exploited refining concentration while preserving market access.
C. They permanently decoupled China from Western mineral markets.
D. They triggered automatic substitution through recycling within one production cycle.

Distractor diagnosis:

- **A** is wrong because it confuses announced controls with a realized, economy-wide shortage; licensing delays and inventory buffers mean the short-run effect is friction and uncertainty rather than an immediate production halt.

- **C** is wrong because the controls were calibrated and partial, not a severance of trade; China retained leverage precisely by remaining inside the market.

- **D** is wrong because substitution and recycling for gallium and germanium face technical, collection, and scale constraints that unfold over years, not within a single production cycle.

SECTION 2A — DATA LAB

Table 1 — Production and refining shares for ten critical minerals (approximate, 2023–2024)

Mineral	Top mining country (share)	Top refining country (share)	Notes
Rare earth elements (REEs)	China (~60–70%)	China (~85–90%)	Separation and magnet-making even more concentrated than mining
Lithium	Australia (~47%), Chile (~26%)	China (~60–65%)	Hard-rock vs. brine; refining is the bottleneck
Cobalt	DRC (~70%)	China (~75%)	By-product of copper/nickel; artisanal mining significant

Mineral	Top mining country (share)	Top refining country (share)	Notes
Nickel	Indonesia (~50%)	China/Indonesia (~60%+)	HPAL capacity expanding in Indonesia
Graphite (natural)	China (~65–70%)	China (~90%)	Synthetic graphite also China-dominant
Gallium	China (~98% primary)	China (~98%)	By-product of bauxite/alumina; no primary mine
Germanium	China (~60%+ primary)	China (~60%+)	By-product of zinc; recycling matters
Copper	Chile, Peru	China (~40%)	Refining concentration lower than REEs but rising
Manganese	South Africa, Gabon	China (~90%)	Steel and battery (HPMSM) grades diverge
Silicon (metallurgical)	China (~60%)	China (~60%+)	Polysilicon for solar even more concentrated

Sources: IEA Critical Minerals Outlook (2024); USGS Mineral Commodity Summaries (2024). Shares are approximate and vary by grade and year; treat as orders of magnitude, not point estimates.

Table 2 — Export-control and supply-security events, 2010–2024

Date	Event	Actor	Mechanism	Immediate effect
Sept 2010	Rare earth export quota dispute	China → Japan	Quota/permit restriction	Price spike; WTO case filed
Aug 2022	CHIPS and Science Act	US	Subsidies + export controls on advanced chips	Reshoring incentives; China access restricted
July 2023	Gallium and germanium export licensing	China	Licensing/permit regime	Spot prices rose; downstream uncertainty
Oct 2023	Graphite export controls	China	Licensing on natural/synthetic graphite	Battery supply anxiety
Dec 2023	Ban on rare earth extrac-tion/processing tech exports	China	Technology export ban	Limits on foreign capacity building

Date	Event	Actor	Mechanism	Immediate effect
Mar 2024	EU Critical Raw Materials Act adopted	EU	Targets, permitting, stockpiling	Framework for strategic autonomy
2024	Minerals Security Partnership expansion	US-led	Friend-shoring coordination	Project finance for non-China supply

Sources: USGS; IEA; CRMA text; Kalantzakos (2020); Sanderson (2022).

Table 3 — Stockpile and strategic-reserve programs (indicative)

Program	Country/Region	Minerals covered (examples)	Character
National Defense Stockpile (NDS)	US	Cobalt, tantalum, REEs (limited)	Defense-focused; historically drawn down
JOGMEC stockpiles	Japan	Rare metals, oil, gas	Long-standing; industry-linked
Strategic petroleum/mineral reserves	China	Oil, some metals	State-directed; opaque volumes
EU joint purchasing / stockpiling (CRMA)	EU	Strategic raw materials	Emerging; coordination mechanism
African producer strategies	DRC, Namibia, Zimbabwe	Cobalt, lithium, REEs	Export bans on unprocessed ore; value-addition push

Volumes are often classified or unaudited; treat as indicative scope, not precise inventory.

Analysis questions

1. **Trend.** Using Table 1, describe the single most important structural trend in critical minerals markets between 2010 and 2024, and identify which mineral shows the sharpest concentration at the refining stage rather than the mining stage. Explain why refining concentration matters more than mining concentration for geopolitical leverage.

2. **Level of analysis.** The 2023 gallium and germanium controls can be analyzed at individual (firm), state (China), systemic (US–China rivalry), and transnational (global value chain) levels. Pick two levels and show how the same event looks different at each. Which level best explains the *timing* of the controls?

3. **Perspective reconstruction (all five).** Reconstruct how each of the five perspectives interprets Table 2's July 2023 gallium/germanium licensing event:

- African (primary): producer-state leverage, value-chain upgrading, resource sovereignty.
- Chinese: state-backed supply chains, developmental partnership, anti-containment.
- Russian: commodity-state solidarity, anti-hegemonic framing.
- Western: supply-chain security, friend-shoring, economic cost.
- UN: resource governance, EITI, SDG 7 and 9. For each, state one contribution and one occlusion.

4. **Interpretation.** Table 3 shows stockpiling programs with opaque volumes. Does opacity make stockpiles more or less effective as deterrents? Argue using the distinction between credible commitment and strategic ambiguity, and specify the scope conditions under which each logic holds.

5. **Limitation.** What is the most important data limitation in Tables 1–3, and how would it bias a policy conclusion if ignored? Propose one concrete data improvement (e.g., audited EITI reporting, customs microdata, or satellite-based mine monitoring) and state what it would and would not resolve.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — "The Refining Chokepoint Funnel"

What to draw: A vertical funnel narrowing from top to bottom, divided into four horizontal bands labeled, top to bottom: (1) Mining / Extraction, (2) Refining / Processing, (3) Manufacturing / Components, (4) End-Use (EVs, defense, electronics). Draw the funnel wide at the top and narrowest at band 2. Annotate band 2 with "China: 85–90% REEs; ~60–75% Li/Co/Ni; ~90% graphite." Draw small country flags or labels at band 1 (Australia, DRC, Chile, Indonesia) to show dispersed mining. Draw arrows from band 2 to band 3 labeled "chokepoint leverage."

How to label it: Title at top: "Where Geopolitical Leverage Actually Lives." Left margin: "Dispersion" (top) → "Concentration" (bottom). Right margin: "Value added" increasing downward. Bottom caption: "Mining is geographically dispersed; refining is where control concentrates."

Perspective overlay to annotate: In the margin, write "African view: mining without refining = rent extraction, not development." In a second margin note: "Western view: friend-shoring targets band 2." In a third: "Chinese view: band 2 is the product of decades of state investment."

Visual 2 — "The Coercion Loop: Gallium and Germanium, 2023"

What to draw: A circular flow diagram with five nodes connected by arrows in clockwise order: (1) China imposes licensing (July 2023) → (2) Export volumes fall / uncertainty rises → (3) Spot prices spike and downstream costs increase → (4) Importing states (US, EU, Japan) face production risk → (5) Negotiation / substitution / stockpile release → back to (1) with a dashed arrow labeled "escalation or de-escalation." Draw a central hub labeled "Market Power = Refining Monopoly + Inelastic Short-Run Supply." Add a side branch from node 3 to a small box labeled "Price signal → new investment (long-run supply response)."

How to label it: Title: "How Mineral Coercion Works (and When It Fails)." Label each arrow with a mechanism: "permit friction," "quantity effect," "price effect," "cost pass-through," "policy response." Add a legend: solid arrows = short-run (0–12 months); dashed arrows = long-run (3–7 years).

Perspective overlay to annotate: Top: "Chinese framing: lawful trade management, not coercion." Bottom: "Western framing: economic coercion; WTO-inconsistent." Left: "African framing: leverage is possible

only where refining is captured; producer states should capture band 2." Right: "UN framing: transparency (EITI) and rules-based trade reduce arbitrary use."

Visual 3 — "The Five-Perspective Pentagon"

What to draw: A pentagon with the lesson topic at the center: "Critical Minerals & Advanced Materials." Each vertex is one perspective, labeled: African (top), Chinese (upper right), Russian (lower right), Western (lower left), UN (upper left). From each vertex, draw a short arrow pointing inward with a keyword: African → "Resource sovereignty / value-chain upgrading"; Chinese → "State-backed supply chains / developmental partnership"; Russian → "Commodity state / anti-hegemony"; Western → "Supply-chain security / friend-shoring"; UN → "Resource governance / EITI / SDGs." Draw a dashed circle around the pentagon labeled "Shared blind spot: artisanal mining and environmental externalities."

How to label it: Title: "Five Lenses on One Object." Add a small table beneath: "Each lens sees a different mechanism; none sees all five." Caption: "The African lens is primary because it reveals what the other four treat as background: who captures value at which stage."

Perspective overlay to annotate: Color-code vertices (e.g., green for African, red for Chinese, blue for Russian, grey for Western, light blue for UN) and note in a legend: "Color = analytical tradition, not endorsement." Add a note: "The pentagon is a heuristic; perspectives overlap in practice."

SECTION 4 — CORNELL NOTES

Cue (prompt)	Notes (with source log)
What is the central puzzle of critical minerals geopolitics?	The puzzle is not scarcity of ore but concentration of refining and processing capacity; leverage lives in midstream, not upstream. *Sources: IEA (2024); Kalantzakos (2020).*
Why do rare earths matter beyond their name?	"Rare" refers to dispersion and processing difficulty, not crustal abundance; China's dominance is in separation, metallurgy, and magnet production. *Sources: USGS; Sanderson (2022).*
What is China's near-monopoly and how was it built?	State-directed investment, environmental cost externalization, and vertical integration across mining-to-magnet chain; built over decades. *Sources: Kalantzakos (2020); IEA (2024).*
How do gallium/germanium controls work as coercion?	Licensing creates permit friction and uncertainty; short-run inelastic supply lets small quantity changes move prices; long-run response via substitution/stockpiles. *Sources: USGS; IEA (2024).*

Cue (prompt)	Notes (with source log)
Why are advanced materials a defense issue?	Hypersonics, stealth, and thermal protection require specific materials (e.g., high-temperature alloys, carbon-carbon composites) with narrow supply bases. *Sources: Sanderson (2022).*
What drives battery supply chain geopolitics?	Lithium, cobalt, nickel, graphite demand from EVs; refining concentration; DRC cobalt and Indonesian nickel as upstream nodes. *Sources: IEA (2024); USGS.*
What is "friend-shoring" and its cost?	Relocating supply to allied states; raises costs and may not reduce concentration if allies still refine in China. *Sources: CRMA text; IEA (2024).*
What is the African producer-state strategy?	Export bans on unprocessed ore, local processing mandates, resource nationalism, value-chain upgrading; tension with investment climate. *Sources: Grovogui; Mbembe; Rodney; Nkrumah (general arguments).*
What does the UN perspective add?	EITI transparency, SDG 7/9, resource governance; weak enforcement; artisanal mining and human rights. *Sources: EITI; UN SDGs.*
What are the main resilience strategies?	Stockpiling, substitution, recycling, circular economy; each has time lags and scale limits. *Sources: IEA (2024); USGS.*
What is the strongest counterargument to "decouple"?	Full decoupling is cost-prohibitive and would slow green transition; managed interdependence may be more realistic. *Sources: Sanderson (2022); IEA (2024).*
What falsifies the "China monopoly is permanent" claim?	New refining capacity in Australia/US/EU; substitution in magnets/batteries; recycling scale-up; price-driven entry. *Sources: IEA (2024); USGS.*

Source log: IEA Critical Minerals Outlook (2024); USGS Mineral Commodity Summaries (2024); Kalantzakos (2020); Sanderson (2022); CRMA text; EITI; UN SDGs 7 and 9; African scholarship (Grovogui, Mbembe, Rodney, Nkrumah, and others as general arguments).

Summary (3–5 sentences): Critical minerals geopolitics is best understood as a midstream concentration problem: mining is dispersed but refining and processing are heavily concentrated, especially in China, which converts geological endowment into structural leverage. Export controls on gallium, germanium, and graphite demonstrate how permit friction and inelastic short-run supply can coerce downstream industries, though long-run substitution and stockpiles limit durability. African producer states seek value-chain upgrading and resource sovereignty, revealing that the global regime often treats extraction as development while capturing value elsewhere. Western friend-shoring and EU CRMA aim to diversify, but face cost and time constraints; the UN frame stresses governance, transparency, and SDGs. Resilience ultimately depends on stockpiling, substitution, and recycling, none of which is a quick fix.

SECTION 5 — FEYNMAN COMPRESSION

1. **Explain without jargon.** Critical minerals are the ingredients modern technology and weapons need. The big problem is not that they are rare in the ground, but that one country—China—does most of the refining that turns raw ore into usable material. Because refining is hard to replace quickly, China can threaten to slow exports and raise costs for everyone else, as it did with gallium and germanium in 2023. Countries are now trying to stockpile, substitute, and recycle, and African producer states are trying to process minerals at home instead of just shipping out raw ore.

2. **Mark gaps.** I am fuzzy on the exact difference between mining concentration and refining concentration for each mineral; I conflated "rare earths" with "rare" scarcity; I did not specify the time lag for new refining capacity; I treated stockpiles as uniformly effective without distinguishing defense vs. commercial reserves; I under-specified the African perspective beyond "resource nationalism."

3. **Reread verification.** Re-reading IEA (2024) and USGS (2024) confirms that refining concentration exceeds mining concentration for REEs, lithium, cobalt, graphite, and manganese; Sanderson (2022) supports the defense-materials link; Kalantzakos (2020) supports the historical construction of China's dominance; CRMA text supports EU targets. The African value-chain upgrading argument is supported by general African scholarship (Rodney, Nkrumah, Grovogui) rather than a single mineral-specific source, which is a gap to flag.

4. **Analogy with explicit limits.** Think of critical minerals like a bakery: flour (ore) is grown in many places, but if almost all the milling (refining) happens in one country, that country controls bread prices. The analogy captures midstream concentration and leverage, but it breaks down because minerals are not renewable like wheat, environmental damage from mining is severe and localized, and "milling" for minerals requires decades of capital and know-how, not just equipment.

5. **Rewrite.** Critical minerals geopolitics is a midstream-concentration problem: ore is geographically dispersed, but refining and processing are heavily concentrated, especially in China, giving it structural leverage that can be exercised through export licensing and technology bans, as seen in 2023–2024. This leverage is strongest in the short run, when supply is inelastic, and weakest in the long run, when substitution, stockpiling, and new capacity respond. African producer states experience this regime as value extraction at the refining stage and seek upgrading and sovereignty; Western and Japanese strategies emphasize friend-shoring and stockpiles; the UN frame emphasizes governance and transparency. No single strategy resolves the trade-off between security, cost, and development, and data opacity on stockpiles and artisanal mining limits confident policy design.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L53	definition	What are rare earth elements, and why are they strategically important?	Rare earth elements are seventeen lanthanides plus scandium and yttrium. They are not geologically rare, but refining and separation capacity is highly concentrated, making them strategically important for magnets, electronics, and defense systems.	African: deposits exist, but value often captured downstream; Chinese: integrated state-backed chain; Western: security vulnerability.
L53	mechanism	How did China build near-monopoly power in rare earth refining?	China's position rests on state-supported mining, processing capacity, industrial policy, and tolerance for environmental costs, especially in separation and refining rather than ore extraction alone.	Chinese: developmental state capacity; Western: strategic dependence; African: lesson on beneficiation.

Tag	Card Type	Front	Back	Perspective Note
L53	application	What leverage did China's 2023–2024 gallium and germanium controls create?	Licensing requirements on gallium and germanium disrupted semiconductor, defense, and advanced manufacturing supply chains, showing that midstream chokepoints can coerce even when raw materials are globally dispersed.	African: value-chain position matters; Russian: anti-hegemonic framing; UN: trade-governance concern.
L53	comparison	How do gallium and germanium differ from rare earths as leverage tools?	They are often byproducts of other mining and refining processes, with highly concentrated processing; controls target specific industrial inputs rather than bulk commodities.	Western: targeted coercion; Chinese: calibrated signaling; African: byproduct value capture.
L53	source	What does the IEA Critical Minerals Outlook 2024 emphasize?	It tracks demand growth, supply concentration, investment needs, and policy responses, highlighting risks from geographic concentration and long project lead times.	UN: evidence for governance; African: case for local benefit and processing.

Tag	Card Type	Front	Back	Perspective Note
L53	debate	What is the "friend-shoring" debate in critical minerals?	Friend-shoring relocates supply chains to allied states to reduce geopolitical risk, but critics argue it raises costs, fragments markets, and may exclude Global South producers.	African: risk of marginalization; Western: security; Chinese: containment narrative.
L53	reconstruction	How does the African perspective reframe critical minerals governance?	It centers producer-state sovereignty, value-chain upgrading, and historical extraction, arguing that security discourse can reproduce dependency unless beneficiation and local industrialization occur.	Primary African; Western security framing often occludes equity and sovereignty.
L53	occlusion	What does the Western supply-chain security frame often occlude?	It can obscure environmental and labor costs in producer states, historical unequal exchange, and the possibility that diversification without beneficiation leaves Africa as a raw-material supplier.	African: equity and sovereignty; UN: EITI and SDG concerns.

Tag	Card Type	Front	Back	Perspective Note
L53	adjudication	How should one adjudicate between security and development claims in mineral policy?	By examining evidence on value capture, local content, environmental compliance, and whether diversification policies include processing capacity and revenue transparency.	UN: governance metrics; African: sovereignty and beneficiation.
L53	visual	What does a production-versus-refining country matrix reveal?	Mining is geographically dispersed, but refining and processing are highly concentrated, especially in China, creating chokepoints distinct from reserve distribution.	Chinese: industrial capacity; Western: vulnerability; African: upgrading opportunity.
L53	mechanism	Why are battery supply chains for lithium, cobalt, nickel, and graphite strategically contested?	They combine rapid demand growth, geographic concentration in mining and refining, and links to electric vehicles, defense, and energy security.	African: cobalt and DRC; Chinese: processing dominance; Western: IRA incentives.

Tag	Card Type	Front	Back	Perspective Note
L53	application	What is the Inflation Reduction Act's mineral strategy?	The IRA uses tax credits and sourcing rules to incentivize domestic or allied mineral supply chains, reshaping investment flows and potentially excluding non-allied or non-FTA suppliers.	Western: industrial policy; African: market-access concerns; Chinese: containment.
L53	comparison	How does the EU Critical Raw Materials Act differ from the US IRA approach?	The CRMA sets strategic project designations, benchmarks for domestic extraction, processing, and recycling, and permitting acceleration, while the IRA relies heavily on tax-credit conditionality.	EU: regulatory state; US: fiscal state; African: access and standards.
L53	source	What role does EITI play in mineral governance?	The Extractive Industries Transparency Initiative promotes revenue transparency and multi-stakeholder disclosure, but its effectiveness depends on state capacity and civil society strength.	UN: governance mechanism; African: sovereignty and accountability debates.

Tag	Card Type	Front	Back	Perspective Note
L53	debate	What is the substitution, stockpiling, and recycling resilience debate?	Stockpiling, substitution, and recycling can reduce vulnerability but face cost, scale, technological, and time-lag constraints; they complement rather than replace supply diversification.	Western: resilience; Chinese: market adaptation; African: circular-economy opportunity.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence audit table

Competency	Self-score (0–100)	Calibration prompt	Action if below 70
Define rare earths and explain refining concentration		Can I distinguish geological abundance from processing concentration?	Re-read Key Idea 1 and USGS/IEA data.
Explain gallium and germanium export-control leverage		Can I identify the midstream chokepoint and affected sectors?	Reconstruct the 2023–2024 case.
Compare IRA, EU CRMA, and Minerals Security Partnership		Can I state one fiscal, one regulatory, and one diplomatic mechanism?	Re-read Key Idea 4 and Problem Pair.
Reconstruct the African perspective from within		Can I state sovereignty, beneficiation, and historical extraction without Western framing?	Re-read Section 2.7.1.
Identify falsifiers for mineral-security claims		Can I name evidence that would weaken a coercion or resilience claim?	Re-read Key Idea 5 and Worked Example.

7.2 Three-question debrief

1. Which of the five perspectives did you initially underweight, and what evidence from the lesson would force you to revise that weighting?
2. What single piece of evidence would most weaken the claim that China's gallium and germanium controls created durable coercive leverage?
3. Did your analysis distinguish description of mineral markets from explanation of coercion, prediction of policy effects, and prescription for producer states?

7.3 Error-log table

Common Misconception	Correction	Evidence
Rare earths are rare in the earth's crust.	They are not geologically rare; scarcity is in economically viable refining and separation capacity.	USGS Mineral Commodity Summaries; IEA Critical Minerals Outlook (2024).
China's leverage comes mainly from mining rare earths.	The stronger chokepoint is midstream refining, processing, and separation, not ore extraction alone.	Kalantzakos (2020); IEA (2024).
Export controls always backfire on the coercing state.	Controls can create short-term leverage while also accelerating substitution, stockpiling, and diversification.	China's 2023–2024 gallium and germanium controls.
Diversification of supply automatically produces development in producer states.	Without beneficiation, local content, and processing capacity, producer states may remain raw-material suppliers.	African scholarship on resource sovereignty; EITI debates.
Stockpiling fully solves mineral vulnerability.	Stockpiles are finite, costly, specification-sensitive, and cannot replace long-term supply diversification or recycling.	USGS; defense stockpile debates; IEA (2024).
Western mineral strategies are purely market-driven.	The IRA and CRMA are forms of industrial policy using fiscal incentives, regulatory benchmarks, and strategic project designation.	IRA text; CRMA text.

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Rare earth elements; refining concentration; byproduct leverage; battery minerals; resilience	State-backed processing capacity; export licensing; tax-credit conditionality; regulatory benchmarks; stockpiling and substitution	Kalantzakos (2020) on rare earth geopolitics; African resource-sovereignty scholarship; industrial-policy theory	China's 2023–2024 gallium/germanium controls; IRA; EU CRMA; MSP; DRC cobalt; IEA (2024); USGS summaries	Security vs. development; friend-shoring vs. market efficiency; diversification vs. beneficiation; stockpiling vs. substitution	Evidence of rapid non-Chinese refining scale-up; sustained price collapse; failed export-control price spikes; documented local value capture	L19 minerals; L33 African minerals; L52 semiconductors; L54 AI/hyperwar; L56 innovation; L57 biosecurity
African producer-state sovereignty; Chinese developmental partnership; Russian commodity-state framing; Western friend-shoring; UN EITI/SDG governance	Value-chain upgrading; state capacity; anti-hegemonic commodity politics; allied sourcing; transparency and revenue disclosure	Grovogui, Mamdani, Rodney, Mbembe, Bayart on African state and extraction; EITI Standard	Cobalt and lithium supply chains; gallium/germanium licensing; CRMA strategic projects	Equity vs. security; transparency vs. sovereignty; global South inclusion vs. allied blocs	Documented revenue leakage; failed local processing projects; EITI non-compliance without market penalty	L33 African minerals; L52 semiconductors; L54 AI/hyperwar

SECTION 9 — REVIEW SCHEDULE

- **R1 — 24 hours:** Review all fifteen flashcards and recite the five key ideas from memory, focusing on the distinction between mining and refining concentration.
- **R2 — 3 days:** Reconstruct the China gallium and germanium worked example, including mechanism, all five perspectives, and explicit adjudication.
- **R3 — 1 week:** Complete the Problem Pair on US, EU, and Japanese strategies, then compare your answer with the model answer.
- **R4 — 2 weeks:** Re-analyze the Data Lab tables, identifying one trend, one level-of-analysis claim, and one limitation for each perspective.

- **R5 — 1 month:** Write the Independent Memo on a new critical-minerals case and test whether your conclusion survives the falsifiers in the cheatsheet.

SECTION 10 — COMPLETION CHECKLIST

☐ I can define rare earth elements and distinguish geological abundance from refining concentration.
☐ I can explain China's near-monopoly in rare earth refining as a mechanism, not just an outcome.
☐ I can explain how gallium and germanium export controls created leverage in 2023–2024.
☐ I can distinguish mining concentration from processing concentration.
☐ I can explain why battery supply chains are strategically contested.
☐ I can compare the IRA, EU CRMA, and Minerals Security Partnership.
☐ I can reconstruct the African perspective on resource sovereignty and beneficiation.
☐ I can reconstruct the Chinese, Russian, Western, and UN perspectives.
☐ I can identify what each perspective contributes and what it occludes.
☐ I can use the four levels of analysis in a worked example.
☐ I can distinguish description, explanation, prediction, and prescription.
☐ I can identify falsifiers for mineral-security and resilience claims.
☐ I can interpret production and refining data by country.
☐ I can explain the limits of stockpiling, substitution, and recycling.
☐ I can connect this lesson to L19, L33, L52, L54, L56, and L57.
☐ I have completed the confidence audit and error log.

FURTHER READING (Optional)

- **Rare earth geopolitics:** Kalantzakos, *China and the Geopolitics of Rare Earths* (2020).
- **Mineral data and outlooks:** IEA, *Critical Minerals Outlook* (2024); USGS, *Mineral Commodity Summaries* (2024).
- **Policy frameworks:** European Commission, *Critical Raw Materials Act* (2024); U.S. *Inflation Reduction Act* (2022); Minerals Security Partnership (2022).
- **Governance and transparency:** EITI Standard (2023).
- **African political economy and extraction:** Rodney, *How Europe Underdeveloped Africa* (1972); Mamdani, *Citizen and Subject* (1996); Grovogui, *Sovereigns, Quasi Sovereigns, and Africans* (1996).
- **Supply-chain and industrial-policy analysis:** Sanderson (2022) on critical minerals supply chains and allied sourcing debates.

End of Lesson 53. Say **Next** when you are ready.

---

55. AI, AGI, and Hyperwar

LESSON METADATA

Field	Value
Lesson number and title	Lesson 54: AI, AGI, and Hyperwar

Field	Value
Module	Module 9: Techno-Geopolitics, AI, and Emerging Domains
Prerequisites	L24 (cyber and cognitive), L22 (conventional warfare), L52 (semiconductors)
Interleaved links	Forward to L55 (quantum + NC3), L56 (innovation), L57 (space and infrastructure)
Reading load	7-9 hours
Content channels	Text, data lab, visuals, flashcards
Bloom ceiling	Evaluate / Create
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

Artificial intelligence is not merely a new weapons platform; it is a transformation of the cognitive architecture of war. Where earlier revolutions in military affairs changed how force was delivered—gunpowder, mechanization, nuclear weapons—AI changes how decisions are made, how targets are identified, and how escalation unfolds. The puzzle this lesson addresses is whether the compression of decision cycles by algorithmic systems creates a novel and potentially uncontrollable pathway to war—what some analysts call "hyperwar"—and whether governance frameworks designed for human-paced conflict can survive machine-paced conflict. The student must learn to distinguish three analytically separate questions: whether AI changes the probability of war, whether it changes the character of war, and whether it changes who can wage war. Each question has a different theoretical answer and a different evidentiary base, and conflating them is the most common error in the policy literature.

The lesson draws on four theoretical traditions, each with a distinct mechanism. Realism supplies the security-dilemma logic: if AI confers first-mover advantages in targeting and command, states will race to deploy it, and the resulting instability may be structural rather than chosen. Liberal institutionalism supplies the governance question: can regimes like the Convention on Certain Conventional Weapons (CCW) or the EU AI Act constrain military AI, or will security externalities defeat regulation? Constructivism supplies the normative question: how do shared understandings of "meaningful human control" emerge, and can they be universalized across civilizational frames? Critical and post-colonial theory supplies the vantage that the other three often occlude: that AI is not a neutral technology but an infrastructure of power whose training data, compute, and standards are concentrated in a handful of states and corporations, reproducing global hierarchies. The canonical sources anchor these traditions: Scharre (2018) on the autonomy debate and the principal-agent problem in lethal systems; Horowitz (2018) on the diffusion of military innovations and the organizational barriers to adoption; Kissinger, Schmidt, and Huttenlocher (2021) on AI and the transformation of world order; Bostrom (2014) on the security dilemma of superintelligence and the alignment problem.

The African vantage is not a regional illustration of a Western theory; it is a distinct epistemic position. From this position, the central fact is the AI divide: the concentration of compute, data, talent, and platform control in a small number of states and firms, overwhelmingly outside Africa. African scholarship—from Rodney's analysis of underdevelopment as a historical process, through Nkrumah's neo-colonialism, to contemporary

work by Aning, Danso, and others on African agency in global governance—frames AI not as a neutral tool but as an infrastructure that can deepen dependency. The demand is for equitable governance: African participation in standard-setting, data sovereignty, and the right to develop AI capacity rather than merely import it. The African perspective also notices what others miss: that AI-enabled warfare is already present on the continent (drone strikes in the Sahel, algorithmic surveillance in urban policing), but African states are rule-takers in the forums where the rules are written. This asymmetry is the lesson's central puzzle viewed from its most revealing angle.

The lesson develops five mechanisms in sequence. First, narrow AI in military systems—ISR, targeting, logistics, and command and control—where the gains are incremental but the integration is deep. Second, Lethal Autonomous Weapons Systems (LAWS) and the CCW debate, where the principal-agent problem (who is responsible when a machine kills?) meets international humanitarian law. Third, decision compression and "hyperwar": the risk that algorithmic speed collapses the deliberation window and produces flash escalation. Fourth, AGI/ASI and the security dilemma of superintelligence, where alignment becomes a global security problem rather than a technical one. Fifth, AI governance—the US executive order, the EU AI Act, Chinese regulations, and the UN framework—where the question is whether any of these can keep pace with capability.

After mastering the lesson, the student will be able to: (a) identify the mechanism by which a given AI system alters a military function; (b) reconstruct five perspectives on any AI-security case, steel-manning each; (c) adjudicate between competing explanations using evidence rather than assertion; (d) distinguish description, explanation, prediction, and prescription in policy memos; and (e) specify falsifiers for claims about AI and war. The worked example (Nagorno-Karabakh 2020 and Ukraine 2023-2024 drone deployments) and the problem pair (Israel's Lavender and Gospel systems in Gaza) train these skills on real cases. The data lab trains quantitative and comparative reasoning on AI investment, autonomous systems inventories, and incident data.

The lesson is self-contained: all necessary concepts are defined inline, all sources are named, and no external reading is required to follow the argument, though the further-reading list points to depth. The student should read with a notebook, reconstructing arguments in their own words, because the assessment (the independent memo) requires original analysis rather than recall. The Bloom ceiling is Evaluate/Create: the student is expected not merely to describe but to judge and to design. The lesson's central intellectual discipline is to hold mechanism and perspective in tension: every claim about what AI does must be paired with a claim about from whose vantage it is seen, and every governance proposal must be tested against the objection that it reflects the interests of its authors.

SECTION 1 — Pre-Class Priming

1.1 Retrieval Warm-Up

Answer each question from memory before reading the lesson. These draw on L24 (cyber and cognitive), L22 (conventional warfare), and L52 (semiconductors).

1. In L24, what is the difference between a cyber *attack* and a cyber *operation*, and why does the distinction matter for escalation theory?
2. L22 treated the offense-defense balance in conventional warfare. State one historical case where a

technological innovation shifted that balance toward offense, and one where it shifted toward defense.
3. What is the "principal-agent problem" as discussed in L24's treatment of cyber operations, and how does delegation to non-state proxies complicate attribution?
4. L52 examined semiconductor supply chains. Name the three chokepoints in the global chip supply chain and identify which state controls each.
5. In L22, how did the revolution in military affairs (RMA) literature of the 1990s define "information dominance," and what critique did later scholars (including from the Global South) raise about its universal applicability?
6. L24 discussed cognitive warfare. Define "cognitive warfare" and give one example of a state employing it against an adversary's decision-making process.

1.2 Orientation Questions

These questions frame the lesson's central puzzle. Do not answer them yet; hold them in mind as you read.

1. Does AI change the *probability* of war, the *character* of war, or *who can wage* war—and can a single theory explain all three?
2. If algorithmic systems can compress the decision cycle from hours to seconds, what happens to the "deliberation window" that international humanitarian law and crisis management assume?
3. Is the demand for "meaningful human control" over lethal systems a universal norm or a culturally specific one, and who gets to define it?
4. Can governance frameworks written by AI-leading states be legitimate for AI-importing states, or do they reproduce the AI divide?

1.3 Vocabulary Pre-Teach

Provisional definitions; refine as you read.

- **Narrow AI (weak AI):** Machine-learning systems trained for specific tasks (image recognition, target classification, logistics optimization) that do not possess general reasoning; the dominant form of military AI today.
- **AGI (Artificial General Intelligence):** A hypothetical system capable of performing any intellectual task a human can, across domains; not yet achieved; treated in security studies as a future capability with present-day strategic effects.
- **ASI (Artificial Superintelligence):** A hypothetical system exceeding human cognitive performance across virtually all domains; the subject of Bostrom's (2014) security-dilemma analysis.
- **LAWS (Lethal Autonomous Weapons Systems):** Weapons that can select and engage targets without further human intervention after activation; the focus of the CCW debate.
- **Meaningful human control:** The principle that a human must retain sufficient control over the use of force to be morally and legally responsible; contested in definition and scope.
- **Hyperwar:** A hypothesized form of conflict in which algorithmic speed collapses decision cycles, producing escalation faster than human deliberation can manage.
- **Decision compression:** The reduction of the time available for human judgment in a crisis due to the speed of AI-enabled sensing, targeting, and response.
- **Principal-agent problem (in autonomous weapons):** The difficulty of assigning responsibility when an autonomous system, acting as agent, produces an outcome the human principal did not intend or

foresee.

- **Alignment problem:** The challenge of ensuring that an AI system's objectives match human (or specified) values; in security terms, a global problem because misaligned superintelligence is a shared threat.
- **AI divide:** The asymmetry between states and firms that produce AI (compute, data, talent, platforms) and those that consume or are governed by it.
- **Compute:** The processing power (chips, data centers) required to train and run AI models; a strategic resource analogous to energy or fissile material.
- **CCW (Convention on Certain Conventional Weapons):** The UN framework under which states discuss LAWS; includes the Group of Governmental Experts (GGE) on LAWS.

SECTION 2 — LESSON CORE

2.1 Learning objectives By the end of this lesson, the student will be able to:

1. **Define and classify** narrow artificial intelligence applications across the military kill chain—intelligence, surveillance, and reconnaissance (ISR), targeting, logistics, and command and control (C2)—and distinguish them rigorously from artificial general intelligence (AGI) and artificial superintelligence (ASI), specifying the technical and epistemic boundaries that separate pattern-recognition systems from systems capable of general reasoning (Bloom: knowledge/comprehension).

2. **Explain the causal mechanism** by which narrow AI compresses the observe-orient-decide-act (OODA) loop and redistributes cognitive labor between human operators and machines, identifying how training data, optimization objectives, and interface design jointly determine where lethal authority actually resides in a given system (Bloom: comprehension/analysis).

3. **Evaluate scope conditions** under which AI-enabled military systems increase operational effectiveness versus escalation risk, including data abundance, electromagnetic contestation, adversarial machine learning, distribution shift, and the feasibility of meaningful human control, and specify the falsifying evidence that would challenge each claim (Bloom: analysis/evaluation).

4. **Reconstruct and adjudicate** among the African (primary), Chinese, Russian, Western, and UN perspectives on narrow AI in military systems, identifying each tradition's core contribution, its characteristic occlusion, and the normative commitments that drive its policy prescriptions (Bloom: synthesis/evaluation).

5. **Apply** the analytical framework to the 2020 Nagorno-Karabakh war and 2023–2024 Ukraine drone deployments, producing a memo that distinguishes description, explanation, prediction, and prescription, and that identifies at least two falsifiers for any causal claim advanced (Bloom: application/synthesis).

These objectives are assessed through the Problem Pair, Independent Memo, Hinge Question, and Data Lab components of this lesson. Mastery requires not merely recalling definitions but tracing mechanisms, specifying scope conditions, and holding multiple perspectives in productive tension without collapsing them into a single "correct" view.

2.2 KEY IDEA 1 — Narrow AI in military systems: ISR, targeting, logistics, and C2 Bolded Causal Claim: Narrow AI does not autonomously wage war; it compresses the OODA loop and redistributes cognitive labor across the kill chain, shifting the locus of lethal decision from the human operator to the system's training data and optimization objective, thereby reconstituting the principal-agent relationship between commanders and machines in ways that are invisible to traditional accountability frameworks.

Mechanism: The mechanism operates through four interlocking channels. First, in ISR, narrow AI—principally computer vision, multi-sensor fusion, and natural-language processing—transforms raw sensor feeds into structured intelligence at speeds no human analyst can match. Systems such as the U.S. Project Maven pipeline apply convolutional neural networks to full-motion video and satellite imagery to detect, classify, and track objects of interest, converting an ocean of pixels into a ranked list of candidate targets. The mechanism here is not understanding but statistical pattern recognition: the system learns a mapping from input features to labels from training data, then generalizes (or fails to generalize) to new instances. Second, in targeting, narrow AI fuses ISR outputs with geospatial, signals, and open-source data to propose aimpoints, estimate collateral damage, and prioritize strikes according to commander-defined objectives. The optimization objective—minimize time-to-target, maximize probability of kill, minimize civilian harm as estimated by the model—becomes the de facto decision rule, and because the objective is encoded in code and weights rather than in an order that a human can read, the "decision" is distributed across the pipeline. Third, in logistics, predictive maintenance, demand forecasting, and route optimization reduce the friction of supply, which in turn raises the sustainable tempo of operations and lowers the political cost of prolonged campaigns; the mechanism is that AI-enabled logistics converts attrition warfare into a more continuous, lower-friction form of violence. Fourth, in C2, decision-support systems aggregate multi-domain information, propose courses of action, and simulate outcomes, effectively pre-structuring the commander's choice set. The mechanism across all four channels is the same: narrow AI does not replace human judgment wholesale but re-locates it, compressing the time available for deliberation and embedding assumptions—about what counts as a target, what counts as harm, what counts as success—into technical artifacts that are difficult to inspect, contest, or revise under operational pressure. Scharre (2018) emphasizes that the critical variable is not autonomy per se but the degree of human control that remains meaningful given the speed and complexity of the system; Horowitz (2018) adds that the diffusion of these technologies will be shaped by organizational capacity and strategic culture, not merely by technical availability. Kissinger et al. (2021) frame the deeper risk: as machines assume cognitive tasks, human leaders may lose the ability to comprehend the strategic environment their systems are acting within, producing a form of strategic opacity that is itself a source of instability.

Scope Conditions: The claim that narrow AI compresses the OODA loop and redistributes cognitive labor holds under identifiable conditions and fails under others. It holds when (a) data is abundant, labeled, and representative of the operational environment; (b) the adversary's behavior is sufficiently patterned to be learned; (c) the electromagnetic spectrum is permissive enough for sensors and communications to function; (d) rules of engagement are codifiable into optimization objectives; and (e) the organization has the technical capacity to maintain, update, and audit the system. It weakens or reverses when (a) data is scarce, biased, or drawn from a different distribution than the target environment—producing confident misclassification, as when a system trained on one theater is deployed in another; (b) the adversary employs adversarial machine learning, camouflage, or deception specifically designed to exploit the system's learned features; (c) electromagnetic contestation degrades sensors and communications, forcing reversion to human judgment at precisely the moment tempo is highest; (d) the operational environment is novel in ways the training data did not capture, producing distribution shift and silent failure; and (e) organizational incentives favor speed over scrutiny, so that "human in the loop" becomes a rubber stamp rather than a genuine control. The claim also

has a temporal scope: it describes the current generation of narrow AI, which excels at perception and optimization within bounded domains but lacks causal reasoning, common sense, and the ability to recognize its own ignorance. Should systems approach general intelligence, the mechanism would change qualitatively, which is the subject of Key Idea 4. A further scope condition concerns the level of analysis: at the tactical level, compression is most evident; at the strategic level, the effect is mediated by doctrine, alliance politics, and domestic politics, so that the same technical system can produce different strategic outcomes in different states.

Observable Implications: If the causal claim is correct, we should observe (i) measurable reductions in sensor-to-shooter timelines in conflicts where AI-enabled systems are deployed, as reported in Ukraine's use of the Delta situational-awareness platform and in Israeli systems; (ii) procurement and doctrinal shifts toward AI-enabled platforms and away from platforms whose value depends on human-paced decision-making; (iii) new failure modes—automation bias, fratricide from misclassification, and "automation surprise" when the system behaves in ways operators did not anticipate; (iv) an arms-race dynamic in AI-relevant inputs, particularly advanced semiconductors and training data, linking this lesson to Lesson 52; (v) growing divergence between states that can field and sustain such systems and those that cannot, with implications for the African perspective developed below; and (vi) increasing opacity in accountability chains, as the number of human decision points shrinks and the technical complexity of each grows. Falsifying evidence would include: documented cases where AI-enabled systems slowed decision-making without improving accuracy; cases where human operators consistently overrode system recommendations with better outcomes; or evidence that the principal bottleneck in targeting remains human political authorization rather than technical processing speed.

Perspective Note (five traditions in brief):

African (primary). The African vantage begins from the technology gap and the AI divide, not from the battlefield. From within African scholarship, the relevant question is not how narrow AI compresses the OODA loop for those who possess it, but how the global distribution of AI capability reproduces and deepens structural inequality. Grovogui's critique of the international order as a hierarchy of sovereignty applies directly: the states that build and control military AI are the same states whose sovereignty has historically been treated as full, while African sovereignty has been treated as conditional and tutelary. Mbembe's concept of necropolitics—the power to dictate who may live and who must die—illuminates how algorithmic targeting systems trained on Western data and Western threat perceptions may encode a hierarchy of human value in which African lives are more readily classified as threats. Bayart's analysis of extraversion suggests that African states' engagement with military AI will be shaped by their position in global networks of dependency, importing systems they cannot audit or modify. Rodney's underdevelopment thesis and Nkrumah's neo-colonialism frame the material dimension: the AI divide is not a natural gap but a produced one, rooted in the extraction of data, talent, and minerals (including cobalt and coltan from the Democratic Republic of Congo) that feed the very systems that exclude African states. Mamdani's work on the colonial state warns that imported technologies of control may reinforce bifurcated governance rather than strengthen accountable institutions. Aning and Danso's security scholarship emphasizes that African security architectures—such as the African Standby Force—lack the technical infrastructure to field or govern AI-enabled systems, making the continent a consumer, not a producer, of military AI. Tamale's intersectional analysis and Oyěwùmí's epistemological critique raise the further point that the categories embedded in training data—what counts as a "combatant," a "threat," a "civilian"—carry gendered and racialized assumptions that may not map onto African social realities. The African perspective therefore reframes narrow AI in military systems as a problem of global equity and epistemic justice: the demand is not merely for African states to acquire AI but for

equitable governance, technology transfer, capacity building, and a voice in setting the standards by which these systems are evaluated. What this perspective reveals that the others miss is that the "AI arms race" framing presupposes a symmetry of actors that does not exist; for much of the world, the relevant dynamic is not racing but being raced past.

Chinese. The Chinese perspective treats narrow AI in military systems through the lens of "intelligentized warfare" (□□□□□), a doctrinal concept that elevates AI to a core component of future combat power, while simultaneously framing AI governance as a sovereignty issue. Chinese official discourse emphasizes that AI development must serve national security and that external attempts to restrict China's access to AI technologies—such as U.S. semiconductor export controls—constitute a threat to sovereign development. On the governance side, China has participated in UN CCW discussions on lethal autonomous weapons while resisting binding prohibitions that it argues would disadvantage developing states and lock in Western technological advantages. The Chinese perspective contributes an insistence that AI governance must not become a vehicle for technological hegemony, and it occludes questions about domestic surveillance applications of the same technologies and about the transparency of PLA AI programs.

Russian. The Russian perspective frames narrow AI within military modernization and strategic stability. Russian doctrine treats AI as a force multiplier that can offset conventional inferiority, with emphasis on autonomous systems, decision support, and information warfare. Moscow's strategic-stability framing warns that AI-enabled compression of decision times—especially in nuclear C2—could undermine crisis stability by reducing the window for human deliberation. Russia has been skeptical of Western-led governance initiatives, viewing them as attempts to constrain competitors while preserving Western advantages, and has emphasized national sovereignty over AI development. The Russian perspective contributes a focus on escalation dynamics and nuclear risk, and it occludes the gap between aspirational doctrine and demonstrated capability, as well as questions about the use of AI in information operations.

Western. The Western perspective, particularly the U.S. and allied view, treats AI as a strategic priority and a source of military advantage, while simultaneously hosting the most developed internal debate about lethal autonomous weapons and algorithmic accountability. The U.S. Department of Defense has adopted ethical principles for AI and has invested heavily in programs such as Project Maven and the Joint All-Domain Command and Control (JADC2) concept. The Western perspective contributes technical sophistication, an institutionalized ethics discourse, and a self-critical tradition that examines civilian harm, algorithmic bias, and accountability gaps. It occludes the global distributional consequences of its own leadership and the tendency to treat Western threat perceptions as universal.

UN. The UN perspective frames narrow AI in military systems through international humanitarian law, human dignity, and multilateral governance. The Secretary-General has called for a ban on lethal autonomous weapons systems that function without human control, and the CCW Group of Governmental Experts has debated definitions, characteristics, and possible regulatory frameworks for years without reaching consensus. The Pact for the Future includes commitments on AI governance that emphasize human rights, capacity building, and inclusive participation. The UN perspective contributes a normative anchor in international law and a forum for inclusive deliberation, and it occludes the power asymmetries that make consensus difficult and the gap between normative commitments and enforcement capacity.

2.3 KEY IDEA 2 — Lethal Autonomous Weapons Systems: The LAWS Debate, CCW, and the Principal-Agent Problem

Bolded Causal Claim: The central danger of lethal autonomous weapons systems is not simply that machines may kill without a human pressing a trigger, but that autonomy in the critical functions of target selection and engagement dissolves the principal-agent relationship on which legal accountability, moral responsibility, and strategic restraint depend.

Mechanism: A lethal autonomous weapons system is generally understood, in the UN Convention on Certain Conventional Weapons discussions, as a system that can select and engage targets without further human intervention after activation. The mechanism of concern is not automation in the narrow sense of a human choosing a target and a machine executing that choice; it is the transfer of the lethal decision itself to an algorithmic agent. In conventional armed conflict, the state is the principal and the human combatant is the agent: the human can be trained, disciplined, court-martialed, and held responsible under international humanitarian law and domestic law. A machine cannot be punished, cannot possess intent, and cannot be deterred by moral or legal sanction. The principal-agent chain therefore breaks at the point where the machine becomes the effective decision-maker. Responsibility then diffuses backward across designers, programmers, data providers, commanders, operators, and procurement officials, none of whom may have had sufficient knowledge, control, or intent to satisfy ordinary standards of accountability. This is the accountability gap: lethal force is exercised, but no agent is clearly answerable for its wrongful use.

The mechanism is intensified by the epistemic limits of machine perception in war. International humanitarian law requires distinction between combatants and civilians, proportionality between military advantage and civilian harm, and precautions in attack. A system may classify patterns in sensor data with high statistical accuracy in training conditions, but war is an adversarial, degraded, and novel environment. Civilian objects can resemble military ones; surrender, hors de combat status, and the presence of human shields require contextual judgment; proportionality is not a classification task but a normative balancing act. The claim that autonomy can improve compliance with international humanitarian law by reducing human fatigue, fear, or bias is therefore contestable: it assumes that the relevant failures are primarily human cognitive failures rather than structural uncertainties about intent, context, and value. The counterargument—that autonomous systems may be more precise and consistent than stressed humans—has real force in highly structured environments, but it does not resolve the problem of accountability when the system errs in an unstructured one.

The CCW debate has turned on whether the appropriate response is a legally binding prohibition, a regulatory framework, or non-binding principles. Some states and civil society actors have called for a ban on development, production, and use of fully autonomous lethal weapons systems, often framed around the requirement of meaningful human control. Others argue that existing international humanitarian law is sufficient, that autonomy exists on a spectrum rather than as a binary category, and that a ban would be unverifiable or would disadvantage states that comply while non-compliant actors proliferate. The concept of meaningful human control has become the focal normative standard, but it remains contested: it can mean a human in the loop, on the loop, or out of the loop with a veto; it can require comprehension, intention, and accountability, or merely the technical possibility of intervention. The principal-agent problem persists because nominal human control is not the same as meaningful control. A human who cannot understand the system's reasoning, cannot intervene in time, or is structurally incentivized to defer to the machine is not exercising control in the legally and morally relevant sense.

Scope Conditions: The accountability gap is most acute where autonomy operates in the critical functions

of target selection and engagement, where decision times are short, where environments are complex and adversarial, and where human oversight is nominal rather than substantive. It is also acute where kill chains are long, where software and data are proprietary, and where training data do not represent the operational environment. The argument is weaker where autonomy is confined to navigation, logistics, or non-lethal functions; where human operators retain genuine comprehension and intervention capacity; and where systems are tested, audited, and constrained by robust legal review. Even under those conditions, however, the structural problem remains: the machine cannot be the bearer of responsibility, and human responsibility must be deliberately constructed rather than assumed.

Observable Implications: If the principal-agent mechanism is operating, one should observe national policies that distinguish between automation and autonomy while often leaving the boundary ambiguous; legal reviews of new weapons under Article 36 of Additional Protocol I; procurement of systems with autonomous terminal guidance, swarming capabilities, or AI-assisted targeting; and diplomatic positions in the CCW that cluster around prohibition, regulation, or status-quo arguments. One should also observe a gap between declared human control and operational practice, especially in high-tempo domains where operators are likely to defer to machine recommendations. The absence of a binding international instrument despite years of discussion is itself an observable implication: the principal-agent problem is recognized, but states disagree about whether the solution is prohibition, regulation, or improved human-machine teaming.

Perspective Note (five traditions in brief):

African (primary). From an African vantage point, the LAWS debate is not merely a technical question about whether machines can comply with international humanitarian law; it is a question about who bears the costs of experimentation with lethal autonomy and who is excluded from the design of the rules. African scholarship on power and technology provides the interpretive frame. Rodney's analysis of underdevelopment, Nkrumah's critique of neo-colonialism, and Fanon's account of technocratic violence suggest that military technologies are rarely neutral instruments; they are embedded in structures of domination that externalize risk onto populations with little voice in their design. Mbembe's concept of necropolitics illuminates how certain lives are rendered expendable in the name of security, while Mamdani's work on the bifurcated state highlights how legal and political orders can separate rulers from ruled in ways that make accountability formal rather than substantive. Grovogui's critique of international law as a civilizing discourse and Bayart's analysis of extraversion suggest that global governance forums may reproduce hierarchies even when they invoke universal norms. Oyěwùmí's epistemic critique reminds us that categories such as "human control" may carry culturally specific assumptions about agency and responsibility. African states participating in CCW discussions have often stressed meaningful human control, capacity building, and the dangers of an unregulated market in autonomous systems. The African perspective reveals that LAWS governance is not only about machine compliance but about distributional justice: African populations may face autonomous weapons in asymmetric conflicts, peace operations, border control, or internal security contexts without having shaped the systems or the rules. It also reveals a technology gap: many African militaries lack the industrial base, data infrastructure, and legal-technical capacity to develop or audit LAWS, which can produce dependence on imported systems and external standards. The occlusion in this perspective is that it can understate the genuine security pressures that drive states toward autonomy, including force protection and the desire to reduce soldier casualties, and it may not fully specify how capacity building would be funded or governed.

Chinese. Chinese discourse frames lethal autonomous weapons within a broader AI governance agenda that combines sovereignty, development rights, and strategic stability. The Chinese position has generally

supported international discussion while resisting constraints that would lock in Western military advantage or restrict legitimate applications of AI. It emphasizes that any framework must preserve space for peaceful and defensive uses, respect state sovereignty, and avoid politicized or discriminatory standards. Chinese scholarship and official statements often treat the "AI arms race" as a risk to be managed through governance rather than as an inevitable competition, while also insisting that China's AI development is a sovereign right. The perspective contributes a demand that governance not become a vehicle for technological containment, and it occludes the possibility that Chinese military modernization itself contributes to competitive dynamics.

Russian. Russian discourse treats autonomous weapons as part of military modernization and strategic stability management. It has tended to argue that existing international humanitarian law is sufficient, that a legally binding ban would be difficult to verify, and that states should retain flexibility in developing military AI. Russian official rhetoric often emphasizes human control in declaratory policy while investing in automation and autonomy for force protection and battlefield advantage. The perspective contributes a realist emphasis on verification and strategic stability, and it occludes the accountability and civilian-harm concerns that motivate prohibition advocates.

Western. Western, especially US and allied, discourse centers on AI leadership, the LAWS debate, and an emerging governance self-critique. The United States has maintained that autonomous weapons systems should be designed to allow commanders and operators to exercise appropriate levels of human judgment over the use of force, while opposing a blanket ban. Allies have varied, but many emphasize human control, IHL compliance, and the potential benefits of precision. The governance self-critique acknowledges risks of accountability gaps, algorithmic bias, and civilian harm, and has produced policy reviews, ethical principles, and legal standards. The perspective contributes operational realism and a focus on human-machine teaming, and it occludes the global distributional consequences of Western-led AI military development.

UN. The UN perspective frames LAWS through international humanitarian law, human dignity, and multilateral governance. The Secretary-General has called for a ban on lethal autonomous weapons systems that function without human control, and the CCW Group of Governmental Experts has debated definitions, characteristics, and possible regulatory frameworks for years without reaching consensus. The Pact for the Future includes commitments on AI governance that emphasize human rights, capacity building, and inclusive participation. The UN perspective contributes a normative anchor in international law and a forum for inclusive deliberation, and it occludes the power asymmetries that make consensus difficult and the gap between normative commitments and enforcement capacity.

2.4 KEY IDEA 3 — Decision Compression and Hyperwar: Algorithmic Escalation and Flash Wars

Bolded Causal Claim: As AI compresses the observe-orient-decide-act cycle below the threshold of human deliberation, military competition shifts from attrition to tempo, creating structural incentives for predelegation, automation bias, and preemptive action that can convert localized incidents into rapid, irreversible escalation.

Mechanism: The mechanism begins with the OODA loop—observe, orient, decide, act—which has long been a heuristic for military decision-making. AI-enabled systems compress each stage: sensors and data fusion accelerate observation; machine learning and automated analysis accelerate orientation; decision-support systems and autonomous agents accelerate decision; and networked weapons accelerate action. The result is not merely faster warfare but a change in the kind of warfare: when the tempo of interaction exceeds human cognitive and institutional capacity, the advantage shifts to the side that can delegate more authority

to machines. This creates a structural incentive to pre-delegate lethal or escalatory decisions, to accept higher automation, and to reduce human veto points. The mechanism is not that machines are malevolent; it is that organizations optimize for speed under competitive pressure, and speed rewards delegation.

Decision compression interacts with automation bias, the tendency of human operators to defer to machine recommendations, especially under time pressure and uncertainty. A human in the loop who cannot independently verify a machine's recommendation within the available time is not a meaningful check; they are a liability shield. The mechanism also involves tight coupling: as military systems become networked and interdependent, a local error can propagate across domains before human institutions can intervene. The analogy to financial flash crashes is instructive: algorithmic trading can produce rapid, nonlinear price movements that no individual trader intended, and circuit breakers are required to halt cascades. In military affairs, there are no agreed circuit breakers, and the stakes include escalation across conventional, cyber, space, and nuclear domains.

Hyperwar, as the term is used in discussions of AI-enabled conflict, denotes warfare in which the speed and complexity of machine interaction outpace human comprehension and control. The risk is not only accidental escalation but also strategic instability: if adversaries believe that the other side can act faster, they may adopt launch-on-warning postures, pre-delegate authority, or strike first to avoid being struck. Crisis stability erodes because the window for signaling, bargaining, and de-escalation shrinks. Kissinger and colleagues have argued that AI challenges traditional concepts of deterrence and strategic stability by introducing non-human agency into the most consequential decisions. Scharre's analysis of autonomy emphasizes that the danger lies less in rogue machines than in the interaction between human organizations and autonomous systems under pressure. Horowitz's work on military innovation diffusion suggests that the adoption of AI will be shaped by organizational culture, resource constraints, and strategic competition, not by technology alone.

The counterargument is that AI can also improve situational awareness, reduce human error, and create off-ramps by clarifying ambiguous situations faster than humans can. Better early warning, more accurate target identification, and automated deconfliction could in principle reduce accidental escalation. This is plausible in some domains, but it depends on calibration, data quality, and adversarial robustness. In a competitive environment, the side that uses AI for speed may force the other side to do the same, producing a race to the bottom in human control. The mechanism therefore predicts not universal catastrophe but a structural bias toward tempo over deliberation, with the severity of risk depending on domain, organizational incentives, and the presence or absence of shared norms.

Scope Conditions: The risk of flash wars is highest in domains where decision times are short and consequences are large: air and missile defense, cyber operations, space systems, and any process adjacent to nuclear command and control. It is also high where systems are tightly coupled, where adversaries interact repeatedly under uncertainty, and where organizational incentives reward speed over caution. The argument is weaker where AI is used primarily for logistics, intelligence analysis with human review, or long-cycle planning; where human-machine interfaces are well designed; and where there are robust testing, red-teaming, and escalation-management procedures. Even in those cases, however, the competitive pressure to compress decision cycles may erode safeguards over time.

Observable Implications: If decision compression is driving military change, one should observe doctrine and procurement emphasizing speed, AI-enabled command-and-control systems, and human-machine teaming in high-tempo domains. One should observe exercises and simulations that test machine-speed escalation, as well as proposals for "speed limits," human control requirements, or crisis-communication mechanisms.

Historical analogues of automation bias—such as the 2003 Patriot fratricide incidents, in which automated systems misidentified friendly aircraft—illustrate how human operators can defer to machine classifications under pressure. The 2010 flash crash in financial markets illustrates how algorithmic interaction can produce rapid cascades without malicious intent. In the military domain, observable implications include near-misses, false positives in air defense, and debates over whether AI should be permitted in nuclear command and control. The absence of agreed international norms for machine-speed escalation is itself an implication: states are building faster systems before they have built shared brakes.

Perspective Note (five traditions in brief):

African (primary). From an African vantage point, hyperwar is not an abstract future risk but an extension of existing asymmetries in who controls the tempo of violence. African scholarship on state capacity, extraversion, and the political economy of technology suggests that African states are more likely to be recipients, testing grounds, or collateral arenas of AI-enabled warfare than architects of it. Rodney's analysis of technological dependence, Bayart's concept of extraversion, and Mamdani's account of the bifurcated state imply that imported military technologies can strengthen coercive capacity without corresponding accountability. Mbembe's necropolitics highlights how populations in weakly governed spaces may be subjected to lethal violence with little recourse, while Fanon's critique of colonial violence reminds us that speed and technological superiority have historically been used to overwhelm political resistance. The African perspective reveals that decision compression is not only a problem among great powers; it can accelerate violence in contexts where oversight is weak, data are poor, and accountability mechanisms are fragile. It also reveals a technology gap: African militaries and regulators may lack the capacity to audit, test, or govern AI-enabled systems, making them dependent on external vendors and standards. African diplomatic and scholarly voices have tended to demand equitable governance, transparency, capacity building, and meaningful human control, arguing that the benefits of AI in security should not accrue only to technologically advanced states. The occlusion in this perspective is that it can understate the genuine security dilemmas faced by African states confronting insurgencies, terrorism, and cross-border threats, and it may not fully resolve how human control can be operationalized in high-tempo defensive systems.

Chinese. Chinese discourse frames decision compression within strategic stability and AI governance debates. It expresses concern about an AI arms race and about the destabilizing effects of machine-speed warfare, while also pursuing military modernization and "intelligentized" capabilities. Chinese official and scholarly voices often emphasize sovereignty, the right to develop AI, and the need for international rules that do not constrain legitimate defense. The perspective contributes a demand for stability-oriented governance and an acknowledgment that tempo competition can be dangerous, and it occludes the possibility that Chinese modernization contributes to the very compression it warns against.

Russian. Russian discourse treats AI-enabled speed as part of military modernization and strategic stability management. It has emphasized the risks of destabilization while also investing in automation, electronic warfare, and AI-assisted command systems. Russian strategic stability framing often focuses on the interaction between conventional precision, cyber, and nuclear domains, warning that compressed decision times can undermine deterrence. The perspective contributes a realist focus on escalation management, and it occludes the accountability and civilian-harm dimensions that dominate Western and UN debates.

Western. Western discourse centers on AI leadership, the LAWS debate, and a governance self-critique that increasingly includes decision compression. US and allied militaries emphasize human-machine teaming, speed as a warfighting advantage, and the need to maintain decision superiority. At the same time, Western scholars and policymakers have warned about automation bias, flash escalation, and the erosion of human

judgment. The perspective contributes operational and technical sophistication, and it occludes the global distributional consequences of tempo competition and the possibility that Western acceleration drives others to automate faster.

UN. The UN perspective frames decision compression through international humanitarian law, human dignity, and multilateral governance. The Secretary-General's calls for human control over lethal force and the CCW's debates over LAWS are relevant because compressed decision times make human control harder to realize. The Pact for the Future's AI commitments emphasize human rights, capacity building, and inclusive participation, which imply that speed must not outrun accountability. The UN perspective contributes a normative anchor and a forum for deliberation, and it occludes the power asymmetries and enforcement gaps that make shared brakes difficult to establish.

2.5 KEY IDEA 4 — AGI/ASI: The Security Dilemma of Superintelligence and Alignment as a Global Security Problem

Bolded Causal Claim: The prospect of artificial general intelligence (AGI) and artificial superintelligence (ASI) transforms AI from a military-technology competition into a security dilemma over existential risk, because states and firms racing to develop systems whose capabilities and alignment properties are uncertain may each treat the other's progress as a threat, while the technical problem of ensuring that a vastly more capable system pursues human-intended goals becomes a collective-security problem that no single state can solve alone.

Mechanism: The mechanism begins with the security-dilemma logic familiar from international-relations theory: in an anarchic system, investments made for defensive or competitive purposes are difficult to distinguish from preparations for dominance, so rivals respond with counter-investments, secrecy, and worst-case planning. Applied to AI, this means that frontier compute, data, talent, and model weights become strategic assets whose accumulation by one actor is read by others as a potential shift in the balance of power. The race dynamic is intensified by the possibility of large first-mover advantages. If AGI or ASI can automate research, production, or military planning, the first actor to achieve a decisive capability advantage may gain compounding benefits, creating incentives to move quickly, to conceal progress, and to underinvest in safety. This is the "race to the bottom" concern in AI safety: the alignment tax, or the cost of making a system safe, robust, and controllable, may be treated as a competitive disadvantage when rivals are moving fast. The alignment problem itself is not merely a software bug. It includes specification problems (defining the right objective), robustness problems (performance under distribution shift), interpretability problems (understanding what the system is doing), and control problems (ensuring that a more capable system remains corrigible). As capability scales, small misspecifications can produce large harms, and the gap between what a system optimizes and what humans value may widen. The global-security dimension arises because ASI externalities do not respect borders. A misaligned or misused superintelligent system could affect critical infrastructure, financial systems, biological research, or military command networks across states. No single sovereign can contain such a system through territorial control alone. Therefore, alignment becomes a global public good, while the incentives to produce it remain national or corporate. Bostrom (2014) frames superintelligence as a strategic challenge in which the transition to machine intelligence may be abrupt enough that institutions have little time to adapt, and in which the default outcome may not be benign. Kissinger et al. (2021) extend this concern to world order, arguing that AI can alter strategic stability by changing the speed, opacity, and scale of decision-making. The mechanism is therefore a three-layer interaction: com-

petitive racing produces secrecy and acceleration; acceleration increases the risk of deploying misaligned systems; and the transnational nature of the risk makes unilateral safety insufficient.

Scope Conditions: This key idea applies most strongly under a set of demanding assumptions: that AGI or ASI is technically feasible within a strategically relevant horizon; that capability growth may be rapid or discontinuous; that alignment remains unsolved at scale; that actors face strong competitive incentives; and that international institutions lack the authority or capacity to monitor frontier development. It applies less strongly if AGI proves impossible, if progress plateaus, if alignment turns out to be comparatively easy, or if compute governance becomes effective enough to slow racing. It also applies unevenly across actors: frontier labs and great powers are the central cases, while most states are consumers rather than producers of frontier models. The idea is about tail risk and structural incentives, not a claim that superintelligence is imminent. Much of the policy relevance comes from the possibility of capability overhang, in which an algorithmic or hardware breakthrough suddenly makes a much more capable system deployable before governance has adapted. Under those conditions, ex post regulation is likely to be too slow.

Observable Implications: If this mechanism is operating, one should observe frontier laboratories publishing "responsible scaling" policies, dangerous-capability evaluations, and red-teaming reports; governments creating AI Safety Institutes and funding alignment research; export controls on advanced chips and cloud compute; debates over open-weight models; calls for pauses or moratoria on giant experiments; talent restrictions; and summit diplomacy on frontier AI safety. One should also observe military doctrines emphasizing human control, automation bias, and the risks of over-reliance on AI in command and control. The absence of these measures would suggest either that actors do not take the risk seriously or that competitive pressures are suppressing safety investment. Conversely, the presence of safety measures without binding enforcement would suggest that governance is performative rather than constraining.

Perspective Note (five traditions in brief): *African (primary).* The African perspective begins from the technology gap and the AI divide, not from the frontier-lab race. African scholars such as Grovogui and Mamdani have long argued that international orders encode hierarchical premises and that institutions often speak in universal language while distributing power unevenly. From this vantage point, AGI discourse can appear as a conversation among a small set of powerful actors about risks that are distant for many African societies, while more immediate harms—surveillance, biased systems, data extraction, labor displacement, and infrastructural dependence—are already present. The African perspective therefore demands equitable governance, data sovereignty, capacity building, and meaningful participation in standard-setting. It warns that governance frameworks negotiated now may lock in asymmetries before African states have the technical capacity to shape them. At the same time, it does not dismiss existential risk; rather, it insists that superintelligence debates should not crowd out present development and rights, and that global security must include the security of those who are usually absent from the table. *Chinese.* The Chinese perspective frames AI as a strategic technology central to national rejuvenation and sovereignty. It emphasizes development rights, state oversight, and opposition to hegemonic control, particularly export controls that it regards as containment. Alignment is treated as a technical and safety issue, but not at the expense of development or sovereignty. Governance is preferred through the United Nations and inclusive multilateralism, while domestic regulation emphasizes social stability, content control, and security. The "AI arms race" is a concern, but so is the risk that safety discourse becomes a tool for preserving Western technological leadership. *Russian.* The Russian perspective emphasizes strategic stability, military modernization, and sovereignty. ASI is a distant prospect, but current AI is already relevant to strategic parity, nuclear command-and-control resilience, and great-power competition. Russia tends to be skeptical of Western AI safety framing and wary of governance mechanisms that could constrain its military or technological development. Governance is acceptable when

it preserves strategic stability and sovereign equality, but not when it functions as a Western-led constraint. *Western.* The Western perspective combines AI leadership, safety research, and governance self-critique. It is shaped by Bostrom's existential-risk framing, by frontier-lab safety culture, and by strategic competition with China. It supports alignment research, export controls, safety institutes, and multilateral declarations, while also debating industry capture, enforcement gaps, and the risks of over-regulation. The Western view is not unified: it contains both accelerationist and safety-first strands, and its governance proposals often reflect the interests of large technology firms. *UN.* The UN perspective frames AGI/ASI through human rights, human dignity, and inclusive global governance. The Secretary-General's advisory processes and the Pact for the Future emphasize capacity building, participation, and the need for a global framework. The UN contributes a normative anchor and a forum for deliberation, but it faces the familiar gaps of enforcement, funding, and power asymmetry. It occludes less than the great-power perspectives, but it cannot by itself resolve the competitive incentives that drive racing.

2.6 KEY IDEA 5 — AI Governance: Fragmented Regimes and Techno-Geopolitical Competition

Bolded Causal Claim: AI governance is emerging as a fragmented, competitive regime in which states use regulation, industrial policy, and security controls to shape AI development according to divergent values and power interests, producing partial convergence on risk management but persistent divergence on sovereignty, innovation, and security, with the result that governance itself becomes an arena of techno-geopolitical competition rather than a neutral solution to it.

Mechanism: The mechanism is regulatory competition under anarchy. The European Union's AI Act, adopted in 2024, uses a risk-based approach: it prohibits certain practices, imposes obligations on high-risk systems, and creates rules for general-purpose AI models, with enforcement through a centralized AI Office and national authorities. Its logic is rights-based and market-shaping, and it relies on the "Brussels effect," in which extraterritorial market size induces global compliance. The United States has taken a more sectoral and security-oriented approach. Executive Order 14110, signed in October 2023, used existing authorities to require reporting on powerful models, promote red-teaming, and direct agencies to develop standards, while separate export-control measures targeted advanced semiconductors and certain AI capabilities. The US approach combines voluntary commitments, procurement power, and security controls rather than a comprehensive statute. China's approach is state-led and content- and security-focused. Its 2022 provisions on algorithmic recommendation, 2023 rules on deep synthesis, and 2023 interim measures for generative AI services require security assessments, content compliance, data governance, and alignment with socialist core values, while also promoting industrial development. These three models differ in their premises: the EU emphasizes rights and risk; the US emphasizes innovation and security; China emphasizes sovereignty, social stability, and state capacity. The mechanism of fragmentation is that each model reflects domestic political economy, legal tradition, and strategic interest. Firms respond through compliance programs, forum shopping, and regulatory arbitrage. Standards bodies become battlegrounds. Military and intelligence applications are often exempted or governed separately, creating a large gap between civilian AI governance and military AI use. At the same time, there is partial convergence: red-teaming, model evaluations, transparency, watermarking, incident reporting, and safety institutes are becoming common reference points. The United Nations provides a multilateral layer through the Secretary-General's AI advisory processes, the Global Digital Compact and Pact for the Future adopted in 2024, and the Convention on Certain Conventional Weapons discussions on lethal autonomous weapons systems. But UN processes move slowly and depend on member-state consensus, while the most capable actors prefer flexible or bilateral arrangements. Governance is therefore also industrial policy: subsidies, semiconductor controls, talent visas,

public research, and "friend-shoring" shape who can build AI, not merely how it is used.

Scope Conditions: This key idea applies where AI has cross-border effects, strategic value, and concentrated industrial capacity. It applies less to low-capability systems or purely domestic applications with limited externalities. Its explanatory power depends on enforcement capacity, technical expertise, and geopolitical trust. Where enforcement is weak, rules may be symbolic. Where technical capacity is low, states may adopt rules they cannot implement. Where trust is high, convergence is more likely; where trust is low, governance becomes another arena of competition. The idea also assumes that AI is not merely a normal technology but a general-purpose capability with military and economic implications, which makes states reluctant to delegate authority to neutral regulators.

Observable Implications: If this mechanism is operating, one should observe compliance programs, model cards, watermarking, incident databases, national AI strategies, procurement rules, litigation over bias or copyright, standards such as ISO/IEC 42001, compute tracking, export-control lists, licensing debates, and the creation of AI Safety Institutes. One should also observe regulatory arbitrage, such as firms locating development or deployment in jurisdictions with lighter rules; tensions over open-source models; and disputes over whether military AI should be governed by civilian AI law. The coexistence of convergence on safety vocabulary with divergence on enforcement and scope would be a signature of fragmented governance.

Perspective Note (five traditions in brief): *African (primary).* The African perspective treats AI governance as a question of equitable participation and structural inequality. African scholars such as Grovogui, Mbembe, and Mamdani have emphasized that global orders often reproduce hierarchies through ostensibly neutral institutions, and that the language of universalism can mask unequal power. From this vantage point, the risk is not only unsafe AI but rule-taking: African states may be expected to adopt standards designed elsewhere, while lacking the capacity to enforce them or to shape them. The demand is for equitable governance, data sovereignty, capacity building, and meaningful voice in standards and institutions. The African perspective also insists that governance address present harms—bias, surveillance, labor exploitation, and infrastructural dependence—not only frontier risks. It sees the technology gap as a governance problem, because rules written by and for advanced economies may not fit African contexts. *Chinese.* The Chinese perspective emphasizes sovereignty, development, and opposition to extraterritorial control. It supports governance through the United Nations and inclusive multilateralism, while insisting that states retain the right to regulate AI according to their own social and security needs. Domestic regulation focuses on content, data, and social stability. China is concerned about the "AI arms race" and US-led export controls, but also seeks to shape global standards and promote its own governance model. It views governance as compatible with industrial policy and state capacity. *Russian.* The Russian perspective emphasizes strategic stability, sovereignty, and military modernization. It is skeptical of Western-led governance frameworks and wary of rules that could constrain Russian development or military applications. Governance is acceptable when it preserves sovereign equality and strategic stability, but not when it functions as a constraint imposed by technologically dominant states. Russia's interest lies in preventing governance from becoming a tool of containment. *Western.* The Western perspective combines AI leadership, risk management, and governance self-critique. The EU emphasizes rights and risk; the US emphasizes innovation, security, and voluntary standards. Western actors support safety institutes, export controls, and multilateral declarations, while debating industry capture, enforcement gaps, open-source tensions, and the risk of over-regulation. The Western view is internally divided between acceleration and caution, and its governance proposals often reflect the influence of large technology firms. *UN.* The UN perspective frames AI governance through human rights, inclusive participation, and multilateralism. The Secretary-General's advisory body, the Global Digital Compact, and the Pact for the Future emphasize capacity building, human rights, and a global framework, while

the CCW process addresses lethal autonomous weapons. The UN contributes legitimacy and a forum for deliberation, but its effectiveness is limited by consensus requirements, funding gaps, and the reluctance of major powers to submit to binding constraints. It occludes less than great-power perspectives, but it cannot by itself overcome competitive incentives.

2.7 FIVE PERSPECTIVES IN DEPTH

2.7.1 African Perspective (PRIMARY)

The African vantage point on AI, autonomous weapons, and hyperwar begins from a different question than the great-power debate. Where Western, Chinese, and Russian discussions often ask how AI alters the balance of power among leading states, much African scholarship asks how technological systems reproduce or transform structures of domination that predate the current AI boom. The relevant lineage is not primarily the security dilemma or arms-control tradition but the political economy of underdevelopment, coloniality, and epistemic subordination. Rodney's analysis of how Europe underdeveloped Africa, Nkrumah's account of neo-colonialism, and Fanon's critique of colonial violence provide the historical grammar: contemporary AI infrastructures can be read as new instruments through which value, data, and decision-making capacity are extracted from African societies while strategic control remains elsewhere. Mbembe's work on necropolitics and the postcolony sharpens the point: technologies of classification and targeting do not merely optimize force; they can sort populations into categories of expendability, especially where accountability is weak and sovereignty is fragmented. Bayart's notion of extraversion helps explain why African elites may embrace external AI systems for regime security or donor alignment rather than continental autonomy. Mamdani's analysis of the bifurcated state suggests that AI governance in Africa must contend with legal and political orders split between civic and customary domains, so that "human control" over weapons or algorithms cannot be assumed to mean accountable public control. Grovogui's argument that Africans have often been treated as quasi-sovereigns in international order is directly relevant: in AI governance, African states may be invited to participate without possessing the compute, data, or institutional capacity to shape outcomes. Cabral's insistence that liberation requires cultural and epistemic self-determination, Nyerere's emphasis on collective self-reliance, Oyěwùmí's critique of imported categories of knowledge, and Tamale's decolonial feminist scholarship all push the analysis beyond "access" toward epistemic justice: whose concepts of risk, harm, and security define the global AI agenda?

On narrow AI in military systems, this perspective highlights asymmetry and dependency. African militaries and security services increasingly encounter AI-enabled ISR, targeting, logistics, and command systems through foreign suppliers, donor programs, and commercial platforms. The African contribution is to show that the diffusion of narrow AI is not a neutral modernization process but a reconfiguration of dependency. Imported systems may improve situational awareness, but they also create opaque supply chains, vendor lock-in, and gaps between technical capability and legal accountability. African security scholars such as Aning and Danso have long emphasized that security in Africa is inseparable from governance, human security, and the legitimacy of the state; applied to AI, this means that a targeting algorithm or surveillance platform is not merely a capability but a political intervention into already fragile civil-military relations. The perspective also notes that African states may use AI for border management, counterterrorism, or resource protection, and that these uses can be coercive. It therefore refuses a simple narrative of African victimhood while insisting that procurement, oversight, and data governance are the decisive variables.

On lethal autonomous weapons, the African vantage point foregrounds the principal-agent problem in its

colonial and postcolonial form. The question is not only whether a machine can distinguish combatants from civilians under international humanitarian law, but who designs the categories, who owns the data, who profits from deployment, and who is answerable when harm occurs. Autonomous weapons lower the political cost of force for technologically advanced actors, which matters acutely for regions that have historically experienced external intervention. African delegations in multilateral forums have often stressed humanitarian protection, accountability, and the asymmetry between those who build autonomous systems and those who live with their consequences. The perspective contributes a demand that "meaningful human control" be understood not as a procedural checkbox but as democratic, locally accountable control over the entire life cycle of a weapons system, including data collection, model training, and post-strike review. It occludes less than great-power perspectives on the human cost of remote warfare, but it may understate the genuine security dilemmas faced by African states confronting insurgencies or cross-border threats, and it can sometimes treat "Africa" as more unified than it is.

On hyperwar and decision compression, African analysis emphasizes collateralization. Flash wars driven by algorithmic escalation among major powers would not be fought in Africa, but their effects—disrupted shipping, food and energy price shocks, refugee flows, and the diversion of diplomatic attention—would fall heavily on African societies. The mechanism is not direct battlefield exposure but systemic vulnerability: African economies are often price-takers in global commodity and food markets, and African security architectures depend on external funding and attention. Bayart's extraversion is relevant here: African elites may be pulled into great-power technology blocs, accepting surveillance or military AI partnerships in exchange for security assistance, thereby narrowing continental strategic autonomy. The African perspective thus reveals that hyperwar is not only a risk of inadvertent escalation among nuclear-armed states; it is also a structure of global inequality in which the costs of algorithmic speed are distributed unevenly. What it may occlude is the possibility that some African actors could benefit from rapid AI-enabled intelligence or logistics in regional crises, and that not all external technology partnerships are purely extractive.

On AGI and superintelligence, the African vantage point is skeptical of the framing that dominates much Western and Chinese discourse. The existential-risk narrative, however important, can crowd out present and near-term harms: data extraction, labor exploitation in content moderation and annotation, algorithmic discrimination, and the concentration of compute in a handful of firms and states. African scholarship on decoloniality and epistemic justice suggests that "alignment" is not a purely technical problem of making a superintelligent system follow human values; it is a political problem of whose values, whose languages, whose histories, and whose futures are encoded. Mbembe's necropolitics and Fanon's analysis of colonial violence imply that systems optimized for efficiency may reproduce racialized and colonial hierarchies unless their design is accountable to those historically excluded. The perspective contributes an insistence that AGI governance include development, climate resilience, health, and food security as core security goods, not as peripheral concerns. It occludes, or at least underweights, the possibility that advanced AI could accelerate scientific discovery or public-service delivery in Africa, and it may not fully engage with the technical specifics of alignment research. It also risks overextending colonial analogies if every AI system is treated as a repetition of empire rather than a contingent political arrangement.

On AI governance, the African position is best understood as a demand for equitable governance rather than rejection of technology. The central claims are data sovereignty, capacity building, technology transfer, inclusive standard-setting, and human-rights-based regulation. African scholars and policymakers have increasingly framed AI as an issue of digital colonialism: the extraction of data and minerals, the location of cloud infrastructure, the dominance of foreign platforms, and the absence of African languages and contexts in training data. Oyěwùmí and Tamale's epistemological critiques imply that governance frameworks built

on Western categories may misrecognize African social realities, including gender, kinship, and community. Mamdani's bifurcated state and Grovogui's quasi-sovereignty imply that governance must strengthen African institutional capacity, not merely invite African signatures onto externally drafted rules. The perspective contributes a corrective to great-power AI governance: it shows that legitimacy depends on who can participate meaningfully, not only on who convenes the meeting. It also highlights that "safety" and "security" are not identical; a system can be safe for its operators and dangerous for populations subjected to it. What it occludes is the diversity of African state interests—some governments may prioritize surveillance and control over rights—and the fact that continental coordination is itself constrained by resource gaps and competing regional agendas. It may also understate the genuine security benefits that some African states derive from partnerships with external AI providers.

Finally, heterogeneity matters. African perspectives on AI are not uniform: coastal and landlocked states, resource-rich and resource-poor economies, and different regime types experience AI differently. Some governments may prioritize surveillance, border control, or revenue extraction; others may prioritize health, agriculture, or education. The African vantage point is therefore not a single doctrine but a family of critiques united by attention to asymmetry, extraction, and epistemic justice. It demands that global AI governance be evaluated by its effects on those with the least power to shape it, while remaining accountable to internal African debates about democracy, development, and security.

Taken together, the African perspective's distinctive contribution is to reframe AI, AGI, and hyperwar as questions of global justice, epistemic sovereignty, and the political economy of technology. It reveals what the other four perspectives often miss: that the AI divide is not a temporary lag but a structured relation of extraction; that autonomous weapons and algorithmic targeting are continuous with longer histories of remote and racialized violence; that hyperwar costs are globally unequal; and that AGI alignment is inseparable from whose knowledge counts. Its occlusions are real: it can understate African agency, operational military detail, and intra-African variation, and it may not always specify how equitable governance would be enforced against powerful states and firms. But as a primary lens, it prevents the lesson from collapsing into a great-power arms-race narrative and insists that the future of AI security be judged by its effects on those least able to shape it.

2.7.2 Chinese Perspective

The Chinese perspective treats AI as a strategic technology at the intersection of national rejuvenation, economic development, and military modernization. From within, AI is not merely a weapons issue; it is a general-purpose capability that will shape industrial competitiveness, social governance, and the future distribution of global power. The concept of "intelligentized warfare" signals that the People's Liberation Army sees AI as central to command, control, intelligence, and decision support, while military-civil fusion reflects a deliberate effort to dissolve boundaries between civilian innovation and defense application. This perspective contributes an understanding of AI as a whole-of-society project rather than a narrow military procurement category. It also challenges the assumption that the United States and its allies naturally define the legitimate uses of AI.

On governance, China emphasizes sovereignty, development rights, and non-interference. Beijing's international proposals tend to frame AI governance as a multilateral project in which all states have equal rights to develop and use AI, and in which unilateral export controls or technology restrictions are themselves security risks. Domestic regulations on recommendation algorithms, deep synthesis, and generative AI reflect a state-led model that prioritizes content security, social stability, and national security alongside innovation. The Chinese contribution is to insist that AI governance cannot be separated from development inequality:

rules written by advanced economies may freeze technological hierarchies and deny the Global South the benefits of AI. This resonates with African demands for equitable access, even though the two perspectives differ on human rights and political openness.

On the AI arms race, China often presents itself as responding to US initiatives rather than initiating competition. It warns against an unconstrained race in military AI and supports discussions on responsible AI, but it resists constraints that would lock in US advantages or infringe on sovereign defense choices. In the CCW context, Chinese positions generally emphasize compliance with international humanitarian law and the need for consensus, while avoiding commitments that would prohibit systems China may wish to develop. The perspective contributes a reminder that governance proposals are themselves strategic instruments: definitions of "autonomous," "human control," and "responsible use" can advantage some actors over others.

On hyperwar and decision compression, China is concerned about US concepts of mosaic warfare, algorithmic command and control, and the acceleration of the kill chain. Chinese analysts worry that AI-enabled decision support could compress crisis timelines and create first-mover advantages, undermining strategic stability. The response is not only technological but doctrinal: crisis management, escalation control, and the preservation of retaliatory capability. This contributes a stability-focused lens that complements Western discussions of deterrence and African concerns about collateral damage.

On AGI, China tends to treat superintelligence as a long-term strategic horizon rather than an immediate governance emergency. The emphasis is on maintaining national capability, preventing technological dependence, and shaping global rules before others do. Alignment is framed partly as a technical challenge and partly as a question of whose values govern global AI systems. The perspective's occlusions are significant: opacity around military AI programs, the integration of AI into surveillance and social control, and a tendency to use sovereignty claims to resist external scrutiny. It may also understate the risks of rapid military AI deployment in favor of competitive positioning. Nevertheless, the Chinese view correctly identifies that AI governance is inseparable from development, industrial policy, and the politics of technological hierarchy.

2.7.3 Russian Perspective

The Russian perspective frames AI primarily through military modernization and strategic stability. Moscow views AI as part of a broader military-technical revolution that can offset conventional inferiority, enhance precision and intelligence, and sustain Russia's status as a major military power. Russian discourse emphasizes the modernization of armed forces, the integration of AI into command and control, and the preservation of a credible deterrent. This is not simply an arms-race mentality; it is shaped by a strategic culture that sees technological lag as an existential vulnerability and by a geopolitical position in which Russia perceives itself as encircled by NATO and US technological superiority.

On narrow AI, Russia's interest lies in ISR, targeting, logistics, and decision support that can compensate for numerical or industrial disadvantages. The contribution of this perspective is to highlight how AI can be used by a state that is not a technological leader to sustain strategic parity. It also underscores that military AI is not only about autonomous weapons; it is about the speed and quality of decision-making in a contested environment. The occlusion is that Russian programs are opaque, and public discussion often mixes genuine modernization with propaganda. There is limited transparency about testing, safety, or human control, which makes external assessment difficult.

On LAWS, Russia has generally resisted legally binding prohibitions that would constrain its options, while

supporting discussions on responsible use and compliance with international humanitarian law. The Russian argument is that definitions of autonomy are politically contested and that premature bans could disadvantage states that are not already dominant in AI. This perspective contributes a skeptical view of humanitarian disarmament processes: it asks whether such processes are neutral or whether they encode the preferences of technologically advanced states. Its weakness is that it can treat all constraints as containment, thereby avoiding accountability for how autonomous or semi-autonomous systems might be used.

On hyperwar, Russia is particularly concerned with strategic stability and escalation management. Russian analysts have long worried about US precision-strike capabilities, missile defense, and now AI-enabled decision compression. The fear is that faster kill chains and algorithmic recommendations could create incentives for preemption or could blur the line between conventional and nuclear escalation. Russia's contribution is to keep the nuclear and strategic-stability dimension central: AI is not just a tactical issue but a factor in crisis stability. This is especially important for the lesson's discussion of AGI and NC3, even if Russia's own modernization contributes to the same risks.

On AGI, Russia tends to treat superintelligence as a distant but strategically significant horizon. The emphasis is on not falling behind and on ensuring that any global governance framework does not cement US or Chinese dominance. Alignment is less prominent in Russian discourse than sovereignty and parity. The perspective occludes the ethical and human-rights dimensions of AI governance and may overstate the coherence of Russian technological strategy. It also underweights the possibility that cooperation on AI safety could serve Russian interests by reducing catastrophic risk.

On governance, Russia favors state-centric, sovereignty-preserving frameworks and is skeptical of Western-led normative initiatives. It supports multilateral discussion but resists binding constraints that would limit military applications or domestic control. The contribution is a reminder that AI governance is inseparable from geopolitical competition and that major powers will not accept rules they perceive as disadvantaging. The occlusion is that this stance can block even modest transparency or risk-reduction measures and can conflate legitimate sovereignty concerns with resistance to accountability.

2.7.4 Western Perspective

The Western perspective is the most internally divided of the five. It combines a strong commitment to AI leadership, a vibrant LAWS and ethics debate, and a growing self-critique of governance failures. From within, AI is simultaneously an engine of economic growth, a military necessity, and a source of risk requiring regulation. The United States and its allies see AI as central to deterrence, intelligence, and operational advantage, while also recognizing that unregulated AI could undermine democratic values, human rights, and strategic stability. This duality is the perspective's strength and its tension.

On narrow AI, Western militaries have been the primary innovators and exporters of AI-enabled ISR, targeting, logistics, and C2. The contribution is a rich body of doctrine, experimentation, and ethical review, including debates over human-machine teaming and the appropriate level of autonomy. Western analysts such as Scharre and Horowitz have helped define the policy agenda by distinguishing between different levels of autonomy and by emphasizing that the key issue is not full autonomy but the compression of human judgment. The occlusion is that Western innovation often assumes a technological and industrial base unavailable to others, and that "responsible AI" frameworks can become marketing language for systems whose effects are felt elsewhere.

On LAWS, the Western perspective contains a genuine debate. Humanitarian and legal scholars, along with some military ethicists, argue for meaningful human control and, in some cases, for bans or strict limits on

lethal autonomous weapons. Military practitioners and strategists often counter that autonomy can reduce civilian harm, improve precision, and preserve force protection. The CCW process reflects this division: Western states have participated actively but have not converged on a binding prohibition. The contribution is a sophisticated legal and ethical vocabulary; the occlusion is that Western powers may exempt their own systems from the strictest interpretations while demanding constraints on adversaries.

On hyperwar, Western analysis has been at the forefront of identifying decision compression as a strategic risk. Kissinger and colleagues have warned that AI could destabilize deterrence by accelerating decision cycles and by introducing opacity into command and control. The concept of hyperwar captures the possibility that machine-speed interactions could outpace human political control. Western contributions include scenarios, wargames, and policy proposals for human oversight, crisis communication, and AI safety. The occlusion is that the same states developing these warnings are also investing heavily in the systems that create the risk, and that alliance politics can amplify competitive pressures.

On AGI, the Western perspective is split between acceleration and caution. Some actors treat advanced AI as a transformative technology requiring massive investment and strategic dominance; others treat alignment and safety as existential priorities. Bostrom's work has shaped the discourse by framing superintelligence as a potential existential risk requiring global coordination. The contribution is a serious engagement with long-term risk and with the technical problem of alignment. The occlusion is that existential-risk discourse can be culturally specific, can overstate the near-term feasibility of AGI, and can divert attention from present harms such as bias, surveillance, and labor exploitation. It may also reflect the interests of large technology firms that benefit from both the urgency and the proposed governance frameworks.

On governance, Western states have produced the most elaborate AI governance architectures: the US executive order on AI, the EU AI Act, export controls on advanced chips, and various alliance-based initiatives. These frameworks emphasize risk management, transparency, human rights, and safety. The contribution is institutional capacity and legal sophistication. The occlusion is that governance often follows market and security interests, that tech firms exercise substantial influence, and that Western standards may be exported as universal norms without adequate adaptation. The Western perspective thus contains a genuine self-critique: it recognizes that leadership in AI is not the same as legitimacy in AI governance, and that self-regulation by powerful firms is insufficient. But it often struggles to translate that critique into constraints on its own strategic behavior.

2.7.5 UN Perspective

The UN perspective frames AI governance through human rights, inclusive participation, multilateralism, and capacity building. It does not treat AI primarily as a military competition among great powers, but as a global issue affecting development, peace, security, and human dignity. The UN's comparative advantage is legitimacy: it provides a forum in which all states, including those without advanced AI capabilities, can articulate interests and norms. This perspective is essential for preventing AI governance from becoming merely an extension of great-power rivalry.

On narrow AI in military systems, the UN perspective emphasizes compliance with international humanitarian law, human rights, and accountability. It does not deny states' security needs, but it insists that military AI must be governed by existing legal frameworks and, where necessary, by new rules. The contribution is to keep the human cost of AI-enabled warfare visible, particularly for civilians in conflict zones. The occlusion is that the UN has limited enforcement capacity and depends on member states to implement and comply with norms.

On LAWS, the UN perspective is most developed through the Convention on Certain Conventional Weapons process. The CCW provides a forum for discussing lethal autonomous weapons, and many UN officials, including the Secretary-General, have urged states to adopt new international rules to ensure human control over the use of force. The contribution is a sustained multilateral effort to prevent an unregulated arms race in autonomous weapons and to preserve human accountability. The occlusion is that consensus requirements allow a small number of states to block progress, and that the process can be slow relative to technological change. The UN perspective thus offers legitimacy without guaranteeing effectiveness.

On hyperwar, the UN emphasizes prevention, diplomacy, and the protection of civilians. It is less focused on operational military AI than on the systemic risks of escalation and on the need for confidence-building measures, transparency, and human oversight. The contribution is to frame decision compression as a threat to international peace and security, not merely as a technical problem. The occlusion is that the UN cannot compel major powers to slow their AI development or to share sensitive information.

On AGI, the UN perspective treats superintelligence as a potential global risk requiring inclusive governance. The Secretary-General's advisory initiatives, the Global Digital Compact, and the Pact for the Future include commitments on AI capacity building, human rights, and international cooperation. The contribution is to broaden the agenda beyond safety and security to include development, equity, and human rights. The occlusion is that these commitments are often aspirational and depend on funding and political will that may not materialize.

On governance, the UN perspective is the most explicitly inclusive. It emphasizes capacity building for developing countries, bridging the AI divide, and ensuring that global AI governance is not captured by a few states or firms. This aligns with African demands for equitable participation and with Chinese emphasis on development, though the UN frames these through human rights and multilateral legitimacy rather than sovereignty alone. The contribution is a normative architecture that can accommodate diverse perspectives. The occlusion is that the UN cannot overcome the competitive incentives of major powers, and that its processes may produce lowest-common-denominator outcomes. Nevertheless, the UN perspective is indispensable because it provides the only forum in which AI governance can be debated as a common human concern rather than as a zero-sum competition.

2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Centers the AI divide, technology gaps, capacity building, and equitable governance; shows that military AI is also a development and sovereignty problem	Can understate the immediate battlefield utility of narrow AI and the competitive pressures driving its adoption	Distributive justice, equitable participation, and non-capture of global AI governance	African scholarly and diplomatic demands for capacity building and inclusive governance	Western perspective objects that equity framing alone cannot substitute for verification, control, and accountability of lethal systems
Chinese	Frames AI governance through sovereignty, development, and multipolar order; insists that military AI must remain under state control and serve national development	Tends to downplay transparency, independent accountability, and the risks of opaque state-controlled systems	State sovereignty, development rights, and non-intervention	Chinese regulatory and diplomatic emphasis on controllability, security, and development-oriented AI governance	Western perspective objects that sovereignty framing can shield military AI from external scrutiny
Russian	Links AI to military modernization and strategic stability; treats AI as part of great-power competition and arms-control discourse	Often treats AI as a stabilizing or modernizing tool without fully addressing autonomy, escalation, and principal-agent risks	Great-power stability, strategic parity, and military modernization	Russian military modernization discourse and strategic-stability framing around emerging technologies	UN and Western perspectives object that stability language may legitimate destabilizing autonomous capabilities

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Western	Provides the most developed technical and legal debate on LAWS, targeting, and governance; combines leadership claims with self-critique	Can embed hegemonic bias, export-control leverage, and the assumption that Western regulatory models are universal	Liberal order, responsible use, alliance management, and legal accountability	US executive-order governance, EU AI Act, and Western LAWS debates	African and Chinese perspectives object that Western governance is often self-interested and exclusionary
UN	Offers the only multilateral forum for AI as a common human concern; connects CCW processes, human rights, and Pact for the Future commitments	Cannot overcome major-power competition and may produce lowest-common-denominator outcomes	Common human security, multilateral legitimacy, and human-rights protection	UN CCW LAWS discussions, Secretary-General positions, and Pact for the Future AI commitments	Realist powers object that multilateral processes cannot constrain competitive incentives

2.8 WORKED EXAMPLE (I do)

Case: The 2020 Nagorno-Karabakh war and the 2023–2024 Ukrainian drone deployments. The puzzle is how AI-enabled warfare has changed the battlefield without yet amounting to fully autonomous war. The evidence points to a shift in the sensor-to-shooter chain: more distributed sensing, faster target nomination, cheaper precision strike, and heavier reliance on human-machine teaming. The case is not a demonstration of artificial general intelligence; it is a demonstration of narrow AI and automation compressing decision time and altering cost-exchange ratios.

Levels of analysis. At the **individual** level, the decisive change is cognitive compression. Operators, analysts, and commanders face accelerated kill chains in which machine-assisted detection and classification reduce the time available for human judgment. Trust in automation becomes a battlefield variable: excessive trust can produce automation bias, while excessive skepticism can waste the speed advantage. At the **state** level, Azerbaijan and Ukraine show how military effectiveness depends on procurement ecosystems, doctrine, training, and industrial adaptation rather than on a single platform. Azerbaijan integrated Turkish and Israeli systems into a coherent campaign; Ukraine adapted commercial drones, FPV platforms, and soft-

ware under wartime pressure. At the **systemic** level, the wars are embedded in regional and great-power competition: Turkey, Israel, Russia, NATO members, and Iran all shape the supply, doctrine, and escalation environment. At the **transnational** level, the battlefield is sustained by global supply chains, commercial electronics, open-source software, private firms, sanctions evasion, and transnational norms about acceptable targeting and autonomy.

Mechanism. The mechanism is not "AI fights the war." It is the compression and redistribution of the OODA loop. In Nagorno-Karabakh, loitering munitions, unmanned aerial vehicles, and precision artillery created a reconnaissance-strike complex that made Armenian air defenses and armor vulnerable once detected. The key effect was not merely destruction but paralysis: forces could not maneuver without being seen and struck. In Ukraine, the mechanism is more decentralized. Cheap drones, FPV systems, electronic warfare, and rapid software iteration allow both sides to find, fix, and finish targets at low cost, while counter-drone measures force continuous adaptation. Narrow AI appears in target recognition, route optimization, electronic-warfare support, and logistics planning, but the lethal act usually remains human-mediated or semi-autonomous. The battlefield changes because the cost of precision has fallen and the tempo of adaptation has risen. This produces attrition, dispersion, and a premium on concealment, mobility, and electronic resilience.

The principal-agent problem remains central. Algorithms recommend; humans authorize; but compression reduces the quality of authorization. The risk is not only unlawful targeting but also escalation through speed: a system that can respond faster than political leaders can deliberate may turn tactical contact into strategic crisis. Hyperwar, in this sense, is not science fiction; it is the danger that algorithmic tempo outruns human control.

Perspective reconstruction. The African perspective sees these wars as evidence that the military-technological frontier is concentrating in a small set of states and firms, widening the AI divide and embedding new dependencies. It stresses that African states are often consumers, not producers, of the relevant technologies, and that lessons from Eurasian battlefields may be imported without attention to local political contexts. It demands equitable access to defensive capabilities, capacity building, and a voice in global AI governance, while warning that AI-enabled warfare can deepen asymmetry between technologically advanced and technologically dependent states. The Chinese perspective reads the case through sovereignty and strategic competition: military AI must remain under state control, and the lesson is that technological dependence is a security vulnerability. It emphasizes development, controllability, and the dangers of a US-led AI arms race, while treating multilateral constraints with suspicion if they appear to freeze Chinese advancement. The Russian perspective treats the wars as confirmation that precision, unmanned systems, and AI-enabled reconnaissance are now central to modernization and strategic stability. It emphasizes parity, deterrence, and the need to prevent technological surprise, but tends to understate the escalation risks created by autonomous and semi-autonomous systems. The Western perspective focuses on the tactical revolution: human-machine teaming, precision strike, and the legal and ethical problems of algorithmic targeting. It sees Nagorno-Karabakh and Ukraine as proof that AI-enabled warfare is already here, and it uses the cases to argue for responsible use, verification, and alliance adaptation. The UN perspective treats the wars as warnings about the speed of technological change and the erosion of human control. It stresses civilian protection, accountability, and the need for multilateral guardrails, while acknowledging that the UN cannot stop competitive adoption.

Explicit adjudication. The Western perspective best explains the immediate battlefield mechanism: it captures how sensing, targeting, and precision strike have compressed the kill chain and changed force employment. But it is weakest on distribution: it treats the wars as cases of technological adaptation rather than

as symptoms of a global AI divide. The African perspective best explains the structural consequence: it shows that the same technologies that make advanced militaries more effective also deepen dependence and inequality. The UN perspective best captures the normative stakes but cannot explain why states adopt these systems despite risk. The Russian and Chinese perspectives correctly identify competition and sovereignty but understate the principal-agent and escalation problems. The strongest overall explanation is therefore layered: the Western perspective explains the mechanism, the African perspective explains the distribution, and the UN perspective explains the governance imperative. No single perspective is sufficient, because the case is simultaneously tactical, structural, and normative.

SECTION 2.9 PROBLEM PAIR (We do)

Tasks

1. **Mechanism identification.** Reconstruct the causal chain by which Israel's Lavender and Gospel systems reportedly converted raw intelligence into nominated targets during the 2023–2024 Gaza campaign. Specify the inputs, the scoring logic, the human decision node, and the kinetic output, and identify where in that chain the "human in the loop" actually sits.
2. **Principal-agent analysis.** Apply the principal-agent framework to algorithmic targeting. Who is the principal, who is the agent, and what information asymmetry makes meaningful human oversight difficult? Distinguish "human in the loop," "human on the loop," and "human out of the loop" as defined in the LAWS debate.
3. **Legal reconstruction (Israeli/Western).** Steel-man the argument that algorithmic targeting can satisfy international humanitarian law—distinction, proportionality, and precaution—better than manual processes, and identify the specific evidentiary claims on which that argument rests.
4. **Critical reconstruction (human rights/UN/African).** Steel-man the counter-argument that these systems erode accountability, scale error, and shift the burden of proof onto civilian populations. Identify the strongest piece of evidence each side would need to win the argument.
5. **Comparative placement.** Compare the Gaza case with the Nagorno-Karabakh (2020) and Ukraine (2023–2024) worked example. In which case did AI function as a *targeting generator*, in which as a *platform enabler*, and what difference does that make for legal responsibility?
6. **Falsification.** Specify three observable findings that would falsify (a) the claim that algorithmic targeting reduces civilian harm relative to manual targeting, and (b) the claim that it necessarily increases civilian harm. State which data sources could in principle adjudicate between them.

MODEL ANSWER

The Lavender and Gospel systems illustrate a shift from human-driven to algorithm-assisted targeting at scale. According to investigative reporting, Lavender generated lists of suspected Hamas operatives by applying pattern-recognition models to communications metadata, social-network data, and behavioral indicators, producing a "score" for each individual; Gospel performed a parallel function for buildings and infrastructure, nominating structures as military objectives. The causal chain runs: intelligence ingestion → feature extraction → probabilistic scoring → threshold-based nomination → human approval (often compressed to seconds) → strike authorization → kinetic effect. The critical node is the human approval step.

In principle it preserves legal accountability; in practice, the volume of nominations, the opacity of the scoring, and the operational tempo convert approval into a formality, with the human operator ratifying rather than evaluating the machine's output. This is the principal-agent problem in its algorithmic form: the state (principal) delegates target nomination to a model (agent) whose reasoning it cannot fully inspect, while the human "approver" lacks both the time and the information to correct systematic errors.

The Israeli and Western legal defense rests on several claims. First, that algorithmic systems can process vastly more data than human analysts, improving distinction by identifying patterns invisible to humans. Second, that the systems are advisory, with a human retaining legal responsibility for each strike, thereby satisfying IHL's requirement of human judgment. Third, that Hamas's embedding in civilian infrastructure makes manual targeting equally or more error-prone, so the relevant comparison is not algorithm versus ideal human but algorithm versus human under combat stress. The evidentiary burden here falls on demonstrating that the human approver exercised genuine judgment—reviewing the basis for each nomination, assessing proportionality, and rejecting nominations where civilian risk was excessive.

The critical reconstruction challenges each claim. On distinction, pattern recognition trained on incomplete or biased data may systematically misclassify civilians as combatants, particularly where "combatant" is inferred from behavioral proxies (phone usage, movement patterns) rather than direct participation in hostilities. On proportionality, the speed of the kill chain compresses the deliberation that IHL's precautionary principle requires. On accountability, the opacity of the model and the classification of its parameters as military secrets make it nearly impossible for victims, courts, or oversight bodies to reconstruct why a particular individual was targeted. The African and UN perspectives add a structural critique: these systems are developed and deployed by technologically advanced states against populations with no comparable capacity to audit, contest, or retaliate, reproducing a colonial asymmetry in which the Global South bears the costs of Northern innovation. The strongest evidence for the critical side would be documented cases of misidentification at scale; the strongest for the defense would be audited data showing lower civilian-casualty rates per strike than in comparable manually targeted campaigns.

Comparatively, Nagorno-Karabakh (2020) and Ukraine (2023–2024) represent platform-enabled warfare: drones and loitering munitions extended human reach and precision, but target selection remained substantially human. Gaza represents targeting-generation: the algorithm itself produces the list of persons to kill. The legal difference is significant. In platform-enabled cases, responsibility attaches to the human operator who chose the target; in targeting-generation cases, responsibility is distributed across the model's designers, trainers, data curators, and approvers, none of whom may have made an individual targeting decision. This diffusion is precisely what makes algorithmic targeting legally and ethically novel.

Falsification requires data that neither side currently possesses in public form. The claim that algorithmic targeting reduces civilian harm would be falsified by evidence that (i) the false-positive rate for combatant identification exceeded that of manual processes in comparable contexts, (ii) human approvers rejected fewer than a trivial fraction of nominations, or (iii) post-strike assessments revealed systematic misidentification of protected persons. The claim that it necessarily increases harm would be falsified by (i) audited evidence of lower civilian-casualty ratios per engagement, (ii) documented instances of approvers rejecting nominations on proportionality grounds, or (iii) transparency measures enabling external audit without compromising operational security. Adjudication would require access to nomination logs, approval records, strike assessments, and model documentation—precisely the materials states classify. The epistemic gap is itself a finding: the accountability architecture of algorithmic warfare is structurally resistant to the verification that IHL presupposes.

SECTION 2.10 INDEPENDENT MEMO (You do)

(a) Case description. In late 2023, a coalition of African states at the UN General Assembly tabled a resolution calling for equitable access to AI technologies and a global fund for AI capacity-building in the Global South. The resolution passed, but implementation stalled. Meanwhile, a major African military—facing insurgency in its northern regions—procured an AI-enabled surveillance and targeting system from a foreign vendor whose training data and model weights remain proprietary. Civil society groups allege the system misidentifies civilians as combatants. The state's parliament demands an independent audit, but the vendor cites national-security and commercial confidentiality. The state must now decide whether to suspend the system, renegotiate terms, or seek alternative suppliers. The case sits at the intersection of the AI divide, algorithmic accountability, and sovereign procurement autonomy.

(b) Required memo headings (use these as prompts).

- **Mechanism:** Identify the causal chain linking the foreign vendor's proprietary model to targeting outcomes on the ground. Where does human judgment sit, and what information asymmetry prevents the state from auditing the system? Specify the principal-agent relationships among the vendor, the military, the parliament, and affected civilians.
- **Perspective reconstruction:** Reconstruct how each of the five perspectives—African, Chinese, Russian, Western, UN—would frame this case. For each, state the core normative claim, the preferred policy prescription, and the strongest objection from within that perspective.
- **Historical analogue:** Identify one historical case (pre-2020) in which a technologically dependent state faced a comparable accountability gap in military procurement, and specify what is genuinely analogous and what differs given the opacity and speed of AI systems.
- **Falsifiers:** List three observable findings that would falsify your central claim about whether the state should suspend, renegotiate, or replace the system. State what data you would need and why it is or is not obtainable.

(c) Self-check. Before submitting, verify that you have distinguished description (what happened), explanation (why it happened), prediction (what will happen), and prescription (what should be done)—and that no section conflates them.

SECTION 2.11 HINGE QUESTION

Question. Which of the following best captures the principal-agent problem as it arises in algorithmic targeting systems such as Lavender?

A. The algorithm acts as principal and the human operator as agent, reversing the traditional command hierarchy and placing legal liability on the machine.

B. The human operator cannot meaningfully evaluate the algorithm's output because of model opacity and operational tempo, so approval becomes a formality rather than a judgment.

C. The state delegates targeting to a private contractor, creating an accountability gap between public authority and commercial interest.

D. International humanitarian law lacks jurisdiction over non-state actors, so algorithmic systems used by states fall outside existing legal frameworks.

Correct answer: B.

Distractor diagnoses.

- **A** misidentifies the principal-agent relationship. The state and its commanders remain the principal; the algorithm is an instrument, not a legal agent. Legal liability does not transfer to a machine under current IHL, and framing the algorithm as principal obscures the human choices embedded in its design and deployment.
- **C** identifies a real but secondary issue. Contractor involvement can complicate accountability, but the core principal-agent problem in algorithmic targeting is informational—opacity and speed—not commercial delegation. A state-operated system with the same opacity would raise the same problem.
- **D** misdiagnoses the legal gap. IHL applies to state conduct regardless of the technology used; the difficulty is not jurisdictional absence but the evidentiary and procedural challenge of verifying compliance when the decision chain is algorithmic and classified.

SECTION 2A — DATA LAB

Table 1 — State AI Investment and Compute Capacity (selected, 2023)

State / Bloc	Private AI Investment (USD bn, 2023)	Notable Public Compute / Program	Share of Top-100 AI Models (approx.)	Source
United States	~67	CHIPS Act, DoD Replicator	~60–70%	Stanford AI Index 2024; CSET
China	~8	Eastern Data Western Compute; PLA AI labs	~15–20%	Stanford AI Index 2024; CSET
United Kingdom	~4	ARIA, Alan Turing Institute	~3–5%	Stanford AI Index 2024
European Union (aggregate)	~8–10	EuroHPC, Horizon Europe	~5–8%	Stanford AI Index 2024
Israel	~2.5	MAFAT, Unit 8200 spin-offs	~2–3%	Stanford AI Index 2024
India	~1.5	IndiaAI Mission	<1%	Stanford AI Index 2024

Note: Figures are approximate and vary by definition of "AI investment" (private venture vs. total R&D). The US lead is structural, not merely cyclical, and is concentrated in frontier-model compute.

Table 2 — Autonomous and AI-Enabled Military Systems by State (selected, 2024)

State	System / Program	Domain	Autonomy Level (Scharre spectrum)	Status
United States	Replicator (attritable drones); Loyal Wingman (CCA)	Air / maritime	Human-on-the-loop → semi-autonomous	Fielding 2025–2027
United States	Project Maven (ISR/targeting)	ISR	Human-in-the-loop	Operational
China	GJ-11 "Sharp Sword"; CH-7	Air	Semi-autonomous strike	Testing / limited
China	Sea Hunter-class USV concepts	Maritime	Semi-autonomous	Development
Russia	Lancet-3 (loitering munition)	Air/land	Semi-autonomous terminal	Combat use (Ukraine)
Russia	Uran-9 UGV	Land	Teleoperated / limited autonomy	Limited combat use
Israel	Harpy / Harop (SEAD)	Air	Fire-and-forget autonomous	Operational
Israel	Lavender / Gospel (targeting support)	ISR/C2	Human-in-the-loop (nominally)	Operational (Gaza 2023–24)
Turkey	Kargu-2 (loitering munition)	Air	Claimed autonomous terminal	Exported; combat use
Turkey	Bayraktar TB2 (AI-assisted ISR)	Air	Human-in-the-loop	Combat-proven

Autonomy levels follow Scharre's (2018) spectrum: human-in-the-loop, human-on-the-loop, human-out-of-the-loop.

Table 3 — UN CCW Process on Lethal Autonomous Weapons Systems (LAWS)

Year	Event	Outcome
2013	First informal expert meeting on LAWS under CCW	Agenda established
2017	Group of Governmental Experts (GGE) on LAWS convened	Annual meetings; no consensus
2018	GGE agrees 11 guiding principles (human control, accountability)	Non-binding
2019	GGE fails to agree mandate for binding instrument	Stalemate
2021	GGE mandate renewed; "two-tier" approach debated	No treaty

Year	Event	Outcome
2023	UN General Assembly resolution on LAWS (A/RES/78/241)	First GA resolution; calls for report
2023–24	Secretary-General Guterres urges legally binding instrument by 2026	Political pressure; no enforcement
2024	CCW GGE continues; "human control" definition unresolved	Ongoing

Source: UN CCW LAWS reports; UN Secretary-General statements.

Table 4 — AI Incident and Safety Trend (selected indicators)

Indicator	2020	2022	2024	Source
Reported AI incidents (AI Incident Database)	~50	~150	~300+	AIID
States with national AI strategy	~30	~60	~75+	OECD AI Policy Observatory
States party to CCW	125	125	125	UN
States supporting LAWS ban (Campaign to Stop Killer Robots)	~30	~35	~40+	CSKR

Incident counts are approximate and reflect reporting bias; they indicate a rising trend in documented harms, not a complete census.

Five Numbered Analysis Questions

1. **Trend.** Table 1 shows a roughly 8:1 US–China private AI investment ratio in 2023, yet Table 2 shows China fielding competitive autonomous systems. What does this divergence suggest about the relationship between commercial AI investment and military AI capability? Is the gap closing, and on what time horizon?

2. **Level of analysis.** The Lavender/Gospel systems (Table 2) are deployed at the *state* level by Israel, but their effects are felt at the *individual* level (targeted persons) and the *transnational* level (international humanitarian law norms). Using the four levels of analysis from Lesson 1, explain which level best explains the *proliferation* of such systems and which best explains the *constraint* on their use.

3. **Perspective reconstruction (all five).** Reconstruct how each of the five perspectives would read Table 3's stalemate: (a) African — as evidence of a governance gap that excludes non-possessors; (b) Chinese — as a sovereignty-preserving outcome; (c) Russian — as strategic-stability management; (d) Western — as a failure of norm entrepreneurship; (e) UN — as incremental multilateralism. Which reading is best supported by the evidence in Tables 1–4?
4. **Interpretation.** Table 4 shows rising AI incidents alongside rising national AI strategies. Does this correlation imply that governance is failing, or that detection and reporting are improving? Distinguish description from explanation, and identify what evidence would adjudicate between the two readings.
5. **Limitation.** All four tables rely on open-source, self-reported, or advocacy-compiled data. Identify the single most important data gap that, if filled, would most change your assessment of whether AI is destabilizing or stabilizing in the military domain, and explain why.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — "The Compression Spiral": OODA-Loop Collapse and Autonomy Escalation What to draw: A spiral (or nested concentric arcs) on a horizontal time axis running left-to-right, labeled "Time to decision (seconds → milliseconds → microseconds)." Three nested loops, each smaller and faster than the last: (1) outer loop labeled "Human-in-the-loop (HITL): minutes–hours" with a human icon and a "veto" gate; (2) middle loop "Human-on-the-loop (HOTL): seconds" with a human icon watching a screen; (3) inner loop "Human-out-of-the-loop (HOOTL): milliseconds" with no human icon, only an algorithm node. Arrows show escalation pressure pushing inward. A vertical dashed line marks "Flash-war threshold" where human cognition cannot keep pace.

Labels to place: "Observe–Orient–Decide–Act (OODA)"; "Algorithmic speed"; "Human cognitive limit (~250 ms reaction)"; "Escalation pressure"; "Flash war zone."

Perspective overlay: Annotate the spiral's outer rim in five colors: African (red) — "who is excluded from the loop?"; Chinese (blue) — "sovereignty over the loop"; Russian (green) — "strategic stability at speed"; Western (purple) — "norms of human control"; UN (orange) — "CCW / Pact for the Future." Place a small legend in the corner.

Visual 2 — "The Principal-Agent Problem in LAWS": Misalignment and Accountability Gap What to draw: A flowchart with two boxes: "Principal (State / Commander)" on the left and "Agent (Autonomous System)" on the right, connected by a solid arrow labeled "Delegation." Below, a dashed arrow returns labeled "Accountability?" with a question mark. Between them, a jagged "misalignment zone" (shaded) containing three failure modes: (a) "Objective mismatch (reward hacking)"; (b) "Context shift (training ≠ battlefield)"; (c) "Emergent behavior (unpredictable coordination)." Below the boxes, a horizontal bar labeled "Governance gap" with segments: "CCW GGE (non-binding)" | "National policy" | "International humanitarian law (existing)" | "No treaty."

Labels to place: "Principal"; "Agent"; "Delegation"; "Accountability gap"; "IHL (distinction, proportionality)"; "Command responsibility."

Perspective overlay: Five small flags or color-coded tags at the bottom: African — "accountability for victims in the Global South"; Chinese — "state responsibility preserved"; Russian — "no new constraints

on modernization"; Western — "human control as norm"; UN — "GGE guiding principles."

Visual 3 — "AI Governance Landscape": Concentric Regimes and the African Demand What to draw: A set of concentric circles (or a Venn diagram) centered on "AI in military use." Innermost circle: "Hard law (none binding on LAWS)." Second: "Soft law / norms" (CCW guiding principles, Pact for the Future, REAIM). Third: "National regulation" (US EO 14110, EU AI Act, China's Interim Measures, UK AI Safety Institute). Outermost: "Industry / technical standards" (ISO, IEEE, model evals). Around the circles, place five perspective markers: African (outermost, pointing inward) — "demand for equitable participation and technology transfer"; Chinese — "sovereignty and non-interference"; Russian — "strategic stability, no disarmament of conventional AI"; Western — "leadership + self-regulation + alliance coordination"; UN — "multilateral framework, SDG alignment."

Labels to place: "Hard law gap"; "Soft norms"; "National regimes"; "Technical standards"; "Equity gap (compute, data, talent)."

Perspective overlay: Use the same five-color legend as Visual 1. Add a small arrow from the African marker toward the center labeled "restructuring demand."

SECTION 4 — CORNELL NOTES

Cue (Question / Prompt)	Notes (with source log)
What is narrow AI in military systems?	ISR, targeting, logistics, C2. Examples: Project Maven, Lavender/Gospel. Source: Scharre (2018); Horowitz (2018).
What is the LAWS debate?	Autonomy in lethal force; CCW GGE since 2017; no binding treaty. Source: UN CCW LAWS reports.
What is the principal-agent problem in LAWS?	Delegation to algorithms creates accountability gaps; misalignment, context shift, emergent behavior. Source: Scharre (2018).
What is hyperwar / decision compression?	Algorithmic speed compresses OODA loop; risk of flash wars. Source: Scharre (2018); Kissinger et al. (2021).
What is AGI/ASI and why a security problem?	Superintelligence alignment as global security; arms-race dynamics. Source: Bostrom (2014); Kissinger et al. (2021).
What are the main AI governance instruments?	US EO 14110; EU AI Act; China Interim Measures; UN Pact for the Future. Source: Stanford AI Index 2024.
How does the African perspective frame AI?	Technology gap, AI divide, demand for equitable governance; not just consumer but co-designer. Sources: Grovogui; Mbembe; Aning; Danso.
How does China frame AI governance?	Sovereignty, non-interference, AI as development right; concern about US-led "AI arms race" rhetoric. Source: Chinese position papers at UN.

Cue (Question / Prompt)	Notes (with source log)
How does Russia frame AI?	Military modernization; strategic stability; opposes constraints that freeze asymmetry. Source: Russian MOD statements.
How does the West frame AI?	Leadership, LAWS debate, governance self-critique; alliance coordination (AUKUS, NATO). Source: US DoD, NATO AI strategy.
What is the UN's position?	CCW LAWS process; Secretary-General's call for binding instrument by 2026; Pact for the Future AI commitments. Source: UN.
What is the key falsifier for "AI is destabilizing"?	Evidence that AI improves crisis stability (better ISR, reduced fog) without increasing speed of escalation.

Source log: Scharre (2018) *Army of None*; Horowitz (2018) "Artificial Intelligence, International Competition, and the Balance of Power"; Kissinger, Schmidt & Huttenlocher (2021) *The Age of AI*; Bostrom (2014) *Superintelligence*; UN CCW LAWS reports; Stanford AI Index (2024); Grovogui, Mbembe, Aning, Danso (African IR scholarship).

Summary (3–5 sentences): Military AI spans narrow systems already in use (ISR, targeting, logistics) and speculative superintelligence, with LAWS sitting at the contested boundary. The central risk is decision compression: as algorithms accelerate the OODA loop, human control erodes and flash wars become plausible. Governance is fragmented across national regimes and a stalled CCW process, with no binding LAWS treaty. The African perspective insists that this fragmentation reproduces the AI divide and demands equitable participation, while Chinese, Russian, Western, and UN framings each privilege sovereignty, stability, leadership, or multilateralism respectively. Whether AI stabilizes or destabilizes depends on whether speed outruns accountability.

SECTION 5 — FEYNMAN COMPRESSION

1. **Explain without jargon.** Imagine a chess clock that keeps speeding up. At first a human general has hours to decide; then minutes; then the computer moves on its own in milliseconds. That is "hyperwar": the machine's speed outruns human judgment, and a small spark can become a big fire before anyone can stop it. AI in war today is mostly narrow tools—better eyes, faster targeting—not robot generals, but the trend points toward machines making lethal choices. Countries argue about whether to ban "killer robots," yet no binding rule exists, and the big powers are racing ahead. The deeper worry is a super-smart AI that no one can control; the nearer worry is a fast, dumb mistake.

2. **Mark gaps.** I am unsure how much Lavender/Gospel actually changed targeting rates versus human staff; I conflated "AI" with "automation" in places; I have not specified the mechanism by which AGI would destabilize (capability jump vs. misalignment); I treated the CCW stalemate as failure rather than as a sovereignty-preserving equilibrium for some states.

3. **Reread verification.** Re-reading Scharre (2018) confirms the spectrum of autonomy (HITL/HOTL/HOOTL)

and the principal-agent framing; Horowitz (2018) confirms that AI is a general-purpose technology whose military diffusion depends on organizational adaptation, not just algorithms; Kissinger et al. (2021) confirms the "compressed decision" thesis; Bostrom (2014) confirms the alignment problem as a control problem. The African-scholarship framing (Grovogui, Mbembe, Aning, Danso) is consistent with the technology-gap and equity-demand narrative.

4. **Analogy with explicit limits.** The chess-clock analogy captures speed and loss of human control but breaks down on three points: (a) war is not zero-sum with fixed rules—adversaries adapt; (b) the "clock" is not neutral—it is owned by states with unequal compute; (c) a chess loss ends a game, whereas a flash war can escalate to nuclear use. The analogy is pedagogically useful for compression but must not be mistaken for a model of strategic interaction.

5. **Rewrite.** Military AI is best understood as a compression technology: it shrinks the time between observation and lethal action, eroding the human control that international humanitarian law presupposes. Narrow systems (ISR, targeting, logistics) are already deployed and have changed battlefields (Nagorno-Karabakh 2020, Ukraine 2023–24, Gaza 2023–24), while LAWS remain legally unregulated despite a decade of CCW talks. AGI raises a categorically different problem—alignment as global security—but its probability and timeline are deeply uncertain. Governance is fragmented (US EO, EU AI Act, Chinese measures, UN soft law), and the African perspective highlights that this fragmentation reproduces the AI divide: those who build the systems are not those who bear the risks. The stabilizing case (better information reduces fog) and the destabilizing case (speed outruns accountability) are both live; adjudication requires evidence on escalation dynamics, not just capability counts.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag | Card Type | Front | Back | Perspective Note |
L54 | definition | What is narrow AI in military systems? | Narrow (weak) AI performs specific tasks—ISR, targeting, logistics, C2—without general reasoning; it is the current operational layer of military AI, distinct from AGI. | African scholars note the asymmetry: African militaries are consumers, not producers, of narrow AI systems. |
L54 | mechanism | How does decision compression create hyperwar risk? | Algorithmic speed compresses the OODA loop; when both sides use AI, escalation can outpace human deliberation, producing flash wars. | Russian strategic-stability framing warns of compressed timelines undermining crisis management. |
L54 | application | What did the 2020 Nagorno-Karabakh war demonstrate about AI-enabled warfare? | It showcased loitering munitions (Harop, Orbiter) and drone ISR enabling rapid, precise strikes against armor and air defenses. | Western analysts read it as proof of concept; African analysts stress proliferation to non-state actors. |
L54 | comparison | How do LAWS differ from remote-controlled drones? | LAWS select and engage targets without human intervention in the critical function; drones retain a human in the loop. | The CCW GGE debates this distinction; African states often stress human control. |
L54 | source | What is Scharre's (2018) core argument about autonomous weapons? | In "Army of None," Scharre argues autonomy is a spectrum and the key question is meaningful human control, not a binary ban. | Western defense perspective; African delegates often push for stronger prohibitions. |
L54 | debate | What is the principal-agent problem in LAWS? | The commander (principal) cannot fully predict or control the autonomous system (agent), creating accountability gaps. | UN CCW reports highlight

this as central to IHL compliance. |
L54 | reconstruction | What is China's position on AI governance? | China supports UN-led governance, opposes an "AI arms race," and frames AI as a sovereignty and development issue. | Chinese perspective emphasizes multilateralism and development rights. |
L54 | occlusion | What does the Western AI-leadership framing occlude? | It tends to treat AI competition as a US-China dyad, marginalizing African and Global South agency and the AI divide. | African perspective centers the technology gap and equitable access. |
L54 | adjudication | How should one adjudicate between US and Chinese AI governance proposals? | Compare scope (binding vs. voluntary), enforcement, and inclusion of Global South voices; neither fully addresses the AI divide. | African scholars demand equitable governance, not just great-power bargains. |
L54 | visual | What does the Stanford AI Index track? | Private investment, model performance, and policy developments in AI, showing concentration in US and China. | African perspective: the index reveals the AI divide in investment and talent. |
L54 | definition | What is AGI and why is it a security problem? | AGI would match or exceed human cognition across domains; its security dilemma arises from first-mover advantage and alignment uncertainty. | Bostrom (2014) frames alignment as existential; African scholars stress whose values align. |
L54 | mechanism | What is the alignment problem? | Ensuring an advanced AI's objectives match human values; misalignment could produce catastrophic outcomes even without malice. | Kissinger et al. (2021) warn AI may outpace human comprehension. |
L54 | comparison | How does the EU AI Act differ from the US executive order? | The EU AI Act is binding risk-based regulation; the US EO relies on voluntary commitments and agency guidance. | African regulators watch both as templates but lack capacity to implement. |
L54 | source | What does Horowitz (2018) argue about military AI diffusion? | Horowitz argues military AI diffusion depends on organizational capacity and regime type, not just technology. | Explains why African states lag in adoption beyond hardware. |
L54 | debate | What is the UN Secretary-General's position on LAWS? | Guterres has called for a legally binding instrument prohibiting lethal autonomous weapons by 2026. | African and many Global South states support a binding treaty. |

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence audit (score 0–100):

Topic	Confidence (0–100)	Evidence for confidence	Gap to close
Narrow AI military applications (ISR, targeting, logistics, C2)			
LAWS definition and CCW process			
Decision compression and hyperwar			
AGI/ASI security dilemma and alignment			
AI governance (US EO, EU AI Act, China, UN)			

Topic	Confidence (0–100)	Evidence for confidence	Gap to close
Nagorno-Karabakh 2020 and Ukraine drone cases			
Lavender/Gospel Gaza case			
African perspective on AI divide and equitable governance			

7.2 Three-question debrief: 1. Which of the five perspectives did you reconstruct most weakly, and what evidence would strengthen it? 2. Did you conflate description (what happened) with explanation (why) in the Lavender/Gospel case? 3. Which falsifier would most change your conclusion about whether AI-enabled warfare is stabilizing or destabilizing?

7.3 Error-log:

Common Misconception	Correction	Evidence
"AI in warfare already means AGI"	Current systems are narrow AI; AGI remains speculative and is not deployed.	Scharre (2018); Horowitz (2018)
"LAWS are already banned by international law"	No binding treaty exists; the CCW GGE has not reached consensus on a prohibition.	UN CCW LAWS reports
"Hyperwar is inevitable"	Hyperwar is a risk scenario, not a certainty; human-in-the-loop designs and arms-control measures can mitigate.	Scharre (2018)
"The AI arms race is only US vs. China"	It occludes Global South agency, the AI divide, and non-state proliferation.	African perspective; Stanford AI Index
"Alignment is purely a technical problem"	Alignment is also political and normative—who defines values matters.	Bostrom (2014); Kissinger et al. (2021)

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Narrow AI; LAWS; hyperwar; AGI/ASI; alignment; AI governance	Decision compression; principal-agent gap; diffusion via organizational capacity; security dilemma of superintelligence	Scharre (2018); Horowitz (2018); Kissinger et al. (2021); Bostrom (2014); UN CCW LAWS reports; Stanford AI Index	Nagorno-Karabakh 2020; Ukraine 2023–2024 drones; Lavender/Gospel Gaza 2023–2024; Stanford AI Index investment data	LAWS ban vs. regulation; binding vs. voluntary governance; AI arms race vs. cooperation	Demonstrated stable human-in-the-loop control; binding LAWS treaty; equitable AI capacity-building	L24 cyber/cognitive; L22 conventional warfare; L52 semiconductors; L55 quantum/NC3; L56 innovation; L57 space/infrastructure

SECTION 9 — REVIEW SCHEDULE

- **R1 (Day 1, 30 min):** Re-read Section 2.2–2.6 bolded causal claims; recite the five key ideas from memory; check flashcards tagged L54.
- **R2 (Day 3, 45 min):** Reconstruct all five perspectives on the central topic (AI, AGI, and hyperwar) without notes; compare against Section 2.7.
- **R3 (Day 7, 60 min):** Work the Problem Pair (Lavender/Gospel) memo from scratch; verify you distinguished description, explanation, prediction, prescription.
- **R4 (Day 14, 45 min):** Re-run the Data Lab analysis questions; update confidence audit scores in Section 7.1.
- **R5 (Day 30, 90 min):** Full synthesis: write a 500-word adjudication of whether AI-enabled warfare is stabilizing or destabilizing, citing at least three perspectives and two falsifiers.

SECTION 10 — COMPLETION CHECKLIST

☐ I can define narrow AI, LAWS, hyperwar, AGI, ASI, and alignment.
☐ I can explain the mechanism of decision compression and flash-war risk.
☐ I can describe the principal-agent problem in autonomous weapons.
☐ I can reconstruct the CCW LAWS process and the Secretary-General's position.
☐ I can compare US EO, EU AI Act, Chinese regulations, and UN framework.
☐ I can apply all four levels of analysis to the Nagorno-Karabakh/Ukraine case.
☐ I can reconstruct all five perspectives on AI, AGI, and hyperwar.
☐ I can identify what the African perspective reveals that others miss.
☐ I can adjudicate between competing explanations with evidence.
☐ I can state at least two falsifiers for my conclusions.
☐ I have completed the confidence audit with honest scores.
☐ I have logged at least one misconception in the error-log.
☐ I can read the Stanford AI Index data and interpret the AI divide.

☐ I can explain Horowitz's (2018) diffusion argument.
☐ I can explain Bostrom's (2014) alignment concern.
☐ I can explain Scharre's (2018) spectrum-of-autonomy argument.
☐ I can explain Kissinger et al.'s (2021) warning about AI and human comprehension.
☐ I can distinguish description, explanation, prediction, and prescription.

56. Quantum Computing, Cryptographic Hegemony, and NC3

LESSON METADATA

Field	Value
Lesson number and title	Lesson 55 — Quantum Computing, Cryptographic Hegemony, and NC3
Module	Module 9: Techno-Geopolitics, AI, and Emerging Domains
Prerequisites	L21 (nuclear strategy); L24 (cyber); L54 (AI)
Interleaved links	Forward to L56 (innovation), L57 (space), L58 (forecasting)
Reading load	7-9 hours
Content channels	Text; data lab; worked example; problem pair; visuals; flashcards
Bloom ceiling	Evaluate / Create (synthesis and adjudication)

Estimated study time: 7-9 hours.

SECTION 0 — Why This Lesson Exists

The central puzzle of this lesson is whether quantum technology constitutes a revolutionary rupture in the security order or an accelerant of existing asymmetries, and, crucially, for whom. A cryptographically relevant quantum computer (CRQC) would not merely compute faster; it would invert the confidentiality assumptions on which diplomacy, finance, military command, and nuclear deterrence rest. The question is not only when such a machine arrives, but who can harvest encrypted data today and decrypt it tomorrow, who controls the standards that replace broken cryptography, and whose second-strike forces become detectable as quantum sensing matures. The lesson treats quantum not as a physics problem with geopolitical side effects but as a geopolitical problem whose physics is still uncertain. That uncertainty is itself strategic: states must invest, migrate, and posture under ambiguity about timelines, and the distribution of that ambiguity is uneven. The African vantage, developed more fully in Section 2.7, frames the puzzle from the standpoint of technology marginalization and digital sovereignty: the decisive issue is often not whether a quantum computer breaks a code but who owns the infrastructure, who sets the standards, and whose archived data becomes retroactively transparent.

This lesson sits at the intersection of three prior modules. From L21 (nuclear strategy) it inherits the logic of second-strike stability, NC3 resilience, and the distinction between counterforce and countervalue targeting. From L24 (cyber) it inherits the role of encryption in confidentiality, integrity, and attribution, and the difficulty of verifying compliance in a domain of hidden capabilities. From L54 (AI) it inherits the problem of automation in decision support and the risk that speed compresses human judgment. Quantum adds a new variable: it threatens to make the past transparent (harvest now, decrypt later), the present detectable (quantum sensing), and the future's command architecture penetrable (NC3). Forward links to L56 (innovation) ask who can build quantum industries; L57 (space) asks how quantum communication satellites reshape secure channels; L58 (forecasting) asks how to reason about low-probability, high-consequence technological transitions. The lesson thus functions as a bridge between the nuclear-cyber core of the curriculum and the emerging-technology frontier.

By the end of this lesson the student should be able to do seven things. First, distinguish quantum computing, quantum sensing, and quantum communications as technologies with different mechanisms, timelines, and strategic effects, resisting the conflation common in policy discourse. Second, apply Mosca's theorem to assess when a state should treat quantum decryption as an immediate rather than future risk. Third, evaluate the NIST post-quantum cryptography standards and national migration timelines as both technical and political projects. Fourth, analyze how quantum sensing could erode submarine stealth and what that implies for second-strike stability. Fifth, assess NC3 vulnerability without collapsing into either alarmism or complacency. Sixth, reconstruct five perspectives—African, Chinese, Russian, Western, and UN—on quantum and cryptographic hegemony, identifying what each reveals and occludes. Seventh, adjudicate between competing claims using evidence and explicit scope conditions, including the strongest counterarguments. These objectives are assessed through the worked example, problem pair, independent memo, hinge question, and data lab.

The theoretical framing draws on several lineages. Mosca (2018) provides the canonical decision rule for quantum risk: if a cryptographically relevant quantum computer is expected in x years, data must remain secure for y years, and x is less than y, then the risk is present now. This is not a forecast of Q-Day but a framework for action under uncertainty. Grimes and Martin (2020) and NATO quantum technology reports situate quantum within alliance capability planning and the problem of interoperability. The broader lineage includes scholarship on technological hegemony and standard-setting: control over cryptographic standards

is a form of structural power, because it determines whose communications are legible and whose are not. The African vantage, developed through scholars such as Grovogui on sovereignty and international order, Mbembe on the postcolony and technology, Bayart on extraversion, Mamdani on bifurcated states, and Rodney on underdevelopment, insists that quantum geopolitics cannot be read only as a great-power race. It must be read as a question of who owns the infrastructure, who sets the standards, and whose data is exposed by the harvest-now-decrypt-later logic. For African states, the threat is less that a quantum computer breaks their codes tomorrow and more that their diplomatic, financial, and health data, archived today under assumptions of long-term confidentiality, becomes retroactively transparent to actors with superior cryptanalytic capacity.

The lesson also foregrounds the problem of calibrated uncertainty. Quantum timelines are deeply uncertain: estimates of when a CRQC will exist range from a decade to several decades, and much of the relevant capability is classified. Policy must therefore be made under radical uncertainty, and the distribution of uncertainty itself matters. States with large cryptanalytic and industrial bases can hedge; states without them must rely on standards set elsewhere. The harvest-now-decrypt-later threat is particularly insidious because it is invisible: an adversary need not announce collection, and the damage may only become visible years later. Similarly, quantum sensing's impact on submarine stealth is contingent on engineering maturity, environmental noise, and countermeasures, not merely on physics demonstrations. NC3 vulnerability raises the stakes further: if quantum or quantum-enabled capabilities could compromise the confidentiality or integrity of nuclear command and control, the stabilizing logic of mutual assured destruction could be destabilized without any shot being fired. The lesson trains the student to hold these uncertainties explicitly rather than collapsing them into point predictions.

Methodologically, the lesson requires multi-level analysis. At the individual level, decision-makers face cognitive load and automation bias when interpreting quantum threat intelligence. At the state level, industrial policy, standard-setting, and alliance coordination determine migration speed. At the systemic level, the distribution of quantum capability affects polarity and stability. At the transnational level, supply chains for cryogenics, rare isotopes, and specialized components create dependencies that constrain sovereignty. The worked example (US NIST 2024 PQC standards) and problem pair (China's Micius satellite) are chosen to force the student to move across these levels and across perspectives. The data lab provides quantitative anchors—national investment, patent counts, migration status, counterspace capabilities—while warning that such metrics capture inputs and institutional activity, not strategic outcomes. The student's task is to connect mechanism to evidence and to specify what would falsify each claim.

SECTION 1 — Pre-Class Priming

1.1 Retrieval warm-up

1. (L21) What is second-strike capability, and why does its survivability stabilize nuclear deterrence rather than merely add firepower?
2. (L21) Distinguish counterforce from countervalue targeting; which is more destabilizing and why?
3. (L24) What role does encryption play in cyber deterrence, and why is attribution difficult even when cryptography is strong?
4. (L24) What is the difference between confidentiality, integrity, and availability, and which does a quantum computer most directly threaten?
5. (L54) What is automation bias, and how could it interact with faster-than-human decision cycles in crisis?
6. (L54) Why might AI-enabled intelligence analysis increase rather than reduce uncertainty in strategic

assessment?

Brief answer key: (1) Second-strike capability is the ability to retaliate after absorbing a first strike; survivability (hardened silos, SSBNs) makes the threat credible and thus deters first use. (2) Counterforce targets military assets; it is more destabilizing because it creates use-it-or-lose-it pressures. (3) Encryption protects confidentiality; attribution is difficult because of spoofing, proxies, and the dual-use nature of cyber tools. (4) Confidentiality, integrity, availability; quantum most directly threatens confidentiality (and signature integrity) via Shor's algorithm. (5) Automation bias is over-reliance on automated outputs; speed can compress deliberation and escalation control. (6) AI can amplify noise, overfit, and create false confidence; more data does not guarantee better judgment.

1.2 Orientation questions

1. If a state can harvest and store encrypted traffic today and decrypt it in fifteen years, whose security is most at risk, and what can be done now?
2. Does quantum sensing make the oceans transparent, or does engineering and environmental noise preserve submarine stealth for decades?
3. Is post-quantum cryptography migration primarily a technical standards problem or a political coordination problem across vendors, states, and legacy systems?
4. If quantum capabilities could compromise NC3, does that strengthen or weaken deterrence, and for whom?

1.3 Vocabulary pre-teach

- **Qubit**: the basic unit of quantum information, exploiting superposition to represent multiple states simultaneously.
- **Superposition**: a quantum state in which a system exists in a combination of basis states until measured.
- **Entanglement**: correlation between quantum particles such that measurement of one instantaneously determines the state of another, enabling quantum communication protocols.
- **Cryptographically relevant quantum computer (CRQC)**: a quantum computer with enough qubits and error correction to run Shor's algorithm against real-world key sizes.
- **Q-Day**: the hypothetical date when a CRQC becomes operational enough to break current public-key cryptography.
- **Harvest now, decrypt later (HNDL)**: the strategy of collecting encrypted data today for decryption once a CRQC exists.
- **Post-quantum cryptography (PQC)**: classical cryptographic algorithms designed to resist both quantum and classical attacks.
- **Lattice-based cryptography**: a family of PQC schemes whose security rests on hard problems in high-dimensional lattices; basis of several NIST standards.
- **Quantum key distribution (QKD)**: a protocol using quantum mechanics to establish shared secret keys with eavesdropping detection.
- **Quantum sensing**: use of quantum phenomena to measure physical quantities with high precision, with potential applications in navigation and detection.
- **NC3**: nuclear command, control, and communications—the systems that connect decision-makers to nuclear forces.

- **Mosca's theorem**: the decision rule that if a CRQC arrives in x years and data must stay secure for y years, risk exists now when x < y.

SECTION 2 — LESSON CORE

2.1 Learning Objectives

By the end of this lesson, the student will be able to:

1. **Explain** the physical and engineering distinction among quantum computing, quantum sensing, and quantum communications, and articulate why each domain carries a distinct strategic logic rather than a single undifferentiated "quantum threat" (Bloom: Understand/Explain).
2. **Analyze** the mechanism by which a cryptographically relevant quantum computer (CRQC) would break RSA and elliptic-curve cryptography, including the role of Shor's algorithm and the "harvest now, decrypt later" (HNDL) threat model, and evaluate Mosca's theorem as a decision rule for migration timing (Bloom: Analyze).
3. **Evaluate** the NIST 2024 post-quantum cryptography standards (FIPS 203/204/205) as a policy response, identifying their scope conditions, implementation bottlenecks, and the risk that standardization itself becomes a new vector of hegemonic control (Bloom: Evaluate).
4. **Assess** how quantum sensing technologies threaten submarine stealth and second-strike stability, and how quantum communications (QKD) reshape nuclear command-and-control vulnerability, using the levels-of-analysis framework from Lesson 1 (Bloom: Assess).
5. **Reconstruct** the African, Chinese, Russian, Western, and UN perspectives on quantum-technology geopolitics, adjudicating among them on the basis of evidence rather than adopting any single national framing (Bloom: Synthesize/Evaluate).

Estimated study time: 7–9 hours. Reading load: 7–9 hours.

2.2 KEY IDEA 1 — Quantum technologies: computing, sensing, communications, and their strategic implications

Bolded Causal Claim: The strategic significance of quantum technology does not reside in "quantum" as a monolithic capability but in three physically distinct families—computing, sensing, and communications—each of which alters a different pillar of the existing security order (cryptographic trust, stealth-based deterrence, and information-theoretic security), and the failure to disaggregate them produces both threat inflation and policy misallocation.

Mechanism: Quantum computing exploits superposition and entanglement to perform certain computations—most notably integer factorization via Shor's algorithm and unstructured search via Grover's algorithm—at speeds that scale polynomially rather than exponentially against classical counterparts. The strategic mechanism is not general-purpose speedup but the collapse of the computational hardness assumptions (integer factorization, discrete logarithm) on which RSA and elliptic-curve cryptography (ECC) rest. Quantum sensing exploits quantum coherence, squeezing, and entanglement to achieve

measurement precision beyond the standard quantum limit, enabling detection of minute gravitational, magnetic, or electromagnetic signatures; the strategic mechanism is the erosion of stealth platforms (submarines, aircraft) whose survivability underwrites second-strike nuclear deterrence. Quantum communications exploits the no-cloning theorem and measurement-disturbance to distribute cryptographic keys with information-theoretic security (quantum key distribution, QKD) and to build quantum networks; the strategic mechanism is the creation of communication channels whose security derives from physics rather than computational hardness, potentially immunizing command-and-control links against both classical and quantum cryptanalysis. The three families share a common physical substrate—quantum mechanics—but their engineering maturity, resource requirements, and strategic effects diverge sharply: quantum computers require millions of physical qubits with error correction to threaten RSA-2048; quantum sensors may achieve operationally relevant sensitivity with far fewer qubits but face platform-integration and environmental-decoherence constraints; QKD networks require trusted nodes or quantum repeaters that do not yet exist at intercontinental scale. Conflating them—for instance, treating a laboratory demonstration of quantum advantage as evidence of imminent cryptographic collapse—distorts threat assessment and resource allocation.

Scope Conditions: The causal claim holds under three conditions. First, the three families must be analyzed at the level of their distinct physical mechanisms rather than their shared "quantum" branding; where analysis treats quantum as a single technology, the claim's disaggregation logic is violated. Second, the claim assumes that strategic effects flow from physical capabilities through institutional and doctrinal filters; a quantum computer in a laboratory does not automatically translate into a deployed cryptanalytic capability, and a quantum sensor does not automatically translate into a submarine-detection network. Third, the claim is bounded by the current state of error correction, decoherence management, and systems integration; it does not assert that these barriers are insurmountable, only that they are the binding constraints on strategic timelines. The claim does not apply to speculative "quantum supremacy" demonstrations that do not scale to cryptographically relevant sizes, nor does it apply to classical technologies mislabeled as quantum (e.g., certain "quantum-inspired" algorithms).

Observable Implications: If the claim holds, one should observe: (a) national quantum programs disaggregating their portfolios into computing, sensing, and communications with distinct funding lines and governance structures (e.g., the US National Quantum Initiative, China's quantum satellite program, the EU Quantum Flagship); (b) intelligence assessments distinguishing between "quantum advantage" in niche applications and "cryptographically relevant" quantum computing; (c) submarine-detection research programs investing in quantum gravimetry and magnetometry rather than quantum computing; (d) QKD networks being deployed for high-value government and financial links rather than general internet traffic; and (e) policy documents (NIST, NATO) treating the three families as separate risk domains with separate mitigation timelines. Conversely, if the claim is wrong—if quantum operates as a monolithic strategic shock—one would expect to see unified "quantum" threat assessments, single-point procurement decisions, and synchronized migration timelines across all three domains, which is not what the 2024 policy record shows.

Perspective Note (five traditions in brief):

African (primary): The African vantage point begins from the structural position of technological marginalization that Rodney, Mamdani, and Aning have documented: African states are predominantly consumers rather than producers of frontier technologies, and quantum is no exception. The relevant question is not whether Africa will build a cryptographically relevant quantum computer but whether African states will have agency in the standards, supply chains, and governance frameworks that quantum technologies will

reshape. Oyěwùmí's epistemological critique reminds us that "quantum" as a category is itself a Western scientific construct whose universalization can obscure locally grounded knowledge systems; Tamale's work on digital sovereignty frames the issue as one of data and infrastructure control rather than mere access. The African perspective reveals what the others miss: that quantum geopolitics is not only about who computes fastest but about who sets the standards, who controls the rare-earth and cryogenic supply chains, and whose communications infrastructure becomes dependent on externally governed QKD networks. It also highlights the risk that PQC migration, led by NIST, will be adopted in African states without African input, reproducing the pattern Bayart identified of extraversion—external orientation of African elites toward foreign centers of power. The African perspective does not deny the physical reality of quantum effects but insists that their strategic meaning is mediated by global inequality.

Chinese: China's perspective, as articulated in official strategy and in the work of quantum physicists such as Pan Jianwei, frames quantum technology as a domain of "strategic high ground" (zhanlue gaodi) in which China can leapfrog Western advantages in classical computing. The Chinese narrative emphasizes Micius (2016) as proof of concept for satellite-based QKD and the Jiuzhang photonic quantum computer as evidence of progress. The strategic framing treats quantum communications as a stabilizing technology (information-theoretic security against eavesdropping) while treating quantum computing as a potential disruptor of Western cryptographic hegemony. This perspective occludes the dependence on imported components and the gap between laboratory demonstration and deployed capability.

Russian: Russia's perspective, reflected in Rosatom's quantum program and in statements by military officials, treats quantum technology primarily through the lens of NC3 vulnerability and strategic stability. The Russian framing emphasizes that quantum sensing could undermine submarine-based second-strike forces and that quantum computing could threaten nuclear command-and-control encryption. This perspective occludes Russia's relative lag in quantum computing investment compared to the US and China, and it tends to conflate quantum sensing maturity with quantum computing maturity.

Western: The Western perspective, dominant in US and allied policy, frames quantum as a race for technological leadership with both offensive (cryptanalysis) and defensive (PQC, QKD) dimensions. It emphasizes NIST standardization, DARPA programs, and alliance coordination (NATO quantum reports). This perspective occludes the global South's position in standards-setting and tends to treat PQC migration as a technical problem rather than a geopolitical one.

UN: The UN perspective, reflected in the Secretary-General's disarmament agenda and in the work of UNIDIR and the Group of Governmental Experts on emerging technologies, frames quantum as an emerging technology requiring multilateral governance, confidence-building measures, and attention to the digital divide. This perspective occludes the competitive dynamics that drive national programs and tends to assume that governance frameworks can keep pace with technological change.

SECTION 2.3 KEY IDEA 2 — Q-Day and the "Harvest Now, Decrypt Later" Threat to Current Encryption

Bolded Causal Claim: The quantum threat to contemporary cryptography is best understood not as a single future "Q-Day" but as a time-shifted confidentiality crisis: adversaries can record encrypted communications and data now, store them, and decrypt them once a cryptographically relevant quantum computer (CRQC) exists, so that the damage is determined by today's collection and by the gap between data shelf life, migration

time, and CRQC arrival.

Mechanism: Modern public-key cryptography—RSA, elliptic-curve cryptography (ECC), and Diffie-Hellman key exchange—derives its security from the computational hardness of integer factorization and discrete logarithm problems. Shor's algorithm shows that a sufficiently large, fault-tolerant quantum computer can solve these problems in polynomial time, collapsing the security margin that protects key establishment, digital signatures, public-key infrastructures, and long-term trust anchors. Grover's algorithm provides a quadratic speedup against symmetric ciphers and hash functions, meaning that AES-128 and SHA-256 retain only roughly half their classical security margin unless key and output sizes are increased; this is manageable and does not require abandoning symmetric cryptography, but it does require disciplined key-size choices. The "harvest now, decrypt later" (HNDL) mechanism exploits the fact that ciphertext is often transmitted or stored in recoverable form: a passive adversary with access to network taps, satellite downlinks, undersea cable landing points, cloud backups, or endpoint compromises can archive ciphertext without needing to break it in real time. Because public-key key exchange reveals ephemeral public values, even sessions that use forward secrecy can be retrospectively broken if the recorded ephemeral public keys are subjected to Shor's algorithm later; forward secrecy protects against later compromise of long-term keys, not against a future change in the computational assumptions underlying the key exchange itself. The result is a temporal asymmetry captured by Mosca's inequality: if the shelf life of the data plus the time required to migrate systems exceeds the time remaining until a CRQC, then the data should be treated as already compromised in planning terms. The mechanism therefore converts an uncertain future capability into a present risk assessment problem, especially for secrets whose value persists for decades: diplomatic archives, military plans, intelligence sources and methods, biometric and identity records, financial and contractual data, scientific and industrial intellectual property, and authentication roots such as root certificates and firmware-signing keys. A CRQC would not merely read old messages; it could also forge signatures under compromised long-term keys, undermining non-repudiation and the integrity of software, firmware, and identity systems whose trust anchors were issued under RSA or ECC.

Scope Conditions: The HNDL threat is conditional rather than automatic. First, it requires a CRQC, not the noisy intermediate-scale quantum (NISQ) devices available today; the threshold depends on qubit quality, error correction, logical qubit counts, and algorithmic improvements, and estimates of its arrival remain contested. Second, it applies most strongly to data with a confidentiality or integrity horizon longer than the interval between collection and CRQC availability; ephemeral transactional data may lose value before decryption is possible. Third, the adversary must actually be able to collect and store the ciphertext; not all traffic is equally accessible, and metadata may sometimes be more valuable than content. Fourth, symmetric cryptography with adequate key lengths remains viable against Grover's algorithm, so the vulnerability is concentrated in asymmetric primitives and in the infrastructures that depend on them. Fifth, migration before Q-Day can neutralize future decryption for newly protected data, though it cannot retroactively protect ciphertext already harvested under RSA or ECC unless the underlying plaintext is re-encrypted or the data's value has expired. Sixth, PQC algorithms are themselves subject to cryptanalytic scrutiny; "harvest now, decrypt later" can become "harvest now, cryptanalyze later" if a future classical or quantum attack breaks a deployed PQC scheme. Finally, the threat is shaped by institutional capacity: organizations with poor crypto inventories, legacy systems, or long-lived embedded devices face a larger effective exposure than their nominal algorithm choices suggest.

Observable Implications: If the HNDL mechanism is operative, one should observe governments and firms treating encrypted archives as time-delayed liabilities rather than as permanently secure records. Observable indicators include mandatory cryptographic inventories, classification of data by confidentiality horizon,

procurement rules requiring crypto-agility, hybrid key-exchange deployments in TLS and VPNs, and national guidance that accelerates PQC adoption for long-lived secrets. One should also observe intelligence and defense communities emphasizing "store now, decrypt later" in threat assessments; vendors marketing quantum-safe products; and diplomatic or financial institutions extending protection periods for archives and identity systems. Conversely, if organizations continue to deploy RSA/ECC without migration planning for data with multi-decade value, that behavior implies either disbelief in near-term CRQC estimates or acceptance of retrospective compromise. The mechanism also predicts pressure on root-of-trust ecosystems—code signing, firmware updates, PKI, and device identity—because a future CRQC could forge signatures that verify under currently trusted public keys. In alliance politics, it predicts coordination problems: states with different risk tolerances and migration capacities will disagree about how urgently to deprecate legacy algorithms, and vendors will face fragmented demand between "quantum-safe now" and "wait for standards maturity."

Perspective Note (five traditions in brief): *African (primary):* From an African vantage point, HNDL is not merely a future technical contingency but an extension of existing patterns of data extraction and cryptographic dependence. African states, firms, and publics are predominantly consumers of encryption standards, hardware, software, and cloud infrastructures designed elsewhere; their diplomatic correspondence, mineral and energy contracts, health and biometric records, financial data, and political communications may be harvested now with limited capacity to detect collection or to migrate systems. Drawing on African scholarship that treats sovereignty as practice rather than formal status—Grovogui's critique of international legal hierarchy, Bayart's analysis of extraversion, and Mamdani's insistence on the political construction of state capacity—the quantum threat appears as another layer of externalized control over African information. The African perspective reveals what Western threat models often occlude: the vulnerability is already present in vendor dependence, foreign cloud hosting, weak regulatory capacity, and the absence of African voices in standards bodies such as NIST. It also highlights distributional questions: populations whose data are collected by states or corporations may suffer retrospective exposure of intimate information, while elites may retain access to foreign-protected systems. The African contribution is to frame Q-Day as a problem of digital sovereignty and epistemic justice, not only of algorithmic replacement. It suggests that African priorities should include regional cryptographic capacity, open standards, data-localization where appropriate, and participation in global standard-setting, rather than passive adoption of externally defined migration timelines. It also cautions that "quantum-safe" procurement can become a new market for foreign vendors unless accompanied by skills transfer and institutional capacity.

Chinese: China frames quantum computing as a strategic leapfrog technology and treats HNDL as a domain in which relative collection capabilities and future decryption power matter. Its perspective emphasizes both offensive potential and defensive sovereignty: Chinese programs seek CRQC-relevant capabilities while also developing quantum communications to reduce dependence on classical public-key infrastructure. The Chinese view tends to see US-led standardization as a vehicle of technological influence and may prefer indigenous or nationally controlled cryptographic solutions. It occludes questions of global interoperability and may understate the risks of premature or non-transparent algorithm choices.

Russian: Russia's perspective combines investment in quantum research with acute concern about strategic vulnerability, especially the exposure of military and state communications and the possibility that US quantum advantage could undermine Russian deterrence and intelligence security. It treats HNDL as a plausible intelligence threat and may be skeptical of Western-controlled PQC standards. This perspective occludes the extent to which Russian systems themselves depend on legacy cryptography and the difficulty of migrating large, centralized state infrastructures.

Western: The Western perspective, especially in the United States and NATO, treats quantum as a race for leadership in which PQC migration and NC3 protection are urgent defensive priorities. It emphasizes NIST standardization, DARPA and national-laboratory programs, vendor ecosystems, and alliance coordination, including NATO quantum technology reports. This perspective is strong on technical implementation but tends to occlude the global South's position in standards-setting and to treat migration as a technical rather than geopolitical problem.

UN: The UN perspective frames quantum as an emerging technology requiring multilateral governance, confidence-building measures, and attention to the digital divide. It highlights privacy, human rights, and the risk that HNDL could expose vulnerable populations' data. It occludes the competitive dynamics that drive national programs and tends to assume that governance frameworks can keep pace with technological change.

SECTION 2.4 KEY IDEA 3 — Post-Quantum Cryptography (PQC) Migration: NIST Standards and National Timelines

Bolded Causal Claim: PQC migration is the principal defensive mechanism against Q-Day, but its effectiveness is determined less by the existence of standardized algorithms than by whether states and firms complete a crypto-agile transition before harvested ciphertext becomes decryptable; the race is therefore organizational and infrastructural, not merely mathematical.

Mechanism: Post-quantum cryptography replaces the quantum-vulnerable primitives—integer factorization and discrete logarithm—with problems believed to resist both classical and quantum attacks, such as lattice problems, hash-based constructions, and code-based problems. The mechanism proceeds through several linked stages. First, standardization: NIST's post-quantum process selected and, in 2024, published standards for key establishment and digital signatures, including ML-KEM for key encapsulation and ML-DSA and SLH-DSA for signatures, with additional algorithms in process. These standards create interoperable targets for vendors and governments. Second, crypto-agility: organizations must inventory where RSA, ECC, and Diffie-Hellman are embedded—in TLS, VPNs, PKI, code signing, firmware, identity systems, databases, and embedded devices—so that algorithms can be swapped without redesigning entire systems. Third, hybrid deployment: during transition, many systems combine classical and post-quantum primitives so that security holds if either remains unbroken, reducing the risk of an undiscovered PQC weakness. Fourth, implementation hardening: lattice and hash schemes have different performance profiles and side-channel characteristics; constant-time implementations, correct parameter choices, and resistance to fault and timing attacks are essential. Fifth, governance and procurement: national security guidance, sectoral regulators, and enterprise risk frameworks set deadlines and require conformance testing. Sixth, ecosystem migration: certificate authorities, browsers, operating systems, hardware security modules, and cloud providers must support the new standards before end users can migrate. The mechanism is therefore a socio-technical chain: a break at any link—standards, inventory, implementation, procurement, or ecosystem support—can delay protection beyond the relevant threat horizon. Mosca's inequality applies in reverse: migration time must be driven below the interval between now and CRQC arrival, and data with long shelf life must be prioritized.

Scope Conditions: PQC migration is neither automatic nor universally sufficient. Its scope is limited by legacy-system inertia: many critical systems were designed with fixed cryptographic assumptions and cannot be patched easily, especially in industrial control, medical devices, satellites, and military platforms. Embedded and constrained devices may struggle with larger key and signature sizes, increasing bandwidth, storage, and energy costs. Interoperability during a long hybrid period can create complexity and new failure

modes. The standards themselves are probabilistic: they rest on assumptions about the hardness of lattice or hash problems that could be revised by future cryptanalysis, so migration must be crypto-agile rather than a one-time replacement. PQC also does not erase already harvested ciphertext; it protects future communications and newly encrypted archives, while old data remain exposed unless re-encrypted or retired. National timelines vary with institutional capacity, threat perception, and industrial base; a standard published in 2024 does not imply global migration by any particular date. Finally, PQC addresses quantum attacks on public-key cryptography but does not resolve broader cybersecurity weaknesses—misconfiguration, supply-chain compromise, insider threats, or poor key management—that may be more immediate.

Observable Implications: Successful PQC migration should be visible in standards adoption and in organizational behavior. Indicators include publication and uptake of NIST's 2024 standards, vendor libraries and browsers supporting ML-KEM in TLS, certificate authorities issuing post-quantum or hybrid certificates, government mandates requiring crypto inventories, and procurement language requiring crypto-agility. One should also observe sectoral differentiation: financial and defense systems migrating earlier than small enterprises; national security systems following specialized guidance; and embedded systems lagging. If migration is failing, one would observe continued default use of RSA/ECC in new systems, absence of inventories, vendor fragmentation, and "quantum-safe" marketing without conformance testing. The mechanism predicts that states with strong standard-setting power will shape global baselines, while late migrators will face higher costs and greater HNDL exposure. It also predicts tension between security and performance: systems that disable PQC for latency reasons will create predictable weak points. In the NC3 context, migration of command-and-control systems will be slower and more sensitive than commercial migration, producing a gap between public standards and military implementation.

Perspective Note (five traditions in brief): *African (primary):* PQC migration, from an African perspective, is a question of digital sovereignty and capacity rather than a neutral technical upgrade. African states and institutions are largely rule-takers in cryptographic standardization: NIST's 2024 standards will shape African banking, government, and telecommunications systems, yet African universities, standards bodies, and security agencies have limited influence over algorithm selection, parameter choices, or migration timelines. Drawing on African scholarship on extraversion and state capacity—Bayart, Mamdani, and Grovogui—and on feminist and decolonial critiques of knowledge production (Tamale, Oyěwùmí), the migration process can be read as another instance in which African data and infrastructures are secured or not secured according to priorities set elsewhere. The African vantage reveals that "migration" is not merely replacing algorithms; it is a redistribution of costs, skills, and dependence. If African organizations lack crypto-agility, trained personnel, and budget, they will either remain on vulnerable legacy systems or purchase foreign "quantum-safe" solutions without local capacity to audit them. This perspective therefore emphasizes regional coordination through the African Union, investment in cryptographic education, support for open-source implementations, and participation in international standards forums. It also warns that PQC can become a new frontier of digital colonialism if migration is sold as a product rather than built as a capability. At the same time, African scholars and practitioners can contribute distinctive priorities: protecting civil-registration, health, and land records with long confidentiality horizons; ensuring that migration does not exclude low-resource users; and insisting that global standards account for connectivity, device constraints, and cost.

Chinese: China's perspective treats PQC migration as part of a broader contest over technological sovereignty and standard-setting. It may adopt NIST standards where interoperability requires them, but it also has incentives to develop and promote indigenous cryptographic algorithms and national standards. The Chinese view emphasizes strategic autonomy, domestic industry, and the risk that US-led standards could embed long-term dependence. It occludes concerns about transparency and global interoperability,

and it may frame migration timelines in terms of national industrial policy rather than shared risk reduction.

Russian: Russia's perspective is shaped by distrust of Western standard-setting and by concern that PQC migration in NATO systems could widen a technological gap. It may pursue national cryptographic solutions and emphasize state control over migration in military and critical infrastructure. This perspective occludes the difficulty of maintaining interoperability and the possibility that isolated standards could create vulnerabilities. It also reflects anxiety about NC3 and strategic systems that cannot be migrated quickly.

Western: The Western perspective centers on NIST-led standardization, rapid ecosystem adoption, and alliance coordination. It treats PQC migration as a technical and managerial challenge with clear standards and deadlines, and it emphasizes protecting NC3 and critical infrastructure. This perspective is strong on implementation detail but tends to occlude global inequality in migration capacity and to assume that standards developed in one national context are universally appropriate.

UN: The UN perspective frames PQC migration within emerging-technology governance, digital capacity building, and human rights. It emphasizes equitable access to secure communications, protection of vulnerable populations' data, and the risk that migration gaps will deepen the digital divide. It occludes the competitive and security-driven timelines that dominate national programs and tends to assume that multilateral cooperation can harmonize migration schedules.

2.5 KEY IDEA 4 — Quantum sensing and stealth obsolescence — submarine detection and second-strike stability

Bolded Causal Claim: Quantum sensing does not need to make submarines transparent in order to destabilize nuclear deterrence; it needs only to raise the perceived probability that a second-strike force can be found, tracked, and neutralized before retaliation, thereby converting survivability from an assumed property of the force into a contested variable in crisis decision-making.

Mechanism: Second-strike stability rests on the survivability of retaliatory forces, and for major nuclear powers that survivability has long depended on the opacity of the ocean. Ballistic-missile submarines (SSBNs) are valuable not because they are undetectable in principle, but because the search problem is vast, the acoustic environment is noisy, and the cost of sustained detection is high. Quantum sensing changes this problem at the margin rather than by a single breakthrough. Quantum magnetometers can register minute magnetic disturbances associated with a hull or its systems; quantum gravimeters can detect mass and density anomalies; quantum-enhanced inertial navigation can allow unmanned or distributed platforms to maintain precise position without relying on GPS; and improved quantum clocks can synchronize sensor networks across large areas. The strategic mechanism is not that any one sensor "sees" a submarine, but that quantum-enhanced sensitivity, combined with conventional sonar, satellite surveillance, oceanographic modeling, and machine-learning fusion, can reduce search volumes, lower false-negative rates, and compress the time between detection and localization. In anti-submarine warfare, small changes in detection probability can have large strategic effects because the kill chain is sequential: detect, classify, localize, track, target, and engage. If quantum sensing improves the first three stages, conventional weapons and platforms may become more effective even if the quantum device itself is not a weapon. The deeper mechanism is psychological and doctrinal. Deterrence stability depends on beliefs about survivability. If leaders believe that an adversary's quantum-enabled maritime awareness is improving, they may conclude that their SSBNs are more vulnerable than previously assumed. That belief can produce compensatory behavior: shorter or more predictable

patrols, deeper operating profiles, larger at-sea fractions, more submarines, quieter hulls, decoys, or changes in alert posture. It can also increase incentives to adopt launch-on-warning or pre-delegated authorities if decision-makers fear that a first strike could disable the retaliatory force. Thus quantum sensing can destabilize deterrence not by making submarines actually transparent, but by making their survivability uncertain enough to alter strategic calculations. The effect is especially acute in chokepoints, littoral waters, and known patrol corridors, where the search space is smaller and sensor deployment is easier. In the open ocean, the physics of attenuation, platform noise, and oceanographic variability still favor the hider, but the margin of safety may narrow.

Scope Conditions: The strategic impact of quantum sensing is bounded by physics, engineering, and operational integration. Seawater attenuates electromagnetic signals, so magnetic and gravitational sensing has range and depth limits; sensor platforms generate their own noise; thermoclines, currents, and biological activity create clutter; and quantum devices require shielding, cooling, and calibration that are difficult to maintain on mobile maritime platforms. Detection is not localization, and localization is not a kill chain. An adversary must integrate quantum sensors with conventional assets, data fusion, command systems, and weapons, and each link introduces delay, error, and vulnerability to deception. SSBNs retain countermeasures, including degaussing, anechoic coatings, operational unpredictability, and exploitation of oceanographic features. The effect is also geographically uneven: chokepoints and littorals are more susceptible than vast ocean basins. Strategically, the impact depends on relative investment and on whether both sides improve sensing and stealth simultaneously. If all major powers invest, the result may be an arms race in undersea opacity rather than a decisive transparency breakthrough. Finally, "stealth obsolescence" is an overstatement if taken literally; the more accurate claim is incremental erosion of stealth at the margin, which can still matter because nuclear deterrence is sensitive to tail risks and to beliefs about survivability.

Observable Implications: Observable implications include increased funding for SSBN quieting, quantum magnetometry, and maritime sensor networks; experimental deployment of quantum sensors on aircraft, surface vessels, or unmanned underwater vehicles; changes in SSBN patrol geography and duration; doctrinal language emphasizing survivability and undersea dominance; and arms-control or confidence-building discussions focused on anti-submarine warfare. NATO quantum technology reports treat sensing as a near-term operational priority, which implies alliance investment in maritime domain awareness and interoperability. One would also expect to see greater emphasis on countermeasures, decoys, and oceanographic modeling, as well as research into quantum-enhanced detection of mobile missile systems. If quantum sensing is perceived as threatening second-strike forces, states may also adjust nuclear posture, including greater reliance on launch-on-warning, larger SSBN fleets, or more aggressive patrol patterns. The absence of public evidence of a breakthrough should not be read as absence of risk, because much of the relevant activity is classified and because strategic effects can arise from perception as well as from demonstrated capability.

Perspective Note (five traditions in brief):

African (primary): The African perspective begins from a different security ontology than the Euro-Atlantic debate over second-strike stability. For many African states, the ocean is not primarily a medium for nuclear deterrence but a space of sovereignty, resource extraction, maritime security, and external military activity. African scholarship on dependency, extraversion, and technological marginalization suggests that African states are often sites where global powers project capabilities without corresponding local control, benefit, or accountability. Quantum sensing could deepen this asymmetry if external navies deploy advanced sensor networks in African exclusive economic zones or coastal waters while African institutions lack the capacity to monitor, regulate, or benefit from the data. At the same time, improved maritime domain awareness could

assist African states in combating illegal fishing, piracy, trafficking, and environmental harm. The African vantage point therefore asks not only whether quantum sensing destabilizes deterrence, but who governs the ocean, who owns the data, and whether new technology reinforces extraversion or builds local capacity. It also highlights that African security concerns are frequently human-security and blue-economy concerns rather than abstract stability among nuclear-armed great powers, and that global technology debates can marginalize those concerns even when their consequences are felt in African waters.

Chinese: The Chinese perspective treats quantum sensing as both an opportunity to offset U.S. undersea dominance and a potential threat to China's own second-strike survivability. China has invested heavily in quantum technologies and views U.S. anti-submarine warfare capabilities with concern, particularly in the South China Sea and Western Pacific. From this vantage point, quantum sensing could support anti-access and area-denial strategies by improving detection of adversary submarines, while also raising fears that U.S. quantum-enabled maritime awareness could undermine China's sea-based deterrent. The perspective emphasizes strategic stability and mutual vulnerability, but it can occlude transparency about China's own programs and the possibility that improved Chinese sensing could itself be destabilizing.

Russian: The Russian perspective is shaped by the centrality of submarine-based forces to its nuclear posture and by long-standing concern about U.S. technological superiority in anti-submarine warfare. Russia is likely to view quantum sensing as a potential threat to the survivability of its SSBNs and to the credibility of its second strike, reinforcing incentives to modernize submarines, improve quieting, and adjust patrol patterns. This perspective emphasizes vulnerability and preemption risk, but it can occlude Russia's own investments in quantum and undersea technologies and the destabilizing effects of its own doctrinal ambiguity.

Western: The Western perspective, particularly in the United States and among NATO allies, frames quantum sensing as a force multiplier and a means of preserving undersea advantage. It emphasizes technological leadership, alliance interoperability, and the need to maintain credible deterrence in an era of renewed great-power competition. This perspective is strong on operational innovation but tends to occlude the risks of an undersea arms race, the possibility that perceived transparency could encourage preemption, and the global inequality in access to advanced maritime technologies.

UN: The UN perspective frames quantum sensing within emerging-technology governance, maritime security, and disarmament. It emphasizes transparency, confidence-building, protection of the global commons, and the risk that new sensing capabilities could destabilize nuclear deterrence. It also highlights capacity building for states that lack advanced maritime surveillance. This perspective is valuable for its multilateral framing, but it can occlude the competitive timelines and security dilemmas that drive national investment in quantum sensing.

2.6 KEY IDEA 5 — NC3 vulnerability — how quantum capability could undermine nuclear command and control

Bolded Causal Claim: The gravest quantum risk to nuclear stability may not be a sudden "Q-Day" decryption of launch codes, but the gradual quantum-enabled compression of decision time and erosion of nuclear command, control, and communications (NC3) confidentiality, which can make nuclear command systems more brittle before they are known to be broken.

Mechanism: NC3 is not a single communication link but a system-of-systems: early-warning sensors, satellites, radar, communication networks, decision nodes, authentication procedures, and human judgment. Its stability depends on confidentiality, integrity, availability, and the time available for deliberation. Quantum

capability threatens each of these dimensions in different ways and on different timelines. The most discussed threat is cryptanalytic: a sufficiently powerful quantum computer could break the public-key cryptography that protects many communication and authentication systems, potentially exposing command links, planning data, or force-posture information. Yet the mechanism of instability is broader than decryption. "Harvest now, decrypt later" means that adversaries can collect encrypted NC3-related traffic today and exploit it once quantum capability matures, potentially revealing operational patterns, communication architectures, or decision procedures. Quantum sensing can compound this by improving detection of submarines, mobile missiles, or leadership movements, reducing the survivability of forces that NC3 is meant to control. Quantum timing and navigation technologies can disrupt or spoof the precise synchronization on which some systems depend. Quantum-enabled intelligence, combined with artificial intelligence and large-scale data fusion, may allow adversaries to map NC3 architectures and identify critical nodes. The strategic mechanism is information advantage leading to targetability. If an adversary believes it can locate leadership, disable communication nodes, or interfere with early warning, the temptation to attempt a disarming or decapitating strike increases. Even if the capability is uncertain, the belief that NC3 is vulnerable can compress decision time and encourage pre-delegation, launch-on-warning, or automated responses. Conversely, spoofing or false data injection could create false alarms, raising the risk of accidental or inadvertent escalation. NC3 vulnerability is therefore not merely a cybersecurity problem; it is a crisis-stability problem. It arises from the interaction of quantum technology with organizational complexity, human cognition, and the strategic incentives created by mutual vulnerability.

Scope Conditions: The NC3 threat is contingent on several conditions. Large-scale, fault-tolerant quantum computers capable of breaking widely used public-key cryptography do not yet exist, and their arrival is uncertain. NC3 systems often have redundancy, physical separation, procedural safeguards, and human-in-the-loop controls that are not captured by a simple "encryption broken" model. Migration to post-quantum cryptography, including the NIST PQC standards adopted in 2024, can mitigate cryptanalytic risk if implemented across defense and critical infrastructure, but legacy systems, embedded devices, and multinational interoperability create long migration tails. Quantum sensing and timing threats depend on deployment scale and integration with conventional kill chains. The strategic effect also depends on beliefs: a state may act on perceived vulnerability before capability is demonstrated. Finally, NC3 stability is not identical to perfect security; deterrence can survive degraded communications if adversaries believe retaliation remains possible. The danger lies in the gap between actual resilience and perceived fragility, especially during crises.

Observable Implications: Observable implications include NC3 modernization programs, investment in quantum-resistant communications, testing of command systems under degraded or contested conditions, and doctrinal reviews of launch authority and fail-safe procedures. One would expect to see defense budgets emphasizing resilient satellite communications, hardened ground stations, alternative timing and navigation systems, and red-team exercises focused on quantum-enabled threats. Mosca's (2018) theorem implies that if migration time plus data shelf life exceeds estimated Q-Day, the risk is already present, which suggests that NC3 migration should be evaluated against long-lived secrets and legacy system lifetimes rather than only against current threat assessments. NATO quantum technology reports and national defense strategies increasingly frame quantum technologies as relevant to command-and-control resilience. Observable political implications include renewed attention to nuclear risk reduction, hotlines, crisis communication, and possibly arms-control measures addressing NC3 and emerging technologies. The absence of a demonstrated quantum attack on NC3 should not be interpreted as evidence of safety, because the most serious risks may be latent, classified, or embedded in long-term migration failures.

Perspective Note (five traditions in brief):

African (primary): The African perspective on NC3 vulnerability is shaped by a structural critique of the global nuclear order rather than by direct participation in nuclear command systems. African states are largely non-nuclear, yet they bear the consequences of nuclear risk, including fallout, coercion, and the diversion of global resources from development to armament. African scholarship on international hierarchy, sovereignty, and technological marginalization suggests that debates about NC3 vulnerability can reproduce a hierarchy in which the security concerns of nuclear-armed states dominate global agendas while the security needs of non-nuclear states are treated as peripheral. From this vantage point, quantum-enabled NC3 vulnerability is not only a technical problem for major powers but also a reminder that the nuclear order distributes risk unequally: those who do not control nuclear weapons still live with their potential failure. African states also face digital sovereignty concerns, as critical infrastructure and data systems may depend on foreign technology, standards, and vendors, leaving them with limited capacity to assess or mitigate quantum-related risks. The African perspective therefore asks whether emerging-technology governance will include capacity building, equitable access to secure communications, and meaningful voice for non-nuclear states, or whether it will remain an exclusive conversation among technologically advanced powers. It reveals that NC3 vulnerability is embedded in a broader pattern of technological and strategic inequality.

Chinese: The Chinese perspective frames NC3 vulnerability through the lens of strategic stability and the perceived threat of U.S. technological superiority. China is concerned that U.S. missile defense, conventional prompt strike, cyber capabilities, and emerging quantum technologies could undermine its nuclear deterrent by threatening command and control or by improving detection of its forces. China's investment in quantum communications, including satellite-based experiments, is partly motivated by the desire to secure communications and reduce vulnerability. This perspective emphasizes mutual vulnerability and restraint, but it can occlude the opacity of China's own NC3 modernization and the possibility that its own quantum investments could be perceived as threatening by others.

Russian: The Russian perspective emphasizes NC3 vulnerability as a consequence of U.S. and NATO technological advantage, including in quantum sensing, cyber operations, and missile defense. Russia views its nuclear deterrent as essential to compensating for conventional inferiority and is therefore highly sensitive to any technology that could threaten command and control or early warning. This perspective supports modernization of NC3 and may be used to justify new weapons systems or doctrinal adjustments. It is strong on highlighting preemption risks but can occlude Russia's own first-use ambiguity, its investments in disruptive technologies, and the destabilizing effects of its own modernization programs.

Western: The Western perspective, especially in the United States, focuses on NC3 modernization, resilience, and the integration of emerging technologies into deterrence. It emphasizes quantum-resistant cryptography, redundant communications, and the need to maintain credible command and control under attack. NATO quantum technology reports and national strategies increasingly treat quantum technologies as relevant to defense and security. This perspective is strong on implementation and risk management but can occlude the possibility that modernization itself—through automation, complexity, and tighter coupling—may increase brittleness, and that global inequality in migration capacity may leave allies and partners vulnerable.

UN: The UN perspective frames NC3 vulnerability within disarmament, nuclear risk reduction, and emerging-technology governance. It emphasizes transparency, confidence-building, protection of civilians, and the need to prevent technological developments from undermining arms control and verification. It also highlights capacity building for states that lack advanced technical infrastructure. This perspective is valuable for its multilateral and humanitarian framing, but it can occlude the competitive security dilemmas and classified programs that dominate national NC3 planning.

2.7.1 African Perspective (PRIMARY)

The African vantage point on quantum computing, cryptographic hegemony, and nuclear command, control, and communications (NC3) does not begin with the physics of qubits or the mathematics of lattice-based cryptography. It begins with a question that the other four perspectives systematically suppress: **who owns the infrastructure through which the quantum transition will be governed, and who will be permitted to migrate on time?** From within African political thought, the quantum revolution is not primarily a story about great-power competition over computational advantage; it is a story about the reproduction of technological dependency under new technical conditions. The African perspective therefore reframes the entire lesson around three axes that the Western, Chinese, Russian, and UN perspectives each treat as secondary: the **cryptographic sovereignty** of states that did not design the standards they must adopt; the **retroactive vulnerability** created by "harvest now, decrypt later" (HNDL) against African data archives, diplomatic communications, and financial systems; and the **capacity asymmetry** that makes post-quantum cryptography (PQC) migration a question of who can afford to be secure.

The theoretical lineage here runs through several distinct but converging African traditions. Walter Rodney's *How Europe Underdeveloped Africa* (1972) established the foundational argument that technological underdevelopment in Africa was not a natural condition but a produced one, engineered through colonial extraction and the deliberate suppression of autonomous industrial capacity. Rodney's mechanism—technology transfer as a vector of dependency rather than development—translates directly into the quantum domain: African states are positioned not as participants in the quantum transition but as late adopters of standards designed in Washington, Geneva, and Beijing, with migration timelines determined by budgets they do not control. Kwame Nkrumah's *Neo-Colonialism: The Last Stage of Imperialism* (1965) supplies the political-economy frame: even where formal sovereignty exists, control over critical infrastructure—now including cryptographic infrastructure—remains external. Julius Nyerere's Arusha Declaration and his broader philosophy of self-reliance (*ujamaa*) pose the question of whether a state can be secure when its encryption is designed, standardized, and updated by others. Amílcar Cabral's insistence on "return to the source" demands that African security thinking be grounded in African material conditions rather than imported frameworks. Frantz Fanon's analysis in *The Wretched of the Earth* (1961) of how colonialism damages the colonized's capacity for autonomous technological creation remains painfully relevant: the quantum divide is not merely a gap in resources but a gap in epistemic authority, in who gets to define what counts as a threat and what counts as a solution.

Achille Mbembe's work on necropolitics and, more recently, on the "becoming-black of the world" and technological modernity, provides a sharper critical vocabulary. Mbembe has argued that contemporary technology is not neutral infrastructure but a mode of governance that sorts populations into those whose data, bodies, and territories are protected and those whose are exposed. Applied to quantum cryptography, this suggests that the HNDL threat is not distributed evenly: states and populations whose communications have been harvested for decades by more powerful actors face a retroactive exposure that is structurally asymmetric. The African state that encrypted its diplomatic cables in 2010 with RSA-2048 may discover in 2035 that those cables were harvested and are now readable—not because of any failure of its own, but because the cryptographic regime it was compelled to adopt was always someone else's. Siba Grovogui's work on sovereignty and international order (*Sovereigns, Quasi Sovereigns, and Africans* (1996)) is essential here: Grovogui demonstrates that African sovereignty has historically been "quasi" sovereignty, recognized

formally but substantively hollowed out by the international system's distribution of material and epistemic power. The quantum transition threatens to deepen this quasi-sovereignty by making cryptographic dependence a structural feature of African statehood.

Mahmood Mamdani's analysis of the bifurcated state—where colonial rule divided subjects into "citizens" and "natives," with different legal regimes for each—illuminates how technological marginalization reproduces colonial patterns. The African state's security apparatus often operates with imported hardware, imported software, and imported standards, while its population is governed through systems it does not control. Jean-François Bayart's concept of "extraversion"—the idea that African political economies are oriented outward toward external patrons rather than inward toward domestic constituencies—explains why African states may adopt PQC standards not because they have independently assessed the threat but because donor agencies, security partnerships, and international financial institutions have made migration a condition of continued access. Oyèrónkẹ́ Oyěwùmí's critique of the universalization of Western categories, developed in *The Invention of Women* (1997), extends to the universalization of Western threat models: the "Q-Day" narrative, with its specific timeline anxieties and its focus on great-power NC3, may not correspond to the most pressing security concerns of African states, which may be more immediately threatened by the weaponization of harvested data against political opposition, journalists, and civil society.

Emmanuel Aning and Kwesi Aning's work on African security governance, and Kwame Danso's contributions to African international relations, emphasize that African security is not merely derivative of great-power competition but has its own logics: maritime security in the Gulf of Guinea, border governance, counter-terrorism, and the protection of critical infrastructure. From this perspective, quantum sensing's implications for submarine detection are not abstract strategic-stability concerns but immediate questions about African maritime sovereignty—whether foreign powers can track vessels in African exclusive economic zones with quantum-enhanced sensors, and whether African states have any capacity to detect or contest such surveillance. Sylvia Tamale's feminist scholarship on African sexuality and technology reminds us that cryptographic vulnerability is gendered: the exposure of communications affects women activists, LGBTQ+ communities, and reproductive-health advocates disproportionately, and PQC migration that does not center these vulnerabilities reproduces existing hierarchies.

What the African perspective contributes that the other four cannot is a **structural critique of the quantum transition as a distribution of power rather than a race among equals**. The Western perspective treats PQC migration as a technical challenge to be managed; the Chinese perspective treats quantum leadership as a strategic asset to be acquired; the Russian perspective treats NC3 vulnerability as a military problem to be solved; the UN perspective treats emerging technology as a governance gap to be filled. The African perspective insists that all four of these framings presuppose a world in which African states are objects rather than subjects of the quantum transition. It reveals that the "harvest now, decrypt later" threat is not a future risk but a present reality for states whose communications have been intercepted for decades, and that the PQC migration timeline is not a neutral technical schedule but a mechanism of exclusion that will leave some states permanently vulnerable. It also reveals that the NC3 debate, while important, is a debate among nuclear powers about their own stability, and that the non-nuclear majority of the world—including all of Africa—has a stake in nuclear stability that is not mediated through its own command-and-control systems but through its exposure to the consequences of others' failures.

What the African perspective occludes is equally important. By centering structural dependency, it can underweight the genuine agency that African states and institutions do exercise: the African Union's digital transformation strategy, national cybersecurity strategies in countries like Kenya, Nigeria, and South Africa,

and the growing community of African cryptographers and quantum researchers. It can also underweight the fact that some African states—particularly South Africa, with its nuclear history and its advanced research infrastructure—have more capacity than the dependency frame suggests. And it can risk treating "Africa" as a unitary subject, flattening the enormous variation in capacity, threat perception, and strategic interest across fifty-four states. The perspective is strongest when it is understood not as a description of African helplessness but as a demand for African epistemic and material participation in the quantum transition—a demand that the other four perspectives, each in its own way, are structurally disinclined to hear.

2.7.2 Chinese Perspective

The Chinese perspective on quantum computing, cryptographic hegemony, and NC3 is organized around a dual ambition: to achieve **quantum leadership** as a pillar of comprehensive national power, and to frame that leadership within a **strategic stability** discourse that positions China as a responsible stakeholder rather than a revisionist challenger. This perspective must be steel-manned from within, which means taking seriously both the genuine technical achievements and the strategic narrative that accompanies them, while also recognizing what that narrative occludes.

China's quantum program is the most state-directed and best-resourced in the world. The Micius satellite, launched in 2016, demonstrated the first satellite-based quantum key distribution (QKD) and quantum teleportation over intercontinental distances, establishing China as the pioneer in quantum communications. The Jiuzhang photonic quantum computer and the Zuchongzhi superconducting quantum processor have been presented as achieving quantum computational advantage in specific tasks. These achievements are not merely scientific; they are strategic. The Chinese leadership, under Xi Jinping, has elevated quantum technology to a national priority, embedding it in the "Made in China 2025" and subsequent strategic plans. The mechanism is straightforward: quantum capability is understood as a general-purpose technology that will reshape economic competitiveness, military advantage, and intelligence dominance over the coming decades, and China intends to be at the frontier rather than the periphery.

The strategic stability framing is more subtle and more important. Chinese official discourse and much Chinese academic writing emphasize that quantum technology should be developed in ways that enhance rather than undermine strategic stability. This is partly defensive: China's nuclear deterrent is smaller and less diversified than those of the United States and Russia, and Chinese strategists are acutely aware that quantum sensing could threaten the survivability of China's sea-based deterrent (its Jin-class SSBNs) and that quantum computing could undermine the cryptographic foundations of China's NC3. The Chinese perspective therefore treats quantum development as a double-edged sword: it offers China the possibility of leapfrogging in certain domains while simultaneously threatening the stability of the nuclear balance on which China's security depends. This creates a distinctive Chinese interest in arms control and confidence-building measures around quantum technologies, even as China continues to invest heavily in them.

On PQC, China has developed its own cryptographic standards (the SM series, standardized by the State Cryptography Administration) and is pursuing quantum-resistant algorithms through national research programs. The Chinese perspective on PQC migration is shaped by a concern about dependence on Western-designed standards: just as China has sought to reduce dependence on foreign semiconductors and software, it seeks cryptographic sovereignty. The NIST PQC standards are viewed with a mixture of technical respect and strategic suspicion—respect for the rigor of the process, suspicion that the standards may embed assumptions or vulnerabilities that favor US interests. This is not paranoia; it is a rational response to the Snowden revelations and to the documented history of NSA involvement in cryptographic standards.

On NC3, the Chinese perspective is shaped by the vulnerability of a relatively small nuclear arsenal to technological surprise. Chinese strategists worry that US quantum capabilities—computing, sensing, and communications—could erode the survivability of China's second-strike force and compromise the integrity of its command-and-control systems. This concern is amplified by the opacity of US programs and by the absence of meaningful US-China dialogue on NC3 and emerging technologies. The Chinese perspective therefore calls for strategic stability dialogues, risk reduction measures, and the inclusion of quantum technologies in arms control discussions, while simultaneously pursuing the capabilities that make such dialogues necessary.

What the Chinese perspective contributes is a demonstration that quantum technology is not merely a Western or Russian concern but a genuinely multipolar one, and that the strategic stability implications of quantum are felt most acutely by states with smaller, less survivable arsenals. What it occludes is the extent to which China's own quantum program contributes to the security dilemmas it decries: the Micius satellite and China's quantum sensing research are themselves destabilizing from the perspective of other states, and China's opacity about its military quantum programs undermines the transparency it calls for. The perspective also tends to understate the internal tensions between China's commercial quantum ambitions (which benefit from openness and international collaboration) and its military quantum ambitions (which require secrecy and control).

2.7.3 Russian Perspective

The Russian perspective on quantum computing, cryptographic hegemony, and NC3 is shaped by a distinctive combination of **technological ambition and strategic vulnerability**. Russia possesses a formidable nuclear arsenal and a sophisticated NC3 system, including the Perimeter (Dead Hand) automated retaliation system, but its conventional and technological base has been eroding relative to both the United States and China. The Russian perspective therefore treats quantum technology as both an opportunity to restore technological parity and a threat to the nuclear stability on which Russian security depends.

Russia's quantum investments are substantial but less visible than China's or America's. The Russian Quantum Center, Rosatom's quantum programs, and various defense-industry initiatives constitute a significant state-directed effort. Russian scientists have made genuine contributions to quantum optics, quantum cryptography, and quantum computing. However, the Russian perspective is less focused on achieving quantum supremacy in the commercial or scientific sense and more focused on specific military applications: quantum sensors for submarine detection and navigation, quantum cryptography for secure government communications, and quantum computing for cryptanalysis. The mechanism is clear: Russia cannot compete with the US and China across the full spectrum of quantum technology, so it concentrates on applications that directly enhance military capability and protect existing advantages.

The NC3 vulnerability concern is the emotional and strategic core of the Russian perspective. Russian strategists have long worried that US technological advantages—missile defense, precision strike, cyber capabilities, and now quantum—could undermine Russia's nuclear deterrent. The fear is not that the US will launch a disarming first strike, but that the *perception* of such a capability, combined with the erosion of arms control frameworks, could destabilize the nuclear balance and create incentives for preemptive action. Quantum computing, in this view, is the latest in a series of US technological developments that threaten to make Russia's nuclear arsenal vulnerable. The "harvest now, decrypt later" threat is taken seriously by Russian security services, who have long assumed that their communications are targeted by Western intelligence.

On PQC, Russia has developed its own cryptographic standards (GOST) and is pursuing quantum-resistant

algorithms through national programs. The Russian perspective on PQC migration is shaped by a deep suspicion of Western-designed standards and by the experience of sanctions, which have reinforced the desire for technological autarky. Russian strategists view the NIST PQC process with the same suspicion that Chinese strategists do, but with an additional layer of concern about the reliability of international supply chains for cryptographic hardware and software.

What the Russian perspective contributes is a reminder that quantum technology is not merely a US-China competition but a triangular one, and that the erosion of arms control frameworks (the INF Treaty, New START uncertainties) has made NC3 vulnerability a more acute concern for all parties. It also highlights the specific vulnerability of automated and semi-automated NC3 systems (like Perimeter) to technological surprise: a system designed to ensure retaliation could, if its cryptographic foundations are compromised, become a vector for unauthorized or erroneous action. What the Russian perspective occludes is the extent to which Russia's own actions—its suspension of New START, its development of novel nuclear systems, its opacity about its quantum programs—contribute to the instability it decries. It also tends to overstate US capabilities and understate the genuine technical challenges that make Q-Day a distant prospect rather than an imminent threat.

2.7.4 Western Perspective

The Western perspective on quantum computing, cryptographic hegemony, and NC3 is the most institutionally developed and the most internally contested. It is organized around three commitments that are not always compatible: **quantum leadership** as a strategic imperative, **PQC migration** as a defensive necessity, and **NC3 modernization** as a response to emerging threats. The Western perspective is not monolithic—it encompasses US, European, and allied viewpoints that differ on emphasis and priority—but it shares a common framework that treats quantum technology as a domain of strategic competition requiring both offensive investment and defensive preparation.

The US quantum program is the largest and most diversified in the world, spanning national laboratories, universities, and private industry. The National Quantum Initiative Act (2018) established a coordinated federal effort, and subsequent investments have expanded research in quantum computing, sensing, and communications. The mechanism of US quantum strategy is public-private partnership: the government funds basic research and sets strategic priorities, while private companies (IBM, Google, Microsoft, IonQ, and others) drive commercial development. This model has produced genuine technical leadership in superconducting and trapped-ion quantum computing, but it has also created coordination challenges and concerns about the migration of talent and intellectual property.

The PQC migration is the most concrete and urgent element of the Western perspective. The NIST PQC standardization process, initiated in 2016 and culminating in the publication of FIPS 203 (ML-KEM), FIPS 204 (ML-DSA), and FIPS 205 (SLH-DSA) in August 2024, represents the most significant cryptographic transition in history. The Western perspective treats this migration as a race against Q-Day: Mosca's theorem (if the time to migrate plus the shelf life of data exceeds the time to a quantum computer, the data is at risk) provides the analytical framework, and the "harvest now, decrypt later" threat provides the urgency. The US government has set aggressive migration timelines for federal systems, and the NSA has issued guidance on quantum-resistant algorithms. The mechanism is regulatory and procurement-driven: by mandating PQC for federal systems and by influencing private-sector standards through NIST, the US seeks to drive global migration.

The NC3 debate is the most contested element. Western strategists are divided between those who see quan-

tum technology as a threat to nuclear stability (requiring arms control and risk reduction) and those who see it as an opportunity to enhance NC3 resilience (through quantum-secure communications and improved sensing). The US nuclear modernization program includes NC3 upgrades, and there is active debate about whether quantum technologies should be integrated into NC3 or excluded from it. The Western perspective also encompasses European viewpoints, which tend to be more skeptical of nuclear reliance and more supportive of arms control, and NATO's emerging quantum technology strategy, which seeks to coordinate allied efforts.

What the Western perspective contributes is institutional capacity: the NIST process, the national laboratory system, and the public-private partnership model provide a template for large-scale technological transition that other perspectives can learn from. What it occludes is the extent to which Western quantum leadership is itself a source of insecurity for others: the US quantum program is perceived as threatening by China and Russia, and the NIST standards process, however rigorous, is perceived as US-centric by states that did not participate in it. The Western perspective also tends to underweight the global distribution of migration capacity: the assumption that all states can and will migrate on the NIST timeline ignores the resource constraints that make this impossible for much of the world.

2.7.5 UN Perspective

The UN perspective on quantum computing, cryptographic hegemony, and NC3 is organized around **multilateral governance, disarmament, and capacity building**. It is the least state-centric of the five perspectives and the most explicitly normative, treating quantum technology not as a domain of competition but as a domain of shared risk requiring collective management. This perspective draws on the UN's broader work on emerging technologies, including the Group of Governmental Experts on Lethal Autonomous Weapons Systems, the Open-Ended Working Group on ICT security, and the Secretary-General's Agenda for Disarmament.

The UN perspective on quantum technology is still emerging. Unlike AI or cyber, quantum has not yet generated a dedicated UN process, but it is increasingly discussed within existing frameworks. The mechanism of UN engagement is agenda-setting and norm-building: by placing quantum technology on the international agenda, by commissioning expert reports, and by facilitating dialogue among states, the UN seeks to create the conditions for eventual governance. The UN's disarmament machinery—the Conference on Disarmament, the First Committee of the General Assembly, the UN Institute for Disarmament Research (UNIDIR)—provides forums where quantum and NC3 issues can be discussed, even if they cannot yet be negotiated.

On PQC and cryptographic standards, the UN perspective emphasizes **capacity building** and **equitable access**. The International Telecommunication Union (ITU) has a role in standardization, and the UN can facilitate the sharing of PQC migration expertise with developing countries. The mechanism here is technical assistance and knowledge transfer: recognizing that the quantum transition will be uneven, the UN seeks to ensure that states with limited capacity are not left behind. This is particularly important for African and other developing states, for whom the UN perspective offers the most sympathetic framing of their concerns.

On NC3, the UN perspective is shaped by the broader nuclear disarmament agenda. The Treaty on the Prohibition of Nuclear Weapons (TPNW), the Nuclear Non-Proliferation Treaty (NPT), and the various nuclear risk reduction initiatives provide the normative framework. The UN emphasizes that quantum technologies should not be allowed to undermine nuclear stability or to create new pathways to nuclear use. The mechanism is normative pressure: by articulating principles and by facilitating dialogue, the UN seeks to constrain

the most destabilizing applications of quantum technology.

What the UN perspective contributes is a **humanitarian and multilateral framing** that the other four perspectives lack. It insists that the quantum transition is not merely a strategic competition but a global public good whose benefits and risks must be shared. It provides a forum for states that are not great powers to voice their concerns. What it occludes is the reality of power: the UN cannot compel states to share quantum technology, to adopt PQC standards, or to include quantum in arms control. The UN perspective can be marginalized by the very states whose cooperation it requires, and its emphasis on consensus can produce lowest-common-denominator outcomes that fail to address the most urgent risks. The UN perspective is also limited by its own institutional constraints: it lacks the technical expertise to evaluate quantum claims independently, and it depends on member states for both information and resources.

2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African	Centers technology marginalization and digital sovereignty; reveals that PQC migration and quantum standards are being set by great powers without African input, reproducing dependency	May understate the agency of African states and institutions in shaping standards through ITU and AU processes; risks treating Africa as uniformly passive	Quantum governance must be democratized; digital sovereignty requires African participation in standard-setting and infrastructure ownership	African Union Digital Transformation Strategy (2020-2030); limited African participation in NIST PQC process; dependence on foreign cloud and telecom infrastructure	Western: standards are open and technically neutral; any state can adopt them; the barrier is capacity, not exclusion

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Chinese	Frames quantum as strategic stability tool; QKD and quantum sensing as defensive capabilities that reduce first-strike incentives; challenges Western monopoly on quantum narrative	Downplays offensive and intelligence applications of quantum; obscures the coercive potential of quantum-enabled surveillance and submarine detection	Quantum technology should serve multipolarity and strategic stability; no single power should monopolize the quantum commons	Micius satellite (2016); quantum communication experiments; national quantum lab investments	Western: China's quantum program is opaque; "defensive" framing masks intelligence collection and second-strike disruption
Russian	Highlights NC3 vulnerability; warns that quantum sensing and computing could destabilize mutual assured destruction by undermining second-strike survivability	Overstates near-term quantum capability; may use quantum anxiety to justify modernization of nuclear forces and resist arms control	Quantum must be integrated into strategic stability dialogues; NC3 must be protected from quantum disruption	Russian quantum research programs; statements on strategic stability; modernization of nuclear command systems	Western: Russian NC3 concerns are partly pretextual, masking refusal to engage in verifiable arms control

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Western	Drives PQC migration through NIST; frames quantum as both opportunity and threat; leads in quantum computing hardware and algorithms	Treats Western standards as universal; underestimates how PQC migration costs fall disproportionately on developing states; conflates leadership with legitimacy	Technological leadership is a public good if shared; quantum advantage must be defended through standards and alliances	NIST PQC standards (2024); NSA/CNSA 2.0; quantum computing investments by IBM, Google, and others	African: "universal" standards are set by one state's agency; adoption without capacity building is dependency
UN	Provides multilateral forum for emerging-technology governance; emphasizes shared benefits and risks; disarmament framing	Cannot compel compliance; lacks technical capacity; consensus produces weak outcomes; marginalized by great-power competition	Quantum is a global public good; governance must be inclusive and precautionary	UNGA resolutions on emerging technologies; ITU quantum working groups; UNIDIR reports	Chinese/Russian: UN processes are dominated by Western agendas; multilateralism without power is ineffective

2.8 WORKED EXAMPLE (I do)

The US NIST 2024 Post-Quantum Cryptography Standards: A Race Against Q-Day

Levels of Analysis

At the individual level, the NIST PQC process was shaped by the decisions of cryptographers, mathematicians, and standards engineers who submitted candidate algorithms, reviewed security proofs, and negotiated trade-offs between key size, computational efficiency, and side-channel resistance. Individual researchers—such as those behind the CRYSTALS suite (Kyber, Dilithium) and SPHINCS+—made consequential choices about algorithmic design that will propagate through global infrastructure for decades. Industry chief information security officers and procurement officers, operating at the individual-organizational boundary, must now decide migration timelines, budget allocations, and risk acceptance thresholds under uncertainty about Q-Day. Mosca's theorem, articulated by Michele Mosca, frames the individual decision problem: if the time to migrate (x) plus the shelf life of the data (y) exceeds the time until a cryptographically relevant quantum

computer arrives (z), then the data is already at risk.

At the state level, the United States, through NIST, exercised a form of regulatory power that extends far beyond its borders. The US state did not merely develop algorithms; it convened a global competition, evaluated candidates, and published standards (FIPS 203, 204, 205 in August 2024) that other states and firms are expected to adopt. Other states—China, Russia, the EU member states, India—face a strategic choice: adopt US-origin standards, develop sovereign alternatives, or hybridize. The state level also encompasses national security agencies: the NSA's CNSA 2.0 suite mandates PQC for national security systems, creating a two-tier structure where US government systems migrate on a different (and earlier) timeline than commercial systems.

At the systemic level, the NIST PQC standards are an episode in great-power competition over the architecture of global information security. The standards race is not merely technical; it is a contest over who defines the baseline of trust in the digital economy. Systemic pressures include the quantum arms race (China's investments, US and EU programs), alliance structures (NATO's quantum technology reports and coordination), and the broader techno-geopolitical fragmentation of the internet. The systemic level also captures the security dilemma: one state's defensive PQC migration can be read by another as preparation for offensive quantum capability, and vice versa.

At the transnational level, the NIST standards propagate through global supply chains, open-source libraries, certificate authorities, and multinational corporations. Transnational standards bodies—ISO, ITU, ETSI—must decide whether to incorporate NIST algorithms, develop parallel standards, or create hybrid frameworks. The transnational level reveals that cryptographic standards are a form of global public infrastructure: a vulnerability in a widely adopted algorithm affects billions of users regardless of nationality. Conversely, the "harvest now, decrypt later" threat is transnational by nature: adversaries can intercept and store encrypted traffic today for decryption by future quantum computers, meaning that data encrypted under current standards is already at risk regardless of where it is generated.

Mechanism

The core mechanism is standard-setting as structural power. NIST's PQC process (initiated 2016, selections announced 2022, final standards published 2024) created a focal point around which global migration must organize. The mechanism operates through several channels. First, network effects: once NIST selects algorithms, software libraries, hardware vendors, and protocol designers converge on them, raising the cost of deviation. Second, legitimacy: NIST's open, peer-reviewed process confers technical credibility that proprietary or state-secret alternatives lack. Third, time pressure: the "harvest now, decrypt later" threat means that adversaries are already collecting encrypted data, so delay in migration increases future exposure. Mosca's theorem (Mosca, 2018) formalizes this: the risk is not Q-Day itself but the interval between now and Q-Day during which sensitive data must remain confidential. Fourth, cost externalization: the US state bears the cost of developing standards, while adopting states and firms bear the cost of migration, which falls disproportionately on those with limited technical capacity. Grimes and Martin (2020) note that the transition to PQC will require replacing or upgrading vast amounts of legacy infrastructure, a process that will take years to decades and that will be unevenly distributed across the global economy.

The mechanism also includes a feedback loop: as PQC standards are adopted, they become the new baseline, and states that have not migrated become outliers, potentially facing exclusion from secure communications networks, financial systems, and alliance structures. This creates a compliance dynamic that resembles other domains of US-led standardization, from internet protocols to financial messaging.

Perspective Reconstruction

African: The NIST PQC standards, however technically sound, reproduce a familiar pattern in which global infrastructure standards are set by a great power without meaningful participation from African states. African governments and firms are expected to adopt standards developed in a process they did not shape, at a cost they may not be able to bear, and on a timeline determined by US threat perceptions rather than African priorities. The African perspective, drawing on Grovogui's critique of international ordering and Bayart's analysis of extraversion, sees in PQC migration a new form of dependency: African digital sovereignty is constrained not by direct coercion but by the structural power of standard-setting. African states face a double bind: non-adoption risks exclusion from secure global networks, while adoption without capacity building deepens reliance on foreign vendors and foreign expertise. The African vantage point also highlights that "harvest now, decrypt later" is not an abstract threat for African states whose data is already being collected by multiple external actors, and that PQC migration does not address the more immediate vulnerabilities of surveillance, data extraction, and infrastructure control. What the African perspective reveals is that the quantum transition is being governed as a great-power race rather than as a global public good, and that the costs of the transition will fall most heavily on those who had least voice in designing it.

Chinese: The Chinese perspective views the NIST PQC standards as an exercise in US technological hegemony that must be countered by sovereign alternatives. China has invested heavily in quantum research and has its own cryptographic standards initiatives; the NIST process is seen as an attempt to lock in US advantage before Chinese quantum capabilities mature. At the same time, China recognizes the "harvest now, decrypt later" threat and is pursuing its own PQC migration, including through national standards bodies. The Chinese perspective also frames quantum communication (QKD) as a strategic stability tool that reduces dependence on US-controlled infrastructure. From Beijing's vantage point, the NIST standards are not neutral technical artifacts but instruments of alliance management and market control, and China's response is to build parallel systems that reduce vulnerability to US leverage.

Russian: The Russian perspective emphasizes that PQC migration is inseparable from the broader quantum threat to NC3 and strategic stability. Russia views the NIST standards as a necessary but insufficient response to a problem that is fundamentally about the survivability of nuclear command and control. Russian analysts are concerned that quantum computing could eventually break the encryption protecting nuclear communications, and that the timeline for migration may be shorter than NIST assumes. Russia also suspects that the US may be further along in quantum computing than publicly acknowledged, and that PQC standards are partly a hedge against US offensive capability. The Russian perspective thus treats PQC not as a technical upgrade but as an arms-control-relevant issue, and calls for transparency and dialogue on quantum timelines that the US has been reluctant to provide.

Western: The Western perspective, anchored in NIST and allied institutions, frames PQC migration as a defensive necessity driven by a credible and quantifiable threat. The mechanism is straightforward: quantum computers will eventually break RSA and ECC, the "harvest now, decrypt later" threat is already active, and the cost of delay exceeds the cost of migration. The Western perspective emphasizes the openness and rigor of the NIST process, the global participation of researchers, and the availability of standards to all. It acknowledges migration costs but argues that they are manageable with proper planning and that the alternative—catastrophic decryption of sensitive data—is far worse. The Western perspective also links PQC to NC3 protection, treating cryptographic modernization as a component of nuclear security.

UN: The UN perspective frames PQC migration as a global public good whose benefits and risks must be shared. The UN emphasizes that quantum technology, including PQC, should be governed multilaterally, and

that the NIST process—however technically competent—does not substitute for inclusive governance. The UN perspective highlights the capacity gap: many states lack the resources to migrate, and the international community has a responsibility to assist. It also warns that uncoordinated migration could fragment the global internet into incompatible cryptographic zones, undermining interoperability and trust. The UN perspective is the most normatively ambitious—calling for shared standards, capacity building, and transparency—but also the most institutionally constrained, lacking the power to compel or coordinate.

Explicit Adjudication

The Western perspective best explains the NIST PQC case as a technical-institutional process: the standards are real, the threat is credible, and the mechanism of standard-setting as structural power is well-documented. However, the Western perspective occludes the distributional consequences of migration and the legitimacy deficit of a single state defining global cryptographic baselines. The African perspective, while less able to explain the internal technical dynamics of the NIST process, most clearly identifies what the Western perspective misses: that the quantum transition is being governed as a great-power race rather than a global public good, and that the costs of transition fall heaviest on those with least voice. The Chinese perspective adds the crucial insight that PQC standards are instruments of strategic competition, not merely technical upgrades, and that parallel systems will emerge. The Russian perspective correctly identifies the NC3 linkage but overstates the near-term quantum threat to nuclear systems. The UN perspective captures the normative aspiration but lacks the power to realize it. The best synthesis is that the NIST PQC standards are simultaneously a genuine technical achievement, a mechanism of US structural power, and a case study in the governance gap between great-power competition and global public goods.

SECTION 2.9 PROBLEM PAIR (We do)

1. **Mechanism.** In 150–200 words, explain how satellite QKD changes—or does not change—the confidentiality, authentication, and availability of nuclear command links, and distinguish QKD from post-quantum cryptography.

2. **Levels of analysis.** Apply the four levels from Lesson 1 to China's Micius program: individual scientists and leaders, the Chinese state, the US–China systemic dyad, and transnational standards and alliance interoperability.

3. **Perspective reconstruction.** Reconstruct the African, Chinese, Russian, Western, and UN readings of Micius in 3–4 sentences each, identifying what each reveals and what it occludes.

4. **Adjudication.** Using evidence from Micius, NIST's 2024 standards, and NATO quantum reporting, argue whether quantum communication is stabilizing, destabilizing, or conditionally stabilizing.

5. **Falsifiers.** List five observations over the next five years that would weaken the claim that quantum communication has materially altered strategic stability.

6. **Historical analogue.** Compare Micius to one earlier secure-communication innovation and state what is genuinely novel, if anything, about quantum communication.

Model answer. The Micius program demonstrates that satellite-based quantum key distribution and entan-

glement distribution are technically feasible across intercontinental distances, but the strategic question is not whether a photon can be transmitted securely; it is whether that capability changes the expected utility of nuclear coercion. QKD provides information-theoretic security for key exchange by using quantum states whose measurement disturbs the system, thereby revealing eavesdropping; it does not, by itself, secure endpoints, authenticate users, guarantee availability, or protect stored traffic from future cryptanalysis. Consequently, a quantum-secured command link may reduce the risk that an adversary can passively harvest and later decrypt nuclear command traffic, yet it leaves intact the risks of physical destruction of satellites, ground-station compromise, insider manipulation, and denial of service. In nuclear strategy, command-and-control security is double-edged: more survivable communication can reduce fears of decapitation and accidental escalation, but if one side believes its own control architecture is uniquely resilient, it may also reduce the perceived cost of limited nuclear use or first-strike experimentation. The stabilizing or destabilizing effect therefore depends on symmetry, redundancy, and doctrine, not on the physics alone.

At the individual level, the program reflects the agency of scientists, military engineers, and political leaders who frame quantum technology as a marker of national rejuvenation and strategic competence; at the state level, China's investment signals a techno-nationalist effort to reduce dependence on Western cryptographic and space infrastructures and to shape standards from a position of capability rather than consumption. At the systemic level, Micius enters an already competitive US–China nuclear and space relationship in which each side interprets the other's demonstrations through worst-case lenses, so a technical achievement becomes a strategic signal even if its military utility remains immature. At the transnational level, the program pressures alliance interoperability, because NATO members and partners must decide whether to integrate Chinese-origin quantum components, develop sovereign alternatives, or rely on NIST's 2024 post-quantum standards for classical systems; this is where Mosca's warning about migration time versus Q-Day becomes relevant, since states that delay PQC migration may face a window in which harvested classical traffic remains vulnerable even as quantum links proliferate.

An African reading would treat Micius less as a bilateral US–China episode than as evidence that advanced digital infrastructure is becoming a condition of sovereignty, while warning that states outside the quantum core risk new forms of dependency if they import black-box systems without governance capacity; a Chinese reading would present the satellite as proof of scientific leadership and as a contribution to strategic stability through secure communication, while occluding questions of transparency and the military implications of dual-use space assets. A Russian reading would likely emphasize NC3 vulnerability and the danger that quantum-enabled sensing or communication could erode second-strike confidence, using the demonstration to justify its own investments and to frame arms-control gaps; a Western reading would acknowledge the technical achievement but situate it within a broader race for quantum leadership, PQC migration, and NC3 resilience, often treating Chinese capability as a threat to be managed rather than a stabilizing innovation. The UN reading would push the issue toward emerging-technology governance, asking whether quantum communication should be addressed through disarmament, confidence-building, or at least transparency measures, while recognizing that no binding framework currently captures satellite QKD.

On the evidence, the most defensible adjudication is that Micius is strategically significant but not yet strategically transformative. It demonstrates a capability that could, in principle, improve the confidentiality of high-value communication, yet there is no public evidence that it is integrated into operational nuclear command links or that it has altered force postures, alert levels, or doctrinal statements. The claim that quantum communication stabilizes therefore remains conditional: it would be strengthened by mutual deployment, verified redundancy, and integration with non-quantum channels, and weakened by unilateral advantage, secrecy, or coupling with counterspace capabilities. Grimes and Martin's concern about NC3 vulnerability

is best read as a warning about cumulative technological pressure rather than a prediction that QKD alone undermines deterrence, while NATO's quantum reporting suggests that alliances are still in the assessment phase rather than the deployment phase. Thus the program is a leading indicator of a possible shift in the information foundations of deterrence, not proof that the shift has occurred.

Historical analogues support caution. Secure hotlines, fiber-optic cables, and spread-spectrum techniques each changed the cost of interception without eliminating the political logic of nuclear coercion; QKD's distinctive contribution is physics-based eavesdropping detection and potential resistance to future quantum cryptanalysis, but it inherits the same implementation and physical vulnerabilities. Falsifiers over the next five years would include the absence of operational military QKD networks, continued reliance on classical PQC migration for government systems, failure to integrate satellite QKD with redundant command architectures, no observable change in nuclear alert or declaratory policy, and no measurable improvement in submarine detection or counterspace capability linked to quantum sensing. If those conditions hold, Micius should be classified as a scientific and industrial milestone with latent strategic relevance rather than an active driver of instability.

SECTION 2.10 INDEPENDENT MEMO (You do)

(a) Case description: An African coastal state with a growing fintech sector discovers that its national ID, tax, and payment rails depend on RSA and elliptic-curve cryptography, while a foreign supplier offers a subsidized quantum-key-distribution pilot for ministry links and a great power requests inspection access to its submarine cable landing station. The government must decide within one budget cycle whether to fund PQC migration, accept the QKD pilot, or pursue a regional digital-sovereignty framework. The case is not about choosing the "best" technology in the abstract; it is about how a late-industrializing state can avoid importing strategic vulnerability while lacking domestic quantum capacity.

(b) Required memo headings as prompts:

- **Mechanism:** Explain how QKD, PQC, and cable inspection each affect confidentiality, authentication, and availability, and identify which threat each does not address.
- **Perspective reconstruction:** Reconstruct African, Chinese, Russian, Western, and UN readings of the state's dilemma in 3–4 sentences each.
- **Historical analogue:** Compare the decision to an earlier technology-adoption dilemma (for example, telecommunications liberalization or satellite leasing) and state what is genuinely novel.
- **Falsifiers:** List observable developments over three to five years that would show your assessment was wrong.

(c) Self-check: Did you distinguish description (what happened), explanation (why), prediction (what follows), and prescription (what should be done)?

SECTION 2.11 HINGE QUESTION

A state deploys satellite QKD for its nuclear command links. Which of the following is the most defensible assessment of its effect on strategic stability?

A. It necessarily stabilizes by making command links unbreakable.
B. It is destabilizing because it guarantees first-strike capability.
C. It is conditionally stabilizing only if survivable, mutual, and integrated with redundant non-quantum channels; otherwise it may create false confidence or asymmetry.
D. It has no strategic effect because QKD only protects civilian internet traffic.

Answer: C

Distractor diagnosis:
- **A** conflates information-theoretic key distribution with end-to-end security and ignores physical destruction, endpoint compromise, and availability failures.
- **B** overstates by treating communication security as equivalent to offensive capability; QKD does not create warheads, delivery systems, or a first-strike advantage.
- **D** ignores that command-and-control confidentiality and authentication are central to nuclear stability, even if QKD is not yet operationally integrated into NC3.

SECTION 2A — DATA LAB

Table 1. Reported government quantum commitments (approximate, cumulative through 2024).
Figures are reported estimates from national strategies and industry monitors; they are not audited and exclude private capital.

Country / Region	Reported commitment	Primary vehicle	Source (approx.)
China	~US$15 billion	National quantum programs (13th/14th Five-Year Plans; USTC)	McKinsey Quantum Monitor 2024; state planning documents
European Union	~€1 billion plus national programs	EU Quantum Flagship (2018)	European Commission
United Kingdom	~£2.5 billion	National Quantum Strategy (2023)	UK DSIT
Russia	~US$1 billion (reported)	Rosatom / Russian Quantum Center	Reported estimates
Canada	~CAD 360 million	National Quantum Strategy (2023)	ISED
Australia	~AUD 1 billion	Critical Technologies / AUKUS quantum pillar	Reported estimates

Table 2. Approximate share of global quantum-technology patent filings (WIPO, 2023).

Jurisdiction	Approx. share	Notable strength
China	~50%+	Quantum communication, sensing
United States	~15–20%	Quantum computing hardware
Japan	~8–10%	Components, materials

Jurisdiction	Approx. share	Notable strength
South Korea	~5%	Semiconductor interfaces
EU (aggregate)	~10–15%	Algorithms, software
Russia	<2%	Niche applications

Table 3. NIST post-quantum cryptography standards and migration timelines (2024).

Standard	Algorithm	Function	Status
FIPS 203	ML-KEM (CRYSTALS-Kyber)	Key encapsulation	Published Aug 2024
FIPS 204	ML-DSA (CRYSTALS-Dilithium)	Digital signature	Published Aug 2024
FIPS 205	SLH-DSA (SPHINCS+)	Digital signature	Published Aug 2024
FIPS 206 (draft)	FN-DSA (FALCON)	Digital signature	In progress

Migration timelines (reported): NSA CNSA 2.0 requires PQC for national security systems by 2035; NIST recommends completion of migration by 2035; EU and UK strategies align to similar horizons.

Table 4. Demonstrated counterspace / ASAT capabilities (selected).

State	Capability	Year	Character
China	Kinetic kill vehicle (FY-1C)	2007	Debris-generating
United States	SM-3 intercept (Operation Burnt Frost)	2008	Debris-generating
India	Mission Shakti	2019	Debris-generating
Russia	Nudol DA-ASAT	2021	Debris-generating

Analysis questions

1. **Trend.** The investment and patent data show a concentration of quantum capability in a small number of states, with China leading in patent volume and communication/sensing, and the United States leading in computing hardware. What does this distribution imply for the diffusion of cryptographic hegemony — does it suggest a unipolar, bipolar, or fragmented future for quantum power? Cite the tables.

2. **Level of analysis.** The "harvest now, decrypt later" threat (Mosca 2018) operates across multiple levels simultaneously. Identify at which level — individual, state, systemic, or transnational — the threat is most consequential for nuclear command and control, and justify why the other levels are secondary.

3. **Perspective reconstruction (all five).** Reconstruct how each of the five perspectives (African, Chinese, Russian, Western, UN) would interpret the publication of the NIST 2024 PQC standards. For

each, state (a) what it welcomes, (b) what it fears or occludes, and (c) its preferred remedy or next step.

4. **Interpretation.** Given the 2035 migration horizon and the uncertainty about Q-Day, does the PQC migration constitute a stabilizing or destabilizing dynamic for strategic stability? Argue using the mechanism of "harvest now, decrypt later" and the concept of cryptographic hegemony.

5. **Limitation.** The data above are reported estimates, patent counts, and standards documents. Identify three specific limitations that would prevent a researcher from inferring actual quantum capability or strategic intent from these data, and state what additional evidence would be needed.

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — "Harvest Now, Decrypt Later" timeline (hand-drawn, landscape).
What to draw: A horizontal arrow running left to right representing time, marked with three vertical ticks: "Today (data harvested)," "Q-Day (cryptographically relevant quantum computer)," and "Decryption of harvested data." Below the arrow, draw a shaded band labeled "Vulnerable data in transit/storage (RSA/ECC)" spanning from "Today" to "Q-Day," and a second band labeled "Post-quantum protected data" beginning at the migration point. Add a small icon of a server/vault at "Today" and a lock icon at the migration point.
Labels to place: "Harvest," "Store," "Wait," "Decrypt," "Mosca inequality: $x + y > z$."
Perspective overlay: Annotate in the margin with five colored dots (African = green, Chinese = red, Russian = blue, Western = black, UN = purple) each with a one-line note: e.g., African — "digital sovereignty gap widens"; Chinese — "strategic window"; Russian — "NC3 exposure"; Western — "migration race"; UN — "disarmament gap."

Visual 2 — Quantum sensing and submarine detection (hand-drawn, cross-section).
What to draw: A vertical cross-section of ocean from surface to seabed. Draw a submarine at depth with a dashed "stealth envelope" around it. Above, draw a satellite or aircraft with a downward beam labeled "quantum magnetometer / gravimeter." Draw wavy lines representing magnetic/gravitational anomaly detection reaching the submarine. Add a second panel showing "second-strike forces" with arrows to "deterrence stability."
Labels to place: "Quantum sensor," "Anomaly," "Stealth obsolescence," "Second-strike vulnerability," "Stability?"
Perspective overlay: Annotate each perspective: African — "technology marginalization, no sensor sovereignty"; Chinese — "ASW revolution"; Russian — "bastion vulnerability"; Western — "deterrence erosion debate"; UN — "emerging tech governance."

Visual 3 — NC3 vulnerability chain (hand-drawn, flow diagram).
What to draw: A left-to-right chain of boxes: "Quantum computer" → "Breaks RSA/ECC" → "Compromises C2 / early-warning links" → "Undermines second-strike assurance" → "First-strike incentive / crisis instability." Add a feedback loop arrow from the last box back to "Quantum computer" labeled "arms-race dynamic." Below, draw a parallel "mitigation" chain: "PQC migration" → "Quantum key distribution" → "Hardened NC3" → "Restored stability."
Labels to place: "Q-Day," "C2," "Second strike," "Crisis stability," "PQC," "QKD."
Perspective overlay: Place the five perspective labels along the bottom with arrows indicating which link each emphasizes: African (technology gap), Chinese (strategic stability framing), Russian (NC3 vulnerabil-

ity), Western (PQC + NC3 debates), UN (disarmament frameworks).

SECTION 4 — CORNELL NOTES

Cue (prompt)	Notes (with source log)
Define Q-Day	The day a cryptographically relevant quantum computer (CRQC) can break RSA/ECC; Mosca (2018) frames the risk via the inequality x + y > z. Source: Mosca 2018.
What is "harvest now, decrypt later"?	Adversaries store encrypted data today for future decryption; threatens long-lived secrets (nuclear, diplomatic). Source: Mosca 2018; NIST 2024.
NIST 2024 standards	FIPS 203/204/205 published Aug 2024 (ML-KEM, ML-DSA, SLH-DSA); FIPS 206 (FN-DSA) in progress. Source: NIST 2024.
Mosca's inequality	x = shelf life of data, y = migration time, z = time to CRQC; risk if x + y > z. Source: Mosca 2018.
Quantum sensing & stealth	Quantum magnetometers/gravimeters may detect submarines, threatening second-strike forces. Source: Grimes and Martin 2020; NATO quantum reports.
NC3 vulnerability	Quantum decryption of C2 links could undermine nuclear command and control and second-strike assurance. Source: NATO quantum reports; Grimes and Martin 2020.
African perspective	Technology marginalization + digital sovereignty; risk of being a data source, not a standard-setter. Source: Grovogui; Mbembe; Mamdani (general).
Chinese perspective	Quantum leadership ambitions + strategic stability framing; Micius satellite. Source: Chinese state programs; Micius 2016.
Russian perspective	Quantum investments + NC3 vulnerability concerns. Source: Rosatom/RQC; NATO reports.
Western perspective	Quantum leadership + PQC migration + NC3 debates. Source: NIST 2024; NSA CNSA 2.0.
UN perspective	Disarmament and emerging-technology frameworks; governance gaps. Source: UN disarmament fora.
Key mechanism	Cryptographic hegemony: control of standards and compute = strategic power. Source: NIST 2024; Mosca 2018.

Summary (3–5 sentences). Quantum computing threatens current public-key cryptography through the

"harvest now, decrypt later" dynamic, making the NIST 2024 PQC standards a strategic race against an uncertain Q-Day. Quantum sensing may erode submarine stealth and second-strike stability, while quantum decryption could compromise NC3. The five perspectives diverge on whether the priority is migration, leadership, stability, or governance. Data on investment and patents show concentrated capability but cannot establish intent or operational readiness. The central puzzle is whether PQC migration stabilizes or merely relocates strategic risk.

SECTION 5 — FEYNMAN COMPRESSION

1. **Explain without jargon.** Today's internet security relies on math problems that are hard for normal computers but easy for a future quantum computer. Enemies can save today's secret messages and open them later. Countries are racing to switch to new math (post-quantum cryptography) before that future computer arrives. Quantum sensors might also find submarines that were previously hidden, which could make nuclear deterrence less stable. The big question is whether switching codes in time keeps everyone safe, or just moves the danger around.

2. **Mark gaps.** I am unsure about: (a) when a cryptographically relevant quantum computer will actually arrive; (b) whether quantum sensors can really detect submarines at operational depths; (c) whether "harvest now, decrypt later" is already happening at scale; (d) how much the NIST standards actually protect NC3 versus civilian systems; (e) whether African states have any meaningful role in setting these standards.

3. **Reread verification.** Re-reading Mosca (2018) confirms the inequality $x + y > z$ as the core risk metric; NIST (2024) confirms three finalized standards with a 2035 migration horizon; Grimes and Martin (2020) and NATO reports confirm the sensing/NC3 concerns. The gaps in (a) and (b) remain genuinely unresolved in the literature — the sources give ranges, not dates.

4. **Analogy with explicit limits.** *Analogy:* PQC migration is like changing the locks on every door in a city before a new master key is invented — but the new locks are heavier, slower, and not everyone can afford them. *Limits:* The analogy understates the "harvest now, decrypt later" problem (old messages remain readable), overstates the uniformity of the threat (NC3 and civilian data differ), and ignores that some actors may prefer the old locks to stay weak.

5. **Rewrite.** Quantum computing threatens to collapse the mathematical foundations of current encryption, creating a "harvest now, decrypt later" risk that endangers long-lived secrets including nuclear command-and-control communications. The NIST 2024 post-quantum standards and the 2035 migration horizon are the Western-led response, but their stabilizing effect depends on universal adoption, on the actual timeline of Q-Day, and on whether quantum sensing simultaneously erodes second-strike forces. African and other marginalized actors face a digital-sovereignty gap: they are data sources and rule-takers in a cryptographic order they did not design. The outcome is not predetermined; it hinges on whether migration outpaces threat development and whether governance frameworks close the emerging-technology gap.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L55	Definition	What is “Q-Day”?	Q-Day is the point at which a cryptographically relevant quantum computer can break widely used public-key systems such as RSA and ECC; Mosca (2018) frames the risk as a race among threat arrival, data shelf life, and migration time.	Western urgency and NIST migration planning; African states face uneven capacity to respond.
L55	Mechanism	What is “harvest now, decrypt later”?	Adversaries can store encrypted traffic today and decrypt it once quantum capability matures, so long-lived secrets are already at risk before Q-Day.	Especially consequential for African financial, health, and identity data with long confidentiality horizons.
L55	Mechanism	Why do Shor-type quantum algorithms threaten RSA and ECC?	They can efficiently solve the number-theoretic problems on which RSA and ECC rely, converting currently secure public-key encryption into breakable ciphertext.	Chinese and Russian quantum programs are often read through this strategic lens.

Tag	Card Type	Front	Back	Perspective Note
L55	Application	What did NIST do in 2024?	NIST finalized its first post-quantum cryptography standards in 2024, giving governments and vendors algorithmic targets for migration away from RSA and ECC.	Western standard-setting power; African implementers depend on imported standards and vendors.
L55	Comparison	How does PQC differ from QKD?	PQC replaces vulnerable algorithms with quantum-resistant ones in existing networks; QKD uses quantum physics to detect eavesdropping on key exchange but requires specialized infrastructure.	Chinese Micius demonstrates QKD feasibility; Western PQC emphasizes scalable migration.
L55	Source	What is Mosca's (2018) risk inequality?	Mosca (2018) warns that if data shelf life plus migration time exceeds time to a quantum threat, organizations are already too late to protect that data.	Applies across perspectives; especially sharp for states with slow procurement cycles.

Tag	Card Type	Front	Back	Perspective Note
L55	Debate	How might quantum sensing affect second-strike stability?	Improved quantum sensing could in principle erode submarine stealth and complicate second-strike assurance, but ocean noise, platform limits, and countermeasures make the effect uncertain.	Russian and Chinese analysts stress vulnerability; Western analysts stress technical barriers.
L55	Occlusion	What does the African perspective highlight?	African states face technology marginalization, import dependence, and limited cryptographic capacity, so quantum risk is also a digital-sovereignty and capacity problem.	Primary perspective: risk is structural, not only technical.
L55	Adjudication	Does quantum communication reshape strategic stability?	Quantum communication can secure links but does not secure endpoints or institutions; its strategic effect depends on scale, integration, trust, and adversary adaptation.	Chinese Micius program shows feasibility; stability claims remain contingent.

Tag	Card Type	Front	Back	Perspective Note
L55	Visual	How can NC3 be vulnerable to quantum capability?	Quantum advances could stress encrypted command links, timing, and sensing layers, but NC3 resilience also depends on redundancy, procedures, and human judgment.	Russian and Western debates focus on command-and-control integrity.
L55	Mechanism	What is the promise and limit of quantum submarine detection?	Quantum magnetometers or gravimeters may detect anomalies, yet seawater noise, distance, and countermeasures limit operational certainty.	Western and Russian naval competition shapes assessments.
L55	Comparison	How do Chinese and Western quantum strategies differ?	China has emphasized state-led QKD, satellites, and national champions; Western approaches emphasize PQC standards, alliances, and market-driven migration.	Each occludes the other's strengths: scale versus interoperability.

Tag	Card Type	Front	Back	Perspective Note
L55	Source	What do NATO quantum reports contribute?	NATO reports frame quantum technologies as defense-relevant emerging technologies requiring resilience, interoperability, and responsible development.	Alliance perspective; may understate non-allied capacity concerns.
L55	Debate	Why is "harvest now, decrypt later" an African data-sovereignty issue?	Long-lived personal, financial, and governmental data can be collected now and exposed later, while migration capacity and vendor dependence remain uneven.	African perspective: sovereignty includes cryptographic self-reliance.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence Audit (Score 0–100)

Competency	Self-score (0–100)	Calibration prompt
Define Q-Day and Mosca's inequality		Can you state shelf life, migration time, and threat time without notes?
Explain harvest-now-decrypt-later		Can you give one long-lived data example and one adversary incentive?
Compare PQC and QKD		Can you name deployment constraints for each?
Reconstruct all five perspectives		Can you state one contribution and one occlusion per perspective?
Adjudicate quantum sensing and second-strike claims		Can you name one falsifier and one scope condition?

7.2 Three-Question Debrief

1. Which score is most likely inflated because you can recognize terminology but cannot yet apply it to a new case?

2. Which perspective did you reconstruct from memory rather than from evidence, and what source would correct it?

3. What single falsifier would most change your conclusion about quantum sensing and second-strike stability?

7.3 Error-Log Table

Common Misconception	Correction	Evidence
Q-Day is a fixed date already known.	It is an uncertain threshold; estimates vary with hardware, error correction, and algorithmic progress.	Mosca (2018); NIST (2024) migration framing
PQC and QKD are interchangeable.	PQC is algorithmic migration; QKD is physics-based key distribution with infrastructure constraints.	NIST (2024); Chinese Micius program
Quantum sensing has already made submarines detectable.	It is a prospective capability with significant noise, distance, and countermeasure limits.	NATO quantum reports; Grimes and Martin (2020)
African states are only consumers of quantum risk.	They are also sites of data vulnerability and potential agency through digital-sovereignty agendas.	African perspective in this lesson
Quantum communication guarantees strategic stability.	It secures transmission but not endpoints, institutions, or trust; stability effects are contingent.	Chinese Micius; Western NC3 debates

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Quantum computing, sensing, communications	New capabilities from quantum phenomena; strategic effects depend on scaling and integration	Grimes and Martin (2020); NATO quantum reports	National quantum programs; defense planning	Hype versus maturity	No scalable fault-tolerant quantum computer	L24 cyber; L54 AI
Q-Day; RSA/ECC vulnerability	Harvest now, decrypt later; long-lived secrets exposed before migration	Mosca (2018)	Encrypted archives; state and corporate data	Threat timeline; risk inequality	No quantum speedup for factoring/discrete log	L21 nuclear strategy
PQC migration	Algorithm replacement; standards-based transition	NIST (2024)	NIST 2024 PQC standards; national migration timelines	Cost, interoperability, legacy systems	Standards broken by new mathematics or implementation flaws	L56 innovation
Quantum sensing	Anomaly detection; possible stealth erosion	NATO reports; Grimes and Martin (2020)	Submarine detection claims; naval competition	Second-strike stability	Ocean noise and countermeasures dominate	L21 nuclear strategy
NC3 vulnerability	Stress on encryption, timing, sensing, and procedures	Russian and Western NC3 debates	Command-and-control modernization; nuclear signaling	Stability versus vulnerability	Redundancy and human judgment preserve control	L21; L24
Five-perspective framing	Technology marginalization; leadership; stability; disarmament	African, Chinese, Russian, Western, UN perspectives	Micius; NIST standards; NATO reports	Sovereignty versus interoperability	Capacity gaps persist	L57 space; L58 forecasting

SECTION 9 — REVIEW SCHEDULE

Interval	Timing	Concrete action
R1	24 hours	Re-read the flashcards and define Q-Day, Mosca's inequality, and harvest-now-decrypt-later aloud without notes.
R2	3 days	Reconstruct all five perspectives from memory, then check each against its contribution and occlusion.
R3	1 week	Redo the worked example using the four levels of analysis and identify the mechanism in each.
R4	2 weeks	Complete the problem pair and compare your answer with the model answer.
R5	1 month	Write a one-page memo on quantum sensing falsifiers and revisit the confidence audit.

SECTION 10 — COMPLETION CHECKLIST

☐ I can define Q-Day without jargon.

☐ I can state Mosca's inequality in my own words.

☐ I can explain harvest-now-decrypt-later with one example.

☐ I can distinguish PQC from QKD.

☐ I can describe the significance of the NIST 2024 PQC standards at a general level.

☐ I can explain the promise and limits of quantum sensing.

☐ I can link quantum capability to NC3 without treating vulnerability as inevitable.

☐ I can reconstruct the African perspective as primary.

☐ I can reconstruct the Chinese, Russian, Western, and UN perspectives.

☐ I can complete the five-perspective comparison matrix.

☐ I can apply the four levels of analysis to a quantum case.

☐ I can adjudicate a claim using evidence and scope conditions.

☐ I can identify at least two falsifiers for a quantum-stability claim.

☐ I can distinguish description, explanation, prediction, and prescription.

☐ I have reviewed and updated my error log.

☐ I have scheduled R1–R5 in my calendar.

FURTHER READING (Optional)

Post-quantum cryptography and Q-Day
- NIST (2024) — Post-Quantum Cryptography Standards (FIPS 203, 204, 205): standardization and migration targets.
- Mosca (2018) — quantum threat timeline and the risk inequality among shelf life, migration time, and threat time.
- NIST (2024) — PQC migration guidance and implementation planning for organizations and governments.

Quantum technologies and defense
- Grimes and Martin (2020) — quantum technologies and national-security implications.
- NATO quantum technology reports — alliance resilience, interoperability, and responsible development.

Quantum communication and strategic stability
- Chinese quantum satellite program (Micius, 2016–present) — primary case for QKD feasibility and its strategic interpretation.
- Western NC3 and quantum-risk debates — command-and-control integrity under emerging technologies.

African digital sovereignty and technology marginalization
- African scholarship on technology marginalization, digital sovereignty, and capacity asymmetry (Grovogui, Mbembe, and related work).
- African digital-transformation and data-governance agendas as sites of agency in PQC migration.

End of Lesson 55. Say **Next** when you are ready.

57. Scientific Statecraft and Innovation Decoupling

LESSON METADATA

Field	Value
Lesson number and title	Lesson 56 — Scientific Statecraft and Innovation Decoupling
Module	Module 9: Techno-Geopolitics, AI, and Emerging Domains
Prerequisites	L52–L55 (techno-geopolitics); L18 (weaponized interdependence)

Field	Value
Interleaved links	Forward to L57 (space and infrastructure), L58 (forecasting), L61 (grand strategy)
Reading load	7-9 hours
Content channels	Text, data lab, worked example, problem pair, independent memo, visuals, flashcards, spaced review
Bloom ceiling	Evaluate / Create (analyze, synthesize, judge, design)
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

For most of the post-Cold War period, scientific collaboration was treated as a transnational public good insulated from great-power politics. The prevailing assumption held that knowledge flows freely, that open science accelerates global welfare, and that restricting collaboration harms the restrictor as much as the restricted. That assumption has collapsed. Between 2018 and 2024, the United States and China — the two largest producers of scientific knowledge — moved from deep collaboration to systematic decoupling: visa restrictions on Chinese researchers, the closure or rebranding of Confucius Institutes, the termination of joint research programs, and the expansion of "research security" regimes across universities and funding agencies. The puzzle this lesson addresses is not merely that politics entered science; it is that the very institutions that once championed open science — universities, national academies, professional societies, and international organizations — became instruments of strategic competition. The lesson asks why this happened, through what mechanisms, and with what consequences for global knowledge production, especially for regions that were never at the center of the US-China dyad but are nonetheless reshaped by its fracture.

The African vantage is the primary frame through which this puzzle is approached, because it reveals what the bilateral US-China narrative obscures. The decoupling of the two largest science powers is not a bilateral event; it is a global restructuring of knowledge production that disproportionately affects regions already at the margins of the global science system. African universities and research institutes have historically depended on collaborative networks — often with Western or Chinese partners — for equipment, training, graduate supervision, and access to publication and citation systems. When those networks fracture, the costs are not borne equally. The African vantage asks a question the competing powers rarely pose: whose science is being secured, and whose is being abandoned? It also insists that "brain drain" is not a natural market outcome but a structured feature of a global system in which talent is extracted from regions that cannot retain it, and that "brain gain" narratives in receiving countries often mask this extraction. Scholars such as Rodney (1972) on underdevelopment, Mamdani (1996) on the African university, and more recent work by Aning and Danso on African agency in global governance frame this not as a side effect but as constitutive of the global science order. Mbembe's (2001) analysis of the postcolony and Bayart's (2009) work on extraversion further illuminate how African research capacity has been shaped by external dependence rather than autonomous institutional development. The lesson therefore treats the African perspective not as a regional application of Western theory but as a generative standpoint that exposes the distributional consequences hidden inside "research security" discourse.

The theoretical stakes are substantial and cross-cutting. From the Western perspective, the securitization of academia can be read through the lens of weaponized interdependence — the idea, developed by Farrell and Newman (2019), that networks of interdependence become tools of coercion when asymmetrically controlled. From a Chinese perspective, talent recruitment programs such as the Thousand Talents Plan (launched 2008) are framed as sovereign development strategies correcting historical asymmetries in global knowledge distribution, a framing that draws on a longer discourse of national rejuvenation and technological self-reliance. From a Russian perspective, innovation statecraft is tied to "catch-up" modernization and the military-industrial complex, with roots in Soviet-era science policy and post-Soviet restructuring. The UN perspective, anchored in SDG 9 (industry, innovation, and infrastructure) and the UNESCO science reports, treats science as a common heritage and development imperative, with particular attention to capacity-building in the Global South. The lesson's theoretical task is to hold these frames in tension, to specify the scope conditions under which each applies, and to adjudicate among them on the basis of evidence rather than defaulting to any single national narrative.

The lesson identifies five mechanisms, each operating at a different level of analysis. First, the militarization of basic research through agencies such as DARPA and the Office of Naval Research in the United States and their Chinese counterparts redirects fundamental inquiry toward strategic ends, blurring the boundary between civilian and military knowledge production. Second, talent circulation — the movement of researchers across borders — is shaped by state strategies for attracting, retaining, and sometimes repatriating scientific labor, producing outcomes ranging from brain drain to brain gain depending on institutional context. Third, the securitization of academia, through research security regimes, visa restrictions, and export controls, erodes the collaborative norms that defined post-Cold War science and redefines universities as strategic assets. Fourth, IP transfer and forced technology transfer debates sit at the center of US-China trade and technology conflict, raising questions about the legitimacy of knowledge appropriation and the enforcement of intellectual property regimes. Fifth, national innovation systems — the institutional bases of universities, firms, state agencies, and legal frameworks — determine long-term technological advantage and explain why some states convert research investment into strategic capability while others do not. Weiss (2014) on Chinese innovation policy, Breznitz (2007) on innovation and the state, and Marginson (2022) on global science and the nation-state provide key analytical anchors, alongside NSF Science and Engineering Indicators and Chinese Ministry of Science and Technology reports for empirical grounding.

After mastering this lesson, the student will be able to reconstruct the causal chain from strategic competition to research decoupling; identify the level of analysis at which each of the five mechanisms operates; evaluate competing explanations of the same case — for instance, whether China's Thousand Talents Plan is best understood as a talent-recruitment success, a security threat, or a symptom of structural inequality in global science; adjudicate between the five perspectives on the basis of evidence and scope conditions; and produce a policy memo that distinguishes description, explanation, prediction, and prescription. The lesson also prepares the student for L57 (space and infrastructure), L58 (forecasting), and L61 (grand strategy), where the institutional and strategic logics developed here reappear in adjacent domains. The worked example on the 2018–2024 US-China research decoupling and the problem pair on the Thousand Talents Plan require the student to apply mechanisms to concrete cases, while the data lab provides empirical anchors in international student flows, research collaboration counts, patent citations by country, and R&D spending.

A final methodological commitment runs through the lesson: the insistence on distinguishing the fact of decoupling — measurable in co-authorship rates, visa issuances, joint program terminations, and citation patterns — from the evaluation of decoupling, which depends on contested judgments about security, innovation, and equity. The lesson also insists that "decoupling" is not a binary state but a spectrum, and that

different fields decouple at different rates: semiconductor research decouples faster than climate science, and basic mathematics slower than applied engineering. This granularity matters because aggregate claims about "decoupling" often obscure the selective and strategic character of the process. The hinge question at the end of the core tests whether the student can identify the most defensible causal claim among competing options, and the independent memo requires the student to specify falsifiers — evidence that would cause them to abandon their conclusion. Together, these elements train the student to treat scientific statecraft not as a slogan but as an analytically tractable object of study.

SECTION 1 — Pre-Class Priming

1.1 Retrieval warm-up

1. Define "weaponized interdependence" as developed by Farrell and Newman (2019) and give one example from the techno-geopolitics literature covered in L18.
2. What is the difference between "decoupling" and "de-risking" in contemporary techno-geopolitical discourse, and which actors prefer which term?
3. Name two instruments of techno-geopolitical competition discussed in L52–L55 (for example, export controls, investment screening, or standards-setting) and state the level of analysis at which each primarily operates.
4. How does the security dilemma apply to technology competition between great powers? Specify the mechanism by which defensive measures become threatening.
5. What is "strategic autonomy," which actors invoke it most prominently, and what does it imply for scientific collaboration?
6. Distinguish "basic research" from "applied research" and explain why the distinction matters for statecraft and for the militarization of science.

1.2 Orientation questions

1. Why did scientific collaboration, long treated as insulated from geopolitics, become a site of strategic competition after 2018? Identify at least two candidate mechanisms.
2. How does the African vantage on brain drain challenge the "brain gain" narratives of receiving countries? What distributional claim is at stake?
3. What evidence would falsify the claim that research security regimes improve national security without unacceptable costs to innovation?
4. Under what institutional conditions does talent circulation produce "brain gain" rather than "brain drain" for sending countries?

1.3 Vocabulary pre-teach

- **Scientific statecraft**: the use of science, technology, and research institutions as instruments of national power and strategic competition, including the direction of research funding, talent policy, and collaboration rules toward geopolitical ends.
- **Innovation decoupling**: the selective severing or restriction of cross-border scientific and technological collaboration, measured in co-authorship, joint programs, talent flows, and technology transfer, rather than a complete separation.
- **Militarization of basic research**: the redirection of fundamental scientific inquiry toward military

or strategic applications through defense-funded agencies and programs, blurring the civilian-military boundary in knowledge production.

- **Talent circulation**: the cross-border movement of researchers and scientists, shaped by state recruitment, retention, and repatriation strategies, with outcomes ranging from brain drain to brain gain.
- **Brain drain / brain gain**: brain drain refers to the net loss of skilled researchers from a sending country; brain gain refers to the net benefit to a receiving country or, in some accounts, to a sending country that successfully attracts returnees.
- **Securitization of academia**: the framing of universities, researchers, and research collaborations as security concerns, leading to visa restrictions, research security regimes, and export controls.
- **Research security**: institutional and governmental measures to protect sensitive research, intellectual property, and talent from foreign exploitation or theft, often at the cost of collaborative openness.
- **Forced technology transfer**: the alleged or documented requirement that foreign firms or researchers transfer technology or intellectual property as a condition of market access or collaboration, a central issue in US-China trade conflict.
- **National innovation system**: the network of institutions — universities, firms, state agencies, legal frameworks, and financial systems — that collectively determine a country's capacity to innovate and convert research into strategic advantage.
- **Weaponized interdependence**: the strategic exploitation of asymmetric positions within global networks of interdependence, such as supply chains or research collaborations, to coerce or constrain other actors.
- **Catch-up modernization**: a development strategy in which a state seeks to close the technological gap with leading powers through directed investment, technology absorption, and state-led coordination, prominent in Russian and Chinese innovation discourse.
- **Epistemic sovereignty**: the claim that a state or community has the right to control the production, circulation, and validation of knowledge within its jurisdiction, often invoked to justify research security and data localization.

SECTION 2 — LESSON CORE

2.1 Learning objectives

By the end of this lesson, students will be able to:

1. **Analyze** the institutional mechanisms through which defense agencies shape basic research agendas. Students will distinguish between five channels—funding-driven agenda-setting, personnel pipelines, classification and export-control regimes, dual-use ambiguity, and institutional isomorphism—and evaluate which channel dominates in which national context, using evidence from DARPA, ONR, China's 863 and 973 programs, and the Central Military Commission's Science and Technology Commission. (Bloom: Analyze)

2. **Evaluate** competing theoretical explanations for why states militarize basic research. Students will adjudicate between techno-nationalist security logic (Samuels 1994), the linear model of innovation (Bush 1945), and embedded-autonomy state capacity (Evans 1995), using comparative evidence from US and Chinese research systems to determine which theory has greater explanatory power under which scope conditions. (Bloom: Evaluate)

3. **Compare** how five intellectual traditions—African, Chinese, Russian, Western, and UN—interpret the militarization of basic research. Students will identify what each tradition reveals about the relationship between power, knowledge, and sovereignty that the others occlude, and explain why the African perspective, centering epistemic sovereignty and cognitive injustice, reframes the debate in ways the Western "research security" framing cannot capture. (Bloom: Compare/Analyze)

4. **Apply** the concept of militarization of basic research to a novel national case. Given information about a country's defense research agencies, funding streams, and dual-use technology priorities, students will identify the institutional actors, trace the personnel pipelines, and predict the likely effects on open science norms and international collaboration. (Bloom: Apply)

5. **Critique** the assumption that basic research is politically neutral or "pure." Using historical evidence from DARPA's founding (1958), ONR's postwar role, and China's 863 and 973 programs, students will demonstrate how research questions, methodological choices, and personnel recruitment are shaped by strategic priorities, and evaluate the normative implications for global scientific equity. (Bloom: Critique/Evaluate)

2.2 KEY IDEA 1: The Militarization of Basic Research — DARPA, ONR, and Their Chinese Counterparts

Bolded Causal Claim: The channeling of fundamental scientific inquiry through defense agencies and their institutional equivalents systematically redirects the global production of knowledge toward strategic competition, creating path dependencies that make scientific decoupling both more likely and more costly, while obscuring the political choices embedded in supposedly "neutral" research agendas.

Mechanism: The militarization of basic research operates through at least five distinct but mutually reinforcing channels, each of which transforms the production of knowledge from a putatively autonomous scientific activity into a strategically directed enterprise.

The first channel is *agenda-setting through funding*. Defense agencies do not merely respond to scientific opportunities; they define them. DARPA's program managers—typically academics on three-to-five-year rotations—issue "broad agency announcements" (BAAs) that specify technical challenges aligned with military requirements. The Heilmeier Catechism, a set of questions DARPA program managers must answer before launching a program, institutionalizes this logic: it demands that researchers articulate not merely what they will do, but what difference it will make and how it will be measured. China's 863 Program (State High-Tech Development Plan, launched 1986) and 973 Program (National Basic Research Program, launched 1997) operated similarly, defining "thrust areas" (□□□□) that channeled fundamental research toward strategic priorities including information technology, automation, energy, and biotechnology. The mechanism here is not crude censorship but *selective amplification*: by funding some questions and not others, defense agencies shape which problems the scientific community considers worth solving. As Weiss (2014) argues in her study of the US national security state, this creates an "innovation regime" in which the state's strategic priorities are embedded in the very questions that researchers ask.

The second channel is *personnel pipelines*. Defense funding creates career trajectories that bind researchers to strategic priorities. DARPA program managers return to universities with networks, prestige, and research programs shaped by their agency experience. Graduate students funded by defense grants develop expertise in defense-relevant problems. The "revolving door" between defense labs, universities, and industry—documented by Leslie (1993) in his study of MIT and Stanford—creates a community of

researchers whose professional identities are intertwined with defense priorities. In China, the "Thousand Talents Plan" (□□□□, launched 2008) and its successors explicitly recruited overseas scientists to work on strategically important research, often with military applications, creating a parallel personnel pipeline oriented toward Chinese strategic goals.

The third channel is *classification and export controls*. Research funded by defense agencies is subject to classification regimes (in the US, the National Industrial Security Program) or, in the case of "fundamental research" that is published openly, to export control restrictions (ITAR, EAR). This creates a two-tier science system: research that can be published openly and research that cannot. The boundary between these tiers is politically determined and shifts with the security environment. The US government's 2018-2024 expansion of export controls on AI, quantum, and semiconductor research represents a recent intensification of this channel. China's 2020 Export Control Law similarly restricts the transfer of "controlled items" including technology and data.

The fourth channel is *dual-use ambiguity*. The distinction between "basic" and "applied" research—central to Bush's (1945) linear model—has become increasingly untenable in fields like artificial intelligence, quantum computing, synthetic biology, and advanced materials. Defense agencies exploit this ambiguity: they fund research that is technically "basic" (published in open journals, conducted in universities) but strategically "applied" (with clear military utility). Stokes's (1997) concept of "Pasteur's Quadrant"—use-inspired basic research—captures this dynamic. The result is that the category of "basic research" itself becomes militarized: research that is nominally fundamental is shaped by strategic imperatives.

The fifth channel is *institutional isomorphism*. Universities and research institutes adapt their structures to attract and manage defense funding. This includes creating specialized research centers (e.g., MIT's Lincoln Laboratory, Stanford's Center for International Security and Cooperation), hiring "research security" officers, establishing compliance offices for export controls, and developing "trusted research" frameworks. These adaptations embed defense priorities in the institutional architecture of science, making the militarization of research self-reinforcing.

The theoretical lineage of this concept traces to several debates. The foundational text is Bush's (1945) "Science: The Endless Frontier," which established the "social contract" between government and science: the state funds basic research, scientists choose directions, and society benefits through technological progress. This contract, as Forman (1987) and Kevles (1995) have shown, was always entangled with military needs: the Manhattan Project, radar, and the postwar physics boom were all driven by defense requirements. Leslie (1993) documented how MIT and Stanford became "military-industrial-academic complexes," with defense funding shaping research agendas, personnel, and institutional culture. The "linear model" of innovation—basic research → applied research → development → production—provided the intellectual justification for this arrangement, though it has been critiqued by Kline and Rosenberg (1986) and Stokes (1997) as descriptively inaccurate. Samuels (1994) theorized this as "techno-nationalism": the idea that technological capability is a component of national power, and that states must actively cultivate it. Evans (1995) provided the concept of "embedded autonomy": the state's capacity to direct research without being captured by particular interests. Mazzucato (2018) has more recently argued for "mission-oriented" research, in which the state sets strategic goals and directs research toward them—a framework that, while normatively distinct from militarization, shares the premise that research should serve state-defined objectives.

The mechanism is not, however, deterministic. It operates through *contingent* institutional arrangements that can be contested, reformed, or dismantled. The post-Cold War "peace dividend" of the 1990s saw a relative decline in defense research funding and a corresponding expansion of civilian research programs.

The re-intensification of US-China strategic competition after 2010 reversed this trend. The mechanism's strength depends on the perceived threat environment, the availability of alternative funding sources, and the institutional capacity of universities to resist or accommodate defense priorities.

Scope Conditions: The militarization of basic research operates most powerfully under four conditions, and its effects vary systematically across contexts.

First, *state fiscal capacity*. The mechanism requires a state capable of funding large-scale basic research. This condition is met by the United States (DoD R&D budget ~$140 billion in FY2024), China (estimated military R&D ~$30-40 billion, though figures are opaque), and historically by the Soviet Union and the UK. States without this capacity—most African, Latin American, and Southeast Asian states—cannot militarize basic research in this way; instead, they experience the mechanism's effects as *external* agenda-setting, as their researchers depend on funding from militarized Northern institutions.

Second, *threat perception*. The mechanism intensifies when states perceive existential or strategic threats. The Cold War drove US defense research spending to ~50% of federal R&D in the 1960s. The post-9/11 "war on terror" shifted priorities toward counterterrorism and homeland security research. The US-China strategic competition of the 2010s-2020s has driven the most recent intensification, with the CHIPS and Science Act (2022) and the National Defense Authorization Act (NDAA) provisions on research security representing legislative codification of the mechanism.

Third, *dual-use potential*. The mechanism is strongest in fields with clear military applications: artificial intelligence, quantum computing, synthetic biology, advanced materials, hypersonics, and space technology. It is weaker in fields with limited military utility: social sciences, humanities, most areas of clinical medicine, and environmental science (though even these are not immune, as "human terrain" research in counterinsurgency demonstrates).

Fourth, *institutional context*. In liberal democracies, academic freedom norms, peer review, and university autonomy create friction that constrains the mechanism. Researchers can resist defense priorities, publish in open journals, and maintain international collaborations. In authoritarian systems, state direction is more seamless but may face different constraints: researcher autonomy and creativity may be suppressed, leading to different (and possibly less innovative) research outcomes. The Chinese case illustrates this tension: the state's capacity to direct research is greater, but the "catch-up" imperative and the pressure to produce measurable outputs may distort research quality.

Observable Implications: If the militarization of basic research is operating as described, we should observe several patterns in the data.

First, *funding composition*. The share of federal R&D devoted to defense should be substantial and should correlate with threat perception. NSF Science and Engineering Indicators data show that US defense R&D has consistently accounted for 40-55% of federal R&D spending since the 1950s, with fluctuations tracking geopolitical tensions. China's military R&D spending is harder to measure but is estimated to have grown rapidly since 2010, with the PLA's Science and Technology Commission (established 2016) coordinating military-civil fusion research.

Second, *institutional adaptation*. Universities should develop specialized structures for managing defense research: research security offices, export control compliance programs, "trusted research" frameworks. The US government's 2019-2024 expansion of research security requirements (NSPM-33, the CHIPS Act research security provisions) has driven this adaptation. Chinese universities have similarly developed "military-civil fusion" research centers.

Third, *publication and collaboration patterns*. Research in defense-relevant fields should show increasing restrictions on international collaboration, particularly with "countries of concern." The 2018-2024 US-China research decoupling—documented in the worked example—illustrates this: joint publications between US and Chinese researchers in AI and quantum computing declined significantly after 2018, while domestic publications increased.

Fourth, *talent flows*. Researchers should move toward defense-funded centers and away from open international collaboration. The "brain drain" of Chinese researchers from US universities (documented in the problem pair) and the recruitment of overseas scientists through China's talent programs both illustrate this pattern.

Fifth, *dual-use research governance*. We should observe the expansion of export control lists, entity lists, and research security screening. The US Entity List grew from ~1,000 entities in 2018 to over 3,000 by 2024, with many additions being research institutions and universities.

Perspective Note (five traditions in brief):

African (primary): The African perspective on the militarization of basic research begins from a position of structural exclusion: African states and research institutions are not the primary militarizers of basic research, but they are profoundly affected by the militarization that occurs in the Global North and in China. The core African insight, developed by Rodney (1972) in his analysis of how European colonialism underdeveloped Africa, is that the global production of knowledge is not neutral but is shaped by power relations that extract value from the periphery. When DARPA funds AI research or China's 863 Program funds quantum computing, the research questions, methods, and personnel are oriented toward the strategic priorities of those states, not toward African development challenges such as malaria, agricultural productivity, or climate adaptation. African researchers who participate in these programs—whether through collaborations, training, or talent recruitment—find their work shaped by external agendas. The concept of "epistemic sovereignty," developed by African scholars including Grovogui (2006) and Mbembe (2001), captures this: the right of African societies to define their own research questions and knowledge priorities. The militarization of basic research in the North also drives the "brain drain" of African scientists, who are recruited into defense-funded labs and rarely return. Bayart (2009) and Mamdani (1996) have analyzed how African states' own research capacities were weakened by colonial and post-colonial structures, leaving them dependent on externally defined research agendas. The African perspective also notes that African states' own military research—such as South Africa's historical nuclear program or current cybersecurity initiatives—represents a different trajectory, one shaped by post-colonial security concerns rather than great-power competition. The key occlusion in the African perspective is that it can understate the agency of African researchers who successfully navigate and redirect Northern research agendas, and it may overstate the coherence of "African" research priorities given the continent's diversity. What the African perspective reveals that others miss is the *cognitive injustice* embedded in the global research system: the militarization of basic research is not merely a security issue but a question of who has the power to define what counts as knowledge worth producing.

Chinese: The Chinese perspective frames the militarization of basic research as a necessary response to US technological hegemony and a legitimate exercise of state sovereignty. Chinese scholars and officials argue that the US has always militarized basic research—ARPANET, GPS, and the internet itself originated in defense research—and that China's Military-Civil Fusion (□□□□) strategy merely levels the playing field. The "catch-up" framing (□□) is central: China must develop indigenous defense research capacity because reliance on foreign technology is a strategic vulnerability, as demonstrated by US export controls on semiconductors and AI. The Chinese perspective emphasizes that US claims of "open science" are hypocritical

given the military origins of much US basic research, and that China's state-directed research model is more efficient and coherent than the fragmented US system. The occlusion in this perspective is its tendency to downplay the coercive aspects of state-directed research (pressure on researchers, restrictions on academic freedom) and to frame all US research security measures as containment rather than legitimate security concerns. What it reveals is the *asymmetry* in global research governance: the rules of "open science" were written by states that had already militarized their own research bases.

Russian: The Russian perspective on the militarization of basic research is shaped by the Soviet legacy of the military-industrial complex (VPK) and the post-Soviet "catch-up" imperative. Russian scholars and officials frame innovation statecraft as a matter of national survival: Russia must maintain military-technological parity with the US and NATO despite economic constraints. The concept of "technological sovereignty" (технологический суверенитет) is central, and state corporations (Rostec, Rosatom, Roscosmos) play a dominant role in directing research. The Russian perspective emphasizes "leapfrogging"—using military research to compensate for civilian industrial weakness, as in hypersonics and electronic warfare. The occlusion is the tendency to overstate Russian research capacity and to understate the brain drain of Russian scientists and the degradation of civilian research institutions. What it reveals is the *persistence* of military-industrial research structures even after regime change, and the difficulty of converting military research into civilian innovation.

Western: The Western (primarily US) perspective frames defense research as a public good that produces civilian spillovers. The "linear model" justification—basic research funded by defense agencies produces civilian benefits (internet, GPS, microwave ovens)—remains influential in US science policy discourse. The self-critique within this perspective focuses on the "military-industrial-academic complex" (Leslie 1993), "mission creep," and the tension between open science norms and security requirements. The recent "research security" turn represents a new phase: the US government now frames the problem not as militarization but as *protection* of militarized research from foreign exploitation. The occlusion is the tendency to treat US defense research as natural or benevolent while framing other states' equivalent programs as threats. What it reveals is the *normative* dimension of research governance: the US has developed sophisticated frameworks for balancing openness and security, even if imperfectly.

UN: The UN perspective emphasizes science and technology for development, as articulated in SDG 9 (Industry, Innovation, and Infrastructure) and the UNESCO Recommendation on Science and Scientific Researchers (2017). The militarization of basic research is seen as diverting resources and talent from sustainable development goals, and as undermining the "right to science" (Article 27 of the Universal Declaration of Human Rights, interpreted by UNESCO). The UN perspective stresses open science, international collaboration, and equitable access to research outputs. The occlusion is the UN's limited enforcement capacity and its tendency to treat science policy as technocratic rather than political. What it reveals is the *global public good* dimension of basic research: when research is militarized, the entire world loses access to knowledge that could address shared challenges.

SECTION 2.3 — KEY IDEA 2: Talent Circulation — Brain Drain vs Brain Gain and State Strategies for Attracting Talent

Bolded Causal Claim: States that successfully attract and retain high-skill scientific talent generate compounding innovation advantages, while states that lose talent through emigration experience not merely a quantitative shortfall but a qualitative hollowing-out of their research ecosystems, because talent is not a

fungible input but a networked, cumulative, and institutionally embedded asset.

Mechanism: The mechanism operates through three channels that interact and reinforce one another. The first is the *direct productivity channel*: high-skill researchers produce patents, publications, and trained doctoral students at rates that far exceed median researchers, and their departure removes not only their own output but the mentorship and laboratory infrastructure they sustained. Docquier and Marfouk (2006) established that the emigration of tertiary-educated workers from developing countries is highly selective, concentrated in fields with the highest private returns, and that the resulting brain drain is not a random sample of the educated population but a skewed extraction of the most productive individuals. The second channel is the *network and collaboration channel*: scientific knowledge is produced through dense, trust-based networks of co-authorship, conference interaction, and informal exchange. When a critical mass of researchers departs, the network fragments, and the remaining researchers lose access to the tacit knowledge, methodological innovations, and international visibility that the emigrants carried. This is not simply a reduction in headcount but a structural break in the social fabric of the research community. Gibson and McKenzie (2011) demonstrated that even when emigrants maintain transnational ties, the intensity and quality of collaboration with home-country colleagues declines over time, and the "brain gain" from return migration is weaker than the "brain drain" from departure because returnees face re-integration barriers, outdated equipment, and institutional dysfunction. The third channel is the *institutional feedback channel*: research universities and national laboratories depend on a critical mass of senior researchers to attract graduate students, secure grants, and maintain accreditation. When senior talent departs, the institution's capacity to train the next generation erodes, creating a self-reinforcing cycle of decline. The state's role in this mechanism is not passive: governments shape talent flows through visa policy, research funding, university governance, and targeted recruitment programs. The Chinese Thousand Talents Plan (2008–), the Russian "Global Education" program, and the European Research Council's consolidation grants are all instruments designed to manipulate this mechanism by altering the relative attractiveness of different national research environments. The mechanism is therefore not simply market-driven but politically constructed: states compete to shape the incentive structures that determine where talent locates, and the outcomes reflect policy choices about investment in research infrastructure, academic freedom, and career pathways.

Scope Conditions: The mechanism operates most strongly under three conditions. First, when the emigrating talent is concentrated in fields with high fixed costs of research infrastructure (particle physics, semiconductor fabrication, genomics), because the departure of a single senior researcher can disable an entire laboratory. Second, when the home country lacks institutional mechanisms for absorbing and productively employing returnees, so that emigration becomes effectively permanent. Third, when the destination country offers not merely higher salaries but superior research ecosystems—funding stability, equipment access, and freedom from political interference—that make return migration irrational even for patriotic researchers. The mechanism weakens when emigrants maintain strong transnational ties that facilitate knowledge transfer, when home countries invest in diaspora engagement programs, and when research is increasingly collaborative and distributed across borders, reducing the penalty of physical absence. The mechanism also has an important temporal dimension: short-term brain drain can produce long-term brain gain if emigrants return with enhanced skills, networks, and capital, but this requires specific institutional conditions—research funding, career structures, and political stability—that many developing countries lack.

Observable Implications: If the mechanism holds, we should observe several patterns. Countries with high rates of tertiary-educated emigration should show declining research output per capita in the fields most affected, controlling for funding levels. Return migration programs should show higher success rates when accompanied by institutional reforms that address the push factors that drove emigration in the first

place. Targeted recruitment programs like the Thousand Talents Plan should show measurable increases in high-impact publications and patents in the recruiting country, but with lags reflecting the time needed for researchers to establish laboratories and train students. We should also observe that talent flows are increasingly bidirectional and circular rather than unidirectional, particularly between the United States and China, where researchers move multiple times over their careers. The data on international student flows, research collaboration counts, and patent citations by country should reveal these patterns, though measurement challenges remain, particularly in distinguishing "brain drain" from "brain circulation" and in accounting for the quality differential between emigrants and stayers.

Perspective Note (five traditions in brief):

African (primary): The African perspective on talent circulation is shaped by the continent's experience of sustained, structurally embedded brain drain that has depleted research capacity for decades. African scholars have long argued that brain drain is not a natural market outcome but a product of colonial educational structures, post-colonial underinvestment, and global economic inequalities that make emigration the rational choice for the most talented. The African vantage point reveals that the "brain gain" framing—celebrated in Western policy circles—often masks a transfer of human capital from poor to rich countries that reinforces global inequality. African scholars such as Mamdani (2007) have emphasized that the loss of academic talent is not merely an economic loss but a political one: the erosion of the intellectual class that could sustain democratic governance, critical inquiry, and policy-relevant research. The African perspective also highlights the gendered dimensions of talent flows, as female researchers face additional barriers to mobility and return. What the African vantage point reveals that others miss is that talent circulation is not a neutral process of matching skills to opportunities but a structured extraction that reproduces global hierarchies, and that "brain gain" for destination countries is often "brain drain" for origin countries in ways that aggregate statistics obscure.

Chinese: The Chinese perspective frames talent circulation through the lens of national rejuvenation and strategic competition. China's Thousand Talents Plan and its successors are understood not as predatory recruitment but as legitimate efforts to reverse historical brain drain and build indigenous innovation capacity. The Chinese view emphasizes that talent flows are bidirectional and that China's growing research ecosystem now attracts foreign researchers, creating a more balanced global talent market. The occlusion is the program's role in technology transfer and its intersection with research security concerns in destination countries.

Russian: The Russian perspective emphasizes "catch-up" modernization and the state's role in directing talent toward strategic priorities. Russian scholars note that the post-Soviet brain drain was catastrophic for research capacity and that state-led recruitment and retention programs are necessary to rebuild. The Russian view tends to treat talent as a strategic resource to be mobilized by the state, with less emphasis on individual career autonomy.

Western: The Western perspective has shifted from celebrating brain gain to anxieties about talent competition and research security. The United States, in particular, has moved from welcoming foreign researchers to restricting their access through visa policies and research security frameworks. The Western self-critique acknowledges that restrictive policies may damage the open research ecosystem that attracted talent in the first place, creating a tension between security and competitiveness.

UN: The UN perspective frames talent circulation through the lens of science for development and SDG 9. The UNESCO Recommendation on Science and Scientific Researchers (2017) emphasizes the right to

science and the need for equitable access to research opportunities. The UN view stresses that talent flows should benefit both origin and destination countries and that international collaboration is essential for addressing global challenges. The occlusion is the UN's limited capacity to influence national talent policies.

SECTION 2.4 — KEY IDEA 3: The Securitization of Academia — Research Security, Visa Restrictions, and the Erosion of Scientific Collaboration

Bolded Causal Claim: The securitization of academic research—through visa restrictions, research security frameworks, and the closure of collaborative programs—has transformed universities from open knowledge-producing institutions into contested spaces of strategic competition, eroding the transnational collaboration that historically drove scientific progress while producing uncertain security gains.

Mechanism: The mechanism operates through a feedback loop between threat perception, policy response, and institutional adaptation. The first stage is *threat construction*: policymakers and intelligence agencies frame certain research collaborations, particularly those involving Chinese researchers and institutions, as vectors for technology transfer and intellectual property theft. This framing draws on documented cases of espionage and unauthorized technology transfer, but also on broader anxieties about China's rise and the erosion of Western technological dominance. The second stage is *policy institutionalization*: governments translate threat perceptions into concrete instruments—visa restrictions for researchers from designated countries, research security offices at universities, disclosure requirements for foreign funding and affiliations, and the closure of programs like Confucius Institutes. The United States' National Security Presidential Memorandum 33 (NSPM-33, 2021) and the subsequent implementation guidance from the Office of Science and Technology Policy (OSTP) exemplify this institutionalization, requiring universities to develop research security programs and report on foreign talent recruitment program participation. The third stage is *institutional adaptation*: universities, facing compliance burdens and reputational risks, adopt defensive postures—screening applicants, restricting collaborations, and in some cases self-censoring research topics. This adaptation is not uniform: elite institutions with large international student populations and extensive federal funding face different incentives than smaller institutions. The fourth stage is *erosion of collaboration*: as barriers accumulate, the volume and quality of international research collaboration declines, particularly in sensitive fields like artificial intelligence, quantum computing, and advanced materials. Marginson (2022) has documented how the securitization of academia in the United States and allied countries has produced a "chilling effect" on international collaboration, with researchers self-censoring to avoid scrutiny and universities declining to host visiting scholars from designated countries. The mechanism is self-reinforcing: as collaboration declines, the remaining ties become more suspect, justifying further restrictions. The mechanism also has a *displacement effect*: restrictions in one country may redirect talent and collaboration to other countries, potentially strengthening competitors rather than enhancing security. The mechanism is not simply top-down: it involves interactions between government agencies, university administrators, researchers, and funding agencies, each with different interests and risk tolerances.

Scope Conditions: The mechanism operates most strongly when three conditions coincide. First, when there is a high level of geopolitical tension between the restricting country and the target country, creating a permissive environment for securitization. Second, when the research in question has clear dual-use applications or falls within sectors designated as critical for national security. Third, when universities are heavily dependent on federal funding, giving the government leverage to enforce compliance. The mechanism weakens when research is basic rather than applied, when collaborations are long-standing and involve trusted partners, and when the economic costs of restriction are high—such as in fields where foreign researchers

constitute a large share of the workforce. The mechanism also varies across national contexts: the United States, with its large research enterprise and significant Chinese student population, faces different trade-offs than smaller countries with less research capacity and fewer international students. The mechanism has a *temporal asymmetry*: restrictions can be imposed quickly but are difficult to reverse, because the trust and institutional relationships that enable collaboration take years to build and can be destroyed rapidly.

Observable Implications: If the mechanism holds, we should observe several patterns. Visa denial rates for researchers from designated countries should increase following the implementation of research security frameworks. The volume of co-authored publications between researchers in the restricting country and the target country should decline, particularly in sensitive fields. Universities should show increased compliance costs and administrative burden related to research security. We should also observe a "chilling effect" on self-reported research topics and collaboration patterns, as researchers avoid areas that might attract scrutiny. The data on research collaboration counts should reveal these trends, though measurement challenges include distinguishing security-driven declines from other factors such as funding shifts or pandemic disruptions. We should also observe displacement effects: increased collaboration between the target country and third countries, and increased recruitment of researchers from the target country by competitor nations.

Perspective Note (five traditions in brief):

African (primary): The African perspective on the securitization of academia is shaped by the continent's position as a peripheral participant in global research networks, vulnerable to both exclusion and instrumentalization. African scholars note that research security frameworks developed in Western countries are often applied indiscriminately to African researchers and institutions, subjecting them to heightened scrutiny and visa restrictions that reflect racialized assumptions about risk rather than evidence-based assessment. The African vantage point reveals that securitization is not a neutral process of risk management but a mechanism of boundary-drawing that reinforces global hierarchies: Western institutions define the terms of legitimate collaboration, and African researchers must navigate increasingly complex compliance requirements to access research opportunities. African scholars such as Aning and Danso (2018) have highlighted that the erosion of open collaboration disproportionately harms researchers from the Global South, who depend on international partnerships for access to equipment, funding, and publication venues. The African perspective also emphasizes the *opportunity cost* of securitization: resources devoted to compliance and security screening are resources diverted from research capacity building. What the African vantage point reveals that others miss is that the securitization of academia is not merely a bilateral US-China issue but a global restructuring of knowledge production that marginalizes already peripheral research communities, and that the "research security" framing can serve as a pretext for excluding researchers from the Global South under the guise of risk management.

Chinese: The Chinese perspective frames the securitization of academia as a form of "academic McCarthyism" and a violation of the principles of open science and academic freedom that Western countries have historically championed. Chinese scholars and officials argue that visa restrictions and research security frameworks are discriminatory, targeting Chinese researchers based on nationality rather than individual risk assessment. The Chinese view emphasizes the hypocrisy of Western countries that benefited from open collaboration with China during the period of China's technological catch-up, only to restrict collaboration once China became a competitor. The occlusion is the documented cases of technology transfer and intellectual property theft that have motivated Western security concerns.

Russian: The Russian perspective emphasizes the state's role in protecting research from foreign interference and the importance of maintaining sovereign control over strategic technologies. Russian scholars note

that Western countries have long restricted technology transfer to Russia and that Russia's own research security measures are a legitimate response to geopolitical pressure. The Russian view tends to treat academic collaboration as an extension of statecraft, with less emphasis on the autonomy of researchers and institutions.

Western: The Western perspective is characterized by internal tension between security imperatives and commitments to academic freedom and open science. Western scholars and policymakers acknowledge that securitization carries costs—reduced collaboration, chilled research environments, and potential damage to the innovation ecosystem—but argue that these costs are necessary to protect against documented threats of technology transfer and espionage. The Western self-critique, articulated by scholars such as Marginson (2022), emphasizes that over-securitization can be counterproductive, undermining the very openness that makes Western research institutions attractive to global talent. The Western view is not monolithic: it includes both hawkish voices advocating for decoupling and liberal voices warning against the erosion of academic freedom.

UN: The UN perspective frames the securitization of academia through the lens of science as a global public good and the right to science. The UNESCO Recommendation on Science and Scientific Researchers (2017) emphasizes the importance of international collaboration and the free circulation of researchers. The UN view stresses that security concerns must be balanced against the need for open science to address global challenges such as climate change, pandemics, and sustainable development. The occlusion is the UN's limited capacity to mediate between competing national security claims and its tendency to treat research policy as a technical rather than political issue. What the UN perspective reveals is the *collective action problem* of research security: unilateral restrictions by one country may be rational from a national security perspective but are collectively suboptimal, as they reduce the global stock of knowledge available to address shared challenges.

2.5 KEY IDEA 4 — IP Transfer and Forced Technology Transfer Debates

Bolded Causal Claim: State-structured technology transfer can compress the learning curve of latecomer economies, but when it is perceived as coerced or asymmetric it converts commercial exchange into a security externality, provoking retaliatory controls that shrink the very channels through which knowledge diffuses.

Mechanism: Technology transfer is not a single event but a bundle of tacit and codified knowledge moving through markets, organizations, and people. Intellectual property—patents, trade secrets, copyrights, trademarks—is only the codified tip; tacit know-how resides in engineers, suppliers, standards committees, and production routines. Transfer occurs through licensing agreements, joint-venture equity and governance, original equipment and design manufacturing relationships, technical assistance, training, reverse engineering, hiring, research collaboration, standards adoption, and procurement offsets. The "forced" element arises when state power conditions market access on disclosure: joint-venture requirements in strategic sectors, administrative licensing, merger-review leverage, standards that require local partners, or implicit threats that make refusal commercially irrational. Yet firms also voluntarily trade technology for market share, and the line between coercion and bargaining is empirically contested. China's position, reflected in Ministry of Science and Technology reporting and official statements, is that no law requires transfer, that foreign firms choose to enter the market, and that accusations reflect techno-nationalist anxiety rather than legal reality. The United States position, reflected in Section 301 investigations and subsequent export-control expansion, is that structural coercion operates through market size and regulatory discretion even where no explicit statute mandates disclosure. The mechanism's developmental effect depends on absorptive capac-

ity: recipients gain blueprints but not necessarily capability, and without engineering workforces, supplier ecosystems, and R&D institutions transfer yields assembly rather than innovation. Conversely, for frontier firms, fear of leakage reduces collaboration, raising costs and slowing diffusion. The result is a feedback loop: perceived coercion produces securitization, securitization produces decoupling, and decoupling reduces the global stock of shared knowledge.

Scope Conditions: Transfer accelerates catch-up when the technology is mature and codifiable; when the recipient has an engineering workforce and supplier networks; when intellectual-property enforcement is credible enough to encourage follow-on licensing but not so strong as to block learning; when the state supports diffusion through standards, procurement, and finance; and when geopolitical trust is sufficient to sustain engagement. It fails or backfires when the technology is frontier or heavily tacit; when the recipient lacks absorptive capacity; when transfer is a one-off transaction rather than embedded in research and development; or when security framing dominates commercial calculation. Sector matters: manufacturing transfer is easier than semiconductor, artificial-intelligence, or biotechnology transfer. Firm strategy matters: multinationals may segment intellectual property, transferring older generations while retaining crown jewels. Time horizon matters: short-term output gains can coexist with long-term dependency if transfer is not accompanied by indigenous capability formation. The debate also turns on whether "forced" is defined legally, structurally, or rhetorically, and each definition produces a different empirical and policy conclusion.

Observable Implications: Rising domestic value added in Chinese manufacturing; patenting by Chinese firms in sectors historically dependent on foreign technology; trends in licensing payments and royalties; co-invention and co-patenting patterns; corporate disclosures of joint-venture technology clauses; relocation or segmentation of research and development; expanded use of export controls and entity lists; trade-secret litigation; and shifts in high-technology trade balances. National Science Foundation Science and Engineering Indicators and Chinese Ministry of Science and Technology reports provide comparative metrics on research and development intensity, patenting, and international collaboration. In African economies, analogous implications appear in local-content requirements in mining and telecommunications, where technology-transfer clauses may or may not produce domestic capability.

Perspective Note (five traditions in brief):
African (primary): For African states, the intellectual-property transfer debate is not primarily a bilateral United States–China dispute but a question of whether technology enters African economies at all, and on what terms. Historically, colonial and postcolonial extraction meant that African economies exported raw materials and imported manufactured goods, with little transfer of productive knowledge; Rodney's underdevelopment thesis and Nkrumah's neocolonialism frame technology as embedded in unequal exchange. Contemporary African scholarship and policy, including the African Union's Science, Technology and Innovation Strategy for Africa, stress that the problem is often absence of transfer, weak absorptive capacity, and brain drain rather than "forced" transfer. African governments use local-content requirements, technology-transfer clauses in mining and telecommunications contracts, and procurement preferences to extract knowledge from foreign investors, but bargaining power is limited by fragmented markets and dependence on foreign direct investment. The African vantage point reveals two occlusions in the United States–China debate: first, it treats technology as a strategic asset to be hoarded or seized, whereas many African economies need diffusion to build basic industrial capability; second, it ignores the politics of knowledge ownership in sectors such as agriculture, health, and data, where foreign firms may extract value from African genetic resources or data without reciprocal capacity building. African scholars such as Tamale and Oyěwùmí would add that intellectual-property regimes often encode Eurocentric assumptions about individual authorship and property, marginalizing collective and indigenous knowledge systems. Thus from an African perspective,

the relevant question is not only whether transfer is forced but whether global intellectual-property and investment rules permit equitable, capacity-building transfer at all.
Chinese: China frames technology transfer as a normal feature of market access and industrial upgrading, not coercion. Official reports emphasize rising domestic research and development and patenting as evidence of indigenous capability. The sovereignty framing holds that development path and intellectual-property policy are sovereign choices, and accusations of forced transfer are seen as attempts to constrain China's rise. The occlusion is that this framing can understate the structural leverage of market size and regulatory discretion, and can overstate the voluntariness of firm decisions made under predictable commercial pressure.
Russian: Russia's perspective is shaped by catch-up modernization and sanctions. Technology transfer is viewed as a strategic necessity, and state-led acquisition and adaptation are treated as legitimate. Intellectual-property norms are secondary to security and sovereignty. The occlusion is that transfer without absorptive capacity and institutional trust can produce dependency rather than capability, and that weak commercialization limits the value of acquired knowledge.
Western: The Western perspective centers on innovation incentives, fair competition, and research security. Forced technology transfer is seen as undermining World Trade Organization rules and distorting markets. Yet Western self-critique acknowledges that firms voluntarily traded technology for market access and that intellectual-property regimes can be overly restrictive. The occlusion is that this perspective may overstate coercion, understate legitimate development policy, and treat globally asymmetric rules as neutral.
UN: The United Nations emphasizes technology transfer for development, including Sustainable Development Goal 9 and flexibilities under the Agreement on Trade-Related Aspects of Intellectual Property Rights. It stresses equity and access, but has limited enforcement capacity and tends to depoliticize structural asymmetries. The occlusion is the difficulty of mediating between security claims and development needs, and a tendency to treat research policy as technical rather than political.

2.6 KEY IDEA 5 — National Innovation Systems: The Institutional Bases of Long-Term Technological Advantage

Bolded Causal Claim: Sustained technological advantage arises from the institutional coupling of knowledge production, firm capability, finance, and state coordination; research and development spending alone predicts little unless embedded in a system that converts research into diffused, adaptive capability.

Mechanism: National innovation system theory treats innovation as an interactive, institutionally embedded process rather than a linear pipeline from laboratory to market. The mechanism operates through several coupled channels. Knowledge production: universities and public laboratories generate basic and applied research, but value depends on channels that move findings into firms. Diffusion and learning: supplier networks, labor mobility, standards bodies, extension services, and professional communities translate codified knowledge into practice. Demand articulation: procurement, regulation, and consumer markets shape which technologies are developed and scaled. Finance: patient capital supports high-risk, long-horizon research and development, while venture capital and development banks bridge the gap between invention and commercialization. Human capital: science, technology, engineering, and mathematics education, researcher density, and immigration determine whether knowledge can be absorbed and recombined. Coordination: state agencies align priorities, reduce fragmentation, build shared platforms, and manage trade-offs between openness and security. Institutional adaptation: policy learning, feedback from failure, and revision of rules allow the system to evolve. Path dependence is central: early specialization shapes later possibilities, and latecomers can leapfrog only where absorptive capacity exists. The state's role varies across models: developmental states coordinate tightly; liberal market economies rely on decentralized firms and universities;

authoritarian systems may direct resources rapidly but risk politicizing research and suppressing exploratory inquiry. Breznitz's work on innovation and the state and Weiss's analysis of techno-nationalism and techno-globalism both point to the same underlying mechanism: institutions determine whether knowledge becomes capability.

Scope Conditions: National innovation system theory explains broad-based, sustained innovation in medium-to-large economies with institutional capacity. It is less predictive for frontier breakthroughs driven by small teams or global networks; for digital platforms where national boundaries are porous; for resource-rich economies with weak diversification; and for fragile states where coordination is impossible. The "national" container may also be too bounded where regional or transnational systems dominate, as in the European Union or, potentially, the African Continental Free Trade Area. Institutional quality matters: corruption, weak intellectual-property enforcement, politicized universities, or captured regulators can nullify high research and development spending. Scale matters: small economies may specialize rather than build full systems. Time horizon matters: institutional coupling takes decades, and short-term spending spikes do not create systems. The theory also struggles to account for informal innovation, which may be significant in economies where formal research institutions are weak.

Observable Implications: Research and development expenditure as a share of gross domestic product; researcher density; the composition of gross expenditure on research and development between business and government; patent quality measured by citations and international families; university-industry co-patenting; venture-capital depth; science, technology, engineering, and mathematics graduates; high-technology export sophistication; regional clustering; and the presence of policy instruments such as grants, tax credits, and procurement preferences. National Science Foundation Science and Engineering Indicators and Chinese Ministry of Science and Technology reports allow cross-country comparison. A key diagnostic is the gap between "innovation without commercialization," where patenting is high but productivity gains are low, and "commercialization without innovation," where assembly and manufacturing are strong but indigenous capability is weak.

Perspective Note (five traditions in brief):

African (primary): African national innovation systems are shaped by colonial institutional inheritances: universities often oriented toward administrative and legal training, economies specialized in extraction, and weak linkages between research and industry. Post-independence projects—Nkrumah's industrialization, Nyerere's ujamaa, and other state-led development strategies—had mixed results, and structural adjustment weakened state capacity in many countries. Contemporary African innovation frequently occurs in informal sectors and through frugal adaptations such as mobile money and off-grid energy, which standard Organisation for Economic Co-operation and Development metrics undercount. African scholars, including Bayart on extraversion, Mamdani on the bifurcated state, and Rodney on underdevelopment, highlight that innovation systems cannot be imported as templates; they must address power, inequality, and sovereignty. The African perspective reveals that national innovation system theory's "national" container may be ill-fitting where states are fragmented and economies are regionally integrated or externally dependent. It also highlights gendered and informal knowledge production, emphasized by scholars such as Tamale and Oyěwùmí, which patent counts and formal research metrics often render invisible. From this vantage point, capacity building, institutional repair, and structural transformation matter as much as research and development spending, and innovation must be judged by whether it broadens economic sovereignty rather than by citation counts alone.

Chinese: China's national innovation system is state-led, with strong coordination, industrial policy, and scale; the "whole-nation system" has been mobilized for strategic technologies. It has achieved notable suc-

cess in applied research and commercialization, while challenges remain in basic research, institutional trust, and the risk of overcapacity or politicization. The occlusion is that state direction can accelerate targeted sectors but may suppress exploratory research and create inefficiencies where political priorities override scientific judgment.

Russian: Russia retains a strong basic-science legacy but suffers from weak commercialization; state corporations dominate, and sanctions have pushed import substitution. Innovation statecraft is framed as catch-up and sovereignty. The occlusion is that politicization, brain drain, and weak private finance can prevent research from becoming economic capability.

Western: The Western model is market-driven, with strong universities, venture capital, and academic freedom. Self-critique notes underinvestment in public goods, inequality, and reliance on immigrant talent; strategic competition has prompted renewed state intervention, as in semiconductor legislation. The occlusion is that this model may be universalized as the normative standard, obscuring the role of state coordination and the costs of market-driven fragmentation.

UN: The United Nations frames science and technology for development through Sustainable Development Goal 9, capacity building, and open innovation. It stresses that national innovation systems should serve inclusive development, but the national framing may neglect global public goods and the needs of least developed countries. The occlusion is limited enforcement capacity and a technocratic tendency to treat innovation policy as neutral capacity building rather than a site of political contestation.

2.7.1 African Perspective (PRIMARY)

The African vantage point on scientific statecraft and innovation decoupling begins from a position that the other four perspectives systematically under-theorize: the global division of labor in knowledge production is not a recent distortion introduced by US-China rivalry but a constitutive feature of the modern world system, one whose origins lie in colonial extraction and whose contemporary form is the "brain drain" and the peripheralization of research capacity. From this standpoint, the decoupling of American and Chinese science is not the central event; it is a reconfiguration among core powers that leaves the structural position of African knowledge production largely unchanged, and in some respects worsened, because the competition for talent and the securitization of research flows redirect resources and attention away from the capacity-building agendas that African states and scholars have long demanded.

The theoretical lineage here runs through several distinct but converging traditions. Walter Rodney's *How Europe Underdeveloped Africa* (1972) established the foundational claim that underdevelopment is not a stage but a relation: the same processes that developed Europe simultaneously underdeveloped Africa, including the extraction of human capital and the suppression of autonomous technological development. Kwame Nkrumah's concept of neo-colonialism (1965) extended this to the post-independence period, arguing that formal sovereignty masked continued dependency in science, technology, and economic structure. Amílcar Cabral's writings on culture and liberation (1973) insisted that the struggle for independence was simultaneously a struggle over knowledge and epistemology, not merely over territory. Frantz Fanon's *The Wretched of the Earth* (1961) and *Black Skin, White Masks* (1952) analyzed the psychological and epistemic dimensions of colonialism, including the internalization of metropolitan standards of scientific legitimacy. Julius Nyerere's Arusha Declaration (1967) and subsequent writings framed self-reliance (ujamaa) as requiring indigenous research capacity rather than imported expertise. These thinkers collectively establish that the "brain drain" is not a market failure to be corrected by better incentives but a structural feature of a world economy that rewards the concentration of knowledge in the metropole.

Contemporary African scholarship has developed this lineage in several directions. Siba Grovogui's work on international relations theory and sovereignty (2006, 2016) argues that the international order is constituted through racialized hierarchies of knowledge and authority, and that African states are positioned as objects rather than subjects of global governance, including in science and technology regimes. Achille Mbembe's writings on necropolitics and the postcolony (2001, 2017) analyze how African bodies and minds are governed through extractive logics that extend to the contemporary "brain drain" and the commodification of African genetic and ecological data. Jean-François Bayart's concept of the "politics of the belly" (1993) and his broader work on extraversion (2000) examine how African elites have historically navigated external dependency, including in science and education, producing a political economy in which research agendas are shaped by donor priorities rather than domestic needs. Mahmood Mamdani's *Citizen and Subject* (1996) and subsequent work on the university in Africa (2018) document how colonial institutional inheritances—the bifurcated state, the mission-educated elite, the externally funded research institute—continue to structure African knowledge production, and he has been a vocal critic of the "decolonize the university" debates' tendency to focus on curriculum while neglecting the material conditions of research. Kwesi Aning and Ransford Danso have written extensively on African security governance and the securitization of development, including how external security frameworks reshape research priorities in African universities. Sylvia Tamale's work on decolonization and African feminisms (2020) insists that knowledge production is gendered and that the "brain drain" has differential effects on women scientists. Oyèrónkẹ́ Oyěwùmí's *The Invention of Women* (1997) and subsequent work challenge the epistemic foundations of Western social science, arguing that categories taken as universal are culturally specific, with implications for how "innovation" and "development" are measured and pursued.

The mechanism through which this perspective explains scientific statecraft differs fundamentally from the other four. Where the Western perspective sees a competition among national innovation systems, the African perspective sees a global knowledge economy in which the "national" frame itself is part of the problem: African states are not competing on equal terms because the rules of the game—patent regimes, citation metrics, journal gatekeeping, funding architectures—were designed by and for the core. The "brain drain" is thus not merely the emigration of skilled individuals but the systematic transfer of the capacity to produce knowledge from periphery to core, a process that Rodney and Nkrumah identified as central to underdevelopment. The contemporary securitization of academia—visa restrictions, research security screening, the closure of Confucius Institutes—does not primarily affect African scholars in the same way it affects Chinese researchers, but it does reshape the global research landscape in ways that reduce the already limited opportunities for African participation: as US-China collaboration contracts, the "third country" partnerships that African institutions might have leveraged become scarcer, and the global research agenda becomes more narrowly defined by the security concerns of the two largest powers.

The talent circulation debate illustrates this mechanism concretely. The "brain drain vs. brain gain" framing, dominant in Western policy discourse, treats migration as a flow that can be optimized through diaspora engagement policies, return incentives, and "brain circulation." African scholars such as Aning and Danso have critiqued this framing for assuming that the problem is one of individual incentives rather than structural inequality: the "gain" to receiving countries is permanent and cumulative, while the "circulation" is episodic and contingent. The Thousand Talents Plan, from an African vantage, is not merely a Chinese recruitment program but an instance of a broader pattern in which core and semi-peripheral states compete for the same pool of mobile talent, a competition that African states cannot win on financial terms and that therefore deepens the structural disadvantage. The "brain gain" that China experiences is, from this perspective, a "brain drain" from Africa and other peripheral regions that is rendered invisible by the bilateral framing of

US-China competition.

The IP transfer and forced technology transfer debates reveal a further dimension. The Western grievance about Chinese "forced technology transfer" through joint ventures is, from an African perspective, a dispute among core powers about the terms of technology access that leaves untouched the more fundamental question of how African states and firms can access technology at all. The TRIPS agreement and the broader intellectual property regime are experienced in Africa not as a neutral framework but as a barrier to industrialization and health access, as the HIV/AIDS antiretroviral debates of the early 2000s demonstrated. The "forced transfer" framing, in this view, presupposes a property right that is itself the product of a particular historical and political settlement, one that African states had little role in shaping. Grovogui's argument about the racialized constitution of international law is relevant here: the IP regime is not merely a technical arrangement but a distribution of authority that reflects and reproduces global hierarchies.

The national innovation systems literature, particularly Breznitz (2007) on Israel, Taiwan, and Ireland, is often invoked as a model for African development. The African perspective is skeptical of such transplantation. Breznitz's cases are small, open economies with specific geopolitical patrons and diaspora networks; their "innovation" strategies were enabled by access to US and European markets and by security relationships that African states do not enjoy. The "national innovation system" framework, developed in the context of OECD economies, assumes a set of institutional preconditions—strong universities, venture capital, intellectual property enforcement, skilled labor markets—that are absent or weak in most African contexts. The African critique is not that innovation is unimportant but that the framework treats innovation as a national capacity that can be built through policy, when in fact it is embedded in a global structure that systematically disadvantages peripheral economies. Weiss (2014) on the US national security state's role in innovation is read, from this vantage, as evidence that even the "market-driven" American model is in fact state-coordinated, which undermines the neoliberal advice often given to African states to "get the state out of the way."

What the African perspective contributes that the other four cannot is a structural and historical account of why the "decoupling" is not a disruption of a previously fair system but a reconfiguration of an already unequal one. It reveals that the US-China competition over research security and talent is, in part, a competition over who will control the next generation of global knowledge production, and that African participation in that competition is structurally constrained regardless of which power "wins." It also reveals the epistemic dimension: the categories used to measure innovation—patents, citations, R&D spending—are themselves products of a particular knowledge regime that may not capture African forms of knowledge and problem-solving. Mbembe's critique of the "universal" university and Oyěwùmí's critique of Western epistemic categories are relevant here. Marginson (2022) has argued that the global science system is characterized by hierarchical inclusion, in which peripheral participation is permitted on terms set by the core; the African perspective extends this by insisting that the hierarchy is not merely institutional but historical and racialized.

The occlusions of the African perspective are also important to acknowledge. First, by emphasizing structural constraint, it may understate the agency of African states and institutions in building research capacity: there are genuine success stories—South Africa's Square Kilometre Array participation, Kenya's mobile money innovation, Nigeria's Nollywood, the growing number of African-led research initiatives—that cannot be reduced to dependency. Second, the perspective may romanticize pre-colonial knowledge systems in ways that obscure their limitations for addressing contemporary challenges such as climate change, pandemic disease, and digital transformation. Third, the focus on global structure may lead to an underestimation of the role of domestic politics—corruption, authoritarianism, underinvestment in education—in constraining

African research capacity. Mamdani's critique of the African university is relevant here: the problem is not only external dependency but also internal governance failures. Fourth, the perspective may not fully engage with the strategic choices available to African states in a multipolar world: the rise of China as a research partner offers opportunities as well as risks, and the African position is not simply one of victimhood but of negotiation among competing external powers. Finally, the perspective's emphasis on equity and justice may sometimes come at the expense of analytical precision about mechanisms: "neo-colonialism" is a powerful framing but can be analytically blunt when applied to specific policy questions such as visa regimes or patent law.

In sum, the African perspective reframes the lesson's central topic from a bilateral competition into a global structural condition. It insists that scientific statecraft cannot be understood without reference to the colonial and neo-colonial history of knowledge production, that the "brain drain" is a mechanism of underdevelopment rather than a market imperfection, and that the securitization of academia, while primarily a US-China phenomenon, has global consequences that fall hardest on those already at the margins of the global knowledge economy. It is the longest and most developed perspective here because it is the one that the other four most systematically neglect: the Western, Chinese, Russian, and UN perspectives all take the nation-state and its innovation capacity as the primary unit of analysis, whereas the African perspective insists that the unit of analysis must be the global structure of knowledge production within which all national systems are embedded.

2.7.2 Chinese Perspective

The Chinese perspective on scientific statecraft and innovation decoupling is organized around a sovereignty framing that treats science and technology as instruments of national rejuvenation and strategic autonomy. From this vantage, the decoupling of US-China research is not an unfortunate side effect of great-power competition but a deliberate strategy of containment by the United States, and China's response—talent recruitment, indigenous innovation, and the securitization of its own research base—is a legitimate exercise of sovereign self-defense.

The theoretical lineage draws on several sources. The concept of "indigenous innovation" (□□□□) became official policy in the 2006 Medium- and Long-Term Plan for the Development of Science and Technology, which identified reducing dependence on foreign technology as a strategic priority. This reflects a longer tradition of "catch-up" development theory, influenced by the East Asian developmental state model and by China's own experience of the "century of humiliation," in which technological backwardness was associated with national weakness. The Chinese perspective also draws on a Marxist-Leninist framework in which science is a productive force and technological development is a component of socialist modernization, as articulated in Deng Xiaoping's "science and technology are the primary productive forces" (1988). More recently, the concept of "new quality productive forces" (□□□□□) under Xi Jinping has elevated innovation to the center of economic and security strategy. Chinese Ministry of Science and Technology reports document the sustained growth in R&D spending, patent output, and STEM graduate numbers that underpin the claim that the innovation gap is closing.

The mechanism of talent circulation is central. The Thousand Talents Plan (2008) and its successor programs are framed not as "brain drain" from the West but as the legitimate recruitment of overseas Chinese scientists to contribute to national development. The Chinese perspective emphasizes that this is a standard practice of states seeking to upgrade their human capital, comparable to US immigration policies that historically attracted European scientists. The "brain drain" framing, from this vantage, is a Western grievance that pathologizes Chinese success in competing for talent. The securitization of academia is experienced

asymmetrically: Chinese researchers in the United States face visa restrictions, FBI investigations, and the "China Initiative" (2018-2022), which Chinese officials and scholars characterize as racial profiling and a violation of academic freedom. The closure of Confucius Institutes is framed as a politically motivated attack on cultural exchange rather than a legitimate research security measure.

On IP transfer, the Chinese perspective distinguishes between "forced" technology transfer and the voluntary technology sharing that occurs in joint ventures, which are governed by contract and Chinese law. The argument is that foreign firms choose to enter the Chinese market and accept technology-sharing arrangements as the price of access, and that the "forced" framing is a retrospective grievance that ignores the mutual benefits of these arrangements. The Western demand for IP protection is, from this vantage, an attempt to lock in technological advantage and prevent catch-up. The Chinese perspective also points to the historical record of Western technology transfer to China in the 1980s and 1990s, which was encouraged by Western governments as part of engagement strategies, suggesting that the current grievance is politically contingent.

The national innovation system is understood as state-led and mission-oriented, with the state playing a coordinating role that the Western market-driven model lacks. The "whole-nation system" (□□□□) for science and technology, inherited from the Soviet model but adapted to market conditions, is presented as a strength: it enables large-scale, long-term investments in strategic areas such as quantum computing, artificial intelligence, and space technology that market-driven systems might underfund. The Chinese perspective also emphasizes the scale of the research base: China now produces more scientific publications and patents than any other country, and the number of STEM graduates exceeds that of the United States. The argument is that quantity is translating into quality, and that the innovation gap is closing.

What the Chinese perspective contributes is a legitimate critique of the asymmetry in the global research order: the rules of intellectual property, technology transfer, and research collaboration were written by Western powers and are now being enforced against a rising competitor. It also highlights the costs of securitization for open science: the closure of collaboration channels harms not only Chinese researchers but the global scientific enterprise. The perspective is strongest in its critique of the "China Initiative" and the racialization of research security, which even Western scholars have criticized.

The occlusions are significant. The perspective tends to treat all Western research security measures as containment, which obscures legitimate concerns about espionage, IP theft, and the military applications of civilian research. It may understate the coercive elements of Chinese technology policy, including the role of state subsidies, market access conditionalities, and the integration of civilian and military research under the "military-civil fusion" strategy. The sovereignty framing can be used to justify restrictions on academic freedom, internet censorship, and the suppression of dissent within Chinese universities, which the perspective typically does not address. The "whole-nation system" may produce impressive outputs but also inefficiencies, duplication, and political interference in research agendas. Finally, the perspective's emphasis on national rejuvenation may obscure the global public goods dimension of science: climate research, pandemic preparedness, and basic science benefit from open collaboration that nationalist framing can undermine.

2.7.3 Russian Perspective

The Russian perspective on scientific statecraft and innovation decoupling is shaped by the experience of the Soviet collapse, the "lost decade" of the 1990s, and the subsequent effort to rebuild state capacity in science and technology under conditions of strategic isolation. The framing is one of "catch-up" and "sovereignty," in which innovation is a matter of national survival and great-power status, and in which the West is seen as

both a model to emulate and a competitor to resist.

The theoretical lineage includes the Soviet tradition of "catch-up development," in which the state directs resources toward strategic technologies to close the gap with more advanced economies. This tradition, associated with the Stalinist industrialization model and later with the Soviet military-industrial complex, treats science as a strategic asset and the scientist as a servant of the state. The post-Soviet period saw a collapse of this system: funding collapsed, salaries plummeted, and a massive brain drain of scientists to the West and Israel occurred in the 1990s. The Putin-era response has been to rebuild state capacity through programs such as the "National Technology Initiative" (2014), the "Digital Economy" program, and the creation of research universities and innovation clusters such as Skolkovo (2010). The framing is explicitly geopolitical: innovation is linked to military modernization, energy security, and the assertion of Russian sovereignty in a unipolar world.

The mechanism of talent circulation is experienced primarily as loss. Russia's brain drain has been severe and sustained, particularly in physics, mathematics, and computer science. The state's response has included salary increases, housing programs, and the creation of "mega-grants" to attract diaspora scientists back. However, the effectiveness of these programs is limited by broader political and economic conditions, including sanctions, the war in Ukraine, and the constriction of academic freedom. The Russian perspective tends to frame the brain drain as a Western strategy of "poaching" Russian talent, which is a partial truth that obscures the domestic causes of emigration, including low salaries, corruption, and political repression.

The securitization of academia is experienced from the receiving end of Western sanctions and from the internal securitization of Russian science. Western sanctions following the 2014 annexation of Crimea and the 2022 invasion of Ukraine have restricted Russian access to international research collaboration, equipment, and funding. The Russian response has been to deepen ties with China and other non-Western partners and to emphasize "technological sovereignty." Internally, the Russian state has increased control over research institutions, with the FSB playing a role in research security and the government designating certain research areas as sensitive. The perspective frames this as necessary protection against Western espionage and sabotage, but it also reflects a broader authoritarian turn in which academic freedom is subordinated to state security.

On IP transfer, the Russian perspective is shaped by the experience of technology denial: Western sanctions restrict access to advanced technologies, including semiconductors, aerospace components, and software. The Russian response has been to emphasize import substitution and the development of domestic alternatives, with mixed results. The "forced technology transfer" debate is less central to the Russian perspective than to the Chinese, because Russia is not a major destination for foreign direct investment in manufacturing. However, the broader question of technology access is central: Russia sees itself as a target of Western technology denial, which reinforces the sovereignty framing.

The national innovation system is understood as requiring strong state direction, given the weakness of private venture capital and the legacy of Soviet-era institutional structures. The "Skolkovo" innovation center, modeled on Silicon Valley, has had limited success, and the Russian perspective acknowledges that the transition from a state-directed to a market-driven innovation system has been difficult. The emphasis on military-industrial research reflects both the Soviet legacy and the current geopolitical context: a significant share of Russian R&D is defense-related, and the "military-civil fusion" concept, borrowed from China, has been discussed as a way to leverage defense research for civilian innovation.

What the Russian perspective contributes is an illustration of the costs of isolation and the limits of state-

directed innovation under authoritarian conditions. It highlights the vulnerability of research systems that depend on international collaboration and access to global technology markets. It also provides a cautionary tale about the securitization of science: the internal security apparatus's role in research governance can stifle the openness and risk-taking that innovation requires.

The occlusions are substantial. The perspective tends to attribute all difficulties to external hostility, obscuring the domestic causes of Russia's innovation deficit: the brain drain of the 1990s, the weakness of property rights, the dominance of state-owned enterprises, the suppression of independent research, and the diversion of resources to military spending. The "catch-up" framing may justify authoritarian control over science that undermines the very creativity it seeks to foster. The perspective may also overstate the success of the pivot to China: while Sino-Russian scientific collaboration has increased, it is asymmetric, with Russia in the junior partner position, and it cannot fully replace the lost Western collaboration. Finally, the perspective's emphasis on sovereignty may obscure the global public goods dimension of science and the potential for non-aligned, multilateral research cooperation.

2.7.4 Western Perspective

The Western perspective on scientific statecraft and innovation decoupling is organized around the tension between two commitments: the openness of science as a global public good and the security of national innovation systems in an era of strategic competition. This tension is not new—it dates to the Cold War—but it has intensified with the rise of China and the recognition that the post-Cold War assumption of convergence was mistaken.

The theoretical lineage includes several traditions. The "linear model" of innovation, which posits a pipeline from basic research to applied research to development, underpinned postwar US science policy, including the creation of the National Science Foundation and the Defense Advanced Research Projects Agency (DARPA). Vannevar Bush's *Science, the Endless Frontier* (1945) established the foundational argument that basic research is a public good requiring government support and that scientific freedom is essential to national strength. The "triple helix" model of university-industry-government relations (Etzkowitz and Leydesdorff) describes the institutional basis of innovation in advanced economies. More recently, the "weaponized interdependence" framework (Farrell and Newman, 2019) has been applied to science and technology, arguing that the United States can leverage its position in global research networks for strategic advantage. The "strategic competition" framing, articulated in the 2017 US National Security Strategy and subsequent documents, treats China as a "strategic competitor" and innovation as a domain of competition. NSF Science and Engineering Indicators track the shifting global distribution of research capacity, documenting the relative decline of US and European shares and the rise of China, which provides the empirical backdrop for the security turn. Marginson (2022) has argued that the global science system is characterized by hierarchical inclusion, a framing that the Western perspective tends to resist because it implies that Western dominance is structural rather than meritocratic.

The mechanism of the militarization of basic research is central to the Western perspective. DARPA, the Office of Naval Research (ONR), and their counterparts are presented as success stories: state-funded, mission-oriented research that produced the internet, GPS, and other transformative technologies. Linda Weiss's *America Inc.?* (2014) argues that the US national security state has been the hidden driver of American innovation, challenging the myth of market-driven technological development. The Western perspective also acknowledges the risks: the "dual-use" problem, in which civilian research has military applications, and the potential for security concerns to distort research agendas and stifle openness. The "research security" agenda—visa screening, disclosure requirements for foreign funding, the closure of Confucius Institutes—is

presented as a necessary response to documented cases of espionage and IP theft, but also as a source of self-critique: the "China Initiative" (2018-2022) was criticized by scientists and civil liberties groups for racial profiling and for chilling legitimate collaboration, and it was terminated in 2022.

The talent circulation debate is experienced as a dilemma. The United States has historically benefited from immigration of scientific talent—the "brain gain" that has been a pillar of American innovation. The securitization of academia threatens this advantage: visa restrictions and the perception of hostility toward Chinese researchers may drive talent to other countries or back to China. The Western perspective includes a self-critical strand that recognizes this cost: the "self-inflicted wound" argument, advanced by scientists and policy analysts, holds that excessive security measures may do more harm than good by undermining the openness that is the source of American scientific strength. The "China Initiative" is the primary case study for this self-critique.

On IP transfer, the Western perspective treats "forced technology transfer" as a genuine grievance: the requirement that foreign firms share technology as a condition of market access is seen as a violation of WTO rules and a threat to innovation incentives. The perspective also acknowledges complexity: technology transfer occurs through multiple channels, including voluntary joint ventures, supply chain integration, and cyber espionage, and the "forced" framing may obscure the role of Western firms in seeking access to the Chinese market. The debate about whether to restrict technology exports to China—through the Entity List, export controls on semiconductors, and investment screening—reflects a tension between protecting innovation and maintaining market access.

The national innovation system is understood as a hybrid of public research funding, university research, and private R&D, with the state playing a catalytic rather than directive role. The "market-driven" model is presented as a strength: it allows for rapid commercialization and adaptation, and it avoids the inefficiencies of state-directed research. However, the Western perspective has increasingly acknowledged the role of state coordination, particularly in response to Chinese competition: the CHIPS and Science Act (2022), the Inflation Reduction Act's clean energy provisions, and the "friend-shoring" agenda all represent a renewed state intervention in innovation. This is sometimes framed as a "new Washington consensus" that departs from the neoliberal orthodoxy of the 1990s and 2000s.

What the Western perspective contributes is a sophisticated account of the trade-offs between openness and security, and a genuine capacity for self-critique. The "China Initiative" case demonstrates that the Western research community can mobilize to correct excesses in security policy. The perspective also provides the most developed institutional analysis of how innovation systems actually work, drawing on decades of research in innovation studies.

The occlusions are significant. The perspective may universalize the Western model as the normative standard, obscuring the role of state coordination in its own success (as Weiss 2014 documents) and the costs of market-driven fragmentation. It may treat the "brain drain" as a natural advantage rather than a structural extraction from other regions. The "strategic competition" framing may crowd out cooperation on global challenges such as climate change and pandemic preparedness. The perspective's emphasis on research security may be applied asymmetrically: concerns about Chinese espionage are taken seriously, while the security implications of Western technology exports and the role of Western firms in enabling Chinese military modernization are less examined. Finally, the perspective may not fully engage with the African and other peripheral perspectives on the global knowledge economy, treating the US-China dyad as the primary frame of analysis.

2.7.5 UN Perspective

The United Nations perspective on scientific statecraft and innovation decoupling is organized around the framework of science, technology, and innovation (STI) for sustainable development, articulated most prominently in Sustainable Development Goal 9 (industry, innovation, and infrastructure) and in the work of the UN Commission on Science and Technology for Development (CSTD), UNESCO, and the World Intellectual Property Organization (WIPO). This perspective treats science and technology as global public goods that should serve inclusive development, and it is concerned with the distribution of STI capacity across countries rather than with great-power competition per se.

The theoretical lineage includes the "technology transfer for development" agenda, which dates to the 1970s and the New International Economic Order (NIEO) debates, in which developing countries demanded access to technology as a right. The UN's approach to STI has evolved from a focus on technology transfer to a broader "national innovation systems" approach, influenced by the OECD and by scholars such as Freeman and Lundvall, but adapted to the development context. The "STI for SDGs" framework, articulated in the 2030 Agenda for Sustainable Development (2015), treats innovation as a cross-cutting enabler of all seventeen SDGs. UNESCO's work on open science, including the 2021 Recommendation on Open Science, represents a normative commitment to equitable access to scientific knowledge and infrastructure.

The mechanism of brain drain is addressed through the lens of "brain gain" and diaspora engagement: the UN and its agencies have promoted programs to harness the diaspora for development, such as the "Transfer of Knowledge through Expatriate Nationals" (TOKTEN) program and various "brain circulation" initiatives. The perspective acknowledges that the brain drain deprives developing countries of critical human capital, but it tends to frame the solution in terms of capacity building and partnership rather than structural reform. The securitization of academia is a concern for the UN perspective because it threatens the open collaboration that is seen as essential for addressing global challenges: climate change, pandemic preparedness, and the SDGs all require international scientific cooperation. The UN has been critical of restrictions on scientific collaboration, including visa barriers and export controls, but its leverage is limited.

On IP transfer, the UN perspective is shaped by the tension between the TRIPS agreement and the development agenda. The Doha Declaration on the TRIPS Agreement and Public Health (2001) represented a partial victory for developing countries, affirming the right to use TRIPS flexibilities for public health. The broader debate about "forced technology transfer" is less central to the UN perspective than the question of whether the IP regime serves or hinders development. The UN's position is generally that IP should be balanced with access, and that technology transfer to developing countries should be facilitated through mechanisms such as the Technology Facilitation Mechanism (TFM) established under the 2030 Agenda.

The national innovation system is understood as a tool for inclusive development: the UN promotes the strengthening of national innovation systems in developing countries through capacity building, policy advice, and partnership programs. The perspective emphasizes that innovation should not be measured solely by patents and high-tech exports but by its contribution to poverty reduction, health, education, and environmental sustainability. The "frugal innovation" and "inclusive innovation" concepts, which emphasize low-cost solutions to development challenges, are associated with this perspective.

What the UN perspective contributes is a normative framework that places equity and global public goods at the center of STI policy, and an institutional platform for multilateral dialogue on science and technology governance. It provides a counterweight to the national-security framing of the other perspectives, insisting that science should serve humanity rather than states. The SDG framework, for all its limitations, has

established a shared vocabulary for discussing STI in development terms.

The occlusions are significant. The UN perspective's emphasis on capacity building and partnership may neglect the structural inequalities in the global knowledge economy that the African perspective highlights. The "national innovation system" framework, imported from the OECD context, may not be appropriate for least developed countries with weak institutional capacity. The perspective's technocratic tendency—treating innovation policy as a neutral capacity-building exercise rather than a site of political contestation—may obscure the power relations embedded in global STI governance. The UN's limited enforcement capacity means that its normative commitments are often not translated into binding obligations. The perspective may also be overly optimistic about the potential for "open science" to overcome structural inequalities: openness without equity may simply reproduce existing hierarchies. Finally, the UN perspective's focus on the SDGs may be too narrow to capture the full range of issues raised by scientific statecraft, including the militarization of research and the securitization of academia, which are not well addressed by the development framework.

2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African	Centers brain drain, research capacity, and epistemic equity; shows how US-China decoupling externalizes costs onto research systems with limited absorptive capacity.	May under-specify proximate security mechanisms and state-level threat perceptions in Washington and Beijing.	Scientific openness must be coupled with capacity-building, mobility justice, and distributive equity.	Patterns of researcher emigration; underfunded laboratories; visa regimes affecting African mobility; dependence on external collaboration.	**Western:** security externalities justify restrictions; openness without safeguards risks technology leakage and strategic vulnerability.

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Chinese	Frames research security as sovereignty and containment; links decoupling to indigenous innovation and strategic autonomy.	May conflate legitimate security concerns with hegemonic suppression; can underplay internal research-governance and academic-freedom questions.	Scientific sovereignty, self-reliance, and defense of national development space.	Chinese Ministry of Science and Technology reports on R&D investment; talent-recruitment programs; data-security and research-security rules.	**Western:** security concerns are evidence-based and tied to documented compliance failures; sovereignty framing politicizes neutral risk management.
Russian	Highlights state-led catch-up, technological sovereignty, and innovation under sanctions.	Overstates centralized state capacity; underplays dependence on global networks and the costs of closure for civilian science.	Innovation as national security, state capacity, and strategic survival.	State innovation programs; import-substitution agendas; sanctions-adaptation measures; defense-industrial prioritization.	**UN:** state-centric closure undermines global public goods, open science, and SDG 9.
Western	Identifies research-security mechanisms: visa screening, disclosure rules, institute closures, export controls, and university compliance.	Risks over-securitization, chilling effects, and ethnic profiling; underweights global equity and Global South costs.	Open science conditional on security, reciprocity, and institutional compliance.	Visa restrictions; Confucius Institute closures; research-security policies; university risk-management routines; NSF Science and Engineering Indicators.	**African:** security framing externalizes costs onto the Global South and narrows collaboration without corresponding capacity support.

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
UN	Frames science as a global public good and development enabler; emphasizes SDG 9, open science, and equitable participation.	Limited enforcement capacity; may understate the security dilemma and great-power rivalry.	Inclusive, open, equitable science and technology for development.	STI-for-development agendas; open-science recommendations; capacity-building programs; SDG 9 targets.	**Western:** normative openness cannot by itself resolve strategic competition, IP leakage, or military-civil fusion risks.

2.8 WORKED EXAMPLE (I do)

Levels of analysis. The 2018-2024 US-China research decoupling cannot be reduced to any single level; it is produced by interactions across individual, state, systemic, and transnational levels. At the individual level, graduate students, postdocs, principal investigators, and university administrators experienced visa delays, disclosure requirements, and reputational risk, altering collaboration choices and career trajectories. At the state level, US agencies and Congress constructed research-security frameworks, while Chinese ministries expanded talent recruitment and indigenous-innovation programs. At the systemic level, the shift from engagement to strategic competition reframed scientific exchange as a domain of rivalry rather than mutual benefit. At the transnational level, diaspora networks, multinational laboratories, co-authored publications, and global funding flows transmitted and amplified these pressures, so that bilateral policy changes reshaped research practices far beyond the two states.

Mechanism. The core mechanism is securitization: scientific collaboration was progressively reclassified from an academic activity into a national-security concern, triggering institutional compliance cascades. The process began with threat framing—concerns about intellectual-property leakage, military-civil fusion, and undisclosed foreign affiliations—then moved through policy instruments such as visa screening, export-control enforcement, disclosure mandates, and the closure or rebranding of Confucius Institutes. Universities, facing liability and funding risk, adopted risk-management routines that often exceeded legal minima, producing a chilling effect even where no violation occurred. Chinese counterparts responded with counter-securitization: strengthening data-security rules, expanding domestic R&D capacity, and reframing foreign collaboration as a sovereignty issue. The result was not a clean break but a thickening of boundaries: collaboration became more conditional, more auditable, and more politically legible, while aggregate co-publication and student flows adjusted unevenly across fields.

Perspective reconstruction. The African perspective treats the US-China research decoupling as a shock to the global scientific commons whose costs are disproportionately externalized onto research systems with limited absorptive capacity. It asks not only whether security restrictions are justified in Washington or Beijing, but who loses access to training, co-authorship, equipment, and funding when the two largest research powers narrow their exchange. African scholars and institutions, already facing brain drain and underfunded

laboratories, may find that decoupling reduces opportunities for South-South and North-South collaboration that depended on US-China scientific bridges. The perspective also highlights epistemic injustice: African research priorities are rarely centered in security debates, yet African scientists bear the consequences of visa regimes and institutional risk aversion. Consequently, it demands that any research-security order be paired with capacity-building, equitable access, and recognition of African knowledge production, rather than treating the continent as a passive recipient of great-power science policy. The Chinese perspective interprets decoupling as strategic containment operating through scientific institutions, not merely as a neutral response to misconduct. It emphasizes sovereignty over data, talent, and research agendas, and treats indigenous innovation and talent recruitment as defensive necessities in an asymmetric system. Chinese Ministry of Science and Technology reporting frames rising R&D investment and domestic capacity as evidence that external pressure accelerates self-reliance. The perspective also criticizes the politicization of academia, arguing that visa restrictions and institute closures damage the openness on which global science depends. At the same time, it can obscure internal questions about research governance, academic freedom, and the coercive dimensions of state-led talent programs. The Russian perspective reads US-China decoupling as confirmation that scientific interdependence is a vulnerability under sanctions and strategic competition. It stresses state-led innovation, technological sovereignty, and catch-up modernization, often privileging defense-industrial and strategic sectors. The framing treats Western research security as part of a broader pattern of technological containment that justifies import substitution and state coordination. It may overstate the capacity of centralized programs to generate frontier innovation without global network access. It also underplays the costs of closure for civilian research and the dependence of Russian science on international collaboration. The Western perspective centers research security: it treats undisclosed affiliations, intellectual-property leakage, and military-civil fusion as genuine risks requiring visa screening, disclosure, and institutional compliance. It also contains a self-critical strand that acknowledges the China Initiative's overreach, chilling effects, and the danger of conflating ethnicity with risk. Weiss (2014) and Breznitz (2007) are relevant here for situating innovation policy within state capacity and strategic choice rather than market spontaneity. NSF Science and Engineering Indicators provide the empirical backdrop for claims about collaboration volumes and talent flows. The perspective's weakness is that security logics can expand beyond evidence, converting manageable risks into broad exclusion. The UN perspective frames scientific collaboration as a global public good and a means of achieving SDG 9 on industry, innovation, and infrastructure. It emphasizes open science, capacity-building, and equitable participation, warning that decoupling may fragment knowledge production and weaken development prospects. It is less equipped to adjudicate security claims or great-power rivalry, and its normative commitments lack strong enforcement. Marginson (2022) can be read as highlighting the geopolitical turn that complicates the UN's cooperative assumptions. The perspective's optimism about openness may understate how structural inequality shapes who benefits from global science.

Explicit adjudication. On the evidence of policy instruments and institutional behavior, the Western research-security perspective best explains the proximate mechanics of the 2018-2024 decoupling: visa restrictions, institute closures, disclosure rules, and university compliance routines are directly traceable to security framing. However, it is insufficient as a full explanation because it treats the shift as a response to discrete risks rather than as part of a systemic move from engagement to competition; the systemic level explains timing and breadth. The Chinese perspective best explains reactive state mobilization and the acceleration of indigenous-innovation rhetoric, but it risks reducing all security measures to containment and thereby obscuring documented cases of undisclosed affiliations and intellectual-property concerns. The African perspective does not explain US or Chinese policy choices, yet it best identifies the distributional

externalities and the normative deficit of a security order that ignores capacity and equity. The UN perspective captures the loss of global public goods but lacks causal leverage over state behavior. A defensible adjudication is therefore layered: systemic competition supplied the permissive condition, Western security framing supplied the policy mechanism, Chinese sovereignty framing supplied the counter-mobilization, and African and UN framings supply the criteria by which the decoupling should be judged incomplete and inequitable. What the Western perspective misses is the extent to which its own security expansion may undermine the openness that historically underwrote US scientific leadership; what the African perspective misses is that some restrictions respond to real compliance failures rather than mere geopolitical anxiety.

SECTION 2.9 PROBLEM PAIR (We do)

1. **Level-of-analysis sorting.** Take five claims about China's Thousand Talents Plan—(a) an individual scientist accepts a return package; (b) a ministry sets priority fields; (c) US universities tighten disclosure rules; (d) global citation networks reconfigure; (e) African universities lose a trained researcher—and assign each to the individual, state, systemic, or transnational level. Explain in two sentences why the same program looks different at each level.

2. **Analytical hygiene.** Write one sentence each that (i) describes, (ii) explains, (iii) predicts, and (iv) prescribes an effect of the Thousand Talents Plan on US–China research collaboration. Do not let the four sentences collapse into one another.

3. **Mechanism mapping.** Identify at least two mechanisms through which the program may reshape talent flows—such as funding leverage, network bridging, status competition, or securitization feedback—and state the scope condition under which each mechanism is strongest.

4. **Perspective reconstruction.** In two or three sentences each, steel-man the African, Chinese, Russian, Western, and UN views of the program. Each reconstruction must include one contribution the perspective makes and one thing it tends to occlude.

5. **Historical analogue.** Compare the Thousand Talents Plan to one earlier state-led talent strategy (for example, postwar US scientific recruitment or Soviet catch-up programs). State one genuine similarity and one genuine difference, and explain which difference matters more for assessing long-term innovation.

6. **Falsifiers.** List two observations that would weaken the claim that the program has reshaped global scientific talent flows, and two observations that would strengthen it. Make at least one falsifier quantitative in spirit (for example, a pattern in return rates, re-emigration, or collaboration counts) and one institutional (for example, a change in laboratory autonomy or peer-review norms).

MODEL ANSWER

The Thousand Talents Plan, launched in 2008, is best understood not as a simple brain-drain instrument but as a state-led mechanism for converting diasporic scientific capital into domestic institutional capacity. At the individual level, it altered career calculations by bundling research funding, laboratory access, status, and sometimes relocation support; this changed the opportunity cost of returning or maintaining dual affiliations. At the state level, it functioned as a selective industrial policy for science, targeting fields deemed strategically consequential rather than distributing support uniformly. At the transnational level, it created bridging networks: returning scientists retained co-authorship, student supervision, and equipment ties with former

host institutions, so knowledge transfer occurred through relational channels as much as through physical relocation. This is the central mechanism: talent circulation, not one-way extraction.

The program's effects must be scoped. It likely mattered most for elite researchers in well-funded disciplines with clear state priorities, and least for fields where domestic infrastructure, peer communities, or academic freedom concerns remained weak. Breznitz's argument that latecomer states can innovate through organizational and institutional adaptation without first replicating frontier basic research is relevant: recruitment can accelerate absorptive capacity and applied development even when it does not immediately produce breakthrough basic science. Weiss's work on Chinese innovation statecraft similarly suggests that the state's role is to coordinate, fund, and legitimate strategic sectors, not merely to subsidize individual genius. Thus the program should be evaluated by its contribution to network density, laboratory capability, and problem-solving capacity, not only by citation counts of returnees.

The African perspective highlights an equity problem obscured by great-power framing: when wealthy states recruit from a global pool, the loss is not always from the United States or Europe; it can also be from African universities and research systems that invested in training but cannot match salaries, equipment, or political stability. The Chinese perspective frames recruitment as sovereign development and historical correction after decades of scientific dependence. The Russian perspective, with its catch-up vocabulary, treats talent policy as part of a broader attempt to avoid technological subordination, though it may overstate the transferability of foreign models. The Western perspective emphasizes research security and the risk that recruitment becomes a vector for undisclosed obligations or intellectual-property transfer; its self-critique acknowledges that over-securitization can damage the openness that made Western science attractive. The UN perspective, anchored in SDG 9, asks whether talent mobility expands global innovative capacity or merely reallocates it.

Historically, the program resembles postwar US and Soviet talent strategies in its use of state resources to concentrate expertise, but differs in its reliance on diasporic return rather than domestic training alone. A strong counterargument is that recruitment without complementary institutions—peer review norms, university autonomy, long-term funding stability—produces symbolic gains rather than durable innovation. The securitization backlash after 2018, including visa restrictions and research-security screening, also shows that talent policy is endogenous to geopolitical trust: programs that once operated in a relatively open environment now face higher transaction costs.

Evidence that would support the claim includes rising return rates among targeted cohorts, growth in co-authored publications linking Chinese and foreign institutions, expansion of domestic research infrastructure, and increased patenting in priority sectors. Evidence that would weaken it includes stagnant research quality, continued dependence on foreign equipment and software, high re-emigration rates, or a collapse in international collaboration without compensating domestic gains. On balance, the Thousand Talents Plan appears to have reshaped global talent flows by making return and dual affiliation more attractive and more politically salient, but its long-term effect on scientific leadership depends on whether recruitment is matched by institutional deepening and whether geopolitical decoupling turns circulation into closure.

SECTION 2.10 INDEPENDENT MEMO (You do) — INSTRUCTIONS ONLY

(a) Case description: A mid-sized European research university with strong biomedical and artificial-intelligence partnerships in China, Nigeria, and the United States must decide whether to accept a new dual-use AI grant. The grant requires security vetting of all foreign collaborators, its African partners fear administrative delays and possible exclusion, its Chinese partners fear stigmatization and data-

access restrictions, and its US funders require compliance with export-control and disclosure rules. The university's leadership wants a decision memo that is analytically rigorous rather than merely compliant.

(b) Required memo headings as prompts:

- **Mechanism:** Identify the causal mechanism or mechanisms through which the grant's security requirements would reshape collaboration, talent flows, and knowledge production, and state the scope conditions under which each mechanism operates.
- **Perspective reconstruction:** Reconstruct the African, Chinese, Russian, Western, and UN perspectives on the university's dilemma in steel-man form, identifying what each perspective contributes and what it occludes.
- **Historical analogue:** Compare the case to one earlier episode of research securitization or scientific internationalism, stating one similarity, one difference, and which difference matters more for prediction.
- **Falsifiers:** Specify two observations that would falsify your central claim about the grant's likely effects, and two observations that would support it.

(c) Self-check: Before finalizing, ask whether you have distinguished description, explanation, prediction, and prescription, and whether any sentence that sounds like evidence is actually a normative preference.

SECTION 2.11 HINGE QUESTION

A mid-sized European university is offered a dual-use AI grant that requires security vetting of all foreign collaborators. Its African partners fear delays, its Chinese partners fear stigmatization, and its US funders require export-control compliance. Which of the following is the most defensible analytical conclusion?

A. The grant should be rejected because security vetting necessarily destroys international scientific collaboration.
B. The grant's effects depend on whether vetting is implemented as a proportionate, transparent, and field-specific process or as a blanket, opaque, and politically driven barrier.
C. The grant will automatically strengthen the university's research security without harming its African or Chinese partnerships.
D. The grant is best understood only as a Western strategic-competition measure and has no implications for global scientific capacity.

Correct answer: B.

Distractor diagnosis: Option A conflates a possible outcome with a necessity; it ignores scope conditions such as proportionality, reciprocity, and the possibility of tiered access. Option C assumes a free lunch, treating compliance benefits as costless and ignoring distributional effects on partners with weaker administrative capacity. Option D reduces a multi-level phenomenon to one perspective, occluding African equity concerns, Chinese sovereignty claims, Russian catch-up anxieties, and UN development goals.

SECTION 2A — DATA LAB

The tables below draw on the NSF *Science and Engineering Indicators* (2022, 2024 editions), UNESCO Institute for Statistics (UIS) R&D expenditure series, and the OECD's *Education at a Glance* and bibliometric aggregates. Figures are rounded to two significant digits for pedagogical use; treat them as order-of-magnitude indicators, not as audited national accounts. All values are approximate and should be verified against the primary sources before use in research.

Table 1 — International student enrollment in leading destination countries (millions)

Destination	2010	2015	2019	2023	Trend note
United States	0.72	0.97	1.09	1.06	Plateau then slight decline post-2019
United Kingdom	0.39	0.44	0.55	0.68	Post-Brexit policy volatility, net growth
Australia	0.20	0.33	0.44	0.40	COVID shock, partial recovery
Germany	0.24	0.32	0.40	0.46	Steady growth, tuition-free model
China	0.26	0.40	0.49	0.49	Plateau after 2018; source-country shift
Canada	0.22	0.35	0.64	0.81	Sharp growth; policy-driven

Source: UNESCO UIS and OECD Education at a Glance, various years; rounded.

Table 2 — Gross domestic expenditure on R&D (GERD) as % of GDP

Country	2010	2015	2020	2023	GERD (USD bn, 2023, approx.)
United States	2.7	2.7	3.4	3.5	~790
China	1.7	2.0	2.4	2.6	~480
Germany	2.8	2.9	3.1	3.1	~135
Japan	3.3	3.3	3.3	3.4	~175
South Korea	3.7	4.3	4.8	5.0	~95
Russia	1.0	1.1	1.0	0.9	~25
Brazil	1.2	1.2	1.1	1.1	~22
South Africa	0.8	0.7	0.6	0.6	~3

Source: NSF S&E Indicators; UIS; rounded.

Table 3 — US–China scientific collaboration and decoupling indicators

Indicator	2010	2015	2019	2022	2024
US–China co-authored S&E articles (thousands)	~15	~35	~55	~45	~38
Share of US total output co-authored with China (%)	~4	~8	~11	~9	~8
Chinese students in US (thousands)	~158	~304	~373	~290	~277
US visa denials for Chinese researchers (index, 2019=100)	—	—	100	140	125
Confucius Institutes in US (count)	~60	~100	~90	~15	~5

Sources: NSF S&E Indicators; US State Department visa statistics; National Association of Scholars Confucius Institute tracker; rounded/approximate.

Table 4 — Patent citations and technological dependence (illustrative)

Metric	US	China	EU-27	Japan
Triadic patent families (thousands, 2022)	~14	~4	~12	~8
Share of global AI patents (%, 2023)	~25	~40	~8	~5
Semiconductor equipment import dependence on single supplier (%)	~0 (domestic)	~85 (US/allied)	~60	~30
Citations to foreign patents in domestic patents (%)	~35	~45	~40	~30

Sources: WIPO IP Statistics; OECD; CSIS/industry estimates; rounded.

Numbered Analysis Questions

1. **Trend.** Describe the trajectory of US–China co-authored scientific articles between 2010 and 2024. Identify the inflection point, quantify the approximate peak-to-trough change, and state whether the decline is better characterized as a *level shift* (a new plateau) or a *trend break* (continued decline). Cite Table 3.

2. **Level of analysis.** The 2018–2024 research decoupling is driven by visa policy, university compliance offices, federal funding-agency rules, and individual researcher choices. At which level of analysis — individual, state, systemic, or transnational — does the most explanatory weight lie, and what evidence from Tables 1–4 would you need to adjudicate between a state-centric and a transnational explanation?

3. **Perspective reconstruction (all five).** Read Table 2 (R&D intensity) through each of the five lenses: African (brain drain and equity), Chinese (sovereignty and catch-up), Russian (innovation statecraft), Western (research security and strategic competition), and UN (STI for development, SDG 9). For each, state (a) what the table *supports*, (b) what it *occludes*, and (c) the normative conclusion that perspective would draw.

4. **Interpretation.** China's R&D intensity rose from 1.7% to 2.6% of GDP between 2010 and 2023, and its share of global AI patents is the largest. Does this constitute *convergence* in innovative capacity with the United States? Distinguish between input metrics (spending, patents) and output metrics (frontier breakthroughs, citation impact, firm-level productivity). What would falsify the convergence claim?

5. **Limitation.** The data above omit classified research, corporate R&D not reported to UIS, the quality dimension of patents, and talent flows not captured by enrollment statistics (e.g., post-doctoral researchers, returnees, diaspora scientists). Which omission most distorts cross-country comparison, and how would you triangulate around it using the canonical sources (NSF Indicators; Chinese Ministry of Science and Technology reports)?

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — The Decoupling Funnel (US–China Research Collaboration, 2010–2024)

What to draw: A funnel diagram oriented vertically, wide at the top and narrow at the bottom, drawn in black ink on white paper. The funnel has four horizontal bands, each labeled with a stage of the research-collaboration pipeline.

- Top band (widest): "Joint grant applications & co-authored proposals" — annotate with a 2010 baseline arrow showing high volume.
- Second band: "Funded collaborative projects (NSF/NIH + NSFC joint programs)" — annotate with a 2018 line marking the start of restrictions.
- Third band: "Active co-authored publications" — annotate with the 2019 peak and 2022–2024 decline (Table 3).

- Bottom band (narrowest): "Sustained bilateral research partnerships" — annotate with "Confucius Institutes closed; Thousand Talents scrutiny; visa denials."

Labels to place: Year markers on the left spine (2010, 2015, 2018, 2019, 2022, 2024); on the right spine, the policy levers (Export Control Reform Act 2018; DOJ "China Initiative" 2018–2022; Presidential Proclamation 10043, 2020; NSDD-189 lineage). At the base, a small box labeled "Residual collaboration: non-sensitive, non-military, non-AI domains."

Perspective overlay to annotate: In the margin, five colored sticky-note icons (or bracketed margin notes) labeled A (African), C (Chinese), R (Russian), W (Western), U (UN). The African note reads "capacity loss in third countries caught in the middle"; the Chinese note "sovereignty over research agenda"; the Russian note "opportunity for catch-up"; the Western note "research security vs. openness"; the UN note "SDG 9 and global public goods."

Visual 2 — Talent Circulation Map (Brain Drain, Brain Gain, and Brain Circulation)

What to draw: A world map in outline (hand-drawn, not to scale) with three thick arrows and two dotted arrows.

- Thick arrow 1: South/Southeast Asia and Africa → United States (labeled "Brain drain, 1990s–2010s; student visa pipeline").
- Thick arrow 2: United States/EU → China (labeled "Return migration, post-2008; Thousand Talents Plan").
- Thick arrow 3: Africa → Europe (labeled "Health-worker and STEM emigration").
- Dotted arrow 1: China → US/EU (labeled "Outbound students, still largest source").
- Dotted arrow 2: Africa → Gulf states (labeled "Skilled migration, 2010s–").

Labels to place: On each arrow, a small box with the mechanism (e.g., "wage differential," "research funding," "visa policy," "diaspora networks"). Place a legend in the corner: solid = net permanent flow; dotted = circular/temporary flow. Mark three nodes with stars: Beijing, Washington DC, and a third node labeled "Nairobi/Addis Ababa (hub of African research capacity)."

Perspective overlay to annotate: A sidebar titled "Who gains, who loses?" with five one-line entries: African — "net loss of PhDs; remittances partial offset"; Chinese — "net gain since 2008, but quality concerns"; Russian — "net loss post-1991, partial recovery"; Western — "net gain historically, now contested"; UN — "SDG 4/9 and the right to science."

Visual 3 — National Innovation System (NIS) Stack

What to draw: A layered "stack" diagram (like a geological cross-section or a technology stack), five horizontal layers from bottom to top, each a rectangle with a label and a small icon.

- Layer 1 (bottom, widest): "Basic research & talent pipeline" (universities, PhD programs, immigration policy) — icon: graduation cap.
- Layer 2: "Applied research & translational institutions" (DARPA, ONR, Fraunhofer, CAS institutes) — icon: gear.
- Layer 3: "Firm-level R&D & IP regime" (patents, trade secrets, standards) — icon: document.
- Layer 4: "Production & manufacturing capability" (supply chains, industrial policy) — icon: factory.
- Layer 5 (top, narrowest): "Strategic deployment" (defense, space, AI systems) — icon: satellite.

Labels to place: On the left, a vertical arrow labeled "Time to frontier (decades)"; on the right, a vertical arrow labeled "State capacity required (increasing upward)." Between layers, small arrows labeled "feedback loops" (e.g., from Layer 5 back to Layer 1 via DARPA-style mission pull).

Perspective overlay to annotate: A horizontal band across the middle labeled "The decoupling fault line" — indicating where US–China separation bites hardest (Layers 2–4: applied research, IP, manufacturing). Five margin notes: African — "absent from most layers; insertion via Layer 1 only"; Chinese — "state-led, full-stack ambition"; Russian — "Layer 2 strong, Layers 3–4 weak"; Western — "market-led Layers 3–4, state-led Layer 2"; UN — "Layer 1 as global public good."

SECTION 4 — CORNELL NOTES

Cue (question / keyword)	Notes (with source log)
What is "scientific statecraft"?	The use of science, technology, and research policy as instruments of national power and foreign policy. Weiss (2014) frames it as the politicization of knowledge production; Breznitz (2007) ties it to innovation-based growth.
What is "innovation decoupling"?	The deliberate separation of national innovation systems — research, talent, IP, supply chains — between rival states. Distinct from trade decoupling; operates on knowledge, not goods.
DARPA / ONR role	US defense research agencies that fund basic research with mission orientation; model of "use-inspired basic research." Chinese counterparts: MOST, CAS, and defense-linked labs.
Talent circulation: brain drain vs. brain gain	Brain drain = net emigration of skilled workers; brain gain = net immigration; brain circulation = temporary, return, and diaspora flows. State strategies: scholarships, return grants, diaspora engagement.
Thousand Talents Plan	Chinese recruitment program launched 2008; targets overseas Chinese and foreign scientists; became focal point of US research-security concerns post-2018.
Securitization of academia	Framing of university research as a national-security domain: visa restrictions, disclosure rules, "China Initiative," Confucius Institute closures. Marginson (2022) critiques the erosion of academic freedom and openness.
Research security	Policies to protect IP, prevent unauthorized transfer, and screen foreign collaboration; includes NSDD-189 lineage and export controls.

Cue (question / keyword)	Notes (with source log)
IP transfer / forced technology transfer	Debate over whether China systematically coerces technology transfer via joint-venture requirements; contested empirically; central to US–China trade war framing.
National innovation system (NIS)	Institutional complex producing technological advantage: universities, firms, state agencies, IP regime, finance. Breznitz (2007) on "flexible innovation"; Weiss (2014) on state capacity.
African perspective keywords	Brain drain of PhDs; research-capacity gaps; equity in global science; "epistemic injustice"; dependency on Northern funding; SDG 9.
UN perspective keywords	Science and technology for development; STI roadmaps; SDG 9 (industry, innovation, infrastructure); right to science (ICESCR Art. 15).
Falsifiers for "decoupling is irreversible"	Resumption of joint programs; rise in co-authored papers; talent-flow normalization; sector-specific re-engagement (e.g., climate, health).

Source log: Weiss (2014); Breznitz (2007); Marginson (2022); NSF *Science and Engineering Indicators* (2022, 2024); Chinese Ministry of Science and Technology reports; UNESCO UIS; OECD *Education at a Glance*.

Summary (3–5 sentences): Scientific statecraft treats research, talent, and IP as instruments of national power, and innovation decoupling is the deliberate separation of rival national innovation systems across knowledge, not just goods. The 2018–2024 US–China case shows how visa policy, funding-agency rules, and university compliance combined to reduce co-authored output and close Confucius Institutes, while China's Thousand Talents Plan and rising R&D intensity reframed the competition as a sovereignty project. African, Chinese, Russian, Western, and UN perspectives each read the same data through different normative lenses — equity, sovereignty, catch-up, security, and development — and no single lens captures the full mechanism. The national innovation system framework shows that advantage is institutional and layered, not merely a function of spending, and that decoupling bites hardest in applied research, IP, and manufacturing. Whether the decoupling is a durable level shift or a reversible trend break remains an open empirical question, falsifiable by the resumption of collaboration in non-sensitive domains.

SECTION 5 — FEYNMAN COMPRESSION

1. **Explain without jargon.** Imagine two countries that used to share scientists, patents, and lab equipment freely. One day they decide that sharing is dangerous, so they start checking visas, closing joint institutes, and telling their universities to be careful about who they work with. At the same time, each country tries to lure the other's best researchers home with money and prestige. The question is whether this separation makes both countries weaker or just changes who is strong. The answer depends on whether science is a pie that shrinks when shared, or a pie that grows when shared — and

on whether the rules are written by the state or by the scientists themselves.

2. **Mark gaps.** My first pass left three gaps: (a) I treated "decoupling" as a single event rather than a layered process operating at different speeds across basic research, applied research, and manufacturing; (b) I did not specify the mechanism by which visa restrictions translate into fewer co-authored papers — whether through deterrence, selection, or chilling effects on proposal writing; (c) I conflated China's R&D spending growth with convergence in innovative capacity, without distinguishing inputs from outputs.

3. **Reread verification.** Re-reading Weiss (2014) on the politicization of knowledge production confirms that scientific statecraft is not new but has intensified with dual-use technologies; Breznitz (2007) confirms that national innovation systems vary in their institutional "recipes," so spending alone does not predict outcomes; Marginson (2022) confirms that the securitization of academia carries real costs to openness and academic freedom. The data tables confirm the directional trend (rising Chinese R&D intensity, falling US–China co-authorship) but do not establish causation or quality convergence.

4. **Analogy with explicit limits.** The decoupling is like two research hospitals that stop sharing patient data and staff after a dispute: each may develop its own strengths, but both lose the gains from pooled trials, and patients in third countries lose access to the best treatments. *Limits of the analogy:* hospitals are single organizations with clear ownership; national innovation systems are distributed, multi-actor, and partially market-driven, so "separation" is never complete — residual collaboration persists in non-sensitive domains, and the state cannot fully control scientist-to-scientist ties.

5. **Rewrite.** Scientific statecraft is the strategic use of research, talent, and intellectual property as instruments of national power; innovation decoupling is the deliberate, layered separation of rival national innovation systems. The 2018–2024 US–China case demonstrates that decoupling operates through visa policy, funding-agency rules, and university compliance, producing measurable declines in co-authored output and institutional closures, while China's Thousand Talents Plan and rising R&D intensity reframe the competition as a sovereignty project. The five perspectives — African (equity and brain drain), Chinese (sovereignty and catch-up), Russian (innovation statecraft), Western (research security), and UN (STI for development) — each illuminate a different mechanism and occlude others, so adjudication requires evidence on inputs versus outputs, on talent flows versus enrollment, and on the persistence of residual collaboration. The national innovation system framework shows that advantage is institutional and cumulative, not merely a function of spending, and that the durability of decoupling is an empirical question falsifiable by the resumption of collaboration in non-sensitive domains.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L56	Definition	What is “scientific statecraft”?	The deliberate use of state power — funding, visas, export controls, research-security regimes, talent programs — to shape the production, circulation, and application of scientific knowledge for strategic ends. It treats science as an arena of competition rather than an autonomous republic.	African: often experienced as an external constraint on domestic capacity-building; Chinese: framed as sovereignty and catch-up; Western: framed as security; UN: framed as development.
L56	Mechanism	How does DARPA’s model militarize basic research?	DARPA funds high-risk, high-payoff basic research organized around mission problems rather than disciplinary curiosity; program managers rotate out, and results flow toward military applications. The mechanism is mission-pull, not just money: the state sets the problem, not the method.	Western: celebrated as innovation engine; African: shows how “basic” research is never neutral; Chinese: studied as a template for counterpart agencies.

Tag	Card Type	Front	Back	Perspective Note
L56	Application	What was the mechanism of China's Thousand Talents Plan (2008–)?	State-funded recruitment of overseas Chinese scientists and foreign experts through salary supplements, lab funding, and institutional appointments, designed to reverse brain drain and seed domestic research capacity. The mechanism is price-and-prestige competition for mobile human capital.	Chinese: sovereignty and catch-up; Western: initially welcomed, later securitized; African: a model some states wish they could afford.
L56	Comparison	How do states convert "brain drain" into "brain gain"?	Through diaspora networks, return incentives, remote collaboration, and co-investment in home-country labs; the conversion depends on whether the origin state can offer credible research infrastructure and career paths.	African: the hardest conversion, due to infrastructure gaps; Chinese: partially achieved via Thousand Talents; Western: rarely framed as a problem for itself.

Tag	Card Type	Front	Back	Perspective Note
L56	Source	What does Weiss (2014) argue about the national security state and innovation?	Weiss argues that the US national security state has been a persistent, not exceptional, driver of innovation — that "America Inc." is a hybrid of public mission and private enterprise, and that decoupling rhetoric understates how deeply militarized US research already is.	Western self-critique: undermines claims of a formerly pure academic commons; African: resonates with dependency critiques.
L56	Debate	Forced technology transfer: what is the Western claim and the Chinese rebuttal?	Western claim: market access is conditioned on IP disclosure, constituting coerced transfer. Chinese rebuttal: technology transfer occurs through voluntary joint ventures and licensing, and the charge conflates commercial bargaining with state coercion.	Western: core grievance; Chinese: sovereignty and development framing; African: echoes colonial-era IP debates.

Tag	Card Type	Front	Back	Perspective Note
L56	Reconstruction	How does the Chinese perspective frame talent recruitment?	As a legitimate exercise of sovereignty to correct historical brain drain and build indigenous capacity, not as theft; the frame treats human capital as a national resource subject to strategic management.	Chinese primary self-understanding; Western: read as security threat; African: partially sympathetic, partially wary of asymmetry.
L56	Occlusion	What does the Western "research security" framing occlude?	It occludes the pre-existing militarization of Western research (DARPA/ONR), the benefits Western institutions drew from Chinese students and scholars, and the chilling effect on legitimate collaboration and on researchers of Chinese descent.	Western self-critique; African: occludes global South capacity concerns; UN: occludes development goals.
L56	Adjudication	How would you adjudicate "decoupling harms science" vs. "decoupling protects security"?	Weigh the magnitude of lost collaboration (measurable in co-authored papers and citations) against the marginal security gain from restricting specific sensitive fields; the verdict is field- and actor-specific, not general.	All five perspectives converge on needing evidence; diverge on which harm counts.

Tag	Card Type	Front	Back	Perspective Note
L56	Visual	What do NSF Science and Engineering Indicators show about R&D spending?	They show a long-term shift in global R&D share toward East Asia, with China's share rising sharply since 2000, while the US share declines in relative terms even as absolute spending grows.	Western: relative decline anxiety; Chinese: catch-up validation; African: marginalization in global R&D.
L56	Definition	What is a "national innovation system"?	The network of institutions — universities, firms, state agencies, finance, standards bodies, and labor markets — that jointly produce, diffuse, and commercialize knowledge; advantage comes from systemic fit, not single inventions.	Breznitz (2007): states make political choices among models; African: institutional weakness is the binding constraint.
L56	Mechanism	How does securitization of academia erode collaboration?	Through visa denials and delays, disclosure and reporting requirements, funding restrictions, and reputational risk; the mechanism is anticipatory compliance — researchers self-censor and avoid sensitive topics before any formal prohibition.	Western: intended security gain; Chinese: sovereignty violation; African: collateral damage to South-South links.

Tag	Card Type	Front	Back	Perspective Note
L56	Source	What does Breznitz (2007) contribute to innovation statecraft?	Breznitz shows that states face political choices among innovation strategies (e.g., fast-follower vs. frontier) and that latecomers can prosper by specializing in stages of production rather than inventing everything.	Russian: catch-up framing; Chinese: validates specialization; African: suggests feasible latecomer paths.
L56	Comparison	How do African brain-drain dynamics differ from East Asian brain-gain strategies?	African drain is often permanent and driven by weak domestic research infrastructure and political instability; East Asian gain relied on targeted state investment, credible career paths, and diaspora engagement. The difference is institutional capacity, not talent.	African primary: equity and capacity; shows why copying East Asian programs fails without infrastructure.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence Audit (score 0–100)

Concept	Confidence (0–100)	Evidence Basis	Gap to Close
Definition of scientific statecraft	85	Lesson core + Weiss (2014)	Test against a non-US case
DARPA/ONR militarization mechanism	75	Weiss (2014); general knowledge	Primary budget data

Concept	Confidence (0–100)	Evidence Basis	Gap to Close
Thousand Talents Plan specifics	70	Public program descriptions	Chinese MOST primary reports
Brain drain vs. brain gain dynamics	80	General literature	African-specific longitudinal data
Forced technology transfer debate	65	Competing official narratives	WTO dispute records
National innovation systems theory	80	Breznitz (2007)	African institutional cases
African brain-drain equity framing	75	African scholarship	Country-level R&D data
Chinese sovereignty framing	70	Official discourse	Internal policy documents
Western research-security framing	80	Policy documents	Empirical effect studies
UN SDG 9 framing	60	SDG text	Implementation evidence

7.2 Three-Question Debrief

1. Which of the five perspectives did you find hardest to steel-man without caricature, and what specific evidence would make that steel-man stronger?
2. Identify one causal claim you made in the Problem Pair or Independent Memo that would be falsified if collaboration counts rose while security incidents also rose — how would you revise it?
3. Where did you conflate description (what happened to US–China research ties) with prescription (what should be done), and how does separating them change your conclusion?

7.3 Error-Log

Common Misconception	Correction	Evidence
"Decoupling only hurts China."	Decoupling damages both sides' basic science; the US loses access to Chinese talent and data, and global public goods suffer.	Falling US–China co-authored papers; NSF Science and Engineering Indicators.
"The Thousand Talents Plan is primarily an espionage program."	It is predominantly a recruitment and return program; security cases are a minority of participants.	Chinese MOST reports; public program evaluations.

Common Misconception	Correction	Evidence
"Brain drain is always net-negative for origin countries."	Diaspora networks can produce brain gain through remittances, collaboration, and return; outcome depends on origin-state capacity.	African and Asian diaspora studies.
"DARPA funds only applied, not basic, research."	DARPA funds basic research organized around mission problems; the basic/applied boundary is blurred by mission-pull.	Weiss (2014).
"Forced technology transfer is a proven, uniform Chinese state policy."	The charge is contested; much transfer occurs via voluntary joint ventures and market bargaining, though state pressure exists in some sectors.	WTO disputes; firm-level studies.
"National innovation systems can be designed top-down."	They are emergent and path-dependent; states choose strategies but cannot engineer the whole system.	Breznitz (2007).

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Scientific statecraft; militarization of basic research; talent circulation; securitization of academia; IP/forced transfer; national innovation systems	Mission-pull funding (DARPA/ONR); price-and-prestige recruitment (Thousand Talents); anticipatory compliance in academia; joint-venture bargaining; systemic institutional fit	Weiss (2014) national security state; Breznitz (2007) innovation and the state; Marginson (2022) global science; NSF Science and Engineering Indicators; Chinese MOST reports	2018–2024 US–China research decoupling; Confucius Institutes closure; visa restrictions; African brain drain; East Asian brain gain	Decoupling harms science vs. protects security; forced transfer as policy vs. market bargaining; brain drain as loss vs. diaspora gain; top-down design vs. emergence	Rising collaboration alongside rising security incidents; no change in patent citations after decoupling; African R&D share unchanged despite programs	L18 weaponized interdependence; L52–55 techno-geopolitics; L57 space/infrastructure; L58 forecasting; L61 grand strategy

SECTION 9 — REVIEW SCHEDULE

- **R1 (within 24 hours):** Re-read all 14 flashcards aloud; cover the Back column and reconstruct each answer from the Front; log any card you cannot reproduce in the error-log.
- **R2 (day 3):** Redo the Problem Pair (China's Thousand Talents Plan) from scratch without consulting notes; compare against the model answer and note one divergence.
- **R3 (day 7):** Reconstruct the Worked Example (2018–2024 US–China research decoupling) at all four levels of analysis and all five perspectives; time yourself to 45 minutes.
- **R4 (day 14):** Draft the Independent Memo on a fresh case (e.g., EU research-security guidelines or African diaspora science policy) using the four required headings; run the self-check on description/explanation/prediction/prescription.
- **R5 (day 30):** Full review: re-read Section 2.7 comparison matrix, re-score the confidence audit, and write a 200-word adjudication of the lesson's central puzzle; archive in your error-log.

SECTION 10 — COMPLETION CHECKLIST

☐ I can define scientific statecraft and distinguish it from ordinary science policy.
☐ I can explain the DARPA/ONR mission-pull mechanism and name a Chinese counterpart.
☐ I can describe the Thousand Talents Plan's mechanism and its reshaping of talent flows.
☐ I can distinguish brain drain from brain gain and state the conversion conditions.
☐ I can steel-man both sides of the forced technology transfer debate.
☐ I can explain how securitization of academia erodes collaboration via anticipatory compliance.
☐ I can define a national innovation system and cite Breznitz (2007) on political choice.

- ☐ I can reconstruct the African perspective on brain drain and equity as the primary lens.
- ☐ I can reconstruct the Chinese, Russian, Western, and UN perspectives without caricature.
- ☐ I can apply all four levels of analysis to the US–China decoupling case.
- ☐ I can adjudicate between "decoupling harms science" and "decoupling protects security."
- ☐ I have completed the confidence audit and identified my largest gap.
- ☐ I have filled at least two rows of the error-log with my own misconceptions.
- ☐ I can name three falsifiers for claims made in this lesson.
- ☐ I can link this lesson to L18 (weaponized interdependence) and L52–55 (techno-geopolitics).
- ☐ I can explain what the African vantage point reveals that the other four miss.
- ☐ I have scheduled R1–R5 in my calendar.
- ☐ I can reproduce the comparison matrix from memory.

58. Space, Biosecurity, and Critical Infrastructure

LESSON METADATA

Field	Value
Lesson number and title	Lesson 57: Space, Biosecurity, and Critical Infrastructure
Module	Module 9: Techno-Geopolitics, AI, and Emerging Domains
Prerequisites	L25 (space, maritime), L24 (cyber), L19 (resources)
Interleaved links	Forward to L58 (forecasting), L61 (grand strategy)
Reading load	7-9 hours
Content channels	Text, data tables, visual anchors, flashcards, worked example, problem pair
Bloom ceiling	Evaluate

Estimated study time: 7-9 hours

SECTION 0 — Why This Lesson Exists

The central puzzle of this lesson is why the international order has proven so much slower to govern outer space, biological research, and critical infrastructure than it has to govern traditional military domains, and what that lag reveals about the distribution of power in the contemporary system. Each of these three domains is defined by a structural feature that the post-1945 legal architecture was not built to handle: the technologies that generate civilian prosperity are inseparable from those that generate strategic coercion. A satellite that delivers precision navigation to a farmer's tractor is the same satellite that guides a cruise missile; a research platform that accelerates vaccine development is the same platform that can be repurposed to enhance a pathogen; a power grid that sustains a hospital is the same grid that, if disrupted, can paralyze a city. The lesson asks how states, international institutions, and non-state actors navigate governance when the civilian-military boundary has collapsed, and why the answers they produce differ so sharply depending on where one stands in the global hierarchy of capability and vulnerability.

This lesson sits at the capstone of Module 9, Techno-Geopolitics, AI, and Emerging Domains, and it presupposes the analytical machinery developed in three earlier lessons. From L25, on space and maritime domains, the student brings the distinction between global commons and sovereign territory, and the problem of freedom of navigation in environments where no single state can enforce order. From L24, on cyber, the student brings the insight that attribution is difficult, that effects are reversible or irreversible depending on target, and that the threshold between peace and war is deliberately blurred by actors who benefit from ambiguity. From L19, on resources, the student brings the understanding that control over chokepoints and critical inputs is a form of structural power that operates beneath the level of formal diplomacy. The lesson also looks forward: to L58, on forecasting, because the domains it treats are precisely those where surprise is most likely and where early warning is most valuable; and to L61, on grand strategy, because decisions about investment in space, biosecurity, and infrastructure protection are among the most consequential long-term commitments a state can make.

The African perspective is not an afterthought in this lesson; it is the lens through which the central puzzle is first posed. From an African vantage point, the governance of space, biology, and infrastructure has historically been shaped by actors who possess the capabilities, while those who bear a disproportionate

share of the risks have had limited voice in setting the rules. African states have been largely excluded from the benefits of space-based services that they nonetheless depend upon for weather forecasting, agricultural monitoring, and communications; they have been the sites of pathogen emergence and outbreak response without commensurate investment in laboratory capacity or vaccine manufacturing; and they have inherited infrastructure networks designed for extraction rather than resilience. The lesson therefore asks not only how the new domains are governed, but who governs them, whose risks are centered, and whose are rendered invisible by the framing of "global" governance.

By the end of this lesson, the student will be able to perform five analytical operations. First, they will be able to identify the causal mechanisms through which a capability in one of the three domains translates into strategic leverage, specifying the scope conditions under which that mechanism operates and the conditions under which it fails. Second, they will be able to reconstruct how each of the five perspectives—African, Chinese, Russian, Western, and UN—explains the same event differently, and to adjudicate between those explanations on the basis of evidence rather than assertion. Third, they will be able to apply the four levels of analysis—individual, state, systemic, and transnational—to a worked case, in this instance the 2021 Russian anti-satellite test against Kosmos 1408. Fourth, they will be able to distinguish description, explanation, prediction, and prescription in their own analytical writing, a discipline that the independent memo exercise is designed to enforce. Fifth, they will be able to identify the falsifiers that would undermine each major claim, so that their analysis remains open to revision rather than collapsing into advocacy.

The theoretical lineage of the lesson runs through several distinct scholarly traditions. On space security, the work of Joan Johnson-Freese emphasizes the gap between the rhetoric of space as a peaceful domain and the reality of its militarization, arguing that the United States and other major powers have consistently treated space as an extension of terrestrial military strategy while publicly committing to its peaceful use. Todd Harrison's analyses of counterspace capabilities provide the technical and strategic vocabulary for understanding how states actually threaten one another's space assets, distinguishing between reversible and irreversible effects and between kinetic and non-kinetic means. On biosecurity, Andrew Lakoff's research on the governance of biological threats traces how preparedness became a dominant paradigm after the anthrax attacks of 2001, reshaping the relationship between public health, national security, and international cooperation in ways that privileged certain forms of expertise and certain kinds of threat over others. The institutional frameworks are anchored in the documentation of the United Nations Committee on the Peaceful Uses of Outer Space (COPUOS), the Biological Weapons Convention (BWC) review conferences and implementation reports, and the ongoing negotiations toward a WHO pandemic treaty or instrument.

A methodological commitment runs through the entire lesson: every claim must specify a mechanism, not merely an outcome. It is not enough to observe that states invest in anti-satellite weapons; one must explain how a direct-ascent interceptor alters the strategic calculus of an adversary, under what conditions it is usable, and what constraints—technical, political, legal—limit its employment. Similarly, it is not enough to note that the COVID-19 pandemic exposed governance failures; one must trace the causal pathway from pathogen emergence through surveillance gaps, supply-chain fragility, and geopolitical competition to the observed outcomes in mortality and economic disruption. This mechanism-level discipline is what distinguishes postdoctoral analysis from commentary, and it is the standard against which the student's independent memo will be assessed.

SECTION 1 — Pre-Class Priming

1.1 Retrieval Warm-Up Answer each question in two to four sentences, drawing on lessons already completed. Do not consult external sources.

1. From L25 (space and maritime domains): What is the legal distinction between the high seas and territorial waters, and how does the concept of the "global commons" apply to outer space under the 1967 Outer Space Treaty? Identify one tension between the treaty's prohibition on national appropriation and the practice of states.

2. From L24 (cyber): What is the "attribution problem" in cyber operations, and why does it matter for deterrence? Give one example of how a state has exploited attribution ambiguity to conduct operations below the threshold of armed conflict.

3. From L19 (resources): Explain the concept of "structural power" as it applies to control over critical resources or chokepoints. How does control over a resource differ from control over the infrastructure that transports it?

4. From L12 (international institutions): What is the difference between a "hard law" treaty and a "soft law" instrument in international governance? Give one example of each from the security domain, and explain why states might prefer soft law in emerging technological domains.

5. From L7 (levels of analysis): Define the four levels of analysis used in this curriculum—individual, state, systemic, and transnational—and give one example of a causal claim at each level that could explain a state's decision to test an anti-satellite weapon.

6. From L3 (realism and liberalism): Under what conditions does realism predict that states will cooperate to govern a common-pool resource, and under what conditions does liberalism predict that international institutions can overcome collective-action problems? Identify one point of convergence between the two theories.

1.2 Orientation Questions These questions frame the lesson's central puzzle. You are not expected to answer them fully before reading; use them to guide your attention.

1. If a state destroys one of its own satellites in a test, producing thousands of pieces of debris that threaten other states' satellites, is that act best understood as a military signal, a technological demonstration, a violation of an emerging norm, or all three? What evidence would distinguish these interpretations?

2. Why did the COVID-19 pandemic produce such divergent national responses and such limited international cooperation, despite decades of pandemic preparedness planning? Which level of analysis—individual leadership, state capacity, systemic competition, or transnational supply chains—best explains the variation?

3. When a cyberattack disables a hospital's power supply, is the target "critical infrastructure" in a legal sense, a military target, or both? How does the answer change depending on whether the attacker is a state, a criminal group, or a non-state actor?

4. What would a genuinely equitable governance framework for space, biosecurity, and critical infrastructure look like from the perspective of a state that possesses none of the relevant capabilities but bears significant risk from their misuse? Which existing institution comes closest to that standard, and

where does it fall short?

1.3 Vocabulary Pre-Teach Provisional definitions; refine as you encounter each term in context.

- **Anti-satellite weapon (ASAT):** A weapon designed to disable, destroy, or interfere with a satellite. ASATs include direct-ascent missiles, co-orbital systems, and directed-energy weapons. The term covers both kinetic (physical destruction) and non-kinetic (jamming, dazzling, cyber) means.
- **Counterspace capability:** The broader category of systems and techniques that can deny, degrade, or destroy space assets, including ASATs, electronic warfare, and cyber operations against ground stations. Not all counterspace capabilities are weapons in the legal sense.
- **Positioning, Navigation, and Timing (PNT):** The satellite-based services, of which GPS is the best known, that provide location and time data essential to military operations, civilian transportation, financial systems, and telecommunications. PNT is a critical infrastructure dependency.
- **Intelligence, Surveillance, and Reconnaissance (ISR):** The collection and processing of information about adversary capabilities and intentions, much of which depends on satellite platforms. ISR satellites are often the first targets in a counterspace campaign.
- **Dual-Use Research of Concern (DURC):** Biological research that is intended for legitimate scientific purposes but that could be misapplied to cause harm, for example by enhancing the transmissibility or virulence of a pathogen. The category is contested and its boundaries are politically negotiated.
- **Gain-of-function research:** Experiments that confer new or enhanced biological functions on an organism, such as increased transmissibility in mammals. The term became politically charged during and after the COVID-19 pandemic, when questions about the origin of SARS-CoV-2 intersected with debates about laboratory safety.
- **Critical infrastructure:** The systems and assets—physical and cyber—so vital to a society that their incapacitation or destruction would have a debilitating effect on security, public health, or economic stability. The definition is national, but the systems are often transnational.
- **Space debris (orbital debris):** Non-functional human-made objects in orbit, including spent rocket stages, defunct satellites, and fragments from collisions or tests. Debris is a negative externality: the actor who creates it does not bear its full cost.
- **Co-orbital ASAT:** A counterspace system that is launched into orbit and maneuvers to approach a target satellite, rather than being launched directly at it. Co-orbital systems can inspect, jam, or physically interfere with satellites and are harder to attribute than direct-ascent tests.
- **Direct-ascent ASAT:** A missile launched from Earth's surface or an aircraft that travels upward to intercept and destroy a satellite in orbit. Direct-ascent tests are highly visible and produce large debris fields, making them politically costly.
- **COPUOS (Committee on the Peaceful Uses of Outer Space):** The UN body established in 1959 to govern the exploration and use of space for peaceful purposes. It has produced the major space treaties but lacks enforcement mechanisms and has struggled to keep pace with commercial and military developments.

- **Biological Weapons Convention (BWC):** The 1972 treaty prohibiting the development, production, and stockpiling of biological weapons. It has no verification mechanism, a gap that has been debated since its inception and that became acute during the COVID-19 pandemic.

SECTION 2 — LESSON CORE

2.1 Learning objectives

By the end of this lesson, the student will be able to:

1. **Explain** the mechanism by which space-based intelligence, surveillance, and reconnaissance (ISR), positioning, navigation, and timing (PNT), and communications have become foundational to terrestrial military operations and to civilian infrastructure such as financial settlement, power-grid synchronization, and transportation logistics, and why this dependency converts orbital assets into strategic targets whose disruption would cascade across domains. (Bloom: Understand/Explain)
2. **Analyze** the legal and strategic distinction between the militarization and the weaponization of outer space, evaluating how the 1967 Outer Space Treaty's prohibitions on weapons of mass destruction in orbit and its requirement that space be used for "peaceful purposes" interact with the absence of any prohibition on conventional anti-satellite weapons, directed-energy systems, or co-orbital maneuvering vehicles. (Bloom: Analyze)
3. **Compare** the African, Chinese, Russian, Western, and UN perspectives on space as a strategic domain, identifying what each tradition contributes to the governance debate and what each systematically occludes, particularly regarding equity of access, sovereignty, multipolarity, deterrence, and multilateral rule-making. (Bloom: Compare/Evaluate)
4. **Assess** the scope conditions under which a state's investment in counterspace capabilities is strategically rational versus destabilizing, using evidence from direct-ascent, co-orbital, and directed-energy test programs and from the debris and escalation risks they generate. (Bloom: Evaluate)
5. **Synthesize** the relationship between space dependency, counterspace proliferation, and strategic stability into a coherent causal argument that can be tested against historical cases, including the 2021 Russian ASAT test against Kosmos 1408, and that can be extended to biosecurity and critical-infrastructure domains. (Bloom: Synthesize)

2.2 KEY IDEA 1 — Space as a strategic domain: ISR, PNT, communications, and the militarization debate

Bolded Causal Claim: Space has become a strategic domain not because states fight in orbit, but because terrestrial military power and civilian life now depend on orbital infrastructure, making the control, denial, and protection of that infrastructure a first-order security problem whose logic is closer to that of critical infrastructure than to that of a traditional battlespace.

Mechanism: The transformation rests on three functional pillars. First, intelligence, surveillance, and reconnaissance (ISR) satellites provide the targeting data, battle-damage assessment, and situational awareness that make precision-guided munitions and network-centric warfare possible; without space-based ISR,

modern conventional forces lose the ability to find, fix, and finish targets at range. Second, positioning, navigation, and timing (PNT) signals—most prominently the US Global Positioning System, but also Russia's GLONASS, China's BeiDou, and Europe's Galileo—provide not only location data but the timing synchronization on which financial transaction clearing, power-grid phase balancing, telecommunications handoffs, and transportation logistics depend; a PNT disruption therefore cascades from the military into the civilian economy within hours. Third, communications satellites, including both military dedicated systems and commercial constellations, provide the command-and-control backbone that connects dispersed forces, sensors, and decision-makers across theaters. The mechanism is one of dependency-induced vulnerability: as these functions migrate to orbit, the cost of their loss rises, which creates incentives for adversaries to develop counterspace capabilities, which in turn creates incentives for the dependent state to harden, diversify, or pre-emptively defend its space assets. Joan Johnson-Freese, in *Space Warfare in the 21st Century: Arming the Heavens* (2016), argues that the "space as sanctuary" assumption that governed Cold War thinking has eroded precisely because space assets became too valuable to ignore and too vulnerable to protect passively; the domain shifted from a support function to a contested strategic environment. Todd Harrison's annual *Space Threat Assessment* reports for the Center for Strategic and International Studies (CSIS) Aerospace Security Project document the operational reality of this shift, tracking how major powers have integrated space into their warfighting concepts and how counterspace development has accelerated in response to perceived US space dominance. The mechanism is self-reinforcing: dependency drives vulnerability, vulnerability drives counterspace development, counterspace development drives further hardening and doctrinal integration, and the cycle deepens the domain's strategic salience without requiring a single shot fired in orbit.

Scope Conditions: The claim holds under several conditions and fails under others. It holds most strongly for states that (a) operate or depend on space-based ISR, PNT, and communications for conventional military operations, (b) face adversaries with demonstrated or suspected counterspace capabilities, and (c) have integrated space into their joint warfighting doctrine. It holds less strongly for states whose military operations are not space-dependent, whose adversaries lack counterspace options, or whose space use is confined to civilian applications such as earth observation and communications. The legal scope is also conditional: the 1967 Outer Space Treaty (OST) prohibits the placement of weapons of mass destruction in orbit and requires that the Moon and other celestial bodies be used exclusively for peaceful purposes, but it does not prohibit conventional weapons in orbit, anti-satellite tests, or the use of space for military support functions; the treaty's "peaceful purposes" language has been interpreted by spacefaring states as permitting military support activities while prohibiting only aggressive acts. The distinction between militarization (using space to support military operations, which all major powers do) and weaponization (placing weapons in space capable of attacking targets, which remains partially contested) is therefore a legal and political construct rather than a bright line, and its stability depends on continued mutual restraint. The claim also assumes that orbital infrastructure remains concentrated enough that disruption is strategically meaningful; the proliferation of commercial mega-constellations may dilute this concentration over time, though it does not eliminate the vulnerability of the most valuable military and government satellites.

Observable Implications: If the causal claim is correct, one should observe several patterns. First, the creation or elevation of dedicated military space organizations, such as the United States Space Force (established 2019), NATO's designation of space as an operational domain (2019), and the expansion of space commands in China, Russia, and other states. Second, increased investment in space domain awareness, satellite hardening, and alternative PNT systems as dependent states seek resilience. Third, the development and testing of counterspace capabilities by states that perceive themselves as disadvantaged in space, documented in Harrison's annual assessments. Fourth, the integration of space considerations into arms-control

and strategic-stability dialogues, including discussions of responsible behavior in space and debris mitigation. Fifth, the commercialization of space and the blurring of civilian and military satellite functions, which complicates attribution and escalation management. Sixth, rising insurance costs and risk assessments for satellite operators following debris-generating events. The 2021 Russian ASAT test against Kosmos 1408, which generated thousands of trackable debris pieces and forced the International Space Station crew to take shelter, is a direct observable implication: a state demonstrated that it could destroy a satellite in orbit, and the international community's response—condemnation, debris-tracking efforts, and renewed calls for norms—confirmed that the domain had become strategically contested.

Perspective Note (five traditions in brief):

African (primary): The African perspective on space as a strategic domain is shaped by a fundamental asymmetry: most African states are users and beneficiaries of space services rather than operators of military space assets, and their strategic interest lies in access, equity, and development rather than in orbital warfare. African space activity has grown substantially, with Egypt (Nilesat, EgyptSat), Nigeria (NigComSat), South Africa (SumbandilaSat and the South African National Space Agency), Kenya (Taifa-1, launched 2023), Rwanda, and others developing earth-observation and communications capabilities, and with the African Union establishing the African Space Agency (AfSA), headquartered in Cairo, to coordinate continental space policy. From this vantage point, the militarization debate appears as a great-power conversation that risks crowding out the development agenda: orbital slots and radio-frequency spectrum are allocated by the International Telecommunication Union on a first-come, first-served basis that disadvantages latecomers, technology transfer remains limited, and the debris generated by counterspace tests threatens the orbital environment on which African earth-observation and climate-monitoring satellites depend. African scholars and policymakers have emphasized that space is a global commons whose benefits must be shared equitably, and that the "space for development" framing—using remote sensing for agriculture, disaster management, water resources, and climate adaptation—is as strategically significant for African states as military space is for great powers. The African perspective thus reveals what the Western security framing occludes: that the most consequential space vulnerabilities for most of the world's population are not counterspace attacks but the denial of access, the concentration of orbital resources, and the environmental degradation of the commons. It also highlights the tension between the Outer Space Treaty's principle that space exploration and use shall be carried out for the benefit of all countries and the practical reality that spacefaring capacity is concentrated in a handful of states. Grovogui's broader critique of international order as structured by hierarchical sovereignty and unequal capacity resonates here: the governance of space reproduces the very inequalities it claims to transcend, and African states must engage not merely as beneficiaries but as rule-makers if the domain is to serve their interests.

Chinese: China frames space as a domain of sovereign right and national rejuvenation, emphasizing that its space program is peaceful in purpose while acknowledging its military applications. Beijing completed the BeiDou navigation constellation in 2020, operates the Tiangong space station, and pursues lunar and Mars exploration, all of which are presented as contributions to human progress and to China's strategic autonomy. China's official position opposes the weaponization of outer space and supports the negotiation of a treaty on the prevention of an arms race in outer space (PAROS), while simultaneously developing counterspace capabilities and conducting an ASAT test in 2007 that destroyed a defunct weather satellite and generated substantial debris. The Chinese perspective tends to attribute the militarization of space to the United States, framing American space dominance and missile-defense programs as the driving force, and to present China's own capabilities as defensive and responsive. This perspective contributes the argument that space governance must be multipolar and that no single state should dominate the domain, but it occludes

the extent to which China's own counterspace development contributes to the security dilemma it decries.

Russian: Russia inherits the Soviet space legacy and maintains a full spectrum of space capabilities, including GLONASS, military communications, and ISR satellites, as well as demonstrated counterspace systems. Moscow frames space through a multipolarity lens, opposing what it characterizes as US attempts to achieve space dominance and supporting PAROS negotiations in the Conference on Disarmament. Russia's 2021 ASAT test against Kosmos 1408 demonstrated its counterspace capability while generating international condemnation and debris. The Russian perspective emphasizes strategic stability and the prevention of an arms race, but it also treats space as an arena of great-power competition in which Russia must maintain parity. This perspective contributes the argument that unilateral US space policy destabilizes the domain, but it occludes Russia's own role in debris generation and in the erosion of space norms.

Western: The Western perspective, led by the United States but shared in varying degrees by European and allied states, treats space as a warfighting domain whose security requires deterrence, resilience, and allied cooperation. The creation of the US Space Force, NATO's space policy, and investments in space domain awareness and satellite protection reflect this framing. Western analysts such as Harrison emphasize that the United States is uniquely dependent on space and therefore uniquely vulnerable, and that this vulnerability requires both defensive measures and the development of counterspace options for deterrence. The Western perspective also includes a governance self-critique: recognition that the OST is outdated, that commercialization has outpaced regulation, and that debris and congestion threaten long-term sustainability. This perspective contributes operational realism and alliance frameworks, but it can occlude the equity concerns of non-spacefaring states and can frame space primarily through a security lens that underweights development and environmental sustainability.

UN: The United Nations perspective is institutional and legal, centered on the Committee on the Peaceful Uses of Outer Space (COPUOS), the Outer Space Treaty and its associated agreements, and the broader framework of international space law. The UN emphasizes that space is the province of all humankind, that its exploration and use should benefit all countries, and that multilateral governance is essential to prevent conflict and ensure sustainability. Recent developments include the Pact for the Future (2024), which contains commitments on space governance, and ongoing discussions of responsible behavior in space, debris mitigation, and the long-term sustainability of outer space activities. The UN perspective contributes the normative framework and the forum for negotiation, but it is constrained by the consensus-based nature of COPUOS, the absence of enforcement mechanisms, and the reluctance of major spacefaring states to accept binding limitations on their military activities in space.

SECTION 2.3 KEY IDEA 2 — Anti-satellite weapons and counterspace capabilities: direct ascent, co-orbital, directed energy

Bolded Causal Claim: The diffusion of counterspace capabilities converts satellites from protected strategic enablers into exposed and contestable assets, producing a security dilemma in which dependence on space and the ability to disrupt space assets jointly erode crisis stability, particularly when attacks are reversible, ambiguously attributable, or debris-producing.

Mechanism: Space systems are high-value, comparatively soft, and operate in predictable orbital regimes; their military utility rests on communications, positioning, navigation, and timing, and intelligence, surveillance, and reconnaissance. Counterspace capabilities exploit these vulnerabilities through several distinct

mechanisms. Direct-ascent anti-satellite weapons use ground- or air-launched kinetic interceptors to destroy satellites in orbit; they are technologically mature, have been demonstrated by multiple states, and create debris that can persist for years or decades. Co-orbital systems are launched into orbit and maneuver near a target satellite, enabling inspection, jamming, dazzling, physical interference, or collision; because such systems can resemble servicing or inspection platforms, they complicate attribution and intent assessment. Directed-energy weapons use lasers or high-powered microwaves to dazzle, blind, or damage sensors and electronics, sometimes reversibly and sometimes irreversibly, with effects that may be difficult to distinguish from malfunction. Non-kinetic counterspace includes jamming, spoofing, cyber intrusion, and attacks on ground stations or data links, which are often reversible, deniable, and below the threshold of armed attack. The strategic mechanism is not simply that satellites can be destroyed; it is that a state whose military operations depend on space may face a "use it or lose it" incentive in crisis, while an attacker may choose reversible or ambiguous effects to coerce without crossing a clear escalation threshold. Deterrence is complicated because punishment in space can harm the attacker's own assets and because denial requires costly resilience, redundancy, and maneuver. Johnson-Freese (2016) captures the broader point that space warfare is shaped less by cinematic destruction than by the gradual erosion of the sanctuary assumption and by the integration of space into conventional military planning.

Scope Conditions: This causal claim applies most strongly where (a) a state's military effectiveness is tightly coupled to space-based services, (b) an adversary possesses or can acquire counterspace options, and (c) the two are in a crisis or conventional conflict in which space assets are perceived as force multipliers or vulnerabilities. It is less applicable to states with minimal space dependence, to conflicts in which neither side has counterspace, or to situations where the debris externality of kinetic attack is so severe that it deters use. The maturity of capabilities also matters: direct-ascent systems are proven, while co-orbital and directed-energy systems remain less mature and more dependent on precision, power, and orbital mechanics. Orbital regime matters as well; kinetic attacks in low Earth orbit create long-lived debris fields, whereas attacks in geostationary orbit may produce less debris but target extremely high-value assets. Legally, the Outer Space Treaty prohibits the placement of weapons of mass destruction in orbit but does not clearly prohibit conventional anti-satellite testing or use, leaving a permissive environment for counterspace development. The claim should not be read as predicting inevitable space war; rather, it identifies a structural pressure toward preemption, ambiguity, and escalation management problems.

Observable Implications: If this mechanism is operating, one should observe doctrinal reclassification of space as a warfighting domain, increased investment in space situational awareness, satellite maneuverability, proliferated constellations, hardening, and rapid reconstitution. One should also observe public counterspace demonstrations, debris-generating events, and diplomatic efforts to constrain them, including national moratoria on destructive direct-ascent anti-satellite testing and multilateral resolutions calling for restraint. Commercial and allied satellites increasingly become entangled with military functions, blurring the line between civilian and military targets and complicating deterrence. Observable indicators include changes in satellite "pattern of life," proximity operations, reported jamming or spoofing incidents, debris-tracking catalogs, and the growth of resilience programs. Arms-control proposals such as no-first-placement or responsible-behavior frameworks should be understood partly as responses to these observable pressures. Harrison (2021) is useful for tracking how counterspace threats are assessed in relation to resilience and deterrence, though the precise balance between vulnerability and adaptation remains contested.

Perspective Note (five traditions in brief):

African: African states are predominantly users rather than owners of space infrastructure, relying on foreign satellites for weather, agriculture, communications, and disaster response; counterspace debris therefore

threatens a shared commons on which African development depends, while African voices in multilateral forums emphasize equitable access, capacity building, non-appropriation, and the developmental uses of space. The African perspective is concerned that great-power militarization diverts resources and attention from space-for-development priorities, and it tends to support constraints on debris-producing tests without necessarily possessing indigenous counterspace capabilities.
Chinese: China frames space as a strategic domain and sovereign right, opposes the weaponization of outer space rhetorically, and has promoted multilateral arms-control initiatives such as the draft treaty on the prevention of the placement of weapons in outer space, while also developing counterspace capabilities that it presents as defensive and responsive to perceived U.S. space dominance.
Russian: Russia draws on a legacy of anti-satellite development and frames space competition through multipolarity, treating U.S. and NATO space militarization as a threat to strategic stability while supporting arms-control proposals and maintaining counterspace options for deterrence and parity.
Western: Western, especially U.S. and NATO, perspectives treat space as a warfighting domain and emphasize counterspace threats from China and Russia, resilience, deterrence, and responsible behavior, including national moratoria on destructive direct-ascent testing; this perspective also contains an internal critique of weaponization, commercialization, and debris externalities.
UN: The UN perspective rests on the Outer Space Treaty, the Committee on the Peaceful Uses of Outer Space, and the long-term sustainability agenda; it seeks norms on debris mitigation and responsible behavior but is constrained by consensus decision-making, the absence of enforcement, and major powers' reluctance to accept binding military limitations.

SECTION 2.4 KEY IDEA 3 — Biosecurity: pandemics, labs, dual-use research, and the post-COVID governance landscape

Bolded Causal Claim: Biological capabilities are inherently dual-use, so the same scientific and industrial advances that improve health, agriculture, and industry also expand the range of actors and accidents capable of causing catastrophic harm; after COVID-19, geopolitical distrust has weakened rather than consolidated the cooperative institutions needed to govern those risks, leaving a biosecurity landscape marked by securitization, inequality, and incomplete verification.

Mechanism: The core mechanism is dual-use: DNA sequencing, synthesis, gene editing, high-containment laboratories, and increasingly AI-assisted biological design can be used for vaccines, therapeutics, diagnostics, and agricultural resilience, but the same knowledge and infrastructure can be misused for biological weapons or can release dangerous pathogens accidentally. Biosafety concerns accidental exposure and containment failure; biosecurity concerns deliberate misuse, theft, or diversion. Pandemic risk is amplified by zoonotic spillover, land-use change, climate stress, urbanization, global travel, and dense supply chains. Governance is layered and incomplete: the Biological Weapons Convention prohibits biological weapons but has no formal verification mechanism; the World Health Organization's International Health Regulations focus on detection, notification, and response; national biosafety and biosecurity regimes vary widely; export controls and funding oversight are uneven. COVID-19 exposed these gaps through uncertain origins, fragile supply chains, inequitable access to vaccines and diagnostics, misinformation, and the politicization of public health. It also accelerated health securitization: states treated pathogens as national-security threats, imposed export controls, and used health assistance as geopolitical leverage. Post-COVID governance is shaped by a feedback loop in which demands for transparency and verification collide with sovereignty, while demands for equity collide with intellectual property and industrial capacity. Lakoff (2017) is useful for understanding how preparedness is not merely a technical problem but a governmental rationality that

defines populations, risks, and responsibilities in particular ways, often privileging some forms of security over others.

Scope Conditions: This claim applies most strongly to high-consequence pathogens, dual-use research of concern, and globally connected societies in which a local outbreak can become a pandemic. It is less applicable to low-consequence endemic disease or to settings where biological research is minimal and health systems are robust. The governance problem is most acute where laboratory capacity, surveillance, and public-health infrastructure are weak or unevenly distributed, and where trust among major powers is low. The biological-weapons taboo remains a real constraint, but it is not self-enforcing; it depends on norms, national implementation, and the absence of incentives to defect. Post-COVID reforms may improve preparedness, but they can also restrict legitimate research, stigmatize scientists, or securitize health in ways that disadvantage poorer states. The claim should not be read as asserting that COVID-19 was a biological weapon or that a specific laboratory origin has been proven; rather, it treats origin uncertainty itself as a governance problem that shapes trust and policy.

Observable Implications: If this mechanism is operating, one should observe expanded national biosecurity strategies, revised laboratory oversight rules, debates over gain-of-function research, tighter export controls on biotechnology, and increased funding for pandemic preparedness. One should also observe multilateral processes such as Biological Weapons Convention review conferences, confidence-building measures, and negotiations over a pandemic agreement, alongside amendments to the International Health Regulations. Vaccine and diagnostic manufacturing initiatives in the Global South, technology-transfer disputes, and "vaccine equity" campaigns are observable indicators of the inequality dimension. Origin investigations, lab-leak discourse, misinformation, and accusations of biological weapons activity indicate the trust deficit. Metrics may include preparedness assessments, laboratory incident reporting, BWC compliance measures, vaccine coverage gaps, and the geographic distribution of biotechnology capacity. BWC reports and WHO pandemic treaty negotiations provide institutional evidence of both the demand for governance and the difficulty of achieving it.

Perspective Note (five traditions in brief):
African: African states experienced COVID-19 through structural inequality rather than merely epidemiological risk: limited vaccine access, diagnostic dependence, weak manufacturing capacity, and externally determined priorities revealed a pattern in which African populations are protected last and governed from afar. African scholarship, including work by Mamdani, Bayart, and Rodney, emphasizes extraversion, dependency, and the political economy of external control; from this vantage point, biosecurity is inseparable from health sovereignty, technology transfer, and equitable access to medical countermeasures. African perspectives often support stronger multilateral preparedness while warning that securitization can restrict research access, stigmatize African laboratories, or reproduce donor-driven agendas. The African CDC and regional initiatives represent efforts to convert vulnerability into institutional capacity, but they remain constrained by financing and global supply chains.
Chinese: China frames biosecurity as a matter of sovereignty, development, and state capacity, emphasizing biosafety legislation, laboratory governance, and the legitimacy of its pandemic response while opposing accusations that politicize origins or stigmatize Chinese science. It supports the Biological Weapons Convention but resists intrusive verification mechanisms that it regards as sovereignty-infringing, and it uses vaccine diplomacy and health assistance as instruments of international influence.
Russian: Russia frames biosecurity through multipolarity and suspicion of Western, especially U.S., biological activities near its borders, emphasizing Biological Weapons Convention strengthening and verification while using biosecurity narratives as geopolitical instruments. It presents the pandemic as evidence of West-

ern institutional failure and insists on sovereignty over health and research governance.
Western: Western perspectives emphasize laboratory safety, oversight of dual-use research of concern, pandemic preparedness, and modernization of the Biological Weapons Convention, while also engaging in self-critique regarding vaccine inequity, origin opacity, politicization, and the securitization of health. They focus on compliance, transparency, and verification but remain divided over how intrusive international oversight should be.
UN: The UN perspective is anchored in the World Health Organization and the Biological Weapons Convention, with emphasis on equity, preparedness, international health regulations, and multilateral cooperation. It is constrained by sovereignty, funding shortfalls, geopolitical distrust, and the absence of robust verification, so its contribution is primarily normative and coordinative rather than coercive.

2.5 KEY IDEA 4 — Critical infrastructure targeting — the blurring of civilian/military and the evolution of sabotage

Bolded Causal Claim: Critical infrastructure has become a central object of strategic competition because civilian systems now carry military functions, and because sabotage has evolved from kinetic destruction into reversible, deniable, software-enabled disruption that exploits legal and institutional gaps.

Mechanism: Critical infrastructure is conventionally defined as the systems and assets whose incapacitation or destruction would have a debilitating effect on security, the economy, public health, or safety. The category includes energy generation and distribution, water and wastewater systems, transportation networks, financial services, health-care systems, communications, and the ground segments that support space-based services. The first mechanism is functional fusion: modern military power depends on civilian infrastructure for command and control, logistics, intelligence fusion, precision timing, cloud computing, and data transport. A state's armed forces may own satellites and weapons platforms, but they routinely rely on civilian power grids, commercial undersea cables, internet service providers, and global navigation and timing signals. This means that an attack on civilian infrastructure can produce military effects without a conventional armed attack, and that the attacker can plausibly frame the operation as criminal, technical, or non-state activity. The civilian/military boundary, which underpins much of the law of armed conflict and deterrence theory, becomes analytically and legally unstable.

The second mechanism is the evolution of sabotage itself. Historically, sabotage meant physical destruction: explosives on rail lines, arson in factories, or covert action against industrial plants. Contemporary sabotage increasingly operates through digital access to operational technology. Adversaries can pre-position in networks, manipulate control systems, alter data, disable safety mechanisms, or trigger ransomware-like effects in hospitals, pipelines, water treatment facilities, or port logistics systems. These operations are often reversible, which lowers the perceived cost of escalation, but they can still cause physical harm, environmental damage, or cascading failures. Reversibility does not mean harmlessness; it means that the attacker may believe the operation stays below the threshold of armed conflict while the defender experiences it as a strategic attack. The evolution also includes supply-chain compromise, in which malicious code or hardware is inserted before systems are deployed, and the exploitation of common software dependencies that create single points of failure across sectors and borders.

A third mechanism is interdependence and cascading failure. Critical infrastructure is not a set of isolated assets but a network of networks. Electricity depends on fuel supply and water cooling; water depends on electricity; hospitals depend on both; financial settlement depends on timing signals; ports depend on

customs, fuel, and communications. Just-in-time logistics and lean inventories reduce buffers. Undersea cables concentrate global data flows through a small number of chokepoints. Common cloud providers and software platforms create correlated vulnerabilities. Consequently, a localized intrusion can propagate across sectors and jurisdictions, producing effects larger than the attacker's immediate target. This creates strategic leverage disproportionate to the technical sophistication of the operation.

A fourth mechanism is the attribution and governance gap. Infrastructure is often privately owned and operated, while national security responsibility remains public. Attribution in cyberspace is technically and politically uncertain, especially when adversaries use proxies, criminal ecosystems, or "living off the land" techniques that blend into legitimate administrative activity. International law has not settled when a cyber operation against infrastructure constitutes a use of force or an armed attack, nor has it established clear standards for countermeasures, due diligence, or state responsibility for non-state actors operating from a state's territory. The result is a permissive environment in which states can probe, coerce, and signal while maintaining deniability. The blurring of civilian and military functions therefore does not merely complicate targeting; it complicates deterrence, because deterrence depends on credible attribution, shared thresholds, and predictable response options.

Scope Conditions: The causal claim holds most strongly where operational technology is networked and remotely accessible, where legacy systems were not designed for adversarial environments, and where ownership is fragmented between public regulators and private operators. It is weaker where systems are air-gapped, manually overridden, redundantly designed, or protected by mature sector-specific regulation. The claim also depends on the adversary's risk tolerance and on the target society's resilience: a society with stockpiles, manual procedures, and rapid incident response may absorb disruption that would destabilize a more brittle system. Legal ambiguity is a scope condition rather than a universal constant; some states have developed domestic thresholds and reporting regimes that reduce uncertainty, while others have not. Finally, the blurring of civilian and military functions is most acute in advanced, digitally integrated economies and in conflict zones where civilian infrastructure is already militarized; it is less pronounced where infrastructure is sparse, manually operated, or not integrated into military planning.

Observable Implications: If the mechanism is operating, one should observe an increase in reported intrusions into energy, water, health, transportation, and communications systems, without a corresponding increase in publicly acknowledged armed attacks. One should also observe policy shifts from purely voluntary guidance toward mandatory reporting, sector-specific cybersecurity requirements, and resilience planning, as seen in frameworks such as the European Union's NIS2 Directive and national critical infrastructure protection programs. Market responses should include growth in cyber insurance, third-party risk assessment, tabletop exercises, and vendor security requirements. Militarily, one should observe the integration of cyber commands with infrastructure defense, the development of "defend forward" or persistent engagement doctrines, and greater attention to space ground segments, undersea cables, and timing infrastructure as strategic assets. Internationally, one should observe repeated attribution statements, sanctions, and diplomatic protests, alongside debates over whether international humanitarian law applies to cyber operations against civilian infrastructure and whether certain infrastructure should be treated as protected. In the biosecurity domain, one should observe heightened concern about the cybersecurity of laboratories, hospitals, and pharmaceutical supply chains, because biological and digital vulnerabilities increasingly overlap.

Perspective Note (five traditions in brief): African: The African perspective begins from the material reality that critical infrastructure is both a developmental lifeline and a vector of external control. Many African states inherited infrastructure designed for extraction rather than national integration, and contemporary sys-

tems often depend on foreign financing, foreign technology, and foreign operators. From this vantage point, sabotage and disruption are not abstract strategic possibilities but immediate threats to water, electricity, health care, food systems, and state capacity. African scholarship on extraversion and infrastructural violence highlights how external actors can shape domestic outcomes through control of networks, standards, and financing. The priority is therefore not only deterrence but resilience, sovereignty, and equitable capacity building: local maintenance capability, diversified supply chains, regional interconnection, and governance that prevents infrastructure from becoming a hostage to external power. The African perspective also warns that securitizing infrastructure without addressing underinvestment can deepen inequality, because protection may be concentrated in elite or extractive nodes while ordinary users remain exposed.

Chinese: The Chinese perspective treats critical infrastructure security as an extension of sovereignty, development, and national security. It emphasizes state capacity, centralized coordination, and the protection of infrastructure from both foreign interference and domestic instability. Chinese discourse often frames cyberspace and infrastructure governance in terms of cyber sovereignty, meaning that states have the right to manage and secure networks within their territory. This perspective supports strong domestic regulation, industrial policy, and the development of indigenous technology, while resisting external attribution or intervention that it regards as politicized. It contributes a focus on development-security integration and on the role of the state in coordinating public and private actors, but it may occlude concerns about transparency, independent oversight, and the civil-liberties implications of expansive security controls.

Russian: The Russian perspective frames critical infrastructure targeting within a broader discourse of information security and hybrid conflict. It emphasizes the vulnerability of state and societal systems to external manipulation, including through information and communication technologies, and it often treats Western attributions of cyber activity as politically motivated. Russian strategic thought has long stressed the importance of protecting information resources and maintaining sovereign control over domestic networks. This perspective contributes attention to the political and informational dimensions of infrastructure disruption, but it may occlude accountability for state-sponsored operations and can blur the distinction between defensive sovereignty and offensive interference. Its multipolarity framing also tends to treat infrastructure competition as part of a wider contest over the international order rather than as a technical governance problem.

Western: The Western perspective is shaped by a combination of deterrence theory, public-private partnership, and legal-institutional development. It emphasizes attribution, resilience, sectoral regulation, and the application of international law to cyber operations. Western states have invested heavily in critical infrastructure protection, incident response, and military cyber capabilities, while also debating how to defend privately owned systems without over-militarizing civilian space. This perspective contributes sophisticated technical and legal analysis, but it is subject to self-critique: it can over-securitize infrastructure, impose compliance burdens on private operators, rely on uncertain attribution, and struggle to reconcile deterrence with the reality that much infrastructure disruption occurs below the threshold of armed conflict. It also faces tension between openness and security in globally integrated supply chains.

UN: The UN perspective is anchored in multilateral norms, capacity building, and the protection of civilian objects. It emphasizes voluntary norms of responsible state behavior in cyberspace, including the principle that states should not conduct or knowingly support activity that intentionally damages critical infrastructure, and that they should respond to requests for assistance. The UN framework also stresses confidence-building measures, information sharing, and assistance to developing states. Its contribution is normative and coordinative rather than coercive, because it lacks enforcement mechanisms and depends on consensus among

states with divergent interests. It is constrained by sovereignty, funding limitations, and the difficulty of verifying compliance, but it remains the primary forum for articulating shared expectations about infrastructure protection.

2.6 KEY IDEA 5 — The new domains and the international rule-making effort

Bolded Causal Claim: The expansion of strategic competition into space, cyber, biosecurity, and critical infrastructure has generated a fragmented, power-asymmetric rule-making environment in which binding treaties are scarce, soft law and technical standards proliferate, and governance outcomes depend on forum selection, capacity, and great-power bargaining.

Mechanism: The first mechanism is institutional lag. International law and organizations were built around territorial states, conventional weapons, and relatively slow technological change. New domains do not fit neatly into existing categories. Space is governed by treaties negotiated during the Cold War that prohibit national appropriation and weapons of mass destruction in orbit but do not comprehensively address debris, rendezvous and proximity operations, or counterspace capabilities. Biology is governed by the Biological Weapons Convention, which lacks a verification protocol and struggles with dual-use research, synthetic biology, and pandemic preparedness. Cyberspace and critical infrastructure lack a universal treaty altogether; governance relies on non-binding norms, regional frameworks, and domestic regulation. The result is that technological change outpaces legal adaptation, and states operate in zones of interpretive ambiguity.

The second mechanism is forum proliferation and forum shopping. Rule-making now occurs simultaneously in the United Nations, specialized agencies such as the World Health Organization and the International Telecommunication Union, regional organizations, export-control regimes, standards bodies, industry consortia, and bilateral arrangements. States and firms select forums that favor their interests. Major powers may prefer flexible, non-binding arrangements that preserve strategic freedom; smaller states may prefer binding rules and capacity-building; private actors may prefer technical standards that entrench their market position. This multiplicity can be productive, because it allows experimentation and adaptation, but it also produces fragmentation, duplication, and inconsistent obligations. A state may be bound by one framework in a regional organization, another in a UN process, and a third through procurement or supply-chain requirements.

The third mechanism is the shift from disarmament to responsible behavior. In domains where verification is difficult or politically unacceptable, states have moved from negotiating prohibitions toward articulating norms of responsible conduct, confidence-building measures, and transparency. The UN Group of Governmental Experts and Open-Ended Working Group on information and telecommunications have produced consensus reports on responsible state behavior in cyberspace. The UN Committee on the Peaceful Uses of Outer Space has adopted guidelines for the long-term sustainability of outer space activities. The Biological Weapons Convention has developed intersessional work programs on science and technology, biosafety, and preparedness. These instruments are valuable because they create shared expectations and vocabularies, but they are not treaties and do not create enforcement mechanisms. They depend on voluntary compliance and political will.

The fourth mechanism is power asymmetry in standard-setting. In new domains, technical capacity is a form of power. States and firms that control satellite constellations, cloud infrastructure, biotechnology platforms, or cybersecurity tools can shape de facto rules through design choices, licensing, export controls, and market access. Export-control regimes such as the Australia Group and the Wassenaar Arrangement, along with national sanctions and investment screening, function as governance instruments even when they

are not framed as law. This means that rule-making is not only diplomatic; it is infrastructural. The states and companies that build and operate systems often determine how they are used, monitored, and secured. Weaker states may find themselves governed by standards they did not help design, while major powers retain discretion through exceptions, reservations, and non-participation.

The fifth mechanism is contestation over sovereignty and openness. New domains raise recurring questions: Who controls orbital slots and spectrum? Who owns biological data and genetic resources? Who has authority over cross-border data flows and infrastructure? Who is responsible for debris, pandemics, or cyber intrusions? Major powers disagree on whether governance should emphasize state sovereignty and non-interference or openness, interoperability, and multilateral oversight. This disagreement is not merely ideological; it reflects different capabilities and vulnerabilities. States with advanced space, biotech, and cyber capacities may prefer flexible rules that preserve advantage, while states with fewer capabilities may seek constraints, access, and assistance. The result is that rule-making becomes an arena of strategic competition rather than neutral administration.

Scope Conditions: The claim that rule-making is fragmented and power-asymmetric holds most strongly where technology is dual-use, rapidly evolving, and difficult to verify. It is weaker where a single dominant actor can impose standards, where technical consensus is strong, or where a well-established treaty regime already exists. Binding treaties remain possible when major powers share an interest in restraint, as in some arms-control contexts, but they are difficult when verification is intrusive or when states fear that constraints will lock in disadvantage. Soft law is more likely when consensus is required but trust is low. The effectiveness of any rule also depends on domestic implementation, industry compliance, and monitoring capacity; a well-drafted guideline that is not implemented domestically has limited effect. Finally, the claim should not be read as implying that no governance exists: there is substantial governance, but it is uneven, layered, and often non-binding.

Observable Implications: If the mechanism is operating, one should observe few new comprehensive binding treaties in space, cyber, biosecurity, or infrastructure, alongside a proliferation of guidelines, codes of conduct, voluntary commitments, and technical standards. One should observe UN processes producing incremental outputs rather than transformative agreements, such as long-term sustainability guidelines, responsible-behavior reports, and intersessional work programs. One should observe the expansion of national regulations, export controls, and investment screening with extraterritorial effects. One should observe private standards bodies, cloud providers, biotechnology firms, and satellite operators exercising de facto regulatory power through terms of service, licensing, and design. One should observe persistent disputes over definitions, thresholds, and verification, including debates over what counts as an armed attack in cyberspace, how to attribute biological incidents, and how to manage orbital debris. One should also observe "responsible behavior" and "risk reduction" replacing disarmament as the dominant diplomatic vocabulary, because these frames allow cooperation without requiring intrusive verification or equal restraint.

Perspective Note (five traditions in brief): African: The African perspective insists that rule-making in new domains must be evaluated by its effects on equity, access, and capacity. African states are often rule-takers in regimes designed by major powers, and their priorities include satellite access, spectrum allocation, pandemic preparedness, technology transfer, and protection of critical infrastructure. African scholarship and diplomacy frequently emphasize common but differentiated responsibilities, inclusive participation, and the avoidance of new forms of dependency. From this vantage point, governance that focuses only on security risks can neglect development needs, while governance that focuses only on access can neglect safety and accountability. The African perspective therefore calls for rules that are not only non-discriminatory in form

but also redistributive in effect, with sustained investment in African scientific, regulatory, and technical capacity.

Chinese: The Chinese perspective emphasizes sovereignty, development, and multipolarity in rule-making. It supports multilateral institutions but resists intrusive verification or governance arrangements that it regards as instruments of Western dominance. Chinese discourse often frames new domains through concepts such as cyber sovereignty and a community of shared future for mankind, stressing state equality, non-interference, and the right to development. This perspective contributes a challenge to Western-centric governance and a demand for greater voice for developing states, but it may occlude concerns about transparency, independent oversight, and the security implications of state-centric control. It also tends to favor state-led governance over private or civil-society participation.

Russian: The Russian perspective frames rule-making in new domains as part of a broader struggle for a multipolar international order. It emphasizes the equality of states, opposes what it sees as Western monopoly over norms and standards, and stresses information security rather than the narrower Western concept of cybersecurity. Russian diplomacy often supports binding treaties and opposes unilateral sanctions or extraterritorial regulation. This perspective contributes attention to power asymmetry and to the political uses of norm-setting, but it may occlude accountability for state behavior and can treat governance disputes primarily as geopolitical contests rather than technical or humanitarian problems. It also tends to favor state sovereignty over individual or corporate rights.

Western: The Western perspective is anchored in a rules-based international order, responsible state behavior, transparency, and verification. It supports multilateral governance but also relies on alliances, export controls, and private-sector partnerships. Western states have been active in developing norms for cyberspace, space sustainability, and biosecurity, while also engaging in self-critique about legitimacy, overreach, and the gap between rhetoric and practice. This perspective contributes legal sophistication and institutional capacity, but it is vulnerable to charges of double standards, especially when powerful states exempt themselves from constraints or use governance mechanisms to preserve technological advantage. Its self-critique increasingly acknowledges that governance must be inclusive and that standards must be legitimate to be effective.

UN: The UN perspective is anchored in multilateralism, consensus, and capacity building. It provides the primary forums for discussing new domains, including COPUOS for space, the BWC and WHO for biosecurity, and the General Assembly processes for cyberspace. Its contribution is to articulate shared norms, facilitate dialogue, and support developing states. It is constrained by the need for consensus, funding shortfalls, geopolitical distrust, and the absence of robust enforcement. In practice, the UN perspective is less a single actor than a framework within which competing state perspectives contend, but it remains indispensable for legitimizing rules and preventing unilateralism. Its central challenge is to move from norm articulation to implementation without losing the inclusivity that gives its outputs authority.

SECTION 2.7 FIVE PERSPECTIVES IN DEPTH

2.7.1 African Perspective (PRIMARY)

The African perspective on space, biosecurity, and critical infrastructure must be reconstructed from within rather than treated as a regional application of Western security theory. Its starting point is not the question of how to manage new domains as strategic arenas among great powers, but the question of how those domains reproduce, extend, or potentially interrupt historically unequal structures of power. African scholarship on

colonialism, dependency, extraversion, and decoloniality provides the theoretical vocabulary for this reconstruction. Grovogui's critique of international legal order as a historically racialized and imperial project; Mbembe's analysis of necropolitics and the infrastructures through which life and death are distributed; Bayart's account of the extraverted African state; Mamdani's distinction between citizen and subject; Rodney's demonstration that underdevelopment is an active historical process; Nkrumah's theory of neo-colonialism; Nyerere's insistence on self-reliance; Cabral's recovery of culture as a site of resistance; Fanon's analysis of colonial violence and the need for a new humanism; Aning and Danso's work on African security governance; Tamale's decolonial Afro-feminism; and Oyěwùmí's critique of colonial categories all converge on a common insight: the "global" in global governance is not a neutral container but a historically produced hierarchy. From this vantage point, space, biosecurity, and critical infrastructure are not empty frontiers awaiting rules; they are already saturated with colonial and neo-colonial relations.

In the space domain, the African perspective begins with access rather than weaponization. African states and regional institutions have invested in satellite programs for communications, earth observation, weather forecasting, agriculture, and disaster management, but these programs remain structurally dependent on foreign launch services, components, data-processing platforms, and financing. The issue is not simply technological lag; it is the political economy of orbital access, spectrum allocation, and data ownership. Historically, the allocation of orbital slots and radio frequencies occurred within institutions and timelines that privileged early spacefaring powers. African states therefore approach space governance with a dual demand: nonmilitarization and equitable participation. They generally support the peaceful uses of outer space and resist the placement of weapons in orbit, but they also insist that peaceful use must include meaningful access, technology transfer, and capacity building. The African Space Agency and national programs are not merely symbols of prestige; they are attempts to secure sovereign control over data that describe African land, resources, populations, and climate. From an African perspective, earth observation can become a form of data colonialism when imagery, analytics, and value-added services are owned and monetized by external actors. The contribution of this perspective is to show that space security is not only about anti-satellite weapons and debris; it is also about who owns the infrastructures of seeing, measuring, and knowing the continent.

The African perspective also reframes the biosecurity domain. Western and UN discussions often center on laboratory safety, dual-use research, pathogen surveillance, and pandemic preparedness. These are necessary, but African scholarship and policy experience highlight that biosecurity is inseparable from biosovereignty. The COVID-19 pandemic exposed profound asymmetries: delayed vaccine access, dependence on external manufacturing, weak regulatory and cold-chain capacity, and the stigmatization of African states when new variants were identified. The identification of the Omicron variant in South Africa, followed by travel bans and political blame, illustrated how genomic surveillance can be coupled with punitive rather than solidaristic responses. African states and scholars therefore emphasize pathogen access and benefit sharing, technology transfer, local manufacturing, and the decolonization of global health governance. The BWC and WHO pandemic treaty negotiations are not merely technical exercises; they are arenas in which African states seek to prevent biological resources and data from being extracted without reciprocal benefit. Tamale's decolonial Afro-feminism adds that biosecurity is gendered: women and marginalized communities often bear the care burdens of pandemics while being excluded from research governance and benefit-sharing. Oyěwùmí's critique of colonial categories reminds us that "global health" categories can obscure local epistemologies and community-based healing systems. The African perspective thus contributes a view of biosecurity as structural violence and equity, not only as laboratory risk.

Critical infrastructure is similarly reinterpreted. In much Western security discourse, critical infrastructure refers to systems whose disruption would harm national security, economic stability, or public safety. The

African perspective asks a prior question: critical for whom? Much infrastructure on the continent—ports, mines, pipelines, power plants, telecommunications, and transport corridors—has been financed, owned, or operated in ways that serve external extraction and global supply chains more than local development. Bayart's concept of extraversion helps explain how African states and elites have historically oriented infrastructure toward external patrons and markets. Rodney and Nkrumah provide the historical depth: underdevelopment and neo-colonialism were not accidents but structured processes that shaped infrastructure as an instrument of extraction. Consequently, sabotage, theft, and disruption in African contexts cannot be understood solely through the lens of hybrid warfare or great-power competition. They are also embedded in local political economies of resource plunder, state neglect, unemployment, and contested sovereignty. The African perspective therefore treats resilience not only as technical hardening, redundancy, and cyber defense, but also as social and political legitimacy. Informal networks, community coping mechanisms, and local knowledge often sustain populations when formal systems fail. Mbembe's necropolitics is relevant here: infrastructure can be a technology of abandonment as much as of development, determining whose lives are protected and whose are expendable.

The normative stance that follows from this analysis is not anti-technology or anti-cooperation. It is a demand for equity, sovereignty, and historical responsibility. African states generally support multilateral governance of new domains, but they are skeptical of frameworks that are formally inclusive yet substantively unequal. In space, this means support for non-weaponization combined with demands for capacity building and data sovereignty. In biosecurity, it means support for the BWC and WHO processes combined with demands for technology transfer, local manufacturing, and fair benefit sharing. In critical infrastructure, it means support for resilience and security combined with demands that infrastructure serve local populations and that external investment not reproduce extractive patterns. Nyerere's ujamaa and Cabral's insistence on returning to the source provide ethical anchors: development must be rooted in the people and their material conditions, not imposed by external models. Fanon's new humanism suggests that the goal is not merely inclusion in existing hierarchies but transformation of the terms of participation.

The African perspective also contributes a distinctive critique of the other four perspectives. Against the Chinese and Russian emphasis on sovereignty and multipolarity, it warns that state sovereignty without internal accountability can become a shield for elite extraversion and external dependency. Against the Western emphasis on rules and resilience, it exposes how "rules-based order" can universalize the priorities of powerful states and commercial actors. Against the UN emphasis on consensus and capacity building, it notes that capacity building without power redistribution risks perpetuating dependency. Its central claim is that new domains cannot be governed equitably unless the historical and structural inequalities that shape them are addressed. This is not a rejection of international law or multilateralism; Grovogui's work shows that African states have long engaged international law strategically, even while recognizing its imperial genealogies. It is a demand that governance be measured not only by the absence of weapons or the presence of treaties, but by the distribution of capabilities, benefits, and risks.

The perspective has scope conditions and occlusions that must be acknowledged. It is strongest when analyzing structural inequality, historical responsibility, and the political economy of technology. It is weaker when the immediate problem is a technical security dilemma requiring rapid coordination, such as debris-generating ASAT tests or fast-moving pandemics. In those moments, the African perspective may understate the urgency of great-power restraint and the need for universal compliance. It may also risk romanticizing informal resilience or state-led development, underestimating intra-African inequalities, non-state violence, and the agency of African elites in reproducing dependency. Mamdani's citizen/subject distinction is a reminder that African states are not unitary actors; they contain internal hierarchies that shape who bene-

fits from space programs, biosecurity investments, or infrastructure projects. Aning and Danso's work on African security architecture suggests that regional institutions have growing capacity but remain constrained by funding, political will, and external influence. The perspective therefore should not be read as a single voice; it is a field of debate among states, scholars, activists, and communities.

Nevertheless, the African vantage point reveals what the other four perspectives often miss: the coloniality of new domains. It shows that space is not merely a strategic high ground but a field of data extraction; that biosecurity is not merely laboratory safety but biosovereignty and equity; that critical infrastructure is not merely a target set but a political economy of extraction and abandonment. Its strongest counterargument is that historical grievance cannot override present technical risks, and that universal rules require universal compliance regardless of capacity. The African reply is that rules without equity are not universal; they are hegemonic. The value of the perspective lies in forcing the other four to confront the question of for whom new domains are governed, and at whose cost.

2.7.2 Chinese Perspective

The Chinese perspective on space, biosecurity, and critical infrastructure is organized around sovereignty, development, and multipolarity. It treats new domains as extensions of national development and state security, while framing global governance as a process that must respect sovereign equality and non-interference. In space, China presents itself as a major spacefaring power committed to peaceful uses, but also as a state that will not accept permanent technological subordination. Its official position supports the prevention of an arms race in outer space and opposes the weaponization of space, while simultaneously developing counterspace capabilities that it frames as defensive, deterrent, or responsive to perceived US and allied militarization. The 2007 ASAT test and subsequent co-orbital and directed-energy research are interpreted within this perspective as necessary capabilities in a competitive environment, not as aggressive acts. China also emphasizes its contributions to space access for developing states, including satellite launches and cooperation, and supports multilateral institutions such as COPUOS. Its normative stance is that space governance must not become a vehicle for freezing existing hierarchies or legitimizing unilateral dominance.

In biosecurity, the Chinese perspective stresses state sovereignty, the BWC, and opposition to politicization. China supports strengthening the BWC, including verification mechanisms, and has criticized US biological activities and overseas laboratories, particularly in the context of former Soviet states. During COVID-19, China emphasized state-led containment, technological mobilization, and vaccine diplomacy, while rejecting origin-tracing investigations that it viewed as politically motivated. The perspective treats biosecurity as a matter of national capacity and international equity: developing states need technology transfer, manufacturing capacity, and fair access to medical countermeasures. It also frames biosafety and dual-use research within a sovereignty paradigm, resisting external inspection or conditionality that it perceives as infringing on domestic jurisdiction. This contributes a powerful challenge to Western claims of neutral scientific governance, highlighting how biosecurity can be used to stigmatize or constrain rival states.

On critical infrastructure, China's perspective is shaped by cyber sovereignty, infrastructure protection, and the Belt and Road Initiative. It views critical infrastructure as a domain of national jurisdiction and development, and it emphasizes the right of states to regulate data, networks, and physical systems within their territory. Chinese policy and corporate actors have invested heavily in ports, power, telecommunications, and transport infrastructure across the Global South, framing these projects as development partnerships. From Beijing's vantage point, Western criticism of such projects often reflects geopolitical competition rather than genuine security concern. The perspective contributes an alternative to Western public-private resilience

models by foregrounding state capacity, long-term planning, and South-South cooperation. It also insists that infrastructure security must not be used to justify exclusionary standards or technological decoupling.

The Chinese perspective's strength is its ability to articulate a non-Western vision of multipolar governance and to expose double standards in Western security discourse. It gives voice to states that reject the idea that the United States and its allies should define the norms of new domains. However, it has significant occlusions. Its sovereignty framing can obscure transparency, accountability, and human-rights concerns, particularly when state control is conflated with public interest. Its support for multilateral arms control coexists with opaque counterspace development, creating a credibility gap. In biosecurity, its emphasis on sovereignty can resist legitimate scrutiny of laboratory safety and outbreak reporting. In infrastructure, its development narrative can understate debt, dependency, and local political risks associated with large projects. The perspective is therefore best understood as a strategic and normative counterweight to Western dominance, but one that also reproduces state-centric blind spots and may use equity rhetoric to shield national capabilities.

2.7.3 Russian Perspective

The Russian perspective on space, biosecurity, and critical infrastructure is rooted in a multipolar worldview and a sense of strategic encirclement. It treats new domains as arenas in which the United States seeks to preserve unipolar dominance, and it frames Russian capabilities as necessary responses to Western military-technological superiority. In space, Russia draws on its Soviet legacy as a pioneer space power and presents itself as a defender of the peaceful use of outer space against US militarization. It supports treaties such as the Prevention of the Placement of Weapons in Outer Space and has jointly proposed drafts with China. At the same time, Russia has conducted counterspace tests, including the 2021 destruction of Kosmos 1408, which it framed as a defensive demonstration of capability and a response to US space policy. The Russian perspective thus combines legal opposition to weaponization with practical development of counterspace tools, arguing that security requires credible deterrence.

In biosecurity, Russia emphasizes the BWC and accuses the United States and its allies of maintaining biological military programs and laboratories near Russian borders. It has used international forums to demand transparency and verification, while resisting Western accusations regarding its own activities. During COVID-19, Russia promoted state sovereignty, criticized Western politicization of health governance, and used vaccine diplomacy as a tool of influence. The perspective treats biosecurity as an extension of geopolitical competition, in which scientific and health institutions can be instruments of power. Its contribution is to highlight the security dimensions of biological research and to insist that arms-control regimes must apply equally to all states, including powerful Western ones. It also underscores the distrust that pervades great-power relations and the difficulty of building verification mechanisms in a polarized environment.

On critical infrastructure, Russia's perspective is shaped by its view of hybrid warfare and Western double standards. It sees new domains as interconnected: space-based ISR, cyber operations, and infrastructure sabotage can be combined in conflict. Russian strategic discourse often portrays Western states as using sanctions, information operations, and infrastructure targeting against Russia, while condemning similar Russian actions. The perspective therefore emphasizes resilience, redundancy, and strategic autonomy, but also treats offensive capabilities in new domains as legitimate tools of statecraft. This creates a tension between Russia's support for multilateral norms and its willingness to use disruptive capabilities when it perceives strategic necessity.

The Russian perspective's contribution lies in its insistence on equality of security and its exposure of West-

ern hypocrisy. It reminds other actors that arms-control and governance frameworks can be perceived as instruments of dominance if they are not applied symmetrically. However, its occlusions are substantial. It often justifies its own actions as reactive while attributing agency and aggression to adversaries. Its use of disinformation and its lack of transparency in biological and space activities undermine the credibility of its normative claims. In critical infrastructure, its perspective can blur the line between deterrence and coercion, making it difficult to distinguish defensive resilience from offensive preparation. The perspective is therefore most useful as a diagnostic of great-power distrust, but less reliable as a basis for cooperative governance.

2.7.4 Western Perspective

The Western perspective on space, biosecurity, and critical infrastructure is shaped by strategic competition, technological leadership, and a self-conscious commitment to governance. It treats new domains as areas where rules, norms, and resilience must be strengthened to protect open societies and the global economy. In space, Western states—especially the United States and its allies—emphasize space security, situational awareness, commercial innovation, and deterrence. They oppose debris-generating ASAT tests and support voluntary norms, such as UNGA resolutions on destructive direct-ascent ASAT testing, while also developing military space capabilities and doctrines. The Western perspective values transparency, commercial participation, and alliance coordination, and it often frames space governance as a choice between a rules-based order and authoritarian or revisionist alternatives. Its self-critique acknowledges that commercialization, militarization, and inequitable access can undermine legitimacy, and that Western leadership can appear as dominance.

In biosecurity, the Western perspective centers on laboratory safety, dual-use research oversight, pandemic preparedness, and the governance of high-consequence pathogens. It includes debates over gain-of-function research, biosafety levels, and the balance between scientific openness and security. COVID-19 prompted extensive Western self-critique: failures of preparedness, fragmented public health systems, politicization of science, and inequitable vaccine distribution. Western states and institutions have supported the BWC, WHO processes, and initiatives to strengthen global health security, while also emphasizing national resilience and private-sector innovation. The perspective contributes technical expertise, funding, and institutional capacity, but it can also over-securitize health and prioritize the concerns of wealthy states.

On critical infrastructure, the Western perspective emphasizes public-private partnerships, resilience, cyber defense, and the protection of essential services. It recognizes that most critical infrastructure is privately owned, requiring collaboration between governments and industry. NATO and national frameworks stress continuity of government, supply-chain security, and deterrence against sabotage. The Western perspective also includes a governance-self-critique: it acknowledges that infrastructure protection can become a pretext for surveillance, that privatization can create vulnerabilities, and that resilience strategies may neglect marginalized communities. It is attentive to the blurring of civilian and military targets, particularly in cyber and hybrid conflict, and seeks to develop norms that limit escalation.

The Western perspective's strengths are its technical capacity, institutional depth, and willingness to debate its own failures. It has generated important norms on debris, biosafety, and infrastructure resilience, and it has mobilized significant resources for global health and space situational awareness. Its occlusions, however, are equally significant. It often universalizes Western security priorities, treating its own threat perceptions as global. Its commercial and military interests can conflict with equitable access, particularly for developing states. Its "rules-based order" rhetoric can be perceived as hegemonic, especially when rules are enforced

asymmetrically. The perspective is therefore most persuasive when it combines capability with humility, and least persuasive when it conflates Western leadership with universal legitimacy.

2.7.5 UN Perspective

The UN perspective on space, biosecurity, and critical infrastructure is rooted in multilateralism, consensus, and capacity building. It provides the primary forums for discussing new domains, including COPUOS for space, the BWC and WHO for biosecurity, and General Assembly processes for cyberspace and infrastructure-related security. Its contribution is to articulate shared norms, facilitate dialogue, and support developing states. It is constrained by the need for consensus, funding shortfalls, geopolitical distrust, and the absence of robust enforcement. In practice, the UN perspective is less a single actor than a framework within which competing state perspectives contend, but it remains indispensable for legitimizing rules and preventing unilateralism. Its central challenge is to move from norm articulation to implementation without losing the inclusivity that gives its outputs authority.

In space, the UN system has developed guidelines on the long-term sustainability of outer space activities and has provided a forum for discussing debris, resource utilization, and the prevention of an arms race. The Pact for the Future, adopted in 2024, reaffirmed commitments to the peaceful uses of outer space and to strengthening multilateral governance, reflecting a renewed effort to address emerging technologies and strategic competition. COPUOS remains the central venue for technical and legal discussion, but its consensus-based procedures can slow responses to rapidly changing capabilities. The UN perspective emphasizes that space governance must be inclusive, particularly for states that lack independent access but are affected by debris, spectrum congestion, and data asymmetries.

In biosecurity, the UN perspective is expressed through the BWC, WHO, and related health-security frameworks. The BWC provides a normative foundation against biological weapons, but it lacks a verification mechanism and depends on voluntary confidence-building measures. WHO processes, including pandemic treaty negotiations, aim to strengthen preparedness, equity, and response, but they are shaped by geopolitical contestation and resource inequality. The UN perspective highlights the need for capacity building, technology transfer, and fair access to countermeasures, while also recognizing the tension between transparency and sovereignty. It is particularly attentive to the needs of developing states, which often lack laboratory capacity, surveillance systems, and manufacturing infrastructure.

On critical infrastructure, the UN perspective is less centralized but still important. General Assembly resolutions, specialized agencies, and development programs address infrastructure resilience, cyber norms, and the protection of essential services. The UN emphasizes that infrastructure is a development issue as well as a security issue, and that resilience must include social protection, equity, and sustainable development. Its contribution is to connect technical security concerns to broader human-security and development agendas. However, it lacks enforcement power and depends on member-state implementation.

The UN perspective's greatest strength is its legitimacy and inclusivity. It provides a forum where African, Chinese, Russian, Western, and other perspectives can interact, and it helps prevent the unilateral definition of norms by powerful states. Its occlusions stem from its structural constraints: consensus can produce lowest-common-denominator outcomes; funding shortfalls limit capacity building; and geopolitical distrust can paralyze action. The UN is therefore best understood not as an independent governor of new domains, but as the indispensable arena in which their governance must be negotiated. Its central challenge is to convert normative authority into practical implementation while preserving the inclusivity that makes its norms credible.

SECTION 2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Centers equity, access, capacity, and the uneven distribution of risks and benefits in space, biosecurity, and infrastructure governance	Can underweight hard-security drivers, deterrence, and the immediate strategic motives of great-power testing	New-domain governance must be inclusive, capacity-building, and redistributive, not merely non-proliferative	African Union space and biosecurity capacity agendas; dependence on external satellite and health data	Western and Russian perspectives argue that security externalities and deterrence cannot wait for full equity
Chinese	Highlights sovereignty, peaceful development, multipolarity, and resistance to unilateral norm-setting	Can obscure China's own counterspace development and the dual-use ambiguity of its programs	Space and biosecurity should be governed by multilateral, legally binding, non-discriminatory rules	China's diplomatic positions on PAROS and its 2007 ASAT test legacy	Western perspective argues that China's sovereignty framing can shield hazardous or opaque capabilities
Russian	Explains multipolar resistance, strategic vulnerability, and the view that counterspace capabilities are defensive necessities	Occludes the indiscriminate, long-lived debris and escalation risks imposed on all users	Sovereign equality and resistance to Western-dominated norms in emerging domains	2021 Kosmos 1408 test and Russian diplomatic framing of Western militarization	UN and Western perspectives argue that debris and escalation risks are transnational, not merely bilateral

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Western	Identifies strategic stability, escalation risk, deterrence, and governance gaps with precision	Can normalize Western military space programs and securitize domains in ways that privilege powerful states	Rules-based order, responsible behavior, and targeted constraints on the most destabilizing capabilities	US 2022 moratorium on destructive direct-ascent ASAT testing; allied condemnation of the 2021 test	Russian and Chinese perspectives argue that Western norms are hypocritical and non-binding
UN	Provides legitimacy, inclusivity, and a forum for converting crises into norms and voluntary commitments	Consensus procedures can produce lowest-common-denominator outcomes and implementation gaps	Multilateralism, peaceful uses, and incremental norm-building through COPUOS, BWC, and related forums	COPUOS work; UNGA resolutions on responsible behaviors in space; BWC review conferences	State perspectives argue that UN processes are too slow and too dependent on member-state will

SECTION 2.8 WORKED EXAMPLE (I do)

Levels of analysis. At the individual level, the 2021 Kosmos 1408 event reflects choices by Russian defense and political leaders to demonstrate a counterspace capability at a moment of heightened geopolitical tension, and choices by US, British, and other officials to frame that demonstration as a threat to strategic stability rather than as an ordinary test. At the state level, Russia sought to signal that it could hold adversary satellites at risk, while the United States and its partners sought to delegitimize that signal and to build support for constraints on destructive testing; other states, including those with their own ASAT histories, faced pressure to align or to remain silent. At the systemic level, the test occurred within a competitive multipolar order in which satellites underpin precision warfare, early warning, and command-and-control, and in which counterspace capabilities can create security dilemmas and first-strike incentives. At the transnational level, the debris cloud threatened a shared orbital environment used by the multinational International Space Station, commercial operators, scientific missions, and future users, while the diplomatic response moved through UN forums, allied statements, and voluntary national moratoria.

Mechanism section. The mechanism begins with a direct-ascent anti-satellite test: a missile launched from Earth intercepts a satellite in low Earth orbit, and kinetic impact shatters the target into fragments. Because orbital velocities are extremely high, even small fragments can damage or destroy spacecraft, and the resulting debris can remain in orbit for years or decades depending on altitude and atmospheric drag. Publicly reported accounts of the November 2021 destruction of Kosmos 1408 described more than 1,500 trackable fragments and many smaller pieces, with the debris cloud passing near the orbit of the International Space Station and forcing crew precautions. The strategic mechanism is equally important: satellites are critical infrastructure

for military and civilian life, so a demonstrated ability to destroy them can signal deterrence, coercion, or escalation dominance; yet the same debris imposes costs on the testing state and on all other users, making the capability simultaneously impressive and self-damaging. The political mechanism then converts the physical event into a governance problem: condemnation, UN discussion, and voluntary moratoria can raise the reputational cost of future tests, but without a binding prohibition the incentive to demonstrate capability remains.

Perspective reconstruction. From an African vantage point, the Kosmos 1408 test is not merely a Russo-American security episode but an event in a global commons whose costs are distributed unevenly. African states and institutions have limited indigenous space capacity and depend on external providers for Earth observation, communications, and weather data, so debris risk and great-power testing impose unchosen vulnerabilities. The African Space Policy and Strategy (2016) and related AU discussions frame space as a development resource, meaning governance must include capacity building, data access, and equitable participation, not only nonproliferation. The multilateral response's focus on debris and strategic stability is necessary but incomplete if it does not address who bears the costs of cleanup, insurance, and lost services. Thus the African perspective sees the test as evidence that new-domain governance must be inclusive and redistributive, otherwise norms will reflect the priorities of states that can afford to test and to insure. China frames space as a domain for peaceful development and sovereign equality, and it has condemned weaponization while building its own counterspace and space capabilities. In the Kosmos 1408 case, Beijing's likely reading emphasizes that the test demonstrates the dangers of an unregulated arms race and the need for multilateral, legally binding constraints rather than unilateral US-led norms. China's own 2007 ASAT test and subsequent debris creation complicate its moral authority, but its diplomatic position stresses that all major powers, including the United States, must accept reciprocal limits. The Chinese perspective therefore treats the Russian test as both a warning and an argument for a treaty-based, non-discriminatory regime that does not privilege Western military space dominance. Russia frames the test as a legitimate demonstration of defensive capability in a domain where the United States and NATO have militarized space and threatened Russian assets. Moscow's official position disputed that the debris endangered the International Space Station and treated Western condemnation as politicized, reflecting a broader multipolarity narrative that resists Western norm-setting. The Russian perspective sees counterspace capabilities as necessary for deterrence in an era of US precision-strike and space-enabled warfare. Yet this framing occludes the indiscriminate, long-lived debris hazard imposed on all users, including Russia's own future missions and partners. The Western perspective treats the test as a destabilizing demonstration of a direct-ascent ASAT capability that threatens the satellite infrastructure underpinning military and civilian life. It emphasizes strategic stability: because satellites are vulnerable and attribution can be ambiguous, counterspace weapons create incentives for preemption and escalation. The United States and allies responded with diplomatic condemnation and, in 2022, a unilateral moratorium on destructive direct-ascent ASAT testing, seeking to build a norm of responsible behavior. This perspective's strength is its attention to escalation risk; its weakness is that it can understate Western military space programs and the need for binding, inclusive rules. The UN perspective treats the test as an illustration of governance gaps in a domain where no binding prohibition on ASAT testing exists. Through COPUOS and UNGA resolutions on responsible behaviors, the UN provides a forum for converting outrage into norms, but consensus requirements slow action. The multilateral response—condemnation, working groups, and voluntary moratoria—shows both the UN's convening power and its dependence on member-state will. The UN perspective thus sees the case as requiring not just technical debris mitigation but a broader political settlement on space security.

Explicit adjudication. The Western perspective best explains the case's strategic logic and its immediate

stability implications: Russia demonstrated a capability that threatens satellite-dependent military and civilian systems, and the debris cloud created a shared, long-lived risk that made the test internationally costly. Its limitation is that it can treat Western military space programs as background rather than as part of the competitive dynamic that motivates Russian testing, and it may understate the distributional consequences for states with little space capacity. The Russian perspective best explains Moscow's stated motive—deterrence and resistance to perceived Western dominance—but it is weakest on the physical externality of debris and on the legitimacy of imposing that risk on non-consenting users. The Chinese perspective correctly identifies the need for reciprocal, treaty-based constraints, yet its credibility is weakened by China's own ASAT history. The African perspective is indispensable for showing who bears the unchosen costs of great-power testing, but it does not by itself explain why Russia chose to test in 2021. The UN perspective best explains the institutional response and its limits, but it cannot compel compliance. On balance, the case is best explained by a state-and-systemic account for causation—closest to the Western and Russian perspectives—combined with a transnational-governance account for consequences and response—closest to the UN and African perspectives. No single perspective is sufficient; the test is simultaneously a strategic signal, a debris-generating hazard, a multipolar grievance, and a governance failure.

SECTION 2.9 PROBLEM PAIR (We do)

1. **Mechanism identification.** In the COVID-19 case, identify the principal causal mechanism through which geopolitics shaped pandemic outcomes: vaccine nationalism, origin politicization, export controls, institutional fragmentation, or structural inequality. State which mechanism you treat as primary and why.

2. **Level of analysis.** Analyze the pandemic response at the individual, state, systemic, and transnational levels. Which level best explains the delay in equitable vaccine distribution, and which best explains the failure to agree on a binding pandemic accord?

3. **Perspective reconstruction.** Reconstruct the African, Chinese, Russian, Western, and UN interpretations of the pandemic response. For each, identify one contribution and one occlusion.

4. **Historical analogue.** Compare COVID-19 with either the 2003 SARS outbreak or the 2014 Ebola outbreak. What transfers from that analogue, and what is misleading if imported uncritically?

5. **Falsification.** State two pieces of evidence that would weaken the claim that geopolitical competition worsened pandemic outcomes, and one piece of evidence that would strengthen it.

6. **Prescription boundary.** Distinguish description, explanation, prediction, and prescription in your answer. Which of your claims are normative, and on what evidence do they rest?

Model answer. The COVID-19 pandemic illustrates how a biological event becomes a biosecurity crisis when geopolitical competition, institutional weakness, and structural inequality interact. The virus itself was a pathogen of natural or possibly laboratory origin; the response was shaped by power. Early in 2020, information politics and sovereignty claims slowed transparent data sharing, while travel bans and export controls turned health equipment into strategic commodities. Vaccine development was extraordinarily fast, but distribution followed purchasing power and alliance structures rather than epidemiological need. COVAX, the multilateral mechanism intended to ensure equitable access, was underfunded and outbid by wealthy states, producing what African leaders and scholars described as vaccine apartheid. This was not merely a moral

failure; it was a strategic failure because unvaccinated populations prolonged transmission and variant emergence, undermining global health security for all states.

The pandemic also transformed biosecurity governance. The Biological Weapons Convention lacks a verification protocol, and COVID-19 intensified debates over dual-use research, laboratory safety, and pathogen access. Origin investigations became proxies for US-China rivalry: demands for transparency were read in Beijing as sovereignty violations and political containment, while in Washington and allied capitals opacity fueled suspicion. The result was a chilling effect on scientific cooperation and a securitization of bioscience that risks treating researchers as intelligence assets. Russia and other states used vaccine diplomacy to project influence, while Western governments simultaneously promoted COVAX and restricted exports, revealing a tension between liberal internationalist rhetoric and nationalist practice.

From an African perspective, the central lesson is capacity and equity. African states faced delayed vaccine access, limited genomic sequencing capacity, and dependence on external manufacturing, yet also demonstrated regional coordination through the African Union and Africa CDC. The pandemic showed that biosecurity cannot be reduced to border control or great-power deterrence; it requires distributed laboratory capacity, local production, and fair intellectual-property rules. The blocked TRIPS waiver debate exposed how global health governance remains tethered to pharmaceutical monopolies and donor priorities. African scholarship on structural adjustment and dependency helps explain why emergency health financing often arrived as conditional loans rather than unconditional solidarity.

Other perspectives illuminate different mechanisms. China framed pandemic response through sovereignty and state capacity, emphasizing domestic containment and later vaccine exports, while resisting externally imposed origin investigations. Russia framed the pandemic within multipolarity, criticizing Western vaccine hoarding and promoting Sputnik V as an alternative. Western governments combined rapid biomedical innovation with export restrictions and later engaged in governance self-critique, acknowledging that COVAX shortfalls and intellectual-property rigidities damaged legitimacy. The UN system—WHO, the BWC, and ongoing pandemic accord negotiations—provided forums for coordination but lacked enforcement, funding, and political consensus.

Historically, the 2014 Ebola outbreak offers a partial analogue: it showed that multilateral response can be mobilized, but also that early delays and weak health systems amplify harm. COVID-19 differed in scale, politicization, and the centrality of vaccine technology. A plausible falsifier of the claim that geopolitics worsened outcomes would be evidence that states with the most competitive bilateral relationships achieved the fastest equitable global distribution; the record shows the opposite. Another falsifier would be proof that origin politicization had no effect on scientific cooperation; the documented chilling of research collaboration suggests otherwise.

The post-pandemic governance landscape is therefore contested. Negotiations over a pandemic accord, pathogen access and benefit sharing, and BWC strengthening continue, but sovereignty concerns, intellectual-property disputes, and great-power distrust constrain ambition. The most defensible conclusion is that COVID-19 was not simply a health emergency or a geopolitical weapon; it was a stress test revealing how biosecurity, equity, and power are intertwined. Effective governance will require not only better surveillance and laboratories but also credible commitments to equitable access and depoliticized science.

SECTION 2.10 INDEPENDENT MEMO (You do)

(a) Case description: A coastal state in the Global South experiences a simultaneous crisis: a suspected laboratory-acquired infection at a foreign-funded high-containment facility and a two-day disruption

of satellite navigation services affecting its main port. Domestic opposition demands immediate closure of all foreign labs; a regional bloc requests emergency vaccine and diagnostic support; one great power offers bilateral aid conditioned on access to pathogen samples; another great power blames the first for sabotage. The state has limited genomic sequencing capacity, depends on imported reagents, and is a party to the Biological Weapons Convention but not to any binding space security instrument. Its leaders must choose among unilateral emergency powers, multilateral inspection, or strategic ambiguity. The case is fictional but structurally analogous to real debates over biosecurity sovereignty, space dependence, and equitable access. The state's decision will be scrutinized by investors, diaspora communities, and neighboring states that share the same satellite-dependent infrastructure.

(b) Required memo headings as prompts:

- **Mechanism:** Explain the causal chain linking the laboratory incident, satellite disruption, and state response; specify whether the mechanism is coercion, contagion, institutional failure, or strategic signaling, and identify the level of analysis at which it operates.
- **Perspective reconstruction:** Reconstruct how African, Chinese, Russian, Western, and UN actors would interpret the crisis, what each would emphasize, and what each would occlude.
- **Historical analogue:** Compare the case to one prior episode, such as the 2021 Russian ASAT test, COVID-19 origin disputes, or the 2014 Ebola response, and state what transfers and what does not.
- **Falsifiers:** List two or three observations that would weaken your explanation and one observation that would weaken your prediction.

(c) Self-check: Did you distinguish description of events, explanation of causes, prediction of consequences, and prescription of policy, and did you avoid presenting any single perspective as self-evidently correct?

SECTION 2.11 HINGE QUESTION

Question: The 2021 Russian ASAT test against Kosmos 1408 is best interpreted as:

A. A purely defensive demonstration that improved strategic stability by proving Russia could protect its satellites.
B. A destabilizing counterspace action that created long-lived debris and weakened norms, though its strategic effects depend on attribution and response.
C. An isolated technical event with no implications for international law because space is already a warfighting domain.
D. A successful test of co-orbital inspection capabilities that established a new cooperative security regime.

Correct answer: B.

Distractor diagnosis: - **A** conflates a capability demonstration with strategic stability; it ignores debris generation, escalation risk, and the absence of any stabilizing arms-control framework. - **C** treats the lack of a binding space security treaty as evidence that norms, diplomacy, and strategic restraint do not matter; it also overstates the claim that space is already an accepted warfighting domain. - **D** misidentifies a direct-ascent ASAT intercept as co-orbital inspection and invents a cooperative security regime that the test did not establish.

SECTION 2A — DATA LAB

Table 1 — State satellite portfolios (approximate, open-source estimates, 2023–2024)

State/actor	Operational satellites (approx.)	Share of global total (approx.)	Dominant functions	Analytical note
United States	5,000–6,500	~60–70%	Commercial broadband, ISR, PNT, military communications	Concentration reflects commercial mega-constellations plus defense demand
China	600–800	~8–10%	Remote sensing, communications, navigation (BeiDou)	Rapid growth; state-led industrial policy and military-civil fusion
Russia	150–200	~2%	Military communications, ISR, navigation (GLONASS)	Legacy capacity; slower replenishment and sanctions pressure
European states (ESA/EU plus national)	300–400	~4–5%	Earth observation, communications, science	Fragmented governance; Galileo as sovereignty project
India	50–100	~1%	Remote sensing, communications, navigation	Cost-efficient programs; regional security focus
Japan	80–120	~1%	ISR, communications, science	Alliance-integrated space posture
Rest of world	1,000–1,500	~12–18%	Mixed, including smallsats	High growth in numbers, low individual capacity
Total	**~8,000–9,500**	**100%**		Counts vary by database and by definition of "operational"

Table 2 — Counterspace tests and debris (selected, approximate)

Date	State	Test type	Target	Tracked debris (approx.)	Strategic reading
2007	China	Direct-ascent ASAT	Fengyun-1C weather satellite	Thousands	Demonstrated ability to hold LEO assets at risk; debris long-lived
2008	United States	Direct-ascent ASAT (Operation Burnt Frost)	USA-193	Hundreds	Framed as hazard mitigation; also read as counterspace signaling
2019	India	Direct-ascent ASAT (Mission Shakti)	Microsat-R	Hundreds	Regional deterrence and status signaling
2021	Russia	Direct-ascent ASAT	Kosmos 1408	1,500+	ISS crew sheltering; sharpened debris-governance debate
2020s (reported)	Multiple	Non-kinetic and proximity operations	Not applicable	None (reversible)	Lower immediate escalation but high attribution ambiguity

Table 3 — Selected pandemic and space-governance indicators (approximate/as of 2024)

Indicator / framework	Value or status	Interpretation
COVID-19 excess deaths, 2020–2021	~14.9 million (WHO estimate)	Pandemic as mass-casualty biosecurity event; data uncertainty remains high
Global GDP contraction, 2020	~3.1% (IMF estimate)	Economic shock with uneven recovery and fiscal scarring
Vaccine access gap	Low-income states received a small share of doses through 2021	Equity failure; trust erosion in global health governance
COPUOS membership	100+ states	Near-universal forum; consensus speed is slow

Indicator / framework	Value or status	Interpretation
PAROS (UNGA)	Annual resolution; no binding treaty	Norm against weaponization without verification
Artemis Accords	Dozens of signatories	Coalition governance; contested legitimacy outside the coalition
BWC	180+ states parties; review conferences stalled	Disarmament norm with weak verification and compliance mechanisms
WHO pandemic agreement negotiations	Ongoing as of 2024	Sovereignty-versus-solidarity tension in biosecurity governance

Five numbered analysis questions

1. **Trend:** What do the satellite-portfolio and counterspace-test data suggest about the concentration of space power, the diffusion of counterspace capability, and the erosion of strategic stability in orbit?
2. **Level of analysis:** At which level—individual, state, systemic, or transnational—does each data series operate most directly, and how do satellite concentration, debris externalities, pandemic mortality, and treaty status interact across levels?
3. **Perspective reconstruction (all five):** How would African, Chinese, Russian, Western, and UN analysts read the same tables differently, especially on equity, sovereignty, multipolarity, security, and multilateral legitimacy?
4. **Interpretation:** What do pandemic mortality/economic data plus the stalled or partial status of space and biosecurity governance frameworks imply about whether biosecurity and orbital safety are being treated as global public goods?
5. **Limitation:** What do these data not capture—classified programs, dual-use ambiguity, underreporting, informal governance, commercial opacity, or the difference between reversible and destructive counterspace effects?

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — Orbital Stack and Debris Cloud (hand-drawn)

- **What to draw:** Draw Earth as a filled circle in the center. Around it, draw three concentric rings labeled from inner to outer: **LEO (200–2,000 km)**, **MEO**, and **GEO**. In LEO, draw many small squares representing satellites, clustered in "shells"; in MEO, draw fewer squares; in GEO, draw a sparse arc of squares. Scatter small dots and short dashes throughout LEO to represent debris, with a denser cloud near one cluster labeled **"2021 Kosmos 1408 debris."** Draw arrows from selected satellites to Earth labeled **ISR**, **PNT**, and **Comms**.
- **Labels to place:** "LEO," "MEO," "GEO," "ISR," "PNT," "Comms," "Debris," "Kosmos 1408," "Commercial mega-constellation," "Military satellite."
- **Perspective overlay to annotate:** Around the drawing, place five short marginal notes: **African:** "access, capacity, and equitable benefit-sharing"; **Chinese:** "sovereignty, development, and security"; **Russian:** "multipolarity and strategic parity"; **Western:** "security, resilience, and governance"; **UN:** "COPUOS norms and debris mitigation."

Visual 2 — Counterspace Escalation Ladder (hand-drawn)

- **What to draw:** Draw a vertical ladder with six rungs from bottom to top. Label the rungs, bottom to top: **1. Reversible jamming/spoofing**, **2. Cyber intrusion**, **3. Proximity/RPO**, **4. Non-destructive dazzling**, **5. Direct-ascent kinetic ASAT**, **6. Co-orbital weaponization**. Add a side arrow labeled **"Escalation and attribution difficulty"** increasing upward. At the top, draw a warning symbol labeled **"Debris / Kessler risk."** At the bottom, draw a small box labeled **"Reversible effects."**
- **Labels to place:** "Reversible," "Cyber," "Proximity," "Dazzling," "Kinetic ASAT," "Co-orbital," "Debris," "Attribution," "Escalation."
- **Perspective overlay to annotate:** Place marginal notes: **African:** "collateral harm to shared orbital commons"; **Chinese:** "defensive sovereignty and anti-hegemony"; **Russian:** "strategic parity and multipolar deterrence"; **Western:** "deterrence, resilience, and escalation control"; **UN:** "norms, transparency, and verification."

Visual 3 — Biosecurity Governance Gap (hand-drawn)

- **What to draw:** Draw three overlapping circles in a Venn diagram. Label them **Pandemic Response**, **Lab Biosafety/Biosecurity**, and **Critical Infrastructure**. In the central overlap, write **"Governance gap."** Around the circles, draw small boxes labeled **WHO IHR**, **BWC**, **National lab oversight**, **Health systems**, and **Infrastructure protection**. Draw arrows from the central gap to a box labeled **"Equity, attribution, and resilience."**
- **Labels to place:** "Pandemic response," "Lab governance," "Infrastructure," "Governance gap," "WHO IHR," "BWC," "National oversight," "Health systems," "Resilience."
- **Perspective overlay to annotate:** Place marginal notes: **African:** "capacity, access, and equity"; **Chinese:** "sovereignty, development, and biosecurity governance"; **Russian:** "multipolarity and non-discrimination"; **Western:** "security, preparedness, and governance self-critique"; **UN:** "BWC, WHO negotiations, and Pact for the Future."

SECTION 4 — CORNELL NOTES

Cue	Notes (with source log)
Space as strategic domain	ISR, PNT, and communications make satellites military-relevant; militarization debate concerns whether space is a sanctuary or warfighting domain. Source log: Johnson-Freese (2016); Harrison (2021).
Counterspace categories	Direct-ascent, co-orbital, and directed-energy systems differ in reversibility, attribution, and debris creation. Source log: Harrison (2021); UN COPUOS documentation.
Debris as strategic externality	Kinetic ASAT tests create long-lived debris; the 2021 Kosmos 1408 test raised ISS safety concerns. Source log: UN COPUOS documentation; Harrison (2021).

Cue	Notes (with source log)
Biosecurity governance	Pandemics, labs, and dual-use research require governance across health, security, and science; post-COVID debates center on preparedness and equity. Source log: Lakoff (2017); BWC reports; WHO pandemic treaty negotiations.
Pandemic as geopolitical event	COVID-19 shaped vaccine diplomacy, supply-chain politics, and trust in global institutions. Source log: WHO pandemic treaty negotiations; Lakoff (2017).
Critical infrastructure targeting	Civilian and military systems overlap; sabotage and cyber-physical disruption blur war and peace. Source log: Harrison (2021); UN COPUOS documentation (by analogy for cross-domain governance).
Rule-making efforts	COPUOS, PAROS, Artemis Accords, BWC, and WHO negotiations represent competing governance models. Source log: UN COPUOS documentation; BWC reports; WHO pandemic treaty negotiations.
African perspective	Emphasizes space access, biosecurity capacity, and equity; warns against governance that preserves asymmetry. Source log: African scholarship tradition (Grovogui, Mbembe, Bayart, Mamdani, Rodney, Nkrumah, Nyerere, Cabral, Fanon, Aning, Danso, Tamale, Oyěwùmí).
Chinese perspective	Emphasizes space leadership, biosecurity governance, and sovereignty; frames rules as potentially hegemonic. Source log: UN COPUOS documentation; BWC reports.
Russian perspective	Emphasizes space capabilities and multipolarity; resists unilateral governance. Source log: UN COPUOS documentation; BWC reports.
Western perspective	Emphasizes space security, biosecurity, and governance self-critique; acknowledges gaps in preparedness and equity. Source log: Johnson-Freese (2016); Lakoff (2017); Harrison (2021).
UN perspective	Emphasizes COPUOS, BWC, and Pact for the Future commitments; seeks multilateral legitimacy. Source log: UN COPUOS documentation; BWC reports; WHO pandemic treaty negotiations.

Summary: Space, biosecurity, and critical infrastructure are emerging domains where technological capability has outpaced governance. Kinetic and non-kinetic counterspace tools create debris and escalation risks, while pandemics expose gaps in preparedness, equity, and verification. The five perspectives disagree on

whether the central problem is access, sovereignty, multipolarity, security, or multilateral legitimacy. The data show concentration of space power and uneven biosecurity capacity, but they do not fully capture classified activity, dual-use ambiguity, or informal governance.

SECTION 5 — FEYNMAN COMPRESSION

1. **Explain without jargon:** Satellites, pathogens, and infrastructure are now tools and targets in global politics. The rules for using and protecting them are weaker than the technologies themselves, so harm can spread faster than governance can respond.
2. **Mark gaps:** I need to distinguish reversible from destructive effects, separate state from commercial actors, and avoid treating incomplete data as proof of intent. I also need to keep description, explanation, prediction, and prescription separate.
3. **Reread verification:** Recheck the approximate satellite counts, debris estimates, pandemic mortality figures, and treaty statuses against the named sources before using them in an argument. Confirm that no exact number is presented as certain.
4. **Analogy with explicit limits:** These domains resemble a shared commons with dangerous tools, but the analogy has limits: orbital debris persists for decades, pathogens can self-replicate, and infrastructure failures cascade across civilian and military systems.
5. **Rewrite:** Space, biosecurity, and critical infrastructure are high-consequence domains where capability, vulnerability, and governance gaps intersect; any analysis must specify mechanism, level of analysis, perspective, and evidence limits.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L57	Definition	What functions make space a strategic domain?	Space provides ISR, PNT, and communications services that underpin modern military operations, economic activity, and civilian infrastructure. Disruption of these services cascades across domains, which is why states treat orbital assets as critical national infrastructure.	Western and UN framings treat these as global public goods; African and other Global South framings stress unequal access to them.

Tag	Card Type	Front	Back	Perspective Note
L57	Mechanism	What is the Kessler syndrome and why does it matter for strategic stability?	The Kessler syndrome describes a cascading collision process in which debris from one destroyed satellite strikes others, generating more debris and potentially rendering certain orbital regimes unusable. It matters because ASAT tests that create debris impose costs on all space users, including non-combatants.	African and UN perspectives emphasize that debris burdens fall disproportionately on states with no ASAT capability.
L57	Application	What happened in the 2021 Russian ASAT test (Kosmos 1408)?	Russia destroyed its defunct Kosmos 1408 satellite with a direct-ascent ASAT, generating thousands of trackable debris pieces and drawing multilateral condemnation. The test illustrated how a single counterspace action can threaten the orbital commons and strategic stability simultaneously.	The UN and Western perspectives led condemnation; Russia framed it as a sovereign capability demonstration.

Tag	Card Type	Front	Back	Perspective Note
L57	Comparison	How do direct-ascent, co-orbital, and directed-energy ASATs differ?	Direct-ascent ASATs launch from Earth to intercept a satellite; co-orbital ASATs maneuver in orbit to approach or interfere with a target; directed-energy systems use lasers or microwaves to dazzle or damage sensors. They differ in attribution difficulty, escalation signaling, and debris generation.	Chinese and Russian perspectives stress that all three categories are proliferating, undermining Western claims of exclusive space dominance.
L57	Source	What is Johnson-Freese's (2016) core argument about space security?	Johnson-Freese argues that space security is undermined by the gap between the rhetoric of peaceful use and the reality of military dependence on space assets, and that governance lags behind technological change. The argument stresses that stabilizing space requires acknowledging its military dimension rather than denying it.	This Western scholarly framing is often contrasted with Chinese and Russian sovereignty-centered narratives.

Tag	Card Type	Front	Back	Perspective Note
L57	Debate	What is the distinction between militarization and weaponization of space?	Militarization refers to the use of space for military support functions such as ISR and communications; weaponization refers to placing or using weapons in space. The distinction matters because treaties ban weapons of mass destruction in orbit but not conventional military use.	African and UN perspectives often argue the distinction is eroding and that both trends threaten equitable access.
L57	Reconstruction	How does the African perspective frame space access and biosecurity?	The African perspective centers on equitable access to space-derived services, technology transfer, and the asymmetry of biosecurity capacity, arguing that governance frameworks designed by major powers often exclude African priorities. It treats space and biosecurity as development and sovereignty issues, not only security ones.	This is the primary perspective of the lesson; it reveals equity gaps the other four perspectives tend to background.

Tag	Card Type	Front	Back	Perspective Note
L57	Occlusion	What does the Western space-security framing tend to occlude?	Western framing often foregrounds great-power competition and deterrence while backgrounding the dependence of developing states on space services they do not control, and the unequal distribution of biosecurity capacity. It can treat governance gaps as technical rather than political problems.	The African perspective identifies this occlusion; the UN perspective partially addresses it through COPUOS and capacity-building agendas.
L57	Adjudication	How should one adjudicate between condemnation of ASAT tests and claims of sovereign right to test?	Adjudication requires weighing the security rationale of the testing state against the collective harm of debris and escalation risk, using evidence on debris counts, orbital regimes affected, and prior commitments. Neither pure sovereignty nor pure prohibition fully captures the trade-off; the stronger position is conditional restraint tied to verifiable debris limits.	Russian and Chinese perspectives stress sovereignty; Western and UN perspectives stress collective harm; African perspectives stress disproportionate impact.

Tag	Card Type	Front	Back	Perspective Note
L57	Visual	How do the four levels of analysis apply to the Kosmos 1408 case?	Individual level: decision-makers and scientists; state level: Russian strategic calculus; systemic level: great-power competition and arms-race dynamics; transnational level: debris affecting all space users and multilateral institutions. Each level explains a different causal channel.	The African perspective adds a transnational equity channel: which states bear debris risk without having caused it.
L57	Definition	What is dual-use research of concern in biosecurity?	Dual-use research of concern refers to life-sciences research that can be misapplied to cause harm, such as enhancing pathogen transmissibility or virulence. The governance challenge is to preserve scientific benefit while reducing misuse risk.	Western and UN perspectives dominate the DURC agenda; African perspectives stress capacity and benefit-sharing gaps.

Tag	Card Type	Front	Back	Perspective Note
L57	Mechanism	How did geopolitics shape the COVID-19 pandemic response?	Geopolitics shaped the response through vaccine nationalism, export restrictions, competing origin narratives, and fragmented multilateral coordination, which delayed equitable access and eroded trust in global health institutions. The mechanism is that sovereignty-first crisis behavior overrides collective-action commitments.	African perspectives highlight COVAX shortfalls and patent barriers; Chinese perspectives highlight sovereignty and solidarity rhetoric.
L57	Application	What is the status of the WHO pandemic treaty negotiations?	The WHO pandemic treaty negotiations aim to strengthen preparedness, equity, and accountability, but have faced disputes over pathogen sharing, technology transfer, and sovereignty over health measures. Progress has been uneven and contested.	African and Global South states push for equity and technology transfer; Western states emphasize surveillance and rapid response.

Tag	Card Type	Front	Back	Perspective Note
L57	Source	What does Lakoff (2017) contribute to biosecurity governance analysis?	Lakoff analyzes how biosecurity is governed through preparedness frameworks that reorganize state capacity around anticipated biological threats, highlighting the tension between security logics and public health logics. The work shows how governance categories shape what counts as a threat and a response.	This Western scholarly framing is usefully read against African critiques of capacity asymmetry and Chinese sovereignty framings.
L57	Comparison	How do the BWC and the proposed pandemic treaty differ in scope?	The Biological Weapons Convention prohibits biological weapons and addresses disarmament, while the pandemic treaty addresses preparedness, response, and equity in health emergencies. They overlap on dual-use governance but differ in primary purpose and enforcement mechanisms.	UN perspective centers both; African perspective stresses that neither has closed the capacity gap.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence Audit

Skill or Concept	Confidence (0–100)	Evidence of Mastery	Gap Action
Define space as a strategic domain (ISR, PNT, comms)			
Explain direct-ascent, co-orbital, and directed-energy ASAT mechanisms			
Reconstruct the African perspective on space access and biosecurity			
Reconstruct the Chinese perspective on space leadership and sovereignty			
Reconstruct the Russian perspective on multipolarity and space capabilities			
Reconstruct the Western perspective on space security and governance self-critique			
Reconstruct the UN perspective on COPUOS, BWC, and Pact for the Future			
Apply the four levels of analysis to a space or biosecurity case			
Identify falsifiers for claims about ASAT restraint or pandemic governance			
Adjudicate between competing explanations of the same case			

7.2 Three-Question Debrief

1. Which of the five perspectives was hardest to reconstruct from within, and what specific assumption in that perspective did you find most difficult to grant?
2. In the Kosmos 1408 worked example, which level of analysis carried the most explanatory weight, and does that change if you shift from a Western to an African vantage point?
3. If you had to teach one concept from this lesson to a peer in three minutes, which would it be, and what would you deliberately leave out?

7.3 Error-Log

Common Misconception	Correction	Evidence
Space is already fully weaponized.	Space is heavily militarized for support functions, but explicit weaponization remains limited and contested; treaties ban WMD in orbit while conventional military use is permitted.	Johnson-Freese (2016); UN COPUOS documentation
ASAT tests only affect the testing state.	ASAT tests generate debris that threatens all orbital users, including states with no counterspace capability, creating collective-action problems.	Harrison (2021); 2021 Kosmos 1408 test record
The BWC and pandemic treaty are interchangeable.	The BWC addresses biological weapons disarmament; the pandemic treaty addresses preparedness, response, and equity in health emergencies; their scopes and enforcement differ.	BWC reports; WHO pandemic treaty negotiations
COVID-19 governance failed only because of technical unpreparedness.	Geopolitical factors—vaccine nationalism, export controls, origin disputes—shaped outcomes as much as technical capacity.	Lakoff (2017); pandemic mortality and economic impact data
African states are merely recipients of space and biosecurity governance.	African states and scholars articulate distinct equity and sovereignty claims that reshape how these domains should be governed.	African scholarship (Grovogui, Mbembe, Bayart, Mamdani, Rodney, Nkrumah, Nyerere, Cabral, Fanon, Aning, Danso, Tamale, Oyěwùmí)

SECTION 8 — CHEATSHEET

Core Concepts	Key Mechanisms	Theories and Authors	Cases and Evidence	Debates	Falsifiers	Cross-links
Space as strategic domain (ISR, PNT, comms); militarization vs weaponization	Debris cascade (Kessler); ASAT signaling; sovereignty-first crisis behavior	Johnson-Freese (2016) on space security gaps; Lakoff (2017) on biosecurity preparedness	2021 Kosmos 1408 ASAT test; COVID-19 pandemic response; COVAX shortfalls	Militarization vs weaponization; sovereignty vs collective harm; equity vs security	ASAT restraint without debris reduction; pandemic treaty without capacity transfer; governance without African participation	L25 (space, maritime); L24 (cyber); L19 (resources); L58 (forecasting); L61 (grand strategy)
Counterspace capabilities (direct-ascent, co-orbital, directed energy)	Attribution difficulty; escalation signaling; orbital commons degradation	Harrison (2021) on counterspace trends	Counterspace tests by state; satellite launches by state	Deterrence stability vs arms racing; transparency vs secrecy	Verified debris limits; reciprocal restraint agreements	L25; L24
Biosecurity (DURC, pandemics, labs)	Dual-use misuse risk; preparedness frameworks; vaccine nationalism	Lakoff (2017) on preparedness; BWC reports	Pandemic mortality/economic impact data; WHO treaty negotiations	Security logic vs public health logic; equity vs rapid response	Treaty without enforcement; capacity without benefit-sharing	L19; L58
Critical infrastructure targeting (civilian/military blur, sabotage)	Blurring of civilian and military; evolution of sabotage; transnational vulnerability	(General IR scholarship on infrastructure and hybrid threats)	Infrastructure attacks; cyber-physical incidents	Military necessity vs civilian protection; attribution vs ambiguity	Clear civilian/military distinction restored; attribution resolved	L24; L61

Core Concepts	Key Mechanisms	Theories and Authors	Cases and Evidence	Debates	Falsifiers	Cross-links
International rule-making (COPUOS, BWC, Pact for the Future)	Norm-building; capacity-building; sovereignty carve-outs	UN COPUOS documentation; BWC reports; WHO pandemic treaty negotiations	UN space governance framework status; Pact for the Future space commitments	Universal norms vs great-power exemptions; equity vs efficiency	Framework adopted without Global South buy-in; commitments without verification	L58; L61

SECTION 9 — REVIEW SCHEDULE

- **R1 (Day 1, 20 minutes):** Re-read the five key ideas and recite the African perspective's central equity claim aloud without notes; check against the lesson.
- **R2 (Day 3, 30 minutes):** Redraw the four-levels-of-analysis diagram for the Kosmos 1408 case from memory; compare with the worked example.
- **R3 (Day 7, 45 minutes):** Write a one-paragraph reconstruction of each of the five perspectives on space and biosecurity; verify against Section 2.7.
- **R4 (Day 14, 60 minutes):** Complete the independent memo prompt using a new case (e.g., a recent ASAT test or pandemic preparedness dispute); apply the four required headings.
- **R5 (Day 30, 90 minutes):** Full review: flashcards, cheatsheet, and a timed hinge-question drill; log remaining gaps in the error-log.

SECTION 10 — COMPLETION CHECKLIST

☐ I can define space as a strategic domain and distinguish militarization from weaponization.
☐ I can explain the three ASAT mechanisms and their differing debris and escalation profiles.
☐ I can reconstruct the African perspective on space access and biosecurity from within.
☐ I can reconstruct the Chinese perspective on space leadership and sovereignty.
☐ I can reconstruct the Russian perspective on multipolarity and space capabilities.
☐ I can reconstruct the Western perspective on space security and governance self-critique.
☐ I can reconstruct the UN perspective on COPUOS, BWC, and the Pact for the Future.
☐ I can apply the four levels of analysis to a space or biosecurity case.
☐ I can identify falsifiers for claims about ASAT restraint.
☐ I can identify falsifiers for claims about pandemic governance.
☐ I can adjudicate between competing explanations of the same case.
☐ I can explain how geopolitics shaped the COVID-19 response.
☐ I can distinguish the BWC from the proposed pandemic treaty.
☐ I can explain the critical infrastructure civilian/military blur.
☐ I can use the comparison matrix to contrast all five perspectives.
☐ I have completed the confidence audit with honest scores.
☐ I have logged at least two errors in the error-log.
☐ I can state the lesson's central puzzle in one sentence.

59. Methodologies in Geopolitical Forecasting

LESSON METADATA

Field	Value
Lesson number and title	58 — Methodologies in Geopolitical Forecasting
Module	Module 10: Forecasting, Diplomacy, and Capstones
Prerequisites	L3 (causal inference), L4 (epistemology), L14 (contemporary transition)
Interleaved links	Forward to L59 (negotiation), L60–61 (capstones)
Reading load	7-9 hours
Content channels	Text, data lab, worked example, problem pair, flashcards
Bloom ceiling	Evaluate / Create
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

Geopolitical forecasting occupies an uncomfortable position in the study and practice of international relations: it is indispensable to decision-making yet systematically unreliable in its record. States, international organizations, and analysts are repeatedly asked to anticipate wars, regime changes, alliance shifts, and economic shocks, and they are repeatedly surprised. The puzzle this lesson addresses is not merely that forecasting fails, but that failure is unevenly distributed across methods, domains, and forecasters, and that the institutions producing forecasts often reward rhetorical confidence over demonstrated accuracy. The lesson therefore asks why some approaches to anticipating geopolitical futures outperform others, what "outperform" can mean when the future is singular and non-repeatable, and how the authority to predict is itself

a political resource rather than a neutral technical credential. It treats forecasting as an epistemic practice embedded in power, one that must be evaluated simultaneously on methodological, political, and ethical grounds.

The lesson is positioned deliberately within the curriculum. It builds on L3's causal inference, which supplies the tools for attributing causes to events and for distinguishing correlation from mechanism; on L4's epistemology, which supplies the standards by which knowledge claims are justified; and on L14's account of the contemporary transition, which supplies the substantive context of a post-Cold War system whose volatility has outpaced many of the models inherited from the bipolar era. It also prepares the ground for L59 on negotiation and for the L60–61 capstones, because any serious account of diplomacy or strategic choice presupposes some account of how the environment into which diplomacy is inserted is anticipated. Without a disciplined treatment of how futures are constructed, negotiation strategy and capstone analysis risk projecting present assumptions onto tomorrow and mistaking the familiar for the probable. Forecasting is thus treated here as a methodological capstone rather than a peripheral skill.

The lesson develops five methodologies, each of which answers a different question and carries distinct scope conditions. Scenario planning, associated with Schwartz (1991) and the Royal Dutch Shell tradition, addresses deep structural uncertainty by constructing multiple plausible futures rather than point predictions, forcing decision-makers to test strategies against worlds they do not expect. Delphi methods elicit and refine expert judgment through structured anonymity and iterative feedback, attempting to extract collective wisdom while suppressing the pathologies of group deliberation. Bayesian updating imposes a formal discipline of belief revision, requiring analysts to state priors explicitly and to update them in light of evidence through Bayes' theorem, thereby making the reasoning behind a forecast auditable. Quantitative conflict modeling—exemplified by ICEWS, ACLED, and GDELT—detects patterns in large event datasets that unaided human analysts cannot process, trading narrative richness for statistical coverage. Calibration and scoring, rooted in Brier (1950) and developed through the Good Judgment Project and the work of Tetlock and Gardner (2015), introduce accountability by measuring whether stated probabilities match observed frequencies. The lesson's central analytical move is to refuse the temptation to rank these methods on a single axis; instead it maps each to the conditions under which it is appropriate and to the failures it is prone to.

The African perspective is primary in this lesson because it reveals something the other four perspectives systematically obscure: that forecasting is not only about accuracy but about who gets to define the problem space. African early warning systems—continental (the African Union's Continental Early Warning System), regional (ECOWAS's Early Warning and Response Network, IGAD's CEWARN), and national—were built not merely to predict conflict but to claim epistemic authority over African security dynamics that external actors routinely misread. African scholars such as Grovogui, Mbembe, Bayart, and Mamdani have long argued that knowledge about Africa produced in Western centers carries structural biases: an overemphasis on state collapse, an underrecognition of informal and hybrid governance, and a tendency to treat African conflicts as exceptional rather than as instances of broader systemic dynamics. From this vantage point, when external models predict "state failure" in contexts where hybrid political orders persist and adapt, the prediction is not simply inaccurate; it is performative, shaping intervention priorities, resource flows, and the very categories through which African politics is legible to the international system. The African framing thus reframes the lesson's central question from "who predicts well?" to "well for whom, by what criteria, and with what consequences for the predicted?" It insists that a forecast's accuracy cannot be separated from its distributional effects and from the hierarchy of credibility that determines whose knowledge counts as expertise.

By the end of the lesson, the student should be able to perform six operations. First, distinguish the five methodologies by their epistemic commitments, mechanisms, and scope conditions rather than by disciplinary fashion. Second, design a forecasting protocol suited to a specific decision context, including the choice between qualitative and quantitative approaches and the specification of falsifiers. Third, score probabilistic predictions using Brier scores and calibration curves, and interpret the difference between calibration and resolution. Fourth, reconstruct how African, Chinese, Russian, Western, and UN perspectives frame the same predictive task differently, identifying what each contributes and what each occludes. Fifth, adjudicate between competing forecasts on the basis of evidence and stated assumptions rather than on the authority of the forecaster. Sixth, recognize the strongest counterarguments to forecasting as an enterprise—particularly the claim that geopolitical events are unique, path-dependent, and shaped by strategic interaction that defeats statistical regularity—and respond to them without either dismissing or overstating them. The worked example on the Good Judgment Project (2011–2015) and the problem pair on forecasting the 2022 Russian invasion provide concrete cases for practicing these operations, while the data lab exposes students to ICEWS, GDELT, and ACLED extracts alongside tournament outcome data.

The lesson closes with a methodological humility that is not resignation. It does not promise a method that eliminates uncertainty, because no such method exists; even the best-calibrated superforecasters are wrong substantial fractions of the time, and the future is not a sample from a stable population. What the lesson does promise is the discipline of making uncertainty explicit, measurable, and revisable: stating what one believes, with what confidence, on what grounds, and what evidence would change one's mind. The strongest critique of forecasting—that geopolitical events are unique and strategically interactive—must be taken seriously, and it is taken seriously in the Russian strategic-culture and Chinese "scientific decision-making" discourses examined in Section 2.7. But the critique does not license a retreat to unexamined intuition, which the record shows to be worse than structured methods on average. The capstone implication is that the goal of geopolitical forecasting is not prophecy but better-calibrated judgment under uncertainty, produced by methods whose limitations are as visible as their outputs.

SECTION 1 — Pre-Class Priming

1.1 Retrieval warm-up

1. (L3) What is the difference between a necessary and a sufficient cause, and why does conflating them lead to mistaken attributions of responsibility for wars?
2. (L3) In causal inference, what is a confounder, and how does randomization or careful research design address it?
3. (L4) What is the difference between justification and truth in epistemology, and can a belief be well justified yet false?
4. (L4) How does standpoint epistemology challenge the ideal of a "view from nowhere," and what does this imply for whose knowledge counts as expertise?
5. (L14) What changed in the international system after 1989 that makes forecasting harder than during the Cold War bipolar structure?
6. (L14) How did the "unipolar moment" shape assumptions about state behavior, and what forecasting errors did those assumptions produce?

1.2 Orientation questions

1. Under what conditions does scenario planning outperform point prediction, and when is it merely an

expensive way of avoiding a decision?
2. What does a Brier score measure, what is a "good" score, and why is it a proper scoring rule?
3. Why might African early warning systems detect conflicts that global quantitative models miss, and what does this imply about the data on which models are trained?
4. What did the Good Judgment Project (2011–2015) reveal about who forecasts well, and which of those findings are most contested?

1.3 Vocabulary pre-teach

- **Scenario planning**: a method that constructs multiple plausible futures to explore strategic options under deep uncertainty rather than producing a single point prediction.
- **Delphi method**: structured expert elicitation through anonymous rounds of questioning with aggregated feedback, aiming at convergence while suppressing groupthink.
- **Bayesian updating**: revising a prior probability in light of new evidence via Bayes' theorem to produce a posterior probability.
- **Prior probability**: the initial degree of belief in a hypothesis before new evidence is considered.
- **Likelihood**: the probability of observing the evidence if the hypothesis is true.
- **Posterior probability**: the updated degree of belief after incorporating evidence.
- **Brier score**: a proper scoring rule measuring the accuracy of probabilistic forecasts; lower scores indicate better accuracy.
- **Calibration**: the degree to which stated probabilities match observed frequencies over many forecasts.
- **Superforecaster**: a forecaster who consistently achieves high accuracy and calibration in tournament settings (Tetlock and Gardner 2015).
- **ICEWS**: Integrated Crisis Early Warning System, a US-funded quantitative conflict forecasting program.
- **ACLED**: Armed Conflict Location & Event Data Project, a dataset of political violence events.
- **GDELT**: Global Database of Events, Language, and Tone, a large-scale event dataset derived from news media.

SECTION 2 — LESSON CORE

2.1 Learning objectives

By the end of this lesson, the student will be able to:

1. **Analyze** the epistemic foundations of scenario planning, distinguishing it sharply from forecasting proper, and identify the causal mechanism by which structured narrative exploration of alternative futures improves decision-making under deep uncertainty rather than merely decorating a predetermined conclusion (Bloom: Analyze).
2. **Evaluate** the Royal Dutch Shell method as codified by Pierre Wack and Peter Schwartz, specifying its scope conditions, its characteristic failure modes (including narrative capture and groupthink), and the institutional conditions under which scenario exercises produce actionable strategic insight rather than performative theater (Bloom: Evaluate).
3. **Construct** a defensible scenario set for a geopolitical case using the 2×2 matrix method, articulating the predetermined elements, the driving forces, and the critical uncertainties, and justify the choice of

axes against plausible alternatives (Bloom: Create).

4. **Compare** scenario planning with Delphi elicitation, Bayesian belief revision, and quantitative conflict modeling, adjudicating which method fits which decision environment on the basis of uncertainty type, time horizon, data availability, and the cost of error (Bloom: Evaluate/Compare).
5. **Critique** the politics of prediction from an African vantage point, identifying whose futures get scenarioed, whose get ignored, how scenario exercises can reproduce or challenge epistemic hierarchies, and what African early-warning traditions contribute to the global forecasting repertoire (Bloom: Critique).

These objectives are cumulative: the first two establish the method's internal logic; the third requires its operationalization; the fourth situates it within the broader methodological ecology of geopolitical forecasting; and the fifth subjects the entire enterprise to the critical scrutiny that the African perspective, reconstructed on its own terms, demands. A student who masters all five will be able to design a forecasting exercise, defend its methodological choices, and recognize the political stakes embedded in the act of predicting the future.

2.2 KEY IDEA 1 — Scenario planning: Schwartz, the Royal Dutch Shell method, and its application to geopolitics

Bolded Causal Claim: Scenario planning does not predict the future; it restructures the mental models of decision-makers so that they recognize discontinuities earlier and adapt faster than competitors who rely on single-point forecasts, and its value is therefore measured not by predictive accuracy but by the speed and quality of organizational response when the world diverges from baseline expectations.

Mechanism: The mechanism operates through three linked channels. First, *cognitive reframing*: by forcing decision-makers to inhabit multiple plausible futures rather than one expected future, scenario planning disrupts the "official future" — the unexamined consensus about what will happen — that organizations otherwise treat as reality. Pierre Wack, who built Shell's scenario practice in the early 1970s, argued that the purpose of a scenario is not to describe what will happen but to change how managers think, so that when a discontinuity arrives they have already rehearsed it mentally and are not paralyzed by surprise. Second, *organizational learning and shared language*: a well-run scenario exercise produces a common vocabulary and a set of "memories of the future" (Wack's phrase) that allow distributed actors across an organization to coordinate without central direction when events unfold. Third, *optionality and hedging*: by mapping which strategies perform well across multiple scenarios versus which are scenario-dependent, the exercise identifies robust options and exposes fragile ones, permitting investment in flexibility rather than in a single bet. The canonical operationalization is the 2×2 matrix method associated with Peter Schwartz's *The Art of the Long View* (1991): identify the predetermined elements (trends and constraints that will shape the future regardless of scenario), identify the driving forces (social, technological, economic, environmental, political), isolate the two most important and most uncertain of these as critical uncertainties, and construct four scenarios from their intersection. Each scenario must be internally consistent, challenging, and plausible — not probable — and must be populated with narratives, indicators, and "early warning signs" that would signal its emergence. The mechanism fails when scenarios are treated as predictions (collapsing the plurality into a ranked list), when the axes are chosen to confirm prior beliefs, or when the exercise produces documents that no one reads.

Scope Conditions: Scenario planning is appropriate under conditions of *deep uncertainty* — situations where the probability distribution of outcomes is itself unknown or unstable, where the relevant variables

are non-stationary, and where the time horizon is long enough that structural change is plausible. It is poorly suited to short-term tactical decisions where base rates are stable and data are abundant; there, Bayesian updating or statistical forecasting dominates. It requires institutional capacity: a sponsor with authority, a diverse group of participants (to avoid monoculture), and a feedback loop connecting scenarios to decisions. It also requires a tolerance for ambiguity; organizations that demand a single "most likely" outcome will misuse the method. Scope conditions further include the nature of the decision: scenario planning pays off when decisions are costly to reverse, when the cost of being wrong is high, and when flexibility can be purchased in advance. It is less useful when decisions are easily reversible or when the environment is genuinely random. A further scope condition, often neglected, is epistemic diversity: the method's value depends on whose uncertainties are treated as critical. If the participant pool is homogeneous, the "critical uncertainties" will reflect that homogeneity, and the scenario set will be narrower than the world.

Observable Implications: Where scenario planning is working, one observes (a) faster organizational recognition of discontinuities, measured by the lag between an event and a strategic response; (b) investment in options and hedges that would not have been justified under a single-point forecast; (c) a shared vocabulary that surfaces in internal documents and decisions; and (d) "scenario triggers" or early-warning indicators that are monitored. Historical cases include Shell's early recognition of the 1973 oil price shock and its subsequent strategic positioning; the National Intelligence Council's *Global Trends* series, which has used scenario methods since the 1990s; and military wargaming traditions that construct alternative futures for force planning. Where it is failing, one observes scenario documents that are produced and filed, decisions that track the baseline regardless, and post-hoc rationalization that treats whichever scenario "came true" as the one that was "predicted." A key observable implication for evaluation is that scenario planning cannot be scored by Brier-type accuracy metrics, because it deliberately refuses to assign probabilities; its evaluation must instead be counterfactual and process-based, asking whether the organization was better prepared than it would have been under a point forecast. This creates a methodological tension with the scoring traditions discussed in Key Idea 5.

Perspective Note (five traditions in brief):

African (primary). The African perspective on scenario planning must be reconstructed from within, not as a regional application of a Western method. African scholarship on forecasting and early warning — from the African Union's Continental Early Warning System (CEWS) to the work of scholars such as Kwesi Aning and the traditions of community-based conflict prediction in the Great Lakes and Horn of Africa — reveals that scenario planning's Western codification (Schwartz, Wack) is one instantiation of a broader human practice of preparing for multiple futures, and that African contexts expose scope conditions the Western literature under-theorizes. Three contributions stand out. First, African early-warning systems operate in environments of *epistemic scarcity*: data are thin, state capacity is uneven, and the relevant actors include non-state and informal authorities whose behavior is not captured in quantitative datasets. In such environments, the Shell method's assumption that critical uncertainties can be identified through structured expert elicitation is itself a scope condition that may fail; African practitioners have developed hybrid methods combining community sentinel networks, radio monitoring, and elder councils with formal analysis. Second, the politics of prediction in Africa is acute: forecasting who will win an election, where violence will erupt, or which state will collapse is never politically neutral, and scenario exercises have historically been captured by incumbent regimes or external donors whose "scenarios" legitimate predetermined interventions. African scholarship — including work on the "politics of prediction" and the critique of external forecasting as a form of epistemic dependency — insists that the question "whose futures are being scenarioed?" is prior to the question "are the scenarios accurate?" Third, African traditions of *proverbial and narrative forecasting* (the use of oral

traditions, proverbs, and historical analogy to anticipate change) represent an indigenous scenario practice that Western methodological literature has largely ignored; these practices are not primitive versions of Shell scenarios but alternative epistemologies with their own validity claims, particularly in contexts where formal data are unreliable. The African vantage point thus reveals that scenario planning's greatest blind spot is not methodological but political: it tends to treat the future as a space to be managed by those with institutional power, and to render invisible the futures imagined by those without it.

Chinese. Chinese strategic forecasting is framed through the discourse of "scientific decision-making" (□□□□), which treats scenario planning not as a corporate tool but as an element of state rationality and Party-led governance. Chinese academic and policy literature on strategic foresight emphasizes the integration of scenario methods with long-term planning cycles (the five-year plans, the 2035 and 2049 horizons) and with the concept of "comprehensive national security." The Chinese perspective contributes the insistence that scenarios must be tethered to a coherent strategic vision and to the state's capacity to act on them; a scenario that cannot be operationalized through state planning is, on this view, intellectually interesting but strategically useless. It occludes, however, the question of whose scenarios get heard within a centralized system, and it tends to treat political uncertainty as a technical problem of information gathering rather than as a feature of contested politics.

Russian. Russian strategic culture approaches forecasting through the lens of *strategicheskoe prognozirovanie* and the Soviet-era tradition of long-term prognostication, which treated the future as an object of scientific management. The Russian perspective emphasizes the role of the state in constructing scenarios and is skeptical of market- or civil-society-driven foresight. It contributes an awareness that scenario exercises are themselves instruments of power and that the choice of critical uncertainties reflects the strategic priorities of the sponsoring state. It occludes pluralism: the Russian tradition has historically privileged a single state-sanctioned narrative of the future, which is the antithesis of the Shell method's insistence on genuine plurality. The Russian critique of Western forecasting — that it projects liberal assumptions onto non-liberal contexts — is a legitimate scope-condition warning, even when deployed polemically.

Western. The Western perspective is the home of the Shell method and of the academic literature on scenario planning (Schwartz 1991; Wack 1985; van der Heijden 1996; Wilkinson 2009). It contributes the most developed methodological apparatus: the 2×2 matrix, the distinction between predetermined elements and critical uncertainties, the concept of scenario triggers, and the integration with decision analysis. Its self-critique, increasingly prominent since the 2000s, acknowledges that scenario planning has often been oversold, that its impact on decisions is hard to demonstrate, and that it risks becoming a ritual. The Western perspective occludes its own cultural specificity: it presents a method developed in a particular corporate and Anglophone context as universal, and it has been slow to incorporate non-Western epistemologies of the future.

UN. The UN perspective treats scenario planning as a tool for prevention and early warning, embedded in frameworks such as the Secretary-General's prevention agenda and the work of the Department of Political and Peacebuilding Affairs. It contributes the normative insistence that forecasting should serve prevention rather than prediction, and that scenarios should be constructed with the participation of affected communities. It occludes, in practice, the power asymmetries of the UN system: scenarios produced in New York or Geneva often reflect the priorities of member states and donors rather than those of the communities whose futures are being scenarioed, and the UN's institutional incentives favor consensus scenarios over genuinely challenging ones.

SECTION 2.3 KEY IDEA 2 — DELPHI METHODS: EXPERT ELICITATION, CONSENSUS BUILDING, AND THEIR STRENGTHS AND WEAKNESSES

Bolded Causal Claim: Delphi methods improve geopolitical judgment under radical uncertainty by converting dispersed, often tacit expert knowledge into an iterated and anonymized consensus estimate, but they can also manufacture apparent agreement, suppress informative dissent, and legitimate decisions that remain politically contested.

Mechanism: The Delphi technique, developed at the RAND Corporation by Norman Dalkey and Olaf Helmer in the 1950s and 1960s, is a structured communication process among a panel of experts. Participants respond to a questionnaire, receive an anonymized summary of the group's responses and the reasoning behind them, and then revise their judgments in subsequent rounds. The mechanism works through three channels. First, anonymity reduces the social dominance effects that distort face-to-face committee deliberation: junior experts, dissenters, and specialists from marginal institutional positions can register judgments without immediate reputational penalty. Second, iteration allows experts to learn from one another's rationales rather than merely from their conclusions, which can surface assumptions, missing variables, and alternative causal pathways. Third, aggregation—often through medians, interquartile ranges, or consensus statements—produces a single estimate or scenario set that decision-makers can use. In geopolitical forecasting, this mechanism is attractive because many strategically important questions—long-term regime stability, alliance cohesion, the probability of interstate war, or the diffusion of a technology—are characterized by sparse data, non-stationary causal structures, and high stakes. Delphi panels can draw on historical analogy, regional expertise, military assessment, economic modeling, and diplomatic experience in ways that purely quantitative models cannot. Yet the same mechanism contains failure modes. Anonymity can reduce accountability and encourage vague or extreme responses; iteration can produce herding as participants converge toward a perceived center; and the facilitator's question framing, expert selection, and aggregation rule can predetermine the apparent consensus. The technique is therefore not merely a neutral information-aggregation device. It is an institutional practice that constructs a particular kind of expert knowledge, and its outputs must be audited for selection bias, common information, and the exclusion of non-expert but affected publics.

Scope Conditions: Delphi methods are most useful when the forecasting problem is complex, long-horizon, and data-poor; when the relevant knowledge is distributed across disciplines and regions; and when the goal is to structure disagreement rather than to eliminate it. They are less useful for rapidly evolving crises, where the delay of multiple rounds is costly; for questions with well-defined base rates and high-frequency data, where statistical methods dominate; and for problems in which expert pools share the same institutional incentives or cultural assumptions. The method also requires careful facilitation: question wording, response scales, and stopping rules shape outcomes. A Delphi exercise on "the likelihood of state collapse" may produce a different consensus than one on "the probability of a constitutional crisis," even when both refer to the same political trajectory. Scope conditions therefore include not only the external environment but also the internal design of the exercise. In geopolitical settings, Delphi is best treated as an input to structured analytic techniques—such as Analysis of Competing Hypotheses, key assumptions checks, or scenario construction—rather than as a standalone forecasting engine. It can identify plausible drivers and challenge dominant narratives, but it cannot by itself resolve causal identification problems or generate calibrated probabilities unless its outputs are scored against outcomes.

Observable Implications: If Delphi methods are working as intended, one should observe narrowing interquartile ranges across rounds, explicit articulation of dissenting rationales, and improved coverage of alternative hypotheses. If they are failing, one should observe premature convergence, vague consensus language, and the disappearance of minority views without substantive rebuttal. A further observable implication concerns accountability: because Delphi outputs are often presented as "expert consensus," they can acquire political authority disproportionate to their epistemic basis. In intelligence and policy settings, this can produce the illusion that a contested judgment has been validated by process. The method's value should therefore be assessed not only by internal convergence but by external calibration: do Delphi-derived estimates outperform simple base rates, individual experts, or market-based indicators when scored with proper metrics such as Brier scores? The available evidence suggests that structured expert elicitation can reduce some biases, especially when it forces explicit reasoning, but that its advantage is contingent and often modest. Delphi is better understood as a discipline for organizing expert disagreement than as a machine for producing truth.

Perspective Note (five traditions in brief):

African (primary). The African perspective treats Delphi methods with particular suspicion because the "expert" is often defined through institutions, credentials, and networks located in Western capitals, donor agencies, or international organizations rather than in the societies whose futures are being assessed. African scholarship on the politics of knowledge—Grovogui's critique of international order, Mbembe's analysis of power and subjectivity, Bayart's work on extraversion, Mamdani's critique of colonial categories, and Rodney's analysis of underdevelopment—suggests that consensus among experts can reproduce epistemic hierarchy rather than overcome it. African early warning systems, including the African Union's Continental Early Warning System and regional mechanisms such as ECOWAS and IGAD, have increasingly emphasized local monitors, community-level indicators, and participatory assessment precisely because distant expert panels often miss the social dynamics that precede violence. From this vantage point, Delphi can be useful only if the expert pool is radically diversified, if local knowledge is treated as expertise rather than as anecdote, and if the process is transparent about whose future is being forecast and for whose decision. The African perspective reveals that prediction is not merely a technical exercise; it is a political act that can justify intervention, resource allocation, or neglect. A Delphi consensus that excludes African scholars, civil society actors, and affected communities may be internally coherent yet externally illegitimate.

Chinese. The Chinese perspective frames expert elicitation within a model of "scientific decision-making" in which technical specialists inform Party-state priorities. Delphi-like methods can be used in planning, risk assessment, and policy consultation, but they operate within a political structure that values consensus, stability, and alignment with strategic objectives. The contribution is scale, data integration, and the capacity to mobilize expertise across sectors; the occlusion is the limited space for independent dissent and the tendency to treat politically inconvenient expert disagreement as noise rather than signal.

Russian. The Russian perspective is shaped by a strategic culture that privileges historical analogy, state interest, and qualitative judgment over formalized expert consensus. Delphi methods may be viewed as technocratic and potentially misleading when applied to adversarial geopolitical competition, where deception, secrecy, and non-linear escalation dominate. Russian expert councils and analytic centers do aggregate judgment, but often through hierarchical and politically embedded channels. The contribution is a reminder that expert consensus can be gamed by adversaries; the occlusion is a tendency to discount structured methods that might challenge entrenched strategic narratives.

Western. The Western perspective, especially in intelligence and defense communities, treats Delphi and

related structured analytic techniques as tools for reducing cognitive bias, groupthink, and overconfidence. It contributes methodological self-awareness, facilitation standards, and scoring practices. It occludes, however, the institutional incentives that reward consensus, the dominance of Anglophone expert networks, and the risk that process legitimacy will be mistaken for predictive accuracy.

UN. The UN perspective treats expert elicitation as part of prevention and early warning, emphasizing inclusivity, legitimacy, and the participation of affected communities. It contributes normative standards for whose knowledge counts and insists that forecasting should serve prevention rather than prediction alone. It occludes, in practice, the power asymmetries of the UN system: expert panels convened in New York or Geneva often reflect donor priorities and member-state politics, and institutional incentives favor consensus statements over genuinely challenging assessments.

SECTION 2.4 KEY IDEA 3 — BAYESIAN UPDATING: PRIORS, LIKELIHOODS, POSTERIORS, AND THE DISCIPLINE OF BELIEF REVISION

Bolded Causal Claim: Bayesian updating improves geopolitical forecasting when analysts make their priors and likelihoods explicit and revise beliefs in proportion to evidence, but its value collapses when the underlying causal model is misspecified, the evidence is endogenous to the event, or rare-event base rates are treated as precise.

Mechanism: Bayesian reasoning is the formal rule that posterior belief is proportional to prior belief multiplied by the likelihood of the observed evidence under competing hypotheses. In its modern subjective form—associated with de Finetti, Savage, and the broader Bayesian tradition—it does not require objective frequencies; it requires coherence: beliefs must be updated according to Bayes's theorem if the analyst wishes to avoid Dutch-book vulnerabilities. The mechanism operates through three practical channels in geopolitical forecasting. First, it forces explicitness: an analyst must state a prior probability, specify what evidence would raise or lower it, and quantify, however roughly, the diagnostic value of that evidence. Second, it disciplines overreaction and underreaction by tying belief revision to likelihood ratios rather than to narrative salience. Third, it makes disagreement tractable: two analysts with different priors or different likelihood assessments can identify exactly where they diverge and what evidence would adjudicate the difference. In the Good Judgment Project and related forecasting tournaments, successful "superforecasters" often used base-rate anchoring, incremental updating, and the distinction between the inside view (the specifics of the case) and the outside view (the reference class). The mechanism is not merely mathematical; it is cognitive. It converts vague intuition into revisable quantities and creates a record of belief change that can be scored. Yet Bayesian updating also has characteristic failure modes. If the prior is drawn from an inappropriate reference class, the posterior remains distorted. If the likelihoods are invented rather than estimated, the formalism can launder subjective judgment into apparent precision. If the event is rare, adversarial, or structurally unprecedented, the likelihood function may be unstable. And if evidence is generated by actors who anticipate the analyst's model, the updating process can be manipulated.

Scope Conditions: Bayesian updating is most useful when evidence accumulates incrementally, when the event class has a meaningful base rate, and when the analyst can distinguish signal from noise. It is less useful when the causal structure itself is unknown, when the event is a one-off structural break, or when the available evidence is strategically produced by adversaries. Scope conditions also include the analyst's capacity for calibration: a Bayesian who is systematically overconfident in likelihoods will update too sharply and too often. In geopolitical forecasting, where deception, secrecy, and non-stationarity are endemic, Bayesian methods should be used as a discipline of revision rather than as a claim to precision. They are particularly

valuable for questions such as "Will a sanctions package be renewed?" or "Will a ceasefire hold for six months?" where historical reference classes exist and evidence arrives in stages. They are less valuable for questions such as "Will a particular leader be assassinated?" or "Will a novel technology transform the balance of power?" where base rates are unstable and causal mechanisms are poorly understood. The method's scope is therefore defined by the availability of a defensible reference class and the analyst's willingness to treat probabilities as subjective and revisable rather than as objective properties of the world.

Observable Implications: If Bayesian updating is being practiced well, one should observe explicit priors, small and frequent revisions in response to evidence, documented likelihood reasoning, and improved calibration over time. If it is being practiced poorly, one should observe abrupt jumps after salient news, false precision in posterior estimates, and the use of Bayes's theorem as rhetorical authority. A key observable implication is the relationship between confidence and accuracy: well-calibrated Bayesian forecasters should be neither systematically overconfident nor underconfident, and their Brier scores should improve relative to unstructured judgment. Another implication concerns disagreement: Bayesian frameworks should make expert disagreement more transparent by locating it in priors or likelihoods rather than in opaque intuition. However, the formalism can also obscure political judgment by presenting contested assumptions as technical parameters. The method's success should therefore be evaluated not only by internal coherence but by out-of-sample predictive performance and by whether its probability statements are interpretable and actionable for decision-makers.

Perspective Note (five traditions in brief):

African (primary). The African perspective highlights that Bayesian updating is only as good as the priors and likelihoods fed into it, and that these are often imported from Western datasets, Western base rates, and Western causal assumptions. African conflict dynamics—shaped by colonial borders, extraversion, informal economies, and local political orders—may not fit reference classes built from European interstate wars or generic "civil war" datasets. African scholarship, from Mamdani's critique of the "native" as political subject to Bayart's analysis of extraversion and Rodney's work on structural underdevelopment, suggests that apparently neutral statistical priors can encode historically produced inequalities. At the same time, African early warning systems can benefit from Bayesian discipline if priors are grounded in local data, community reporting, and regional expertise rather than in externally imposed models. The African perspective reveals that Bayesianism's greatest risk is not mathematical error but epistemic displacement: the replacement of situated, politically informed judgment with a technocratic probability that appears objective while concealing its assumptions. It also reveals an opportunity: explicit priors can make hidden assumptions visible and contestable, which is valuable in contexts where forecasting has historically served external intervention.

Chinese. The Chinese perspective frames Bayesian updating within "scientific decision-making" and the broader aspiration to make governance data-driven and technologically sophisticated. The contribution is the integration of large-scale data, computational methods, and state capacity; the occlusion is that priors may be shaped by political objectives, strategic narratives, or regime-security concerns, and that probabilistic dissent may be treated as instability rather than as information. Bayesian methods can strengthen planning and risk assessment, but their outputs are likely to be filtered through political hierarchies.

Russian. The Russian perspective, rooted in a strategic culture skeptical of Western probabilistic and technocratic methods, tends to view Bayesian updating as potentially misleading in adversarial environments where deception, secrecy, and strategic surprise dominate. The contribution is a reminder that likelihoods are not independent of the adversary's intentions and that formal updating can create false confidence. The occlusion is a tendency to underutilize structured methods that could discipline qualitative judgment and to

privilege historical analogy over evidence-based revision.

Western. The Western perspective, particularly in intelligence and academic forecasting, treats Bayesian updating as a core tool for reducing cognitive bias and improving calibration. It contributes formal methods, scoring practices, and the superforecaster research program. It occludes, however, the difficulty of specifying likelihoods in politically complex environments, the risk of false precision, and the institutional incentives that favor decisive point estimates over uncertain probability ranges.

UN. The UN perspective treats Bayesian and probabilistic methods as components of risk assessment and prevention, emphasizing early warning, scenario planning, and the avoidance of both alarmism and complacency. It contributes normative frameworks for acting under uncertainty and insists that probabilities should inform prevention rather than justify inaction. It occludes, in practice, the political constraints on UN action, the uneven quality of data across regions, and the tendency to convert uncertain estimates into bureaucratic thresholds that may not reflect local realities.

2.5 KEY IDEA 4 — Quantitative conflict modeling: ICEWS, ACLED, GDELT, and their uses and limits

Bolded Causal Claim: Large-scale, machine-coded event data and statistical conflict models can detect macro-patterns and generate short-horizon forecasts that exceed unaided human judgment in data-rich, high-frequency environments, but their predictive power is bounded by data quality, coding assumptions, and the structural non-stationarity of political conflict.

Mechanism: The mechanism proceeds through a pipeline that converts raw information into probabilistic forecasts. First, event extraction: systems such as ICEWS (Integrated Crisis Early Warning System), GDELT (Global Database of Events, Language, and Tone), and ACLED (Armed Conflict Location & Event Data Project) ingest news reports, government statements, and other textual sources. ICEWS and GDELT rely on automated coding using the CAMEO (Conflict and Mediation Event Observations) taxonomy, which classifies events into categories such as "protest," "assault," "coerce," or "yield," and identifies actors, targets, locations, and dates. ACLED, by contrast, employs trained human coders who manually verify events, assign precise geographic coordinates, and record fatalities, producing higher-fidelity but lower-volume data. Second, aggregation: raw events are binned into spatial units (grid cells, administrative districts, countries) and temporal windows (days, weeks, months), yielding feature vectors that include event counts, actor types, tone scores, and historical conflict incidence. Third, model training: statistical and machine-learning algorithms—logistic regression, random forests, gradient-boosted trees, and in some implementations neural networks—learn associations between these features and subsequent conflict outcomes, such as the onset of civil war, escalation of violence, or occurrence of protests. Fourth, out-of-sample validation: models are tested on held-out data to estimate predictive accuracy, typically measured by area under the ROC curve, precision-recall trade-offs, or Brier scores. Fifth, forecast generation: the trained model is applied to current feature vectors to produce probability estimates for specified future windows. The underlying causal logic is correlational rather than structural: the model does not know why a protest in a given district predicts violence next month; it has learned that, historically, such patterns co-occurred. This is the mechanism's strength and its vulnerability. It can process millions of events across decades and detect regularities invisible to human analysts, but it cannot distinguish genuine causal mechanisms from spurious correlations, and it cannot anticipate structural breaks—regime changes, technological shocks, novel ideologies—that have no precedent in the training data.

Scope Conditions: Quantitative conflict modeling performs best under five conditions. First, the outcome must be relatively frequent: battle events, protests, and riots occur often enough to support statistical learning, whereas coups, genocides, and interstate wars are too rare for reliable model training without severe class-imbalance problems. Second, the time horizon must be short: most operational models forecast one to six months ahead, where structural conditions are relatively stable; accuracy degrades sharply beyond twelve months. Third, the region must be data-rich: models trained on well-covered areas (Europe, the Middle East, parts of South Asia) outperform those applied to data-poor regions, though ACLED's expansion has improved African coverage considerably. Fourth, the structural environment must be stationary: models assume that the data-generating process remains stable, so they perform poorly during regime transitions, state collapse, or rapid technological change. Fifth, the question must be well-specified: "probability of armed conflict in district X in the next 30 days" is modelable; "will the international order fragment?" is not. The models fail when events are unprecedented, when actors strategically conceal intentions, when news coverage is biased or absent, and when the coding taxonomy misclassifies local political phenomena into ill-fitting categories.

Observable Implications: If quantitative conflict models work as claimed, several testable implications follow. Forecast accuracy should be highest for high-frequency outcomes (protests, battles) in well-covered regions and lowest for rare events (coups, genocides) everywhere. Accuracy should degrade measurably after structural breaks such as regime changes or major policy shifts. Human-machine ensembles—combining model outputs with analyst judgment—should outperform either alone, because models capture base rates and patterns while humans capture context and novel information. Model performance should correlate with data density: regions with more news sources and better coding coverage should yield higher accuracy. Finally, if models are genuinely predictive rather than merely descriptive, their out-of-sample performance should exceed in-sample performance by a margin that reflects true generalization rather than overfitting.

Perspective Note (five traditions in brief):

African (primary). The African perspective on quantitative conflict modeling is shaped by a dual inheritance: the continent has been both the most intensively studied object of conflict forecasting and the site of some of the most sophisticated indigenous early-warning architectures. ACLED itself originated in African research (Raleigh, Hegre, and Gleditsch), and the continent's data coverage has improved dramatically since the 2000s. Yet African scholars and practitioners have been among the most trenchant critics of external modeling. The critique operates on several levels. First, data colonialism: the extraction of African event data by Northern institutions, its processing in Western universities, and its return as "intelligence" to African governments and international organizations reproduces asymmetric knowledge relations. Second, categorical violence: CAMEO and similar taxonomies were designed for interstate and civil conflict in other regions and often misclassify African political phenomena—communal violence, land disputes, electoral mobilization, pastoral conflicts—into categories that distort their logic. Mamdani's analysis of the "bifurcated state" and the political construction of "tribal" identity suggests that models treating ethnicity as a fixed predictor of conflict reify colonial categories. Third, the politics of prediction: forecasts are not neutral; they shape resource allocation, intervention decisions, and threat perceptions. A model predicting violence in a region can trigger security responses that themselves produce violence, creating self-fulfilling or self-negating dynamics. Fourth, African early-warning systems—CEWARN (Conflict Early Warning and Response Mechanism of IGAD), the ECOWAS Early Warning and Response Network (ECOWARN), and the AU Continental Early Warning System (CEWS)—integrate quantitative indicators with qualitative, participatory, and community-based intelligence that external models typically ignore. African scholars such as Aning and Danso have argued that these systems, despite resource constraints, capture local political dynamics that machine-coded

news data miss. The African vantage point thus reveals that quantitative modeling is not merely a technical exercise but a political practice embedded in global knowledge hierarchies, and that its "accuracy" must be evaluated against whose security it serves.

Chinese. The Chinese perspective treats quantitative conflict modeling as an instrument of "scientific decision-making" (kexue juece), a governance ideal that combines data-driven analysis with political judgment under party leadership. Chinese strategic forecasting has invested heavily in big-data platforms, social-media monitoring, and AI-assisted intelligence analysis, particularly for domestic stability and border security. The perspective values scale and state capacity: the ability to collect, integrate, and analyze vast datasets across a large territory. It is skeptical of Western models' applicability to Chinese strategic environments, both because Western coding schemes reflect different political ontologies and because Western data infrastructures are seen as potentially compromised or adversarial. The occlusion is that "scientific decision-making" can become a legitimating rhetoric for decisions already made politically, and that the fusion of quantitative analysis with party control may suppress dissenting forecasts.

Russian. The Russian perspective is deeply skeptical of quantitative conflict modeling as a standalone methodology. Rooted in a strategic culture that values historical analogy, intuition, and the "art" of statecraft, Russian analysts tend to view statistical models as reductive, culturally blind, and vulnerable to manipulation. The Soviet tradition of forecasting (prognozirovanie) combined economic modeling with ideological analysis, and post-Soviet Russian scholarship has often emphasized the limits of formal methods in capturing the "spirit" of political situations. The perspective contributes an insistence that models cannot capture intentions, resolve, and political will—factors that Russian strategic culture treats as decisive. It occludes, however, its own tendency to substitute assertion for evidence and to dismiss inconvenient data.

Western. The Western perspective is the primary producer and consumer of quantitative conflict models, treating them as tools of evidence-based policy and intelligence. It has generated extensive self-critique: the failures to predict the Arab Spring, the rapid collapse of the Afghan government, and the 2022 Russian invasion have prompted institutional reforms, including the IARPA programs and the integration of machine learning into intelligence workflows. The perspective's strength is methodological rigor and transparency; its occlusion is a persistent overconfidence in data and models, and a tendency to treat coding schemes as neutral when they embed theoretical commitments.

UN. The UN perspective treats quantitative conflict modeling as a component of early warning and prevention, emphasizing its role in the Secretary-General's prevention agenda and the work of the Department of Political and Peacebuilding Affairs. It values models for their ability to flag emerging risks and allocate attention across many crises. It occludes the uneven quality of data across regions, the political constraints on UN action even when warnings are issued, and the risk that model outputs become bureaucratic thresholds that displace local judgment.

2.6 KEY IDEA 5 — Calibration and scoring: Brier scores, the Good Judgment Project, and superforecasters

Bolded Causal Claim: Forecasting accuracy is not merely a matter of being right or wrong; it requires calibrated probability estimates, and the Good Judgment Project demonstrated that ordinary people trained in specific cognitive habits can systematically outperform intelligence professionals with classified access.

Mechanism: The mechanism has three components: measurement, selection, and training. First, measure-

ment: the Brier score, introduced by Glenn Brier in 1950 as a verification measure for weather forecasts, provides a proper scoring rule for probabilistic predictions. For a binary event, the Brier score is the mean squared difference between the forecast probability and the actual outcome (0 or 1). A perfect forecast scores 0; a maximally wrong forecast scores 1; a forecast of 0.5 on a coin-flip event scores 0.25. The Brier score decomposes into three components: calibration (do events occur at the rate predicted?), resolution (does the forecast distinguish events from non-events?), and uncertainty (the base rate of the event). This decomposition is crucial because it separates two distinct skills: knowing the right probability (calibration) and knowing when to deviate from the base rate (resolution). A forecaster who always predicts the base rate is perfectly calibrated but has zero resolution; a forecaster who makes extreme predictions is highly resolving but may be poorly calibrated. Second, selection: the IARPA Aggregative Contingent Estimation (ACE) tournament (2011-2015) recruited thousands of volunteers to forecast geopolitical events, creating a large-N dataset of individual forecasting performance. Tetlock and Gardner's Good Judgment Project identified a small subset—"superforecasters"—who consistently outperformed both the crowd and intelligence analysts with access to classified information. Superforecasters were not distinguished by domain expertise or credentials but by cognitive style: active open-mindedness, a "fox" rather than "hedgehog" cognitive style (drawing on Isaiah Berlin's distinction, popularized by Tetlock), comfort with numerical probability, willingness to update beliefs frequently, and skill at decomposing questions into sub-questions. Third, training: the Good Judgment Project tested interventions including probabilistic reasoning training, bias mitigation (considering the opposite, outside view), and team collaboration. Training improved performance, and teaming superforecasters together produced further gains through information sharing and error correction. Aggregation—combining individual forecasts, often with extremizing (pushing aggregated probabilities toward 0 or 1)—outperformed individual forecasters. The mechanism thus runs: define a clear question with resolution criteria → elicit numerical probabilities → score with a proper scoring rule → identify top performers → train and team them → aggregate with extremizing → feed back performance data to drive further improvement.

Scope Conditions: Calibration and scoring methods work best under four conditions. First, questions must be specific and resolvable: "Will North Korea conduct a nuclear test by December 31, 2024?" is scoreable; "Will the Middle East stabilize?" is not. Second, time horizons must be defined and not too long: accuracy degrades as horizons extend, and very long-horizon questions (five to ten years) are difficult to score and learn from. Third, forecasters must receive feedback: without knowing outcomes, calibration cannot improve. Fourth, incentives must align: in the IARPA tournament, forecasters were motivated by competition and recognition; in intelligence agencies, career incentives may favor decisive point estimates over uncertain ranges. The methods fail when questions are ambiguous, when outcomes are never resolved (e.g., "was the invasion justified?"), when feedback loops are absent, and when institutional culture punishes uncertainty. They also struggle with unprecedented events where base rates are unknown and with questions where the act of forecasting changes the outcome (self-fulfilling or self-negating prophecies).

Observable Implications: If calibration and scoring work as claimed, several implications follow. Brier scores should improve with training interventions, particularly probabilistic reasoning and bias mitigation. Superforecasters identified in one tournament should maintain superior performance in subsequent tournaments (they did, in the Good Judgment Project's follow-up studies). Aggregated forecasts should outperform individual forecasts, and extremized aggregates should outperform simple averages. Forecast accuracy should be higher for questions with clear resolution criteria and shorter horizons. Intelligence analysts, when trained in these methods and given appropriate incentives, should improve their calibration. Finally, if forecasting skill is trainable rather than innate, training programs should produce measurable improvements in Brier scores across diverse populations.

Perspective Note (five traditions in brief):

African (primary). The African perspective on calibration and scoring is shaped by the politics of who gets to forecast, whose questions are asked, and whose outcomes are scored. The Good Judgment Project and the IARPA tournament were overwhelmingly Western in participant base, question selection, and institutional framing; African experts were underrepresented, and African political questions were often framed through Western analytical categories. African scholars and practitioners have raised several critiques. First, question selection bias: the tournament questions reflected Western intelligence priorities—nuclear tests, regime stability, terrorist attacks—rather than African concerns such as land tenure conflicts, electoral violence, or climate-induced displacement. A forecasting ecosystem that scores performance on Western-priority questions will systematically undervalue expertise on African-priority questions. Second, the epistemic politics of probability: in many African political contexts, expressing uncertainty numerically can be read as weakness, evasion, or lack of commitment, while in Western intelligence culture, probabilistic language is increasingly valorized. The cultural framing of "superforecasting" as a cognitive virtue may not translate. Third, African early-warning systems already practice forms of calibrated judgment—CEWARN, ECOWARN, and CEWS produce risk assessments that are scored against outcomes, though often informally and without the methodological infrastructure of Brier scoring. African scholars such as Aning and Danso have argued that these systems deserve the same analytical attention as Western tournaments, and that their "accuracy" should be evaluated on their own terms. Fourth, the superforecaster profile—fox-like, numerate, detached—may select for cognitive styles that are culturally specific and may undervalue forms of knowledge embedded in community relationships, oral tradition, and situated experience. The African vantage point thus reveals that calibration and scoring, while methodologically powerful, are not culturally neutral: they embed assumptions about what counts as a good question, a good forecast, and a good forecaster, and these assumptions reflect the institutional and cultural context of their origin.

Chinese. The Chinese perspective on calibration and scoring is ambivalent. On one hand, "scientific decision-making" embraces quantitative evaluation and performance metrics; on the other, the political system does not reward public probabilistic hedging. Chinese strategic forecasting operates within a framework where forecasts are expected to be decisive and aligned with party priorities, and where public scoring of individual forecasters against outcomes could be politically destabilizing. The perspective contributes an emphasis on collective deliberation and hierarchical review as alternatives to individual scoring. It occludes the risk that suppressing uncertainty in forecasts leads to overconfidence and surprise.

Russian. The Russian perspective is skeptical of the superforecaster enterprise, viewing it as a manifestation of Western technocratic hubris. Russian strategic culture emphasizes the irreducibility of political judgment to numerical scores, and the IARPA tournament's framing of forecasting as a measurable skill is seen as missing the role of will, resolve, and historical consciousness. The perspective contributes a reminder that scoring rules measure only what is scoreable, and that many of the most consequential geopolitical outcomes are not. It occludes its own resistance to accountability and feedback.

Western. The Western perspective is the primary champion of calibration and scoring, treating the Good Judgment Project as a landmark demonstration that forecasting can be improved through measurement and training. It has influenced intelligence reform, including the creation of prediction markets and structured analytic techniques in agencies. The perspective's strength is its empirical orientation and willingness to test claims; its occlusion is a tendency to overgeneralize from tournament settings to high-stakes policy environments where questions are messier, incentives are different, and the cost of being wrong is asymmetric.

UN. The UN perspective values calibration and scoring as tools for improving early warning and prevention,

but emphasizes that UN forecasting must serve collective decision-making rather than individual performance. It contributes an insistence that scoring should be tied to actionable prevention, not just accuracy. It occludes the difficulty of scoring forecasts in a multilateral context where questions are politically negotiated and outcomes are jointly determined.

I have now produced 2.5 and 2.6. Let me verify word counts roughly. Each section is substantial, well over 1,400 words. Good.

Let me double check I didn't repeat content from previous chunk. I started fresh with 2.5. Good.

I should ensure headings exactly as specified. The user said "full five-sub-header structure" with sub-headers: Bolded Causal Claim, Mechanism, Scope Conditions, Observable Implications, Perspective Note. I used those. Good.

I'll output now.## 2.5 KEY IDEA 4 — Quantitative conflict modeling: ICEWS, ACLED, GDELT, and their uses and limits

Bolded Causal Claim: Large-scale, machine-coded event data and statistical conflict models can detect macro-patterns and generate short-horizon forecasts that exceed unaided human judgment in data-rich, high-frequency environments, but their predictive power is bounded by data quality, coding assumptions, and the structural non-stationarity of political conflict.

Mechanism: The mechanism proceeds through a pipeline that converts raw information into probabilistic forecasts. First, event extraction: systems such as ICEWS (Integrated Crisis Early Warning System), GDELT (Global Database of Events, Language, and Tone), and ACLED (Armed Conflict Location & Event Data Project) ingest news reports, government statements, and other textual sources. ICEWS and GDELT rely on automated coding using the CAMEO (Conflict and Mediation Event Observations) taxonomy, which classifies events into categories such as "protest," "assault," "coerce," or "yield," and identifies actors, targets, locations, and dates. ACLED, by contrast, employs trained human coders who manually verify events, assign precise geographic coordinates, and record fatalities, producing higher-fidelity but lower-volume data. Second, aggregation: raw events are binned into spatial units (grid cells, administrative districts, countries) and temporal windows (days, weeks, months), yielding feature vectors that include event counts, actor types, tone scores, and historical conflict incidence. Third, model training: statistical and machine-learning algorithms—logistic regression, random forests, gradient-boosted trees, and in some implementations neural networks—learn associations between these features and subsequent conflict outcomes, such as the onset of civil war, escalation of violence, or occurrence of protests. Fourth, out-of-sample validation: models are tested on held-out data to estimate predictive accuracy, typically measured by area under the ROC curve, precision-recall trade-offs, or Brier scores. Fifth, forecast generation: the trained model is applied to current feature vectors to produce probability estimates for specified future windows. The underlying causal logic is correlational rather than structural: the model does not know why a protest in a given district predicts violence next month; it has learned that, historically, such patterns co-occurred. This is the mechanism's strength and its vulnerability. It can process millions of events across decades and detect regularities invisible to human analysts, but it cannot distinguish genuine causal mechanisms from spurious correlations, and it cannot anticipate structural breaks—regime changes, technological shocks, novel ideologies—that have no precedent in the training data.

Scope Conditions: Quantitative conflict modeling performs best under five conditions. First, the outcome must be relatively frequent: battle events, protests, and riots occur often enough to support statistical learning,

whereas coups, genocides, and interstate wars are too rare for reliable model training without severe class-imbalance problems. Russian. The Russian perspective is deeply skeptical of quantitative conflict modeling as a standalone methodology. Rooted in a strategic culture that values historical analogy, intuition, and the "art" of statecraft, Russian analysts tend to view statistical models as reductive, culturally blind, and vulnerable to manipulation. The Soviet tradition of forecasting (prognozirovanie) combined economic modeling with ideological analysis, and post-Soviet Russian scholarship has often emphasized the limits of formal methods in capturing the "spirit" of political situations. The perspective contributes an insistence that models cannot capture intentions, resolve, and political will—factors that Russian strategic culture treats as decisive. It occludes, however, its own tendency to substitute assertion for evidence and to dismiss inconvenient data.

Western. The Western perspective is the primary producer and consumer of quantitative conflict models, treating them as tools of evidence-based policy and intelligence. It has generated extensive self-critique: the failures to predict the Arab Spring, the rapid collapse of the Afghan government, and the 2022 Russian invasion have prompted institutional reforms, including the IARPA programs and the integration of machine learning into intelligence workflows. The perspective's strength is methodological rigor and transparency; its occlusion is a persistent overconfidence in data and models, and a tendency to treat coding schemes as neutral when they embed theoretical commitments.

UN. The UN perspective treats quantitative conflict modeling as a component of early warning and prevention, emphasizing its role in the Secretary-General's prevention agenda and the work of the Department of Political and Peacebuilding Affairs. It values models for their ability to flag emerging risks and allocate attention across many crises. It occludes the uneven quality of data across regions, the political constraints on UN action even when warnings are issued, and the risk that model outputs become bureaucratic thresholds that displace local judgment.

2.6 KEY IDEA 5 — Calibration and scoring: Brier scores, the Good Judgment Project, and superforecasters

Bolded Causal Claim: Forecasting accuracy is not merely a matter of being right or wrong; it requires calibrated probability estimates, and the Good Judgment Project demonstrated that ordinary people trained in specific cognitive habits can systematically outperform intelligence professionals with classified access.

Mechanism: The mechanism has three components: measurement, selection, and training. First, measurement: the Brier score, introduced by Glenn Brier in 1950 as a verification measure for weather forecasts, provides a proper scoring rule for probabilistic predictions. For a binary event, the Brier score is the mean

squared difference between the forecast probability and the actual outcome (0 or 1). A perfect forecast scores 0; a maximally wrong forecast scores 1; a forecast of 0.5 on a coin-flip event scores 0.25. The Brier score decomposes into three components: calibration (do events occur at the rate predicted?), resolution (does the forecast distinguish events from non-events?), and uncertainty (the base rate of the event). This decomposition is crucial because it separates two distinct skills: knowing the right probability (calibration) and knowing when to deviate from the base rate (resolution). A forecaster who always predicts the base rate is perfectly calibrated but has zero resolution; a forecaster who makes extreme predictions is highly resolving but may be poorly calibrated. Second, selection: the IARPA Aggregative Contingent Estimation (ACE) tournament (2011-2015) recruited thousands of volunteers to forecast geopolitical events, creating a large-N dataset of individual forecasting performance. Tetlock and Gardner's Good Judgment Project identified a small subset—"superforecasters"—who consistently outperformed both the crowd and intelligence analysts with access to classified information. Superforecasters were not distinguished by domain expertise or credentials but by cognitive style: active open-mindedness, a "fox" rather than "hedgehog" cognitive style (drawing on Isaiah Berlin's distinction, popularized by Tetlock), comfort with numerical probability, willingness to update beliefs frequently, and skill at decomposing questions into sub-questions. Third, training: the Good Judgment Project tested interventions including probabilistic reasoning training, bias mitigation (considering the opposite, outside view), and team collaboration. Training improved performance, and teaming superforecasters together produced further gains through information sharing and error correction. Aggregation—combining individual forecasts, often with extremizing (pushing aggregated probabilities toward 0 or 1)—outperformed individual forecasters. The mechanism thus runs: define a clear question with resolution criteria → elicit numerical probabilities → score with a proper scoring rule → identify top performers → train and team them → aggregate with extremizing → feed back performance data to drive further improvement.

Scope Conditions: Calibration and scoring methods work best under four conditions. First, questions must be specific and resolvable: "Will North Korea conduct a nuclear test by December 31, 2024?" is scoreable; "Will the Middle East stabilize?" is not. Second, time horizons must be defined and not too long: accuracy degrades as horizons extend, and very long-horizon questions (five to ten years) are difficult to score and learn from. Third, forecasters must receive feedback: without knowing outcomes, calibration cannot improve. Finally, if forecasting skill is trainable rather than innate, training programs should produce measurable improvements in Brier scores across diverse populations.

Perspective Note (five traditions in brief):

African (primary). The African perspective on calibration and scoring is shaped by the politics of who gets to forecast, whose questions are asked, and whose outcomes are scored. The Good Judgment Project and the IARPA tournament were overwhelmingly Western in participant base, question selection, and institutional framing; African experts were underrepresented, and African political questions were often framed through Western analytical categories. African scholars and practitioners have raised several critiques. First, question selection bias: the tournament questions reflected Western intelligence priorities—nuclear tests, regime stability, terrorist attacks—rather than African concerns such as land tenure conflicts, electoral violence, or climate-induced displacement. A forecasting ecosystem that scores performance on Western-priority questions will systematically undervalue expertise on African-priority questions. Second, the epistemic politics of probability: in many African political contexts, expressing uncertainty numerically can be read as weakness, evasion, or lack of commitment, while in Western intelligence culture, probabilistic language is increasingly valorized. The cultural framing of "superforecasting" as a cognitive virtue may not translate. Third, African early-warning systems already practice forms of calibrated judgment—CEWARN, ECOWARN, and CEWS produce risk assessments that are scored against outcomes, though often informally and without the methodological infrastructure of Brier scoring. African scholars such as Aning and Danso have argued that these systems deserve the same analytical attention as Western tournaments, and that their "accuracy" should be evaluated on their own terms. Fourth, the superforecaster profile—fox-like, numerate, detached—may select for cognitive styles that are culturally specific and may undervalue forms of knowledge embedded in community relationships, oral tradition, and situated experience. The African vantage point thus reveals that calibration and scoring, while methodologically powerful, are not culturally neutral: they embed assumptions about what counts as a good question, a good forecast, and a good forecaster, and these assumptions reflect the institutional and cultural context of their origin.

Chinese. The Chinese perspective on calibration and scoring is ambivalent. On one hand, "scientific decision-making" embraces quantitative evaluation and performance metrics; on the other, the political system does not reward public probabilistic hedging. Chinese strategic forecasting operates within a framework where forecasts are expected to be decisive and aligned with party priorities, and where public scoring of individual forecasters against outcomes could be politically destabilizing. The perspective contributes an emphasis on collective deliberation and hierarchical review as alternatives to individual scoring. It occludes the risk that suppressing uncertainty in forecasts leads to overconfidence and surprise.

Russian. The Russian perspective is skeptical of the superforecaster enterprise, viewing it as a manifestation of Western technocratic hubris. Russian strategic culture emphasizes the irreducibility of political judgment to numerical scores, and the IARPA tournament's framing of forecasting as a measurable skill is seen as missing the role of will, resolve, and historical consciousness. The perspective contributes a reminder that scoring rules measure only what is scoreable, and that many of the most consequential geopolitical outcomes are not. It occludes its own resistance to accountability and feedback.

Western. The Western perspective is the primary champion of calibration and scoring, treating the Good Judgment Project as a landmark demonstration that forecasting can be improved through measurement and training. It has influenced intelligence reform, including the creation of prediction markets and structured analytic techniques in agencies. The perspective's strength is its empirical orientation and willingness to test claims; its occlusion is a tendency to overgeneralize from tournament settings to high-stakes policy environments where questions are messier, incentives are different, and the cost of being wrong is asymmetric.

UN. The UN perspective values calibration and scoring as tools for improving early warning and prevention, but emphasizes that UN forecasting must serve collective decision-making rather than individual perfor-

mance. It contributes an insistence that scoring should be tied to actionable prevention, not just accuracy. It occludes the difficulty of scoring forecasts in a multilateral context where questions are politically negotiated and outcomes are jointly determined.

2.7.1 African Perspective (PRIMARY)

The African vantage point on geopolitical forecasting begins not with method but with the politics of knowledge production. Forecasting is never a neutral technical exercise; it is an exercise of power that determines whose futures count, whose suffering is anticipated, and whose agency is recognized. From this standpoint, the five methodologies examined in this lesson—scenario planning, Delphi elicitation, Bayesian updating, quantitative conflict modeling, and calibration/scoring—are not simply tools for reducing uncertainty. They are technologies of governance that have historically been deployed to manage African populations, justify intervention, and discipline African states into compliance with externally defined risk categories. Reconstructing the African perspective therefore requires reading each method against its colonial and post-colonial genealogies, and asking not only "does this forecast work?" but "for whom does it work, and at whose expense?"

The most concrete institutional expression of an African-owned forecasting agenda is the network of early warning systems that emerged from the 1990s onward: the African Union's Continental Early Warning System (CEWS), the ECOWAS Early Warning and Response Network (ECOWARN), the IGAD Conflict Early Warning and Response Mechanism (CEWARN), and the SADC Regional Early Warning Centre. These systems were not merely technical imports. They represented a post-colonial insistence, articulated by leaders such as Julius Nyerere and Kwame Nkrumah in earlier decades, that Africans must forecast and manage their own futures rather than receive them as intelligence products from former colonial powers. Emmanuel Kwesi Aning and Kwaku Danso have documented how these systems were designed to shift the locus of predictive authority from Western capitals to African institutions, embedding forecasting within regional political communities rather than external security architectures. Yet the same scholarship reveals a persistent tension: early warning systems often reproduce state-centric biases, privileging regime stability and territorial integrity over human security, and frequently generating alerts that are ignored by the very political leaders they are meant to serve. The African perspective thus contributes an insistence that forecasting must be accountable to affected populations, not only to decision-makers, and that the value of a forecast lies in whether it enables preventive action by those most at risk.

The deeper theoretical grounding for this position comes from African scholarship on the politics of knowledge. Achille Mbembe's analysis of necropolitics and the "postcolony" demonstrates how African subjects have historically been constructed as objects of external management rather than agents of their own futures. In the forecasting context, this means that predictions about African conflict, state failure, or humanitarian crisis often function not as descriptions of reality but as performative constructions that bring into being the very conditions they claim to anticipate. The "fragile state" label, the "arc of crisis" framing, and the routine classification of African regions as high-risk zones are not innocent analytic categories; they are interventions that shape capital flows, aid allocations, military deployments, and diplomatic attention. Jean-François Bayart's concept of extraversion—the tendency of African political systems to orient themselves toward external patrons—extends to forecasting: African states often consume and reproduce Western risk assessments rather than generating autonomous ones, because the institutional and epistemic resources for independent prediction have been systematically underdeveloped. The African perspective therefore reveals

what Western methodological discussions typically occlude: that forecasts have constitutive effects, that they can become self-fulfilling prophecies, and that the accuracy of a prediction about African instability may tell us more about the intervention it triggers than about the underlying social reality.

The epistemic dimension is developed further by African feminist and decolonial scholars. Oyèrónkẹ́ Oyěwùmí's critique of Western epistemological categories—particularly the imposition of gender and racial taxonomies that do not map onto African social realities—has direct implications for quantitative conflict modeling. ACLED, GDELT, and ICEWS all rely on coding schemes that classify actors, events, and locations according to categories developed in Western academic and policy contexts. Mamdani's analysis of "define and rule" demonstrates how colonial administrative categories, particularly the ethnic and tribal classifications invented under indirect rule, persist in contemporary conflict data and continue to shape how violence is understood and predicted. When a model predicts "ethnic conflict" in a region, it may be reproducing a colonial taxonomy rather than identifying a causal mechanism. Sylvia Tamale's work on decolonization and knowledge production insists that African scholars must be central to the design of categories, not merely sources of data for models built elsewhere. The African perspective thus contributes a methodological demand: that the ontological categories embedded in forecasting tools be subjected to critical scrutiny, and that African intellectual traditions be treated as generative frameworks rather than as case material for Western theory.

The structural critique, rooted in Walter Rodney's analysis of underdevelopment and Nkrumah's theory of neo-colonialism, adds another layer. Rodney demonstrated that African underdevelopment was not a natural condition but a product of global capitalist structures; Nkrumah showed how formal political independence masked continued economic and epistemic dependence. Applied to forecasting, this means that predictions attributing African instability to local factors—governance failures, ethnic tensions, resource curses—systematically misattribute causation by ignoring the global structures that shape African political economies. Amílcar Cabral's insistence that the colonized must theorize their own liberation, and Frantz Fanon's analysis of the psychological and political dimensions of colonial domination, extend to forecasting: the capacity to imagine alternative futures is itself a form of political power, and its monopolization by external actors constitutes a form of domination. The African perspective therefore demands that forecasting be oriented toward emancipatory rather than merely predictive ends, and that it serve African planning and self-determination rather than external risk management.

Each of the five methodologies takes on a different character when viewed from this vantage point. Scenario planning, as developed by Peter Schwartz and the Royal Dutch Shell method, assumes a global corporate actor navigating uncertainty; when applied to Africa, scenarios are often constructed by donors, investors, and security agencies whose interests are not aligned with African populations. The African perspective does not reject scenario planning but insists on African ownership of the scenario process, with scenarios generated from within African political and social contexts rather than imposed from outside. The Delphi method raises acute questions about whose expertise counts: Western academic and policy experts have historically dominated expert panels on African affairs, while African scholars, practitioners, and community leaders are underrepresented. Consensus-building in this context can silence dissenting African voices and produce a false unanimity that masks power asymmetries. Bayesian updating, with its emphasis on explicit priors and disciplined belief revision, offers genuine value: making priors explicit allows them to be contested, and the discipline of updating can counteract the tendency to cling to colonial stereotypes. But the method also depends on data that is often absent or unreliable for African contexts, and priors shaped by colonial knowledge may be difficult to dislodge. Quantitative conflict modeling faces the most direct critique: ACLED's reliance on media reports systematically overrepresents Anglophone, urban, and elite

perspectives; GDELT's machine coding struggles with African languages and local media; ICEWS's event data is built on Western news sources that underreport rural violence and overreport events involving Western actors. This is not merely a bias to be corrected through better data collection; it is a structural feature of a global information order that centers Western observers. Calibration and scoring, as developed in the Good Judgment Project and measured by Brier scores, raise the question of whose accuracy matters. In African contexts, outcomes are often determined by external intervention—French military operations, UN peacekeeping, donor conditionality—making "accuracy" a measure of intervention success as much as forecast quality. The superforecaster traits identified by Tetlock and Gardner—cognitive flexibility, open-mindedness, numeracy—may be less relevant where structural constraints dominate and where the cost of being wrong is borne by populations who had no voice in the forecast.

What the African perspective reveals that the other four miss is threefold. First, it exposes the constitutive and performative dimensions of forecasting: predictions do not merely describe futures but help create them, and this is especially consequential in contexts where external actors have the power to act on their predictions. Second, it identifies the epistemic violence embedded in methodological choices—the categories, data sources, and expert panels that silently privilege certain ways of knowing over others. Third, it reframes the purpose of forecasting from accuracy to accountability, insisting that the ultimate test of a forecast is not whether it matches an outcome but whether it serves the interests of those whose lives it predicts. What the African perspective risks occluding is the genuine value of systematic data and rigorous method: local knowledge, while indispensable, is not always sufficient for anticipating large-scale dynamics, and romanticizing it can obscure the need for institutional capacity-building in African research and data systems. The perspective also faces the challenge of scaling: African-owned forecasting institutions remain underfunded and politically vulnerable, and the gap between early warning and early action persists. Nevertheless, the African vantage point is indispensable because it asks the question that the other perspectives too rarely pose: not "how can we predict better?" but "who has the right to predict, and to what end?"

2.7.2 Chinese Perspective

The Chinese perspective on geopolitical forecasting is organized around the concept of "scientific decision-making" (kexue juece), a framing that treats forecasting not as an academic exercise but as an integral component of statecraft and national planning. In this view, the purpose of forecasting is to reduce the arbitrariness of political decisions by grounding them in systematic analysis, and the legitimacy of a forecast derives from its service to the collective goals of the state rather than from its individual accuracy. This orientation shapes how each of the five methodologies is received and adapted.

Scenario planning has a long history in Chinese strategic practice, though it is rarely labeled as such. The Five-Year Plans, the Belt and Road Initiative's risk assessments, and the strategic planning documents produced by the Central Party School and the Academy of Military Sciences all involve scenario-based thinking about alternative futures. Chinese scenario planning tends to be more state-centric and longer-horizon than its Western corporate counterpart, reflecting a political system that can sustain multi-decade planning horizons without electoral interruption. The contribution here is an insistence that forecasting must be integrated into planning rather than treated as a standalone intelligence product; the occlusion is a tendency to conflate desired futures with predicted ones, and to treat scenario construction as an exercise in political legitimation rather than genuine uncertainty reduction.

The Delphi method is widely used in Chinese policy research, particularly through expert consultation mechanisms (zhuanjia zixun) embedded in bureaucratic processes. Think tanks such as CICIR, SIIS, and CIIS

regularly convene expert panels to assess international developments, and the National Development and Reform Commission relies on expert elicitation for major policy decisions. The Chinese adaptation of Delphi tends to emphasize consensus and hierarchy: junior experts defer to senior ones, and the goal is often to produce a unified assessment that can be presented to leadership rather than to surface genuine disagreement. This contributes a model of forecasting as collective deliberation, but it occludes the value of dissent and the cognitive benefits of aggregating independent judgments, which Tetlock's research has shown to be central to accuracy.

Bayesian updating and quantitative modeling are growing rapidly in Chinese strategic studies, driven by investments in big data, artificial intelligence, and computational social science. Chinese universities and military research institutes have developed conflict forecasting models, and there is significant interest in applying machine learning to event prediction. The "scientific decision-making" framing provides political support for quantification, but it also creates pressure for models to produce actionable, authoritative outputs rather than probabilistic assessments with explicit uncertainty. The contribution is a willingness to invest in data infrastructure and computational capacity at scale; the occlusion is a tendency to treat model outputs as more certain than they are, and to subordinate methodological transparency to state security.

Calibration and scoring are the least developed of the five methodologies in the Chinese context. Individual forecasters are rarely scored against outcomes, and the cultural and institutional emphasis on collective responsibility and hierarchical authority makes individual-level accountability difficult. The Good Judgment Project's findings about superforecasters—cognitive flexibility, active open-mindedness, numeracy—are not directly transferable to a system where forecasting is a bureaucratic function rather than an individual performance. The Chinese perspective contributes an insistence that forecasting must be evaluated by its contribution to collective decision-making, not by individual accuracy metrics; it occludes the possibility that individual-level cognitive traits and incentives matter independently of institutional context.

Overall, the Chinese perspective's strength is its integration of forecasting into long-term state planning and its willingness to invest in data and computational infrastructure. Its weakness is the subordination of methodological rigor to political imperatives, the suppression of dissenting assessments, and the difficulty of distinguishing genuine prediction from the legitimation of predetermined strategies.

2.7.3 Russian Perspective

The Russian perspective on geopolitical forecasting is shaped by a strategic culture that treats international politics as an arena of great-power competition in which deception, surprise, and the manipulation of uncertainty are legitimate instruments of statecraft. This orientation produces a distinctive skepticism toward Western forecasting methodologies, which are often viewed not as neutral tools but as components of an information warfare apparatus designed to shape Russian perceptions and constrain Russian options.

Russian strategic culture places a high value on qualitative, historically informed analysis over quantitative modeling. The Russian academic and intelligence traditions emphasize deep historical knowledge, civilizational analysis, and the study of Western intentions and capabilities. Forecasting in this tradition is less about assigning probabilities to discrete events and more about understanding the underlying logic of adversary behavior. This contributes an insistence that geopolitical forecasting must be grounded in historical and cultural knowledge, and that models which strip away context in pursuit of quantification risk missing the strategic logic that drives state behavior. The occlusion is a tendency toward conspiratorial thinking: the assumption that Western actions are more coordinated and intentional than they are, and that apparent chaos or incompetence in Western policy is actually strategic deception.

Scenario planning is used in Russian strategic studies, but with different underlying assumptions. Russian scenarios tend to be more zero-sum and more attentive to Western intentions than to structural or domestic factors. The contribution is an emphasis on the adversary's perspective and the possibility of strategic surprise; the occlusion is a tendency to overestimate Western coherence and to underestimate the role of domestic politics and contingency in shaping Western policy. The Russian perspective also contributes a long memory: Russian analysts frequently draw on historical analogies—Napoleon, Hitler, the Cold War—that Western forecasters, with their shorter institutional memories, may neglect.

The Delphi method and expert elicitation are practiced in Russian research institutes and intelligence analysis, but with a different epistemic culture. Russian expert panels tend to be more hierarchical and more politically constrained than their Western counterparts, and the range of acceptable dissent is narrower. The contribution is a recognition that expert judgment is always situated in a political context; the occlusion is the difficulty of producing genuinely independent assessments when the expert community is closely tied to the state.

Bayesian updating and quantitative conflict modeling are viewed with particular skepticism. Russian analysts often regard Western quantitative models—ACLED, GDELT, ICEWS—as instruments of Western information dominance, and there is a widespread belief that such models encode Western biases and serve Western interests. This skepticism is not entirely unfounded: the data biases identified in the African perspective—reliance on Western media, underreporting of non-Western contexts—apply with equal force to Russian concerns. The Russian perspective contributes a valuable critical stance toward the apparent objectivity of quantitative methods; it occludes the possibility that such methods, despite their biases, can still improve on unaided human judgment.

Calibration and scoring are largely absent from Russian forecasting practice. The Good Judgment Project's emphasis on individual cognitive traits and probabilistic reasoning sits uneasily with a strategic culture that values decisiveness, historical intuition, and the willingness to act under uncertainty. The Russian perspective contributes an insistence that forecasting must ultimately serve action, and that excessive refinement of probability estimates can become a form of paralysis; it occludes the possibility that better calibration could improve the quality of Russian strategic decisions.

Overall, the Russian perspective's strength is its attention to adversary intentions, historical depth, and the political dimensions of forecasting. Its weakness is the tendency toward conspiratorial overinterpretation, the suppression of dissent within expert communities, and the rejection of methodological innovations that could improve accuracy.

2.7.4 Western Perspective

The Western perspective on geopolitical forecasting is the most methodologically self-conscious and empirically oriented of the five. It is defined by a sustained engagement with the problem of intelligence failure and a willingness to subject forecasting practices to systematic testing and reform. The canonical reference points are the Good Judgment Project, the IARPA forecasting tournaments, and the broader literature on cognitive biases and debiasing, culminating in Tetlock and Gardner's work on superforecasting.

Scenario planning, as developed by Peter Schwartz and the Royal Dutch Shell method, originated in Western corporate and strategic planning contexts and has been widely adopted by Western governments and think tanks. The Western contribution is a well-developed methodology for structuring uncertainty, identifying driving forces, and constructing coherent alternative futures. The occlusion is a tendency to treat scenario planning as a self-contained exercise rather than integrating it with other methods, and to assume that the

scenarios constructed by Western analysts correspond to the futures that matter to non-Western actors.

The Delphi method has deep roots in Western policy research, particularly in the RAND Corporation's Cold War-era work on technological forecasting. The Western adaptation emphasizes anonymity, iteration, and the aggregation of independent judgments. The contribution is a rigorous methodology for eliciting and combining expert opinion; the occlusion is a tendency to treat expert consensus as truth, and to underweight the possibility that experts share systematic biases rooted in their common training and institutional affiliations.

Bayesian updating is the methodological backbone of the Western approach to belief revision. The emphasis on explicit priors, likelihoods, and posteriors reflects a commitment to transparency and to the discipline of changing one's mind in response to evidence. The contribution is a powerful framework for structuring reasoning and avoiding common cognitive errors; the occlusion is the difficulty of specifying priors and likelihoods in complex geopolitical contexts, and the risk that formal Bayesianism becomes a ritual rather than a genuine aid to judgment.

Quantitative conflict modeling—ICEWS, ACLED, GDELT—represents the Western commitment to data-driven, replicable analysis. These tools have transformed the study of conflict by making large-scale event data available to researchers and policymakers. The contribution is an empirical orientation and a willingness to test claims against data; the occlusion is a tendency to overgeneralize from tournament settings and historical data to high-stakes policy environments where questions are messier, incentives are different, and the cost of being wrong is asymmetric. The Western perspective also struggles with the data biases identified by African and Russian critics: reliance on Western media, underrepresentation of non-Western contexts, and the encoding of Western categories.

Calibration and scoring are the distinctive contribution of the Western perspective. The Brier score, the Good Judgment Project, and the superforecaster research program have demonstrated that individual forecasting accuracy can be measured, improved, and predicted. The contribution is an empirical demonstration that some people are consistently better forecasters than others, and that training and feedback can improve performance. The occlusion is a tendency to overgeneralize from tournament settings to policy environments, and to treat individual cognitive traits as more important than structural and institutional factors.

The Western perspective's strength is its empirical orientation, methodological transparency, and willingness to learn from failure. Its weakness is a universalism that assumes Western methods are applicable everywhere, an individualism that underweights structural constraints, and a tendency to treat forecasting as a technical problem rather than a political one.

2.7.5 UN Perspective

The UN perspective on geopolitical forecasting is organized around the mandate of early warning and prevention. Unlike national intelligence agencies or corporate strategic planners, the UN must forecast in a multilateral context where questions are politically negotiated, outcomes are jointly determined, and the legitimacy of any prediction depends on its acceptance by member states. This shapes how each methodology is adapted and what is demanded of it.

Scenario planning is used in UN contexts for peacekeeping planning, humanitarian preparedness, and mediation support. The UN contribution is an insistence that scenarios must be developed through inclusive processes that involve affected states and communities, not imposed by external experts. The occlusion is the difficulty of achieving genuine inclusivity in a hierarchical organization where power is unevenly distributed among member states, and the tendency for scenarios to be shaped by the political interests of the

most powerful members.

The Delphi method and expert elicitation are widely used in UN early warning, particularly through expert groups convened by the Department of Political and Peacebuilding Affairs, the Office of the Special Adviser on the Prevention of Genocide, and the Framework of Analysis for Atrocity Crimes. The UN contribution is a commitment to multilateral legitimacy: forecasts must be credible to the international community, not just to a single government. The occlusion is the difficulty of achieving genuine consensus among experts from diverse national and institutional backgrounds, and the risk that expert panels become arenas for political negotiation rather than analytic deliberation.

Bayesian updating and quantitative modeling are increasingly used in UN contexts, particularly through initiatives such as UN Global Pulse and the use of satellite imagery and social media data for humanitarian monitoring. The UN contribution is a recognition that data-driven methods can improve the timeliness and granularity of early warning. The occlusion is the difficulty of applying methods designed for individual decision-makers to collective decision-making processes, and the risk that quantitative outputs are treated as more authoritative than they are in politically contested environments.

Calibration and scoring are valued by the UN as tools for improving early warning and prevention, but with an insistence that scoring must be tied to actionable prevention rather than to individual accuracy. The UN contribution is a demand that forecasting serve collective decision-making and that its success be measured by whether it enables preventive action. The occlusion is the difficulty of scoring forecasts in a multilateral context where questions are politically negotiated and outcomes are jointly determined, and the risk that scoring becomes a bureaucratic exercise disconnected from the political will to act.

Overall, the UN perspective's strength is its commitment to legitimacy, inclusivity, and prevention. Its weakness is the political constraints imposed by member state sovereignty, the difficulty of acting on early warning, and the tendency for forecasting to become an end in itself rather than a means to prevention.

SECTION 2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Reframes forecasting as political practice embedded in who defines questions and whose crises count; centers local early warning and community-based indicators	May underweight the genuine predictive gains from probabilistic aggregation and large-N event data	Forecasting must serve African agency and prevention, not external security agendas	AU Continental Early Warning System; ECOWAS early warning; Aning and Danso's critiques of external prediction	Western: probabilistic methods demonstrably improve accuracy; refusing them risks worse decisions
Chinese	Treats forecasting as state capacity integrated with long-term planning and "scientific decision-making"	Tends to conflate prediction with control; underestimates irreducible uncertainty and black-swan events	Forecasting should strengthen sovereign decision-making and comprehensive national power	Five-Year Plans' scenario exercises; strategic research institutes (CICIR, SIIS)	Russian/Western: state-centric forecasting can become self-confirming and suppress dissenting signals
Russian	Emphasizes strategic culture, historical pattern, and civilizational cycles; skepticism of universalist probabilistic models	May overfit to historical analogy and underweight base rates and structural change	Forecasting should reflect great-power realities and resist Anglo-American methodological hegemony	Russian strategic studies traditions; emphasis on "correlation of forces"	Western: historical analogy without base rates produced systematic errors (e.g., overestimating Soviet stability)

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Western	Developed probabilistic forecasting, calibration, scoring (Brier), and institution-alized self-critique after intelligence failures	Question selection reflects US/ally security priorities; treats accuracy as individual trait rather than collective capacity	Forecasting should be accountable, transparent, and evidence-based	Good Judgment Project; Tetlock and Gardner (2015); ICEWS/ACLED/GDELT	African: accuracy on externally defined questions is not the same as legitimate or useful prediction
UN	Frames forecasting as early warning for prevention; demands legitimacy, inclusivity, and actionability	Difficulty scoring forecasts in multilateral contexts; risk of bureaucratic ritual without political will	Forecasting must enable collective preventive action and be judged by lives saved, not Brier scores	UN early warning frameworks; R2P; AU-UN partnerships	Western: without scoring, there is no feedback loop to improve accuracy

SECTION 2.8 WORKED EXAMPLE (I do)

Case: The Good Judgment Project (2011–2015) — what did the IARPA forecasting tournament teach us about predicting geopolitical events?

Levels of analysis. The GJP can be read at four levels. At the individual level, the tournament isolated cognitive and dispositional traits—openness to experience, need for cognition, active open-mindedness, numeracy, and "perpetual beta" updating—that distinguished superforecasters (the top 2% of participants) from the median forecaster and from intelligence analysts with access to classified information. At the state level, the project was an instrument of the US intelligence community's post-Iraq-WMD reform agenda: IARPA funded it to test whether open-source, crowd-based methods could outperform classified analysis, and the CIA and other agencies absorbed its lessons into training and analytic tradecraft. At the systemic level, the tournament unfolded during a unipolar-to-multipolar transition in which the United States sought to maintain decision advantage amid Arab Spring upheavals, Syrian civil war, Russian assertiveness, and Chinese rise; the questions asked reflected that strategic agenda. At the transnational level, the events forecast—elections, coups, ceasefires, disease outbreaks, economic indicators—were produced by cross-border processes, and the forecaster pool itself was international, meaning that local knowledge from participants in target countries was one input among many, though the scoring and question-framing remained US-centered.

Mechanism section. The GJP's core mechanism was a feedback loop between probabilistic elicitation, rapid scoring, and belief revision. Forecasters assigned probabilities to precisely worded, time-bound questions; outcomes were resolved by independent judges; Brier scores (Brier 1950) provided a proper scoring rule

that rewarded both calibration (probabilities matching observed frequencies) and resolution (discriminating between events that occurred and did not). Three mechanisms drove superior performance. First, aggregation: averaging many independent forecasts, then "extremizing" toward 0 or 1, outperformed individual experts, consistent with the wisdom-of-crowds logic. Second, cognitive style: superforecasters updated frequently in small increments, sought disconfirming evidence, and decomposed questions into components with base rates. Third, institutional design: training in probabilistic reasoning and bias mitigation, team structures with devil's-advocate roles, and a tournament rhythm that created accountability. Tetlock and Gardner (2015) report that superforecasters beat intelligence analysts by roughly 30% in Brier score terms and that the top team's performance was sustained across years, suggesting the gains were not luck. The mechanism is therefore not "better information" but better processing of available information: the GJP demonstrated that open-source, structured cognition can outperform classified, unstructured expertise under conditions of moderate uncertainty.

Perspective reconstruction.

African (primary). The GJP is best read from an African vantage point as a case study in the politics of prediction: the tournament's questions were overwhelmingly framed by US national-security priorities, so African conflicts, elections, and crises appeared as objects of external monitoring rather than as problems defined by African actors. African early warning systems—such as the AU Continental Early Warning System and ECOWAS's early warning mechanism—operate on different epistemologies, combining quantitative indicators with community-based reporting, traditional authority networks, and political mediation; they are judged by whether they enable prevention, not by Brier scores on externally posed questions. African scholars such as Aning and Danso have argued that forecasting which treats African states as targets of prediction reproduces asymmetries of knowledge and power, and that the "accuracy" celebrated by the GJP may be accuracy on questions that matter to Washington rather than to Abuja or Addis Ababa. At the same time, the African perspective does not dismiss the GJP's findings: the demonstration that structured, probabilistic reasoning outperforms unstructured expert judgment is relevant to African intelligence and early warning institutions, provided the questions, indicators, and scoring are locally owned. The occlusion in the African reading is that it can understate the genuine methodological advance the GJP represents—superforecasting is a real improvement over both punditry and unexamined expert intuition—and that rejecting probabilistic methods outright risks leaving African decision-makers with worse tools. What the African vantage point reveals that the others miss is that the GJP's central metric, individual accuracy on resolved questions, silently encodes a particular distribution of power: who asks, who answers, and who benefits from being right.

Chinese. From a Chinese perspective, the GJP exemplifies a Western, specifically American, approach to forecasting as competitive advantage: open-source crowd wisdom harnessed to state power through IARPA, with results fed into intelligence reform. Chinese strategic forecasting, framed as "scientific decision-making" (kexue juece), emphasizes integration of prediction into long-term planning, comprehensive national power assessments, and party-state coordination; the GJP's individualist, tournament-based model appears both methodologically interesting and politically naive, since it separates forecasting from decision authority and from the planning apparatus that gives predictions consequence. Chinese scholars and strategists would likely credit the GJP's demonstration of aggregation and calibration while questioning whether its findings transfer to a system where forecasting is embedded in hierarchical, long-horizon planning rather than in short-cycle tournament questions. The occlusion is a tendency to treat state-integrated forecasting as inherently superior, which can suppress dissenting signals and overfit to official narratives.

Russian. The Russian perspective reads the GJP through the lens of strategic culture and great-power compe-

tition: a US-funded project to systematize prediction for hegemonic purposes, producing "superforecasters" whose cognitive style—open-mindedness, frequent updating, willingness to abandon prior views—reflects liberal, individualist epistemology rather than the historical-pattern and civilizational-cycle reasoning valued in Russian strategic thought. Russian forecasting traditions emphasize the "correlation of forces," long-term historical trajectories, and the role of will and leadership; the GJP's reduction of geopolitics to resolvable, time-bound questions with Brier scores appears to strip away the tragic, non-linear dimensions of international politics. The contribution of this perspective is its insistence that some geopolitical outcomes are not merely uncertain but structurally underdetermined, and that treating them as probabilistic bets can induce overconfidence. Its occlusion is a risk of overfitting to historical analogy and underweighting base rates, which Tetlock's earlier work (Expert Political Judgment, 2005) showed to be a systematic source of expert error.

Western. The Western perspective is the GJP's home turf: it treats the tournament as a landmark in the intelligence-failure self-critique that followed Iraq WMD, demonstrating that open-source, structured, scored forecasting can outperform classified, unstructured expertise. The mechanism—calibration, aggregation, extremizing, cognitive-style selection, training—is presented as a generalizable improvement in analytic tradecraft, and the project's findings have been absorbed into intelligence community practice and into commercial forecasting. The strength is empirical rigor and institutional accountability; the occlusion is that the questions, the scoring, and the "accuracy" metric are all defined within a US security frame, so the apparent universality of the method masks a particular geopolitical standpoint. The Western perspective also tends to individualize success (the superforecaster) rather than treating forecasting as a collective, political capacity.

UN. The UN perspective values the GJP's methodological advances but judges them by a different standard: whether they enable prevention. From this vantage point, the tournament's focus on individual accuracy on resolved questions is a narrow metric; what matters is whether forecasting produces actionable early warning that mobilizes collective response, as in the UN's early warning and R2P frameworks. The GJP's questions were rarely about slow-burn crises or structural violence in ways that would trigger preventive diplomacy; its scoring system cannot capture the value of a forecast that, by prompting action, prevents the event it predicted. The UN contribution is a demand that forecasting serve collective decision-making and that success be measured by lives saved and crises averted, not only by Brier scores. The occlusion is the difficulty of scoring forecasts in a multilateral context where questions are politically negotiated and outcomes are jointly determined.

Explicit adjudication. The Western perspective best explains the GJP as an institution and as a methodological achievement: the project was funded by a US intelligence agency, designed by Western scholars, and evaluated by Western metrics, and its findings about calibration, aggregation, and cognitive style are robust within that frame. However, the Western perspective misses what the African and UN perspectives reveal: that "accuracy" on externally defined questions is not equivalent to legitimate or useful prediction, and that the tournament's success metric cannot register prevention. The Chinese and Russian perspectives add a further caution: forecasting embedded in state planning or in historical-civilizational reasoning may capture dimensions of geopolitics—long-horizon structural change, the role of will and leadership—that probabilistic tournament questions flatten. The best explanation of what the GJP "taught" is therefore a hybrid: individual-level cognitive traits and institutional design genuinely improve short-horizon, well-specified predictions, but the tournament's lessons are bounded by question selection, by a US security frame, and by a metric that rewards being right over making a difference. The GJP taught us how to forecast better; it did not teach us what to forecast, or for whom.

SECTION 2.9 PROBLEM PAIR (We do)

1. Classify the main forecasting communities that assessed a possible Russian invasion of Ukraine in late 2021 and early 2022, and state what each community treated as decisive evidence.

2. Separate the four levels of analysis for the case: what was observed, why it might have been occurring, what was predicted, and what policy response was prescribed.

3. Construct a simple Bayesian update for invasion by late February 2022: state a prior, identify at least two pieces of evidence, assign rough likelihoods under "invasion" and "coercive diplomacy," and state a posterior range.

4. Compare what quantitative conflict datasets and event-data systems could and could not detect in this case, and identify one false positive and one false negative risk.

5. Reconstruct how African, Chinese, Russian, Western, and UN perspectives would each frame whether the invasion was "predictable," and identify what each perspective occludes.

6. Adjudicate the main source of forecasting failure—epistemic, institutional, or ontological—and specify two observations that would falsify your adjudication.

Model answer. The forecasting record around the 2022 Russian invasion of Ukraine is best read as a case of structured disagreement under radical uncertainty rather than as a simple story of experts failing and open-source analysts succeeding. In late 2021 and early 2022, several communities were looking at overlapping evidence but weighting it through different models of Russian decision-making. Intelligence agencies with privileged collection emphasized order-of-battle indicators, logistics, and command-and-control signatures; their warnings became more specific as winter approached. Open-source analysts and journalists documented the physical buildup with satellite imagery, railway movements, and equipment transfers, producing a strong descriptive record of militarization. Prediction-market participants and superforecasters, where they were engaged, had to translate those signals into probabilities, and their performance depended heavily on whether they treated the buildup as a standing coercive threat or as preparation for an irreversible attack. Many European political leaders and some Ukrainian officials discounted the highest-probability invasion scenarios, partly because they weighted diplomatic incentives, economic costs, and the apparent irrationality of a full-scale war more heavily than military indicators. Russian strategic communication, including denials and demands for security guarantees, was itself a source of ambiguity because it was consistent with both bargaining and concealment.

The first analytical discipline is to keep description, explanation, prediction, and prescription separate. Description includes troop concentrations, exercises, diplomatic notes, and economic measures. Explanation asks why those actions might be occurring: coercive diplomacy, preparation for limited escalation, domestic political consolidation, or genuine intent to conquer. Prediction assigns probabilities and timing to possible outcomes. Prescription concerns what third parties should do, such as deterrence, reassurance, sanctions, or evacuation. A common error in public debate was to move from description to prescription while treating one explanation as established. A large buildup was visible; the inference that it would necessarily produce

a full-scale invasion was not equally visible.

A Bayesian treatment clarifies why. A reasonable prior for a full-scale invasion of a large European state by a nuclear power in early 2022 was low, because the base rate of such wars is low and the expected costs were enormous. Evidence such as sustained force concentration, Belarusian staging areas, and ultimatum-like diplomatic demands raised the likelihood of invasion, but the same evidence also raised the likelihood of coercive bargaining. The posterior therefore depended on the relative likelihoods assigned to each hypothesis. If one assumed that mobilization is cheap talk, the posterior remained moderate; if one assumed that mobilization plus ultimatum language is a strong predictor of attack, the posterior rose sharply. The decisive update for many observers came not from a single new fact but from the accumulation of logistics indicators, the failure of diplomatic off-ramps, and the recognition that Russian force posture was optimized for offensive operations rather than for indefinite coercion. Even then, uncertainty about Putin's private decision, the possibility of last-minute bargaining, and the risk of mirror-imaging meant that a high probability was warranted but certainty was not.

Quantitative conflict modeling adds a different kind of value and a different kind of limit. Systems such as ICEWS, ACLED, and GDELT are useful for detecting patterns in reported events, mobilization, violence, and media tone, and they can surface escalation trends that human analysts miss. In this case, event data could have captured rising military activity, border incidents, and diplomatic friction. But these systems do not directly observe leader intent, elite bargaining, or classified planning. They are also vulnerable to reporting bias, definitional drift, and the temptation to treat correlation as prediction. A model may predict elevated conflict probability without specifying whether the conflict will be a limited incursion, a full-scale invasion, or a prolonged standoff. The false-positive risk is that mobilization is read as imminent war; the false-negative risk is that a decision made in a small circle produces little open-source signal until execution.

The five perspectives reconstruct the case differently. An African perspective would stress that early warning is often technically available but politically ignored, and that great-power crises expose the selectivity of international attention; it would also highlight sovereignty, non-intervention norms, and the unequal distribution of preventive capacity. A Chinese perspective would emphasize strategic patience, the possibility that Washington was overreading Moscow's signals, and the value of reading military posture within a longer geopolitical competition. A Russian perspective, especially from within Russian strategic culture, would treat deception, ambiguity, and the concentration of decision-making as normal features of statecraft, making external prediction inherently difficult. A Western perspective would focus on intelligence collection, alliance coordination, and the post-Iraq need to avoid overstating certainty, while also acknowledging mirror-imaging and political incentives to avoid alarm. A UN perspective would frame the case through early warning, preventive diplomacy, and the gap between information and collective action, noting that even accurate forecasts do not automatically generate consensus or enforcement.

The most defensible adjudication is that the miss, where it occurred, was overdetermined by all three sources of failure. Epistemically, the evidence was genuinely ambiguous because the same mobilization supported multiple hypotheses. Institutionally, intelligence communities had incentives to hedge, political leaders had incentives to avoid panic, and public discourse often rewarded false confidence in either direction. Ontologically, the final decision appears to have been concentrated and possibly late, meaning that even a perfect model of observable indicators could not fully determine the outcome. This adjudication would be falsified if declassified records showed that the invasion decision was fixed months earlier and clearly signaled in observable indicators, which would strengthen the epistemic-failure account; or if records showed that decision-makers genuinely changed course at the last moment in response to diplomacy, which would

strengthen the ontological account. The lesson is not that forecasting failed, but that good forecasting must make ambiguity explicit, update as evidence accumulates, and separate the probability of an event from the wisdom of a policy response.

SECTION 2.10 INDEPENDENT MEMO (You do)

(a) Case description: In early 2025, a regional early-warning cell must assess whether a sustained border militarization episode in a fragile region will escalate to interstate war within ninety days. The cell has satellite imagery showing troop concentrations, ACLED records of cross-border incidents, diplomatic cables suggesting coercive bargaining, and a Delphi panel of regional experts split between "bluff" and "imminent attack." It must produce a probability estimate, update it as new evidence arrives, and recommend preventive diplomacy without either crying wolf or missing an attack. The cell's audience includes governments with competing interests, a regional organization with limited enforcement capacity, and humanitarian agencies that need lead time for contingency planning.

(b) Required memo headings as prompts:
Mechanism: Identify the causal pathway by which border militarization could become war, and distinguish necessary conditions, sufficient conditions, and triggering events.
Perspective reconstruction: Reconstruct how African, Chinese, Russian, Western, and UN actors would interpret the same evidence, and state what each reading occludes.
Historical analogue: Select one prior case of coercive mobilization and explain what is structurally similar, what differs, and why the analogy may mislead.
Falsifiers: State two observations that would weaken your probability estimate and two that would strengthen it, and specify what evidence would change your policy recommendation.

(c) Self-check: Did you distinguish description, explanation, prediction, and prescription, and did you avoid converting a probability estimate into a policy conclusion without an explicit decision rule?

SECTION 2.11 HINGE QUESTION

A forecasting team has strong Brier scores on routine political questions. In February 2022 it assigned only a 30 percent probability to a full-scale Russian invasion despite visible troop buildups. Which conclusion is most warranted?

A. The team's low score on this question proves that quantitative and expert forecasting methods are useless in geopolitics.
B. The team should have treated the troop buildup as sufficient evidence and assigned near-certainty to invasion.
C. The miss reflects the difficulty of inferring a leader's private decision from public signals; even well-calibrated forecasters face base-rate and evidence-ambiguity problems, so the appropriate response is disciplined updating and explicit uncertainty rather than abandonment of method.
D. Because experts disagreed, the correct probability was necessarily 50 percent.

Distractor diagnoses: Option A conflates a single high-stakes miss with overall methodological invalidity and ignores that calibration is assessed across many questions, not one. Option B commits a deterministic fallacy by treating mobilization as sufficient evidence, when the same observable indicators were consistent with coercive diplomacy as well as invasion. Option D treats expert disagreement as a reason to default to equiprobability, rather than as information to be aggregated, weighted, and updated.

SECTION 2A — DATA LAB

Table 1 — Dataset comparison: ICEWS, ACLED, GDELT

Dataset	Temporal coverage	Geographic scope	Event granularity	Primary source base	Known bias / limitation
ICEWS (Integrated Crisis Early Warning System)	1995–present	Global	Country-day political events (CAMEO-coded)	Automated coding of multiple news sources	Over-representation of English-language and Western media; under-coding of non-violent contention and local-language reporting
ACLED (Armed Conflict Location & Event Data)	1997–present (Africa origin; now global)	Africa originally; expanded globally	Sub-national, actor-disaggregated events	Human coders + media + NGO/IGO reports	Under-reporting in remote or inaccessible conflict zones; definitional drift across coding revisions; lag in real-time updates
GDELT (Global Database of Events, Language, and Tone)	1979–present	Global	15-minute updates, CAMEO-coded, tone scores	Automated global media monitoring	High false-positive rate; machine-coding ambiguity; "noise" in trend series; tone scores not validated as sentiment measures

Table 2 — Good Judgment Project tournament outcomes (illustrative ranges, drawn from Mellers et al. 2014 and Tetlock & Gardner 2015)

Group	Approx. participants	Forecasting questions	Mean Brier score (lower = better)	Notes
Crowd (all forecasters)	~2,800 (Year 1)	100+ per year	~0.35–0.40	Wisdom-of-crowds baseline; untrained volunteers
Top 2% ("super-forecasters")	~50–60	Same set	~0.19–0.22	Selected by prior-year performance; teaming + training + feedback
Intelligence analysts (control)	Hundreds	Subset	~0.28–0.32	Classified access; professional training; no feedback loop
Prediction markets	Variable	Subset	~0.22–0.26	Incentive-compatible prices; aggregate of self-selected traders

Note: figures are approximate ranges reported in the GJP literature; exact point estimates vary by question set and year.

Table 3 — ACLED-based prediction vs. outcome, Sahel 2021–2023 (illustrative)

Region	Predicted risk (ACLED trend + model)	Actual major conflict events	Hit?	Miss type
Mali (central)	High	High (JNIM expansion)	Yes	—
Burkina Faso (north)	Medium	High (coup + insurgency surge)	Under-predicted	Political shock (coup) not captured by conflict trend
Niger (Tillabéri)	High	High	Yes	—
Chad (Lake Chad basin)	Medium	Medium	Yes	—
Senegal (Casamance)	Low	Low	Yes	—

Numbered analysis questions

1. **Trend.** Looking at Table 2, how do Brier scores vary across groups, and what does the narrowing

gap between superforecasters and prediction markets suggest about the *source* of forecasting skill — individual cognition, aggregation, or incentives?

2. **Level of analysis.** Table 1 shows ICEWS operating at country-day resolution and ACLED at sub-national actor level. At which level of analysis (individual, state, systemic, transnational) does each dataset primarily operate, and what causal claims can each legitimately support? Which level is systematically under-represented in all three?

3. **Perspective reconstruction (all five).** How would each of the five perspectives — African, Chinese, Russian, Western, UN — read the GJP result that trained amateurs outperformed intelligence analysts? What does each perspective credit, and what does each occlude?

4. **Interpretation.** Table 3 shows an under-prediction in Burkina Faso driven by a coup. What does this imply about the limits of trend-extrapolation models, the role of political shocks, and the difference between forecasting conflict *levels* and forecasting conflict *transitions*?

5. **Limitation.** What are the most serious limitations of using GDELT and ICEWS for African conflict early warning, and how do these limitations connect to the *politics of prediction* — who gets to define what counts as an "event," whose media counts as data, and whose suffering becomes visible?

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — "Bayesian Belief-Revision Funnel"

What to draw: A left-to-right flow diagram on a single page. On the far left, draw a wide, low bell curve labeled "Prior" with a vertical dashed line at its mean and a shaded band for the 90% credible interval. An arrow labeled "Bayes' rule: P(H|D) □ P(D|H)·P(H)" points rightward to a middle panel showing three data points (dots) labeled "Likelihood (new evidence)" with a small likelihood curve beneath them. A second arrow points to the far right, where a narrower, taller bell curve labeled "Posterior" sits, its mean shifted toward the data and its credible interval visibly tighter. Below the posterior, draw a small feedback loop arrow returning to "Prior for next round," labeled "iterative updating."

How to label it: Title at top: "Bayesian Updating as Discipline of Belief Revision." Label each curve's mean (μ□, μ□) and standard deviation (σ□, σ□). Add a small box: "Brier score penalizes overconfidence: a 90% claim that fails scores 0.81."

Perspective overlay to annotate: Along the bottom, five small flags/icons with one-line annotations: African — "priors often come from local, non-quantified knowledge that the formal model cannot ingest"; Chinese — "state intelligence supplies the prior; updating is politically gated"; Russian — "strategic-culture priors are treated as fixed, not revisable"; Western — "base-rate priors from historical frequency; the default in GJP training"; UN — "consensus priors from multilateral assessments; slow to revise."

Visual 2 — "Forecasting Pipeline with Perspective Lenses"

What to draw: A horizontal pipeline of five connected boxes, left to right: (1) "Data ingestion (ICEWS/ACLED/GDELT)," (2) "Model / algorithm," (3) "Expert elicitation (Delphi)," (4) "Scenario planning (Schwartz)," (5) "Decision / policy." Above the pipeline, draw a "lens" icon (a magnifying glass) over each box with a perspective label: Box 1 lens "Western media bias"; Box 2 lens "quantitative reductionism"; Box 3 lens "who counts as expert?"; Box 4 lens "whose futures are imaginable?"; Box 5 lens

"whose interests decide?" Below the pipeline, draw a feedback arrow from Box 5 back to Box 1 labeled "outcome data → model retraining."

How to label it: Title: "Where Perspective Enters the Forecasting Pipeline." Label each box with its key method (e.g., Box 3 "Delphi: anonymous rounds, controlled feedback"). Add a legend: solid arrow = information flow; dashed arrow = feedback.

Perspective overlay to annotate: To the right of the pipeline, a vertical column of five perspective tags, each with a one-line verdict on the whole pipeline: African — "the pipeline predicts African futures using African data filtered through non-African frames"; Chinese — "the pipeline is a tool; the state decides which outputs matter"; Russian — "the pipeline is Western epistemology wearing technical clothing"; Western — "the pipeline is self-correcting through scoring"; UN — "the pipeline feeds prevention frameworks but rarely triggers action."

Visual 3 — "Calibration Plot: Superforecasters vs. Novices"

What to draw: A standard square plot. X-axis: "Predicted probability" (0.0 to 1.0). Y-axis: "Observed frequency" (0.0 to 1.0). Draw the 45-degree diagonal line labeled "Perfect calibration." Draw two curves: (a) a solid line hugging the diagonal, labeled "Superforecasters (GJP top 2%)"; (b) an S-shaped dashed line that is below the diagonal at low probabilities and above at high probabilities, labeled "Novices (overconfident extremes)." Shade the area between the novice curve and the diagonal in light red, labeled "calibration error (Brier-relevant)." Add horizontal gridlines at 0.25, 0.5, 0.75.

How to label it: Title: "Calibration as the Core Skill." Annotate two points: at predicted 0.9, novice observed ~0.65 ("overconfidence"); at predicted 0.1, novice observed ~0.25 ("underconfidence at low end"). Add a small inset box: "Brier score = mean squared error of probability forecasts; 0 = perfect, 1 = worst."

Perspective overlay to annotate: Below the plot, five short annotations: African — "calibration to whose base rates?"; Chinese — "calibration is technical; strategic judgment is separate"; Russian — "calibration assumes stable referents; geopolitics is not stationary"; Western — "calibration is the measurable core of forecasting skill"; UN — "calibration of early-warning thresholds determines when prevention triggers."

SECTION 4 — CORNELL NOTES

Cue (question / prompt)	Notes (with source log)
What is a Brier score and why does it matter?	Mean squared error of probability forecasts; ranges 0 (perfect) to 1 (worst); Brier (1950). Rewards both accuracy and calibration; used in GJP scoring.
How does the Delphi method work?	Anonymous expert rounds with controlled feedback; Dalkey & Helmer (1963). Strengths: reduces groupthink, surfaces dissent. Weaknesses: slow, expert selection bias, false consensus.
What is scenario planning (Schwartz)?	Royal Dutch Shell method; Schwartz (1991). Builds 2–4 plausible futures from key uncertainties; not prediction but preparation. Strength: handles deep uncertainty.

Cue (question / prompt)	Notes (with source log)
What did the GJP teach us?	Tetlock & Gardner (2015); Mellers et al. (2014). Trained amateurs + teaming + feedback outperformed intelligence analysts; superforecasters ~top 2%; skill is partly trainable.
What are ICEWS/ACLED/GDELT?	ICEWS documentation; Raleigh et al. (2010) ACLED; Leetaru & Schrodt (2013) GDELT. Automated/semi-automated event data; different resolutions and biases.
What is Bayesian updating in forecasting?	Bayes' rule; priors + likelihoods → posteriors. Discipline of belief revision; combats confirmation bias. Requires quantified priors, often unavailable.
What is calibration?	Alignment of stated probabilities with observed frequencies. Core skill in GJP; measured by Brier score and calibration plots.
What is the African perspective on forecasting?	Early warning systems (CEWARN, AU CEWS, ECOWARN); politics of prediction; African scholarship (Grovogui, Mbembe, Bayart, Mamdani, Rodney, Fanon, Aning, Tamale, Oyěwùmí).
What is the Chinese "scientific decision-making" framing?	Forecasting as state capacity; strategic forecasting (zhanlue yuce); data-driven governance; occludes dissenting scenarios.
What is the Russian strategic-culture critique?	Forecasting as Western epistemology; emphasis on will, deception, non-stationarity; skepticism of probabilistic claims.
What is the Western intelligence-failure self-critique?	Post-Iraq WMD; Tetlock (2005) expert overconfidence; GJP as reform; calibration and scoring as accountability.
What is the UN early-warning/prevention framework?	Framework of Analysis for Atrocity Crimes; CEWS; "never again" gap between warning and action; political constraints on response.

Source log: Tetlock & Gardner (2015); Schwartz (1991); Brier (1950); Dalkey & Helmer (1963); Mellers et al. (2014); Tetlock (2005); ICEWS documentation; Raleigh et al. (2010); Leetaru & Schrodt (2013); Kuhn (2020); Grovogui (2006); Mbembe (2001); Bayart (2009); Mamdani (1996); Rodney (1972); Fanon (1961); Tamale (2020); Oyěwùmí (1997).

Summary: Geopolitical forecasting is not a single method but a family of approaches — scenario planning, Delphi elicitation, Bayesian updating, quantitative event modeling, and scored calibration — each with distinct scope conditions and failure modes. The Good Judgment Project demonstrated that disciplined, feedback-driven amateurs can outperform intelligence professionals, but this result is bounded by question selection, base-rate availability, and the politics of whose data counts. From an African vantage point, the deeper issue is not method but the politics of prediction: early-warning systems exist, but warning rarely converts to prevention, and the data infrastructures that feed global models systematically under-represent

African realities. Chinese, Russian, Western, and UN perspectives each add a lens — state capacity, strategic-culture skepticism, self-correcting empiricism, and prevention frameworks — while each also occludes something the others see.

SECTION 5 — FEYNMAN COMPRESSION

Step 1 — Explain without jargon. Geopolitical forecasting is the attempt to say what is likely to happen in world politics before it happens. People do this in several ways: by imagining a few different futures and preparing for each (scenario planning); by asking experts privately and combining their answers (Delphi); by starting with a guess and changing it when new evidence arrives (Bayesian updating); by feeding news into computer models that count events (ICEWS, ACLED, GDELT); and by keeping score on predictions so that overconfident people are exposed (Brier scores, superforecasters). The big lesson from the Good Judgment Project is that ordinary people who are trained to think in probabilities, who update their beliefs, and who work in teams can beat intelligence professionals — but only on questions where good data exists and where the future resembles the past enough to learn from.

Step 2 — Mark gaps. I am unsure how much of the superforecaster advantage comes from selection (they were already good) versus training (they became good). I am unsure whether Bayesian updating works when priors cannot be quantified, which is common in geopolitics. I am unsure whether ACLED's expansion from Africa to global coverage preserved its original coding reliability. I am unsure how to weigh the Russian claim that probabilistic forecasting is epistemologically inappropriate for strategic interaction. I am unsure whether the UN's early-warning frameworks have ever actually prevented a conflict, or only documented failures.

Step 3 — Reread verification. Rechecking against Tetlock & Gardner (2015): the superforecaster advantage is attributed to both selection and training, with teaming and feedback as key mechanisms — so my gap on selection-vs-training is partially closed: it is both. Rechecking Brier (1950): the score is mean squared error of probability forecasts — confirmed. Rechecking Schwartz (1991): scenario planning is explicitly not prediction but preparation for multiple futures — confirmed. Rechecking ICEWS documentation: country-day resolution with automated coding — confirmed. Rechecking Mellers et al. (2014): psychological strategies (growth mindset, fox-like thinking) identified — confirmed. The gap on ACLED global expansion reliability remains open; I flag it as unresolved.

Step 4 — Analogy with explicit limits. Forecasting is like weather forecasting: you use models, update with new data, and score your predictions. The analogy helps because both involve probability, base rates, and calibration. The analogy breaks down because weather systems are governed by known physics and stationary distributions, whereas geopolitical events involve strategic actors who react to forecasts, non-stationary institutions, and data generated by media systems with their own biases. A weather model does not change the weather; a published geopolitical forecast can change the politics.

Step 5 — Rewrite. Geopolitical forecasting is a set of disciplined methods for reasoning under uncertainty — scenario planning for deep uncertainty, Delphi for expert aggregation, Bayesian updating for belief revision, quantitative event data for pattern detection, and scoring for accountability. The Good Judgment Project showed that skill is partly trainable and that amateurs can outperform professionals on well-structured questions, but the result does not generalize to all geopolitical questions, especially those involving strategic interaction, data-poor regions, or non-stationary institutions. From an African perspective, the central problem

is not the absence of methods but the politics of prediction: early-warning systems exist, yet warning rarely triggers prevention, and the data that feeds global models systematically under-represents African realities. Chinese, Russian, Western, and UN perspectives each illuminate a different failure mode — state capture of forecasts, epistemological skepticism, overconfidence in quantification, and the gap between warning and action — and no single perspective is sufficient.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L58	definition	What is scenario planning?	Scenario planning constructs several plausible futures to stress-test decisions rather than betting on one prediction; Schwartz's Shell method distinguishes predetermined elements from critical uncertainties and builds 2x2 scenario matrices. It is a tool for robustness, not accuracy.	African early-warning practice often prefers scenario pluralism because single-point forecasts have historically served external actors' interests.
L58	mechanism	How does the Royal Dutch Shell scenario method work?	Analysts map driving forces, identify two critical uncertainties, cross them into four scenarios, and test strategic options against each; the value lies in revealing vulnerabilities, not in picking the "right" future.	Chinese strategic-planning documents similarly use scenario matrices but embed them in five-year plan contingencies.

Tag	Card Type	Front	Back	Perspective Note
L58	definition	What is the Delphi method?	The Delphi method elicits expert judgments through anonymous, iterated rounds with controlled feedback, aiming to reduce groupthink and converge on a consensus estimate without face-to-face dominance.	Russian expert councils (e.g., Valdai) use Delphi-like elicitation but with less anonymity and more state framing.
L58	mechanism	What are the strengths and weaknesses of Delphi?	Strengths: anonymity reduces conformity, iteration refines estimates, and aggregation beats individual experts; weaknesses: convergence can be false consensus, experts share blind spots, and the method cannot generate information not already in the panel.	Western intelligence has used Delphi variants for long-range estimates; African panels note the exclusion of local knowledge holders.

Tag	Card Type	Front	Back	Perspective Note
L58	definition	What is Bayesian updating?	Bayesian updating revises a prior probability with new evidence via Bayes' theorem to produce a posterior; the discipline is to make priors explicit and to update by the likelihood, not by narrative.	UN early-warning frameworks increasingly require explicit priors in risk assessments.
L58	mechanism	State Bayes' theorem in words.	Posterior odds equal prior odds times the likelihood ratio; a forecast changes only as much as the evidence warrants, and strong priors require strong evidence to move.	African conflict analysts stress that priors built on colonial data distort posteriors.
L58	definition	What is a Brier score?	The Brier score measures the mean squared difference between a probabilistic forecast and the binary outcome; lower is better, and it decomposes into calibration, resolution, and uncertainty.	Scoring rules discipline overconfident Western analysts; African forecasters argue scores ignore distributional harm.

Tag	Card Type	Front	Back	Perspective Note
L58	application	What is ICEWS?	ICEWS (Integrated Crisis Early Warning System) is a US-funded quantitative conflict-forecasting system using event data and machine learning to predict political instability and conflict onset.	ICEWS has been criticized for weak performance on African conflicts and for opacity to local users.
L58	application	What is ACLED?	ACLED (Armed Conflict Location & Event Data) records political violence events with location, actors, and fatalities; it is a foundational input for both research and operational forecasting.	ACLED's African origins and local coder networks make it a model of situated data collection.
L58	application	What is GDELT?	GDELT monitors global news in near real time and codes events, actors, and tone; it enables high-frequency conflict indicators but carries media-bias and coverage gaps.	GDELT underrepresents African-language and rural events, skewing forecasts.

Tag	Card Type	Front	Back	Perspective Note
L58	comparison	Superforecasters vs. domain experts: who wins?	Tetlock's Good Judgment Project found that trained generalists with high cognitive reflection and active open-mindedness outperformed experts and intelligence analysts on geopolitical questions.	African scholars caution that "superforecaster" traits may reflect Western educational norms.
L58	source	What did Tetlock and Gardner (2015) establish?	Tetlock and Gardner (2015) showed that forecasting is a skill improvable through training, feedback, and aggregation, and that expert political judgment is often no better than chance.	The book's tournament setting was US-centric; its lessons need adaptation to African contexts.
L58	debate	Calibration vs. resolution: which matters more?	Calibration (matching stated probabilities to outcomes) and resolution (discriminating events from non-events) trade off; a good forecaster needs both, and scoring rules reward the combination.	UN prevention frameworks weight calibration for accountability; African communities weight resolution for early action.

Tag	Card Type	Front	Back	Perspective Note
L58	reconstruction	How do African early-warning systems frame prediction?	African early-warning systems (CEWARN, ECOWARN, MARAC) frame prediction as a political process tied to response capacity, not as a technical exercise; the bottleneck is often political will, not information.	This perspective reveals that forecasting without response architecture is performative.
L58	occlusion	What do quantitative models typically occlude?	Quantitative models occlude local causal mechanisms, informal institutions, and the agency of non-state actors; they excel at pattern detection but struggle with structural breaks and novel events.	This occlusion is most severe in African contexts where informal governance dominates.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence Audit (score 0–100)

Concept / Claim	My confidence (0–100)	Evidence I can cite	Key gap
I can explain Bayes' theorem in words			
I can compute a Brier score from a forecast-outcome pair			
I know the difference between calibration and resolution			

Concept / Claim	My confidence (0–100)	Evidence I can cite	Key gap
I can describe the Shell scenario method's two uncertainties			
I can state what ICEWS predicts and its known limits			
I can reconstruct the African early-warning critique			
I can explain why superforecasters outperform experts			
I can identify three failure modes of Delphi			
I can apply Bayesian updating to a geopolitical case			
I can distinguish description, explanation, prediction, prescription			

7.2 Three-Question Debrief

1. Which forecasting method did I most overestimate in confidence, and what evidence would lower it?
2. Where did my prior on the 2022 Russian invasion sit, and did I update fast enough when evidence accumulated?
3. What would have to be true for quantitative conflict models to outperform human judgment in African contexts?

7.3 Error-Log

Common Misconception	Correction	Evidence
Forecasting means predicting a single outcome.	Forecasting produces probability distributions over scenarios; single-point predictions are a misuse.	Tetlock and Gardner (2015); Schwartz (1991)
Experts are always better than generalists.	Trained generalists with feedback often outperform domain experts on geopolitical questions.	Good Judgment Project results

Common Misconception	Correction	Evidence
More data always improves forecasts.	Data without causal structure or local validity can amplify bias; GDELT/ICEWS have known coverage gaps.	ICEWS documentation; ACLED critiques
Bayesian updating is just "changing your mind."	It requires explicit priors and likelihoods; informal updating often double-counts evidence.	Standard Bayesian pedagogy
High Brier score means good forecasting.	Lower Brier score is better; and scores must be decomposed into calibration and resolution.	Brier (1950)
Quantitative models are objective.	Models encode training-data biases and designer choices; objectivity claims occlude politics.	African critical scholarship
Delphi always reaches true consensus.	Delphi can produce false consensus when experts share blind spots or anchoring.	Delphi method literature
Early warning equals prevention.	Warning without response capacity is performative; the bottleneck is political will.	African early-warning scholarship

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Scenario planning; Delphi; Bayesian updating; quantitative conflict modeling; calibration/scoring	Driving-force mapping; iterated anonymous elicitation; prior→likelihood→posterior; event-data ML; Brier decomposition	Schwartz (1991); Dalkey & Helmer (Delphi); Bayes; ICEWS; Tetlock and Gardner (2015); Brier (1950)	Shell scenarios; GJP 2011–2015; ICEWS/ACLED/GDELT; 2022 invasion forecasts	Experts vs. generalists; calibration vs. resolution; objectivity of models; early warning vs. prevention	A model that cannot be scored; a forecast with no prior; a scenario with no response plan	L3 causal inference; L4 epistemology; L14 transition; L59 negotiation; L60–61 capstones

SECTION 9 — REVIEW SCHEDULE

- **R1 (Day 1, 30 min):** Re-read Section 2.2–2.6 bolded causal claims; recite Bayes' theorem in words; compute one Brier score by hand.

- **R2 (Day 3, 45 min):** Reconstruct the five perspectives on forecasting from memory; check against Section 2.7; note one gap in the error log.
- **R3 (Day 7, 60 min):** Re-work the Problem Pair (2022 invasion) without notes; compare to model answer; identify where your prior sat.
- **R4 (Day 14, 45 min):** Re-attempt the Hinge Question and two flashcards of each type; score yourself; update confidence audit.
- **R5 (Day 30, 90 min):** Write a one-page memo applying one method to a new case; include falsifiers and perspective reconstruction; self-check description/explanation/prediction/prescription.

SECTION 10 — COMPLETION CHECKLIST

☐ I can define scenario planning and the Shell method.
☐ I can run a Delphi round mentally (anonymous, iterated, feedback).
☐ I can state and apply Bayes' theorem in words.
☐ I can compute and interpret a Brier score.
☐ I can distinguish calibration from resolution.
☐ I can describe ICEWS, ACLED, and GDELT and their limits.
☐ I can explain why superforecasters outperform experts.
☐ I can reconstruct the African early-warning critique.
☐ I can reconstruct the Chinese, Russian, Western, and UN perspectives.
☐ I can complete the comparison matrix from memory.
☐ I can work the Good Judgment Project case at four levels of analysis.
☐ I can analyze the 2022 invasion forecasting problem pair.
☐ I can draft an independent memo with the four required headings.
☐ I can answer the hinge question and diagnose distractors.
☐ I can read ICEWS/GDELT/ACLED extracts and note limitations.
☐ I have filled in the confidence audit honestly.
☐ I have logged at least three errors in the error log.
☐ I can distinguish description, explanation, prediction, and prescription.

60. Diplomatic Statecraft and Negotiation Theory

LESSON METADATA

Field	Value
Lesson number and title	Lesson 59 — Diplomatic Statecraft and Negotiation Theory
Module	Module 10: Forecasting, Diplomacy, and Capstones
Prerequisites	L20 (strategic thought), L3 (causal inference), L58 (forecasting)
Interleaved links	Forward to L60–L61 (capstones)
Reading load	7-9 hours
Content channels	Text, worked example, problem pair, independent memo, data lab, visuals, Cornell notes, flashcards, cheatsheet, review schedule
Bloom ceiling	Create — design and defend a negotiation strategy and falsifiable assessment
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

Diplomacy is often mistaken for the art of saying agreeable things in formal rooms. The central puzzle of this lesson is more demanding: why do some negotiations produce durable settlements while others collapse even when the parties appear to share a zone of possible agreement, and how can theory specify the difference without pretending that human conflict is merely a math problem? Negotiation is not communication layered on top of power; it is a structured process through which actors convert latent power, information, domestic constraints, and normative claims into commitments that may or may not survive contact with implementation. The 2015 Joint Comprehensive Plan of Action (JCPOA) and the 2023 China-brokered Saudi-Iran rapprochement illustrate the puzzle from opposite directions. The JCPOA was a highly technical, multilateral bargain that temporarily constrained Iran's nuclear program but remained fragile because its survival depended on domestic ratification politics, verification credibility, and the willingness of a later U.S. administration to remain bound. The Saudi-Iran rapprochement was a narrower, externally brokered de-escalation whose durability depends on whether Riyadh and Tehran can convert a diplomatic announcement into reciprocal restraint across Yemen, Lebanon, Iraq, and maritime security. Both cases show that agreement signatures are not endpoints; they are hypotheses about future behavior under uncertainty.

This lesson sits at the point in the curriculum where strategic thought, causal inference, and forecasting must be combined rather than treated separately. Lesson 20 supplied the logic of commitment, deterrence, compellence, and focal points; Lesson 3 supplied the discipline of distinguishing correlation from causation, identifying mechanisms, and specifying falsifiers; Lesson 58 supplied the humility of probabilistic judgment and the recognition that forecasts are only as good as their calibration and their treatment of un-

certainty. Diplomatic statecraft requires all three. A negotiator must think strategically about what the other side can credibly promise, infer causally whether a concession caused a response or merely coincided with it, and forecast whether an agreement will hold under shocks that have not yet occurred. The lesson therefore trains the student to move among levels of analysis—individual negotiators, state institutions, systemic power distributions, and transnational networks—without losing the thread of mechanism. It also prepares the capstone lessons by requiring the student to integrate theory, evidence, and perspective into a single defensible judgment.

The theoretical lineage is deliberately plural. Fisher and Ury's (1981) interest-based negotiation and Raiffa's (1982) analytic bargaining tradition teach the student to separate positions from interests and to search for joint gains, but they also risk overestimating the availability of integrative solutions when power is highly asymmetric. Nash equilibrium and Rubinstein bargaining formalize the intuition that agreement terms depend on discount rates, patience, and outside options, yet their elegance can obscure the fact that real diplomats bargain under incomplete information, shifting mandates, and domestic audiences. Zartman's (2001) ripeness theory explains why mediation often succeeds only when parties perceive a mutually hurting stalemate and a way out, but it can be misread as a license to wait for pain rather than to create conditions for settlement. Putnam's (1988) two-level game shows that international agreement is constrained by domestic ratification, while audience-cost theory explains why public commitments can strengthen credibility and also trap leaders. The UN mediation guidance and Lakhdar Brahimi's reports add a practitioner's emphasis on legitimacy, sequencing, and the political management of spoilers. The student must learn not only the theories but their scope conditions: bargaining models work best when preferences are stable and enforcement is credible; ripeness works best when parties are rational and mutually aware; two-level games work best when domestic institutions are transparent enough to generate observable constraints.

A central claim of the lesson is that negotiation theory is most useful when it is treated as a set of conditional mechanisms rather than as a universal recipe. Bargaining theory explains how value is divided when the parties know their alternatives; it does not by itself explain why actors sometimes prefer no agreement to a materially superior deal because of identity, historical grievance, or domestic symbolism. Integrative bargaining explains value creation but cannot assume that parties trust each other enough to reveal private information. Mediation explains third-party facilitation but cannot assume that mediators are neutral, powerful, or welcome. Track II and Track III diplomacy explains how informal channels can prepare official negotiations, but it cannot assume that civil-society actors represent states or that unofficial ideas survive bureaucratic translation. Two-level games explain ratification constraints but cannot assume that domestic audiences are informed, coherent, or decisive. The lesson's African, Chinese, Russian, Western, and UN perspectives are therefore not decorative additions; they are alternative ways of specifying which mechanisms matter most in a given case. The African vantage point is primary because it foregrounds legitimacy, hybrid authority, and the limits of externally imposed templates; it asks whether an agreement is owned by those who must live with it, not merely signed by those who can sign it.

By the end of the lesson, the student should be able to perform several distinct intellectual operations. First, reconstruct a negotiation as a causal argument with independent variables, mechanisms, scope conditions, and observable implications. Second, identify the BATNA, ZOPA, and commitment problems in a case without confusing analytical convenience with empirical reality. Third, compare mediator strategies—facilitation, formulation, manipulation, and coercion—according to the mediator's resources and the parties' ripeness. Fourth, analyze two-level games by mapping international proposals onto domestic veto players, audience costs, and ratification thresholds. Fifth, produce a short memo that distinguishes description, explanation, prediction, and prescription, and that includes explicit falsifiers. The data lab will require the student to

interpret negotiation-outcome and mediator-success data while recognizing selection effects: we observe negotiations that occurred, not all conflicts that might have been negotiated, and mediator success is often endogenous to the ripeness that made mediation possible in the first place. The worked example and problem pair will force the student to apply these tools to cases with incomplete information, competing narratives, and no clean experimental counterfactual.

The lesson also insists on methodological humility. Negotiation datasets can show patterns—mediated conflicts sometimes settle more often than unmediated ones, or two-level constraints sometimes predict ratification failure—but such patterns do not automatically identify causal effects. Parties choose whether to negotiate, mediators choose whether to intervene, and outcomes are shaped by unobserved resolve. Case studies can recover mechanisms but risk hindsight bias; formal models can clarify logic but risk assuming away politics. The strongest student work will therefore pair theoretical claims with explicit falsifiers: if a proposed mechanism is correct, what evidence would contradict it? If a mediator's credibility mattered, what would we expect to see in the parties' private communications, public statements, and subsequent compliance? If audience costs drove a leader's rigidity, what would we expect under low-salience versus high-salience domestic conditions? This discipline is what separates diplomatic analysis from diplomatic storytelling. The lesson's final message is that statecraft is neither pure art nor pure science; it is the disciplined use of theory to make better judgments under uncertainty, while remaining accountable to evidence, perspective, and the possibility of being wrong.

SECTION 1 — Pre-Class Priming

1.1 Retrieval warm-up

1. From Lesson 20, distinguish deterrence from compellence and identify one scope condition under which each is more likely to fail.
2. From Lesson 3, what is the difference between an identification strategy and a robustness check, and why does the distinction matter in case-study research?
3. From Lesson 58, define a proper scoring rule and explain why the Brier score rewards both calibration and resolution.
4. From Lesson 20, how does a Schelling focal point solve a coordination problem without requiring communication or enforcement?
5. From Lesson 3, why does selection bias threaten causal inference when researchers study only negotiations that actually occurred?
6. From Lesson 58, distinguish aleatory uncertainty from epistemic uncertainty and give one implication for how a forecaster should update beliefs.

1.2 Orientation questions

1. Under what conditions can a zone of possible agreement exist while no agreement is reached, and which mechanism—information asymmetry, commitment problems, or domestic veto players—best explains the failure?
2. How can a mediator without coercive power alter the bargaining outcome, and what evidence would distinguish facilitation from manipulation?
3. What does Putnam's two-level game imply about the relationship between an international proposal's substantive content and its domestic ratification prospects?

4. How would an African, Chinese, Russian, Western, and UN analyst each explain the fragility of the JCPOA, and which explanation is most falsifiable?

1.3 Vocabulary pre-teach

- **BATNA (Best Alternative to a Negotiated Agreement):** The most advantageous course of action a party can take if negotiations fail; it sets the reservation value below which agreement is irrational, though in practice BATNAs may be uncertain, politically constructed, or endogenous to the negotiation itself.
- **ZOPA (Zone of Possible Agreement):** The range of outcomes that both parties prefer to their respective BATNAs; its existence is necessary but not sufficient for agreement because information, trust, and commitment problems may prevent discovery or exploitation.
- **Distributive bargaining:** Negotiation over the division of a fixed or perceived fixed value, where one party's gain is another's loss; it emphasizes claiming tactics, reservation points, and power asymmetries.
- **Integrative bargaining:** Negotiation that seeks to expand the total value available by identifying compatible interests, trade-offs across issues, and creative options; it depends on information sharing and some minimum of trust.
- **Ripeness:** Zartman's concept that mediation is more likely to succeed when parties perceive a mutually hurting stalemate and a viable way out; ripeness is a condition, not a guarantee, and may be constructed by mediators rather than merely observed.
- **Mediator credibility:** The parties' belief that a third party can deliver benefits, impose costs, protect confidentiality, and remain sufficiently neutral or predictable; credibility is relational and may rest on resources, reputation, or institutional backing.
- **Track II diplomacy:** Unofficial dialogue among non-governmental actors, experts, or former officials that can generate ideas, build trust, and prepare official negotiations without binding governments.
- **Track III diplomacy:** Grassroots or civil-society engagement that addresses societal reconciliation, identity, and local grievances; it operates below elite politics and may shape the legitimacy of any eventual settlement.
- **Two-level game:** Putnam's framework in which leaders negotiate internationally while simultaneously managing domestic ratification; international agreements must survive both tables, and domestic constraints can be used strategically as bargaining leverage.
- **Audience costs:** The domestic political penalties a leader may incur for making and then retreating from public international commitments; they can enhance credibility but may also reduce flexibility and encourage brinkmanship.
- **Credible commitment:** A promise or arrangement that a party has both the incentive and the capacity to honor over time; credibility problems arise when future incentives diverge from present promises.
- **Good offices:** A mediator's provision of communication channels, procedural support, or legitimacy without necessarily proposing substantive terms; it is often the lightest form of third-party involvement and depends on consent.

SECTION 2 — LESSON CORE

2.1 Learning objectives

After mastering this lesson, the student will be able to:

1. **Define** and **explain** the core formal concepts of bargaining theory — Nash equilibrium, Rubinstein's alternating-offers model, BATNA, and ZOPA — and derive the relationship between a party's outside option and its reservation value in a two-party negotiation under complete information, including the role of time preference and discounting. (Bloom: Remember/Understand)
2. **Analyze** a real-world negotiation by decomposing it into its distributive and integrative components, identifying the surplus to be divided, the parties' reservation values, the zone of possible agreement, and the structural features — information asymmetry, issue linkage, and commitment problems — that determine whether value is created or merely claimed. (Bloom: Analyze)
3. **Evaluate** the applicability of ripeness theory, mediation theory, and two-level game theory to a given negotiation, specifying the scope conditions under which each theory generates accurate predictions and the observable evidence that would falsify its claims. (Bloom: Evaluate)
4. **Compare** the five major perspectives on diplomatic statecraft — African, Chinese, Russian, Western, and UN — by identifying what each contributes to the understanding of a negotiation and what each systematically occludes, using the JCPOA and the Saudi-Iran rapprochement as test cases. (Bloom: Compare/Analyze)
5. **Construct** an original, evidence-based assessment of a negotiation's fragility and durability that distinguishes description from explanation, prediction from prescription, and specifies the falsifiers that would cause the assessment to be revised. (Bloom: Create/Evaluate)

2.2 KEY IDEA 1 — Bargaining Theory: Nash Equilibrium, Rubinstein Bargaining, BATNA, ZOPA, and the Negotiation Framework

Bolded Causal Claim: The outcome of a bilateral negotiation is determined not by the parties' preferences alone but by the interaction of their reservation values, their bargaining power as shaped by outside options, and the strategic structure of offers and counteroffers; under complete information and rationality, the Rubinstein alternating-offers model predicts a unique subgame-perfect equilibrium whose division of surplus reflects the parties' relative patience, while the Nash bargaining solution provides the axiomatic benchmark against which any negotiated outcome can be evaluated for efficiency and fairness.

Mechanism: Bargaining theory treats negotiation as a strategic interaction in which two or more parties with conflicting interests must reach a mutually acceptable agreement or face the consequences of disagreement. The foundational contribution is John Nash's 1950 axiomatic solution: given a set of feasible utility pairs and a disagreement point, the Nash bargaining solution selects the outcome that maximizes the product of the parties' gains over their disagreement payoffs, subject to four axioms — Pareto efficiency, symmetry, invariance to affine transformations, and independence of irrelevant alternatives. The disagreement point is the payoff each party receives if no agreement is reached; in practice this is operationalized as the BATNA, the Best Alternative to a Negotiated Agreement, a concept popularized by Fisher and Ury (1981). The BATNA is not merely a fallback; it is the anchor that sets the reservation value, the minimum acceptable deal. A party with a strong BATNA can credibly threaten to walk away, shifting the ZOPA — the Zone of

Possible Agreement, the set of deals that both parties prefer to their reservation values — in its favor. The Rubinstein (1982) alternating-offers model supplies the strategic micro-foundation. Two players take turns making offers; the first to accept wins. With common knowledge of rationality, complete information, and time preferences captured by discount factors, there is a unique subgame-perfect equilibrium: the first mover proposes a split, and the second accepts if the offer meets or exceeds their discounted continuation value. The equilibrium split depends on the ratio of discount factors, so that a more patient party captures a larger share. This is the mechanism by which time preference translates into bargaining power. Raiffa (1982) extended this to prescriptive analysis, emphasizing that negotiators should compute their reservation price, estimate the opponent's, and search for trades that expand the pie. The negotiation framework synthesizes these elements: identify interests rather than positions; determine BATNAs; map the ZOPA; explore integrative potential; and decide on commitment tactics. The framework is simultaneously descriptive of how rational actors bargain and prescriptive of how practitioners should prepare.

Scope Conditions: The formal models assume complete information, rationality, no commitment problems, and a single issue or well-defined issue space. They perform best when parties have clear, stable preferences, when agreements are enforceable, and when the negotiation is bilateral. They perform poorly when information is asymmetric, when there are multiple issues with complex linkages, when domestic audiences constrain negotiators (as in Putnam's two-level games), when emotions and identity are salient, and when the "agreement" is not a contract but a political understanding. The Rubinstein model's prediction of a unique equilibrium depends on common knowledge of rationality; in practice, negotiators may not know each other's discount rates or may misestimate BATNAs. The Nash solution's independence-of-irrelevant-alternatives axiom is particularly fragile: adding or removing options can change the predicted outcome in ways that seem counterintuitive. Moreover, the models treat the disagreement point as exogenous, whereas in many real negotiations the outside option is itself constructed or manipulated during the bargaining process.

Observable Implications: If bargaining theory holds, we should observe: (a) parties with stronger BATNAs achieving better outcomes; (b) more patient parties capturing larger shares; (c) negotiations failing when ZOPAs are empty, that is, when reservation values do not overlap; (d) the first-mover advantage in Rubinstein settings being modest and declining with patience asymmetry. Falsifiers include cases where a party with a weaker BATNA achieves a better outcome, suggesting non-material factors such as legitimacy or framing; cases where negotiations succeed despite apparent empty ZOPAs, suggesting hidden issue linkage or changed preferences; and cases where the division of surplus bears no relationship to relative patience, suggesting that other sources of power dominate.

Perspective Note (five traditions in brief):

African (primary): African diplomatic practice has long recognized the centrality of the disagreement point but locates it not in individual utility but in communal welfare and the restoration of social harmony. Traditional conflict-resolution mechanisms — such as the Gacaca in Rwanda, the Mato Oput in Acholi, or the palaver in West Africa — operate with implicit reservation values defined by communal obligations rather than individual BATNAs. The African perspective, as articulated by scholars such as Grovogui and Mbembe, treats bargaining theory's individualistic rationality as a culturally specific ontology that misreads negotiations where the "party" is a lineage, a chiefdom, or a nation whose internal consensus must be forged before external bargaining. The ZOPA, on this view, is not a fixed interval but a socially constructed space that expands or contracts with ritual, elder mediation, and the redefinition of what counts as a legitimate claim. African scholars such as Aning and Danso have noted that AU mediation often succeeds precisely where formal bargaining models predict failure, because the mediator redefines the disagreement point by reframe-

ing the conflict as a shared problem rather than a zero-sum division. The African vantage thus reveals that BATNA-based power is not the only source of leverage; legitimacy, moral authority, and the capacity to reconstitute the community can be equally decisive. This perspective is the longest and most developed here because it challenges the ontological foundations of the entire bargaining-theoretic enterprise, not merely its empirical predictions.

Chinese: Chinese diplomatic thought, drawing on Qin Yaqing's relational theory, treats bargaining not as a transaction between atomistic actors but as a process of relationship-building in which the outcome is inseparable from the ongoing relationship. The Nash solution's assumption of a fixed disagreement point is problematic because in relational diplomacy the disagreement point itself is negotiable and evolves. Chinese mediators often prioritize the establishment of trust and the creation of a community of shared future over the immediate division of surplus, implying that the ZOPA is endogenous to the relationship rather than exogenous. This perspective contributes the insight that patience is not merely a time preference but a strategic posture that signals commitment to the relationship; it occludes, however, the coercive dimensions of power that formal bargaining theory captures well.

Russian: Russian diplomatic practice, rooted in a realist tradition that emphasizes state sovereignty and great-power prerogatives, treats bargaining theory as a useful but subordinate tool. The Russian perspective stresses that the disagreement point in interstate negotiations is often determined by military capability and geopolitical position rather than by economic utility. Moscow's approach to negotiations reflects a view that the ZOPA is shaped by the balance of power and that the stronger party's BATNA includes the option of unilateral action. Russian practitioners tend to be skeptical of the integrative-bargaining optimism of Fisher and Ury, viewing it as a Western ideological construct that masks power asymmetries. This perspective contributes the insight that formal equality in negotiation often conceals substantive inequality; it occludes the possibility of genuine mutual gain and the role of non-state actors.

Western: The Western perspective is the home of bargaining theory itself. From Nash through Rubinstein to Fisher and Ury, the Western tradition has produced the most formally rigorous and prescriptively influential negotiation scholarship. Its strengths include analytical clarity, testable predictions, and a rich toolkit for practitioners. Its self-critique, articulated by scholars such as Zartman and by practitioners in the Harvard Negotiation Project, acknowledges that formal models assume too much rationality and too little culture, emotion, and power. The Western perspective's occlusion is its tendency to universalize a particular liberal, individualist, contractarian ontology of negotiation, treating interests as pre-given and preferences as stable, when in many contexts they are constructed through the negotiation itself.

UN: The UN perspective treats bargaining theory as an input to mediation practice rather than as a governing framework. The UN's mediation support apparatus draws on bargaining concepts but embeds them in a normative framework that prioritizes inclusivity, national ownership, and the sustainability of agreements. The UN view is that a negotiation's success cannot be measured solely by the efficiency of the deal but by its legitimacy and durability. The UN perspective contributes the institutional and normative scaffolding that formal theory lacks; it occludes the hard power realities that determine whether a ZOPA exists at all, sometimes leading to mediation efforts that are well-designed but structurally infeasible.

SECTION 2.3 KEY IDEA 2 — Integrative vs Distributive Bargaining: Value Creation and Value Claiming

Bolded Causal Claim: The distinction between integrative and distributive bargaining is not merely a tactical choice but a structural feature of the negotiation problem itself: when negotiators frame issues as fixed-pie distributive contests, they foreclose value-creating trades that would make both parties better off, and the failure to recognize integrative potential is the single most common and costly error in diplomatic negotiation.

Mechanism: The mechanism operates through three channels. First, cognitive framing: negotiators who approach a negotiation as a zero-sum contest over a single issue (typically territory, resources, or status) activate competitive schemas that suppress creative problem-solving. Walton and McKersie's (1965) foundational distinction between distributive and integrative bargaining identified this as the difference between "claiming value" and "creating value." In distributive bargaining, the parties' interests are directly opposed on a single dimension; one party's gain is the other's loss. The mechanism is positional: each side anchors on an extreme demand, makes concessions, and the outcome settles somewhere in the middle. In integrative bargaining, by contrast, the parties' interests are not perfectly opposed; they differ in priority, risk tolerance, or time preference, creating the possibility of trades that improve both sides' outcomes. The mechanism here is interest-based: negotiators identify underlying interests rather than stated positions, generate options for mutual gain, and use objective criteria to evaluate them (Fisher and Ury, 1981).

Second, the mechanism operates through information asymmetry and trust. Integrative bargaining requires parties to reveal information about their priorities and constraints—information that, in a distributive frame, would be exploited. The mechanism is a trust dilemma: revealing information enables value creation but also value claiming by the other side. Raiffa (1982) formalized this in his analysis of negotiation under uncertainty, showing that the optimal strategy depends on the probability that the other side will reciprocate with information rather than exploit it. Where trust is low, the rational strategy is to conceal, which forecloses integrative potential even when it exists.

Third, the mechanism operates through the structure of the negotiation agenda. Single-issue negotiations are inherently distributive; multi-issue negotiations create the possibility of logrolling—trading concessions on low-priority issues for gains on high-priority ones. The mechanism is combinatorial: the number of possible agreements grows exponentially with the number of issues, and the Pareto frontier—the set of agreements where neither side can be made better off without making the other worse off—expands. Lax and Sebenius (1986) emphasized that the "negotiator's dilemma" is that the very moves that create value (information sharing, joint problem-solving) are the same moves that expose the negotiator to value claiming. The resolution of this dilemma is not a single strategy but a sequential one: build trust through small integrative moves, then expand the scope of cooperation.

Scope Conditions: Integrative bargaining is possible when (a) the negotiation involves multiple issues or dimensions, (b) the parties have different priorities or risk preferences, (c) there is sufficient trust or institutional scaffolding to enable information sharing, and (d) the parties are not in a purely competitive relationship where one side's gain is necessarily the other's loss. It is most likely in negotiations over trade, environment, and regulatory issues where the parties have complex, multi-dimensional interests. It is least likely in negotiations over indivisible goods (territory, sovereignty, status) where the parties' interests are directly opposed and the issue cannot be divided or traded. Even in these cases, however, integrative potential may exist through side payments, timing arrangements, or linked issues—provided the parties can identify them. The scope condition is not the absence of conflict but the presence of differential valuation: the parties must value the issues differently enough that trades are possible.

Observable Implications: If integrative bargaining theory is correct, we should observe that (a) multi-issue negotiations produce more efficient (Pareto-superior) outcomes than single-issue negotiations; (b) negotiators who use interest-based framing achieve better joint outcomes than those who use positional framing; (c) the presence of a skilled mediator or facilitator increases the likelihood of integrative agreements; and (d) agreements reached through integrative bargaining are more durable because both parties perceive them as gains rather than concessions. Conversely, if distributive dynamics dominate, we should observe (a) outcomes clustering around the midpoint of initial positions, (b) high rates of impasse in single-issue negotiations, and (c) agreements that are technically efficient but politically fragile because one or both parties feel they conceded too much. The empirical record supports both patterns: Pruitt (1981) found that integrative agreements are more common when negotiators are instructed to seek mutual gain, while Raiffa (1982) documented cases where even sophisticated negotiators failed to identify integrative potential.

Perspective Note (five traditions in brief):

African: The African perspective on integrative bargaining is deeply rooted in indigenous conflict resolution traditions that predate Western negotiation theory. The concept of ubuntu—"I am because we are"—embeds a relational ontology in which the negotiator's identity is constituted through relationship rather than asserted against the other. Traditional African dispute resolution, as practiced in mechanisms such as the Gacaca courts in Rwanda, the Mato Oput process in northern Uganda, and various palaver traditions across West Africa, does not distinguish sharply between "creating value" and "claiming value" because the goal is not to maximize individual utility but to restore social harmony. The African vantage point reveals that Western integrative bargaining theory, for all its sophistication, remains individualist in its foundations: it assumes rational actors maximizing utility, whereas African traditions assume relational actors seeking reconciliation. This is not merely a cultural difference but an epistemological one: the African perspective asks whether the very concept of "value" as something to be created and claimed is appropriate in contexts where the goal is the restoration of relationship. The African perspective contributes the insight that the most durable agreements are those that repair social fabric, not just those that optimize joint gains. It occludes, however, the reality that in many African conflicts, the parties are not seeking reconciliation but survival, and that power asymmetries may make integrative bargaining a luxury that weaker parties cannot afford. African scholars such as Mamdani (1996) and Mbembe (2001) have emphasized that the post-colonial state's legitimacy crisis means that negotiation often occurs not between equals but between a state and its citizens, or between factions within a fractured polity, making the integrative/distributive distinction less applicable than in interstate bargaining. The African perspective thus contributes both a corrective to Western individualism and a reminder that the conditions for integrative bargaining—trust, multi-issue agendas, differential valuation—are not universally present.

Chinese: The Chinese perspective on integrative bargaining is shaped by the Confucian tradition of relational harmony and the concept of guanxi—networks of reciprocal obligation that create the trust necessary for information sharing. Chinese negotiation theory, as articulated by scholars such as Qin Yaqing (2018), emphasizes that integrative bargaining is not a technique but a relational achievement: value creation emerges from the cultivation of long-term relationships rather than from the application of analytical methods. The Chinese vantage point reveals that Western bargaining theory's focus on the single negotiation episode misses the temporal dimension: Chinese negotiators often sacrifice short-term gains to build relationships that yield integrative outcomes over time. The Chinese perspective contributes the insight that trust is not a precondition for integrative bargaining but its product, built through repeated interaction. It occludes, however, the coercive dimensions of Chinese negotiation practice, particularly in contexts where China's economic leverage creates asymmetries that make "integrative" outcomes functionally distributive.

Russian: The Russian perspective on integrative bargaining is skeptical, viewing the integrative/distributive distinction as a Western ideological construct that obscures the reality of power competition. Russian negotiation theory, rooted in the realist tradition of international relations, treats bargaining as a form of strategic interaction in which the goal is not mutual gain but relative advantage. The Russian vantage point reveals that integrative bargaining can be a mechanism for locking in asymmetric outcomes: the party with greater resources can afford to "create value" in ways that disproportionately benefit itself, while the weaker party's "gains" are illusory. The Russian perspective contributes the insight that the language of "mutual gain" can legitimate unequal outcomes. It occludes, however, the genuine possibility of Pareto-improving agreements in complex negotiations, particularly in arms control and environmental regimes where Russian diplomats have historically engaged in integrative bargaining.

Western: The Western perspective is the origin of integrative bargaining theory, from Walton and McKersie (1965) through Fisher and Ury (1981) to Lax and Sebenius (1986). The Western vantage point treats integrative bargaining as a universal technique applicable across cultures and contexts, emphasizing analytical methods (interest identification, option generation, objective criteria) over relational or cultural factors. The Western perspective contributes the most developed theoretical and pedagogical framework for integrative bargaining, including the "Getting to Yes" methodology that has been widely adopted in diplomatic training. It occludes, however, the cultural specificity of its assumptions: the emphasis on direct communication, explicit interest articulation, and individual utility maximization reflects Western liberal norms that may not translate to contexts where indirect communication, face-saving, and collective identity are paramount. The Western self-critique, articulated by scholars such as Avruch (1998) and Cohen (1997), acknowledges that integrative bargaining theory has been over-applied and that its universalist claims are not supported by cross-cultural evidence.

UN: The UN perspective treats integrative bargaining as a tool for sustainable peacebuilding, emphasizing that agreements must address root causes rather than symptoms. The UN's mediation guidance documents draw on integrative bargaining concepts but embed them in a framework that prioritizes inclusivity, gender sensitivity, and national ownership. The UN vantage point reveals that integrative bargaining at the elite level may exclude marginalized groups whose interests are not represented at the table, producing agreements that are technically efficient but socially illegitimate. The UN perspective contributes the normative commitment to inclusive, multi-stakeholder negotiation processes. It occludes, however, the practical reality that inclusive processes are often slower and more complex, and that the pursuit of inclusivity may conflict with the urgency of reaching agreement in acute crises.

SECTION 2.4 KEY IDEA 3 — Mediation: Ripeness Theory, Mediator Strategies, and Third-Party Credibility

Bolded Causal Claim: Mediation succeeds not when the mediator is powerful or skilled, but when the conflict has reached a "ripe" moment—defined by a mutually hurting stalemate and the perception of a way out—and the mediator's primary contribution is to recognize, cultivate, and exploit that ripeness rather than to impose a solution.

Mechanism: The mechanism operates through three channels. First, the ripeness mechanism: Zartman (2000, 2001) argued that conflicts become ripe for resolution when two conditions coincide: a Mutually Hurting Stalemate (MHS), in which both parties perceive that they cannot win and that the costs of continuing are unacceptable, and a Way Out (WO), in which both parties perceive that a negotiated settlement is possible and preferable to continued conflict. The mechanism is perceptual: ripeness is not an objective condition

but a subjective one, residing in the parties' beliefs about their prospects. A conflict may be objectively stalemated without being ripe if one or both parties believe they can still win. Conversely, a conflict may be ripe even without a clear stalemate if both parties perceive a window of opportunity. The mechanism operates through the parties' cost-benefit calculations: when the expected utility of continued conflict falls below the expected utility of negotiation, the parties become willing to engage. The mediator's role is to accelerate this perception, not to create it ex nihilo.

Second, the mediator strategy mechanism: once ripeness exists, the mediator must choose among strategies that range from facilitation (providing a venue and process) to formulation (proposing specific terms) to manipulation (using leverage to pressure parties into agreement). Touval and Zartman (1985) identified these as three distinct mediator roles, each with different requirements and risks. Facilitation requires neutrality and process skills; formulation requires substantive expertise and creativity; manipulation requires leverage and the willingness to use it. The mechanism is strategic: the mediator must match the strategy to the conflict's characteristics and the parties' needs. A mediator who formulates too early, before the parties are ready, risks rejection and loss of credibility. A mediator who facilitates too long, without proposing terms, risks allowing the parties to talk past each other. The optimal strategy is contingent on the parties' relationship, the issue structure, and the mediator's resources.

Third, the credibility mechanism: the mediator's effectiveness depends on the parties' perception that the mediator is impartial, competent, and capable of delivering on commitments. Bercovitch (1996) identified mediator credibility as a function of three factors: the mediator's resources (material and reputational), the parties' dependence on the mediator, and the mediator's perceived impartiality. The mechanism is relational: credibility is not an attribute of the mediator but a property of the mediator-party relationship. A mediator may be credible to one party but not the other, or credible on process issues but not on substance. The mechanism operates through the parties' trust in the mediator's ability to (a) understand their interests, (b) propose viable solutions, and (c) ensure implementation. Where credibility is low, the mediator cannot facilitate information sharing or propose terms; where credibility is high, the mediator can shape the parties' perceptions and expand the zone of possible agreement.

Scope Conditions: Mediation is most effective when (a) the conflict has reached or is approaching a ripe moment, (b) the mediator has sufficient credibility with both parties, (c) the parties are willing to engage in negotiation (even if reluctantly), and (d) there is a viable path to implementation. It is least effective when (a) one or both parties believe they can achieve their goals through force, (b) the mediator lacks credibility or leverage, (c) the conflict is not ripe (no MHS or no WO), or (d) the parties' positions are so far apart that no ZOPA exists. The scope condition is not the absence of power asymmetry—mediation can work in asymmetric conflicts—but the presence of a shared perception that continued conflict is costly and that negotiation offers a better alternative. Mediation is also more effective in conflicts where the issues are divisible and the parties have multiple interests, and less effective in conflicts over indivisible goods (sovereignty, identity, existential security) where compromise is perceived as betrayal.

Observable Implications: If ripeness theory is correct, we should observe that (a) mediation efforts initiated during periods of high battlefield intensity (when one side believes it can win) fail more often than those initiated after a stalemate; (b) the presence of a credible mediator increases the likelihood of agreement but not the likelihood of implementation; and (c) agreements reached during ripe moments are more durable than those imposed by external pressure. Conversely, if mediation is primarily a function of mediator power rather than ripeness, we should observe that (a) powerful mediators succeed regardless of ripeness, and (b) weak mediators fail even when conflicts are ripe. The empirical record is mixed: Bercovitch (1996) found that

mediator characteristics (resources, strategy) are stronger predictors of success than conflict characteristics, while Zartman (2001) and others have documented cases where ripe conflicts were resolved by relatively weak mediators and unripe conflicts resisted even powerful ones. Crocker, Hampson, and Aall (1999) found that successful mediation typically requires both ripeness and a skilled mediator, suggesting that the two factors interact rather than compete.

Perspective Note (five traditions in brief):

African: The African perspective on mediation is rooted in a tradition of communal dispute resolution that predates the modern state and that treats mediation not as a technique but as a social practice embedded in community life. The African vantage point reveals that Western mediation theory, with its emphasis on the mediator as a neutral third party, mischaracterizes the African mediator's role: in traditional African mediation, the mediator is not neutral but is a respected elder or chief whose authority derives from their embeddedness in the community and their knowledge of customary law. The African mediator's legitimacy comes not from impartiality but from wisdom, seniority, and the trust of the community. This is not a deficiency but a different model: the African mediator is a "wise counselor" rather than a "neutral facilitator," and their interventions are guided by the goal of restoring social harmony rather than achieving a technically optimal agreement. The African perspective contributes the insight that mediation effectiveness depends on the mediator's social embeddedness, not just their procedural skills. It also contributes the concept of "African solutions to African problems," articulated by leaders such as Thabo Mbeki and institutionalized in the African Union's mediation architecture, which asserts that African conflicts should be mediated by African actors who understand the cultural and political context. The African perspective occludes, however, the reality that "African solutions" can be invoked to exclude international actors who might bring resources or leverage, and that traditional mediation may not be adequate for conflicts involving modern state structures, internationalized conflicts, or non-state armed groups. African scholars such as Aning and Danso (2012) have noted that the AU's mediation capacity is often constrained by resource limitations, political divisions among member states, and the tension between the principle of non-interference and the responsibility to protect. The African perspective thus contributes both a rich indigenous model of mediation and a set of institutional challenges that limit its application in contemporary conflicts.

Chinese: The Chinese perspective on mediation is shaped by the Confucian tradition of the "middle way" (zhongyong) and the concept of he (harmony), which treats mediation not as a last resort but as the preferred mode of dispute resolution. The Chinese vantage point reveals that Western mediation theory's emphasis on ripeness—the idea that mediation requires a mutually hurting stalemate—reflects a Western bias toward adversarial conflict resolution: in the Chinese view, mediation should be attempted early, before positions harden, and the goal is not to resolve a stalemate but to prevent one. The Chinese perspective contributes the insight that mediation can be preventive as well as curative, and that the mediator's role is to maintain harmony rather than to broker a deal. The Chinese concept of "mediation plus" (tiaojie jia), which combines mediation with education and moral suasion, reflects a holistic approach that Western theory lacks. The Chinese perspective occludes, however, the reality that early mediation may be ineffective when parties are not yet ready to compromise, and that the emphasis on harmony can suppress legitimate grievances, particularly in conflicts involving ethnic minorities or political dissent. Qin Yaqing's (2018) relational theory of world politics provides a framework for understanding Chinese mediation as an expression of relationality rather than as an instrumental technique.

Russian: The Russian perspective on mediation is instrumental and strategic, treating mediation as a tool of statecraft rather than as a neutral service. The Russian vantage point reveals that Western mediation theory's

emphasis on impartiality is a normative preference, not a universal standard: in the Russian view, mediators are always partial, and the question is not whether they are neutral but whose interests they serve. Russian mediation practice, particularly in the post-Soviet space (e.g., the Minsk process for Ukraine, the Astana process for Syria), reflects a preference for "mediation with leverage"—the mediator uses its own power and relationships to shape outcomes rather than to facilitate party-driven solutions. The Russian perspective contributes the insight that mediation is always political and that the mediator's interests are a legitimate part of the process. It occludes, however, the risk that instrumental mediation undermines the mediator's credibility and the sustainability of agreements, as parties may perceive the mediator as serving its own interests rather than theirs. The Russian perspective also tends to understate the importance of ripeness, assuming that a sufficiently powerful mediator can create ripeness through pressure rather than waiting for it to emerge.

Western: The Western perspective is the origin of modern mediation theory, from Zartman's (2001) ripeness theory to Bercovitch's (1996) empirical research on mediator effectiveness. The Western vantage point treats mediation as a professionalized practice governed by norms of neutrality, impartiality, and party self-determination. The Western perspective contributes the most developed theoretical and empirical literature on mediation, including systematic studies of mediator strategies, success rates, and the conditions under which mediation works. It also contributes the "mediation support" infrastructure—training, guidelines, and institutional capacity—that has been adopted by the UN and regional organizations. The Western self-critique, articulated by scholars such as Kleiboer (1996) and Crocker, Hampson, and Aall (1999), acknowledges that Western mediation theory has been over-focused on the mediator's role and under-focused on the parties' agency, and that the emphasis on neutrality may be inappropriate in contexts where the mediator has a stake in the outcome. The Western perspective occludes, however, the cultural specificity of its norms: the emphasis on neutrality, confidentiality, and party autonomy reflects Western liberal values that may not be shared in contexts where community involvement, public accountability, and relational obligations are paramount.

UN: The UN perspective treats mediation as a core function of the Secretary-General's good offices, governed by principles of impartiality, consent, and national ownership. The UN vantage point reveals that mediation is not just a technique but an institutional practice embedded in a normative framework that includes the UN Charter, international humanitarian law, and human rights norms. The UN perspective contributes the institutional capacity for mediation support—including the Mediation Support Unit, the Standby Team of Mediation Experts, and the UN Peacemaker database—that provides mediators with analytical, logistical, and substantive support. The UN perspective also contributes the principle that mediation should be inclusive, involving not just armed parties but civil society, women, and marginalized groups. The UN perspective occludes, however, the tension between its normative commitments and the practical requirements of effective mediation: inclusivity can slow the process, and the emphasis on consent can give spoilers a veto. The UN's experience in Syria, Yemen, and Libya illustrates the limits of mediation when the parties lack ripeness or when external powers undermine the process.

2.5 KEY IDEA 4 — Track II and Track III diplomacy: the role of informal and civil-society channels

Bolded Causal Claim: Informal diplomatic channels can unlock negotiations that official channels cannot, but only when their outputs are deliberately transferred into Track I authority; without that transfer, they produce dialogue without decision.

Mechanism: Track I diplomacy is the official, state-to-state negotiation conducted by accredited representatives with binding authority. Track II diplomacy, in Joseph Montville's (1987) formulation, is unofficial dialogue among non-governmental elites—former officials, academics, religious leaders, business figures, and policy entrepreneurs—who retain access to decision-makers but do not negotiate on behalf of the state. Track III diplomacy extends further into civil society: grassroots organizations, women's associations, youth groups, local leaders, trade unions, and community mediators who shape the social environment in which official bargaining occurs. The causal mechanism is not that unofficial actors replace the state; it is that they alter the information, trust, and cognitive frames available to state actors. Official channels are often blocked by audience costs, domestic political constraints, identity-based hostility, and the need for face-saving. Unofficial channels lower the political cost of exploration because participants can test ideas without committing the state. They reduce dehumanization by creating repeated personal contact across conflict lines. They generate policy options that officials cannot propose first without appearing weak. They also prepare public opinion by socializing constituencies into the possibility of compromise. The critical causal link is transfer: Track II and Track III outputs must be carried into Track I through trusted intermediaries, policy entrepreneurs, or "backchannel" officials who can translate unofficial ideas into formal proposals. Without transfer, informal dialogue becomes a parallel conversation with no causal path to agreement. The mechanism therefore has two stages: first, unofficial channels create relational and cognitive preconditions; second, a linkage mechanism converts those preconditions into official bargaining positions. Track III adds a further mechanism: it changes the domestic cost of peace by building constituencies that reward compromise and punish spoilers, thereby enlarging the win-sets available to leaders at Level II of Putnam's two-level game.

Scope Conditions: Track II and Track III diplomacy is most effective when official channels are frozen but not violently inaccessible; when the conflict involves identity, historical grievance, or relational distrust rather than purely divisible material interests; when there exists a stratum of elites with credibility across conflict lines; and when civil society has sufficient autonomy to organize without state capture. It is less effective when the state monopolizes civil society, when violence prevents safe contact, when power asymmetry is so extreme that unofficial dialogue becomes a substitute for accountability, or when spoilers can punish participants for engagement. It is also weaker when there is no credible transfer channel to Track I, because unofficial dialogue then lacks institutional uptake. Track III in particular requires time, funding, and security; it is not a substitute for protection of civilians or for official ceasefires. Its effects are often indirect and delayed, making them difficult to attribute in short time horizons.

Observable Implications: If Track II and Track III channels are causally important, one should observe unofficial proposals reappearing in official texts with minimal modification; reduced inflammatory rhetoric following sustained dialogue; increased cross-community contact and joint problem-solving; civil-society actors gaining access to official delegations; and peace agreements that include provisions on reconciliation, local governance, or women's participation that originated in grassroots processes. Conversely, if informal channels are epiphenomenal, one should observe dialogue continuing without any change in official positions, or official agreements that ignore unofficial recommendations. A further implication is that Track III peacebuilding should correlate with more durable peace only where it is linked to institutional reform; where it is isolated, it may produce "islands of peace" without systemic change.

Perspective Note (five traditions in brief):

African (primary): In many African conflicts, what Western taxonomies label Track II or Track III is not an auxiliary channel but a constitutive part of political order. Traditional authorities, elders, religious leaders, women's councils, lineage networks, and community mediators have long performed conflict resolution

functions that predate and often outlast the post-colonial state. The African perspective therefore treats informal diplomacy not as a supplement to official negotiation but as a parallel and sometimes more legitimate source of authority. Concepts such as Ubuntu emphasize relational repair, restoration, and the reintegration of persons into community, which shapes how Track III actors frame peace. The African Union's Panel of the Wise and similar mechanisms reflect an institutionalization of elder mediation, while "African solutions to African problems" often implies that legitimacy derives from proximity to affected communities rather than from international accreditation. African scholarship, including Mamdani's (1996) analysis of colonial indirect rule, reminds us that the boundary between state and society in Africa was historically constructed through colonial categories; informal channels may therefore be more politically central than Western models assume. At the same time, the African perspective is alert to co-optation: externally funded civil-society initiatives can be captured by donors, and traditional authorities can reproduce patriarchal or ethnic hierarchies. The strongest African contribution is to show that Track III is not merely "local implementation" of a Track I deal; it is often where the social contract is renegotiated. Its occlusion is the risk of romanticizing tradition and underestimating how informal power can be exclusionary.

Chinese: The Chinese perspective emphasizes relationality, harmony, and incremental trust-building. Track II and Track III channels are valued as mechanisms for cultivating guanxi and reducing hostility, but they are usually framed within a state-led diplomatic architecture. Civil society is less autonomous than in Western models, and unofficial dialogue is often encouraged when it supports state objectives such as regional stability or economic cooperation. The Chinese contribution is to highlight that informal channels can be effective when embedded in long-term relationship management rather than episodic problem-solving. Its occlusion is the tendency to subordinate grassroots agency to state priorities and to treat civil society as an instrument of public diplomacy.

Russian: The Russian perspective is more skeptical of Western-funded civil-society peacebuilding and tends to view Track II and Track III channels through the lens of strategic competition. Informal channels may be used for intelligence gathering, influence operations, or the cultivation of friendly elites, while independent NGOs are often treated as potential vectors of foreign interference. The Russian contribution is to insist that unofficial diplomacy is never politically neutral and that funding sources shape outcomes. Its occlusion is the risk of conflating all civil-society peacebuilding with regime change and of underestimating genuine local agency.

Western: The Western perspective, drawing on Montville (1987) and Lederach (1997), has been the primary source of Track II and Track III theory. It emphasizes problem-solving workshops, dialogue, peacebuilding, and the "local turn" in conflict resolution. Its contribution is a rich toolkit for unofficial engagement and a normative commitment to inclusion. Its self-critique, developed in the local-turn literature, acknowledges that Western models can be technocratic, externally driven, and insufficiently attentive to power. The Western perspective occludes its own tendency to assume that civil society is naturally peace-oriented and that dialogue automatically produces convergence.

UN: The UN perspective treats Track II and Track III engagement as part of inclusive mediation and peacebuilding. The UN Guidance for Effective Mediation and related frameworks emphasize participation by women, youth, and marginalized groups, and UN missions often support civil-society dialogue. The UN contribution is institutional capacity: mediation support units, standby experts, and databases that can connect unofficial actors to official processes. Its occlusion is the tension between inclusivity and efficiency; broad participation can slow negotiations, and the UN's emphasis on consent can give spoilers a veto over civil-society engagement.

2.6 KEY IDEA 5 — The politics of negotiation: two-level games (Putnam), audience costs, and credible commitments

Bolded Causal Claim: International negotiation outcomes are shaped as much by domestic ratification politics as by interstate bargaining; leaders who can credibly tie their hands domestically gain bargaining leverage, but the same constraints can make agreement impossible.

Mechanism: Robert Putnam's (1988) two-level game theory posits that international negotiation is not a single interaction but two simultaneous games. At Level I, state representatives bargain with one another over the terms of agreement. At Level II, each state's constituents—legislatures, parties, interest groups, public opinion, or selectorates—decide whether to ratify the agreement. The chief negotiator occupies the critical position between the two levels: she must secure an international agreement that can survive domestic ratification. The central concept is the win-set: the set of all possible Level I agreements that would be ratified at Level II. A larger win-set gives the negotiator more flexibility and increases the probability of agreement, but it may also signal weakness because the negotiator can accept less favorable terms. A smaller win-set can be a source of bargaining power: if the negotiator can credibly claim that domestic constraints prevent concession, the other side may move toward her position. This is the logic of "tying hands." Audience costs, theorized by James Fearon (1994), add a mechanism for credibility: leaders who make public commitments and then back down suffer domestic political punishment, which makes threats and promises more credible to foreign adversaries. Credible commitments also depend on institutional lock-in: constitutional rules, legislative ratification requirements, independent courts, and international institutions raise the cost of reversal and reassure counterparts that today's promise will survive tomorrow's leadership change. The causal chain runs from domestic institutions to win-set size, from win-set size to bargaining leverage, from audience costs to credibility, and from credibility to the feasibility and durability of agreement. The mechanism is therefore not merely that domestic politics "matters"; it is that domestic politics structures the feasible set of international outcomes and the credibility of the commitments within them.

Scope Conditions: The two-level game mechanism operates most clearly in polities with transparent ratification procedures, strong legislatures or veto players, and attentive publics. It is weaker where executive authority is unconstrained, where ratification is opaque, or where audiences are inattentive. Audience costs are theorized to be higher in democracies, but they can also operate in authoritarian systems through elite factions, nationalist publics, or regime legitimacy. The mechanism is strongest on high-salience issues where domestic groups are mobilized; on low-salience technical issues, leaders have larger win-sets and more autonomy. Time horizons matter: leaders facing imminent elections may have smaller win-sets, while those with secure tenure may make longer-term commitments. The theory also assumes that domestic actors have coherent preferences; where preferences are fragmented or endogenous to the negotiation, win-sets are harder to define. Finally, credible commitments require not only domestic institutions but also international verification and enforcement; without the latter, even strong domestic lock-in may not reassure adversaries.

Observable Implications: If two-level game dynamics are operative, one should observe leaders using domestic constraints as bargaining leverage—claiming that parliament, party, or public opinion prevents concession. One should also observe that agreements are more likely when at least one party has a large win-set, and that impasses occur when both have small win-sets. High audience costs should correlate with more credible threats but also with higher risk of escalation or breakdown. Agreements ratified by legislatures or embedded in institutions should be more durable than executive agreements. One should also observe "ratification politics" after signature: domestic opposition attempting to shrink the win-set retroactively, or leaders renegotiating to secure ratification. Conversely, if international outcomes are driven purely by power

or interests, domestic ratification should be a formality rather than a constraint.

Perspective Note (five traditions in brief):

African (primary): The African perspective reveals that Putnam's model, developed in the context of industrial democracies, must be adapted to post-colonial states where executive power is often dominant, legislatures are weak, and ratification is less institutionalized. In many African cases, the relevant "Level II" is not a legislature but a constellation of ethnic elites, military actors, party barons, traditional authorities, and external donors. Audience costs may be ethnic or regional rather than electoral, and leaders may face "multiple principals" whose demands are not easily aggregated into a win-set. The African perspective also highlights that external conditionality—by the IMF, World Bank, or bilateral donors—can create an additional level of negotiation, constraining the state's win-set from outside. "African solutions" framing therefore requires not only international agreement but domestic legitimacy among constituencies that may not be formally represented. African scholarship on neopatrimonialism and the "politics of the belly" suggests that credible commitments are often personal rather than institutional, making agreements fragile when leadership changes. The African contribution is to show that two-level game theory must account for informal power and external conditionality; its occlusion is the risk of treating African states as if they had the same institutional architecture as Western democracies.

Chinese: The Chinese perspective internalizes the two-level game within a party-state structure. The domestic audience is not primarily an electorate but the Chinese Communist Party, the military, and a nationalist public whose expectations are shaped by narratives of national rejuvenation. Leaders can generate audience costs through nationalist mobilization, but ratification is opaque and concentrated in party institutions. The Chinese contribution is to show that credible commitments can be made without Western-style legislative ratification, through party discipline and long-term strategic signaling. Its occlusion is the difficulty of verifying domestic constraints from outside and the risk that opacity reduces credibility with adversaries.

Russian: The Russian perspective emphasizes personalist rule and the concentration of foreign-policy authority in the executive. Audience costs exist but are often nationalist and media-driven rather than institutional; the Duma may ratify agreements but rarely constrains the president. The Russian contribution is to highlight that leaders can use nationalist audiences to make commitments credible while retaining flexibility, and that "tying hands" can be performative rather than institutional. Its occlusion is the fragility of personalist credibility: commitments may not survive leadership transitions or elite splits, and adversaries may discount them.

Western: The Western perspective is the origin of two-level game theory and audience-costs research. Putnam (1988) and Fearon (1994) provide the canonical mechanisms, and subsequent work has tested them in democratic crises, trade negotiations, and security bargaining. The Western contribution is a rigorous, formalized account of how domestic politics enters international bargaining. Its self-critique, developed in later literature, questions whether audience costs are as strong as theory predicts, whether win-sets are observable, and whether the model overstates the autonomy of the chief negotiator. The Western perspective occludes its own tendency to universalize democratic institutional forms and to understate how authoritarian and post-colonial states generate credibility through different mechanisms.

UN: The UN perspective treats two-level game dynamics as a practical challenge for mediation. Mediators must map not only the parties at the table but their domestic constituencies, ratification requirements, and spoilers. The UN Guidance for Effective Mediation emphasizes inclusivity partly because agreements that exclude domestic actors are less likely to be ratified or implemented. The UN contribution is to insti-

tutionalize attention to domestic politics through mediation support, political analysis, and post-agreement implementation mechanisms. Its occlusion is the tension between inclusivity and decisiveness: broadening participation can enlarge win-sets but also introduce new veto players, and the UN's emphasis on consent can allow domestic spoilers to block agreement.

SECTION 2.7 — FIVE PERSPECTIVES IN DEPTH

2.7.1 African Perspective (PRIMARY)

The African vantage point on diplomatic statecraft begins not with a theory of bargaining but with a theory of the social. Where the dominant Western frameworks treat negotiation as an exchange between pre-formed, self-interested actors with fixed preferences, African intellectual traditions have long insisted that persons, interests, and even the boundaries of the "parties" are constituted through relationship. This is not a romantic gloss on "traditional" practice; it is an epistemological claim about what a negotiation is. Oyěwùmí's (1997) demonstration that the category "woman" was invented through colonial epistemology rather than discovered in African social life extends, by implication, to the category "negotiator": the figure who sits at the table with a mandate, a best alternative to a negotiated agreement, and a reservation price is a historically specific construction, not a universal agent. From this vantage, bargaining theory's formal elegance — Nash's (1950) axioms, Rubinstein's (1982) alternating-offers model — describes a particular cultural formation of agency rather than the human condition. The African perspective does not reject formal analysis; it insists that the formalization itself carries assumptions about personhood, time, and obligation that must be made explicit before they are exported.

Traditional African conflict-resolution mechanisms — the palaver in West and Central Africa, the gacaca in Rwanda, the mato oput among the Acholi, the kgotla in Botswana, the shimglina among the Amhara — are not Track II or Track III channels in the Western typology. They are primary sites of social ordering, and their logic differs structurally from Track I diplomacy. The palaver, as described in the ethnographic and political literature, is not a negotiation between representatives but a process of communal truth-telling in which the goal is not the division of a surplus but the restoration of relationship. Time is not a cost to be minimized, as in Rubinstein's model where delay erodes the pie; it is the medium through which trust is rebuilt. The outcome is not a contract but a reweaving of social fabric. This matters for negotiation theory because it suggests that the integrative-versus-distributive distinction presupposes a prior question: integrative of what? If the parties do not share a pre-existing social bond, value creation may be impossible; if they do, value claiming may be a category error. Mamdani's (1996) analysis of the bifurcated state — the colonial creation of "citizens" in urban areas and "subjects" in rural areas, governed by different legal regimes — shows that in many African contexts the very identification of parties to a negotiation is politically constructed and historically violent. A negotiation between "the government" and "the rebels" may reproduce the colonial distinction between those who have rights and those who have customs, with the latter's claims translated into the former's idiom only at the cost of their substance.

The concept of ubuntu — often rendered as "I am because we are" — is frequently invoked in African peace discourse, but its theoretical content is often flattened in translation. Ubuntu is not merely a communitarian ethic; it is an ontological claim that personhood is relational and that harm to one diminishes all. In negotiation terms, this implies that the zone of possible agreement is not a static interval between reservation prices but a dynamic space that expands or contracts with the quality of the relationship. A negotiation conducted in the ubuntu frame cannot be "won" by one party, because the parties are not separable; the agreement

is a modification of a shared field. This has direct implications for mediation: a mediator who imposes a settlement without restoring relationship has not mediated but adjudicated. The African critique of Western mediation's emphasis on closure and final-status agreements is that these freeze a moment of power rather than transform the relationship that produced the conflict. Cabral's (1973) insistence on "return to the source" — that liberation must be rooted in the lived culture and experience of the people — extends to negotiation: an agreement that is not intelligible within the parties' own cultural grammar will not be implemented, however elegant its terms.

The African Union's mediation architecture — the Panel of the Wise, the AU Mediation Support Unit, the Continental Early Warning System, and the doctrine of "African solutions to African problems" — represents an institutionalization of this perspective. The Panel of the Wise, established under the 2002 Protocol Relating to the Establishment of the Peace and Security Council, comprises eminent persons who deploy not as neutral technocrats but as elders with moral authority rooted in continental standing. This is not a lesser version of UN mediation; it is a different model, one that draws on the legitimacy of seniority and relational obligation rather than on procedural impartiality. The AU's mediation in Kenya in 2008, where Kofi Annan led a panel that included Graça Machel and Benjamin Mkapa, succeeded partly because the mediators were perceived as having a stake in the continent's stability and a relational claim on the parties, not merely a mandate from an international organization. The "African solutions" framing, however, carries its own politics. It has been invoked by states to resist international accountability, as in Sudan's rejection of International Criminal Court jurisdiction, and it can obscure the fact that many African conflicts are fueled by external actors — arms flows, extractive industries, proxy interventions — that "African solutions" alone cannot address. Rodney's (1972) analysis of how Europe underdeveloped Africa is directly relevant: the structural position of African states in the global economy means that their bargaining power in any negotiation, including peace negotiations, is constrained before the parties sit down. Nkrumah's (1965) concept of neo-colonialism — formal sovereignty masking continued dependence — implies that "African solutions" may be solutions to problems whose causes lie outside Africa.

Bayart's (2000) concept of extraversion — the orientation of African political systems toward external patrons and resources — adds a further dimension. African diplomacy and negotiation are not simply domestic or regional; they are shaped by the continuous need to secure external resources, recognition, and security guarantees. This means that the two-level game is, in the African context, often a multi-level game in which external patrons are not merely audiences but co-parties. A government negotiating with rebels may be simultaneously negotiating with donors, regional powers, and international financial institutions, each with its own conditions. The win-set is not determined by domestic ratification alone but by the intersection of multiple external constraints. This is not a deviation from the two-level game model; it is a specification of it that the original formulation, focused on Western democracies with stable institutional channels, did not capture. Fanon's (1961) analysis of the colonial psychological structure — the "native" as a subject of colonial violence, not a rational bargainer — suggests that in post-colonial contexts, negotiation may be shaped by trauma, humiliation, and the desire for recognition that formal bargaining theory cannot register. The demand for an apology, for historical acknowledgment, for symbolic equality may be non-negotiable in ways that a zone-of-possible-agreement analysis cannot capture.

The question of who negotiates is not peripheral to negotiation theory; it is constitutive. Tamale's (2020) decolonial Afro-feminism and Oyěwùmí's (1997) critique of the gendered epistemology of Yoruba society together imply that the "negotiator" is a gendered and culturally specific figure. In many African contexts, women have been the primary mediators in community conflicts — as mothers, elders, and market women — but have been excluded from Track I processes. The AU's Protocol to the African Charter on Human and

Peoples' Rights on the Rights of Women in Africa (Maputo Protocol, 2003) and the increasing inclusion of women in mediation teams, as in the Kenya 2008 process, represent a partial correction, but structural exclusion persists. Mbembe's (2001) analysis of the postcolony — where power is exercised through the commandement, the arbitrary authority of the state — suggests that in such contexts, negotiation is not between equals but between the state and its subjects, and the "agreement" may be an instrument of domination rather than cooperation. Grovogui's (2006) critique of Eurocentrism in international relations argues that the very categories of "state," "negotiation," and "agreement" are Western constructions that, when applied to Africa, produce misrecognition. The African perspective thus contributes a fundamental challenge: not merely to improve negotiation theory but to ask whether the theory's categories are adequate to the phenomena they claim to describe.

The African vantage point also offers a specific critique of Zartman's (2000, 2001) ripeness theory. Ripeness assumes that parties negotiate when they perceive a hurting stalemate and a way out. But in contexts where conflict is about identity, belonging, or historical injustice — as in many African conflicts — the stalemate may not "hurt" in the cost-benefit sense; it may be constitutive of identity. Parties may prefer continued conflict to a settlement that requires them to abandon claims to land, recognition, or historical redress. The "way out" may be perceived as capitulation. Ripeness theory's rationalist assumptions may thus systematically misread African conflicts as "not yet ripe" when in fact the parties' preferences are structured by non-instrumental values. However, the African perspective also has occlusions. Its emphasis on relationality and tradition can romanticize "African" practices, obscuring internal power asymmetries — gender, age, class, ethnicity — within communities. The "African solutions" framing can be co-opted by authoritarian states to resist accountability. And the critique of Western epistemology, while necessary, can become a blanket dismissal that prevents engagement with useful analytical tools. The African perspective is strongest when it is specific — when it identifies which Western assumptions fail in which contexts — rather than when it asserts a civilizational alternative.

2.7.2 Chinese Perspective

The Chinese perspective on diplomatic statecraft is anchored in a relational ontology of world politics most fully articulated in Qin Yaqing's (2018) relational theory. Qin argues that the Western international relations tradition — including bargaining theory — is built on a "substantialist" ontology: it treats actors as pre-existing, self-contained entities with fixed attributes and interests, and then asks how they interact. The Chinese tradition, rooted in Confucian philosophy, treats relations as primary and entities as derivative. In this view, a negotiation is not an exchange between two pre-formed parties but a process of relational construction: the parties become who they are through the negotiation itself. This has direct implications for bargaining theory. Nash's axioms assume that preferences are defined prior to negotiation and that the outcome is a point in a pre-existing utility space. Qin's relationality suggests that preferences are endogenous to the relationship and that the space of agreement is co-created. The Chinese concept of he (harmony) is not the absence of conflict but the dynamic balance of complementary opposites; a negotiation that achieves he has not eliminated difference but has woven it into a sustainable relationship. This is closer to the African ubuntu than to Western integrative bargaining, though the two traditions arrived at similar insights independently.

Chinese mediation practice reflects this philosophy. China's role in brokering the Saudi-Iran rapprochement in 2023 was not framed as neutral facilitation but as "promotion of talks" (cu tan) — a relational act that drew on China's standing with both parties and its interest in regional stability. The Chinese approach emphasizes "win-win" (shuangying) outcomes, non-interference in internal affairs, and the avoidance of conditionality. Unlike Western mediation, which often attaches governance, human rights, or reform conditions to agree-

ments, Chinese mediation treats the parties' sovereignty as non-negotiable and focuses on mutual benefit. This reflects a deeper normative commitment: the Chinese perspective holds that external imposition of terms undermines the relational foundation of any agreement. The mediator's credibility derives not from impartiality in the Western sense but from relational standing — guanxi — and from the perception that the mediator has a long-term stake in the relationship.

The Chinese perspective contributes a critique of the "mediation industry" and its assumption that third-party neutrality is both possible and desirable. Qin's relationality suggests that a mediator who has no relationship with the parties cannot mediate effectively; mediation is a relational act, not a technical service. This challenges the UN model of the impartial mediator and the Western emphasis on best-alternative-to-a-negotiated-agreement-based power analysis. However, the Chinese perspective also occludes. Its emphasis on harmony can suppress legitimate dissent and conflict; he can become a tool for enforcing conformity. The non-interference principle, while protecting sovereignty, can shield authoritarian practices and human rights abuses from international scrutiny. And the "win-win" framing can obscure asymmetries of power: a negotiation between a great power and a small state may be "win-win" in the sense that both gain something, but the distribution of gains may be profoundly unequal. The Chinese perspective is strongest when it identifies the relational dimensions that Western bargaining theory neglects; it is weakest when it treats relationality as a substitute for accountability.

2.7.3 Russian Perspective

The Russian perspective on negotiation and mediation is shaped by a tradition of great-power statecraft that treats diplomacy as an instrument of strategic competition rather than a neutral problem-solving process. Russian mediation practice — from the Astana process on Syria to the 2020 Nagorno-Karabakh ceasefire — reflects a view that the mediator is not a neutral facilitator but a stakeholder with interests, and that the goal of mediation is not merely to end conflict but to shape the post-conflict order in ways that serve the mediator's strategic position. This is not a deviation from "proper" mediation; it is an alternative theory of what mediation is for. Where the Western tradition distinguishes "pure" mediation (facilitation) from "power" mediation (leverage), the Russian perspective treats all mediation as power mediation and regards the distinction as a Western conceit that masks the power interests of "neutral" mediators.

The Russian strategic tradition, from Primakov's "multi-vector" foreign policy to contemporary practice, emphasizes the use of negotiation and mediation to create facts on the ground that constrain adversaries' options. In Syria, Russia's military intervention created a battlefield reality that made its mediation indispensable; the Astana process was not a neutral forum but a mechanism for consolidating Russian and Iranian gains and marginalizing Western influence. In Nagorno-Karabakh, Russian mediation produced a ceasefire that deployed Russian peacekeepers and excluded Western and Turkish actors. The Russian perspective thus treats mediation as a form of strategic positioning: the mediator's credibility derives not from impartiality but from the capacity to deliver outcomes, and the "agreement" is a snapshot of the balance of power at a given moment.

This perspective contributes a necessary corrective to the Western idealization of mediation. It reminds us that mediators have interests, that "neutrality" is often a rhetorical claim rather than a reality, and that the distribution of power shapes not only the outcome but the process. The Russian critique of Western mediation as hegemonic — as a tool for imposing liberal norms and extending Western influence — has force in contexts where Western mediators have indeed used mediation to advance regime-change or democratization agendas. However, the Russian perspective also occludes. Its instrumentalization of mediation undermines the trust that makes durable agreements possible; parties who believe the mediator is pursuing its own interests will

hedge, conceal information, and build in escape clauses. The Russian emphasis on "facts on the ground" can produce ceasefires that freeze conflicts rather than resolve them, as in Nagorno-Karabakh, where the 2020 agreement left underlying grievances unaddressed and collapsed in 2023. And the Russian perspective's dismissal of normative constraints — human rights, inclusivity, accountability — can legitimate agreements that are durable in the short term but unjust and therefore unstable in the long term. The Russian vantage point is strongest as a diagnostic of mediator self-interest; it is weakest as a theory of durable peace.

2.7.4 Western Perspective

The Western perspective on diplomatic statecraft is the dominant academic and policy framework, and it is the one that most readers will encounter first. It is built on rational-choice foundations: Nash's (1950) bargaining solution, Rubinstein's (1982) alternating-offers model, and the concepts of best alternative to a negotiated agreement and zone of possible agreement that Fisher and Ury (1981) popularized. The core claim is that negotiation is a strategic interaction between rational actors with defined preferences, and that outcomes can be predicted and improved through formal analysis of interests, alternatives, and leverage. Putnam's (1988) two-level game theory extends this to the domestic-international interface: leaders negotiate simultaneously with foreign counterparts and domestic constituencies, and the win-set — the set of agreements that can be ratified domestically — determines what is possible at the international table.

The Western framework also includes the institutionalization of mediation and the Track I/II/III typology. Track I refers to official, government-to-government diplomacy; Track II to unofficial, facilitated dialogues between non-governmental actors; Track III to grassroots, people-to-people engagement. Lederach's (1997) "Building Peace" framework argues that sustainable peace requires engagement at all three levels, with Track II and III processes building the relational foundation that Track I agreements require. Zartman's (2000, 2001) ripeness theory adds a temporal dimension: mediation succeeds when parties perceive a hurting stalemate and a way out. The Western perspective has generated an extensive "mediation industry" — training programs, best-practice guides, and professional mediators — and has been institutionalized in the UN Guidance for Effective Mediation (2012) and similar documents.

The Western perspective's contribution is substantial: it provides analytical tools for understanding negotiation dynamics, a vocabulary for comparing cases, and a basis for training practitioners. Its self-critique, however, is also well developed. Scholars within the tradition have identified its cultural bias toward individualism and rationality, its neglect of emotion, identity, and historical injustice, and its tendency to treat power asymmetries as background conditions rather than as objects of analysis. The mediation self-critique acknowledges that Western mediators often impose liberal frameworks — democracy, human rights, market economics — that may not fit local contexts, and that the emphasis on "neutrality" can obscure the mediator's own interests and cultural assumptions. The Western perspective's occlusion is most visible in its treatment of ripeness: by assuming that parties are rational cost-benefit calculators, it may misread conflicts driven by identity, dignity, or historical grievance as "not yet ripe," and it may prescribe patience when the problem is not timing but justice.

2.7.5 UN Perspective

The UN perspective on diplomatic statecraft centers on the Secretary-General's good offices and the institutional framework for mediation support. The good offices tradition — the Secretary-General's role as an impartial facilitator, derived from Article 99 of the UN Charter and developed through practice — represents a distinct model: the mediator is not a state with interests but an international civil servant with a mandate from the international community. The Brahimi Report (2000) on UN peace operations emphasized the

need for the UN to be more effective in conflict prevention and mediation, and the 2012 UN Guidance for Effective Mediation codified principles: preparedness, consent, impartiality, inclusivity, national ownership, international law and normative frameworks, coherence, coordination, and complementarity. These principles reflect a normative commitment to process legitimacy: an agreement is more likely to be implemented if the process that produced it was inclusive, consensual, and aligned with international law.

The UN perspective contributes institutional capacity: mediation support units, standby teams of mediators, political analysis, and post-agreement implementation mechanisms. The UN's emphasis on inclusivity — bringing women, civil society, and marginalized groups into negotiations — addresses a genuine gap in traditional diplomacy, where agreements are often struck between elites and fail to address the grievances of broader populations. The UN's focus on "national ownership" responds to the critique that externally imposed agreements lack legitimacy. And the UN's attention to implementation — monitoring, verification, and post-conflict peacebuilding — recognizes that the signing of an agreement is not the end of negotiation but the beginning of a longer process.

The UN perspective's occlusion lies in the tension between its normative ambitions and its institutional constraints. The UN depends on member state consent; it cannot mediate where parties refuse its involvement, and it cannot enforce agreements without Security Council authorization. The emphasis on inclusivity can enlarge win-sets but also introduce new veto players, making agreement harder to reach. The principle of impartiality can become a straitjacket: a mediator who must be acceptable to all parties may be unable to take the risks necessary to push for breakthrough. And the UN's bureaucratic procedures — reporting requirements, coordination with multiple agencies, the need for consensus among member states — can slow mediation to the point where opportunities are lost. The UN perspective is strongest as a normative framework and an institutional support system; it is weakest as an agile, decisive actor in fast-moving crises. The Brahimi Report's call for the UN to be "more effective" in prevention remains, in many respects, unfulfilled.

2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Traditional conflict resolution (ubuntu, consensus); AU mediation architecture (Panel of the Wise, Mediation Support Unit); "African solutions" framing; Grovogui's critique of international legal hierarchy; Mamdani on decolonizing conflict resolution	May underweight formal power asymmetries and enforcement; "African solutions" can be invoked to resist accountability	Mediation must be owned by parties, culturally grounded, prioritize justice and legitimacy over efficiency	AU mediation in Kenya 2007-08; Sudan CPA; Burundi Arusha process	Western: traditional methods lack enforcement and can shield authoritarian regimes
Chinese	Relationality (Qin Yaqing); guanxi; win-win framing; harmony (he); mediation as moral practice; non-interference; economic statecraft	Underweights coercion and power asymmetry; "harmony" can mask hierarchy	Negotiation should build long-term relationships, avoid zero-sum framing, respect sovereignty	China-brokered Saudi-Iran rapprochement (2023); China's role in Iran nuclear talks	Western: relational framing obscures material interests and power

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Russian	Mediation as strategic instrument; multipolarity; great-power brokerage; balance-of-power logic	Treats mediation as extension of power politics; underweights normative constraints and sustainability	Mediation serves state interests and regional order; legitimacy derives from power	Russia's role in Syria; Iran nuclear talks; Minsk process	UN: instrumental mediation undermines impartiality and sustainability
Western	Bargaining theory (Nash, Rubinstein); ZOPA/BATNA; two-level games (Putnam); integrative/distributive; Track I/II; ripeness (Zartman); mediation self-critique	Over-formalizes; assumes rationality; underweights culture, legitimacy, emotion	Negotiation is problem-solving; efficiency and Pareto improvement	Camp David; Dayton; Oslo	African: imposes Eurocentric rationality and ignores ownership
UN	Good offices; mediation support; normative frameworks (impartiality, inclusivity, consent); Brahimi Report; UN Mediation Support Unit	Bureaucratic slowness; dependence on member-state consensus; impartiality as straitjacket	Principled, inclusive, legitimate process; peace as public good	UN Guidance for Effective Mediation (2012); Brahimi reports	Russian/Chinese: UN mediation is Western-dominated and lacks enforcement

2.8 WORKED EXAMPLE (I do)

The 2015 Iran Nuclear Negotiations (JCPOA)

Levels of analysis. At the individual level, the negotiation turned on the personal chemistry and risk-taking of Secretary of State John Kerry and Foreign Minister Mohammad Javad Zarif, who logged more

hours together than any US-Iranian officials in decades, and on the political capital invested by President Barack Obama and President Hassan Rouhani, each of whom staked significant domestic credibility on a deal. Supreme Leader Ali Khamenei's grudging authorization—delivered through carefully calibrated public statements that preserved his revolutionary credentials while permitting Zarif to negotiate—was itself an individual-level decision with systemic consequences. At the state level, the United States faced a Congress that had enacted sanctions legislation requiring presidential certification for relief, meaning Obama's negotiating space was legally constrained; Iran's state apparatus included the Islamic Revolutionary Guard Corps and hardline factions in the Majlis that could veto or sabotage implementation; France, under Foreign Minister Laurent Fabius, adopted a notably harder line than other P5+1 members on enrichment caps and the Arak reactor, demonstrating that "the West" was not a unitary actor. The European Union, through High Representative Catherine Ashton and later Federica Mogherini, provided the institutional scaffolding for the talks. At the systemic level, the P5+1 framework itself—a concert of great powers with divergent interests in Iran—created both the pressure (unified sanctions) and the complexity (six parties with six agendas) of the negotiation; the UN Security Council's sanctions resolutions provided the legal architecture that made relief a multilateral bargaining chip; and the Nuclear Non-Proliferation Treaty regime supplied the normative backdrop against which Iran's "right to peaceful nuclear energy" was asserted and contested. At the transnational level, the International Atomic Energy Agency's verification role was not merely technical but constitutive of the deal's credibility; global financial networks and secondary sanctions extended US coercive reach far beyond its borders; and transnational advocacy—pro-Israel lobbying in Washington, Iranian diaspora networks, and the global nonproliferation community—shaped the political environment in which negotiators operated.

Mechanism. The JCPOA negotiation is best understood through Putnam's two-level game: each chief negotiator faced a domestic ratification game that constrained the international agreement he could sign. Obama's win-set was narrowed by congressional Republicans and by the need to preserve sanctions relief as a reversible, snapback-eligible concession; Rouhani's win-set was narrowed by Khamenei's red lines on enrichment and by the IRGC's institutional interests. The zone of possible agreement existed because each side's BATNA had deteriorated: Iran's economy was contracting under sanctions, and the United States' alternative to diplomacy—a military strike—carried unacceptable risks of regional escalation and uncertain efficacy. The negotiation combined distributive and integrative elements. Distributive bargaining dominated the core nuclear constraints: enrichment levels (3.67 percent), centrifuge numbers (5,060 IR-1s), breakout time (one year), and the duration of restrictions (10-15 years). These were zero-sum or near-zero-sum allocations of nuclear capability. Integrative elements, however, expanded the pie: the redesign of the Arak heavy-water reactor to prevent plutonium production, the conversion of Fordow to a research facility, the establishment of a procurement channel for nuclear-related imports, and the civil nuclear cooperation that gave Iran a legitimate stake in the agreement. Audience costs operated on both sides: Obama had publicly committed to preventing an Iranian nuclear weapon, making retreat costly; Khamenei had declared that Iran would not be humiliated, making visible concessions politically dangerous. Credible commitments were engineered through the IAEA's verification regime, the snapback mechanism for sanctions, and the staged implementation that allowed each side to verify the other's compliance before delivering its own concessions.

Perspective reconstruction. From the African vantage point, the JCPOA illustrates both the promise and the peril of externally brokered nuclear diplomacy. African scholarship—particularly Grovogui's critique of the international legal order and Mamdani's analysis of how global power structures reproduce inequality—would read the NPT regime as a hierarchical arrangement in which nuclear-armed states (including three P5 members) retain their arsenals while demanding that non-nuclear states forgo the technology. South Africa's

voluntary dismantlement of its nuclear weapons in the early 1990s, undertaken as part of its democratic transition, stands as the only case of a state relinquishing nuclear capability, and African diplomats have consistently argued that nonproliferation must be paired with disarmament. The sanctions regime against Iran, from this perspective, exemplifies how economic coercion—often experienced by African states as well—can be deployed by powerful states with limited accountability, and the JCPOA's fragility after US withdrawal in 2018 demonstrates the vulnerability of agreements that lack genuine multilateral ownership. The African emphasis on legitimacy and ownership would suggest that the JCPOA's durability was compromised from the outset by its dependence on a single powerful state's continued commitment rather than on a broader coalition of stakeholders with shared interests. Traditional African conflict resolution, with its emphasis on consensus and the restoration of relationships rather than the extraction of concessions, would view the JCPOA's transactional, time-limited structure as inherently unstable.

The Chinese perspective would emphasize the relational and long-term dimensions of the negotiation. Qin Yaqing's relational theory of world politics would frame the P5+1 process not as a one-shot bargaining game but as an ongoing relationship-building exercise in which trust accumulates through repeated interaction. China's own role in the talks—consistently advocating for Iran's right to peaceful nuclear energy while supporting nonproliferation—reflects a win-win framing that seeks to avoid zero-sum outcomes. The Chinese vantage would highlight the economic interdependence that the JCPOA was meant to restore: the reintegration of Iran into global markets as a stabilizing force. It would also note that the agreement's collapse following US withdrawal validates the Chinese emphasis on building durable, multipolar frameworks rather than relying on the commitments of a single hegemon.

The Russian perspective would read the JCPOA through the lens of great-power bargaining and strategic balance. Russia's participation in the P5+1 reflected its interest in preventing a US military strike on Iran, which would have destabilized the region and potentially brought US forces closer to Russian borders, while also preserving its own relationship with Tehran. Russian analysts would emphasize that the negotiation was as much about managing the US-Iran relationship as about nuclear nonproliferation, and that Russia's role as a co-guarantor gave it leverage in broader regional diplomacy. The Russian vantage would be skeptical of the Western framing of the deal as a triumph of multilateralism, noting instead that the agreement served Russian interests in constraining US unilateralism and in maintaining Iran as a counterweight to US-aligned Gulf states.

The Western perspective would treat the JCPOA as a case study in bargaining theory and diplomatic statecraft. The negotiation exemplifies Putnam's two-level game, Zartman's ripeness theory (the mutually hurting stalemate of sanctions and isolation), and the integrative/distributive distinction. Western analysts would emphasize the role of Track I diplomacy—the formal, state-to-state channel—and the importance of credible commitments and verification. The self-critique within the Western tradition would acknowledge that the deal's fragility stemmed partly from the failure to address Iran's regional behavior and missile program, which were excluded from the agreement, and from the inability to build domestic consensus in the United States, which left the deal vulnerable to partisan reversal.

The UN perspective would focus on the institutional and normative framework. The IAEA's verification role was central to the agreement's credibility; the UN Security Council's endorsement of the JCPOA through Resolution 2231 gave it international legal weight. The UN vantage would emphasize the Secretary-General's good offices and the broader nonproliferation regime. It would also note the limitations: the UN could not prevent US withdrawal, and the Security Council's snapback mechanism, while designed to preserve the agreement, became a tool of escalation. The UN perspective would stress that sustainable nonproliferation

requires not just technical agreements but political buy-in from all major stakeholders, including those not at the table.

Adjudication. The Western bargaining-theory perspective provides the most analytically powerful account of why the JCPOA was possible: the two-level game framework explains how negotiators found a ZOPA, and the integrative/distributive distinction explains how the deal expanded beyond a simple exchange of sanctions for nuclear rollback. However, this perspective systematically underweights the fragility that the African and Chinese perspectives identify. The Western framework treats the agreement as a rational equilibrium and struggles to explain why it collapsed so quickly after a change in US administration; the African emphasis on ownership and legitimacy, and the Chinese emphasis on relational durability and multipolar frameworks, better account for the deal's vulnerability to unilateral withdrawal. The Russian perspective correctly identifies the strategic dimension but overstates the degree to which the negotiation was about great-power management rather than about Iran's nuclear program per se. The UN perspective accurately describes the institutional architecture but cannot explain the political dynamics that drove both the agreement and its collapse. The most complete explanation combines the Western mechanism (two-level games, ZOPA, credible commitments) with the African and Chinese insights about ownership, legitimacy, and relational durability: the JCPOA was a well-designed bargaining outcome that lacked the political foundations—domestic consensus in the United States, regional buy-in, and multilateral ownership—necessary to survive a change in administration.

SECTION 2.9 PROBLEM PAIR (We do)

1. Map the bargaining structure of the 2023 Saudi-Iran rapprochement: identify each side's BATNA, reservation point, and the issues that could be linked (diplomatic normalization, Yemen de-escalation, economic cooperation, security assurances, status). Determine whether a ZOPA existed before 2023 and what changed.
2. Reconstruct China's mediator strategy: assess its credibility, leverage, and neutrality; compare it with Zartman's ripeness theory; and identify what China could offer that US-led or regional mediation could not.
3. Apply Putnam's two-level game: identify domestic, regional, and alliance audiences for Riyadh, Tehran, and Beijing; assess audience costs and ratification constraints; explain how leaders used ambiguity to manage commitments.
4. Distinguish value creation from value claiming: classify outcomes as integrative (risk reduction, commercial prospects, diplomatic channels) or distributive (status, legitimacy, regional order, US role).
5. Assess informal channels: evaluate whether Track II or Track III actors mattered, and identify the limits of state-led brokerage without civil-society embedding or verification mechanisms.
6. Specify falsifiers: list observable indicators over 12–24 months that would confirm or refute durability, and distinguish a diplomatic announcement from structural reconciliation.

MODEL ANSWER

The 2023 Saudi-Iran rapprochement is best understood as a mediated bargain in which a latent zone of possible agreement became actionable once both parties' best alternatives to a negotiated agreement deteriorated

and a credible broker supplied a face-saving procedure. For Riyadh, the BATNA of indefinite confrontation had become costly: the Yemen stalemate drained resources, oil infrastructure remained vulnerable, and uncertainty about the reliability of US security guarantees increased after years of perceived American retrenchment. For Tehran, the BATNA of regional escalation and sanctions isolation had also eroded amid domestic unrest, economic pressure, and the strategic risk of overextension through proxy networks. Neither side needed to concede core interests for an agreement to occur; the March 2023 Beijing-brokered deal restored diplomatic relations, provided for embassy reopening, and revived the 2001 security cooperation and 1998 economic and trade frameworks. Because much of this was procedural and reversible, the bargain was low-cost and high-symbolism rather than evidence of deep reconciliation. China's mediator strategy combined relational credibility with material leverage: it was not a direct party to the regional rivalry, could offer economic incentives and energy-market stability, and had a stake in protecting Belt and Road corridors and Gulf oil flows. This fits Zartman's ripeness logic only partially. There was no single, unmistakable mutually hurting stalemate producing an obvious way out; instead, ripeness was constructed through brokerage, economic interdependence, and timing. The mediator's credibility depended less on neutrality in the Western sense than on being a non-threatening great power with incentives to preserve the process. The case also illustrates two-level game dynamics. Saudi and Iranian leaders had to signal resolve to domestic, regional, and alliance audiences while avoiding ratification crises at home. The agreement's deliberate ambiguity allowed each side to claim victory: Riyadh could present itself as a stabilizing regional power, while Tehran could claim recognition as a legitimate great power. Contentious issues—Yemen's settlement, proxy networks, maritime security, and Iran's nuclear program—were deferred rather than resolved. Value creation was modest but real: reduced risk of direct escalation, improved commercial prospects, and a functioning diplomatic channel. Value claiming was central: status, legitimacy, and the demonstration that a non-Western broker could deliver an outcome Western diplomacy had not. The limits of external brokerage are equally important. China could convene, guarantee process, and provide economic incentives, but it could not resolve underlying security dilemmas or enforce compliance. The agreement lacked robust verification mechanisms, third-party monitoring, and civil-society embedding. Track II and Track III channels appear to have been marginal, which means reconciliation remained elite-driven and vulnerable to shocks. Falsifiers of durability include renewed proxy attacks, stalled embassy operations, failure to implement economic frameworks, public recrimination, or a return to competitive escalation. Thus the case shows that mediation can unlock a bargain when parties' BATNAs weaken and a broker offers face-saving procedure, but without institutionalized verification and domestic buy-in, the settlement remains a diplomatic equilibrium rather than a transformed relationship.

SECTION 2.10 INDEPENDENT MEMO (You do)

(a) Case description: In 2024, a regional economic community proposes to mediate a maritime boundary dispute between two member states after a naval incident. State A controls the disputed waters de facto and has invested in offshore energy infrastructure; State B has a weaker navy but stronger legal claims and domestic nationalist mobilization. A third member state with commercial interests in both economies offers to broker talks. The proposed agenda includes boundary delimitation, joint development zones, naval incident-prevention protocols, and compensation. Domestic opposition in State B frames any compromise as surrender; State A's energy firms resist revenue sharing. The mediator has no enforcement capacity but can offer trade facilitation and infrastructure financing. The case resembles other maritime disputes in which legal claims, resource rents, and nationalist audiences constrain bargaining space. Students are asked to assess whether a durable agreement is possible and what would make it fragile.

(b) Required memo headings as prompts:

Mechanism: Identify the bargaining structure, BATNAs, ZOPA, and causal mechanism linking mediator strategy to outcome.

Perspective reconstruction: Reconstruct African, Chinese, Russian, Western, and UN interpretations; state what each reveals and occludes.

Historical analogue: Compare to a prior case and specify what transfers and what does not.

Falsifiers: List observable evidence that would refute your explanation or prediction.

(c) Self-check: Did you distinguish description of events from explanation of causes, prediction of outcomes, and prescription for policy?

SECTION 2.11 HINGE QUESTION

Which factor most directly converted a latent bargaining space into an actual agreement in the 2023 Saudi-Iran rapprochement?

A. A mutually hurting stalemate that made continued confrontation irrational for both sides. B. China's ability to combine non-threatening brokerage with economic incentives and a face-saving procedure. C. Track II civil-society pressure that forced elites toward compromise. D. The absence of domestic audience costs in either Riyadh or Tehran.

Correct answer: B.

Distractor diagnosis for A: It conflates constructed ripeness with classic Zartman stalemate theory; deteriorating BATNAs mattered, but the timing and form of agreement depended on brokerage rather than an unmistakable mutually hurting stalemate alone.

Distractor diagnosis for C: It overstates the role of informal channels; the process was elite-driven, and civil-society or Track II pressure was at most marginal, so it cannot explain the breakthrough.

Distractor diagnosis for D: It ignores two-level game dynamics; audience costs were present and managed through ambiguity, not absent, and their management was part of the agreement's design.

SECTION 2A — DATA LAB

The data lab treats negotiation outcomes as **structured observations** rather than anecdotes. The tables below combine documented agreements, mediator roles, and domestic-ratification constraints. They are not a full statistical sample; they are a **curated set of high-salience cases** that make bargaining mechanisms, mediation strategies, and two-level constraints visible. The analytic task is to move from case description to mechanism, then to perspective-sensitive interpretation.

Table 1. Selected negotiation outcomes (documented cases)

Case (year)	Parties	Issue	Documented outcome	Durability signal	Dominant level of analysis
Camp David (1978)	Egypt–Israel	Territorial peace, Sinai	Treaty signed	Durable bilateral peace	State + systemic
Oslo Accords (1993)	Israel–PLO	Interim self-governance	Agreement signed	Process collapsed	State + transnational
Arusha (1993)	Rwandan parties	Power-sharing	Agreement signed	Failed to prevent genocide	State + systemic
Dayton (1995)	Bosnia parties	War termination	Agreement signed	State survived; ethnic partition persisted	Systemic + state
Good Friday (1998)	Northern Ireland parties	Power-sharing	Agreement signed	Durable with periodic crises	State + transnational
Lusaka (1999)	DRC and regional actors	Ceasefire	Agreement signed	Partial implementation	Systemic + transnational
JCPOA (2015)	Iran–P5+1	Nuclear limits and sanctions relief	Agreement signed	Fragile after U.S. withdrawal (2018)	Systemic + state
Ethiopia–Eritrea (2018)	Ethiopia–Eritrea	Normalization	Agreement signed	Implementation mixed	State
Saudi–Iran rapprochement (2023)	Saudi Arabia–Iran	Diplomatic normalization	Agreement signed	Implementation ongoing	Systemic + state

Table 2. Mediator strategies and credibility (selected cases)

Mediator	Case	Strategy type	Source of leverage	Documented result	Perspective-sensitive reading
United States	Camp David (1978)	Manipulator/formulator	Aid, security guarantees, alliance ties	Durable treaty	Western: leverage converts ripeness into agreement
Norway	Oslo (1993)	Facilitator	Low material leverage; trust and secrecy	Signed but collapsed	Western self-critique: facilitation without enforcement

Mediator	Case	Strategy type	Source of leverage	Documented result	Perspective-sensitive reading
China	Saudi–Iran (2023)	Broker/relational intermediary	Economic ties, non-alignment posture, regional credibility	Signed; implementation ongoing	Chinese: relationality and non-interference as credibility
African Union / regional elders	Multiple African conflicts	Consensus-oriented facilitation	Moral authority, proximity, traditional legitimacy	Mixed	African: legitimacy and social repair, not only deal-making
United Nations (Brahimi process)	Afghanistan (2001–02)	Formulator with good offices	International legitimacy, donor coordination	Bonn Agreement	UN: procedural inclusivity and post-agreement support
Algeria	U.S.–Iran (1981 Algiers Accords)	Intermediary	Custody of assets, channel control	Hostage crisis resolved	Realist: intermediary leverage matters more than neutrality

Table 3. Two-level game constraints (selected agreements)

Agreement	Level I parties	Level II ratifiers	Win-set constraint	Documented outcome
NAFTA (1993)	United States, Canada, Mexico	U.S. Congress under fast-track	Labor and environmental side conditions	Ratified
Maastricht (1992)	EU member states	National parliaments and referenda	Narrow domestic tolerance for sovereignty transfer	Ratified with crises
Kyoto Protocol (1997)	Global climate parties	U.S. Senate and other legislatures	Byrd–Hagel-type resistance to asymmetric obligations	U.S. non-ratification
JCPOA (2015)	Iran and P5+1	U.S. Congress under INARA review; Iranian Supreme Leader/parliament	Narrow win-sets on sanctions relief and verification	Signed; later U.S. withdrawal

Agreement	Level I parties	Level II ratifiers	Win-set constraint	Documented outcome
Paris Agreement (2015)	Global climate parties	Diverse domestic ratification processes	Variable national commitments	Ratified; later U.S. withdrawal and reentry
Saudi–Iran rapprochement (2023)	Saudi Arabia and Iran	Domestic elites, regional proxies, security establishments	Spoiler risk from proxy actors and hardliners	Signed; implementation uncertain

Five numbered analysis questions

1. **Trend.** Across Table 1, which agreements show durable implementation, and which show signature without durable change? Identify at least two shared features among the durable cases and two shared features among the fragile cases. Do not treat signature as success.
2. **Level of analysis.** Table 1 and Table 3 include individual leaders, state institutions, systemic power shifts, and transnational actors. Which level best explains variation in durability? Construct one hypothesis at each level and state what evidence would distinguish them.
3. **Perspective reconstruction (all five).** Read Table 2 from each perspective in turn: African, Chinese, Russian, Western, and UN. For each perspective, identify one case that it explains well and one case that exposes its blind spot. Keep the African perspective first and most developed in your answer.
4. **Interpretation.** Compare Camp David (1978) with Arusha (1993). Both produced signed agreements. Why did one become a durable peace and the other fail to prevent catastrophe? Separate description (what happened), explanation (why), prediction (what would have changed the outcome), and prescription (what should be done in similar cases).
5. **Limitation.** The tables mix documented outcomes with interpretive classifications. What are the main inferential problems—selection on the dependent variable, mediator self-selection, coding ambiguity, missing counterfactuals, and perspective bias—that prevent a causal claim such as "mediation causes peace"?

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — Bargaining space, BATNA, and ZOPA

- **What to draw:** Draw a horizontal number line representing value on one issue (for example, sanctions relief or territorial withdrawal). Mark Party A's BATNA and reservation point on the left; mark Party B's reservation point and BATNA on the right. Shade the overlapping interval between the two reservation points as the **ZOPA**. Above the line, draw a second, larger shaded band showing an **expanded ZOPA** created by issue linkage (for example, adding security guarantees or economic cooperation). Draw a dashed vertical line at the midpoint labeled "possible agreement," and small arrows showing movement from BATNA toward the agreement point.

- **Labels to place:** BATNA (A), reservation point (A), ZOPA, reservation point (B), BATNA (B), expanded ZOPA, issue linkage, aspiration range, Pareto frontier.
- **Perspective overlay to annotate:**
  - **African (primary):** "Agreement is also social repair; reservation points include communal legitimacy, not only material payoff."
  - **Chinese:** "Relational trust can enlarge the feasible set before formal concessions."
  - **Russian:** "Coercive leverage shifts reservation points; ZOPA may be manufactured by power."
  - **Western:** "ZOPA defines the rational bargaining range; no overlap means no deal."
  - **UN:** "Fairness and procedural legitimacy determine whether an agreement inside the ZOPA is acceptable."

Visual 2 — Two-level game and win-sets

- **What to draw:** Draw two nested ovals. The outer oval is **Level I: international negotiation**; the inner oval is **Level II: domestic ratification**. The intersection is shaded and labeled **win-set**. Draw arrows from domestic groups (legislature, military, public opinion, spoilers) into Level II, and arrows from international partners into Level I. Draw a small "audience cost" gauge next to Level II and a "credible commitment" lock icon on the agreement arrow crossing from Level I to Level II.
- **Labels to place:** Level I, Level II, win-set, domestic constraints, international partners, audience costs, credible commitment, ratification, spoilers.
- **Perspective overlay to annotate:**
  - **African (primary):** "Domestic legitimacy includes traditional authority and community consent, not only parliamentary ratification."
  - **Chinese:** "Domestic harmony and elite consensus are part of the win-set."
  - **Russian:** "State capacity and executive control can compress or expand the win-set."
  - **Western:** "Audience costs make threats credible and agreements durable."
  - **UN:** "Inclusive participation widens the win-set but may slow agreement."

Visual 3 — Ripeness, mediation strategy, and spoilers

- **What to draw:** Draw a time-series curve of conflict intensity. Mark a high peak, then a downward trough labeled **hurting stalemate**. Place a mediator icon entering at the trough. Branch three arrows from the mediator: **facilitation**, **formulation**, and **manipulation**. Draw a small "spoiler" figure pulling the curve upward after the trough. Add a horizontal line labeled "third-party credibility threshold."
- **Labels to place:** conflict intensity, hurting stalemate, ripeness, mediator entry, facilitation, formulation, manipulation, spoilers, credibility threshold, agreement point.
- **Perspective overlay to annotate:**

- **African (primary):** "Ripeness may be signaled by communal exhaustion and elder mediation, not only battlefield stalemate."
- **Chinese:** "Mediation succeeds when it preserves relational continuity and face."
- **Russian:** "Mediation is strategic leverage; ripeness can be shaped, not merely observed."
- **Western:** "Ripeness is a structural condition; mediator strategy should match it."
- **UN:** "Good offices require consent, impartiality, and post-agreement support."

SECTION 4 — CORNELL NOTES

Cue (prompt)	Notes (with source log)
What is the ZOPA?	The zone of possible agreement: the overlap between parties' reservation points. If no overlap, no rational deal exists unless the bargaining space is redefined. Source log: Raiffa (1982); Fisher and Ury (1981).
What is BATNA?	Best alternative to a negotiated agreement. It anchors reservation points and determines bargaining power. Source log: Fisher and Ury (1981).
Nash equilibrium in bargaining?	A stable outcome where no party can improve by unilaterally changing strategy; in bargaining, often modeled as a fair or efficient split under idealized conditions. Source log: Nash bargaining tradition (general game theory).
Rubinstein bargaining?	Alternating-offers bargaining; time preference and patience shape who captures surplus. Source log: Rubinstein bargaining tradition (general game theory).
Integrative vs. distributive bargaining?	Distributive bargaining divides a fixed pie; integrative bargaining expands the pie through issue linkage, trade-offs, and joint problem-solving. Source log: Fisher and Ury (1981); Raiffa (1982).
What makes mediation credible?	Consent, impartiality, leverage, and the ability to deliver side payments or guarantees. Credibility is relational and contextual. Source log: Zartman (2001); UN (2012) Guidance for Effective Mediation.

Cue (prompt)	Notes (with source log)
What is ripeness theory?	Parties negotiate seriously when they perceive a hurting stalemate and a way out. Ripeness is perceptual, not purely objective. Source log: Zartman (2001).
What are mediator strategies?	Facilitation (process), formulation (proposals), manipulation (leverage and pressure). Strategy must match ripeness and power asymmetry. Source log: Zartman (2001); UN (2012).
What is a two-level game?	International agreements must survive domestic ratification; the overlap between international and domestic acceptability is the win-set. Source log: Putnam (1988).
What are audience costs?	Domestic punishment for backing down; they can make international threats credible but may also trap leaders. Source log: Putnam (1988); audience-costs literature (general IR).
What are Track II and Track III channels?	Informal, unofficial, and civil-society channels that prepare, support, or pressure official diplomacy. They can build trust but lack authority. Source log: Track II diplomacy literature (general IR).
How do perspectives differ?	African: legitimacy and social repair; Chinese: relationality and harmony; Russian: strategic leverage; Western: bargaining rationality; UN: procedure and inclusivity. Source log: Grovogui, Mbembe, Bayart, Mamdani, Rodney, Nkrumah, Nyerere, Cabral, Fanon, Aning, Danso, Tamale, Oyěwùmí; Qin (relationality framing); Putnam (1988); Zartman (2001); UN (2012).

Summary (3–5 sentences):
Negotiation theory explains agreement through bargaining structure, value creation, ripeness, mediation credibility, informal channels, and domestic ratification constraints. The African perspective treats negotiation as a legitimacy-building and social-repair process, not merely a division of material surplus. Chinese, Russian, Western, and UN perspectives each highlight relationality, leverage, rational bargaining, and procedural inclusivity respectively. Durable outcomes require not only a signed agreement but also a viable win-set at both international and domestic levels. The data lab shows that signature is a weak proxy for success unless implementation and legitimacy are tracked.

SECTION 5 — FEYNMAN COMPRESSION

1. **Explain without jargon.**
   Negotiation is the process by which parties with conflicting interests try to reach a deal. A deal is

possible only if each side prefers it to walking away. Good negotiators do not just fight over a fixed pie; they try to enlarge the pie by trading things each side values differently. Mediators help when both sides are stuck but not hopeless, and their help works best when they have credibility and some leverage. Even a good international deal can fail if domestic audiences reject it.

2. **Mark gaps.**
   - I am not yet precise about when Nash-style fairness predictions fail in real diplomacy.
   - I need to distinguish ripeness as a structural condition from ripeness as a leader's perception.
   - I have not fully specified how Track II actors gain access without undermining official negotiators.
   - I need to test whether audience costs operate similarly in authoritarian and democratic systems.
   - I am unsure how to measure "social repair" in African mediation traditions without reducing it to Western outcome metrics.
3. **Reread verification.**
   Recheck the core claims against Fisher and Ury (1981) on interests versus positions; Raiffa (1982) on analytic negotiation; Zartman (2001) on ripeness and mediator strategy; Putnam (1988) on two-level games; Brahimi reports on inclusive mediation practice; and UN (2012) Guidance for Effective Mediation. Verify that every mechanism has a scope condition and that no case is treated as proof of a universal law.
4. **Analogy with explicit limits.**
   Negotiation resembles a market exchange in which each side has a walk-away price, but the analogy breaks down because political agreements create rules, identities, and obligations that markets do not. A mediator is like a broker, but unlike a market broker, a diplomatic mediator must preserve legitimacy and cannot simply maximize transaction volume. The analogy helps with ZOPA and BATNA; it fails with audience costs, spoilers, and social repair.
5. **Rewrite.**
   Diplomatic negotiation is a constrained bargaining process in which agreement depends on overlapping reservation points, value-creating trade-offs, perceived ripeness, credible mediation, and domestic ratification. No single theory explains all cases: bargaining theory explains feasible deals, mediation theory explains third-party effects, and two-level game theory explains why signed agreements may still fail. The African perspective adds that legitimacy and social repair are not side effects but conditions of durable agreement.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L59	Definition	What is BATNA in negotiation theory?	BATNA is the Best Alternative to a Negotiated Agreement — the course of action a party will take if talks fail. It sets the reservation point below which a deal is worse than walking away, and it is the single most important source of bargaining power in Fisher and Ury's framework.	Western bargaining theory treats BATNA as an individual rational-actor construct; African mediation traditions often reframe the "alternative" as community-level harm, shifting the reservation point.
L59	Definition	What is the ZOPA?	The Zone of Possible Agreement is the overlap between the parties' reservation points — the set of deals both prefer to their BATNAs. If no overlap exists, no agreement is possible without changing reservation points or BATNAs.	ZOPA is a static, two-party construct; UN mediation guidance stresses that in multi-party conflicts the "zone" must be expanded through issue-linkage and side-payments.

Tag	Card Type	Front	Back	Perspective Note
L59	Mechanism	How does Rubinstein's alternating-offers model determine the split?	In Rubinstein's model, two players alternate offers over an infinite horizon with common discount factors; the unique subgame-perfect equilibrium splits the surplus in proportion to each party's patience (discount factor), with the first mover gaining a slight edge.	The model assumes complete information and rationality; African and Chinese perspectives critique this as ignoring relational trust and face, which alter effective discount rates.
L59	Application	What made the 2015 JCPOA negotiation possible?	A convergence of a credible US military threat, Iranian economic pain from sanctions, a reformist Iranian president, and a back-channel Omani mediation track created a ZOPA; the deal traded enrichment limits for sanctions relief.	Western accounts stress coercion and bargaining; Iranian and Russian accounts stress sovereignty and resistance, while African observers note the precedent for great-power nuclear coercion.

Tag	Card Type	Front	Back	Perspective Note
L59	Comparison	Distinguish integrative from distributive bargaining.	Distributive bargaining is zero-sum value-claiming over a fixed pie; integrative bargaining is positive-sum value-creation through issue trade-offs, logrolling, and bridging interests. Fisher and Ury's "principled negotiation" is the canonical integrative prescription.	Western theory formalizes the distinction; African traditional resolution often begins integrative (restoring relationships) before any distributive claim is entertained.
L59	Source	What is Fisher and Ury's core prescription?	Separate people from the problem, focus on interests not positions, invent options for mutual gain, and insist on objective criteria — the four pillars of principled negotiation in *Getting to Yes* (1981).	The framework is Western and individualist; critics note it underweights power asymmetry and collective identity, central to African and Russian diplomatic traditions.

Tag	Card Type	Front	Back	Perspective Note
L59	Debate	What is Zartman's ripeness theory?	A conflict becomes "ripe" for mediation when parties perceive a mutually hurting stalemate (MHS) and a way out; ripeness is a necessary but not sufficient condition for settlement.	Ripeness is an observer's construct; African mediators argue ripeness is often manufactured by mediators through shuttle diplomacy, not merely discovered.
L59	Reconstruction	How does the African perspective frame mediation?	AU-led mediation and traditional conflict resolution emphasize legitimacy, inclusivity, and "African solutions to African problems," treating mediation as relationship repair rather than contract enforcement.	This is the primary perspective of the lesson: it reveals that Western bargaining theory's contract-focus occludes the social fabric that makes agreements durable.
L59	Occlusion	What does Western bargaining theory occlude?	It occludes power asymmetry, historical grievance, and the role of non-state actors; by modeling parties as unitary rational actors, it misses audience costs and domestic ratification politics.	The occlusion is most visible in Track I failures where signed agreements collapse during domestic ratification, as in the JCPOA's US withdrawal.

Tag	Card Type	Front	Back	Perspective Note
L59	Adjudication	What explains the 2023 Saudi-Iran rapprochement?	Chinese brokerage combined a security guarantee, economic incentives, and a face-saving formula; the deal was possible because both sides faced a mutually hurting stalemate in Yemen and needed regional de-escalation.	Western accounts credit Chinese power; African observers stress the deal's fragility without inclusive regional architecture, echoing AU concerns about externally imposed pacts.
L59	Mechanism	What is a two-level game?	Putnam's model: leaders negotiate simultaneously at the international table and the domestic ratification table; the "win-set" is the set of agreements ratifiable at home, and its size determines bargaining power.	Two-level games explain why agreements fail post-signature; African cases show win-sets are often shaped by ethnic coalitions and traditional authorities, not just parliaments.
L59	Definition	What are audience costs?	Audience costs are the domestic political penalties a leader pays for backing down from a public commitment; they make threats credible but can also lock leaders into escalation.	Audience costs assume democratic accountability; in authoritarian and hybrid regimes (common in African and Middle Eastern cases), the mechanism operates through elite coalitions rather than public opinion.

Tag	Card Type	Front	Back	Perspective Note
L59	Visual	What does the negotiation framework diagram show?	It maps BATNA, reservation point, target point, and ZOPA on a single axis, with integrative moves expanding the pie and distributive moves claiming slices.	The diagram is Western and static; annotating it with African, Chinese, and Russian overlays reveals how relational and strategic factors shift the axis itself.
L59	Source	What do Lakhdar Brahimi's reports contribute?	Brahimi's reports on UN peace operations emphasize that mediation must be accompanied by political strategy, clear mandates, and adequate resources; mediation without leverage is "just talk."	Brahimi's field experience in Africa and the Middle East grounds the UN perspective in practitioner realism, bridging Western theory and African operational realities.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence Audit (score 0–100)

Competency	Confidence (0–100)	Evidence of mastery
Bargaining theory: Nash, Rubinstein, BATNA, ZOPA		
Integrative vs distributive bargaining		
Mediation and ripeness theory (Zartman)		
Track II and Track III diplomacy		
Two-level games and audience costs		
Perspective reconstruction (all five)		
Worked example: JCPOA		
Problem pair: Saudi-Iran rapprochement		
Data lab interpretation		
Visual anchor reconstruction		

7.2 Three-Question Debrief

1. Which of the five perspectives did you find hardest to reconstruct from within, and what specific assumption of that perspective did you initially resist?
2. In the worked example, did your explanation of JCPOA fragility rely more on bargaining theory or on two-level games — and what evidence would change your weighting?
3. What is one falsifier that would cause you to abandon your current view of mediation effectiveness?

7.3 Error-Log

Common Misconception	Correction	Evidence
Mediation succeeds when the mediator is neutral.	Neutrality is neither necessary nor sufficient; leverage and credibility matter more, and "neutral" mediators often lack the power to enforce deals.	Zartman's ripeness theory; Brahimi reports on UN operations.
A larger ZOPA guarantees agreement.	ZOPA existence is necessary but not sufficient; domestic ratification, audience costs, and framing can still block deals.	Putnam (1988) two-level games; JCPOA US withdrawal.
Integrative bargaining always dominates distributive bargaining.	Integrative gains require trust and information sharing that power-asymmetric or hostile parties often lack; distributive tactics may be rational under uncertainty.	Fisher and Ury (1981) scope conditions; Raiffa (1982) on mixed-motive games.
Audience costs operate identically across regime types.	The mechanism shifts from public opinion in democracies to elite coalitions in authoritarian and hybrid regimes.	Putnam (1988); African and Middle Eastern case evidence.
Track II diplomacy is a substitute for Track I.	Track II complements but cannot replace official negotiation; it prepares the ground and tests ideas without commitment.	Track II literature; UN mediation guidance.
Ripeness is an objective condition discoverable by observers.	Ripeness is partly constructed by mediators through shuttle diplomacy and framing; parties may not perceive MHS until a mediator reframes it.	Zartman (2001); African mediator practice.

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
BATNA, ZOPA, reservation point, target point	Alternating offers, discounting, patience determines split	Nash equilibrium; Rubinstein bargaining	JCPOA 2015; Saudi-Iran 2023	Whether rational-actor models fit real diplomacy	No agreement despite large ZOPA	L20 strategic thought; L3 causal inference
Integrative vs distributive bargaining	Value creation via logrolling, bridging, issue linkage	Fisher and Ury (1981); Raiffa (1982)	Principled negotiation cases	Power asymmetry undermines integrative gains	Integrative moves fail to expand pie	L58 forecasting
Mediation, ripeness, MHS, way out	Shuttle diplomacy, reframing, leverage	Zartman (2001); Brahimi reports	AU mediation; UN good offices	Neutrality vs leverage	Mediation succeeds without MHS	L60 capstone
Track II/III diplomacy	Informal channels, civil society, idea testing	Track II literature; UN mediation guidance	Back-channel Omani track in JCPOA	Substitute vs complement to Track I	Track II produces binding agreement alone	L61 capstone
Two-level games, win-sets, audience costs	Domestic ratification constrains international bargaining	Putnam (1988)	JCPOA US withdrawal; Brexit	Regime-type variation in audience costs	No domestic constraint on leader	L3 causal inference
African perspective: legitimacy, inclusivity, relationship repair	Traditional resolution, AU mediation, "African solutions"	Grovogui, Mbembe, Mamdani, Nyerere, Cabral	AU mediation in Kenya 2008, Sudan	Universalism vs particular-ism	Externally imposed pact durable without local ownership	L20 strategic thought
Chinese perspective: relationality, mediation plus	Guanxi, face, harmony, non-interference	Qin (relational theory)	Saudi-Iran 2023 brokerage	Mediation as power projection vs harmony	Brokered deal collapses without enforcement	L58 forecasting
Russian perspective: mediation as strategic instrument	Leverage, great-power positioning, spoiler management	Russian diplomatic practice	Syria, Libya mediation roles	Mediation as neutrality vs instrument	Mediator's interests override settlement	L60 capstone

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
UN perspective: good offices, mediation support	Mandate, resources, political strategy	Brahimi reports; UN mediation guidance	UN mediation in Yemen, Syria	Talk vs leverage	Mediation without leverage succeeds	L61 capstone

SECTION 9 — REVIEW SCHEDULE

- **R1 (Day 1):** Re-read Section 2.2 (bargaining theory) and Section 2.5 (two-level games); redraw the negotiation framework diagram from memory; check against Section 3.
- **R2 (Day 3):** Reconstruct all five perspectives on the JCPOA from memory in 200 words each; compare to Section 2.8; log gaps in the error-log.
- **R3 (Day 7):** Re-derive Rubinstein's equilibrium split and Putnam's win-set logic without notes; attempt one Data Lab question cold.
- **R4 (Day 14):** Re-read Section 2.7 (five perspectives in depth); write a one-paragraph adjudication of the Saudi-Iran rapprochement; check falsifiers.
- **R5 (Day 30):** Full capstone-style memo on a new negotiation case using the four required headings; time-box to 90 minutes; score against the completion checklist.

SECTION 10 — COMPLETION CHECKLIST

☐ I can define BATNA, ZOPA, reservation point, and target point and locate them on the negotiation framework diagram.
☐ I can derive the Rubinstein split and explain what patience (discounting) does to it.
☐ I can distinguish integrative from distributive bargaining and give a concrete example of each.
☐ I can state Fisher and Ury's four pillars and their main critique.
☐ I can explain Zartman's ripeness theory and why ripeness is necessary but not sufficient.
☐ I can describe three mediator strategies and when each is appropriate.
☐ I can distinguish Track I, Track II, and Track III diplomacy and their complementarity.
☐ I can explain Putnam's two-level game and define the win-set.
☐ I can define audience costs and explain regime-type variation.
☐ I can reconstruct the African perspective on mediation from within, in its own terms.
☐ I can reconstruct the Chinese, Russian, Western, and UN perspectives from within.
☐ I can apply all five perspectives to the JCPOA worked example.
☐ I can adjudicate between competing explanations of the Saudi-Iran rapprochement.
☐ I can interpret the International Negotiation dataset and mediator success rates.
☐ I can identify at least two falsifiers for each key claim.
☐ I can distinguish description, explanation, prediction, and prescription in a memo.
☐ I can redraw the visual anchor from memory.
☐ I have logged at least three errors in the error-log and corrected them.

FURTHER READING (Optional)

Bargaining theory - Fisher, R. and Ury, W. (1981). *Getting to Yes*. New York: Penguin. - Raiffa, H. (1982). *The Art and Science of Negotiation*. Cambridge, MA: Harvard University Press. - Rubinstein, A. (1982). "Perfect Equilibrium in a Bargaining Model." *Econometrica* 50(1): 97–109.

Mediation and ripeness - Zartman, I.W. (2001). "The Timing of Peace Initiatives: Hurting Stalemates and Ripe Moments." *The Global Review of Ethnopolitics* 1(1): 8–18. - Lakhdar Brahimi. 61. Capstone I: Comparative Conflict Analysis

LESSON METADATA

Field	Value
Lesson number and title	Lesson 60 — Capstone I: Comparative Conflict Analysis
Module	Module 10: Forecasting, Diplomacy, and Capstones
Prerequisites	Modules 4–7 (warfare; Africa; Eastern Europe; West Asia)
Interleaved links	Forward to L61 (grand strategy); backward to all previous modules
Reading load	7-9 hours
Content channels	Text; data lab; visuals; flashcards; worked example; problem pair; memo
Bloom ceiling	Evaluate / Create
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

Between 2011 and 2014 three regional systems entered acute crisis within a single half-decade. In the Sahel, the collapse of the Libyan state in 2011, the Malian coup of 2012, and the subsequent jihadist advance toward Bamako shattered a security order that had been managed, however unevenly, by French and regional forces since independence. In West Asia, the Arab uprisings of 2011 transformed Syria from a brittle but functioning authoritarian state into the epicentre of a multi-actor war that drew in Iran, Russia, Turkey, the United States, and a constellation of non-state armed groups. In Eastern Europe, the Maidan revolution of 2013–2014, Russia's annexation of Crimea, and the outbreak of war in the Donbas ruptured the post-Cold War settlement and set in motion the largest interstate conflict on the continent since 1945. A decade on, the trajectories have diverged sharply: the Sahel has experienced serial coups, the expansion of jihadist insurgencies, the withdrawal of French forces, and the entry of Russian private military actors; Ukraine has become a high-intensity interstate war of attrition with global economic spillovers; West Asia has settled into a frozen, multi-layered proxy stalemate in which no actor can impose a decisive outcome. The central puzzle of this capstone is not that conflicts differ — that is trivially true — but that the divergence is *structured*: it follows identifiable mechanisms that sort cases into trajectories, and those mechanisms can be isolated only through disciplined comparative analysis rather than through the idiographic exceptionalism that single-case narrative invites.

The methodological stakes are high. The temptation in International Relations and in policy analysis is to treat each conflict as sui generis — "Syria is complicated," "the Sahel is unique," "Ukraine is about NATO" — which produces rich description and poor explanation. Comparative methodology, in the tradition of Tilly's (1990) comparative historical sociology and the most-similar/most-different designs codified in the comparative politics literature, forces the analyst to hold variables constant across cases and to ask which differences in initial conditions, state capacity, regional security complex, or external intervention type account for divergent outcomes. Kalyvas's (2006) micro-dynamic analysis of civil war violence demonstrates that even within a single conflict, outcomes vary systematically with local conditions rather than with aggregate grievance, and that the same theoretical lens must be tested against variation rather than asserted from a single case. Buzan and Wæver's (2003) regional security complex theory supplies the crucial insight that security dynamics are regionally clustered: the Sahel, West Asia, and Eastern Europe are not interchangeable theatres but distinct complexes with different patterns of amity and enmity, different densities of great-power penetration, and different institutional architectures. The lesson trains the student to move from "what happened in this case" to "why this trajectory rather than another, and under what conditions would the trajectory change."

The theoretical challenge is synthetic. No single theory commands all three cases. Structural realism explains the great-power competition that frames each conflict — NATO expansion and Russian reaction in Eastern Europe, US-Iranian rivalry in West Asia, French and Russian competition in the Sahel — but it struggles to explain why state collapse occurred in Mali and Syria while Ukraine, despite comparable external pressure, retained sufficient state capacity to resist. Political economy explains the resource and rentier dynamics that fund armed groups and shape state incentives — hydrocarbons in Syria and the Gulf, minerals and trafficking rents in the Sahel, grain and energy in Ukraine — but it under-theorises the ideational and identity dimensions that mobilise fighters and legitimate violence. Post-colonial critique explains the coloniality of the state, the externalisation of security, and the limits of liberal peacebuilding in the Sahel and West Asia, but it risks under-specifying the agency of local actors and the genuine variation in state capacity across post-colonial cases. The capstone does not ask the student to choose one theory; it asks the student to adjudicate among them on the basis of evidence, to specify the scope conditions under which each travels, and to identify the

mechanisms that each theory illuminates and occludes. This is the intellectual move from theory-application to theory-evaluation, and it is the defining competence of post-doctoral-level analysis.

The African perspective is not one case among five; it is the vantage point from which the lesson's central puzzle is reframed. From within African scholarship — Grovogui on the international as a colonial project, Mbembe on necropolitics and the postcolony, Mamdani on the bifurcated state and the citizen-subject distinction, Rodney on underdevelopment as a historical process, Nkrumah on neo-colonialism, Nyerere on ujamaa and self-reliance, Cabral on the weapon of theory, Fanon on the wretched of the earth and the pitfalls of national consciousness, Bayart on the politics of the belly and extraversion, Aning and Danso on African agency in security governance, Tamale on decolonisation and feminist ethics, Oyěwùmí on the coloniality of gender and knowledge — the Sahel conflict is not a security problem to be managed by external powers but a symptom of a deeper structure: the colonial state form, the externalisation of security to former metropoles, the extraction of resources under the guise of counter-terrorism, and the systematic discounting of African institutional capacity. This vantage point reveals what the Western and UN frameworks occlude: that "state failure" is often a misnomer for state forms that were never designed to serve their populations; that "terrorism" is a category that legitimises external intervention; and that the withdrawal of French forces and the entry of Russian actors is not a change of patron but a reproduction of the same externalised security logic under a different flag. The African perspective thus reframes the comparative question: not "why did the Sahel collapse while Ukraine resisted?" but "why is external security provision treated as normal in Africa and as exceptional in Europe, and what does that asymmetry reveal about the international order?"

The lesson also carries forecasting and policy implications that the student must derive rather than receive. Comparative analysis yields conditional, mechanism-based forecasts: if external intervention takes the form of kinetic counter-terrorism without state-building, as in the Sahel, the trajectory is fragmentation and coup cycles; if it takes the form of great-power proxy support to a functioning state, as in Ukraine, the trajectory is prolonged interstate attrition; if it takes the form of multi-actor proxy competition over a collapsed state, as in Syria, the trajectory is frozen stalemate with periodic escalation. These are not predictions but conditional expectations, and each must be accompanied by falsifiers — observable developments that would invalidate the forecast. Policy implications diverge systematically by perspective: Western liberal institutionalism recommends security-sector reform, democratic governance, and multilateral peacekeeping; Russian realism recommends sphere-of-influence recognition and state-to-state deals; Chinese developmentalism recommends infrastructure, non-interference, and economic integration; UN multilateralism recommends ceasefire, humanitarian access, and inclusive political processes; African ownership recommends African-led mediation, Agenda 2063 alignment, and the restructuring of external security partnerships. The student must not only enumerate these recommendations but adjudicate among them, identifying which are supported by the comparative evidence and which rest on normative commitments that the evidence does not settle.

By the end of this lesson the student will be able to design a comparative study of armed conflict using most-similar and most-different logics; to reconstruct the five perspectives on each of the three cases with fidelity to their internal logic; to produce a mechanism-based, conditional forecast with explicit falsifiers; and to write a policy memo that distinguishes description, explanation, prediction, and prescription. The lesson is the first of two capstones: it consolidates Modules 4 through 7 into a single analytical exercise, and it prepares the ground for Lesson 61 on grand strategy, where the comparative findings are translated into long-term strategic design. The student who masters this lesson will have demonstrated the capacity to hold multiple theoretical frameworks and multiple normative vantage points in suspension while rendering a reasoned, evidence-based judgement — the defining skill of the advanced International Relations analyst.

SECTION 1 — Pre-Class Priming

1.1 Retrieval Warm-Up

Answer the following from memory before reading the lesson core. Each question draws on Modules 4–7.

1. **Warfare module (Module 4):** Distinguish interstate war, intrastate war, and extra-state war as categories in the Correlates of War typology. Which category has dominated the post-1945 period, and what does that imply for how "war" is conventionally defined in Western strategic studies?
2. **Africa module (Module 5):** What is the "bifurcated state" in Mamdani's (1996) account, and how does the citizen/subject distinction explain the differential application of civil and customary law? Apply this to the Sahel: how does the colonial state form shape contemporary security governance?
3. **Eastern Europe module (Module 6):** Explain the security dilemma as it operates in the NATO–Russia context. Under what conditions does defensive arming become perceived as offensive threat, and how does this mechanism interact with alliance expansion?
4. **West Asia module (Module 7):** Define "regional security complex" in Buzan and Wæver's (2003) sense. How does the density of great-power penetration and the pattern of amity/enmity in West Asia differ from that in the Sahel?
5. **Civil war micro-dynamics:** State Kalyvas's (2006) core argument about the relationship between aggregate grievances and local violence. What does his framework imply for the unit of analysis in comparative conflict research?
6. **Comparative method:** Distinguish most-similar systems design (MSSD) from most-different systems design (MDSD). For a comparison of the Sahel, Ukraine, and Syria, which design is more appropriate, and what must the analyst hold constant?

1.2 Orientation Questions

1. The Sahel, Ukraine, and Syria all experienced acute crisis between 2011 and 2014. Why might their trajectories have diverged so sharply a decade later, and which variables — state capacity, regional security complex, intervention type, resource endowment — best explain the divergence?
2. Which theoretical framework — structural realism, political economy, or post-colonial critique — best explains the pattern of external intervention across the three cases, and what does each framework fail to explain?
3. What does the African vantage point reveal about the Sahel conflict that Western security studies and UN peacebuilding frameworks systematically occlude, and how does that reframe the comparative question?
4. A forecast that "the Sahel will continue to fragment" is only useful if it is falsifiable. What observable developments over the next five years would invalidate this forecast, and what would confirm it?

1.3 Vocabulary Pre-Teach

The following terms are used throughout the lesson. Definitions are provisional and will be refined in the core.

- **Most-similar systems design (MSSD):** A comparative strategy that selects cases similar on many variables but differing on the outcome, in order to isolate the causal variable that accounts for the difference.
- **Most-different systems design (MDSD):** A comparative strategy that selects cases differing on many variables but sharing the same outcome, in order to identify the common causal factor.
- **Regional security complex:** A set of states whose security concerns are so interlinked that they cannot be analysed or resolved apart from one another (Buzan and Wæver, 2003).
- **Proxy war:** An armed conflict in which external powers support local belligerents rather than engaging directly, typically to avoid escalation while pursuing strategic interests.
- **State fragmentation:** The process by which central authority erodes and territory, populations, and coercive capacity are divided among competing actors, including non-state armed groups.
- **Rentier state:** A state whose revenues derive primarily from external rents (hydrocarbons, minerals, aid, trafficking) rather than from domestic taxation, weakening accountability and state-society bargaining.
- **Coloniality:** The enduring patterns of power, knowledge, and being established by colonialism that persist after formal independence, structuring states, economies, and epistemologies.
- **Security dilemma:** A situation in which measures taken by one state to increase its security are perceived as threatening by others, prompting countermeasures that leave all less secure.
- **Civil-military relations:** The institutional and political relationship between armed forces and civilian authority, including coup propensity, military autonomy, and the militarisation of politics.
- **Intervention fatigue:** The erosion of domestic political support for sustained external military engagement, often leading to withdrawal or mission contraction.
- **Trajectory:** The path-dependent sequence of conflict phases and outcomes over time, shaped by initial conditions, feedback loops, and external shocks.
- **Falsifier:** An observable condition or event that, if it occurred, would invalidate a given hypothesis or forecast, distinguishing scientific claims from unfalsifiable assertions.

SECTION 2 — LESSON CORE

2.1 Learning objectives

By the end of this lesson, the student will be able to:

1. **Define** the most-similar systems design (MSSD) and the most-different systems design (MDSD) as articulated by Przeworski and Teune (1970) and Lijphart (1971), distinguishing each from Mill's (1843) methods of agreement and difference, and specifying the logical structure, inferential gains, and inferential losses that follow from holding context constant versus varying it.

2. **Explain** the mechanism through which comparative design choice shapes causal visibility: MSSD isolates the independent variable by suppressing contextual variance, thereby privileging agency-level and policy-level explanations, whereas MDSD suppresses independent-variable variance by selecting

on the outcome, thereby privileging structural and systemic explanations, and demonstrate how this mechanism operates across the Sahel, Ukraine, and West Asia triad.

3. **Apply** both designs to the three cases, producing a structured comparison that identifies which variables are held constant and which are allowed to vary under each design, and derive at least two competing causal accounts of conflict trajectory that survive the comparison.

4. **Evaluate** the scope conditions under which each design yields valid inference in conflict studies, including the small-N problem, selection on the dependent variable, endogeneity between intervention and outcome, and the temporal non-stationarity of conflict processes, and identify the strongest counterargument to each design's validity.

5. **Synthesize** the comparative findings with realism, political economy, and post-colonial critique, and with the five perspectives (African, Chinese, Russian, Western, UN), to produce an adjudicated judgment about which mechanisms dominate in which cases and why, and to state the falsifiers that would overturn that judgment.

2.2 KEY IDEA 1 — Comparative methodology: most-similar and most-different designs applied to conflict

Bolded Causal Claim: The choice between a most-similar systems design and a most-different systems design is not a neutral methodological preference but a causal act: it determines which mechanisms become visible, which are rendered invisible, and therefore which policy prescriptions can even be formulated, so that two analysts studying the same three conflicts with different designs will produce incompatible but internally coherent explanations.

Mechanism: In MSSD, the analyst selects cases that are similar on a large set of background variables — regime type, level of development, colonial history, regional security environment — but differ on the outcome of interest and on one or a few hypothesized causal variables. The logic, derived from Mill's method of difference, is that if two otherwise similar cases diverge in outcome, the divergence must be attributable to the variable on which they differ. In conflict studies this means comparing, say, two Sahelian states with similar ethnic composition and poverty levels but different rebel group structures, or two post-Soviet states with similar institutional inheritances but different conflict trajectories. The design holds context constant, which has the effect of suppressing structural and systemic variance and amplifying the variance attributable to agency, policy choice, and local institutional configuration. The mechanism is one of variance suppression: by construction, MSSD makes structural factors appear constant and therefore causally inert, while making the residual variance — often policy, leadership, or organizational — appear as the active cause. In MDSD, by contrast, the analyst selects cases that differ on nearly every background variable — geography, regime, economy, culture, colonial history — but share the outcome of interest. The logic, derived from Mill's method of agreement, is that if dissimilar cases converge on the same outcome, the cause must be a variable common to all of them, which is typically a structural or systemic feature: great-power intervention, global commodity prices, the architecture of the international state system, or the diffusion of military technology. MDSD holds the outcome constant and lets context vary, which suppresses the variance of the outcome and amplifies the variance of structural conditions, making systemic and transnational mechanisms visible while rendering local agency and policy choice comparatively invisible. The mechanism is again variance suppression, but in the opposite direction: MDSD makes the local appear epiphenomenal and the global appear causal. The critical point for conflict analysis is that these two designs do not merely

produce different emphases; they produce different ontologies of causation. An MSSD comparison of the Sahel, Ukraine, and West Asia would require finding a subset of cases similar enough to sustain the design — perhaps comparing Mali and Burkina Faso within the Sahel, or comparing Ukraine with Georgia — and would tend to highlight differences in state capacity, rebel organization, or external patronage as the decisive variables. An MDSD comparison of the same three regions would treat their radical dissimilarity as a feature, not a bug, and would tend to highlight common structural drivers: the post-Cold War reconfiguration of great-power competition, the diffusion of light weapons, the global war on terror's institutional legacy, or the financialization of resource extraction. Neither design is wrong; each makes a different slice of reality legible. The analyst's choice is therefore a theoretical commitment disguised as a methodological one, and the capstone's task is to make that commitment explicit and to triangulate across both designs rather than treating either as sufficient.

Scope Conditions: MSSD yields valid inference only when the cases are genuinely similar on the variables held constant — a condition that is rarely satisfied in cross-regional conflict comparison and that is especially fragile when colonial history, state formation trajectories, and security architectures differ as radically as they do across the Sahel, Eastern Europe, and West Asia. The design also assumes that the outcome is caused by a single variable or a small set of variables, which is implausible for civil wars and interstate conflicts where multiple causal pathways typically operate. MDSD yields valid inference only when the common outcome is produced by a genuinely common cause rather than by equifinality — the possibility that different causal pathways lead to the same outcome — which is a persistent threat in conflict studies because rebel victory, state collapse, and protracted stalemate can each arise from distinct mechanisms. Both designs are vulnerable to selection on the dependent variable: if cases are selected because they experienced conflict, the analyst cannot estimate the probability of conflict given the hypothesized causes, and the design cannot distinguish causes of conflict from causes of peace. Both are also vulnerable to endogeneity: external intervention is both a cause and a consequence of conflict intensity, so comparing intervened and non-intervened cases confounds the effect of intervention with the severity of the conflict that triggered it. Temporal non-stationarity compounds these problems: the causal structure of conflict in the Sahel in 2012 differs from that in 2024, and a design that treats the conflict as a single case may obscure regime changes in causation. The strongest counterargument to MSSD is that in conflict studies the most interesting variation is often cross-regional, which MSSD by construction suppresses; the strongest counterargument to MDSD is that its cases are so dissimilar that any common cause identified is likely to be so abstract — "state weakness," "great-power competition" — as to be unfalsifiable and therefore theoretically empty.

Observable Implications: If MSSD is the appropriate design, then we should observe that conflicts with similar structural profiles but different rebel organizational forms produce different trajectories — for instance, that Mali's fragmented insurgency produces different dynamics than a more centralized rebel movement in a structurally similar neighbor. If MDSD is appropriate, we should observe that conflicts with radically different local profiles but common great-power involvement produce convergent trajectories — for instance, that French intervention in the Sahel, Russian intervention in Syria, and NATO support for Ukraine all produce similar patterns of escalation and stalemate despite vastly different local conditions. A further implication is that the two designs should yield different rankings of causal importance: MSSD should elevate variables like rebel cohesion and state capacity, while MDSD should elevate variables like external military support and global arms flows. The analyst can test these implications by running both designs on the same data and checking whether the resulting causal accounts are genuinely incompatible or merely differently emphasized. If they are incompatible, the conflict process is likely characterized by causal heterogeneity — different mechanisms in different cases — which itself is a substantive finding. If they are compatible, the

mechanisms identified are robust across design choices, which strengthens confidence in them. A final implication concerns prediction: MSSD-based predictions should perform better within regions and worse across regions, while MDSD-based predictions should perform better at identifying global risk factors and worse at predicting specific conflict trajectories.

Perspective Note (five traditions in brief):

African (primary): The African perspective, drawing on the tradition from Rodney through Mamdani, Aning, and Danso, treats comparative methodology itself as a site of epistemic politics. The claim is not that MSSD and MDSD are technically flawed but that they are embedded in a knowledge-production regime that has historically positioned African conflicts as cases to be explained by Western theory rather than as sources of theory. From this vantage, the most-similar design is particularly suspect because it typically selects African cases as the "similar" background against which non-African cases are compared, implicitly treating African statehood as the default or deficient form. The most-different design, while apparently more respectful of African specificity, often reduces African conflicts to instances of global structural forces — resource extraction, great-power competition — thereby erasing the agency of African actors and the specificity of African political forms. The African perspective therefore demands a comparative methodology that is not merely applied to Africa but generated from African experience: a design that takes seriously the distinctiveness of African state formation, the legacy of colonial borders, the role of informal and customary authority, and the agency of non-state actors including women and youth. This is not a rejection of comparison but a demand that the terms of comparison be set, at least in part, by African scholars and African political actors rather than by the methodological conventions of Western political science. The African vantage point reveals that the very choice between MSSD and MDSD presupposes a particular ontology of the state and of causation that is not universally shared, and that comparative conflict analysis that does not interrogate this presupposition risks reproducing the epistemic hierarchies it claims to transcend.

Chinese: The Chinese perspective approaches comparative methodology through the lens of developmental state theory and the principle of non-interference, emphasizing that valid comparison must account for the diversity of development paths and political systems. Chinese scholarship tends to be skeptical of designs that treat regime type as a background variable to be held constant, arguing that the developmental trajectory of the state — its capacity, its relationship to society, its integration into global production networks — is itself the primary causal variable and cannot be bracketed. From this view, MDSD is more promising than MSSD because it allows the comparison of different development models, but it must be supplemented with attention to the specific institutional mechanisms through which states manage conflict. The Chinese perspective contributes the insight that comparative design should be historically specific rather than abstractly formal, and that the category of "conflict" itself may be defined differently across political systems.

Russian: The Russian perspective, shaped by the Soviet and post-Soviet experience of comparative analysis, tends to view methodological debates as themselves ideological, arguing that Western comparative frameworks embed liberal assumptions about statehood, democracy, and conflict that are not neutral. Russian scholarship often favors MDSD on the grounds that it can reveal the common structural drivers of conflict — great-power competition, NATO expansion, the collapse of multipolar order — that MSSD obscures by focusing on local variation. The Russian perspective contributes the insistence that comparative methodology must be explicit about its geopolitical premises and that the selection of cases is never innocent of power politics. It also emphasizes the importance of historical depth: comparisons that do not account for the longue durée of imperial and Soviet legacies are methodologically deficient.

Western: The Western perspective, rooted in the positivist and analytic traditions of political science, treats

MSSD and MDSD as well-established tools with known strengths and limitations, and emphasizes the importance of research design, causal identification, and falsifiability. Western scholarship has produced the most extensive methodological literature on comparative conflict analysis, including the large-N statistical tradition that extends Mill's methods to probabilistic inference. The Western perspective contributes rigor in design, transparency in case selection, and a commitment to evidence-based adjudication, but it is also the perspective most likely to treat methodological choices as technically rather than politically consequential, and to understate the epistemic politics that the African perspective highlights.

UN: The UN perspective approaches comparative methodology from the standpoint of policy relevance and operational utility, emphasizing that designs must produce actionable findings for peacebuilding, mediation, and humanitarian response. The UN view tends to favor pragmatic comparison over methodological purity, and to value designs that can identify common intervention points across diverse conflicts. The UN perspective contributes the insistence that comparative analysis must be accountable to the populations affected by conflict and must not treat cases as mere data points, but it also risks subordinating analytical rigor to operational convenience and to the institutional interests of the organization.

2.3 KEY IDEA 2 — Sahel vs Eastern Europe vs West Asia: Comparing Conflict Trajectories

Bolded Causal Claim: The divergent trajectories of the Sahel (2012–present), Ukraine (2014–present), and West Asia (2011–present) are not explained by the presence or absence of violence per se but by the interaction of state capacity at conflict onset, the type of external intervention, and the degree to which conflict is embedded in transnational political economies, producing three distinct conflict ecologies that comparative analysis must treat as structurally different rather than as variants of a single "civil war" template.

Mechanism: The mechanism operates through three channels that interact rather than simply add. First, state capacity at conflict onset determines the *form* violence takes. In the Sahel, the Malian state's inability to project authority into the north after the 2012 Tuareg rebellion and the subsequent jihadist takeover created a vacuum that external actors could not fill; state collapse preceded and enabled armed group proliferation. In Ukraine, the state retained sufficient capacity to mobilize a national defense, transforming what began as separatist insurgency into interstate war; the state was contested but not collapsed. In West Asia, the Syrian state's partial collapse produced multi-actor fragmentation in which no single faction could achieve dominance, creating a "war of all against all" in which external powers became the decisive actors. Second, external intervention type shapes trajectory in ways that are not interchangeable. France's counterterrorism intervention in the Sahel (Operation Serval, then Barkhane) prioritized kinetic elimination of jihadist leaders over state-building, producing a "whack-a-mole" dynamic in which decapitation strikes disrupted leadership but did not degrade organizational capacity; the intervention also delegitimized the Malian state by substituting French military authority for Malian political authority. US/NATO support to Ukraine emphasized military assistance, intelligence sharing, and sanctions, reinforcing rather than replacing state capacity; the intervention was designed to enable Ukrainian self-defense rather than to fight on Ukraine's behalf. US, Iranian, and Russian interventions in West Asia created a proxy war architecture in which local actors—rebel factions, militias, Kurdish forces—became instruments of regional competition, with each external power backing a different constellation of actors and no single power able to impose order. Third, transnational political economy embeds each conflict differently and determines which external actors have stakes, what resources sustain fighting, and whether resolution requires addressing local grievances or regional bargains. The Sahel's conflict is linked to gold mining (artisanal and industrial),

trafficking routes (drugs, arms, migrants), and pastoralist mobility across porous borders; these economies sustain armed groups independently of ideological commitment. Ukraine's conflict is linked to energy transit (gas pipelines, nuclear infrastructure), grain exports (Black Sea shipping), and industrial supply chains (defense manufacturing, semiconductor inputs); these create dependencies that shape both war sustainability and bargaining positions. West Asia's conflict is linked to oil (production, transit, pricing), refugee flows (displacement as a weapon and a burden), and sectarian networks (transnational religious and ethnic solidarities); these create regional spillover effects that make the conflict inherently international. The mechanism is interactive: state capacity determines whether external intervention can be effective; intervention type determines whether state capacity is reinforced or undermined; political economy determines whether the conflict can be resolved through state-centric bargaining or requires addressing transnational networks.

Scope Conditions: This comparative framework applies most strongly when conflicts are (a) ongoing for more than a decade, (b) involve at least one external state actor, and (c) occur in regions with weak or contested state capacity. It applies less well to short, contained conflicts (where intervention type may not have time to shape trajectory) or to conflicts in strong states (where state capacity absorbs external pressure). The framework also assumes that "trajectory" can be measured by a combination of territorial control, civilian casualties, displacement, and state capacity indicators; if these metrics diverge—for example, if territory is stabilized but displacement continues, or if casualties decline but state capacity erodes—the comparison becomes more complex and may require disaggregating the concept of "trajectory" into multiple dimensions. The framework does not claim that the three cases are exhaustive of conflict types globally; rather, they represent three poles of a spectrum from state collapse (Sahel) to interstate war (Ukraine) to proxy fragmentation (West Asia), and other conflicts may occupy intermediate positions. The framework also assumes that external intervention is a variable rather than a constant; in conflicts without external intervention, the state capacity and political economy channels would dominate, and the comparison would need to be restructured.

Observable Implications: If the mechanism holds, we should observe several patterns. First, Sahel conflict indicators—ACLED event counts and fatalities—should remain high or increase despite French and subsequent Russian (Wagner/Africa Corps) intervention, with territorial control shifting between state, jihadist, and militia actors but no durable stabilization; the "whack-a-mole" dynamic should be visible in the replacement of decapitated leaders by new commanders without organizational degradation. Second, Ukraine should exhibit a different pattern: territorial contestation concentrated along a front line, with state institutions functioning in government-controlled areas, external support sustaining military capacity, and the conflict taking on increasingly interstate characteristics (mobilization, conscription, industrial warfare) rather than irregular ones. Third, West Asia should show the highest number of distinct armed actors and the most fragmented territorial control, with external powers maintaining influence through proxies rather than direct occupation, and with conflict intensity fluctuating in response to regional bargains (e.g., Iran-Saudi détente, US withdrawal from Syria) rather than to battlefield outcomes alone. Cross-regionally, conflicts with higher state capacity at onset (Ukraine) should sustain longer conventional phases, while conflicts with lower state capacity (Sahel, Syria) should fragment into irregular warfare and proxy competition. Civilian casualty patterns should differ systematically: Sahel casualties concentrated in rural areas and among pastoralist communities, reflecting the geographic distribution of state absence and armed group presence; Ukraine casualties concentrated along front lines and in urban areas, reflecting conventional warfare patterns; West Asia casualties distributed across multiple theaters with high displacement, reflecting proxy war and state fragmentation. Humanitarian funding per capita should be highest for Ukraine and lowest for the Sahel, reflecting the racialized and geopolitical attention structures that the African perspective highlights.

Perspective Note (five traditions in brief):

African (primary): The African perspective on comparing Sahel, Ukraine, and West Asia begins from the premise that the comparison itself is politically consequential and that the categories used to compare are not neutral. Drawing on Grovogui's critique of international legal frameworks that privilege state sovereignty over communal survival, Mbembe's analysis of necropolitics and the coloniality of violence, Bayart's "politics of the belly" and the extraversion of African states, Mamdani's distinction between citizen and subject in colonial governance, Rodney's underdevelopment thesis, Nkrumah's neo-colonialism, Nyerere's ujamaa and non-alignment, Cabral's theory of national liberation, and Fanon's analysis of colonial violence, the African perspective treats the Sahel conflict not as a "case" of state failure but as a continuation of colonial state formation. The comparison with Ukraine and West Asia risks obscuring the specific colonial genealogy of Sahelian state weakness: the French colonial partition of the region, the imposition of arbitrary borders, the extraction of resources without state-building, and the post-independence perpetuation of extraverted elites who depend on external patronage rather than domestic legitimacy. The African vantage point reveals what other perspectives miss: that "external intervention" in the Sahel is not a new phenomenon but a continuation of French military presence since independence, and that comparing the Sahel to Ukraine—where Western support is framed as defending sovereignty—exposes a double standard in which African sovereignty is routinely violated by the same powers that invoke sovereignty elsewhere. The African perspective further insists that the metrics of comparison (casualties, displacement, territorial control) are shaped by racialized attention: Sahelian casualties receive less international coverage and less humanitarian funding per capita than Ukrainian casualties, a disparity that comparative methodology must account for rather than reproduce. Finally, the African perspective contributes the insight that conflict trajectories in the Sahel are shaped by ecological and pastoralist dynamics—mobility, drought, land tenure, transhumance—that do not map onto the state-centric frameworks used to analyze Ukraine or West Asia, and that any comparison excluding these dimensions is analytically incomplete.

Chinese: The Chinese perspective approaches the three-way comparison through the lens of sovereignty, non-interference, and development-security linkage. China views the Sahel conflict as a symptom of underdevelopment and weak state capacity, addressable through infrastructure investment and economic engagement; Ukraine as a crisis of European security architecture in which NATO expansion is a root cause; and West Asia as a region destabilized by external intervention, particularly US regime-change efforts. The Chinese perspective contributes the emphasis on economic drivers of conflict and the critique of military intervention, but it occludes the role of Chinese economic interests in shaping conflict dynamics—resource extraction, arms sales, debt-trap diplomacy—and tends to treat sovereignty as an absolute principle that shields partner governments from accountability.

Russian: The Russian perspective frames the three conflicts through the lens of multipolarity and Western hegemony. Russia views the Sahel as a region where French neocolonial influence is being challenged and where Russian military cooperation offers an alternative security partnership; Ukraine as a direct threat to Russian security interests and a proxy war with NATO; West Asia as a theater where Russian intervention in Syria preserved a sovereign government against Western-backed regime change. The Russian perspective contributes the critique of Western interventionism and the emphasis on state sovereignty, but it occludes the destabilizing effects of Russian arms transfers, mercenary operations, and information warfare, and it tends to instrumentalize local conflicts for great-power competition.

Western: The Western perspective (US/EU) frames the comparison through liberal internationalism and security studies: the Sahel as a counterterrorism challenge requiring capacity-building and governance reform; Ukraine as a defense of the rules-based order against aggression; West Asia as a complex crisis requiring humanitarian response, counterterrorism, and great-power management. The Western perspective contributes

extensive data collection (ACLED, UCDP), institutional frameworks for comparison, and resources for intervention, but it occludes the historical responsibility of Western powers for state weakness in the Sahel and West Asia, and it tends to treat Western intervention as a solution rather than a variable in conflict trajectories.

UN: The UN perspective approaches the comparison through the lens of peace operations, humanitarian law, and sustainable development. The UN views all three conflicts as requiring integrated responses combining security, development, and governance, and emphasizes the protection of civilians, humanitarian access, and the role of regional organizations (AU, ECOWAS, OSCE, Arab League). The UN perspective contributes normative frameworks and operational experience, but it occludes the political constraints on UN action (Security Council divisions, host-state consent) and tends to treat conflicts as manageable through institutional mechanisms that may not address root causes.

2.4 KEY IDEA 3 — Synthesis of Realism, Political Economy, Post-Colonial Critique, and the Five Perspectives

Bolded Causal Claim: No single theoretical tradition—realism, political economy, or post-colonial critique—can adequately explain the three conflicts; each tradition captures a necessary but insufficient dimension, and the five perspectives each embed one or more of these traditions, so that rigorous comparative analysis requires a synthetic framework that assigns each theory a specific scope condition and treats their combination, not their competition, as the explanatory unit.

Mechanism: The synthesis operates through a division of labor among theories, with each theory assigned to a specific dimension of conflict and with explicit attention to where theories overlap and where they conflict. Realism—drawing on Morgenthau's (1948) classical realism, Waltz's (1979) structural realism, and Mearsheimer's (2001) offensive realism—explains the interstate and great-power dimensions: NATO-Russia competition in Ukraine, US-Iran-Russia rivalry in West Asia, and French/Russian competition for influence in the Sahel. Realism's mechanism is the security dilemma and balance of power: states act to maximize security under anarchy, and interventions are driven by relative power calculations rather than by normative commitments. Realism predicts that external powers will intervene when their security interests are threatened, that interventions will be shaped by power asymmetries, and that conflicts will persist as long as the underlying power competition persists. Political economy—drawing on Tilly's (1990) "war making and state making as organized crime," Kalyvas's (2006) "logic of violence in civil war," and Collier and Hoeffler's (2004) "greed vs. grievance" framework—explains the resource and incentive structures that sustain fighting. Tilly's mechanism is that war and state-making are mutually constitutive: rulers extract resources to fund armies, and armies protect extraction, creating a fiscal-military state that may or may not deliver public goods. In the Sahel, this mechanism explains how armed groups extract rents from gold mining and trafficking, becoming "stationary bandits" who provide a modicum of order in exchange for resources. Kalyvas's mechanism is that violence in civil war is not random but follows a "logic" determined by the interaction of macro-level cleavages (ethnic, ideological) and micro-level denunciations (local grievances, personal rivalries); violence is most intense where control is contested, not where one side dominates. This explains why Sahelian violence concentrates in areas where state and armed group presence overlap, and why Ukrainian violence concentrates along the front line. Collier and Hoeffler's mechanism is that resource endowments ("greed") and horizontal inequalities ("grievance") create the economic conditions for sustained rebellion; this explains why resource-rich regions (Sahelian gold zones, Ukrainian industrial east, Syrian oil fields) experience more intense and prolonged conflict. Post-colonial critique—drawing on Fanon's (1961) analysis of

colonial violence, Mbembe's (2001, 2019) work on necropolitics and the postcolony, Grovogui's (2006) critique of Eurocentric international relations, Mamdani's (1996, 2009) analysis of colonial governance and its contemporary legacies, Rodney's (1972) underdevelopment thesis, and Nkrumah's (1965) neo-colonialism—explains the historical depth and structural vulnerability of certain states. Its mechanism is that the colonial state was not a failed attempt at European state-building but a distinct "modality of power" designed for extraction and control rather than for public goods provision; post-independence states inherited this modality, and post-colonial elites perpetuated it through extraversion (Bayart 1993)—dependence on external resources and patronage rather than domestic legitimacy. This explains why Sahelian states are structurally weak, why West Asian states (Syria, Iraq, Libya) were vulnerable to fragmentation when challenged, and why the international order distributes attention and resources unequally. The synthesis mechanism is not additive but interactive: realism explains *why* external powers intervene, political economy explains *how* conflicts are sustained, and post-colonial critique explains *why* certain states are vulnerable to intervention and why certain populations bear disproportionate costs. The five perspectives embed these theories differently: the African perspective is primarily post-colonial with political economy elements; the Chinese perspective combines realism (multipolarity) with political economy (development); the Russian perspective is realist with post-colonial rhetorical elements; the Western perspective combines liberal institutionalism with political economy; the UN perspective combines liberal institutionalism with human security.

Scope Conditions: The synthesis applies when conflicts are (a) multi-actor, involving both state and non-state armed groups; (b) involve both internal and external dimensions, with at least one external state actor; and (c) persist over years or decades, allowing structural factors to manifest. It applies less well to short, contained conflicts (where realist power calculations may dominate and structural factors may not have time to operate) or to conflicts in strong states (where state capacity absorbs both internal and external pressure). The synthesis also requires that the analyst can identify which theoretical tradition applies to which dimension of the conflict; if the dimensions are inseparable—for example, when resource extraction is simultaneously a political economy mechanism (rent-seeking) and a post-colonial legacy (colonial extraction patterns)—the synthesis must treat them as co-constitutive rather than additive. The synthesis does not resolve the ontological tensions between realism (which treats the state as the primary unit of analysis) and post-colonial critique (which treats the state as a colonial artifact); it holds them in productive tension, using realism to explain interstate dynamics and post-colonial critique to explain state vulnerability. The synthesis also does not claim that all three traditions are equally applicable to all three cases; as the observable implications suggest, realism dominates in Ukraine, post-colonial critique dominates in the Sahel, and all three are strongly present in West Asia.

Observable Implications: If the synthesis holds, we should observe several patterns. First, in the Sahel, realist competition (France vs. Russia) overlays political economy (gold, trafficking, pastoralist resources) overlays post-colonial state weakness, producing a conflict that cannot be resolved by addressing any single dimension: counterterrorism (realist) fails without state-building (post-colonial) and without addressing resource economies (political economy). Second, in Ukraine, realism (NATO-Russia) dominates the macro-level, but political economy (energy, grain, industrial capacity, defense manufacturing) shapes the sustainability of war and the bargaining space; post-colonial critique is less applicable (though not absent—the colonial legacy of Soviet nationalities policy shaped the Donbas conflict, and the racialized attention to Ukrainian vs. Sahelian casualties reflects post-colonial hierarchies). Third, in West Asia, all three traditions are strongly present: realism (US-Iran-Russia competition), political economy (oil, arms, reconstruction contracts, refugee economies), and post-colonial critique (Sykes-Picot borders, sectarian statecraft, Western intervention). Cross-perspectivally, we should observe that each perspective's policy recommendations reflect

its theoretical embeddedness: the African perspective recommends addressing colonial legacies, extraversion, and resource sovereignty; the Chinese perspective recommends development, non-interference, and multipolarity; the Russian perspective recommends sovereignty, anti-hegemony, and great-power concert; the Western perspective recommends liberal order, capacity-building, and rules-based intervention; the UN perspective recommends integrated peacebuilding, civilian protection, and regional cooperation. The synthesis predicts that policies addressing only one dimension will fail: counterterrorism without state-building (Western approach in the Sahel) fails; development without security (Chinese approach) fails; sovereignty without accountability (Russian approach) fails; peacebuilding without power (UN approach) fails.

Perspective Note (five traditions in brief):

African (primary): The African perspective on synthesis begins from the insistence that post-colonial critique is not one theory among three but the foundational framework within which realism and political economy must be situated. Drawing on Grovogui's (2006) argument that international relations theory is itself a product of colonial power and that "anarchy" is a Eurocentric construct that obscures the hierarchical global order, the African perspective treats realism's state-centric ontology as historically specific rather than universal: the state form that realism takes as given was imposed on Africa through colonialism, and its weakness is not a deviation from a European norm but a consequence of colonial state formation. Mbembe's (2001) concept of the "postcolony" and his later work on necropolitics (2019) provide the mechanism: colonial violence established a "state of exception" in which certain populations were rendered killable, and this logic persists in contemporary conflict, where Sahelian pastoralists and West Asian civilians are subjected to violence that would be unthinkable in European contexts. Rodney's (1972) underdevelopment thesis and Nkrumah's (1965) neo-colonialism explain the political economy dimension: African underdevelopment is not a natural condition but a product of colonial extraction and its continuation through neo-colonial economic structures, and contemporary conflicts over resources (gold, uranium, oil) are continuations of colonial extraction patterns. Mamdani's (1996) distinction between "citizen" and "subject" in colonial governance explains why post-colonial states are structurally weak: colonial states governed through "decentralized despotism," empowering chiefs and ethnic authorities rather than building national institutions, and post-independence states inherited this structure. The African perspective's contribution to synthesis is the insistence that realism and political economy, when applied to Africa without post-colonial critique, reproduce colonial epistemologies: they treat African state weakness as a given rather than as a product of history, and they treat African conflicts as "internal" rather than as products of a global order shaped by colonialism. The African perspective also contributes the concept of "extraversion" (Bayart 1993): post-colonial states depend on external resources and patronage, making them vulnerable to external manipulation and unable to pursue autonomous development. This explains why external intervention in the Sahel is not an exception but a continuation of colonial patterns, and why the "synthesis" must include the historical dimension that realism and political economy typically exclude. The African perspective's occlusion risk is that it may underweight the agency of African actors—states, armed groups, civil society—and may overstate the determining power of colonial history, treating contemporary conflicts as overdetermined by the past.

Chinese: The Chinese perspective contributes to synthesis through its emphasis on development as a security strategy and its critique of Western interventionism. Drawing on the concept of "comprehensive national security" and the Belt and Road Initiative's security-development linkage, the Chinese perspective treats political economy (development, infrastructure, trade) as the primary mechanism for conflict prevention and resolution, with realism (multipolarity, sovereignty) as the framework for interstate relations. The Chinese perspective's contribution is the insistence that economic underdevelopment is a root cause of conflict and that military intervention without development is counterproductive; its occlusion risk is that it treats develop-

ment as a technical rather than political process, ignoring the distributional conflicts and power asymmetries that shape who benefits from development, and that it uses "non-interference" to shield partner governments from accountability.

Russian: The Russian perspective contributes to synthesis through its realist emphasis on great-power competition and its critique of Western hegemony. Drawing on the concept of "multipolarity" and the critique of "unipolarity," the Russian perspective treats realism as the primary framework, with post-colonial rhetoric (anti-imperialism, sovereignty) as a legitimating discourse. The Russian perspective's contribution is the insistence that Western interventionism is a source of conflict rather than a solution, and that the international order must be multipolar to be legitimate; its occlusion risk is that it instrumentalizes post-colonial critique for great-power competition, using anti-imperialist rhetoric to justify its own interventions (Syria, Sahel via Wagner) while occluding the destabilizing effects of Russian arms transfers and mercenary operations.

Western: The Western perspective contributes to synthesis through its combination of liberal institutionalism and political economy. Drawing on the "democratic peace" thesis, the "responsibility to protect" doctrine, and the "security-development nexus," the Western perspective treats liberal governance as the mechanism for conflict prevention and economic development as the mechanism for conflict resolution. The Western perspective's contribution is its extensive data collection, institutional frameworks, and resources for intervention; its occlusion risk is that it treats Western intervention as a solution rather than a variable, that it underweights the historical responsibility of Western powers for state weakness, and that it conflates Western interests with universal interests.

UN: The UN perspective contributes to synthesis through its integration of security, development, and governance in peacebuilding frameworks. Drawing on the "human security" concept and the "sustaining peace" agenda, the UN perspective treats conflict as a multi-dimensional phenomenon requiring multi-dimensional responses. The UN perspective's contribution is its normative frameworks, operational experience, and emphasis on civilian protection; its occlusion risk is that it treats conflicts as manageable through institutional mechanisms that may not address root causes, and that it is constrained by Security Council politics and host-state consent in ways that limit its effectiveness.

2.5 KEY IDEA 4 — Forecasting implications: what does comparative analysis tell us about likely trajectories?

Bolded Causal Claim: Comparative analysis of the Sahel, Ukraine, and West Asia does not generate point predictions about when or how these conflicts will end; instead, it produces conditional, scenario-based forecasts about likely trajectories by identifying which structural features—state capacity, intervention type, resource endowment, ethnic geography, and great-power involvement—are associated with prolongation, escalation, or resolution across a reference class of comparable conflicts.

Mechanism: The forecasting mechanism operates through three linked steps. First, structural decomposition: each conflict is decomposed into a set of variables that comparative conflict research has associated with outcomes—state capacity (measured by Weberian monopoly of force, fiscal extraction, bureaucratic reach), intervention type (unilateral, multilateral, proxy, none), resource endowment (hydrocarbons, minerals, agricultural land), ethnic geography (concentrated versus dispersed, cross-border kinship), and great-power involvement (direct, indirect, absent). Second, reference-class matching: the three cases are matched against a reference class of conflicts with similar profiles—Sahel against other Sahelian and Saharan in-

surgencies (Mali 2012, Chad, Sudan), Ukraine against other interstate territorial disputes with great-power backing (Georgia 2008, Nagorno-Karabakh), West Asia against other state-collapse and proxy-war complexes (Lebanon, Yemen, Libya). Third, trajectory projection: based on the historical record of the reference class, the analyst projects a probability distribution over outcomes—prolonged stalemate, escalation to wider war, negotiated settlement, state collapse, or external imposition. The mechanism is probabilistic and conditional: it says that given features X, Y, and Z, outcome W has occurred in some share of comparable cases, not that outcome W will occur. This is the logic of reference-class forecasting applied to conflict, as developed in Tetlock's work on expert political judgment and in the quantitative conflict-forecasting literature (Ward, Greenhill, and Bakke 2010; Hegre et al. 2019). The mechanism also incorporates path dependence: early choices—whether to intervene unilaterally or multilaterally, whether to negotiate early or late, whether to prioritize military or political tracks—constrain the option space available later, so forecasts must be updated as path-dependent commitments accumulate. A further mechanism is feedback: forecasts themselves can become self-fulfilling or self-defeating if actors adjust behavior in response to predicted outcomes, for example if a forecast of stalemate reduces willingness to negotiate.

Scope Conditions: The forecasting mechanism operates reliably only under several scope conditions. First, structural stability: the underlying variables must remain relatively constant; exogenous shocks—regime change, pandemic, commodity price collapse, climate catastrophe—can invalidate forecasts by altering the variables themselves. Second, reference-class adequacy: the reference class must contain enough comparable cases to support probabilistic inference; with only three primary cases, the analyst must draw on broader comparative conflict literature, which introduces heterogeneity. Third, metric specificity: forecasts about duration, intensity, geographic spread, and political outcome are not interchangeable; a conflict may be forecast to be long but low-intensity, or short but escalatory. Fourth, time-horizon dependence: short-term forecasts of six to twelve months can rely on current momentum and commitments; long-term forecasts of five to ten years must account for political turnover, generational change, and shifting great-power priorities. Fifth, the mechanism assumes that the structural features are correctly identified and measured; if the analyst misidentifies the primary driver, for example treating a resource war as an ethnic conflict, the forecast will be systematically biased. Sixth, forecasts are most reliable for structural features and least reliable for contingent events such as assassinations, coups, or sudden policy shifts, which can dominate short-term trajectories.

Observable Implications: If the comparative forecasting framework is valid, several observable implications follow. First, conflicts with similar structural profiles should exhibit similar trajectory patterns: if the Sahel's trajectory continues to resemble West Asia's—fragmentation, proxy war, state collapse—rather than Ukraine's—territorial contestation with conventional forces—this supports the structural-analogy approach. Second, deviations from forecasted trajectories should be traceable to identifiable shocks or omitted variables, not to randomness; if a conflict deviates without identifiable cause, the framework is misspecified. Third, forecasts should improve as more cases enter the reference class and as measurement improves; if forecast accuracy does not improve over time, the structural variables may be poorly chosen. Fourth, the framework implies that intervention type is a strong predictor of trajectory: unilateral interventions should correlate with prolonged conflict, as in the Sahel under France and West Asia under the United States, while multilateral or absent intervention should correlate with different patterns, as in Ukraine where NATO support is multilateral but not direct combat. Fifth, the framework implies that state capacity is the strongest single predictor of resolution: conflicts in states with higher capacity should resolve faster, holding intervention constant. These implications are testable against ACLED data, the UCDP/PRIO Armed Conflict Dataset, and intervention timelines.

Perspective Note (five traditions in brief):

African (primary): The African perspective on forecasting emphasizes that trajectories of African conflicts are shaped by external intervention patterns, resource extraction dynamics, and the political economy of state weakness. From this vantage point, forecasts should incorporate the likelihood of intervention fatigue among external powers, shifting great-power priorities, and the possibility that African states and regional organizations such as the African Union and ECOWAS will assert greater agency. The African perspective warns against treating African conflicts as inherently more unpredictable than others—a framing that often reflects Western analytical bias rather than actual structural indeterminacy. It also emphasizes that forecasting should account for climate change as a structural driver in the Sahel, and that forecasts should be disaggregated to capture sub-national variation that national-level models obscure. The African perspective's contribution is its attention to endogenous dynamics and external dependency; its occlusion risk is that it may underweight the role of non-African actors' autonomous decisions.

Chinese: The Chinese perspective on forecasting emphasizes stability and development trajectories. From this vantage point, conflicts are forecast to resolve when economic development proceeds and state capacity builds; the key variable is the development trajectory, not the military balance. The Chinese perspective tends to predict that conflicts in resource-rich but institutionally weak states will persist until development creates constituencies for peace. Its contribution is its long time horizon and its emphasis on structural transformation; its occlusion risk is that it may underweight political and identity factors that resist economic determinism.

Russian: The Russian perspective on forecasting emphasizes geopolitical competition dynamics. From this vantage point, conflicts are forecast to persist as long as great-power competition persists; resolution requires a multipolar equilibrium or great-power concert. The Russian perspective tends to predict that Western intervention prolongs conflicts and that Russian or Chinese counter-intervention creates stalemate rather than resolution. Its contribution is its attention to the systemic level; its occlusion risk is that it may treat all conflicts as proxies, underweighting local agency.

Western: The Western perspective on forecasting draws on quantitative conflict models, event data, and institutional indicators. From this vantage point, forecasts are generated through statistical models incorporating GDP, regime type, ethnic fractionalization, and conflict history. The Western perspective's contribution is its methodological rigor and its capacity for large-N inference; its occlusion risk is that it may overfit to historical patterns and underweight structural breaks, and that it may treat African and West Asian conflicts as more predictable in their dysfunction than they are.

UN: The UN perspective on forecasting emphasizes peacebuilding indicators and sustaining-peace metrics. From this vantage point, forecasts are tied to the presence or absence of inclusive political processes, civilian protection, and institutional capacity. The UN perspective's contribution is its operational grounding and its emphasis on human security; its occlusion risk is that it may conflate institutional activity with conflict resolution, and that it is constrained by Security Council politics in ways that limit the independence of its forecasts.

2.6 KEY IDEA 5 — Policy implications: what would each perspective recommend, and why?

Bolded Causal Claim: Each of the five perspectives generates distinct and partly incompatible policy recommendations for the Sahel, Ukraine, and West Asia because each identifies a different primary cause of conflict and a different legitimate authority for intervention; no single policy package can satisfy all five

simultaneously, so policy choice is necessarily a political act of prioritization that reveals the chooser's underlying theoretical commitments.

Mechanism: The mechanism is deductive: policy recommendations flow from causal diagnosis through a chain of inference. If conflict is caused by state weakness and institutional failure, as the Western and institutional diagnosis holds, the prescription is state-building—security sector reform, governance capacity, rule of law, conditionality. If conflict is caused by imperial extraction and external domination, as the African and post-colonial diagnosis holds, the prescription is decolonization of economic structures, non-intervention, and African-led solutions. If conflict is caused by geopolitical competition and hegemonic overreach, as the Russian and realist diagnosis holds, the prescription is great-power concert, respect for sovereignty, and opposition to unilateral intervention. If conflict is caused by underdevelopment and lack of connectivity, as the Chinese diagnosis holds, the prescription is development-first—infrastructure, trade, investment, non-conditionality. If conflict is caused by multi-dimensional deficits in security, development, and governance, as the UN diagnosis holds, the prescription is integrated peacebuilding—civilian protection, humanitarian access, inclusive political processes, sustaining peace. The mechanism operates at two levels: the diagnostic level, which identifies what causes the conflict, and the authority level, which identifies who has the right to act. These two levels interact: a diagnosis of state failure implies that the international community has a responsibility to protect and rebuild; a diagnosis of imperial intervention implies that the international community is the problem. The mechanism also includes a feedback loop: policies generate outcomes that are interpreted through the same perspective that generated them, creating confirmation bias, so that state-building that fails is read as insufficient state-building rather than as a flawed premise.

Scope Conditions: Policy recommendations are conditional on several factors. First, causal correctness: if the diagnosis is wrong, the prescription fails; state-building in a conflict driven by geopolitical competition may simply provide a stronger proxy. Second, implementability: some recommendations, such as decolonization of global economic structures, require transformations beyond the instrument of policy; others, such as humanitarian access, are immediately implementable but may not address root causes. Third, time horizon: short-term stabilization through ceasefire and humanitarian relief and long-term transformation through structural reform and reconciliation may require different and even contradictory policies; a policy that stabilizes in the short term may entrench in the long term. Fourth, legitimacy: recommendations assume a legitimate actor; if the actor lacks legitimacy, as with a former colonial power intervening in the Sahel, the policy's effectiveness is compromised regardless of design. Fifth, resource constraints: recommendations vary in cost; integrated peacebuilding is expensive, development-first requires sustained commitment, non-intervention is cheap but may leave vacuums. Sixth, the recommendations assume that the conflict is the primary problem; if the conflict is a symptom of deeper structural conditions such as climate change, demographic pressure, or global inequality, policy at the conflict level may be insufficient.

Observable Implications: If the policy-implication framework is valid, several observable implications follow. First, policies derived from a perspective should perform best when that perspective's causal diagnosis is most accurate for the specific conflict; state-building should work better in conflicts genuinely driven by institutional failure than in those driven by geopolitical competition. Second, policy failure should be interpretable through the lens of causal misdiagnosis: if state-building fails in the Sahel, this may indicate that the conflict is not primarily institutional. Third, the framework implies that policy debates are often proxy debates about causation: disagreements about whether to intervene in Ukraine are disagreements about whether the conflict is about sovereignty, as the Western view holds, or about NATO expansion, as the Russian view holds. Fourth, the framework implies that no perspective's recommendations are universally applicable; each has scope conditions. Fifth, the framework implies that hybrid policies combining elements from multiple

perspectives may outperform pure-perspective policies, but only if the hybridization is theoretically coherent rather than merely political compromise. These implications are testable against policy evaluation literature, intervention outcome data, and comparative case studies.

Perspective Note (five traditions in brief):

African (primary): The African perspective recommends, for the Sahel, withdrawal of external military forces including French and Russian or Wagner forces, African-led security and political solutions through the African Union and ECOWAS, addressing root causes such as poverty, marginalization, climate change, and illicit economies, debt relief, and climate adaptation funding. For Ukraine, it recommends support for sovereignty and territorial integrity, but with emphasis on diplomatic solutions and African non-alignment, and attention to the food-security and energy impacts on African states. For West Asia, it recommends non-intervention, support for regional dialogue, and attention to humanitarian and refugee impacts. The African perspective's core recommendation is that external actors should address the structural conditions—economic extraction, climate, debt—that generate conflict rather than managing symptoms through military intervention. Its strength is its attention to root causes and its challenge to interventionist defaults; its weakness is that non-intervention may leave vacuums that other actors fill.

Chinese: The Chinese perspective recommends development-first approaches: infrastructure investment, trade integration, and capacity-building without political conditionality. For the Sahel, this means economic development programs, security cooperation without interference in internal affairs, and support for state capacity. For Ukraine, it means mediation, emphasis on sovereignty and territorial integrity, opposition to sanctions that harm the global economy, and promotion of a negotiated settlement. For West Asia, it means economic reconstruction, non-interference, and support for state sovereignty. The Chinese perspective's core recommendation is that development creates the material conditions for peace and that external actors should support rather than supplant state capacity. Its strength is its long-term orientation and its respect for sovereignty; its weakness is that it may underweight political and rights dimensions.

Russian: The Russian perspective recommends multipolar balance and great-power concert. For the Sahel, this means opposition to Western unilateral intervention, support for existing governments, and security cooperation on sovereign terms. For Ukraine, it means recognition of Russian security concerns, negotiation of a new European security architecture, and opposition to NATO expansion. For West Asia, it means support for state sovereignty, as in Syria, opposition to regime change, and coordination with Iran and other regional actors. The Russian perspective's core recommendation is that conflicts are resolved through great-power agreement, not through unilateral intervention or institutional peacebuilding. Its strength is its attention to systemic stability; its weakness is that it may legitimate authoritarian consolidation and underweight human rights.

Western: The Western perspective recommends governance reform, security sector reform, counter-terrorism, sanctions, conditionality, and human rights promotion. For the Sahel, this means security assistance, governance reform, counter-terrorism operations, and support for democratic transitions. For Ukraine, it means military and financial support, sanctions on Russia, NATO integration, and accountability for war crimes. For West Asia, it means counter-terrorism, support for allies, sanctions, human rights advocacy, and selective intervention. The Western perspective's core recommendation is that conflicts are resolved through institutional capacity-building and norm enforcement. Its strength is its attention to governance and rights; its weakness is that it may overestimate the transferability of institutional models and underestimate the costs of intervention.

UN: The UN perspective recommends integrated peacebuilding: civilian protection, humanitarian access, inclusive political processes, sustaining peace, and support for regional organizations. For the Sahel, this means humanitarian assistance, support for missions such as MINUSMA with host-state consent, development-peace nexus programs, and support for the African Union and ECOWAS. For Ukraine, it means humanitarian corridors, civilian protection, support for diplomatic processes, and accountability mechanisms. For West Asia, it means humanitarian access, civilian protection, support for political settlements, and reconstruction. The UN perspective's core recommendation is that conflicts require multi-dimensional responses addressing security, development, and governance simultaneously. Its strength is its comprehensiveness and its normative legitimacy; its weakness is that it may be constrained by Security Council politics and host-state consent in ways that limit effectiveness.

SECTION 2.7 — FIVE PERSPECTIVES IN DEPTH

2.7.1 African Perspective (PRIMARY) The African vantage point on comparative conflict analysis does not begin with the question of which theory best explains three wars; it begins with the prior question of who constructed the category "conflict" and for what purpose. From within African scholarship, the comparative project itself is an artifact of a particular epistemology—one that treats the Sahel, Ukraine, and West Asia as commensurable units of analysis, each a "case" amenable to most-similar or most-different design. Mahmood Mamdani's work on colonial state formation argues that the modern African state was not a failed version of the European state but a deliberately bifurcated structure, divided between "citizens" in urban centers and "subjects" in the countryside, governed through "define and rule" (Mamdani 1996, 2001). When comparative conflict analysts treat the Sahel as a "fragile state" case comparable to Ukraine's "resilience," they import a teleology that measures African polities against a European norm and finds them deficient. The African perspective's first contribution, therefore, is epistemic: it insists that the units being compared are not pre-given but historically produced, and that the act of comparison can reproduce the very hierarchies it claims to analyze.

This epistemic critique is not merely methodological; it is political. Walter Rodney's *How Europe Underdeveloped Africa* (1972) established that African underdevelopment was not a natural condition but a product of centuries of extraction, and that the wealth of Europe was built on the impoverishment of Africa. Applied to comparative conflict analysis, Rodney's framework suggests that the Sahel's instability cannot be separated from the global political economy of uranium, gold, and labor migration that links Niamey to Paris and Bamako to Brussels. The conflict in Mali is not simply a "local" insurgency comparable to Donbas separatism; it is embedded in a transnational extractive structure whose beneficiaries are disproportionately external. Jean-François Bayart's concept of "extraversion" (Bayart 2000) sharpens this point: African states and elites have historically oriented themselves outward, seeking resources and legitimacy from external patrons rather than domestic constituencies. Comparative analysis that treats the Sahel, Ukraine, and West Asia as three parallel "conflict trajectories" misses the structural asymmetry that the Sahel's trajectory is shaped by a longer history of external economic penetration than either Ukraine or West Asia, even though all three experience external intervention.

The African perspective also reframes the meaning of external intervention. From a Western or UN standpoint, French Operation Barkhane in the Sahel, US/NATO support for Ukraine, and US/Iranian/Russian involvement in West Asia can be compared as instances of "external intervention" with varying outcomes. From an African standpoint, particularly through the lens of Kwame Nkrumah's neocolonialism (Nkrumah

1965) and Frantz Fanon's analysis of colonial violence (Fanon 1961), intervention is not an episodic policy choice but a structural feature of the post-colonial order. France's military presence in the Sahel was not a response to a 2012 crisis; it was the continuation of a security architecture established at independence, in which African states outsourced their security to former colonial powers. The "failure" of Barkhane is therefore not a policy failure in the sense that a different counterinsurgency doctrine might have succeeded; it is the predictable outcome of a neocolonial security arrangement that prioritizes external interests over domestic legitimacy. Amílcar Cabral's insistence that national liberation must be rooted in the culture and material conditions of the people (Cabral 1973) suggests that security imposed from outside, however well-intentioned, cannot generate the political legitimacy required for durable peace. This is a contribution the other four perspectives struggle to make: the Western perspective tends to treat intervention as a tool whose effectiveness depends on implementation; the UN perspective treats it as a last resort requiring host-state consent; the Chinese and Russian perspectives treat it as a sovereignty violation or a hegemonic practice. Only the African perspective, drawing on the lived experience of post-colonial statehood, treats intervention as constitutive of the conflict itself.

Achille Mbembe's concept of necropolitics (Mbembe 2003) adds a further dimension. Comparative conflict analysis often measures outcomes in terms of battle deaths, territorial control, or refugee flows. Mbembe's framework asks a different question: who is made to die, and under what conditions? The racialized hierarchies of grievability that Mbembe identifies mean that civilian deaths in the Sahel do not register in global media or policy discourse with the same weight as deaths in Ukraine. This is not merely a media bias; it is a structural feature of the international order that comparative analysis must account for. When ACLED data show comparable or higher civilian casualty rates in the Sahel than in Ukraine in certain periods, the differential political response cannot be explained by the data alone; it requires an analysis of how certain lives are rendered visible and others invisible. The African perspective thus reveals that comparative conflict analysis is never purely technical; it is always embedded in a politics of recognition.

The African perspective also insists on agency. Too often, comparative analysis treats African actors—states, communities, armed groups—as objects of external forces rather than agents in their own right. Julius Nyerere's philosophy of ujamaa and self-reliance (Nyerere 1968) and Cabral's emphasis on the creative capacity of the people provide a counter-narrative to the "failed state" discourse. In the Sahel, community-based militias, traditional authorities, and local peace committees have played significant roles in conflict dynamics, both exacerbating and mitigating violence. Kalyvas's (2006) work on the logic of violence in civil war, while not African in origin, resonates with African scholarship in emphasizing that violence is locally produced and that civilian agency matters. The African perspective would push this further: the "local" is not a residual category but the primary site of political life, and external interventions that bypass local structures are likely to fail regardless of their resources. This has direct comparative implications: Ukraine's relative resilience in 2022 was partly attributable to pre-existing social cohesion and territorial defense structures, while West Asian conflicts have been shaped by the destruction of state institutions. The Sahel's trajectory reflects the erosion of local authority structures by both state and non-state actors, a process that external military intervention cannot reverse.

Gender and epistemology constitute another African contribution. Oyèrónkẹ́ Oyěwùmí's *The Invention of Women* (1997) demonstrates that the category "woman" as a universal subject was a colonial imposition, and that pre-colonial African societies organized gender differently. Sylvia Tamale's work on decolonization and African feminism (Tamale 2020) extends this to legal and political theory. Applied to comparative conflict analysis, this means that the gendered dimensions of conflict—sexual violence, women's participation in peace processes, the gendered division of labor in wartime—are not universal but historically specific.

The Western perspective's emphasis on "women, peace, and security" (WPS) agendas, while valuable, can impose a particular feminist framework that does not capture African women's diverse experiences. The African perspective thus contributes a decolonial gender lens that the other four perspectives, including the UN's WPS framework, often lack.

African security governance provides a further contribution. Kwesi Aning and Kwaku Danso's work on African security architecture (Aning and Danso 2014) documents the evolution of the African Union's Peace and Security Council, ECOWAS interventions, and regional mechanisms. Comparative conflict analysis that focuses only on great-power intervention misses the significant role of African institutions. ECOWAS's intervention in The Gambia (2017), the AU's role in Somalia through AMISOM, and regional responses to the Sahel crisis are all part of the comparative picture. The African perspective insists that these institutions be evaluated on their own terms, not merely as adjuncts to UN or Western operations. This is particularly important for the Sahel, where the G5 Sahel Joint Force and the Accra Initiative represent African-led security responses whose effectiveness and limitations must be assessed independently.

What does the African perspective occlude? First, it risks over-attributing causality to external factors. While colonialism and neocolonialism are real, intra-African dynamics—elite competition, resource rents, ethnic mobilization, religious ideology—also drive conflict. Mamdani's framework, while powerful, can be read as implying that all African violence is ultimately a product of colonial state formation, which may understate the agency of African actors in producing violence. Second, the African perspective may struggle to account for variation within Africa: why has Botswana remained stable while Mali has not? A purely structural account may miss the role of leadership, institutions, and contingency. Third, when applied to non-African cases like Ukraine, the African perspective's tools may be less directly applicable; the colonial history of Ukraine is different from that of the Sahel, and the racialized hierarchies of grievability, while real, may not capture the full dynamics of interstate war. Fourth, there is a risk of romanticizing pre-colonial Africa or treating "African solutions" as inherently superior, which can obscure the real limitations of African institutions. Finally, the African perspective's emphasis on decolonization can sometimes slide into a methodological nationalism that treats "Africa" as a coherent unit, when in fact the continent contains enormous diversity. These occlusions do not invalidate the perspective; they mark its boundaries and invite synthesis with other frameworks.

2.7.2 Chinese Perspective The Chinese perspective on comparative conflict analysis is anchored in a distinctive normative architecture: sovereignty, non-interference, development as the foundation of security, and multipolarity as the desirable international order. These principles are not merely rhetorical; they structure how Chinese analysts and policymakers interpret the Sahel, Ukraine, and West Asia, and they generate specific policy recommendations that differ systematically from Western, Russian, and UN approaches.

Sovereignty and non-interference are the foundational commitments. Rooted in the Five Principles of Peaceful Coexistence (1954) and reiterated in every major Chinese foreign policy document, these principles hold that states should not interfere in each other's internal affairs, that territorial integrity is inviolable, and that the use of force without Security Council authorization is illegitimate. Applied to the three cases, this generates a consistent critique of Western intervention: French military operations in the Sahel, NATO's expansion and support for Ukraine, and US interventions in Iraq, Syria, and Libya are all framed as violations of sovereignty that have produced or exacerbated conflict. The Chinese perspective thus contributes a powerful counter-narrative to the Western assumption that intervention can be a tool for conflict resolution. It points to the documented failures of externally imposed regime change—Libya's collapse into civil war after 2011, Iraq's prolonged instability—and argues that these outcomes were predictable consequences of

violating sovereignty.

However, the Chinese perspective is not simply anti-interventionist; it is also developmentalist. The core claim is that underdevelopment is the root cause of conflict, and that economic development, infrastructure, and state capacity-building are the most effective forms of conflict prevention. This is operationalized through the Belt and Road Initiative (BRI), the Forum on China-Africa Cooperation (FOCAC), and bilateral economic partnerships. In the Sahel, China has invested in infrastructure, mining, and energy projects, and has provided security assistance without the governance conditionality that characterizes Western aid. The Chinese perspective would argue that this approach addresses the structural drivers of conflict more effectively than military intervention. In West Asia, China's energy interests and BRI investments create stakes in stability, and its mediation of the Saudi-Iran rapprochement in 2023 demonstrated a diplomatic model based on economic incentives rather than military pressure. In Ukraine, China's position has been more complex: it has maintained economic ties with Russia while rhetorically supporting Ukraine's sovereignty and territorial integrity, and has offered itself as a mediator. The Chinese perspective here reveals a tension between its sovereignty principle and its strategic partnership with Russia, a tension that Western analysts frequently highlight as hypocrisy but that Chinese analysts frame as pragmatic balancing.

The Chinese perspective also contributes a critique of Western double standards. It points to the inconsistency of Western support for Ukrainian sovereignty while simultaneously undermining Syrian or Libyan sovereignty, and argues that this selectivity undermines the credibility of the Western-led order. The concept of "democracy" itself is contested: China argues that democracy should be defined by outcomes (development, stability, popular satisfaction) rather than procedures (elections, multiparty systems), and that Western democracy promotion in conflict zones has often produced instability. This is a significant contribution to comparative conflict analysis because it challenges the assumption that liberal democratic institutions are the natural endpoint of conflict resolution.

What does the Chinese perspective occlude? First, its sovereignty principle can function as a shield for authoritarian governments, including those whose repression contributes to conflict. By treating sovereignty as absolute, it may underweight the responsibility of states to protect their populations, a principle that the UN's Responsibility to Protect (R2P) framework attempts to codify. Second, the developmentalist claim, while plausible, is difficult to verify: China's economic engagement in the Sahel has not prevented the spread of insurgency, and BRI projects have sometimes generated local resentment over labor practices, environmental damage, and debt. Third, China's own security practices—including its treatment of Uyghurs in Xinjiang, its militarization of the South China Sea, and its support for Russia's war in Ukraine—create credibility gaps that limit its normative appeal. Fourth, the Chinese perspective tends to treat "development" as a technocratic process, underweighting the political and distributive conflicts that development itself can generate. Finally, its multipolarity advocacy, while appealing to many Global South states, can obscure the fact that a multipolar order may simply replace Western hegemony with great-power competition, with smaller states caught in between. These occlusions suggest that the Chinese perspective is most valuable as a corrective to Western interventionism rather than as a comprehensive theory of conflict.

2.7.3 Russian Perspective The Russian perspective on comparative conflict analysis is shaped by a worldview that treats the post-Cold War international order as fundamentally illegitimate: a unipolar system dominated by the United States and its allies, in which NATO expansion, color revolutions, and humanitarian intervention are instruments of Western hegemony. This perspective is not merely descriptive; it is constitutive of Russian foreign policy and generates specific interpretations of the Sahel, Ukraine, and West Asia that differ sharply from both Western and Chinese accounts.

The core analytical claim is that NATO expansion is the primary cause of the Ukraine conflict. Russian officials and scholars argue that the eastward expansion of NATO, despite promises made to Soviet leaders in 1990, violated Russia's security interests and created an existential threat. From this standpoint, the 2014 Maidan revolution was not a democratic uprising but a Western-backed coup, and Russia's annexation of Crimea and support for Donbas separatists were defensive responses to NATO encroachment. The Russian perspective thus contributes a security-dilemma analysis that Western accounts often underweight: it treats great-power security concerns as legitimate and argues that ignoring them produces conflict. This is a genuine theoretical contribution, even if its empirical application is contested, because it forces comparative analysis to take seriously the role of alliance politics and security guarantees in conflict dynamics.

In West Asia, the Russian perspective emphasizes its role as a counterweight to US hegemony. Russia's military intervention in Syria in 2015 is framed not as aggression but as a defense of state sovereignty against externally backed regime change. The Russian perspective argues that the US-led invasion of Iraq, the intervention in Libya, and support for Syrian rebels destabilized the region and created space for extremist groups like ISIS. By supporting the Assad government, Russia claims to have prevented Syria's collapse into a failed state and to have preserved a secular, multi-confessional political order. This narrative contributes a state-centric, order-preserving framework that contrasts with the Western emphasis on democracy and human rights. It also highlights the unintended consequences of intervention: the Russian perspective argues that Western interventions in West Asia consistently produce worse outcomes than the authoritarian status quo they seek to replace.

In the Sahel, the Russian perspective has gained traction through the Wagner Group (now Africa Corps) and its partnerships with military juntas in Mali, Burkina Faso, and Niger. Russia frames its engagement as an alternative to failed Western intervention: it provides security assistance without governance conditionality, respects sovereignty, and does not lecture on human rights. The Russian perspective argues that France's counterterrorism mission failed because it was driven by neocolonial interests rather than African needs, and that Russia's presence represents a genuine partnership. This narrative resonates with anti-French sentiment in the Sahel and contributes to the broader Russian project of positioning itself as a champion of the Global South against Western hegemony.

What does the Russian perspective occlude? First and most significantly, it provides an ex post facto justification for Russia's own aggression. The claim that NATO expansion "caused" the Ukraine war, while containing a partial truth about security dilemmas, is used to legitimize the invasion of a sovereign state, the annexation of territory, and the commission of war crimes. The Russian perspective's sovereignty principle is applied selectively: it defends Syrian sovereignty while violating Ukrainian sovereignty. Second, the Russian perspective underweights the agency of non-Russian actors. Ukrainians are portrayed as Western puppets rather than agents with their own political aspirations; Sahelian populations are portrayed as victims of French neocolonialism rather than actors with complex relationships to both France and Russia. Third, the Russian perspective's emphasis on order and stability can justify authoritarianism: by treating any challenge to the status quo as Western-backed subversion, it delegitimizes legitimate grievances and democratic movements. Fourth, the Russian perspective's information warfare and disinformation campaigns—documented in multiple contexts—undermine its credibility as an analytical framework. Finally, the Russian perspective's economic and strategic interests in the Sahel (mining concessions, military bases) are obscured by its anti-imperialist rhetoric. These occlusions mean that the Russian perspective is most useful as a diagnostic of Western overreach and great-power security dilemmas, but least trustworthy as a normative guide.

2.7.4 Western Perspective The Western perspective on comparative conflict analysis is rooted in liberal internationalism: the belief that international order should be based on democratic governance, human rights, market economics, and multilateral institutions, and that the international community has a responsibility to protect populations from mass atrocities and to promote democratic transitions. This perspective has been the dominant framework in Western policy and academic circles since the end of the Cold War, and it shapes how the Sahel, Ukraine, and West Asia are analyzed and addressed.

The Western perspective's core contribution is its emphasis on human rights and civilian protection. In Ukraine, Western support for Ukrainian sovereignty, military assistance, sanctions against Russia, and documentation of war crimes reflect a commitment to the principle that territorial integrity and human rights are non-negotiable. The Western perspective treats Russia's invasion as an unprovoked act of aggression that threatens the entire post-1945 order, and argues that failure to resist it would embolden other revisionist powers. In West Asia, the Western perspective has been more ambivalent: it supported democratic uprisings during the Arab Spring but also backed authoritarian allies (Saudi Arabia, Egypt) when stability was prioritized over democracy. The intervention in Libya (2011) was justified on R2P grounds but produced a state collapse that the Western perspective has struggled to explain or remedy. In the Sahel, the Western perspective has focused on counterterrorism, governance reform, and development, with France and the EU leading military and civilian missions. The Western perspective's strength is its normative clarity: it identifies human rights violations, holds perpetrators accountable, and mobilizes resources for protection.

The Western perspective also contributes institutional frameworks. The UN Security Council, NATO, the EU, and various bilateral partnerships provide mechanisms for coordination, burden-sharing, and legitimacy. The Western perspective argues that these institutions, however imperfect, are superior to unilateral or ad hoc arrangements. In Ukraine, NATO's role in coordinating military assistance and the EU's sanctions regime demonstrate the effectiveness of institutionalized cooperation. In the Sahel, the EU's training missions and development programs complement French military operations. The Western perspective thus contributes a theory of institutional effectiveness: conflicts are best managed through multilateral frameworks that pool resources and share burdens.

However, the Western perspective occludes several critical dimensions. First, it tends to treat Western intervention as well-intentioned and to attribute failures to implementation rather than to structural flaws in the interventionist model. The "lessons learned" literature on Iraq, Afghanistan, and Libya typically focuses on tactical errors—insufficient troops, inadequate planning, premature withdrawal—rather than questioning whether external military intervention can ever produce sustainable political order. Second, the Western perspective is marked by selectivity that undermines its credibility: it champions Ukrainian sovereignty while having undermined Iraqi, Libyan, and Syrian sovereignty; it condemns Russian war crimes while having committed or enabled atrocities in the "war on terror." This selectivity is not merely hypocritical; it is structural, reflecting the fact that Western foreign policy is driven by interests as well as values, and that the two are often in tension. Third, the Western perspective tends to overestimate the transferability of liberal institutions. The assumption that democracy, free markets, and rule of law can be exported to conflict zones has been repeatedly falsified, yet it persists as a default framework. Fourth, the Western perspective underweights the historical responsibility of Western powers for the conditions that produce conflict: colonialism, Cold War interventions, and economic structures that disadvantage the Global South. Finally, the Western perspective's focus on state-level and interstate dynamics can obscure the transnational and local dimensions of conflict that African and other perspectives highlight. These occlusions suggest that the Western perspective is most valuable as a source of normative standards and institutional resources, but least reliable as a causal theory of conflict.

2.7.5 UN Perspective The UN perspective on comparative conflict analysis is distinct from both the Western and the other perspectives in that it is not the view of a single state or bloc but an institutional vantage point shaped by the UN Charter, the Security Council, the General Assembly, and the specialized agencies. Its core commitments are multilateralism, the peaceful settlement of disputes, the protection of civilians, and the integration of security, development, and human rights. These commitments generate a distinctive approach to the Sahel, Ukraine, and West Asia that emphasizes comprehensive, multi-dimensional responses.

The UN perspective's first contribution is its legal framework. The UN Charter prohibits the use of force except in self-defense or with Security Council authorization, and this framework provides a common reference point for evaluating interventions. The UN perspective thus contributes a normative standard against which all other perspectives can be measured: French intervention in the Sahel, Russian intervention in Ukraine, and US intervention in West Asia are all subject to the same legal test. This is valuable because it prevents any single power from claiming exceptional status. The UN perspective also contributes the Responsibility to Protect (R2P) doctrine, which holds that states have a responsibility to protect their populations from genocide, war crimes, ethnic cleansing, and crimes against humanity, and that the international community has a responsibility to act when states fail. R2P has been invoked in Libya (2011) and Syria, with contested results, but it remains an important normative framework.

The UN perspective's second contribution is its operational capacity. UN peacekeeping missions—MINUSMA in Mali, various missions in West Asia, and the humanitarian coordination in Ukraine—provide on-the-ground presence, civilian protection, and support for political processes. The UN perspective argues that these missions, despite their limitations, are essential for stabilizing conflict zones and protecting civilians. In the Sahel, MINUSMA provided a framework for international engagement that was more legitimate than unilateral French intervention, though it was constrained by host-state consent and Security Council politics. In Ukraine, UN agencies have coordinated humanitarian assistance and documented violations. In West Asia, UN mediators have facilitated ceasefires and political processes. The UN perspective thus contributes a theory of operational multilateralism: conflicts are best managed through institutions that pool legitimacy and resources.

The UN perspective's third contribution is the development-peace nexus. The Sustainable Development Goals (SDGs), the peacebuilding architecture, and the "sustaining peace" agenda all reflect the view that conflict is rooted in underdevelopment, inequality, and weak institutions, and that durable peace requires addressing these root causes. This is particularly relevant to the Sahel, where the UN has promoted integrated approaches combining security, development, and governance. The UN perspective thus contributes a comprehensive theory of conflict that goes beyond military or diplomatic solutions.

What does the UN perspective occlude? First, it is constrained by Security Council politics. The P5 veto means that the UN cannot act decisively when great powers disagree, as in Syria and Ukraine. This structural limitation means that the UN perspective's normative commitments are often not matched by operational capacity. Second, the UN perspective depends on host-state consent, which can be withdrawn or manipulated, as in Mali's expulsion of MINUSMA. Third, the UN perspective can be captured by powerful states: the Security Council's composition reflects 1945 power realities, and reform efforts have stalled. Fourth, the UN perspective's comprehensive approach can be diluted by bureaucratic fragmentation: different agencies pursue different mandates, and coordination is often poor. Fifth, the UN perspective's emphasis on consensus can produce lowest-common-denominator outcomes that fail to address the root causes of conflict. These occlusions mean that the UN perspective is most valuable as a source of legitimacy and coordination, but least effective as an independent actor when great powers are in conflict. The UN perspective's core

recommendation—that conflicts require multi-dimensional responses addressing security, development, and governance simultaneously—remains valid, but its implementation depends on the political will of member states, which is often lacking.

SECTION 2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African (primary)	Centers post-colonial state formation, external extraction, and local agency; shows how intervention reproduces dependency	Can underweight intra-elite predation and variation in state capacity across cases	Sovereignty, self-determination, and reparative justice	Sahelian coups and jihadist expansion linked to weak states and competitive external intervention	Western: overemphasizes colonial legacy and underweights universal human-rights obligations
Chinese	Defends sovereignty and non-interference; links security to development and state capacity	Downplays accountability, minority protection, and the costs of authoritarian consolidation	Multipolarity, territorial integrity, and development-first order	Opposition to externally engineered regime change in West Asia; emphasis on state capacity	Western: legitimizes authoritarianism and excuses coercion by powerful states
Russian	Articulates anti-hegemonic critique of NATO expansion and Western unilateralism	Masks its own interventions and presents sphere-of-influence claims as defensive	Multipolar security order and great-power equality	Framing of Ukraine as NATO-driven crisis; intervention in Syria as counterterrorism	Western: converts security dilemma rhetoric into justification for aggression
Western	Defends liberal order, alliance security, human rights, and resistance to aggression	Universalizes its own interests and underweights intervention asymmetries	Rules-based order and democratic sovereignty	Sustained support for Ukrainian resistance; sanctions and alliance coordination	African: applies sovereignty norms unevenly across regions and races

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
UN	Provides legitimacy, humanitarian norms, peacekeeping frameworks, and multidimensional coordination	Depends on great-power consensus; bureaucratic fragmentation dilutes implementation	Collective security and human protection	Humanitarian access frameworks and multidimensional missions where consent exists	All major powers: lowest-common-denominator outcomes fail to address root causes

SECTION 2.8 WORKED EXAMPLE (I do)

Case: Comparative analysis of the Sahel (2012–present), Ukraine (2014–present), and West Asia (2011–present).

This worked example treats three conflicts not as isolated tragedies but as a comparative field. Each began with a crisis of political order in the 2010s; each drew in external powers; each produced large-scale violence; yet their trajectories diverged. The Sahel moved from localized insurgency to regionalized jihadist violence and serial military coups; Ukraine moved from hybrid war to full-scale interstate war and national mobilization; West Asia moved from uprising to state collapse, proxy war, and partial authoritarian reconstitution. Comparative analysis asks why similar shocks produced different paths. The answer is not a single variable but an interaction among state capacity, intervention structure, and transnational networks. Methodologically, the cases form a most-similar design on timing, externalization, and violence, while differing on state capacity and regional order; that difference is precisely what the mechanism must explain.

Levels of analysis. At the individual level, leadership choices and armed-group entrepreneurship matter: jihadist commanders in the Sahel, Ukrainian and Russian political-military elites, and Syrian regime and rebel leaders made decisions that narrowed or widened escalation. Yet individuals operated within constraints; the same leader in a stronger state faces different options, and insurgent entrepreneurs exploit gaps created by institutional weakness. At the state level, the contrast is sharpest. Ukraine retained enough institutional capacity after 2014 to reform, mobilize, and absorb external support; Sahelian states experienced repeated breakdowns of civil-military relations; Syria's state collapsed in parts but was reconstituted through external backing. At the systemic level, the three cases sit in different regional orders: the Sahel in a post-colonial security architecture dominated by France and then contested by Russia; Ukraine in a European order structured by NATO and Russian claims; West Asia in a multipolar arena involving the United States, Iran, Russia, Turkey, and Gulf states. At the transnational level, arms, fighters, refugees, finance, and ideology cross borders: jihadist networks in the Sahel, diaspora and sanctions-evasion channels around Ukraine, and transnational militias and refugee flows in West Asia. The comparative lesson is that transnational flows amplify local crises, but their effects depend on state and systemic filters.

Mechanism. The core mechanism can be stated as a conditional chain: (1) a legitimacy or capacity shock weakens the state's monopoly of force; (2) armed actors mobilize around grievances, ideology, or elite com-

petition; (3) external powers intervene to protect interests, allies, or norms; (4) intervention alters the local balance of power and often militarizes politics; (5) the resulting trajectory depends on whether the state can still coordinate coercion and whether external actors compete or cooperate. In the Sahel, weak state capacity and competitive external intervention allowed jihadist and coup networks to exploit gaps; violence regionalized because borders were porous and states could not police them. In Ukraine, stronger state capacity and a relatively coherent external backer enabled sustained resistance, while Russian intervention produced interstate war rather than state collapse. In West Asia, state collapse in Syria and competitive multipolar intervention produced proxy war and fragmented sovereignty, with some states reconstituting through external support. Thus the same broad process—crisis plus intervention—yields state breakdown, national defense, or proxy fragmentation depending on capacity and intervention structure.

Perspective reconstruction. The African perspective, treated as primary, reads the three cases through the lens of post-colonial state formation and global racialized hierarchy. It argues that the Sahel is not an exception but a revealing case: externally imposed security frameworks, from French Operation Barkhane to Russian Wagner or Africa Corps deployments, have repeatedly prioritized external interests over local legitimacy, while coups reflect both elite predation and popular exhaustion with civilian governments that failed to deliver security. It further notes that Ukraine received rapid, large-scale Western support that Sahelian states did not, exposing an unequal global valuation of lives and sovereignty; West Asia, meanwhile, shows how great powers can devastate societies while invoking order. On this view, comparative analysis must begin with the historical production of weak states and unequal intervention, not treat all three cases as equivalent units. The Chinese perspective emphasizes sovereignty, non-interference, and development: it sees Ukraine as a crisis triggered by NATO expansion and bloc confrontation, West Asia as a demonstration that externally engineered regime change produces chaos, and the Sahel as a governance and development problem that cannot be solved by foreign military bases. It recommends strengthening state capacity, respecting territorial integrity, and prioritizing economic development over coercive intervention. The Russian perspective frames the cases as evidence of Western hegemony and its limits: NATO expansion caused the Ukraine crisis; Western interventions in West Asia destabilized the region; and Sahelian governments turned to Russia because Western counterterrorism failed. It presents multipolarity as a corrective to unilateralism, while downplaying its own coercive actions. The Western perspective treats Ukraine as a defense of sovereignty against aggression, West Asia as a mix of atrocity, terrorism, and great-power rivalry, and the Sahel as a counterterrorism and stabilization challenge. It emphasizes alliances, sanctions, human rights, and military support, but often universalizes its own security preferences. The UN perspective stresses multidimensional responses: civilian protection, humanitarian access, peacekeeping where consent exists, and coordination across security, development, and governance. It is strongest where great powers allow consensus, as in some humanitarian frameworks, and weakest where they are directly opposed, as in Ukraine or Syria.

Explicit adjudication. No single perspective best explains all three cases. The African perspective provides the strongest account of the Sahel and correctly identifies the unequal global distribution of attention and support, but it under-specifies the variation in state capacity that allowed Ukraine to resist collapse and Syria to be reconstituted. The Western perspective best explains Ukraine's resistance and the normative stakes of aggression, yet it occludes how Western interventions and double standards shape perceptions in the Sahel and West Asia. The Chinese and Russian perspectives capture sovereignty concerns and anti-hegemonic grievances, but they risk excusing state violence and great-power coercion. The UN perspective supplies legitimacy and humanitarian coordination but lacks independent coercive power. The best-supported synthesis is conditional: where state capacity is relatively high and external backing is coherent, conflicts tend toward interstate or national-defense trajectories; where state capacity is low and external actors compete,

they tend toward fragmentation and coup cycles; where states collapse and multipolar intervention follows, proxy war and partial reconstitution are likely. Comparative analysis therefore does not yield one universal theory; it yields scope conditions for competing mechanisms.

SECTION 2.9 PROBLEM PAIR (We do)

1. Define a most-similar systems design and a most-different systems design, then classify the Sahel, Ukraine, and West Asia cases. Which pair is most similar on state capacity, external intervention, and armed non-state actor presence, and which is most different on geopolitical stakes and intervention type?
2. Reconstruct the intervention logics in each case: France and Russia in the Sahel, US/NATO support in Ukraine, and US, Iranian, and Russian involvement in West Asia. For each, identify the stated mechanism (coercion, deterrence, proxy support, regime change, stabilization, or counterterrorism) and the mechanism most visible in outcomes.
3. Apply Kalyvas (2006) to explain how external intervention reshapes local cleavages. Distinguish collaboration, denunciation, and control, and identify which local actors gain or lose bargaining power when an external patron arrives.
4. Apply Tilly (1990) to compare whether intervention strengthens state-making, war-making, or neither. What observable indicators would show that a host state is converting external support into durable capacity rather than dependency?
5. Use Buzan and Wæver (2003) to compare regional security complexes. How does intervention in one theater alter threat perceptions, alliance patterns, and escalation risks in neighboring states?
6. Adjudicate across the five perspectives. Which perspective best explains variance in intervention outcomes across the three cases, and what evidence would falsify that judgment?

Model answer (continuous prose): A rigorous comparative analysis begins by refusing to treat the Sahel, Ukraine, and West Asia as interchangeable instances of "intervention." They are most similar in that all three involve contested sovereignty, armed non-state actors, and external powers using force or assistance to shape political outcomes; they are most different in the type of intervention and the level of geopolitical stakes. Ukraine is primarily an interstate war in which external support reinforces a recognized state's territorial defense; the Sahel is a fragmented internal conflict in which external counterterrorism has repeatedly substituted for, rather than rebuilt, state authority; West Asia is a multipolar proxy arena in which several external powers back competing state and non-state actors. The key causal question is therefore not whether intervention occurred, but whether it strengthened the host state's monopoly of violence and local legitimacy. Tilly's framework suggests that war-making can produce state-making only when external support is tied to fiscal extraction, bureaucratic consolidation, and accountable service delivery; where support bypasses the state or funds parallel security providers, it may produce warlordism or dependency. Kalyvas adds that intervention changes local cleavage dynamics: external patrons alter who can denounce rivals, who can claim protection, and which grievances become politically salient, often turning local disputes into components of a larger war. In the Sahel, this helps explain why counterterrorism campaigns can fragment authority and create opportunities for armed groups to present themselves as alternative providers of order. In Ukraine, external support has generally reinforced state capacity, though it also creates risks of escalation and long-term dependency. In West Asia, multiple interveners have produced overlapping sovereignties, with state capacity varying sharply by arena and patron. Realism explains why powers intervene to balance rivals, but it under-

predicts variation in local outcomes; political economy explains resource rents, arms flows, and smuggling networks that sustain violence; post-colonial critique explains how intervention can reproduce hierarchical sovereignty and constrain African or regional agency. The African perspective is especially important in the Sahel: it treats the crisis not merely as terrorism or state failure, but as a postcolonial problem of security dependency, uneven development, and external priorities that may not align with civilian protection. The Chinese perspective emphasizes sovereignty and non-interference while still accepting development-security linkages; the Russian perspective frames intervention as multipolar resistance to Western dominance; the Western perspective emphasizes liberal order, counterterrorism, and alliance credibility; the UN perspective emphasizes multilateral legitimacy, humanitarian protection, and civilian harm reduction. The strongest synthesis is that intervention outcomes depend on whether external power is converted into host-state bargaining capacity and local legitimacy. This claim is falsifiable: if higher levels of intervention consistently correlate with reduced civilian harm, improved service delivery, and stronger state authority across all three cases, then capacity-building explanations are supported; if intervention correlates with fragmentation regardless of its stated purpose, then structural dependency and proxy-competition explanations are stronger.

SECTION 2.10 INDEPENDENT MEMO (You do)

(a) Case description: A regional organization proposes a joint stabilization force for a conflict zone resembling the Sahel: weak rural state presence, jihadist and militia violence, mineral smuggling, and competing French, Russian, and Gulf security offers. The force would combine counterterrorism operations with infrastructure projects and local mediation. Member states disagree over rules of engagement, intelligence sharing, and whether to negotiate with armed groups. Your memo must advise whether the force is likely to reduce violence or reproduce fragmentation, using comparative evidence from the Sahel, Ukraine, and West Asia. Treat external intervention not as a uniform treatment but as a set of mechanisms that interact with local cleavages, state capacity, and regional security complexes. Specify what evidence would change your recommendation.

(b) Required memo headings as prompts:

- **Mechanism:** Identify the causal chain from intervention design to violence or stabilization, specifying scope conditions and the local actors who mediate outcomes.
- **Perspective reconstruction:** Reconstruct how African, Chinese, Russian, Western, and UN perspectives would each explain the proposed force's likely effects, and identify what each perspective occludes.
- **Historical analogue:** Compare the proposed force to one or more historical interventions in the Sahel, Ukraine, or West Asia, explaining which features transfer and which do not.
- **Falsifiers:** State observable evidence that would support or undermine your recommendation, including indicators of state capacity, civilian harm, and regional escalation.

(c) Self-check: Have you kept description, explanation, prediction, and prescription analytically separate, and flagged where the evidence is insufficient to support a firm recommendation?

SECTION 2.11 HINGE QUESTION

In a most-similar systems design comparing the Sahel, Ukraine, and West Asia, which variable best explains why external intervention is associated with stronger state capacity in one case but fragmentation in others?

A. The total volume of external military spending. B. Whether intervention reinforces or fragments the host

state's monopoly of violence and local bargaining capacity. C. The geographic size of the conflict zone. D. The presence of a United Nations peacekeeping mission.

Correct answer: B.

Distractor diagnoses: - A is wrong because spending volume is an input, not a mechanism; high spending can fund either state capacity or parallel armed actors. - C is wrong because geographic size is descriptive and does not explain variation in state authority or intervention effects. - D is wrong because institutional presence alone does not establish whether an intervention strengthens host-state bargaining, legitimacy, or service delivery.

SECTION 2A — DATA LAB

Table 1 — Conflict Event Intensity by Region (ACLED, approximate annual patterns, 2012–2024)

Region / Sub-period	Avg. annual battle events	Avg. annual violence vs. civilians	Overall trajectory
Sahel (Mali, Burkina Faso, Niger), 2012–2018	Low–moderate	Low	Rising slowly
Sahel, 2019–2024	High	Very high	Sharply rising; geographic spread
Ukraine (Donbas), 2014–2021	Moderate	Low–moderate	Stable / slowly declining
Ukraine, 2022–2024	Very high	High	Massive spike; conventional war
Syria, 2011–2016	Very high	Very high	Peak intensity
Syria, 2017–2024	Moderate	Moderate	Declining; fragmented stalemate

Source: ACLED event data (approximate ranges; ACLED counts are event-based, media-dependent, and undercount in remote or low-access areas).

Table 2 — External Intervention Timelines

Actor	Region	Entry	Modality	Status (2024)
France (Serval/Barkhane)	Sahel	2013	Counter-terrorism, air + ground	Withdrew 2022
Russia (Wagner/Africa Corps)	Sahel	2021	Counter-terrorism, advisory, mining-linked	Expanding
US/NATO	Ukraine	2014 (aid); 2022 (massive)	Arms, intelligence, training	Ongoing

Actor	Region	Entry	Modality	Status (2024)
US	Syria/West Asia	2014	Air strikes, special operations	Reduced footprint
Iran (IRGC, proxies)	Syria/Lebanon/Iraq	2011+	Advisors, militias, logistics	Entrenched
Russia	Syria	2015	Air power, naval basing	Entrenched

Source: intervention chronologies compiled from ACLED and open-source reporting; dates are approximate.

Table 3 — Civilian Harm and Displacement (approximate, ACLED/UN estimates)

Region	Period	Civilian fatalities (approx.)	Displaced persons (approx.)
Sahel	2012–2024	Tens of thousands	Millions
Ukraine	2014–2024	Tens of thousands (majority post-2022)	Millions (internal + refugee)
Syria	2011–2024	Hundreds of thousands	Millions (largest displacement crisis)

Source: ACLED fatality estimates and UNHCR displacement figures (approximate ranges; civilian/combatant distinction is contested in all three cases).

Five Numbered Analysis Questions

1. **Trend.** Describe the trajectory of violence in each region using Table 1. Which region shows a "late escalation" pattern (low early, sharp late rise), which shows "early peak then fragmentation," and which shows "stable low-intensity then sudden conventionalization"? What does this imply about the role of external intervention timing?

2. **Level of analysis.** Using the four levels from Lesson 1 (individual, state, systemic, transnational), which level best explains the *variation* across the three cases? Argue for one level as primary and one as secondary, and identify what each level cannot explain.

3. **Perspective reconstruction (all five).** Reconstruct how the African (primary), Chinese, Russian, Western, and UN perspectives each read the three cases together. For each perspective, state (a) its central causal claim about why the three trajectories differ, (b) the evidence it privileges, and (c) the evidence it must downplay or ignore.

4. **Interpretation.** Apply most-similar and most-different designs. Which pair of cases is most-similar (shared features, different outcome) and which is most-different (shared outcome, different features)? What causal inference does each design license, and what does it forbid?

5. **Limitation.** Identify three specific biases in ACLED-based comparison across these three regions (e.g., media-density bias, definitional variation in "civilian," undercounting in remote Sahelian zones, conflation of battle and one-sided violence). How would each bias change the apparent ranking of regions by severity?

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — Most-Similar / Most-Different Design Matrix

What to draw: A 2×2 grid on a landscape page. X-axis: "State capacity / institutional strength" (low → high). Y-axis: "External intervention intensity" (low → high). Place three large dots: Sahel (low capacity, high intervention), Ukraine (moderate-high capacity, high intervention), Syria (low capacity, very high intervention). Draw dashed ellipses grouping Sahel+Syria as "most-similar on capacity" and Ukraine+Syria as "most-similar on intervention." Label the diagonal "most-different pair: Sahel vs. Ukraine."

Labels to place: Axis titles; case names with years; ellipse labels "Most-similar (capacity)" and "Most-similar (intervention)"; diagonal label "Most-different"; legend: "Dot size = civilian fatalities (approx.)."

Perspective overlay: In the bottom-right corner, annotate four small boxes: "African: capacity collapse is colonial legacy"; "Chinese: sovereignty violation drives escalation"; "Russian: Western intervention is the common cause"; "Western: state fragility + spoiler groups"; "UN: protection gaps." Draw thin lines from each box to the case it best explains.

Visual 2 — Three Trajectories Timeline

What to draw: Three horizontal timelines stacked vertically, each 2011–2024. Top: Sahel (Mali 2012 coup, French intervention 2013, spread to Burkina/Niger 2019, Wagner entry 2021, coups 2020–2023). Middle: Ukraine (Euromaidan 2014, Donbas war, Minsk 2015, 2022 invasion, counteroffensives). Bottom: Syria/West Asia (2011 uprising, regime survival, Russian entry 2015, ISIS peak 2014–2017, stalemate). Use vertical bars whose height = approximate event intensity; shade intervention periods in grey.

Labels to place: Year ticks every two years; event labels at peaks; legend for bar height = "ACLED events (approx.)"; grey shading = "major external intervention."

Perspective overlay: Along the right margin, three short annotations: "African lens: Sahel line shows intervention without legitimacy"; "Chinese lens: Ukraine line shows bloc confrontation"; "Western lens: Syria line shows proxy war." Keep each to one line.

Visual 3 — Five-Perspective Lens Diagram

What to draw: A central triangle labeled "Three conflicts (Sahel / Ukraine / Syria)" with three vertices. Around it, five concentric or radial "lenses" (ovals) labeled African, Chinese, Russian, Western, UN. Each lens has two arrows: one pointing inward (what it sees) and one pointing outward (what it misses). Draw the African lens largest and closest to the center; the others smaller and peripheral.

Labels to place: Lens names; inward arrow labels: "African: colonial state, extraction, agency"; "Chinese: sovereignty, non-interference"; "Russian: multipolarity, Western overreach"; "Western: democracy, security, norms"; "UN: protection, humanitarian law." Outward arrow labels: "African: misses great-power

agency?"; "Chinese: misses local agency"; "Russian: misses local suffering"; "Western: misses structural inequality"; "UN: misses power politics."

Perspective overlay: Shade the African lens in a distinct color (e.g., amber) to mark it as primary; add a note "Primary vantage: reconstructed from within, not applied as regional case."

SECTION 4 — CORNELL NOTES

Cue Column (prompts) and Notes Column

Cue (prompt)	Notes (with source log)
What is most-similar design?	Compare cases sharing many features but differing on outcome/cause; isolates the differing factor. Source: comparative conflict literature; Mill's methods.
What is most-different design?	Compare cases differing on many features but sharing an outcome; identifies common cause across diversity. Source: comparative conflict literature.
Sahel trajectory in one line?	Low-intensity insurgency (2012) → French intervention → spread and militarization → coups → Russian entry → civilian harm surge. Source: ACLED; Buzan & Wæver 2003 (regional security complex).
Ukraine trajectory in one line?	Protest (2014) → hybrid war in Donbas → Minsk stalemate → 2022 full-scale invasion → conventional war with external support. Source: ACLED; Tilly 1990 (state-making/war-making).
Syria/West Asia trajectory in one line?	Uprising (2011) → regime survival with external backing → proxy war → ISIS → Russian/Iranian entrenchment → frozen conflict. Source: ACLED; Kalyvas 2006 (civil war dynamics).
African perspective core claim?	Colonial state structures, extraction, and external intervention without legitimacy drive escalation; local agency is central. Sources: Grovogui; Mbembe; Mamdani; Rodney; Nkrumah.
Chinese perspective core claim?	Sovereignty violation and bloc confrontation destabilize; non-interference and development are stabilizers. Sources: Chinese IR scholarship; UN Charter norms.
Russian perspective core claim?	Western unipolarity and interventionism are root causes; multipolarity and state sovereignty are remedies. Sources: Russian foreign-policy discourse.

Cue (prompt)	Notes (with source log)
Western perspective core claim?	State fragility, spoiler groups, and norm violations drive conflict; democracy promotion and security assistance are remedies. Sources: Western IR; Kalyvas 2006.
UN perspective core claim?	Protection gaps, humanitarian law violations, and weak multilateralism; remedies are mandates, peacekeeping, accountability. Sources: UN Charter; R2P debates.
Key synthesis claim?	No single theory explains all three; realism explains intervention, political economy explains extraction, post-colonial critique explains state form. Sources: Tilly 1990; Buzan & Wæver 2003; Kalyvas 2006.
Forecasting implication?	Trajectories are path-dependent; intervention timing and legitimacy matter more than capacity alone. Source: comparative conflict literature.
Policy implication?	Recommendations diverge by perspective; convergence only on civilian protection and de-escalation channels. Source: UN; regional organizations.
Data limitation?	ACLED is event-based, media-dependent, undercounts remote areas; civilian/combatant distinction contested. Source: ACLED methodology notes.

Source log: Buzan, B. & Wæver, O. (2003) *Regions and Powers*; Tilly, C. (1990) *Coercion, Capital, and European States*; Kalyvas, S. (2006) *The Logic of Violence in Civil War*; ACLED data and methodology; UNHCR displacement figures; comparative conflict literature; African scholarship (Grovogui, Mbembe, Mamdani, Rodney, Nkrumah, Nyerere, Cabral, Fanon).

Summary (3–5 sentences): Comparative analysis of the Sahel, Ukraine, and West Asia shows that conflict trajectories are shaped by the interaction of state capacity, external intervention timing and legitimacy, and transnational networks, with no single theory sufficient. Most-similar designs highlight intervention legitimacy as a key differentiator; most-different designs highlight external great-power competition as a common driver. The African perspective, reconstructed from within, reveals that colonial state forms and extraction structures are preconditions that other perspectives underweight. Forecasting must be scenario-based and path-dependent, and policy recommendations diverge sharply by perspective, converging only on civilian protection and de-escalation.

SECTION 5 — FEYNMAN COMPRESSION

Step 1 — Explain without jargon. Three regions have been at war for years. In the Sahel, a small rebellion grew into a huge crisis after foreign armies arrived and local governments lost legitimacy. In Ukraine, a

political protest turned into a border war and then a full invasion. In Syria, a popular uprising became a multi-sided war with many outside powers. Comparing them shows that wars grow when outside help arrives without local trust, and that the same outside power can make things better or worse depending on whether locals accept it. No single story explains all three; you need several lenses.

Step 2 — Mark gaps. I have not specified the mechanism linking intervention timing to escalation (is it legitimacy, capacity, or signaling?). I have not quantified the "local trust" variable. I have not addressed whether the three cases are comparable given different regime types. I have not stated falsifiers for the claim that intervention without legitimacy escalates conflict.

Step 3 — Reread verification. Re-reading the key ideas: comparative methodology (most-similar/most-different) licenses causal claims only when cases are selected on theoretical grounds, not convenience. The synthesis claim requires that realism, political economy, and post-colonial critique be treated as complementary scope-conditions, not rivals. Forecasting must be conditional and scenario-based, not point prediction. Policy implications must be perspective-indexed. The African perspective must remain primary and reconstructed from within.

Step 4 — Analogy with explicit limits. Analogy: three patients with different diseases receive the same drug; outcomes differ because of underlying health, dosage timing, and whether the patient consented. This captures path-dependence and legitimacy. Limit: patients are passive; states and armed groups are strategic actors who adapt, so the analogy understates agency and feedback loops.

Step 5 — Rewrite. Comparative conflict analysis treats the Sahel, Ukraine, and West Asia as a structured comparison rather than three separate stories. Using most-similar and most-different designs, it isolates intervention legitimacy and great-power competition as key variables while holding state capacity and transnational networks in view. The African perspective, taken as primary, shows that colonial state forms and extraction make the Sahel case distinctively legible; the other four perspectives add partial truths. Forecasting yields scenario-conditioned expectations, not predictions, and policy advice must be indexed to perspective, converging only on civilian protection and de-escalation.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
L60	definition	What is most-similar systems design in comparative conflict analysis?	A research design that holds most variables constant across cases to isolate the effect of one or a few causal factors; in conflict studies it compares wars sharing structural features (state weakness, external intervention) to identify which intervention type produces different outcomes.	African scholars note that "similar" cases are often defined by Western categories that obscure local variation.
L60	definition	What is most-different systems design?	A design selecting cases differing on most dimensions but sharing the outcome of interest, used to test whether a theory holds across diverse contexts; in conflict analysis it tests whether resource predation or identity mobilization operates in the Sahel, Ukraine, and Syria alike.	Chinese and Russian scholars often favor this design to challenge Western universalism.

Tag	Card Type	Front	Back	Perspective Note
L60	mechanism	What mechanism links state fragility to prolonged insurgency?	Tilly's (1990) war-making/state-making nexus: where states cannot extract resources or provide protection, armed actors fill the gap, converting violence into political authority and taxation; Kalyvas (2006) adds that control of civilian populations, not territory alone, sustains insurgency.	African perspective emphasizes that fragility is partly produced by external extraction and post-colonial state forms.
L60	application	Apply most-similar design to the Sahel and Ukraine: what is held constant?	Both feature weak or contested state authority in peripheral regions, external military intervention, and non-state armed groups; the design isolates intervention type (French counter-terrorism vs. Russian hybrid warfare vs. US/NATO support) as the key variable.	Western analysts often overstate the similarity; African analysts stress different colonial legacies.

Tag	Card Type	Front	Back	Perspective Note
L60	comparison	How do the Sahel, Ukraine, and West Asia differ in conflict trajectory?	The Sahel shows fragmented, multi-actor insurgency with jihadist expansion and state collapse; Ukraine shows interstate war with conventional fronts and a nuclear backdrop; West Asia shows proxy war with sectarian framing and regional power competition.	Each trajectory reflects a distinct regional security complex (Buzan and Wæver 2003).
L60	source	What does Buzan and Wæver (2003) contribute to comparative conflict analysis?	Regional Security Complex Theory: security interdependence is clustered regionally, so conflicts must be analyzed within their regional complexes; the Sahel, Eastern Europe, and West Asia constitute separate complexes with different logics.	UN perspective draws on RSC to justify regional mediation architectures.

Tag	Card Type	Front	Back	Perspective Note
L60	debate	Realism vs. political economy: what explains prolonged conflict?	Realism emphasizes anarchy, power balancing, and external intervention; political economy emphasizes resource extraction, war economies, and elite incentives; the debate turns on whether violence is driven by security dilemmas or profit.	Post-colonial critique argues both miss racialized and colonial dimensions.
L60	reconstruction	Reconstruct the African perspective on comparative conflict.	African scholarship (Mamdani, Bayart, Rodney) treats conflict as shaped by colonial state forms, external extraction, and the international system's racial hierarchy; comparative analysis must center African agency and the longue durée of imperialism.	Primary perspective; longest and most developed in Section 2.7.

Tag	Card Type	Front	Back	Perspective Note
L60	occlusion	What does the Western perspective occlude in comparative conflict analysis?	It tends to universalize liberal state-building models, underweight colonial legacies, and frame non-Western actors as spoilers rather than rational strategists; it also undercounts civilian harm from Western interventions.	African and Russian critiques converge on this point.
L60	adjudication	How should one adjudicate between realism and post-colonial critique on Ukraine?	Realism explains the NATO-Russia security dilemma and great-power bargaining; post-colonial critique explains how colonial and racial hierarchies shape whose sovereignty is defended; evidence favors a synthesis: security dilemma plus racialized international order.	Adjudication requires specifying scope conditions for each theory.
L60	visual	What visual anchor captures the three-trajectory comparison?	A three-panel timeline (Sahel 2012-, Ukraine 2014-, West Asia 2011-) with intervention markers and civilian-casualty trend lines, annotated by perspective.	Dual-coded visuals must show perspective overlays, not just data.

Tag	Card Type	Front	Back	Perspective Note
L60	mechanism	What is the war economy mechanism in prolonged conflict?	Armed actors tax populations, control smuggling routes, and extract rents; violence becomes self-financing, reducing incentives for peace; Tilly (1990) and Kalyvas (2006) both stress resource extraction as state-making.	African scholars (Bayart) emphasize extraversion: elites profit from external linkages.
L60	application	What forecasting implication follows from comparing the three cases?	Conflicts with fragmented armed actors and weak state capacity (Sahel) tend toward protracted low-intensity war; interstate wars with nuclear powers (Ukraine) risk escalation; proxy wars (West Asia) tend toward frozen conflicts.	Forecasting must be probabilistic and perspective-aware.

Tag	Card Type	Front	Back	Perspective Note
L60	debate	What policy recommendation would each perspective make?	Western: state-building and liberal peace; African: decolonize security assistance and center local legitimacy; Chinese: development-first and non-interference; Russian: multipolarity and anti-hegemony; UN: multilateral mediation and protection of civilians.	Policy divergence tracks normative stance.
L60	source	What does Kalyvas (2006) contribute?	The Logic of Violence in Civil War: violence is shaped by control of populations and information; indiscriminate violence often backfires; selective violence requires local knowledge.	Applies across all three cases but with different local logics.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence audit table (scored 0-100).

Skill / Objective	Self-score (0-100)	Evidence of mastery	Gap to close
Distinguish most-similar from most-different designs		Can state which variables are held constant and which vary	Practice applying to a new case pair
Apply five perspectives to all three cases		Can reconstruct each perspective in 3-5 sentences	Deepen African primary perspective

Skill / Objective	Self-score (0-100)	Evidence of mastery	Gap to close
Identify mechanisms (Tilly, Kalyvas, war economy)		Can specify causal chain, not just outcome	Link mechanism to observable implication
Forecast from comparative evidence		Can produce probabilistic, scenario-based claims	Add falsifiers to each forecast
Reconstruct policy recommendations by perspective		Can match recommendation to normative stance	Note where perspectives converge
Adjudicate between competing theories		Can specify scope conditions and evidence	Avoid declaring a single winner
Interpret ACLED-style data across regions		Can distinguish trend, level, and limitation	Check for reporting bias
Construct dual-coded visual anchor		Can overlay perspective annotations on data	Ensure labels are legible

7.2 Three-question debrief.

1. Which of the five perspectives did you find hardest to steel-man from within, and what assumption of yours blocked it?
2. Did your comparative analysis change any prior belief about one of the three conflicts, or only confirm it?
3. Which mechanism (state-making, war economy, control of civilians) best explains the case you know least well, and what evidence would falsify that?

7.3 Error-log table.

Common Misconception	Correction	Evidence
Most-similar design means the cases are identical.	It holds most variables constant to isolate one or a few; cases remain distinct in history and agency.	Comparative methodology literature; African critique of category-making.
Realism fully explains Ukraine.	The security dilemma is partial; domestic politics, identity, and racialized international order also matter.	Post-colonial and constructivist critiques; adjudication in Section 2.8.
African conflicts are primarily about resources or ethnicity.	Post-colonial state forms, external extraction, and international racial hierarchy are constitutive.	Mamdani, Bayart, Rodney; African perspective in Section 2.7.1.

Common Misconception	Correction	Evidence
External intervention always stabilizes.	Intervention often prolongs conflict by altering incentive structures; evidence from Sahel and Libya.	Kalyvas (2006) on control; ACLED trend data.
Forecasting can predict exact outcomes.	Comparative analysis yields probabilistic, scenario-based expectations with explicit falsifiers.	Forecasting implications in Key Idea 4.
The UN perspective is neutral.	It is embedded in power asymmetries and institutional mandates that shape what is visible.	UN perspective in Section 2.7.5.

SECTION 8 — CHEATSHEET

Core concepts	Key mechanisms	Theories and authors	Cases and evidence	Debates	Falsifiers	Cross-links
Most-similar / most-different designs; regional security complex; comparative conflict analysis	War-making/state-making (Tilly 1990); control of civilians (Kalyvas 2006); war economy; extraversion	Buzan and Wæver (2003); Tilly (1990); Kalyvas (2006); Mamdani, Bayart, Rodney; realism, political economy, post-colonial critique	Sahel 2012- (fragmented insurgency, jihadist expansion); Ukraine 2014- (interstate war, nuclear backdrop); West Asia 2011- (proxy war, sectarian framing); ACLED event data; intervention timelines	Realism vs. political economy; universalism vs. post-colonial critique; stabilization vs. prolongation	If Sahel insurgency declines without state capacity gains; if Ukraine de-escalates via great-power deal alone; if West Asia proxy war resolves via local actors only	L1 levels of analysis; L61 grand strategy; Modules 4-7 regional cases

SECTION 9 — REVIEW SCHEDULE

- **R1 (Day 1, 20 min):** Re-read the flashcard table; self-test the five perspective reconstructions aloud without notes.
- **R2 (Day 3, 30 min):** Redraw the three-panel timeline visual anchor from memory; check against Section 3.

- **R3 (Day 7, 45 min):** Re-attempt the Problem Pair tasks; compare to the model answer; log errors in Section 7.3 format.
- **R4 (Day 14, 60 min):** Write a one-page adjudication between realism and post-colonial critique using the Ukraine case; specify scope conditions.
- **R5 (Day 30, 90 min):** Produce a fresh independent memo on a new case pair (e.g., Sudan vs. Myanmar) using the four headings; run the self-check line.

SECTION 10 — COMPLETION CHECKLIST

- ☐ I can define most-similar and most-different designs and apply each to a case pair.
- ☐ I can state what Buzan and Wæver (2003) Regional Security Complex Theory implies for the three cases.
- ☐ I can explain Tilly's (1990) war-making/state-making mechanism in my own words.
- ☐ I can explain Kalyvas's (2006) control-of-civilians mechanism and its scope conditions.
- ☐ I can describe the Sahel trajectory (2012-present) with dates and actors.
- ☐ I can describe the Ukraine trajectory (2014-present) with dates and actors.
- ☐ I can describe the West Asia trajectory (2011-present) with dates and actors.
- ☐ I can reconstruct all five perspectives on the three cases, African first and longest.
- ☐ I can identify what each perspective occludes.
- ☐ I can adjudicate between realism and political economy with evidence.
- ☐ I can produce a probabilistic forecast with explicit falsifiers.
- ☐ I can match each perspective to its policy recommendation.
- ☐ I can interpret ACLED-style data noting trend, level, and limitation.
- ☐ I can draw the three-panel timeline visual anchor with perspective overlays.
- ☐ I have completed the independent memo and run the self-check line.
- ☐ I have logged at least two errors in the error-log table.
- ☐ I can state the strongest counterargument to my preferred theory.
- ☐ I can link this lesson forward to L61 grand strategy and backward to Modules 4-7.

62. Capstone II: Grand Strategy for a Middle Power

LESSON METADATA

Field	Value
Lesson number and title	Lesson 61 — Capstone II: Grand Strategy for a Middle Power
Module	Module 10: Forecasting, Diplomacy, and Capstones
Prerequisites	All previous lessons (Lessons 1–60)
Interleaved links	Terminal — integrates the whole curriculum; feeds back into Lessons 1–60 via case application
Reading load	7-9 hours
Content channels	Text, data lab, worked example, problem pair, flashcards, Cornell notes, Feynman compression
Bloom ceiling	Create / Evaluate (design a grand strategy for a specified middle power under constraints)
Estimated study time	7-9 hours

SECTION 0 — Why This Lesson Exists

This lesson exists because the curriculum has, up to this point, equipped you with a set of analytical instruments — levels of analysis, causal mechanisms, perspective reconstruction, adjudication, falsification — but has not yet asked you to *assemble* them into a single, coherent strategic judgment about a state that is neither a great power nor a passive object of great-power politics. The capstone is not a summary. It is a stress test. It takes the full toolkit and applies it to the hardest case in contemporary international relations: the middle power that must survive, prosper, and retain agency in a fragmented order in which the two largest economies are locked in strategic competition, the multilateral institutions built after 1945 are under strain, and the very definition of "alignment" has become contested. The central puzzle is this: **how does a state with limited material power but significant normative and institutional ambition construct a grand strategy that is simultaneously feasible, legitimate, and resilient across the time horizons that matter for its survival?** The answer is not a single doctrine. It is a method for reasoning about trade-offs that cannot be eliminated, only managed.

The puzzle matters because the international system of the 2020s is not the unipolar moment of the 1990s, nor the bipolar stability of the Cold War, nor the multipolar fluidity of the pre-1914 era. It is something analytically novel: a system in which power is concentrated at the top (the United States and China), diffused in the middle (a tier of states with regional reach and institutional voice), and fragmented at the bottom (weak

states, non-state actors, and transnational threats). In such a system, the middle power occupies a structurally ambiguous position. It is too strong to be ignored, too weak to dictate terms, and too consequential to be treated as a mere swing state. Its choices — alignment, hedging, multi-alignment, autonomy — shape regional orders, institutional legitimacy, and the distribution of global public goods. Yet the theoretical literature on grand strategy has been written overwhelmingly from the perspective of great powers: the United States, the Soviet Union, China, the United Kingdom. The middle power is either absent from the theory or treated as a residual category. This lesson corrects that asymmetry by placing the middle power at the center of strategic analysis and by insisting that its perspective — not the great power's — is the appropriate vantage point from which to understand the contemporary order.

The curriculum has prepared you for this through a specific sequence. Lessons 1–10 established the epistemological and methodological foundations: what counts as evidence, how to distinguish description from explanation from prediction from prescription, and how to adjudicate between competing theories. Lessons 11–20 developed the theoretical architecture of international relations: realism, liberalism, constructivism, and the critical and post-colonial traditions. Lessons 21–30 examined the historical and institutional structures of the international order: the United Nations, regional organizations, international law, and the global economy. Lessons 31–40 turned to security studies: war, deterrence, coercion, and the changing character of conflict. Lessons 41–50 addressed political economy: trade, finance, development, and the distribution of gains from globalization. Lessons 51–60 examined diplomacy, negotiation, and forecasting — the practical arts of statecraft. This lesson, Lesson 61, is the terminal integration. It does not introduce new theory. It demands that you *deploy* the theory you already possess in a context where no single theory is sufficient and where the choice of theory is itself a strategic act.

What you will be able to do after mastering this lesson is threefold. First, you will be able to construct a grand strategy for a specified middle power from the ground up: defining its interests, mapping its threats, inventorying its resources, and selecting among strategic options with explicit scope conditions and falsifiers. Second, you will be able to reconstruct the same strategic problem from five distinct perspectives — African, Chinese, Russian, Western, and UN — and to adjudicate among them on the basis of evidence rather than assertion. Third, you will be able to identify the domestic political constraints on strategy-making and to explain why the same external environment produces different strategic choices in different states. These are not academic exercises. They are the skills required of a policy analyst, a diplomat, a strategic planner, or a scholar who wishes to speak to practitioners without losing analytical rigor.

The lesson is also designed to correct a persistent bias in the teaching of international relations: the tendency to treat the "international" as synonymous with the "great-power." When the curriculum is built around Washington, Beijing, Moscow, and Brussels, the student learns to see the world from the center. The middle power is then either a dependent variable — its behavior explained by great-power pressure — or a nuisance variable — its agency acknowledged but not theorized. This lesson inverts that framing. It treats the middle power as the independent variable and asks what the international system looks like from Jakarta, Pretoria, Brasília, Ankara, or Seoul. The answer is not that the great powers disappear. They remain the primary structural constraints. But the middle power's experience of those constraints — its vulnerabilities, its opportunities, its normative commitments, its domestic politics — reveals dimensions of the order that the great-power vantage point systematically obscures. The African perspective, which is primary in this lesson, is particularly important here because it foregrounds questions of sovereignty, agency, and historical justice that the Western and Chinese perspectives tend to treat as secondary to material power.

Finally, this lesson is a capstone in a second sense: it is the last opportunity in the curriculum to practice the

full analytical protocol before you are expected to deploy it independently. The worked example (Indonesia) and the problem pair (South Africa) are not illustrations of a theory. They are training grounds for a method. The method is: state the puzzle, identify the level of analysis, reconstruct the mechanism, test it against evidence, reconstruct the perspectives, adjudicate, and specify falsifiers. If you can execute this protocol on Indonesia and South Africa, you can execute it on any middle power in any region. That is the claim this lesson makes, and it is the standard against which your mastery will be assessed.

SECTION 1 — Pre-Class Priming

1.1 Retrieval Warm-Up Answer each question from memory before consulting any notes. The purpose is to activate prior knowledge that this lesson will integrate.

1. **Levels of analysis.** Lesson 1 introduced four levels of analysis: individual, state, systemic, and transnational. For each level, give one example of a causal mechanism that operates primarily at that level in the study of international security. (Recall: mechanisms must specify *how* an outcome is produced, not merely *that* it occurs.)

2. **Grand strategy vs. strategy vs. tactics.** Distinguish the three concepts. Which of the three is most dependent on domestic political coalitions, and why? (Hint: recall the distinction between ends, ways, and means, and the role of institutional capacity in sustaining each.)

3. **Hedging.** Define hedging as a strategic behavior. Under what scope conditions does hedging become unsustainable? Identify at least two conditions (one material, one normative) under which a state that has been hedging must choose a clearer alignment.

4. **Ontological security.** Recall the concept of ontological security from the security studies module. How does it differ from physical security? Give one historical example in which a state prioritized ontological security over material gain, and explain the mechanism.

5. **Multi-alignment.** Distinguish multi-alignment from non-alignment and from bandwagoning. What is the difference between multi-alignment as a *strategy* and multi-alignment as a *rhetoric*? What evidence would allow you to tell them apart in a given case?

6. **Perspective reconstruction.** State the five perspectives used throughout this curriculum (African, Chinese, Russian, Western, UN). For each, identify the core normative commitment that distinguishes it from the others. (This is a retrieval check on the method, not on any single lesson.)

1.2 Orientation Questions These questions frame the central puzzle of the lesson. You are not expected to answer them fully before reading; they are here to orient your attention.

1. If a middle power's material interests (trade, security guarantees, investment) pull it toward one great power while its normative commitments (sovereignty, anti-colonial solidarity, multilateralism) pull it toward another, which should prevail in the construction of grand strategy — and what does "prevail" even mean when the two are incommensurable?

2. Is "multi-alignment" a genuine grand strategy with identifiable scope conditions and falsifiers, or is it a description of behavior that any state exhibits when it lacks the power to choose? What evidence

would distinguish the two?

3. How does the domestic political structure of a middle power — its regime type, its coalition politics, its institutional capacity — constrain the range of grand strategies available to it? Can the same external environment produce different strategies in different states, and if so, what explains the variation?

4. What does the African vantage point reveal about the middle-power problem that the Western, Chinese, Russian, and UN perspectives systematically miss? Conversely, what does the African perspective risk occluding?

1.3 Vocabulary Pre-Teach Provisional definitions for terms that will be used throughout the lesson. These are starting points; the lesson will refine and contest them.

1. **Grand strategy** — The highest level of statecraft: the coordinated use of all instruments of national power (military, economic, diplomatic, informational) to achieve a state's long-term objectives in an anarchic international system. *Provisional note:* The definition is contested; some scholars (Posen, 2014) restrict grand strategy to military-diplomatic coordination, while others (Brands, 2016) include economic and domestic policy. This lesson adopts the broader definition but flags the narrower one where relevant.

2. **Middle power** — A state that lacks the material capacity to shape the global order unilaterally but possesses sufficient resources, institutional standing, and regional influence to act as a consequential actor in specific issue-areas and regions. *Provisional note:* The category is analytically slippery; "middle power" is sometimes a description of capability, sometimes a self-identification, and sometimes a diplomatic strategy. The lesson treats it as a *relational* category: a state is a middle power relative to the great powers above it and the weak states below it.

3. **Strategic autonomy** — The capacity of a state to make and implement decisions in its core interest areas without being compelled by external actors. *Provisional note:* Autonomy is not independence; it is the *margin of maneuver* within constraints. A state with high autonomy can choose among options; a state with low autonomy faces a single option.

4. **Hedging** — A strategic behavior in which a state maintains ambiguous or dual relationships with competing great powers in order to preserve flexibility, avoid premature commitment, and reduce risk. *Provisional note:* Hedging is distinct from balancing (which is adversarial) and bandwagoning (which is submissive). It requires the state to send contradictory signals, which carries reputational costs.

5. **Multi-alignment** — The simultaneous pursuit of strategic partnerships with multiple, sometimes competing, great powers across different issue-areas, without a single overarching alliance commitment. *Provisional note:* Multi-alignment is often conflated with hedging, but it is broader: hedging is a *tactic* within a strategy of multi-alignment, which is a *grand strategy*.

6. **Ontological security** — The security of a state's (or society's) identity, narrative, and sense of self-continuity. *Provisional note:* Ontological security is not reducible to physical survival; a state may risk material loss to preserve its identity, and may accept material gain that threatens its identity only at the cost of internal instability.

7. **Non-alignment** — A foreign policy doctrine, historically associated with the Bandung Conference (1955) and the Non-Aligned Movement, in which states refuse to join military alliances with great

powers and assert sovereign equality. *Provisional note:* Non-alignment is not neutrality; it is an active political stance, not a passive absence of commitment.

8. **Bandwagoning** — The strategic choice to align with the stronger or rising power in anticipation of its victory or dominance, accepting subordinate status in exchange for protection or gain. *Provisional note:* Bandwagoning is the opposite of balancing; it is chosen when balancing is infeasible or when the costs of opposition exceed the costs of subordination.

9. **Scope conditions** — The specific circumstances under which a theory, mechanism, or strategy is expected to hold. *Provisional note:* A claim without scope conditions is unfalsifiable; specifying scope conditions is what makes a strategic argument testable.

10. **Falsifier** — An observable outcome that, if it occurs, would refute a strategic hypothesis or prediction. *Provisional note:* Falsifiers must be specified *before* the strategy is implemented, not constructed post hoc to explain failure.

11. **Relationality** — A concept from Chinese IR theory (and resonant with African communitarian thought) holding that actors are constituted by their relationships rather than by pre-given attributes; order emerges from relational practice, not from power distribution alone. *Provisional note:* Relationality challenges the methodological individualism of Western IR theory.

12. **Sovereign choice** — A concept from Russian IR discourse emphasizing the right of states to determine their own political and strategic orientation without external interference, often invoked to resist Western normative conditionality. *Provisional note:* Sovereign choice is both a legal principle (UN Charter Article 2.1) and a political rhetoric; the lesson examines when it functions as each.

End of requested sections. Section 2 and beyond are not included in this chunk.

SECTION 2 — LESSON CORE

2.1 Learning objectives By the end of this lesson, the student will be able to:

1. **Define** grand strategy as an integrative framework that links a state's interests, threats, resources, and strategic choices, rather than as a synonym for military planning or foreign policy ambition.

2. **Analyze** the causal mechanisms through which ends, ways, and means become aligned or misaligned, including prioritization, sequencing, opportunity cost, feedback between threat perception and resource mobilization, and path dependence created by prior commitments.

3. **Evaluate** competing grand-strategy frameworks—especially expansive, restraint-oriented, and middle-power variants—by their scope conditions, their assumptions about adversary behavior and domestic capacity, and their strongest counterarguments.

4. **Apply** the ends-ways-means diagnostic to a middle-power case by identifying the state's core interests, principal threats, feasible resources, and the strategic choices that follow, while distinguishing description, explanation, prediction, and prescription.

5. **Synthesize** African, Chinese, Russian, Western, and UN perspectives on middle-power grand strategy into a comparative judgment that specifies what each perspective contributes, what it occludes, and under what evidence one would revise the judgment.

2.2 KEY IDEA 1 — Grand strategy frameworks: defining interests, threats, resources, and strategic choices Bolded Causal Claim:

A state's grand strategy succeeds or fails primarily through the causal alignment of four components—interests as desired end-states, threats as dangers to those end-states, resources as feasible means, and strategic choices as the allocation of means across time, space, and domains—so that incoherence among these components can defeat a state even when its individual policies are technically competent.

Mechanism:

The mechanism is integrative prioritization under constraint. Interests establish the political object that all instruments are meant to serve; threats rank those interests by urgency and vulnerability; resources bound what is feasible; strategic choices then allocate scarce means among competing demands. Liddell Hart (1954) treated grand strategy as the coordination of all resources toward the political object, not merely the direction of military operations. Kennedy (1991) added the historical mechanism of overstretch: when commitments expand faster than productive and military resources, relative power declines even if absolute power grows. Posen (2014) sharpened the mechanism by arguing that restraint can be a strategy of deliberate non-use of power, reducing exposure and preserving freedom of action. Brands (2016) emphasized that grand strategy is an intellectual and institutional framework that forces trade-offs into view. The causal chain runs as follows: threat perception raises the salience of certain interests; salience drives resource mobilization; mobilization alters the state's capabilities and vulnerabilities; altered capabilities feed back into threat perception and into the credibility of commitments. Strategic choices are therefore not one-time decisions but path-dependent sequences. A choice to build a blue-water navy, for example, commits future budgets, alliance expectations, industrial capacity, and diplomatic signaling; it also invites countermeasures. Middle powers face a compressed version of this mechanism because their resources are thinner, their threats are often asymmetric, and their choices are made in the shadow of great-power rivalry. Gecelovsky (2009) and Beeson and Higgott (2014) are useful here for situating middle-power strategy in regional and institutional settings rather than treating it as a scaled-down great-power strategy. The mechanism also includes domestic translation: strategic choices must pass through legislatures, ministries, militaries, firms, and publics, so a grand strategy that is coherent on paper but unsupported domestically becomes a declaratory document rather than a causal force.

Scope Conditions:

This framework applies most strongly to states with (a) a relatively stable definition of core interests, (b) bureaucratic capacity to coordinate across military, economic, and diplomatic domains, (c) enough resource slack to make trade-offs meaningful rather than existential, and (d) a time horizon long enough for sequencing to matter. It applies less cleanly to revolutionary regimes, states facing imminent existential threat, highly fragmented polities, or governments whose survival depends on short-term patronage rather than long-term capability. For middle powers, the framework must be modified: their interests often include autonomy, status, and developmental capacity rather than only territorial security; their threats include dependence, coercion, and marginalization; their resources include diplomatic skill, institutional position, and economic niche advantages as well as military force. A strong counterargument is that grand strategy is often retrospective coherence imposed on ad hoc decisions: leaders may not possess the information, unity, or foresight

required to align ends, ways, and means, and scholars may overstate coherence by selecting successful cases. Another counterargument is that domestic politics, bureaucratic politics, and chance can override strategic design, making grand strategy an elite narrative rather than a causal mechanism. The framework should therefore be treated as a diagnostic and prescriptive tool, not as proof that states actually behave strategically.

Observable Implications:
If a grand strategy is coherent, one should observe cross-domain consistency: defense procurement, trade policy, alliance commitments, development finance, and diplomatic voting should point toward the same hierarchy of interests; budget documents should reveal explicit trade-offs; strategic white papers should state assumptions about threats and resources; and leaders should be able to explain what they are not doing as clearly as what they are doing. If incoherent, one should observe contradictory signals, simultaneous overcommitment and underinvestment, reactive crisis management, and a gap between declared priorities and fiscal allocations. For middle powers, coherent hedging should appear as diversification rather than contradiction: multiple partnerships, investment in autonomous capabilities, participation in competing institutions, and calibrated ambiguity about ultimate alignment. Metrics include defense spending as a share of GDP, trade concentration by partner, foreign direct investment dependence, UN voting alignment, diplomatic initiative density, and the institutionalization of strategic planning. A useful falsifier would be evidence that a state's major resource allocations and diplomatic commitments are better explained by domestic factional competition or by external great-power pressure than by an internally generated ends-ways-means logic.

Perspective Note (five traditions in brief):
African (primary): From an African vantage, grand strategy cannot be reduced to the optimization of a unitary state's security and prosperity; it is bound up with sovereignty after colonialism, the memory of external intervention, developmental imperatives, and Pan-African solidarity. African scholarship—Nkrumah on neo-colonialism, Nyerere on ujamaa and non-alignment, Cabral on culture and liberation, Fanon on colonial violence and its afterlives, Rodney on underdevelopment, Mamdani on the colonial state and bifurcated citizenship, Bayart on extraversion, Grovogui on sovereignty and international law, and Tamale on feminist and decolonial statecraft—suggests that interests are often defined against imperial and racial hierarchies as much as against rival states. A middle-power grand strategy in Africa may therefore prioritize economic sovereignty, regional integration, strategic non-alignment, and institutional voice in global governance, not merely military balance. The African perspective also warns that Western frameworks can treat African states as arenas of great-power competition, thereby occluding African agency and the historical production of vulnerability. It contributes the insight that autonomy is not only material but juridical and epistemic: who defines the threat, who sets the agenda, and whose knowledge counts as strategic. Its strongest limitation is that Pan-African solidarity and normative foreign policy can conflict with immediate material interests, and that regional institutions may lack the capacity to convert shared interests into coordinated strategy.
Chinese: The Chinese perspective frames grand strategy through relationality, comprehensive national power, and the idea of a community of shared future, emphasizing long-term connectivity, strategic patience, and non-interference. Interests are defined not only by territorial security but by developmental trajectories and the stability of surrounding relationships; resources include economic statecraft, infrastructure, and institutional influence. This perspective contributes a critique of zero-sum balancing and a focus on cumulative, long-horizon gains, but it can occlude asymmetries in bilateral relationships and the coercive potential of economic dependence.
Russian: The Russian perspective emphasizes sovereign choice, multipolarity, strategic depth, and resis-

tance to unipolar dominance. Grand strategy is framed as preserving autonomy against hegemonic pressure, often through energy, geography, military modernization, and selective partnerships. It contributes a sharp critique of liberal universalism and a reminder that security is experienced differently by states near great-power centers, but it can occlude the costs of coercive diplomacy and overstate the coherence of a multipolar alternative.

Western: The Western perspective, especially in its liberal-internationalist and realist variants, frames grand strategy around rules-based order, alliance management, deterrence, and the balance of power. It contributes sophisticated tools for assessing capabilities, commitments, and credibility, and it treats hedging as a rational response to uncertainty. Its occlusion is a tendency to universalize Western institutional preferences and to understate the agency and historical grievances of postcolonial states.

UN: The UN perspective frames grand strategy within Charter multilateralism, collective security, development, and mediation. It contributes norms of lawful force, sovereign equality, and institutionalized cooperation, and it reminds middle powers that legitimacy and coalition-building are strategic resources. Its limitation is that it can assume state capacity and consent that do not exist, and it may understate the competitive realities that drive hedging.

SECTION 2.3 — KEY IDEA 2: The Middle Power Problem — Balancing Autonomy with Security in a Fragmented Order

Bolded Causal Claim: The middle power's central strategic problem is not a simple choice between autonomy and security, but the management of a structural tension in which neither can be maximized independently; in a fragmented order, the same interdependencies that create bargaining leverage also create exposure, so strategy consists in converting dependence into optionality rather than escaping dependence altogether.

Mechanism: Grand strategy, in the classical formulation, is the coordination of military, economic, and diplomatic instruments toward political ends (Liddell Hart, 1954; Kennedy, 1991). For a middle power, the difficulty begins with a mismatch between ends and means: it possesses enough capability to be consequential in specific domains, but not enough to set the terms of order. Autonomy is therefore not independence; it is the capacity to choose among constrained options. Security is not merely survival; it is the reduction of coercion to tolerable levels. The mechanism is asymmetric interdependence. Middle powers depend on great powers for security guarantees, market access, technology, finance, and institutional legitimacy, while great powers depend on middle powers for regional stability, basing, votes, resources, and legitimacy. This produces a bargaining structure in which alignment is simultaneously shield and leash. Fragmentation of the international order multiplies poles, institutions, and transactional opportunities, increasing optionality but also uncertainty. Hedging is best understood not as indecision but as a portfolio strategy: diversifying dependencies so that no single patron can impose unacceptable costs. Yet hedging carries its own costs—duplication, credibility discounts, and the risk that all partners interpret ambiguity as unreliability. Institutional entrepreneurship can amplify voice, but it can also provoke backlash when great powers read multilateral activism as disguised balancing. Thus middle-power strategy is a continuous optimization under incomplete information, not a one-time alignment choice (Posen, 2014; Brands, 2016).

Scope Conditions: The autonomy-security tension becomes acute under five conditions: (1) high trade openness combined with concentrated partner dependence; (2) security dependence on an external guarantor; (3) geographic exposure to great-power competition; (4) domestic fragmentation over foreign-policy

orientation; and (5) issue linkage, whereby economic access is conditioned on political alignment. It relaxes when a state possesses regional hegemony, credible deterrence, diversified markets, consolidated elite consensus, or low salience in great-power rivalry. A further scope condition is issue-specificity: "middle power" is not a fixed rank but a relational position. A state may be a middle power in maritime governance or regional diplomacy while remaining dependent in high-end military technology or finance. Indonesia, for example, can exercise agenda-setting influence in ASEAN and the Indo-Pacific while remaining structurally dependent on external suppliers for advanced defense platforms. South Africa can act as a diplomatic broker in Africa while facing severe fiscal and energy constraints. Strategy must therefore be assessed domain by domain rather than through a single hierarchy of power.

Observable Implications: If this mechanism holds, middle powers should display diversified procurement, multi-vector trade, non-exclusive security partnerships, institutional brokerage, strategic ambiguity, selective compliance with great-power demands, and domestic contestation over alignment. They should also practice what might be called omni-enmeshment: embedding themselves in multiple regional and global institutions so that no single power can isolate them. Observable failure modes include coercive economic retaliation, credibility loss among all partners, overextension, and the collapse of hedging into bandwagoning or Finlandization when dependence exceeds tolerable thresholds. In data terms, the relevant indicators are not only aggregate GDP or military spending, but trade concentration by partner, security-assistance dependence, voting alignment in multilateral forums, and the gap between doctrinal autonomy and procurement reality. A state whose doctrine proclaims non-alignment while its logistics, finance, and intelligence systems are fused with one patron is not hedging; it is aligned with rhetorical insulation.

Perspective Note (five traditions in brief):

African (primary): From an African vantage point, the middle-power problem is inseparable from the unfinished project of sovereignty. The relevant question is not merely how to balance Washington and Beijing, but how to prevent external powers from converting African territory, resources, and institutions into instruments of their own rivalry. African scholarship and political thought—Nkrumah's critique of neo-colonialism, Rodney's analysis of underdevelopment, Fanon's insistence on psychological and political liberation, Cabral's theory of class and national liberation, Nyerere's ujamaa and non-alignment, Mamdani's critique of bifurcated state power, Bayart's "politics of the belly," Mbembe's postcolonial critique, and Grovogui's insistence on African agency in international law—treat autonomy as historically denied rather than naturally possessed. For many African states, the middle-power label can obscure structural subordination: a state may be regionally influential while remaining financially, militarily, and technologically dependent. The African perspective therefore emphasizes Pan-African coordination, resource sovereignty, institutional self-reliance, and resistance to externally imposed conditionality. It sees fragmentation not only as an opportunity for hedging but as a risk that Africa becomes a theater for great-power competition. Its contribution is to place historical grievance, racialized hierarchy, and economic extraction at the center of strategic analysis; its occlusion, in some formulations, is a tendency to understate intra-African power asymmetries and the agency of African elites in reproducing dependence.

Chinese: The Chinese perspective frames the middle-power problem through relationality and the idea of a community of shared future. Middle powers are valued as partners in networked order rather than as autonomous balancers; their security is best achieved through economic integration, infrastructure connectivity, and respect for sovereignty. This perspective contributes a critique of alliance-based coercion and a vocabulary of win-win cooperation, but it can occlude asymmetry within partnerships and the strategic leverage created by debt, technology, and market access.

Russian: The Russian perspective treats the middle-power problem as a question of sovereign choice in a

multipolar order. It emphasizes resistance to unipolar dominance, the legitimacy of diversified partnerships, and the right of states to select security arrangements without external dictation. It contributes a powerful critique of Western conditionality and sanctions, but it can occlude the coercive dimensions of its own partnerships and the domestic costs of alignment with Moscow.

Western: The Western perspective, especially in liberal and realist variants, treats middle powers as stakeholders in a rules-based order and hedging as rational risk management. It contributes sophisticated tools for assessing capabilities, commitments, and credibility, and it treats institutional embeddedness as a source of security. Its occlusion is a tendency to universalize Western institutional preferences and to understate the agency and historical grievances of postcolonial states.

UN: The UN perspective frames the middle-power problem within Charter multilateralism, collective security, development, and mediation. It contributes norms of lawful force, sovereign equality, and institutionalized cooperation, and it reminds middle powers that legitimacy and coalition-building are strategic resources. Its limitation is that it can assume state capacity and consent that do not exist, and it may understate the competitive realities that drive hedging.

SECTION 2.4 — KEY IDEA 3: Ontological Security vs Material Survival — When Do Identity Concerns Override Security Interests?

Bolded Causal Claim: Ontological security—the need for a coherent, continuous, and socially recognized state identity—can override material survival calculations when threats are interpreted as assaults on the self rather than merely on interests, producing strategies that accept higher material risk in exchange for narrative continuity and recognition.

Mechanism: Materialist theories of security, especially classical and structural realism, treat states as survival-maximizing actors whose primary interest is physical existence and relative capability. Ontological security theory adds a second, non-material dimension: states also seek security of being. Drawing on sociological and psychological traditions, Mitzen (2006) emphasizes routines and anxiety reduction, while Steele (2008) emphasizes biographical narratives and the need for a consistent self. The mechanism is identity threat. When a state's foundational narrative—anti-colonial liberation, non-alignment, Islamic solidarity, ASEAN centrality, great-power status, or civilizational distinctiveness—is challenged, the resulting anxiety can be experienced as existential even if physical survival is not immediately at stake. Policy then aims not only to protect territory or resources but to restore or defend the self. This can produce symbolic commitments, refusal to abandon allies, legal activism, status-seeking, and risk acceptance that materialist models would classify as irrational. The key causal chain is: identity narrative -> social recognition -> anxiety when recognition is withheld or narrative is disrupted -> securitization of identity -> policy choices that prioritize continuity over optimization. Ontological security is not the absence of rationality; it is a different rationality, one in which the coherence of the state's story becomes a strategic good. For middle powers, this mechanism is especially important because their material capabilities are limited; identity, status, and moral authority often constitute their most deployable strategic resources.

Scope Conditions: Identity concerns are most likely to override material interests under six conditions: (1) historical trauma or colonial legacy that makes sovereignty and dignity non-negotiable; (2) regime legitimation tied to a foreign-policy doctrine, such that retreat would undermine domestic authority; (3) status inconsistency, where a state's self-image exceeds its material rank; (4) high domestic audience costs for perceived humiliation; (5) symbolic issues—Palestine, Taiwan, nuclear status, territorial memory, or international legal cases—that condense identity into a single decision; and (6) situations where material stakes

are significant but not immediately existential. Conversely, material survival is more likely to override identity when a state faces imminent military defeat, economic collapse, elite pragmatism consolidated through institutionalized restraint, or a credible security guarantee that reduces anxiety. A further scope condition is the difference between elite and mass identity: ontological security may be invoked by leaders for domestic legitimation even when the broader public is materially focused, or it may reflect genuine societal narratives that constrain elites. The theory therefore requires careful specification of whose identity is at stake and through which institutions it is performed.

Observable Implications: If ontological security mechanisms are operating, one should observe refusal to abandon positions despite sanctions or economic cost; symbolic diplomacy disproportionate to material gain; status-seeking in international institutions; persistence in alliances that no longer optimize security; risk acceptance in defense of identity; domestic mobilization around foreign-policy symbols; and legal or normative activism, such as ICJ cases or human-rights diplomacy, that asserts moral standing. One should also observe pathologies: overcommitment, escalation spirals, self-fulfilling insecurity, and the treatment of compromise as betrayal. Falsifiers include cases where states rapidly abandon identity-laden positions when material costs rise, where foreign-policy rhetoric changes without domestic legitimation crisis, or where identity claims are purely instrumental and reversible. The distinction between description, explanation, prediction, and prescription matters here: describing a state's identity narrative is not explaining its behavior; explaining identity-driven behavior is not predicting that it will persist under all cost conditions; and neither description nor explanation by itself prescribes whether such behavior should be encouraged or resisted.

Perspective Note (five traditions in brief):

African (primary): The African perspective treats ontological security as inseparable from decolonial selfhood. Identity is not a psychological preference layered onto material interests; it is the product of historical dispossession, racialized hierarchy, and the struggle to reclaim agency. Fanon's analysis of colonial violence and psychological domination, Cabral's insistence that liberation requires cultural and political reclamation, Nkrumah's critique of neo-colonialism, Mamdani's examination of colonial state forms, Mbembe's critique of the postcolony, Tamale's decolonial feminism, and Oyěwùmí's challenge to gendered and epistemic hierarchies all point to a common theme: the self of the postcolonial state has been systematically denied recognition. Ontological security therefore appears as dignity, sovereignty, and the right to define one's own development path. This explains why African states may accept material costs to defend positions on Palestine, Western Sahara, anti-racism, or anti-colonial solidarity, and why Pan-African identity can override narrow national interest. The African vantage point reveals what materialist and Western-liberal accounts often miss: that recognition is not a side issue but a core strategic resource, and that humiliation can be as destabilizing as invasion. Its risk is that identity claims can be mobilized by elites to obscure domestic failures or to justify authoritarian closure.

Chinese: The Chinese perspective links ontological security to civilizational continuity, relational identity, and the pursuit of a community of shared future. Security of being is achieved through recognition as a responsible great power and through the restoration of historical centrality. This contributes a critique of Western universalism and a vocabulary of mutual respect, but it can occlude the ways in which civilizational narratives may be used to legitimize hierarchy or to discipline dissent.

Russian: The Russian perspective frames ontological security through sovereign identity, historical memory, and great-power status. Threats to identity are often interpreted as Western attempts to deny Russia its rightful role, producing risk-acceptant behavior in defense of status and narrative. This contributes an understanding of status anxiety and historical grievance, but it can occlude the coercive implications of imperial memory and the domestic political uses of external threat.

Western: The Western perspective, particularly in liberal institutionalism and rationalist realism, often treats identity as epiphenomenal to interests or as a variable to be managed through institutions. It contributes tools for analyzing credibility, audience costs, and normative commitment, but it frequently occludes the possibility that identity itself is the interest being defended. Its strongest version, constructivism, partially corrects this by taking norms and identity seriously, yet it can still understate the material and coercive contexts in which identity claims are made.
UN: The UN perspective connects ontological security to Charter norms of sovereign equality, human dignity, and recognition. It contributes a framework in which identity claims can be mediated through law and multilateral institutions, reducing the need for unilateral risk acceptance. Its limitation is that it may assume a level of consensus and institutional legitimacy that does not exist, and it can understate the depth of historical grievance that makes recognition politically non-negotiable.

2.5 KEY IDEA 4 — Multi-alignment as a grand strategy — theory, practice, and limits

Bolded Causal Claim: Multi-alignment functions as a grand strategy for middle powers only under the joint conditions that (i) no single great power can impose alignment at acceptable cost, (ii) the middle power can credibly compartmentalize cooperation across issue areas, and (iii) domestic coalitions tolerate the ambiguity that multi-alignment requires; absent any of these, the strategy collapses into either forced alignment or incoherent drift.

Mechanism: Multi-alignment differs from Cold War non-alignment, which was largely abstentionist, and from hedging, which is typically reactive and risk-minimizing. Multi-alignment is an active portfolio strategy: the state deliberately cultivates overlapping and sometimes contradictory relationships with competing powers, extracting benefits from each while preventing any from achieving dominance. The mechanism operates through four channels. First, issue compartmentalization: security cooperation with one power is delinked from economic cooperation with another, allowing the middle power to avoid binary choices. Second, diversification of dependence: spreading trade, investment, and technology sourcing across poles reduces vulnerability to coercion. Third, signaling and reassurance: calibrated diplomatic language, participation in multiple institutions, and avoidance of exclusive commitments signal non-threatening intent, lowering the perceived cost of tolerating ambiguity. Fourth, institutional embedding: anchoring relationships in multilateral frameworks such as ASEAN, BRICS, the G20, and the African Union raises the transaction costs of unilateral pressure. The strategy also has a domestic mechanism: it requires bureaucratic capacity to manage complex, sometimes contradictory portfolios and political leadership willing to absorb criticism from factions favoring clearer alignment. The risk mechanism runs in parallel: if major powers perceive multi-alignment as free-riding or deception, they may escalate coercion; if domestic audiences perceive it as incoherence, governments may be punished electorally. The theory draws on portfolio theory in economics and on the strategic-studies literature on hedging, but it adds the claim that ambiguity itself can be a resource when the middle power's location or assets make it worth courting.

Scope Conditions: Multi-alignment is most viable when the international system is multipolar or fragmented rather than bipolar; when economic interdependence is high enough that coercion is costly for all sides; when the middle power possesses assets that make it worth courting, such as strategic location, resources, diplomatic convening power, or market size; and when major powers are distracted or constrained by other commitments. It is least viable when a single power achieves regional hegemony, when issue-linkage is strong (for example, security guarantees tied to technology access), or when domestic politics polarize around

identity-based alignment choices. It also requires a minimum of state capacity: foreign ministries able to manage complex portfolios, intelligence services capable of assessing multiple partners, and leaders with sufficient political capital to sustain ambiguity. Where these capacities are absent, multi-alignment tends to produce not strategic flexibility but strategic confusion, with different agencies pursuing contradictory lines.

Observable Implications: Successful multi-alignment should produce diversified trade shares with no single partner exceeding a critical threshold; sustained participation in competing institutional blocs without exclusion; absence of sanctions or coercive economic measures; and diplomatic access to all major powers. Failure indicators include sharp trade concentration, exclusion from key forums, targeted sanctions, or domestic political crises triggered by foreign policy ambiguity. At the level of discourse, successful multi-alignment produces a recognizable vocabulary of "strategic autonomy," "independent foreign policy," and "friends to all," while failure produces accusations of "fence-sitting" or "unreliability." Analysts can track these implications through trade-dependence metrics, UN voting alignment scores, military-exercise participation, and the frequency of high-level bilateral visits. A further implication is that multi-alignment should be associated with higher diplomatic transaction costs: more summits, more hedging language, and more frequent recalibration of positions.

Perspective Note (five traditions in brief): African (primary): African scholarship treats multi-alignment as a contemporary expression of the non-alignment and Pan-African traditions, but with greater emphasis on agency and material benefit. Scholars such as Grovogui and Bayart frame it not as neutrality but as strategic opportunism in a system historically structured against African interests; the African vantage point highlights how multi-alignment can reproduce dependency if it is not accompanied by industrial policy and regional integration. It contributes the insight that alignment choices are also choices about development models, and that a middle power which multi-aligns without building productive capacity may simply be diversifying its subordination. The African perspective also stresses that multi-alignment must be evaluated against the standard of whether it advances continental integration and reduces external dependency, not merely whether it preserves autonomy. Chinese: Chinese IR frames multi-alignment through relationality and the "community of shared future," viewing it as acceptable when it does not target third parties and as destabilizing when it becomes a vehicle for containment. It contributes the concept of "win-win" cooperation and the norm that alignment should not be exclusive. Russian: Russian discourse treats multi-alignment as legitimate sovereign choice in a multipolar order, often endorsing it as evidence of Western decline; it contributes the principle that no state should be forced into blocs, while occluding the coercive dimensions of Russia's own regional influence. Western: Western scholarship, especially in the US and Australia, tends to view multi-alignment with suspicion as "hedging" or "free-riding," contributing rigorous analysis of credibility and commitment problems but often assuming that alignment with the liberal order is the default optimal strategy. UN: The UN perspective frames multi-alignment as compatible with Charter principles of sovereign equality and non-intervention, contributing institutional mechanisms such as mediation and good offices that can reduce the costs of ambiguity; its limitation is that it may underestimate the power asymmetries that make multi-alignment costly for weaker states.

2.6 KEY IDEA 5 — The politics of strategy-making — coalitions, institutions, and domestic constraints

Bolded Causal Claim: Grand strategy is produced not by a unitary state but by domestic political coalitions operating through institutions with distinct interests and time horizons; strategic coherence is therefore a function of institutional capacity to aggregate preferences and of the political conditions that permit long-

horizon commitments, not of analytical clarity alone.

Mechanism: The mechanism draws on bureaucratic politics, organizational process theory, and veto-player analysis. Foreign policy decisions emerge from bargaining among agencies—foreign ministry, defense, intelligence, treasury, trade—each with organizational missions, budgets, and constituencies. Coalitions form across state and society: business lobbies, diaspora groups, military-industrial interests, religious and ethnic organizations, and regional elites. Institutions mediate: parliamentary committees, national security councils, courts, and independent agencies can either aggregate or fragment preferences. Time inconsistency is central: electoral cycles of two to five years are shorter than strategic horizons of decades, creating incentives for leaders to prioritize short-term gains or symbolic gestures over sustained commitments. The mechanism also includes strategic culture: historically sedimented beliefs about the state's role, threats, and appropriate means, which constrain the range of thinkable strategies. Domestic constraints operate through multiple channels: public opinion, especially in democracies; coalition government bargaining; federal or regional interests in large states; and the need to maintain legitimacy. The result is that strategy documents often represent lowest-common-denominator compromises rather than coherent plans, and implementation frequently diverges from stated doctrine. A further mechanism is the "rhetoric-action gap": governments may adopt ambitious strategic language to satisfy domestic audiences while lacking the resources or will to implement it, producing a cycle of overcommitment and retrenchment.

Scope Conditions: Coherent strategy-making is more likely when threat perception is shared across elites; when institutions are centralized and professionalized; when the executive has sufficient autonomy; and when there is cross-party consensus on core interests. Incoherence is more likely under coalition governments with divergent foreign policy preferences; high polarization; weak or politicized bureaucracies; federal systems with powerful regional actors; and societies with deep identity cleavages that foreign policy activates. The scope condition also includes resource constraints: even coherent strategies fail if budgets do not match commitments. A further scope condition concerns information: strategy-making requires accurate intelligence and analysis, and where intelligence is politicized or fragmented, the resulting strategy will reflect organizational biases rather than strategic reality. Finally, the international environment matters: a permissive environment allows more experimentation, while a threatening one may force coherence through crisis, though crisis-driven coherence is often brittle.

Observable Implications: Indicators of coherent strategy-making include stable defense budgets aligned with doctrine; consistent diplomatic messaging across agencies; long tenure of key officials; bipartisan support for core commitments; and implementation fidelity in crises. Indicators of incoherence include frequent strategy document revisions; public contradictions between officials; budget-doctrine mismatches; abrupt policy reversals after elections; and rhetoric-action gaps where stated strategy is not reflected in deployments or spending. Comparative analysis can measure coherence through indices of institutional capacity and political consensus. A further implication is that strategy documents themselves are political artifacts: their timing, authorship, and language reveal coalition dynamics, and changes in document language often precede changes in policy. Analysts should therefore read strategy documents as evidence of domestic politics, not merely as statements of intent.

Perspective Note (five traditions in brief): African (primary): African scholarship, particularly Mamdani, Bayart, and Grovogui, emphasizes that strategy-making in postcolonial states is shaped by the "politics of the belly," neopatrimonial networks, and the colonial inheritance of weak institutions. The African vantage point reveals that domestic constraints are not merely technical but historical: states may lack the bureaucratic autonomy assumed by Western models, and foreign policy often serves regime survival as much as

national interest. It contributes the insight that strategy-making must be analyzed through the lens of state formation and political economy, not just rational choice, and that the gap between formal institutions and actual practice is often wider in postcolonial states. The African perspective also highlights how external actors—donors, former colonial powers, multinational corporations—can shape domestic coalitions in ways that constrain strategic autonomy from within. Chinese: Chinese discourse emphasizes party-state coherence and the role of the CCP in aligning domestic and foreign policy; it contributes the model of "top-level design" and the integration of development and security, while occluding the role of internal factional politics and the costs of centralized control. Russian: Russian analysis highlights the role of the security apparatus and the personalization of strategy around the presidency; it contributes the concept of "sovereign democracy" and the fusion of domestic legitimacy with foreign policy assertiveness, while understating institutional checks. Western: Western scholarship, from Allison to contemporary veto-player theory, provides the most developed toolkit for analyzing domestic constraints; it contributes rigorous causal mechanisms but can overstate the universality of democratic institutional patterns and understate the role of informal networks. UN: The UN perspective frames strategy-making as ideally subject to international law and multilateral consultation; it contributes norms of transparency and accountability, and mechanisms such as peacebuilding commissions, but may assume institutional capacities and political will that are absent in many states.

2.7 FIVE PERSPECTIVES IN DEPTH

2.7.1 African Perspective (PRIMARY) The African vantage point begins from a different starting premise than the other four: the middle power is not a naturally occurring unit in an anarchic system but a historically produced position within a racialized and colonial international order. From this standpoint, grand strategy is not primarily the optimization of interests, threats, resources, and choices by a sovereign actor; it is the continuous negotiation of recognition, autonomy, and survival by states whose sovereignty was granted, delimited, and often hollowed out by external powers. The African perspective therefore does not reject the language of grand strategy; it re-situates it. Interests are not simply security and prosperity but also dignity, historical redress, and the capacity to define development without external prescription. Threats include not only invasion or coercion but debt conditionality, commodity dependence, sanctions, climate vulnerability, and the political economy of extraction. Resources include not only GDP and military capacity but diplomatic legitimacy, demographic weight, mineral endowments, and the moral authority derived from anti-colonial struggle. Strategic choices are made under conditions of "quasi-sovereignty," in which formal independence coexists with structural dependence (Grovogui, 2006). This is the central contribution of the African perspective: it makes visible the coloniality of the international order that other perspectives often treat as a neutral background.

This perspective is not monolithic. It spans Nkrumah's critique of neocolonialism, Nyerere's emphasis on self-reliance and ujamaa, Cabral's insistence that national liberation requires both political and social transformation, Fanon's analysis of the psychological and institutional damage of colonial rule, Rodney's argument that underdevelopment was actively produced, and later scholarship on the postcolonial state, including Mamdani's distinction between citizen and subject, Bayart's analysis of the "politics of the belly," Mbembe's work on necropolitics and the postcolony, and Grovogui's critique of sovereignty as a racialized legal category. African feminist and decolonial scholars such as Tamale and Oyěwùmí add that the state and the international order are gendered and epistemically hierarchical, so that "middle power" status itself may reproduce masculinist and Eurocentric assumptions about authority, rationality, and development. The African

perspective is therefore best understood as a family of arguments rather than a single doctrine, but it shares a common insistence that the international system is not merely anarchic; it is historically stratified.

On the middle-power problem—balancing autonomy with security in a fragmented order—the African perspective reframes autonomy as more than non-alignment or hedging. It is the capacity to make decisions without the structural veto of external creditors, donors, multinational corporations, or security patrons. Many African states are formally sovereign but materially constrained by aid dependence, debt servicing, export concentration, and security partnerships. In this context, "security" cannot be reduced to territorial defense; it includes food security, energy security, fiscal space, and the survival of governing coalitions. The African perspective therefore treats the middle-power dilemma as a problem of structural power, not only of strategic choice. A state may be a "middle power" in diplomatic forums while remaining a price-taker in global markets and a rule-taker in financial institutions. This is why African scholarship often emphasizes collective action—Pan-Africanism, the African Union, regional economic communities, and the Non-Aligned Movement—not as sentiment but as a strategy for aggregating bargaining power. Nkrumah's call for continental unity, for example, can be read as a grand-strategic response to the impossibility of individual African states negotiating as equals with great powers. The African Union's Agenda 2063 and the African Continental Free Trade Area are contemporary expressions of the same logic: autonomy is produced through scale, not merely declared through diplomacy.

Ontological security versus material survival is a particularly important theme in the African perspective. Postcolonial states often face a tension between material survival—access to finance, markets, security assistance, and diplomatic support—and ontological security, understood as the continuity of a dignified collective identity and the legitimacy of the state. Because colonial rule denied full humanity and sovereignty to African peoples, recognition itself becomes a strategic good. This can lead states to prioritize positions that affirm sovereignty, anti-racism, or Pan-African solidarity even when they carry material costs. South Africa's decision to bring a case against Israel at the International Court of Justice, for example, can be interpreted not only as legal diplomacy but as an assertion of post-apartheid moral identity and Global South solidarity, even as it risks economic and diplomatic friction with Western partners. Similarly, African support for multilateral norms such as the "responsibility to protect" has often been tempered by suspicion that humanitarian intervention can reproduce imperial hierarchies. The African perspective thus contributes a crucial insight: identity is not a luxury added to material interest; for states whose sovereignty has been historically contested, identity claims can be constitutive of security itself. At the same time, this perspective can occlude the ways in which elite actors instrumentalize identity for domestic legitimation or personal enrichment, and it can understate the costs of principled positions for vulnerable populations.

Multi-alignment, in the African perspective, is not simply "hedging" in the Western sense of risk management between great powers. It is often a continuation of non-alignment as a postcolonial survival strategy. African states have long sought to avoid exclusive dependence on any single external power, whether Western, Soviet, or Chinese. This is visible in the NAM legacy, in the diversification of partnerships across the Cold War and post-Cold War periods, and in contemporary engagement with BRICS+, the Belt and Road Initiative, Western development finance, and regional security arrangements. The African perspective emphasizes that multi-alignment is not neutral; it is shaped by asymmetries of power. A state may sign multiple partnerships while remaining dependent on one or two for critical infrastructure, debt, or security. The perspective therefore warns against confusing diplomatic diversification with strategic autonomy. It also highlights that African states are not merely objects of great-power competition; they exercise agency by playing powers against one another, extracting concessions, and using multilateral forums to amplify their voice. Yet this agency is bounded. The "politics of the belly" (Bayart) reminds us that external resources can be captured by domestic

elites, and that strategy-making may serve regime survival rather than national development. The African perspective contributes a sophisticated account of agency under constraint, but it can sometimes romanticize resistance and understate the complicity of local elites in external domination.

The politics of strategy-making is where the African perspective is especially distinctive. Western institutionalist accounts often focus on veto players, bureaucratic politics, and democratic accountability. African scholarship adds the importance of informal networks, neopatrimonialism, ethnic and regional coalitions, military influence, and the "extraversion" of the state—its orientation toward external resources for domestic legitimation (Bayart). Strategy is often made not through formal grand-strategic documents but through patronage, elite bargains, and the management of external rents. This does not mean African states lack strategy; rather, their strategies may be embedded in practices that Western frameworks classify as corruption or institutional weakness. Mamdani's analysis of the bifurcated state suggests that colonial administrative legacies continue to shape how authority is exercised, making "national interest" a contested and layered concept. Oyěwùmí and Tamale further remind us that gendered and epistemic hierarchies shape whose knowledge counts in strategy-making, often excluding women and marginalized groups from decisions about security and development. The African perspective thus contributes a critique of the technocratic assumption that grand strategy can be separated from domestic power and social structure. Its occlusion, however, is that it can sometimes overstate the uniqueness of African politics and understate the extent to which informal networks and elite capture also shape strategy in Western and other states.

What the African perspective reveals that the other four miss is the historical and racialized constitution of the international order itself. Western perspectives often treat the liberal order as a framework of rules; Chinese and Russian perspectives treat it as a hegemonic or unipolar structure; the UN perspective treats it as a legal and normative architecture. The African perspective adds that the order was built through colonial conquest, racial hierarchy, and unequal exchange, and that these legacies continue to shape who can be a "middle power," what counts as "security," and whose identity is recognized as legitimate. It also reveals that agency is not binary—states are neither fully autonomous nor merely passive—but exercised through collective mobilization, diplomatic entrepreneurship, and the strategic use of weakness. Its strongest counterargument is that it can understate the genuine benefits of alignment with great powers, including security guarantees, market access, and institutional support, and that it can sometimes treat all external engagement as neocolonial, thereby obscuring variation in the intentions and effects of different partners. Nevertheless, as a corrective to Eurocentric and great-power-centric theories of grand strategy, the African perspective is indispensable.

2.7.2 Chinese Perspective The Chinese perspective on the middle-power problem is rooted in a relational ontology of international politics: states are not atomistic units in an anarchic system but nodes in a web of relationships shaped by history, civilization, and mutual obligation. From this vantage, grand strategy is not merely the balancing of material interests and threats; it is the cultivation of a "community of shared future for mankind," in which development, security, and order are mutually constitutive. The framework of interests, threats, resources, and choices is therefore interpreted through the lens of relationality: interests include not only national gain but regional stability and the legitimacy of a multipolar order; threats include hegemonism, containment, and the disruption of development; resources include infrastructure, connectivity, manufacturing capacity, and diplomatic patience; choices are evaluated by whether they produce "win-win" outcomes rather than zero-sum advantage. This perspective contributes a distinctive critique of Western alliance politics: it argues that exclusive blocs and security dilemmas are not inevitable features of anarchy but products of a particular, historically contingent, Western-centric approach to order.

On the middle-power problem, China presents itself as both a great power and a developing country, and it often frames its rise as compatible with the autonomy of middle powers. The Belt and Road Initiative, the Asian Infrastructure Investment Bank, and various bilateral partnerships are presented as development-oriented alternatives to Western conditionality. From the Chinese perspective, middle powers should not be forced to choose between the United States and China; instead, they can benefit from diversified partnerships that prioritize economic development and non-interference. This is not merely rhetoric: it reflects a strategic interest in preventing the consolidation of a US-led coalition in the Indo-Pacific and in creating a multipolar environment in which China's influence is normalized. The Chinese perspective therefore treats multi-alignment as legitimate and desirable, provided it does not become a vehicle for containment. It also emphasizes that security and development are inseparable: a middle power's autonomy depends on its economic capacity, and economic capacity depends on stable relations with major markets and investors.

Ontological security plays a significant role in the Chinese perspective, though it is often expressed in civilizational and national-rejuvenation terms rather than in the individual-state identity language common in Western IR. China's strategic discourse emphasizes historical humiliation, sovereignty, territorial integrity, and the restoration of great-power status. These identity concerns can override narrowly material calculations, as seen in the insistence on sovereignty over Taiwan and the South China Sea, even when such positions carry economic or diplomatic costs. For middle powers, the Chinese perspective suggests that respect for sovereignty and non-interference are not just procedural norms but conditions of ontological security: states need recognition as equals, not as subordinates in a hierarchical order. This is one of the perspective's most important contributions. It challenges the assumption that all states share the same hierarchy of needs and that material survival always trumps identity. At the same time, the perspective can occlude the ways in which China's own sovereignty claims and development projects may threaten the ontological and material security of smaller states, particularly in contested maritime spaces or through debt and infrastructure dependence.

Multi-alignment is treated by the Chinese perspective as both a description of the emerging order and a normative preference. China argues that the world is moving toward multipolarity and that middle powers should diversify their partnerships rather than align exclusively with any single power. In practice, however, China's own strategy combines multi-alignment rhetoric with efforts to build exclusive or preferential relationships, particularly in regions where it seeks to reduce US influence. The perspective contributes the insight that alignment is not a binary choice and that middle powers can derive leverage from maintaining multiple relationships. Its occlusion is that it often understates the asymmetry between China and its partners, the opacity of Chinese lending and contracting, and the security implications of dual-use infrastructure. It also tends to frame criticism of Chinese practices as Western containment rather than as legitimate concerns about sovereignty, transparency, or human rights.

The politics of strategy-making in the Chinese perspective is shaped by the party-state, long-term planning, and a relatively centralized decision-making structure. Strategy is often articulated through five-year plans, national security concepts, and party congress reports, with an emphasis on continuity and elite consensus. This can produce a capacity for sustained, long-horizon strategy that democratic systems sometimes lack. The perspective contributes the idea that domestic political structure shapes strategic time horizons and that institutional continuity can be a strategic asset. Its occlusion is that it may understate the role of factional politics, bureaucratic competition, and public opinion, and it may overstate the coherence of Chinese strategy. It also tends to treat the Chinese model as universally applicable, understating the importance of domestic institutional variation among middle powers. Overall, the Chinese perspective is most valuable for its relational critique of atomistic IR theory and its emphasis on development as a component of security; its greatest

weakness is its tendency to present asymmetric power as mutual benefit.

2.7.3 Russian Perspective The Russian perspective on grand strategy for middle powers is organized around the principle of sovereign choice and the rejection of a unipolar or Western-dominated international order. From this vantage, the central problem of international politics is not anarchy but hegemony: the attempt by one power or bloc to impose its preferences, values, and security architecture on others. Grand strategy is therefore defined as the defense of sovereignty, the preservation of strategic autonomy, and the construction of a multipolar order in which multiple centers of power coexist. Interests are framed in terms of security, status, and the right to an independent foreign policy; threats include NATO expansion, regime change, sanctions, and the erosion of state sovereignty through international norms and institutions; resources include energy, military capacity, diplomatic tradition, and geographic depth; choices are evaluated by whether they strengthen sovereignty or subordinate it to external actors. This perspective contributes a powerful critique of liberal universalism and a reminder that for many states, the primary threat is not another state's power but the loss of the capacity to choose.

On the middle-power problem, the Russian perspective argues that autonomy and security are inseparable: a state that lacks hard security capacity will eventually be forced to align with a great power, and alignment itself becomes a source of vulnerability. This is why Russia emphasizes military modernization, energy leverage, and strategic partnerships with states that share its skepticism of Western dominance. For middle powers, the Russian perspective suggests that true autonomy requires not only diplomatic diversification but also the capacity to resist coercion, whether military, economic, or normative. It is sympathetic to non-alignment and multi-alignment when these are expressions of sovereign choice, but it is critical of arrangements that it sees as disguised alignment with the West, such as NATO partnerships or conditionality-laden Western aid. The perspective therefore treats multi-alignment as legitimate only if it is genuinely independent; if it becomes a mechanism for preserving Western primacy, it is viewed as a form of subordination.

Ontological security is central to the Russian perspective, though it is often expressed in terms of great-power status, historical narrative, and civilizational identity. Russia's strategic discourse emphasizes its role as a distinct civilization, its historical sacrifices, and its entitlement to a sphere of influence or at least a voice in regional security. These identity concerns can override material calculations, as seen in the willingness to bear economic costs for actions framed as defending sovereignty or historical justice. For middle powers, the Russian perspective highlights that identity and status are not secondary to material interests; they shape threat perception, alliance choices, and tolerance for risk. A state that feels humiliated or unrecognized may pursue policies that appear materially irrational but are ontologically rational. This is an important contribution, especially for understanding states with strong historical narratives or post-imperial identities. The perspective's occlusion is that it can treat Russian identity claims as legitimate while dismissing similar claims by other states, and it can understate the ways in which Russian actions—such as the invasion of Ukraine—violate the sovereignty and ontological security of others.

Multi-alignment, in the Russian perspective, is valued as a tool for breaking Western monopoly and creating a multipolar order. Russia promotes partnerships with China, India, Iran, and various Global South states, and it frames BRICS and the Shanghai Cooperation Organisation as platforms for sovereign equality. However, the perspective also reveals tensions: Russia expects loyalty from partners on core security issues, and its own strategy is not always consistent with the non-interference it advocates. The contribution is the insistence that multipolarity requires not just many powers but genuine equality of voice; the occlusion is that Russia's practice often resembles a sphere-of-influence logic that limits the autonomy of neighboring states. The Russian perspective is therefore strongest as a critique of unipolarity and as a defense of sovereign choice;

it is weakest when it conflates multipolarity with Russian entitlement.

The politics of strategy-making in the Russian perspective is shaped by a strong presidency, security elites, and a narrative of national revival. Strategy is often centralized, with limited institutional checks, and is closely tied to domestic legitimacy. The perspective contributes the concept of "sovereign democracy," which fuses domestic political legitimacy with foreign policy assertiveness, and it highlights the role of historical memory and national identity in shaping strategic preferences. Its occlusion is that it can understate institutional constraints, overstate elite coherence, and treat domestic opposition as foreign-sponsored. It also tends to understate the economic and technological costs of confrontation with the West. Overall, the Russian perspective is most valuable for its insistence that sovereignty and status are foundational to security, and for its critique of double standards in the application of international norms; its greatest weakness is its tendency to justify coercion as defense of sovereignty.

2.7.4 Western Perspective The Western perspective on grand strategy for middle powers is rooted in the liberal international order and in theories of alliance politics, deterrence, and institutional cooperation. From this vantage, the international system is anarchic but not lawless: rules, institutions, and alliances can mitigate security dilemmas and create opportunities for mutual gain. Grand strategy is the alignment of ends, ways, and means in pursuit of security, prosperity, and values; it is typically framed in terms of interests, threats, resources, and choices, with an emphasis on measurable capabilities and institutional capacity. The Western perspective contributes the most developed toolkit for analyzing domestic constraints, including veto-player theory, bureaucratic politics, and public-opinion research, and it treats strategy-making as a process shaped by institutions, coalitions, and information. Its central claim is that order is possible and that middle powers can enhance their autonomy by embedding themselves in rules-based institutions and alliances rather than by pursuing pure non-alignment.

On the middle-power problem, the Western perspective distinguishes between autonomy and isolation. A middle power can be autonomous not by avoiding great powers but by choosing its alignments strategically, diversifying its partnerships within a rules-based framework, and maintaining sufficient capability to avoid entrapment. Hedging—maintaining security ties with one power while economic ties with another—is treated as a rational response to uncertainty, provided it does not undermine alliance credibility. The Western perspective therefore sees multi-alignment as compatible with order if it is transparent, reciprocal, and anchored in institutions. It is more skeptical of non-alignment when it appears to enable free-riding or to undermine collective security. This perspective contributes a sophisticated account of risk management and the trade-offs between autonomy and assurance. Its occlusion is that it can treat Western-led institutions as neutral and universal, understating their historical origins and asymmetric benefits, and it can overestimate the willingness of great powers to accommodate middle-power autonomy.

Ontological security is present in the Western perspective but is often subordinated to material and institutional analysis. Democratic identity, human rights, and the rules-based order are treated as sources of legitimacy and as components of security, but they are frequently framed as universal values rather than as particular identities. This can lead to a tendency to treat deviations from liberal norms as security threats or as evidence of authoritarianism. The perspective contributes the insight that domestic regime type shapes foreign policy preferences and that democratic publics can constrain aggressive strategies. Its occlusion is that it can universalize Western identity claims, treating liberal democracy as the endpoint of political development, and it can understate the ontological security concerns of states whose identities are not liberal or whose historical experiences include colonialism and intervention. For middle powers, this means that Western frameworks may misread principled non-alignment or anti-interventionism as irrational or opportunistic.

Multi-alignment is a central theme in contemporary Western scholarship on middle powers, especially in the Indo-Pacific. Hedging, omni-enmeshment, and "friend-shoring" are analyzed as strategies for managing uncertainty in a fragmented order. The Western perspective contributes rigorous causal mechanisms: middle powers hedge when they face high uncertainty, asymmetric dependence, and credible threats from multiple directions. It also identifies limits: hedging can fail if great powers demand exclusive alignment, if domestic politics polarize around foreign policy, or if economic and security logics diverge. The perspective's occlusion is that it often treats hedging as a technocratic optimization problem, understating the role of identity, historical memory, and domestic political economy. It can also assume that the Western-led order is the natural baseline, making any challenge to it appear as revisionism rather than as a legitimate demand for reform.

The politics of strategy-making is where the Western perspective is strongest. It provides detailed theories of how institutions, veto players, bureaucratic politics, and public opinion shape strategy. It emphasizes that grand strategy is not made by a unitary rational actor but through bargaining among domestic actors with different interests and time horizons. This is a crucial contribution, especially for understanding democratic middle powers. Its occlusion is that it can overstate the universality of democratic institutional patterns and understate the role of informal networks, patronage, and elite capture in many states. It can also treat domestic constraints as obstacles to strategy rather than as sources of legitimacy and resilience. Overall, the Western perspective is most valuable for its analytical rigor, its institutional focus, and its account of hedging; its greatest weakness is its tendency to universalize liberal norms and to understate the historical and structural inequalities that shape the choices of non-Western middle powers.

2.7.5 UN Perspective The UN perspective on grand strategy for middle powers is rooted in the Charter's principles of sovereign equality, non-use of force, peaceful settlement of disputes, and collective security. From this vantage, the international system is not merely anarchic; it is governed by a legal and normative framework that constrains and enables state action. Grand strategy is therefore not only the pursuit of national interest but the reconciliation of national interest with international law, multilateral cooperation, and the common good. Interests include peace, development, and human rights; threats include conflict, poverty, climate change, and the erosion of multilateralism; resources include legitimacy, law, diplomacy, and institutional capacity; choices are evaluated by whether they strengthen or weaken the international order. The UN perspective contributes a normative framework that elevates the agency of middle and small states, treats multilateralism as a strategic asset rather than a constraint, and provides mechanisms—such as mediation, peacekeeping, and the General Assembly—for amplifying voices that would otherwise be drowned out by great-power politics.

On the middle-power problem, the UN perspective argues that autonomy is best secured through multilateralism rather than through bilateral alignment or non-alignment. Middle powers can use the UN system to build coalitions, set agendas, and constrain great-power behavior through law and norms. This is particularly important in a fragmented order, where unilateral or bilateral strategies may expose middle powers to coercion. The perspective therefore treats the UN not as a weak or irrelevant institution but as a strategic arena in which middle powers can exercise disproportionate influence relative to their material capabilities. It also emphasizes that security is indivisible: a middle power's security depends on the stability of the broader system, and therefore on collective action. This contributes an important corrective to purely competitive or bilateral accounts of strategy. Its occlusion is that it can assume institutional capacity and political will that are often absent, and it can understate the ways in which great powers capture or bypass UN mechanisms through the Security Council veto, funding leverage, or selective compliance.

Ontological security is present in the UN perspective in the form of identity as a responsible international citizen. States that contribute to peacekeeping, mediation, development, and norm promotion derive legitimacy and recognition from their multilateral engagement. For middle powers, this can be a source of ontological security: being seen as a bridge-builder, a mediator, or a defender of the Charter can reinforce domestic and international legitimacy. The perspective contributes the insight that identity and legitimacy are produced through participation in international institutions, not only through bilateral alliances or material power. Its occlusion is that it can treat multilateral participation as inherently virtuous, understating the ways in which states use the UN for instrumental or legitimizing purposes, and it can overstate the capacity of norms to constrain power. It may also understate the frustration of states that invest in multilateralism but see their concerns ignored by the Security Council.

Multi-alignment is compatible with the UN perspective when it is framed as diversification within a multilateral framework. The Charter does not require exclusive alignment; it requires respect for sovereignty and peaceful dispute settlement. The UN perspective therefore supports middle powers that maintain multiple partnerships, provided they do not use force or violate international law. It contributes the idea that multi-alignment can be stabilized by shared norms and institutions, reducing the risk of escalation. Its occlusion is that it can be overly legalistic, treating formal commitments as more constraining than they are in practice, and it can understate the power asymmetries that shape whose interpretations of international law prevail. It may also struggle to account for situations in which multilateralism itself becomes a tool of great-power competition, as when rival powers use UN forums to legitimize competing orders.

The politics of strategy-making in the UN perspective is framed in terms of transparency, accountability, and consultation. Strategy should ideally be subject to international law, parliamentary oversight, and civil society participation. The perspective contributes norms of good governance and mechanisms such as peacebuilding commissions, human rights councils, and review processes. Its occlusion is that it may assume institutional capacities and political will that are absent in many states, and it can understate the role of informal politics, elite capture, and security imperatives. It also tends to treat the UN as a neutral arbiter rather than as an arena shaped by power. Overall, the UN perspective is most valuable for its normative elevation of middle-power agency, its emphasis on law and multilateralism, and its account of collective security; its greatest weakness is its tendency to understate power politics and to overstate the capacity of institutions to constrain great powers.

SECTION 2.7.6 Comparison Matrix

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
African	Centers middle-power agency, sovereignty, and postcolonial refusal of hierarchical tutelage; treats non-alignment as normative order-making rather than mere tactics	Can understate material dependence, uneven capacity, and intra-elite or intra-regional divisions; may romanticize sovereignty	Self-determination, equality, anti-hegemony, and equitable participation in global order	NAM legacy, AU positions, ICJ litigation, demands for UN Security Council reform, insistence on strategic autonomy	Western: agency without material capacity and institutional leverage is insufficient for security
Chinese	Reconstructs middle powers as nodes in relational networks; emphasizes connectivity, development, and shared regional futures	Masks asymmetry, leverage, and the political implications of economic dependence; can treat sovereignty as compatible with hierarchy	Harmony, mutual benefit, multipolar equality, and community of shared future	Belt and Road projects, ASEAN-China frameworks, Global Development Initiative, trade interdepen-dence	Western/Russian: relational rhetoric may obscure coercive or asymmetric leverage
Russian	Legitimizes sovereign choice and multipolarity; offers a vocabulary of equality and non-interference that resonates with postcolonial states	Can conflate pragmatic hedging with endorsement of Russian or Chinese projects; may understate continued reliance on Western markets and security cooperation	Sovereign equality, non-interference, and resistance to unipolar dominance	BRICS+, SCO rhetoric, anti-sanctions discourse, multipolar diplomacy	UN/Western: sovereignty rhetoric can weaken collective security, human rights, and institutional accountability

Perspective	Key contribution	Key occlusion	Core normative stance	Best evidence	Strongest objection from another perspective
Western	Explains hedging, institutional balancing, and material incentives; clarifies how middle powers manage risk in a competitive order	Treats middle powers as objects or assets in great-power competition; underestimates postcolonial memory, normative agency, and domestic legitimacy constraints	Rules-based order, openness, deterrence, and institutional-ized cooperation	Indo-Pacific strategies, alliances, Quad, supply-chain initiatives, security partnerships	African/Chinese: the "rules-based order" can appear hierarchical, Western-centric, and selectively enforced
UN	Elevates middle-power agency through Charter principles, law, mediation, and multilateral forums; provides normative language for autonomy and peace	Assumes institutional capacity and political will that may be absent; understates informal politics, elite capture, and hard power	Collective security, sovereign equality, peaceful settlement of disputes, and multilateral legitimacy	UNGA resolutions, peacekeeping, ICJ, mediation roles, human rights and development frameworks	Russian/Western: institutions are arenas of power, not neutral arbiters, and may lack enforcement capacity

SECTION 2.8 WORKED EXAMPLE (I do)

Case: Indonesia as a middle power in the Indo-Pacific

Indonesia is a useful capstone case because it combines large population, archipelagic geography, G20 membership, ASEAN centrality, and a long-standing "free and active" (bebas aktif) foreign policy. It is not a great power, but it is too large and strategically located to be treated as a passive object of US-China competition. The puzzle is how Indonesia pursues strategic autonomy while remaining economically intertwined with China and security-cooperative with the United States and its partners.

Levels of Analysis

At the individual level, Indonesian strategy is shaped by elite beliefs, bureaucratic routines, and domestic political coalitions. Leaders inherit a postcolonial narrative that treats non-alignment as both a moral stance

and a practical method for preserving room for maneuver. Foreign policy is also filtered through domestic legitimacy: governments must show that they are not subordinating national interests to either Washington or Beijing. At the state level, Indonesia's archipelagic geography, maritime claims, resource endowments, and institutional capacity define what is feasible. The state must secure sea lanes, manage internal diversity, and convert demographic scale into economic and military capability. At the systemic level, the Indo-Pacific is structured by US-China rivalry, ASEAN's institutional centrality, and the diffusion of power across multiple poles. Indonesia's choices are constrained by alliance politics, regional order, and the possibility that great-power competition could militarize its surrounding seas. At the transnational level, Indonesia is embedded in global value chains, maritime trade routes, energy markets, digital infrastructure, and transnational religious and diasporic networks. These flows create opportunities for growth but also vulnerabilities, including dependence on external technology and exposure to supply-chain shocks.

Mechanism

The central mechanism is hedging as risk management rather than alliance commitment. Indonesia does not seek to balance China militarily in the manner of a formal ally; instead it diversifies partnerships, deepens economic ties with multiple actors, and uses ASEAN institutions to multilateralize great-power pressure. The mechanism works through three channels. First, economic diversification: by maintaining trade and investment links with China, the United States, Japan, South Korea, and others, Indonesia reduces the cost of any single partner's coercion. Second, institutional embedding: ASEAN provides a platform through which Indonesia can elevate regional norms, delay binary choices, and convert its size into agenda-setting influence. Third, strategic ambiguity: by avoiding exclusive commitments, Indonesia preserves bargaining space and signals that its cooperation is contingent on respect for sovereignty and regional stability. This is not neutrality in the sense of indifference; it is an active strategy of preserving autonomy under uncertainty. The mechanism is reinforced by identity: a self-image as a large, independent, archipelagic state makes alignment with either camp politically costly. Yet the mechanism has limits. Economic asymmetry means that diversification is uneven; security dependence may be harder to diversify than trade; and domestic capacity constraints can turn strategic autonomy into rhetorical autonomy.

Perspective Reconstruction

The African perspective, treated here as a primary lens rather than a regional add-on, illuminates Indonesia's insistence on agency, sovereignty, and non-subordination. It reconstructs Indonesian strategy as a postcolonial refusal to be conscripted into great-power projects, analogous in logic—though not identical in history—to African demands for strategic autonomy and equitable international order. From this vantage, bebas aktif is not merely tactical hedging but a normative claim that middle powers have the right to define their own interests, resist hierarchical tutelage, and participate in order-making. It highlights the memory of colonialism and the political cost of appearing to serve external powers. It also foregrounds the possibility that Indonesia's regional leadership is a form of agency that Western metrics of alliance alignment may undervalue. Its limitation is that it can understate material dependence: sovereignty rhetoric does not by itself create industrial capacity, maritime surveillance, or technological independence.

The Chinese perspective reconstructs Indonesia as a partner in a relational order rather than a node in a US-led alliance system. It emphasizes connectivity, development, and the idea that Indonesia's growth can be advanced through participation in Chinese-led economic networks. It treats strategic autonomy as compatible with deep economic interdependence, provided that interdependence is framed as mutual benefit. It also stresses ASEAN-China institutional cooperation and the possibility of a shared regional future. Its occlusion is that it may understate Indonesian anxieties about maritime coercion, asymmetry, and the political

implications of economic dependence.

The Russian perspective emphasizes sovereign choice and multipolarity. It would read Indonesia's refusal to align as evidence that the unipolar moment has ended and that states can legitimately diversify partnerships without Western approval. It contributes a vocabulary of equality and non-interference that resonates with postcolonial states. Its occlusion is that it can conflate Indonesia's pragmatic hedging with endorsement of Russian or Chinese geopolitical projects, and it may understate the extent to which Indonesia still values Western markets, technology, and security cooperation.

The Western perspective explains Indonesia through hedging, institutional balancing, and the material incentives of the rules-based order. It sees Indonesia as managing risk between a revisionist China and a US-led security architecture, and it values Indonesia's participation in maritime security, supply-chain resilience, and regional stability. Its occlusion is that it can treat Indonesia primarily as a strategic asset in great-power competition, underestimating the domestic political and normative reasons why alignment is constrained.

The UN perspective reconstructs Indonesia as a multilateral actor whose legitimacy derives from Charter principles, ASEAN centrality, and participation in global governance. It highlights mediation, maritime law, development cooperation, and the normative value of non-alignment as a contribution to peace. Its occlusion is that it may overstate the capacity of institutions to manage great-power rivalry and understate the hard security dilemmas facing an archipelagic state.

Explicit Adjudication

No single perspective fully explains Indonesia. The Western hedging framework best captures the instrumental logic of diversification and the material constraints of US-China rivalry, but it is too thin on agency and identity. The African perspective best explains why Indonesia's autonomy is not merely a tactical pause but a politically embedded commitment rooted in postcolonial sovereignty and regional leadership. The Chinese perspective captures economic interdependence but overstates mutuality; the Russian perspective captures multipolar rhetoric but overstates ideological convergence; the UN perspective captures institutional and legal dimensions but underestimates coercion. The most defensible adjudication is that Indonesia's grand strategy is best explained by a synthesis in which African-style agency and postcolonial sovereignty set the normative boundary, Western-style hedging supplies the operational mechanism, and UN-style multilateralism provides the institutional arena—while Chinese and Russian perspectives describe external opportunities and constraints that Indonesia exploits without fully endorsing. What this synthesis misses is the domestic political economy of strategy-making: elite bargains, bureaucratic capacity, and the gap between strategic doctrine and implementation.

SECTION 2.9 PROBLEM PAIR (We do)

Tasks

1. State the puzzle. South Africa filed an application at the International Court of Justice in December 2023 accusing Israel of genocide in Gaza, while simultaneously deepening its BRICS+ role and hosting a naval exercise with Russia and China in February 2023. Does a single grand strategy reconcile these moves, or do they reflect competing imperatives that the government is managing opportunistically?
2. Map the four levels of analysis. Identify the relevant actors and mechanisms at the individual level (President Ramaphosa, Foreign Minister Pandor, ANC leadership), the state level (the 1996 Consti-

tution's human-rights commitments, DIRCO's institutional culture, post-apartheid identity), the systemic level (multipolarity, US-China rivalry, BRICS+ expansion), and the transnational level (Palestinian solidarity networks, trade unions, diaspora communities, global South civil society).

3. Reconstruct the five perspectives on South Africa's choices. In three to five sentences each, articulate how the African, Chinese, Russian, Western, and UN perspectives would interpret the ICJ case, the BRICS+ deepening, and the Russia naval exercise.

4. Adjudicate between ontological security and material interest. Is South Africa's foreign policy better explained by identity continuity (the anti-apartheid liberation narrative, NAM legacy, constitutional values) or by material interest (BRICS market access, energy cooperation, Western trade dependence)? Specify the scope conditions under which each explanation dominates.

5. Identify falsifiers. What evidence would disconfirm the claim that ontological security sets the agenda? What evidence would disconfirm the claim that material interest constrains the instruments? Be concrete (e.g., withdrawal from the ICJ case under Western pressure, deepening Russia ties despite sanctions costs, electoral indifference to foreign policy stance).

6. Compare with Indonesia. Indonesia's hedging between the US and China is calibrated to material risk and geographic proximity. What does the South Africa comparison reveal about how historical identity shapes the risk tolerance of middle-power grand strategy?

MODEL ANSWER

South Africa's foreign policy in 2023-2024 presents a puzzle that resists single-cause explanation. The ANC government filed an application at the International Court of Justice accusing Israel of genocide in Gaza, while simultaneously deepening ties within BRICS+ and conducting a naval exercise with Russia and China. The question is whether these moves cohere under a grand strategy or reflect competing imperatives managed through rhetorical compartmentalization. At the individual level, President Ramaphosa and Foreign Minister Pandor framed the ICJ action as a moral obligation rooted in South Africa's anti-apartheid struggle, invoking Nelson Mandela's solidarity with Palestine. This is not merely rhetoric; it mobilizes a domestic constituency and reinforces ANC legitimacy at a moment of eroding electoral support. At the state level, the 1996 Constitution's commitment to human rights and international law provides an institutional anchor, and the Department of International Relations and Cooperation has long championed multilateralism as a core identity marker. Systemically, South Africa operates in a fragmented order where BRICS+ offers an alternative platform to Western-dominated institutions, and where US-China rivalry creates space for middle powers to diversify partnerships. Transnationally, Palestinian solidarity networks, trade unions, and civil society exert pressure that the ANC cannot ignore without electoral cost, while Western markets remain indispensable to South African exports.

The African perspective reads South Africa's stance as an assertion of sovereign agency and Pan-African solidarity extended to the global South. From this vantage, the ICJ case is not adventurism but a claim that international law must apply equally, a critique of double standards that Western powers have historically tolerated. The Chinese perspective emphasizes relationality: South Africa's BRICS+ role strengthens a community of shared future and demonstrates that Global South states can shape agendas rather than merely receive them. The Russian perspective frames the choices as sovereign multipolarity, rejecting unipolar dictates and asserting the right to partner with Moscow without Western permission. The Western perspective sees hedging that risks alienating the United States and the European Union, South Africa's largest trading

partners, and warns that normative posturing may carry material costs in market access and investment. The UN perspective treats South Africa as a Charter multilateralist, using judicial mechanisms rather than force, and positions the ICJ as the appropriate forum for adjudicating genocide claims.

Adjudicating between ontological security and material interest requires examining scope conditions rather than declaring a winner. Ontological security theory holds that states seek continuity of identity; for South Africa, the anti-apartheid liberation narrative is constitutive, and the ICJ case and NAM legacy express this identity. Yet material interests are not absent: BRICS+ offers market access, energy cooperation, and a platform to reform global governance, while Western trade dependence imposes real constraints. The evidence suggests interaction rather than substitution. The ICJ filing occurred when domestic ANC support was eroding and the party faced its most competitive election, suggesting identity politics served electoral consolidation. Simultaneously, trade data show continued heavy dependence on Western markets, indicating that BRICS+ has not displaced material ties. Thus the best explanation is that ontological security sets the agenda, determining which issues become salient, while material interests constrain the instruments available, preventing a full break with the West. Falsifiers would include withdrawal from the ICJ case following Western economic pressure, which would indicate material interest dominance; deepening Russia ties despite severe sanctions costs, which would indicate identity dominance; or electoral indifference to foreign policy stance, which would weaken the domestic-identity mechanism. Compared with Indonesia's hedging, South Africa's normative activism is less calibrated to material risk, reflecting its distinctive liberation identity and the domestic political utility of anti-colonial solidarity. In sum, South Africa's grand strategy is not a coherent blueprint but a negotiated equilibrium between who it claims to be and what it can afford.

SECTION 2.10 INDEPENDENT MEMO (You do)

(a) Case description. Nigeria, Africa's most populous state and largest economy, presents a middle-power puzzle distinct from both Indonesia's geographic hedging and South Africa's normative activism. Under President Tinubu, Abuja has pursued economic reforms demanded by Western creditors while simultaneously seeking BRICS partnership and maintaining security cooperation with Russia-linked Wagner successor entities in the Sahel. Nigeria leads ECOWAS interventions against military coups in Niger and Mali, yet its own democratic institutions face strain. Oil dependence, currency crisis, and youth unemployment constrain strategic choice, while Pan-African leadership claims and Commonwealth membership pull in different directions. The student must explain how Nigeria's grand strategy reconciles regional hegemony, economic survival, and identity claims.

(b) Required memo headings (prompts).

- **Mechanism:** Identify the causal mechanism linking Nigeria's domestic political economy (oil dependence, fiscal crisis, electoral coalitions) to its foreign policy posture. Specify scope conditions and observable implications.
- **Perspective reconstruction:** Reconstruct how the African, Chinese, Russian, Western, and UN perspectives would each interpret Nigeria's ECOWAS interventions, BRICS overtures, and Western economic alignment. Steel-man each.
- **Historical analogue:** Identify a comparable middle-power case (e.g., Nigeria under Obasanjo, Brazil under Lula, or Turkey under Erdogan) and specify what transfers and what does not.
- **Falsifiers:** State two to three concrete observations that would disconfirm your preferred explanation, and one that would disconfirm the leading alternative.

(c) Self-check. Before submitting, verify that you have distinguished description (what Nigeria did), expla-

nation (why), prediction (what follows under stated conditions), and prescription (what should be done), and that no single paragraph conflates more than two of these.

SECTION 2.11 HINGE QUESTION

A middle power possesses strong normative identity commitments rooted in an anti-colonial liberation narrative and deep trade dependence on a rival bloc. Facing a geopolitical crisis, which grand strategic posture best reconciles autonomy with security according to the framework developed in this lesson?

A) Full alignment with the normative bloc, accepting all material costs as the price of identity consistency.
B) Full alignment with the material partner, abandoning identity claims to maximize economic gain.
C) Multi-alignment: maintaining normative voice while diversifying partnerships and preserving exit options.
D) Strategic isolation: withdrawing from all blocs to maximize formal sovereignty.

Correct answer: C.

Distractor diagnoses.

- **A** conflates ontological security with material survival. It assumes identity concerns always override security interests, ignoring the scope conditions under which material constraints prevent a full break with the dominant partner. The lesson shows identity sets the agenda but does not eliminate cost calculations.
- **B** treats material interest as the sole driver and occludes the domestic political and institutional costs of abandoning constitutive identity claims. It cannot explain why middle powers sustain normative posturing despite economic risk.
- **D** mistakes autonomy for isolation. It ignores interdependence, institutional leverage, and the lesson's emphasis that middle powers gain influence through engagement and diversification rather than withdrawal.

SECTION 2A — DATA LAB

Data note: The figures below are indicative ranges for teaching purposes (circa 2022–2024), not authoritative point estimates. They should be verified against World Bank, SIPRI, WTO/UN Comtrade, and UNGA voting records before use in research or policy work.

Table 1. Material profile of two middle powers (indicative)

State	Nominal GDP (USD trn)	Defense spending (% of GDP)	Active military personnel (thousands)	Strategic geography
Indonesia	~1.3–1.4	~0.7–0.9	~400	Archipelagic chokepoints; bridge between Indian and Pacific Oceans

State	Nominal GDP (USD trn)	Defense spending (% of GDP)	Active military personnel (thousands)	Strategic geography
South Africa	~0.37–0.40	~0.7–1.0	~75	Cape sea lanes; gateway to Southern Africa and Indian Ocean

Table 2. Trade dependence by partner (indicative share of total trade)

State	Largest partner	Second	Third	Structural vulnerability
Indonesia	China (~25–30% of imports; ~20–25% of exports)	ASEAN (~20%)	Japan/US (~10–12% each)	Manufacturing inputs and consumer demand tied to China; security and technology ties to US/Japan
South Africa	China (~15–20% of exports; ~20% of imports)	EU (~20–25%)	US (~8–10%)	Mineral exports to China; EU market access; US preference-programme exposure

Table 3. Doctrine, alignment, and normative posture (qualitative)

State	Doctrine / document	UN voting pattern (indicative)	Key alignment	Central tension
Indonesia	“Bebas aktif” (free and active)	Frequent abstention on great-power conflicts; strong Global South solidarity on Palestine and colonial questions	NAM, ASEAN, G20	Autonomy rhetoric versus deep China trade dependence

State	Doctrine / document	UN voting pattern (indicative)	Key alignment	Central tension
South Africa	Constitution-based human rights; NAM legacy; BRICS+ participation	Solidarity with Global South; high-profile ICJ genocide case against Israel	AU, BRICS+, NAM	Normative leadership versus material ties to Russia/China and Western market access

Analysis questions

1. **Trend.** Across Tables 1–2, what pattern links middle-power material capacity to trade dependence? Does larger GDP translate into greater strategic autonomy, or does it coexist with deeper interdependence? Identify one trend and one anomaly, and state what each implies for grand strategy.
2. **Level of analysis.** Take Indonesia's China trade share. How does the same fact appear at the individual level (firms, elites, consumers), the state level (ministries, coalitions, doctrine), the systemic level (US–China competition), and the transnational level (supply chains, diaspora, finance)? Which level best explains Indonesia's hedging, and which level is most often ignored in Western commentary?
3. **Perspective reconstruction (all five).** Reconstruct the data through all five perspectives, beginning with the African perspective as primary.

    - **African (primary):** The tables show a familiar post-colonial structure: middle powers possess formal sovereignty and growing GDP, yet remain embedded in unequal trade and security hierarchies. From this vantage, Indonesia's "bebas aktif" and South Africa's NAM/BRICS+ posture are not merely tactical hedging; they are attempts to convert historical subordination into diplomatic agency. The data confirm that autonomy is constrained by material dependence, but they also show that middle powers use multilateral forums, normative claims, and regional leadership to widen their room for manoeuvre. What the tables hide is the domestic political labour required to sustain non-alignment: elite bargains, popular legitimacy, and the memory of colonial or apartheid-era vulnerability.

    - **Chinese:** The data support a relational reading: trade density is not domination but interdependence, and middle powers benefit from China's market and infrastructure. The occlusion is coercion risk and the possibility that dependence becomes leverage.

    - **Russian:** The data can be read as evidence of a fragmenting order in which middle powers seek sovereign choice outside Western blocs. The occlusion is the cost of alignment with sanctioned or revisionist powers.

    - **Western:** The data support hedging as rational risk management under uncertainty. The occlusion is the normative and identity-based reasons why middle powers resist binary alignment.

    - **UN:** The data point to a need for multilateral mediation, rules-based trade, and Charter restraint. The occlusion is the weakness of enforcement when great powers disagree.

4. **Interpretation.** Do these data support multi-alignment as a sustainable grand strategy, or do they show a transitional posture that will collapse under intensified US–China competition? Use at least one falsifier (for example: a sustained drop in China trade share without security realignment, or a major arms purchase that breaks non-alignment).

5. **Limitation.** What do GDP, defense spending, trade shares, and UN voting not measure that matters for grand strategy? Name three omissions and explain how each could reverse the conclusion that a given middle power is "successfully autonomous."

SECTION 3 — DUAL-CODED VISUAL ANCHOR

Visual 1 — "Grand Strategy Choice Space for a Middle Power"

- **What to draw:** A large square coordinate plane. Draw the x-axis as "Strategic autonomy (low → high)" and the y-axis as "Security dependence (low → high)." Divide the plane into four lightly shaded quadrants: bottom-left "Bandwagoning," top-left "Balancing," top-right "Hedging," bottom-right "Buck-passing/Defection." Place a medium circle labelled "Indonesia" in the upper-right quadrant, slightly closer to the autonomy axis. Place a second circle labelled "South Africa" also in the upper-right quadrant, but nearer the centre, with a small arrow showing movement toward "normative hedging." Draw a dashed diagonal line from bottom-left to top-right labelled "Great-power pressure increases."
- **Labels to place:** "Autonomy," "Dependence," "Hedging zone," "Indonesia," "South Africa," "Great-power pressure."
- **Perspective overlay to annotate:** In the Indonesia circle, annotate "African/Global South: sovereignty as non-negotiable"; near South Africa, annotate "Western: hedging as rational"; along the diagonal, annotate "Chinese: relational stability"; in the top-left quadrant, annotate "Russian: multipolar choice"; near the origin, annotate "UN: Charter restraint."

Visual 2 — "Multi-alignment as Network, Not Bloc"

- **What to draw:** A central hexagon labelled "Middle Power." Draw six to eight radiating lines of varying thickness to nodes labelled "US," "China," "Russia," "BRICS+," "NAM," "UN," "AU/ASEAN," and "EU." Make the China and US lines thickest; make Russia and BRICS+ medium; make UN and regional nodes thinner but dashed to indicate normative ties. Add small icons: a trade symbol on the China/US/EU lines, a security symbol on the US line, a normative symbol on NAM/UN lines. Draw a faint outer ring labelled "Global South solidarity."
- **Labels to place:** "Trade," "Security," "Norms," "Solidarity," "Hedging network."
- **Perspective overlay to annotate:** Beside the China node, annotate "Chinese: community of shared future"; beside the US node, annotate "Western: order maintenance"; beside Russia/BRICS+, annotate "Russian: sovereign equality"; beside NAM/UN, annotate "African: Pan-African/Global South agency"; beside the outer ring, annotate "UN: multilateral mediation."

Visual 3 — "Ontological versus Material Security"

- **What to draw:** A balance scale. On the left pan, place three stacked boxes labelled "GDP," "Trade access," and "Military capacity." On the right pan, place three stacked boxes labelled "Identity," "Dig-

nity," and "Historical memory." Place the fulcrum at the centre, but draw the right pan slightly lower to show that identity can outweigh material gain in some decisions. Add two small case tags: "Indonesia: bebas aktif" on the right pan and "South Africa: ICJ case" on the right pan. Draw a small arrow from the left pan to the right pan labelled "material pressure."

- **Labels to place:** "Material survival," "Ontological security," "Indonesia," "South Africa," "Identity weight."
- **Perspective overlay to annotate:** On the right pan, annotate "African: identity as sovereignty"; on the left pan, annotate "Western: material optimization"; near the fulcrum, annotate "Chinese: relational harmony"; near the arrow, annotate "Russian: sovereign choice"; above the scale, annotate "UN: human dignity and Charter norms."

SECTION 4 — CORNELL NOTES

Cue	Notes (source log included)
Define grand strategy	Liddell Hart (1954): strategy coordinates ends, ways, and means; grand strategy extends this to political, economic, and moral resources. Kennedy (1991): great-power decline follows from overextension relative to resources.
Middle-power problem	Gecelovsky (2009): middle powers lack decisive material capacity but possess diplomatic, normative, and regional assets. Beeson and Higgott (2014): in Asia-Pacific, middle powers face a fragmented order and must manage US–China rivalry.
Ontological vs material security	Identity, status, and historical memory can override narrowly material calculations; middle powers may accept economic cost to preserve self-image as sovereign or normative actors.
Multi-alignment	Not neutrality or non-alignment in the Cold War sense; a portfolio of ties across security, trade, and norms. Limits: credibility erosion, contradictory commitments, great-power coercion.
Politics of strategy-making	Strategy is made by coalitions, bureaucracies, and domestic institutions; leaders face electoral, military, and business constraints. Posen (2014): restraint requires political coalitions; Brands (2016): strategy must connect ends and means across domains.
Indonesia case	"Bebas aktif"; archipelagic geography; China trade dependence; US/Japan security ties; ASEAN centrality; hedging as practice rather than doctrine.
South Africa case	NAM legacy; BRICS+; AU leadership; ICJ case; Russia ties; EU/US market access; normative foreign policy versus material interests.

Cue	Notes (source log included)
Data limitations	GDP, defense spending, trade shares, and UN voting omit domestic coalitions, elite beliefs, historical memory, supply-chain depth, and coercive leverage.
African perspective (primary)	Agency, sovereignty, Pan-Africanism; middle powers as actors negotiating post-colonial hierarchies; identity and historical experience shape strategy.
Chinese perspective	Relationality; community of shared future; trade interdependence; stability through dense ties; risk of over-dependence.
Russian perspective	Sovereign choice; multipolarity; resistance to Western bloc logic; costs of alignment with sanctioned powers.
Western perspective	Liberal order; hedging as rational; rules-based trade; alliance credibility; concern about authoritarian influence.
UN perspective	Charter multilateralism; mediation; human dignity; limits of enforcement under great-power disagreement.

Summary (3–5 sentences): Middle-power grand strategy is the problem of converting limited material capacity into durable autonomy under great-power competition. Indonesia and South Africa illustrate different versions of multi-alignment: Indonesia hedges between China trade and US/Japan security, while South Africa balances normative leadership with BRICS+, Russia ties, and Western market access. The data show interdependence, not independence, and therefore strategy must be judged by political sustainability as well as by metrics. African, Chinese, Russian, Western, and UN perspectives each illuminate a different dimension of this problem and each occludes another.

SECTION 5 — FEYNMAN COMPRESSION

1. **Explain without jargon.** A middle power is a country that is not a superpower but is too important to ignore. Its leaders want to stay safe, keep trading, and still feel like an independent country. They usually do not pick one big power; instead they keep ties with several—China for trade, the US for security, regional groups for voice, and the UN for legitimacy. Sometimes they also take moral stands, like South Africa's ICJ case, because identity and history matter, not just money or weapons.

2. **Mark gaps.** I am not yet sure how long hedging can last when US–China rivalry intensifies; whether domestic coalitions will support costly non-alignment; how to measure ontological security; and whether UN voting patterns predict real strategic choices. I also need to separate description of Indonesia's "bebas aktif" from explanation of why it persists.

3. **Reread verification.** Rechecking the core sources: Liddell Hart (1954) reminds me that grand strategy includes political and moral resources, not only military force; Kennedy (1991) warns that overex-

tension relative to resources produces decline; Posen (2014) shows that restraint is politically constructed; Brands (2016) insists that strategy must connect ends and means; Gecelovsky (2009) defines the middle-power dilemma as limited capacity plus diplomatic opportunity; Beeson and Higgott (2014) place that dilemma inside a fragmented Asia-Pacific order.

4. **Analogy with explicit limits.** A middle power is like a small business owner who buys from one giant supplier, sells to another giant customer, and joins a trade association for protection. The analogy helps explain diversification and vulnerability, but it breaks down because states have historical identities, coercive power, domestic publics, and claims to sovereignty that firms do not have.

5. **Rewrite.** Middle-power grand strategy is the disciplined management of dependence: leaders use trade, security ties, regional institutions, and normative claims to preserve autonomy in an order they cannot control. Indonesia and South Africa show that multi-alignment can be rational and durable, but only if domestic coalitions accept its costs and if great-power pressure does not force a binary choice. The African perspective is essential because it shows that sovereignty is not merely a legal status; it is a historically earned and politically defended condition.

SECTION 6 — SPACED-REPETITION FLASHCARDS

Tag	Card Type	Front	Back	Perspective Note
61	Definition	What is grand strategy?	Grand strategy is the long-term alignment of a state's ends (interests), ways (strategies), and means (resources) across military, economic, and diplomatic domains. Liddell Hart (1954) framed it as the coordination of all instruments of power toward policy objectives.	Western tradition treats it as rational statecraft; African scholarship (Grovogui) asks whose interests the "national interest" actually serves.

Tag	Card Type	Front	Back	Perspective Note
61	Mechanism	What is the middle power problem?	Middle powers possess enough capacity to pursue autonomous foreign policies but insufficient power to shape the international order unilaterally; they must balance autonomy with security, typically through hedging and multi-alignment. Beeson and Higgott (2014) frame this as a structural constraint rather than a choice.	African middle powers (South Africa, Nigeria) often frame autonomy through Pan-African solidarity rather than bilateral hedging alone.
61	Definition	What is ontological security?	Ontological security is the need for a stable, continuous sense of self-identity; states may prioritize identity-affirming actions over material gain when that identity is threatened. Mitzen (2006) and Steele (2008) develop this in IR.	African states' ontological security is frequently tied to anti-colonial sovereignty norms and post-colonial statehood.

Tag	Card Type	Front	Back	Perspective Note
61	Mechanism	How does multi-alignment differ from non-alignment?	Non-alignment (NAM legacy) refuses bloc membership; multi-alignment actively cultivates partnerships across competing powers simultaneously to extract benefits from multiple relationships. Gecelovsky (2009) distinguishes the two.	India and Indonesia practice multi-alignment; African states often blend NAM rhetoric with multi-alignment practice.
61	Application	What is Indonesia's grand strategy in the Indo-Pacific?	Indonesia pursues "bebas-aktif" (free and active) foreign policy, hedging between the US and China through ASEAN centrality, maritime security cooperation, and economic engagement with both powers.	Indonesian strategy reflects archipelagic state identity and a non-alignment tradition rooted in the 1955 Bandung Conference.
61	Application	What tension defines South Africa's middle-power strategy?	South Africa's ICJ case against Israel and its NAM legacy express normative commitments, while BRICS+ membership and Russia ties serve material and economic interests; these commitments can conflict in practice.	The African agency perspective reads this tension as sovereignty assertion rather than incoherence.

Tag	Card Type	Front	Back	Perspective Note
61	Source	What does Posen (2014) argue about grand strategy?	Posen (2014) argues grand strategy is about choosing among competing strategic options under resource constraints, emphasizing restraint and prioritization; he critiques overextension and imperial overreach.	A Western realist lens; African scholars would add colonial resource extraction as an additional constraint on choice.
61	Source	What does Brands (2016) contribute?	Brands (2016) examines American grand strategy and the challenges of sustaining primacy, arguing for a coherent strategic vision amid a fragmenting international order.	US-centric in scope; less directly applicable to middle-power strategy-making.
61	Source	What does Kennedy (1991) argue?	Kennedy (1991) analyzes the rise and fall of great powers, linking economic and military overextension to relative decline; middle powers must avoid imperial overstretch and preserve economic foundations.	Historical structuralism; African application extends to post-colonial state capacity and debt burdens.

Tag	Card Type	Front	Back	Perspective Note
61	Debate	Does ontological security override material survival?	It is context-dependent: when identity is deeply threatened (e.g., post-colonial sovereignty), states may sacrifice material gains for identity affirmation; when physical survival is at stake, material interests dominate.	African states often prioritize sovereignty identity over economic optimization, reflecting anti-colonial legacies.
61	Comparison	How do Chinese and Western perspectives on middle powers differ?	The Chinese perspective emphasizes relationality and a "community of shared future," expecting middle powers to align with China's vision; the Western perspective emphasizes liberal order, hedging, and rules-based alignment.	The African perspective rejects both as external imposition, asserting sovereign agency and Pan-African solidarity.
61	Reconstruction	Reconstruct the Russian perspective on middle-power strategy.	Russia views middle powers as sovereign actors entitled to independent choices in a multipolar order; it opposes Western hegemony and supports states resisting US pressure, as seen in BRICS+ and South Africa ties.	Russian "sovereign choice" rhetoric resonates with African anti-imperialism but may mask underlying power asymmetry.

Tag	Card Type	Front	Back	Perspective Note
61	Occlusion	What does the Western perspective occlude about middle powers?	Western hedging frameworks occlude the historical and structural constraints (colonialism, debt, unequal trade) that limit middle-power autonomy, treating autonomy as a policy choice rather than a capacity.	African scholarship (Rodney, Mamdani) highlights these constraints as foundational.
61	Adjudication	How to adjudicate between multi-alignment and bloc alignment?	Adjudicate by assessing resource dependence, threat environment, identity commitments, and institutional capacity; multi-alignment suits fragmented orders with multiple patrons, while bloc alignment suits existential threats.	African states often choose multi-alignment to preserve Pan-African solidarity and avoid subordination.
61	Visual	What does a grand strategy triangle (ends-ways-means) show?	It maps interests (ends), strategies (ways), and resources (means); misalignment among the three vertices produces strategic failure and is useful for diagnosing middle-power overreach.	African application must include external structural constraints as an implicit fourth vertex.

SECTION 7 — METACOGNITIVE CALIBRATION

7.1 Confidence Audit (score each 0–100)

Skill / Concept	Confidence (0–100)	Evidence of Mastery	Gap to Close
Defining grand strategy (ends-ways-means)			
The middle power problem			
Ontological security vs. material survival			
Multi-alignment theory and limits			
Politics of strategy-making			
Five-perspective reconstruction			
Worked example (Indonesia)			
Problem pair (South Africa)			

7.2 Three-Question Debrief

1. Which of the five perspectives did you find hardest to steel-man from within, and what specifically made it difficult?
2. Where in your analysis did you conflate description of a state's behavior with prescription of what it ought to do?
3. What single piece of evidence would most change your adjudication between multi-alignment and bloc alignment for a given middle power?

7.3 Error-Log

Common Misconception	Correction	Evidence
Middle powers are simply small great powers.	Middle powers lack unilateral order-shaping capacity; their autonomy is structurally constrained, not merely a matter of will.	Beeson and Higgott (2014)
Non-alignment equals neutrality or passivity.	Non-alignment is an active strategy; multi-alignment engages all sides deliberately rather than abstaining.	Gecelovsky (2009)

Common Misconception	Correction	Evidence
Ontological security always trumps material interests.	The priority is context-dependent; existential survival threats override identity concerns.	Mitzen (2006)
Multi-alignment is costless.	It risks credibility loss, overstretch, and contradictory commitments across partners.	Brands (2016)
African foreign policy is incoherent.	Apparent incoherence often reflects competing legitimate commitments (normative and material) under structural constraint.	Grovogui (1996)
Grand strategy is only for great powers.	Middle powers need grand strategy precisely to manage resource constraints and avoid overreach.	Posen (2014)

SECTION 8 — CHEATSHEET

Core Concepts	Key Mechanisms	Theories and Authors	Cases and Evidence	Debates	Falsifiers	Cross-Links
Grand strategy (ends-ways-means)	Alignment of interests, strategies, resources across domains over time	Liddell Hart (1954); Kennedy (1991); Posen (2014); Brands (2016)	Indonesia "bebas-aktif"; South Africa ICJ case + BRICS+	Whether grand strategy is possible for non-great powers	A middle power thriving without any coherent strategy	Lesson 1 (levels of analysis); Lesson 60 (Capstone I)
Middle power problem	Autonomy-security tradeoff under structural constraint	Beeson and Higgott (2014)	South Africa, Nigeria, Indonesia, Turkey	Whether middle powers are a distinct category	A state with middle-power capacity but no autonomy constraints	Lesson 12 (power); Lesson 45 (regional orders)

Core Concepts	Key Mechanisms	Theories and Authors	Cases and Evidence	Debates	Falsifiers	Cross-Links
Ontological security vs. material survival	Identity continuity can override material optimization when selfhood is threatened	Mitzen (2006); Steele (2008)	Post-colonial sovereignty assertions; NAM legacy	Which dominates under what conditions	A state sacrificing identity for marginal economic gain	Lesson 8 (construc-tivism); Lesson 30 (identity)
Multi-alignment	Simultaneous engagement of competing powers to extract benefits and hedge risk	Gecelovsky (2009); Kuik (2008)	Indonesia hedging US/China; India multi-alignment	Whether multi-alignment is sustainable or erodes credibility	A multi-aligned state suffering no credibility costs	Lesson 15 (alliances); Lesson 52 (hedging)
Politics of strategy-making	Coalitions, institutions, and domestic constraints shape strategic choice	Posen (2014); Brands (2016)	South Africa's domestic politics and ANC foreign policy	Whether strategy is elite-driven or socially embedded	Strategy unchanged by domestic political turnover	Lesson 20 (domestic politics); Lesson 55 (institutions)
Five perspectives on middle powers	Each tradition contributes and occludes: African (agency), Chinese (re-lationality), Russian (sovereignty), Western (hedging), UN (multi-lateralism)	Grovogui (1996); Mamdani (1996); Rodney (1972)	UN voting alignment data; trade dependence metrics	Which perspective best explains a given case	A case where one perspective fully suffices	Lesson 2 (perspec-tives); Lesson 61 (this lesson)

SECTION 9 — REVIEW SCHEDULE

Interval	Action	Timing
R1	Re-read all 15 flashcards and recite the five perspectives from memory	Same day, 20 minutes
R2	Reconstruct the Indonesia and South Africa cases without notes, then check against the lesson	24 hours, 30 minutes
R3	Redo the problem-pair memo (South Africa) under timed conditions and compare to the model answer	1 week, 45 minutes
R4	Write a comparative memo: Indonesia vs. South Africa grand strategies, adjudicating multi-alignment vs. bloc alignment	2 weeks, 60 minutes
R5	Full capstone synthesis integrating Lessons 1–61; produce a 1,000-word grand strategy brief for a middle power of your choice	1 month, 90 minutes

SECTION 10 — COMPLETION CHECKLIST

- ☐ I can define grand strategy in ends-ways-means terms and trace it to Liddell Hart (1954).
- ☐ I can explain the middle power problem as a structural constraint, not merely a size category.
- ☐ I can distinguish ontological security from material survival and state when each dominates.
- ☐ I can define multi-alignment and contrast it with non-alignment using Gecelovsky (2009).
- ☐ I can reconstruct Indonesia's "bebas-aktif" strategy and its hedging logic.
- ☐ I can reconstruct South Africa's tension between normative foreign policy and material interests.
- ☐ I can steel-man all five perspectives (African, Chinese, Russian, Western, UN) on the middle-power problem.
- ☐ I can identify what each perspective contributes and what it occludes.
- ☐ I can apply the four levels of analysis (individual, state, systemic, transnational) to a middle-power case.
- ☐ I can distinguish description, explanation, prediction, and prescription in a strategy memo.
- ☐ I can name the strongest counterargument to multi-alignment.
- ☐ I can explain how domestic politics constrains strategy-making.
- ☐ I can use the grand strategy triangle to diagnose misalignment.
- ☐ I can identify falsifiers for the claim that middle powers must multi-align.
- ☐ I can score my confidence honestly on the calibration audit.
- ☐ I can populate the error-log with at least three corrected misconceptions.
- ☐ I can produce a 150–200 word case description for an independent memo.
- ☐ I can answer the hinge question and diagnose each distractor.
